# LODenominator Property

**Description**
Sets or returns the denominator value of the LO Fractional Multiplier.

If you are changing several mixer configuration settings, you can make all the changes first and then issue the **Calculate** and **Apply** commands as you would do from the user interface.

**VB Syntax**
```
obj.LODenominator (n) = value
```

**Variable**
- `obj` (Type) - Description
  - `obj` A Mixer Interface pointer to the Measurement (object)
  - Or
  - A Converter Object

- `value` (Long) - LO denominator value
- `n` (Long) - LO stage number

Choose from 1 or 2

**Return Type** Long

**Default** 1

**Examples**
```
Print mixer.LODenominator(1) 'prints the value of the first LODenominator
```

**C++ Syntax**
```
HRESULT get_LODenominator(long *pVal)

HRESULT put_LODenominator(long newVal)
```

**Interface**
- IMixer
- IConverter
### LOFixedFrequency Property

**Description**  
Sets or returns the LO frequency value.  

If you are changing several mixer configuration settings, you can make all the changes first and then issue the Calculate and Apply commands as you would do from the user interface.

**VB Syntax**  
`obj.LOFixedFrequency (n) = value`

**Variable**  
- `obj`  
A Mixer Interface pointer to the Measurement (object)

Or

A Converter Object

- `value`  
(double) - LO Frequency in Hertz.

- `n`  
(Long) - LO stage number  
Choose from 1 or 2

**Return Type**  
Double

**Default**  
0 Hz

**Examples**  
`Print mixer.LOFixedFrequency(1) 'prints the value of the first LO fixed frequency`

**C++ Syntax**  
`HRESULT get_LOFixedFrequency(double *pVal)`

`HRESULT put_LOFixedFrequency(double newVal)`

**Interface**  
IMixer

IConverter
**LOFrequencyDelta Property**

**Description**
Sets and returns LO Frequency Delta. There is usually no need to set this value. Read this value to determine the difference between the LO Frequency that is stated in the Mixer dialog box and the last measured LO Frequency.

**VB Syntax**
```vbnet
obj.LOFrequencyDelta = value
```

**Variable**
- **obj**
  - An `EmbeddedLO (object)` or
  - A `ConverterEmbeddedLO (object)`

- **value**
  - (Double) LO Frequency delta in Hertz.

**Return Type**
(Double)

**Default**
Not Applicable

**Examples**
```vbnet
embedLO.LOFrequencyDelta = 0 'write
value = embedLO.LOFrequencyDelta 'read
```

**C++ Syntax**
```cpp
HRESULT get_LOFrequencyDelta(double* val);

HRESULT put_LOFrequencyDelta(double val);
```

**Interface**
IEmbededLO
**LogMagnitudeOffset Property** Superseded

**Description**

*Note: This property is replaced by DoReceiverPowerCal Method.*

For **Receiver Calibration** - Sets or returns the value to offset the normalized unratioed power measurement data. The unratioed power measurement is effectively calibrated to the power level specified by the value of LogMagnitudeOffset as soon as the Normalization property is set to ON after calling the DataToDivisor method.

To offset the data trace magnitude a specified value, use **MagnitudeOffset Property**

**VB Syntax**

```vbnet
meas.LogMagnitudeOffset = value
```

**Variable**

- **meas** *(object)* - A Measurement object
- **value** *(double)* - Offset value in dBm.

**Return Type**

Double

**Default**

0

**Examples**

```vbnet
meas.LogMagnitudeOffset = -10 'Write (-10 dBm)
calpower = meas.LogMagnitudeOffset 'Read
meas.DataToDivisor 'Store meas data as measurement divisor
meas.Normalize = 1 'Measurement is now calibrated to -10 dBm
```

**C++ Syntax**

```cpp
HRESULT put_LogMagnitudeOffset(double newVal);
HRESULT get_LogMagnitudeOffset(double *pVal);
```

**Interface**

IMeasurement
**LOName Property**

**Description**
Sets or returns the name of the VNA internal source or external source to use as the LO in an FCA measurement.

**VB Syntax**

```vbnet
obj.LOName(n) = value
```

**Variable**

- `obj` (Type) - Description
  - A Mixer Interface pointer to the Measurement (object)
  - Or
  - A Converter Object

- `n` (Long) - LO stage number
  - Choose from 1 or 2

- `value` (string) - LO Source name. Use `SourcePortNames Property` to return a list of valid source ports. An external source must be configured and selected to be valid. Learn more about external source configuration.

**Note:** If the port is defined by a string name, such as an external source or one of the Source 2 outputs on the 2-port, 2-source VNA-x model, then you must use `cap.getPortNumber` to translate the string into a port number. To learn more see `[Remotely Specifying a Source Port](#)`.

**Return Type**
String

**Default**
"Not controlled"

**Examples**

```
mixer.LOName(1) = "MySource"
```

**C++ Syntax**

- HRESULT `get_LOName(string *pVal)`
- HRESULT `put_LOName(string newVal)`

**Interface**
MIXer
IConverter
### LONumerator Property

**Description**
Sets or returns the numerator value of the LO Fractional Multiplier.

If you are changing several mixer configuration settings, you can make all the changes first and then issue the Calculate and Apply commands as you would do from the user interface.

**VB Syntax**

```vbnet
obj.LONumerator (n) = value
```

**Variable**

- `obj` A Mixer Interface pointer to the Measurement (object)
  
  Or

- A Converter Object

- `value` (Long) - LO denominator value

- `n` (Long) - LO stage number

Choose from 1 or 2

**Return Type**

Long

**Default**

1

**Examples**

```vbnet
Print mixer.LONumerator(1) 'prints the value of the first LO Numerator
```

**C++ Syntax**

```cpp
HRESULT get_LONumerator(long *pVal)

HRESULT put_LONumerator(long newVal)
```

**Interface**

IMixer

IConverter
## LOPower Property

**Description**: Sets or returns the value of LO Power.

**VB Syntax**: `obj.LOPower(n) = value`

**Variable** *(Type) - Description*

- **obj**: A Mixer Interface pointer to the Measurement (object)
  
  Or

- A Converter Object

- **n**: (Long) - LO stage number
  
  Choose from 1 or 2

- **value**: (double) - LO Power in dBm.

**Return Type**: Double

**Default**: -10dBm

**Examples**: `Print mixer.LOPower(1)` 'prints the value of the LO Power'

**C++ Syntax**

- `HRESULT get_LOPower(double *pVal)`
  
  `HRESULT put_LOPower(double newVal)`

**Interface**: IMixer

IConverter
### LORangeMode Property

**Description**
Sets or returns the LO sweep mode.

If you are changing several mixer configuration settings, you can make all the changes first and then issue the Calculate and Apply commands as you would do from the user interface.

**Note:** There is also a LORangeMode on the Converter Object.

**VB Syntax**

```
obj.LORangeMode (n) = value
```

**Variable (Type) - Description**

- **obj** A Mixer Interface pointer to the Measurement (object)
- **n** (Long) - LO stage number.

Choose from 1 or 2

- **value** (Enum as MixerRangeMode) - LO sweep mode. Choose from:
  - 0 - mixSwept
  - 1 - mixFixed

**Return Type**
Enum

**Default**
0 - mixSwept

**Examples**

```
mixer.LORangeMode(1)=mixSwept
```

**C++ Syntax**

```c++
HRESULT get_LORangeMode(long LO, enum *pVal)

HRESULT put_LORangeMode(long LO, enum newVal)
```

**Interface**
IMixer3
**LORangeMode Property**

**Description**
Sets or returns the LO sweep mode.

If you are changing several mixer configuration settings, you can make all the changes first and then issue the Calculate and Apply commands as you would do from the user interface.

Note: There is also a LORangeMode on the Mixer Interface

**VB Syntax**

```
obj.LORangeMode (n) = value
```

**Variable**

(Type) - Description

- **obj**: A Converter Object
- **n**: (Long) - LO stage number.
  - Choose from 1 or 2
- **value**: (Enum as NARangeMode) - LO sweep mode. Choose from:
  - 0 - naSwept
  - 1 - naFixed

**Return Type**
Enum

**Default**
0 - naSwept

**Examples**

```
mixer.LORangeMode(1)=naSwept
```

**C++ Syntax**

```
HRESULT get_LORangeMode(long LO, enum *pVal )

HRESULT put_LORangeMode(long LO, enum newVal)
```

**Interface**
IConverter
# Loss Property

<table>
<thead>
<tr>
<th>Description</th>
<th>Sets and Returns the insertion loss for the calibration standard.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>VB Syntax</strong></td>
<td><code>calstd.loss = value</code></td>
</tr>
</tbody>
</table>

**Variable** (Type) - Description

- `value` (single) - Insertion loss in Gohms / sec. (Giga Ohms per second of electrical delay)

**Return Type** Single

**Default** Not Applicable

**Examples**

```vbnet
calstd.loss = 3.5 'Write 3.5 Gohms of loss
stdLoss = calstd.loss 'Read the value of Loss
```

**C++ Syntax**

- `HRESULT get_Loss(float *pVal)`
- `HRESULT put_Loss(float newVal)`

**Interface** ICalStandard
## Loss (Power Segment) Property

### Description
Sets or returns the loss value associated with a PowerLossSegment.

### VB Syntax
```
lossSeg.Loss = value
```

### Variable (Type) - Description
- **lossSeg**: A PowerLossSegment (object)
- **value**: (double) – Loss value in dB. Loss is entered as a POSITIVE number.

### Return Type
Double

### Default
0

### Examples
```
lossSeg.Loss = 0.5 'Write
lossVal = lossSeg.Loss 'Read
```

### C++ Syntax
```
HRESULT put_Loss(Double newVal);
HRESULT get_Loss(Double *pVal);
```

### Interface
IPowerLossSegment
## LOStage Property

## LOStartFrequency Property

**Description**
Sets or returns the LO start frequency value. This command can only be used with SMC (not VMC) measurements.

If you are changing several mixer configuration settings, you can make all the changes first and then issue the Calculate and Apply commands as you would do from the user interface.

**VB Syntax**
```vbnet
obj.LOStartFrequency(n) = value
```

**Variable**
- **obj**: A Mixer Interface pointer to the Measurement (object)
- Or
- A Converter Object

**value**: (double) - LO Start Frequency in Hertz.

**n**: (Long) - LO stage number
Choose from 1 or 2

**Return Type**: Double

**Default**: Not Applicable

**Examples**
```vbnet
Print mixer.LOStartFrequency(1) 'prints the value of the first LO start frequency
```

**C++ Syntax**
```c++
HRESULT get_LOStartFrequency(long id, double *pVal)
HRESULT put_LOStartFrequency(long id, double newVal)
```

**Interface**
- IMixer3
- IConverter
**LOStartPower Property**

**Description**
Sets or returns the Start value of a LO Power sweep. Also set imdx.SweepType to naIMDLOPowerSweep.

**VB Syntax**

```vbnet
obj.LOStartPower(n) = value
```

**Variable**

<table>
<thead>
<tr>
<th>(Type)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>obj</code></td>
<td>A Converter Object</td>
</tr>
<tr>
<td><code>n</code></td>
<td>(Long) - LO stage number. Choose 1</td>
</tr>
<tr>
<td><code>value</code></td>
<td>(double) - LO start power in dBm.</td>
</tr>
</tbody>
</table>

**Return Type**
Double

**Default**
-20 dBm

**Examples**

```vbnet
convtr.LOStartPower(1) = -5 'Sets the LO Power sweep start value
start = convtr.LOStartPower(1) 'Reads the start value
```

**C++ Syntax**

```c
HRESULT get_LOStartPower(long LOStage, double *pVal)
HRESULT put_LOStartPower(long LOStage, double newVal)
```

**Interface**
IConverter
**LOStopFrequency Property**

**Description**
Sets or returns the LO stop frequency value. This command can only be used with SMC (not VMC) measurements.

If you are changing several mixer configuration settings, you can make all the changes first and then issue the Calculate and Apply commands as you would do from the user interface.

**VB Syntax**

```vbnet
obj.LOStopFrequency (n) = value
```

**Variable** *(Type)* - Description

- **obj**
  - A Mixer Interface pointer to the Measurement (object)
  - Or
  - A Converter Object

- **value** *(double)* - LO Stop Frequency in Hertz.

- **n** *(Long)* - LO stage number
  - Choose from 1 or 2

**Return Type**
Double

**Default**
Not Applicable

**Examples**

```vbnet
Print mixer.LOStopFrequency(1) 'prints the value of the first LO stop frequency
```

**C++ Syntax**

```cpp
HRESULT get_LOStopFrequency(long id, double *pVal)
HRESULT put_LOStopFrequency(long id, double newVal)
```

**Interface**
IMixer3

IConverter
## LOStopPower Property

**Description**
Sets or returns the Stop value of a LO Power sweep. Also set `imdx.SweepType` to `naIMDLOPowerSweep`.

**VB Syntax**

```
obj.LOStopPower (n) = value
```

**Variable**

<table>
<thead>
<tr>
<th>(Type)</th>
<th>- Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>obj</code></td>
<td>A Converter Object</td>
</tr>
<tr>
<td><code>n</code></td>
<td>(Long) - LO stage number. Choose 1</td>
</tr>
<tr>
<td><code>value</code></td>
<td>(double) - LO Stop power in dBm.</td>
</tr>
</tbody>
</table>

**Return Type**

Double

**Default**

-10 dBm

**Examples**

```vbnet
cnvtr.LOStopPower(1) = -5 'Sets the LO Power sweep Stop value
Stop = cnvtr.LOStopPower(1) 'Reads the Stop value
```

**C++ Syntax**

```c
HRESULT get_LOStopPower(long LOStage, double *pVal)

HRESULT put_LOStopPower(long LOStage, double newVal)
```

**Interface**

### Description
Enables/disables the low frequency extension (LFE). Learn more.

### VB Syntax
`chan.LowFrequencyExtension = value`

### Variable (Type) - Description

- **value** *(boolean)* - Choose either:
  - **False** - LFE is disabled.
  - **True** - LFE is enabled.

### chan Channel (object)

### Return Type
Boolean

### Default
False

### Examples
- `chan.LowFrequencyExtension = True` *(Write)*
- `lfestate = chan.LowFrequencyExtension` *(Read)*

### C++ Syntax
```cpp
HRESULT get_LowFrequencyExtension(VARIANT_BOOL* lfestate);
HRESULT put_LowFrequencyExtension(VARIANT_BOOL lfestate);
```

### Interface
IChannel26
LXI Device ID State Property

Description

Opens and closes the LAN Status dialog with the LAN Status Indicator showing IDENTIFY.

The VNA supports this capability to satisfy a requirement of the LAN eXtensions for Instrumentation (LXI) standard. Changing the value of this property is the same operation that occurs when clicking the Toggle LXI Identification button on the Welcome web page presented by the VNA web server.

VB Syntax

```vbnet
app.LXIDeviceIDState = bool
```

Variable (Type) - Description

- `app` An Application (object)
- `bool` (boolean) Choose from:

  - **True** - Displays the LAN Status dialog with the Status Indicator showing IDENTIFY.
  - **False** -
    
      - If the dialog had been opened by this property, then the LAN Status dialog is closed.
      - If the dialog was opened manually, then it will stay open.

Return Type

Boolean

Default

False

Examples

```vbnet
app.LXIDeviceIDState = True 'Write
value = app.LXIDeviceIDState 'Read
```

C++ Syntax

```csharp
HRESULT get_LXIDeviceIDState( VARIANT_BOOL* pState);

HRESULT put_LXIDeviceIDState( VARIANT_BOOL  state);
```

Interface

IApplication14
**MagnitudeOffset Property**

**Description**
Offsets the data trace magnitude by the specified value.

To offset the data trace magnitude to a slope value that changes with frequency, use `MagnitudeSlopeOffset` Property.

To implement a Receiver Cal offset, use `LogMagnitudeOffset` property.

**VB Syntax**

```
meas.MagnitudeOffset = value
```

**Variable (Type) - Description**

- `meas` (object) - A Measurement object
- `value` (double) - Offset value in dB.

**Return Type**
Double

**Default**
0

**Examples**

```
meas.MagnitudeOffset = 4 'Write
offs = meas.MagnitudeOffset 'Read
```

**C++ Syntax**

```
HRESULT put_MagnitudeOffset(double newVal);
HRESULT get_MagnitudeOffset(double *pVal);
```

**Interface**
IMeasurement4
### MagnitudeSlopeOffset Property

**Description**
Offsets the data trace magnitude to a value that changes linearly with frequency. The offset slope begins at 0 Hz.

To offset the entire data trace magnitude by a specified value, use `MagnitudeOffset` Property.

**VB Syntax**
```vbnet
meas.MagnitudeSlopeOffset = value
```

**Variable**
- `meas` (object) - A Measurement object
- `value` (double) - Offset slope value in dB / 1GHz.

**Return Type**
Double

**Default**
0

**Examples**
```vbnet
meas.MagnitudeSlopeOffset = 4 'Writes a slope offset of 4dB/1GHz.
offs = meas.MagnitudeSlopeOffset 'Read
```

**C++ Syntax**
```cpp
HRESULT put_MagnitudeSlopeOffset(double newVal);
HRESULT get_MagnitudeSlopeOffset(double *pVal);
```

**Interface**
IMeasurement4
MainToneIFBandwidth Property

Description
Sets and returns the IF Bandwidth for measurement of the Main tones.

VB Syntax
```vb
imd.MainToneIFBandwidth = value
```

Variable (Type) - Description

- `imd` (A SweptIMD Object)
- `value` (Double) IF Bandwidth in Hz. Choose from:
  - 1 | 2 | 3 | 5 | 7 | 10 | 15 | 20 | 30 | 50 | 70 |
  - 100 | 150 | 200 | 300 | 500 | 700 | 1k | 1.5k | 2k | 3k | 5k | 7k | 10k | 15k | 20k | 30k | 50k |
  - 70k | 100k | 150k | 200k | 280k | 360k | 600k

Learn more about setting IFBW for IMD.

If an invalid number is specified, the analyzer will round up to the closest valid number.

- **Return Type**: Double
- **Default**: 1 kHz

Examples
```vb
imd.MainToneIFBandwidth = 2e3 'Write
value = imd.MainToneIFBandwidth 'Read
```

C++ Syntax
```cpp
HRESULT get_MainToneIFBandwidth(double *pVal)
HRESULT put_MainToneIFBandwidth(double newVal)
```

Interface
ISweptIMD
## MarkCoupControlsMkrState Property

**Write/Read**  

**Description**  Set and return whether the Coupled Markers setting controls the ON|OFF state of markers that are coupled. Learn more about Coupled Markers. Refer also to CoupledMarkers Property.

**VB Syntax**  

```
pref.MarkCoupControlsMkrState = value
```

**Variable**  

<table>
<thead>
<tr>
<th>(Type)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>pref</code></td>
<td>A Preferences (object)</td>
</tr>
<tr>
<td><code>value</code></td>
<td>(Boolean) - Choose from:</td>
</tr>
</tbody>
</table>

- **True** - With Coupled Markers ON, when a marker is turned on, the same-numbered marker on all coupled traces will also be turned on. Likewise, turning off a marker will turn it off on all coupled traces.

- **False** - Turning a marker on or off will have no effect on the markers on other traces.

**Return Type**  Boolean

**Default**  False

**Examples**  

```
pref.MarkCoupControlsMkrState = True 'Write

value = pref.MarkCoupControlsMkrState 'Read
```

**C++ Syntax**  

```
HRESULT get_MarkCoupControlsMkrState (VARIANT_BOOL* preference);

HRESULT put_MarkCoupControlsMkrState (VARIANT_BOOL val)
```

**Interface**  IPreferences15
MarkCoupMethPresetIsChan Property

Set and return whether Coupled Markers is set to Channel or All after Preset. Learn more about Coupled Markers. Refer also to CoupledMarkers Property and MarkCoupPresetIsOn.

**VB Syntax**

`pref.MarkCoupMethPresetIsChan = value`

**Variable**

- **pref** (Type) - Description
  
  A Preferences (object)

- **value** (Boolean) - Choose from:
  
  **True** - Marker Coupling Method is set to Channel after Preset.

  **False** - Marker Coupling Method is set to ALL after Preset.

**Return Type**

Boolean

**Default**

False

**Examples**

```vbnet
pref.MarkCoupMethPresetIsChan = True 'Write
value = pref.MarkCoupMethPresetIsChan 'Read
```

**C++ Syntax**

```cpp
HRESULT get_MarkCoupMethPresetIsChan (VARIANT_BOOL* preference);
HRESULT put_MarkCoupMethPresetIsChan (VARIANT_BOOL val)
```

**Interface**

IPreferences15
# MarkCoupPresetIsOn Property

**Write/Read**

**Description**
Set and return whether Coupled Markers is set to ON or OFF after Preset. Learn more about Coupled Markers.

**VB Syntax**

```
pref.\[MarkCoupPresetIsOn\] = value
```

**Variable**

- **Type**: Description
- **pref** A Preferences *(object)*
- **value** *(Boolean)* - Choose from:
  - **True** - Coupled Markers is ON after Preset.
  - **False** - Coupled Markers is OFF after Preset.

**Return Type**

Boolean

**Default**

False

**Examples**

```
pref.MarkCoupPresetIsOn = True 'Write
value = pref.MarkCoupPresetIsOn 'Read
```

**C++ Syntax**

```
HRESULT get_MarkCoupPresetIsOn (VARIANT_BOOL* preference);
HRESULT put_MarkCoupPresetIsOn (VARIANT_BOOL val)
```

**Interface**

IPreferences15
**MarkerAnnotation Property**

**Description**  
Returns the Y-axis marker value from the specified tuning sweep. Use `IsMarkerOn` to confirm if a marker was used for the tuning sweep.

**VB Syntax**  
```vb
value = embedLODiag.MarkerAnnotation(n)
```

**Variable**  
*(Type)* - Description

- **value** *(String)* Variable to store the returned data.
- **embedLODiag** An `EmbeddedLODiagnostic` *(object)*
- **n** *(Long)* Tuning sweep number. Use `NumberOfSweeps` to find the number of sweeps taken.

**Default**  
Not Applicable

**Examples**  
```vb
data= embedLO.MarkerAnnotation 3 'read
```

**C++ Syntax**  
```cpp
HRESULT MarkerAnnotation(long sweep, BSTR* annotation);
```

**Interface**  
`IEmbeddedLODiagnostic`
## MarkerFormat Property

**Description**
Sets the format of all the markers in the measurement. To override this setting for an individual marker, use `mark.Format`.

**VB Syntax**
`meas.MarkerFormat = value`

**Variable**
- `meas` (Type) - Description: A Measurement (object)
- `value` (enum NAMarkerFormat) - Choose from:
  - 0 - naMarkerFormat_LinMag
  - 1 - naMarkerFormat_LogMag
  - 2 - naMarkerFormat_Phase
  - 3 - naMarkerFormat_Delay
  - 4 - naMarkerFormat_Real
  - 5 - naMarkerFormat_Imaginary
  - 6 - naMarkerFormat_SWR
  - 7 - naMarkerFormat_LinMagPhase
  - 8 - naMarkerFormat_LogMagPhase
  - 9 - naMarkerFormat_RealImaginary
  - 10 - naMarkerFormat_ComplexImpedance
  - 11 - naMarkerFormat_ComplexAdmittance
  - 12 - naMarkerFormat_Kelvin
  - 13 - naMarkerFormat_Fahrenheit
  - 14 - naMarkerFormat_Centigrade

**Return Type**
Not Applicable

**Default**
1 - naMarkerFormat_LogMag

**Examples**
```vbnet
meas.MarkerFormat = naMarkerFormat_SWR 'Write
```
**C++ Syntax**
HRESULT put_MarkerFormat(tagNAMarkerFormat NewFormat)

**Interface**
IMeasurement
InterpolateMarkers Method

Description
Turns all Marker Interpolation ON and OFF for the measurement. Marker interpolation enables X-axis resolution between the discrete data values. The analyzer will calculate the X and Y-axis data values between discrete data points. To override this property for individual markers, use the Interpolated property.

VB Syntax
meas.Interpolate = value

Variable (Type) - Description
meas A Measurement (object)
value (boolean)
False - Turns interpolation OFF for all markers in the measurement
True - Turns interpolation ON for all markers in the measurement

Return Type
Boolean
Default
True (ON)

Examples
meas.Interpolate = 1

C++ Syntax
HRESULT InterpolateMarkers(VARIANT_BOOL bNewVal)

Interface
IMeasurement
### Number Property

<table>
<thead>
<tr>
<th>Description</th>
<th>Returns the number of the marker.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>VB Syntax</strong></td>
<td><code>marknum = mark.Number</code></td>
</tr>
<tr>
<td><strong>Variable</strong></td>
<td>(Type) - Description</td>
</tr>
<tr>
<td><code>marknum</code></td>
<td>(long) - Variable to store marker number</td>
</tr>
<tr>
<td><code>mark</code></td>
<td>A Marker (object)</td>
</tr>
<tr>
<td><strong>Return Type</strong></td>
<td>Long Integer</td>
</tr>
<tr>
<td><strong>Default</strong></td>
<td>Not applicable</td>
</tr>
<tr>
<td><strong>Examples</strong></td>
<td><code>marknum = mark.Number 'Read</code></td>
</tr>
</tbody>
</table>

#### C++ Syntax

`HRESULT get_Number(long *pVal)`

#### Interface

`IMarker`
# MarkerPosition Property

**Description**  
Returns the X-axis marker position from the specified tuning sweep.

**VB Syntax**  

```vbnet
value = embedLODiag.MarkerPosition(n)
```

**Variable (Type) - Description**

- `value` (**Double**) Variable to store the returned data.

- `embedLODiag` **An EmbeddedLODiagnostic (object)**

- `n` (**Long**) Tuning sweep number. Use `NumberOfSweeps` to find the number of sweeps taken.

**Default**  
Not Applicable

**Examples**  

```vbnet
data= embedLO.MarkerPosition 3 'read
```

**C++ Syntax**  

```c++
HRESULT MarkerPosition(long sweep, double *position);
```

**Interface**  
IEmbededLODiagnostic
## MarkerReadout Property

<table>
<thead>
<tr>
<th>Description</th>
<th>Enables or disables the readout of markers in the window. To show the marker on the screen use ShowMarkerReadout Method.</th>
</tr>
</thead>
<tbody>
<tr>

<tr>
<td> </td>
<td><code>HRESULT put_MarkerReadout(VARIANT_BOOL newVal)</code></td>
</tr>
<tr>
<td><strong>Interface</strong></td>
<td>INAWindow</td>
</tr>
</tbody>
</table>
## MarkerReadoutResponsePlaces Property

**Description**
For the Y-axis (response), sets the number digits to display after the decimal point in marker readouts.

**VB Syntax**
```
win.MarkerReadoutResponsePlaces = value
```

**Variable (Type) - Description**
- `win` - A NAWindow (object)
- `value` - (Long Integer) Number of digits to display. Choose a value between 1 and 4.

**Return Type**
Long Integer

**Default**
2

**Examples**
```
win.MarkerReadoutResponsePlaces = 3 'Write
value = app.ActiveNAWindow.MarkerReadoutResponsePlaces 'Read
```

**C++ Syntax**
```
HRESULT get_MarkerReadoutResponsePlaces(long *pVal)

HRESULT put_MarkerReadoutResponsePlaces(long newVal)
```

**Interface**
INAWindow3
MarkerReadoutSize Property

<table>
<thead>
<tr>
<th>Description</th>
<th>Specifies the size of font used when displaying Marker Readout in the selected window.</th>
</tr>
</thead>
<tbody>
<tr>
<td>VB Syntax</td>
<td><code>win.MarkerReadoutSize = value</code></td>

<td>INAWindow3</td>
</tr>
</tbody>
</table>
### MarkerReadoutXPosition Property

<table>
<thead>
<tr>
<th>Description</th>
<th>Sets the X-axis position of marker readouts. Readouts are right-justified at the specified position.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>VB Syntax</strong></td>
<td><code>win.MarkerReadoutXPosition = value</code></td>
</tr>
</tbody>
</table>
| **Variable** | *(Type)* - Description  
  *win* A NAWindow (object)  
  *value* (Double) X-axis position. Choose a value between 1 (far left) and 10 (far right). |
| **Return Type** | Double |
| **Default** | 10 |
| **Examples** |  
  `win.MarkerReadoutXPosition = 3 'Write`  
  `value = app.ActiveNAWindow.MarkerReadoutXPosition 'Read` |
| **C++ Syntax** | HRESULT get_MarkerReadoutXPosition(double *pVal)  
  HRESULT put_MarkerReadoutXPosition(double newVal) |
| **Interface** | INAWindow3 |
### MarkerReadoutYPosition Property

**Description**
Sets the Y-axis position of marker readouts. Readouts are right-justified at the specified position.

**VB Syntax**
```
win.MarkerReadoutYPosition = value
```

**Variable**
- **(Type)** - Description
  - **win**: A NAWindow (object)
  - **value**: (Double) Y-axis position. Choose a value between 1 (bottom) and 10 (top).

**Return Type**
Double

**Default**
10

**Examples**
```
win.MarkerReadoutYPosition = 3 'Write
value = app.ActiveNAWindow.MarkerReadoutYPosition 'Read
```

**C++ Syntax**
```
HRESULT get_MarkerReadoutYPosition(double *pVal)
HRESULT put_MarkerReadoutYPosition(double newVal)
```

**Interface**
INAWindow3
## Markers Property

<table>
<thead>
<tr>
<th>Description</th>
<th>Set and return the color of data trace markers for nth trace in a window.</th>
</tr>
</thead>
<tbody>
<tr>
<td>VB Syntax</td>
<td><code>trace(n).Markers = value</code></td>
</tr>
<tr>
<td>Variable</td>
<td><strong>trace(n)</strong> - Description</td>
</tr>
<tr>
<td></td>
<td>One of the 8 ComTraceColors objects</td>
</tr>
<tr>
<td></td>
<td><strong>value</strong> <em>(Long Integer)</em> - RGB color of the Markers pen.</td>
</tr>
</tbody>
</table>

Convert the three RGB colors to an integer as follows:

\[
RGB = R + (G \times 2^8) + (B \times 2^{16})
\]

To find the three RGB values from the Display Colors dialog, click **Change Color**, then **Define Custom Color**.

<table>
<thead>
<tr>
<th>Return Type</th>
<th>Long</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default</td>
<td>Varies for each trace.</td>
</tr>
</tbody>
</table>

| Examples    | R = 10  
|            | G = 10  
|            | B = 10  
|            | RGB = 10 + (10 \times 2^8) + (10 \times 2^{16})  
|            | `tracel.Markers = RGB 'Write`  
|            | `color = tracel.Markers 'Read`  |

| C++ Syntax  | HRESULT get_Markers(long* pVal);  
|            | HRESULT put_Markers(long newVal);  |

| Interface   | ITraceColors |
**MarkerState Property**

**Description**
Sets or returns the ON / OFF state of the specified marker.

**VB Syntax**
```vbnet
meas.MarkerState (n) = state
```

**Variable**
(Type) - Description
- **meas**
  A Measurement (object)
- **n**
  (Long Integer) Marker number to turn on or off.
- **state**
  (boolean) -
  True - turns the specified marker ON
  False - turns the specified marker OFF

**Return Type**
Boolean

**Default**
False

**Examples**
```vbnet
meas.MarkerState(1) = True
reference = meas.MarkerState(2)
```

**C++ Syntax**
```c++
HRESULT get_MarkerState(long markerNum, VARIANT_BOOL bState)
HRESULT put_MarkerState(long markerNum, VARIANT_BOOL* bState)
```

**Interface**
IMeasurement3
<table>
<thead>

</tr>
</tbody>
</table>
### MarkerSymbolsAboveTrace Property

**Description**
Specifies whether or not to force marker symbols to be displayed above the trace. When ON, all marker symbols will be displayed above the trace and the active marker will be filled solid.

**VB Syntax**
```
win.MarkerSymbolsAboveTrace = value
```

**Variable (Type) - Description**

- `win` (NAWindow (object))
- `value` (Boolean)

**False** - ONLY the active marker is displayed above the trace. Inactive markers are displayed below the trace.

**True** - ALL marker symbols are displayed above the trace. The active marker is always filled solid.

**Return Type**
Boolean

**Default**
OFF (ON in IM Spectrum and SA measurement classes)

**Examples**
```
win.MarkerSymbolsAboveTrace = True 'Write
```
```
value = app.ActiveNAWindow.MarkerSymbolsAboveTrace 'Read
```

**C++ Syntax**
```
HRESULT get_MarkerSymbolsAboveTrace(VARIANT_BOOL* pbState)
```
```
HRESULT put_MarkerSymbolsAboveTrace(VARIANT_BOOL bState)
```

**Interface**
INAWindow4
### Type (Marker) Property

**Description**  
Sets and reads the marker type.

**VB Syntax**  
`mark.Type = value`

**Variable**  
- **chan**  
  A Marker (object)

- **value**  
  (enum NAMarkerType) - Marker Type. Choose from:
  - **0** - `naMarkerType_Normal` - the X-axis value for a normal marker will always be determined by the measurement data of the marker.
  - **1** - `naMarkerType_Fixed` - retains and keeps its x-axis value at the time the marker type is set.

**Return Type**  
Long Integer

**Default**  
`naMarkerType_Normal`

**Examples**  
- `mark.Type = naMarkerType_Normal` 'Write
- `MrkType = mark.Type` 'Read

**C++ Syntax**  
- `HRESULT get_Type(tagNAMarkerType *pVal)`
- `HRESULT put_Type(tagNAMarkerType newVal)`

**Interface**  
IMarker
Stimulus Property

Description
Sets and reads the X-Axis value of the marker.

If the marker is a delta marker, the value will be relative to the reference marker.

See Reference Marker example below.

See Also: Read Y-axis value.

VB Syntax
mark.Stimulus = value

Variable
(mark) - Description
(mark) A Marker (object)
(value) (double) - X-Axis value. Choose any number within the full span of the channel or User Range (if set).

Return Type
Double

Default
First activated Marker turns ON in the middle of the X-axis range. Subsequent markers turn ON at the position of the most recently active marker.

Examples
mark.Stimulus = 3e9 'Write
XVal = mark.Stimulus 'Read

C++ Syntax
HRESULT get_Stimulus(double *pVal)
HRESULT put_Stimulus(double newVal)

Interface
IMarker
Read-only

Value Property

Description
Reads the Y-axis value of the marker. You cannot set the Y-axis value of a marker. The marker remains at the position at the time you set `marker.Type`.

If the marker is a delta marker, the value will be relative to the reference marker.

See Reference marker example below.

See Also: Set and Read X-axis value.

**Note:** To accurately read the marker Y-axis value with trace smoothing applied, the requested format must match the displayed format. Otherwise, the returned value is un-smoothed data. For example, to read the smoothed marker value when measuring group delay, both the display format and the marker format must be set to (Group) Delay.

---

**VB Syntax**

`YValue = mark.Value (format)`

<table>
<thead>
<tr>
<th>Variable</th>
<th>(Type)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>YValue</code></td>
<td></td>
<td>A variable to store the Y-axis value</td>

<td></td>
</tr>
<tr>
<td>13</td>
<td>naMarkerFormat_Fahrenheit (1)</td>
<td></td>
</tr>
<tr>
<td>14</td>
<td>naMarkerFormat_Celsius (1)</td>
<td></td>
</tr>
</tbody>
</table>

Return Type: Variant - The (parens) in the previous list of formats indicates the number of values that are returned in a variant array

Default: Not applicable

Examples:

```
YVal = mark.Value(0) 'Read

' or

YVal = mark.Value(naMarkerFormat\_LinMag)
```

C++ Syntax:
```
HRESULT get_Value(tagNAMarkerFormat format, VARIANT *pVal)
```

Interface: IMarker
### MatchCorrectPower Property

<table>
<thead>
<tr>
<th>Description</th>
<th>Turns match-correction ON or OFF. Use this command AFTER performing a Guided Power Cal. <a href="#">Learn more</a>.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>VB Syntax</strong></td>
<td><code>corrMethods.MatchCorrectPower = value</code></td>
</tr>
<tr>
<td><strong>Variable</strong></td>
<td>(Type) - Description</td>

</tbody>
</table>
| **C++ Syntax** | `HRESULT get_MatchCorrectPower(VARIANT_BOOL* val);`  
`HRESULT put_MatchCorrectPower(VARIANT_BOOL newVal);` |
| **Interface** | ICorrectionMethods |
### MaximumFrequency Property

Sets and Returns the maximum frequency for the calibration standard.

**VB Syntax**

```vbnet
calstd.MaximumFrequency = value
```

**Variable**

- **calstd**: A CalStandard *(object)*. Use calKit.GetCalStandard to get a handle to the standard.
- **value**: *(double)* - Maximum frequency in Hertz.

**Return Type**

Double

**Default**

Not Applicable

**Examples**

- `calstd.MaximumFrequency = 9e9` *(Write)*
- `maxFrequency = calstd.MaximumFrequency` *(Read)*

**C++ Syntax**

```cpp
HRESULT get_MaximumFrequency(double *pVal)
HRESULT put_MaximumFrequency(double newVal)
```

**Interface**

ICalStandard
## MaximumFrequency Property

<table>
<thead>
<tr>
<th>Description</th>
<th>Returns the maximum frequency of the remote VNA, including any over-sweep. Over-sweep frequencies can be set but are not specified.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>VB Syntax</strong></td>
<td><code>value = cap.MaximumFrequency</code></td>
</tr>
<tr>
<td><strong>Variable</strong></td>
<td><strong>(Type)</strong> - <strong>Description</strong></td>

<td><code>HRESULT get_MaximumFrequency(&amp;frequencyMax);</code></td>
</tr>
<tr>
<td><strong>Interface</strong></td>
<td>ICapabilities</td>
</tr>
</tbody>
</table>
### MaximumFrequency Property

**Description**
Set and returns the maximum usable frequency specified for the power sensor.

**VB Syntax**
```vbnet
pwrSensor.MaximumFrequency = value
```

**Variable (Type) - Description**

- `pwrSensor` A `PowerSensor` (Object) or a `PowerSensorAsReceiver` (Object)
- `value` (double) - Frequency in Hertz.

**Return Type**
Double

**Default**
Device dependent

**Examples**
```vbnet
pwrSensor.MaximumFrequency = 6e9 'Write
MaxFreq = pwrSensor.MaximumFrequency 'Read
```

**C++ Syntax**
```cpp
HRESULT put_MaximumFrequency(double newVal);
HRESULT get_MaximumFrequency(double *pVal);
```

**Interface**
- `IPowerSensor`
- `IPowerSensorAsReceiver`
## MaximumIFFrequency Property

<table>
<thead>
<tr>
<th>Description</th>
<th>Returns the Maximum allowed value for the IFFrequency Property</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>VB Syntax</strong></td>
<td><code>value = IfConfig.MaximumIFFrequency</code></td>
</tr>
<tr>
<td><strong>Variable</strong></td>
<td><em>(Type)</em> - Description</td>
</tr>
<tr>
<td><code>value</code></td>
<td><em>(double)</em> Variable to store the returned maximum allowed frequency that can be applied to the IFFrequency Property.</td>
</tr>
<tr>
<td><strong>IfConfig</strong></td>
<td>IFConfiguration (object)</td>
</tr>
<tr>
<td><strong>Return Type</strong></td>
<td>Double</td>
</tr>
<tr>
<td><strong>Default</strong></td>
<td>Not Applicable</td>
</tr>
<tr>
<td><strong>Examples</strong></td>
<td><code>val = App.ActiveChannel.IFConfiguration.MaximumIFFrequency</code></td>
</tr>
<tr>
<td><strong>C++ Syntax</strong></td>
<td><code>HRESULT get_MaximumIFFrequency( double * pMaxFreq);</code></td>
</tr>
<tr>
<td><strong>Interface</strong></td>
<td>IIFConfiguration3</td>
</tr>
</tbody>
</table>
**MaximumIterationsPerPoint Property**

**Description**
This command, along with IterationsTolerance Property deal with adjustments made to the source power.

Sets the maximum number of readings to take at each data point for iterating the source power. Power readings will continue to be made, and source power adjusted, until a reading is within the IterationsTolerance value or this max number of readings has been met. The last value to be read is the valid reading for that data point.

The following two commands allow for settling of power readings:

- **ReadingsPerPoint Property**
- **ReadingsTolerance Property**

**VB Syntax**

```vbnet
pwrCal.MaximumIterationsPerPoint = value
```

**Variable**

- **(Type)** - Description
- **pwrCal** - A `SourcePowerCalibrator` object
- **value** - Maximum number of readings. Choose any number between 1 and 100.

**Return Type**
Long Integer

**Default**
5

**Examples**

```vbnet
Set powerCalibrator = pna.SourcePowerCalibrator
powerCalibrator.MaximumIterationsPerPoint = 5 'Write
MaxReads = powerCalibrator.MaximumIterationsPerPoint 'Read
```

**C++ Syntax**

```csharp
HRESULT get_MaximumIterationsPerPoint( long *pVal);

HRESULT put_MaximumIterationsPerPoint( long newVal);
```

**Interface**
ISourcePowerCalibrator3
**MaximumNumberOfChannels Property**

Description  Returns the maximum possible number of channels that can be used in the VNA.

**VB Syntax**

```vbnet
value = cap.MaximumNumberOfChannels
```

**Variable**  (Type) - Description

- `value` (Long) - Variable to store the returned maximum value for number of channels.
- `cap` A Capabilities (object)

**Return Type**  Long

**Default**  Not Applicable

**Examples**

```vbnet
value = cap.MaximumNumberOfChannels 'Read
```

**C++ Syntax**

```cpp
HRESULT get_MaximumNumberOfChannels(long *maximumNumberOfChans);
```

**Interface**  ICapabilities2
### MaximumNumberOfTracesPerWindow Property

<table>
<thead>
<tr>
<th>Description</th>
<th>Returns the maximum possible number of traces that can reside in any window.</th>
</tr>
</thead>
<tbody>
<tr>
<td>VB Syntax</td>
<td><code>value = cap.MaximumNumberOfTracesPerWindow</code></td>
</tr>
<tr>
<td>Variable</td>
<td><strong>(Type) - Description</strong></td>

**MaximumNumberOfPoints Property**

**Description**
Returns the maximum possible number of data points.

**VB Syntax**
```vbnet
value = obj.MaximumNumberOfPoints
```

**Variable**

<table>
<thead>
<tr>
<th>(Type)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>value</code></td>
<td>(Long) - Variable to store the returned maximum value for number of points.</td>
</tr>
</tbody>
</table>

**cap**
A Capabilities (object)

or
A GainCompression (object)

**Return Type**
Double

**Default**
Not Applicable

**Examples**
```vbnet
value = cap.MaximumNumberOfPoints 'Read
```

**C++ Syntax**
```csharp
HRESULT get_MaximumNumberOfPoints(double *maximumNumberOfPoints);
```

**Interface**
ICapabilities

IGainCompression
### MaximumNumberOfWindows Property

<table>
<thead>
<tr>

## MaximumReceiverStepAttenuator Property

**Description**
Returns the maximum amount of receiver attenuation.

**VB Syntax**
```
value = cap.MaximumReceiverStepAttenuator(n)
```

**Variable**
- **Type** - Description
- **value** (Double) - Variable to store the returned value of maximum receiver attenuation.
- **cap** A Capabilities (object)
- **n** (Long) - port number to query for step attenuators

**Return Type**
Double

**Default**
Not Applicable

**Examples**
```
value = cap.MaximumReceiverStepAttenuator
```

**C++ Syntax**
```
HRESULT get_MaximumReceiverStepAttenuator(long portNumber, double * attenuation);
```

**Interface**
ICapabilities
# MaximumSourceALCPower Property

</tbody>
</table>
# MaxOutputState Property

Sets and returns the "Define Max As" ON/OFF state for an external DC Source.

## Description
Sets and returns the "Define Max As" ON/OFF state for an external DC Source.

## VB Syntax
`extDC.MaxOutputState = value`

## Variable (Type) - Description
- **extDC**: An `ExternalDCDevice (object)`
- **value**: (Boolean) "Define Max As" ON/OFF state. Choose from:
  - **True**: Turn "Define Max As" ON
  - **False**: Turn "Define Max As" OFF

## Return Type
Boolean

## Default
True

## Examples
```vbnet
extDC.MaxOutputState = True 'Write
value = extDC.MaxOutputState 'Read
```

## C++ Syntax
- `HRESULT get_MaxOutputState(VARIANT_BOOL *value)`
- `HRESULT put_MaxOutputState(VARIANT_BOOL value)`

## Interface
`IExternalDCDevice3`
# MaxPreciseTuningIterations Property

<table>
<thead>

</tr>
</tbody>
</table>
# MaxProduct Property

Sets and returns the maximum intermod product frequencies to be calibrated.

**Description**

**VB Syntax**

```
imd.MaxProduct = value
```

**Variable** *(Type) - Description*

- `imd` A **SweptIMDCal** *(object)*
- `value` Maximum IM products to calibrate. Choose from:
  - 2 - second order products
  - 3 - third order products
  - 5 - fifth order products
  - 7 - seventh order products
  - 9 - ninth order products

**Return Type** Long Integer

**Default** 3

**Examples**

```
imd.MaxProduct = 7 'Write
mprod = imd.MaxProduct 'Read
```

**C++ Syntax**

```
HRESULT get_MaxProduct(long * Val)
HRESULT put_MaxProduct(long newVal)
```

**Interface** ISweptIMD
### Mean Property

<table>
<thead>
<tr>
<th>Description</th>
<th>Returns the mean value of the measurement. To retrieve all 3 statistics value at the same time, use <code>meas.GetTraceStatistics</code></th>

<td></td>
</tr>
<tr>
<td><code>average</code> (single)</td>
<td>Variable to store mean value</td>
</tr>
<tr>
<td><code>meas</code></td>
<td>A Measurement (object)</td>
</tr>
<tr>
<td><strong>Return Type</strong></td>
<td>Single</td>
</tr>
<tr>
<td><strong>Default</strong></td>
<td>Not applicable</td>
</tr>
</tbody>
</table>
| **Examples** | Dim average as Single  
`average = meas.Mean 'Read` |
| **C++ Syntax** | HRESULT get_Mean(float* mean) |
| **Interface** | IMeasurement |
**Measurement Property**

<table>
<thead>
<tr>
<th>Description</th>
<th>Returns the measurement handle of the trace object. Learn the difference between a Trace and a Measurement.</th>
</tr>
</thead>
<tbody>
<tr>
<td>VB Syntax</td>
<td><code>myMeas = trace.Measurement</code></td>
</tr>
<tr>
<td>Variable</td>
<td>(Type) - Description</td>
</tr>
<tr>
<td><code>myMeas</code></td>
<td>(Object) Variable to store the returned Measurement object.</td>
</tr>
<tr>
<td><code>trace</code></td>
<td>A Trace (object)</td>
</tr>
<tr>
<td>Return Type</td>
<td>Object</td>
</tr>
<tr>
<td>Default</td>
<td>Not Applicable</td>
</tr>
<tr>
<td>Examples</td>
<td><code>myMeas = myTrace.Measurement</code></td>
</tr>
<tr>
<td>C++ Syntax</td>
<td>HRESULT get_Measurement(IMeasurement** ppMeas);</td>
</tr>
<tr>
<td>Interface</td>
<td>ITrace2</td>
</tr>
</tbody>
</table>
### MeasurementClassProperties Property

**Description**  Provides access to the MeasurementClassProperties Object.

**VB Syntax**  

```
handle = cap.MeasurementClassProperties (measClass)
```

**Variable**  
- **Type** - Description
- **handle** (Variant) - Variable to store the returned object.
- **cap** A Capabilities (object)
- **measClass** (String) - Name of the measurement class to be accessed.

Use **AvailableMeasurementClasses Property** to return a list of measurement classes installed on the VNA.

**Return Type**  Object

**Default**  Not Applicable

**Examples**  

'Access the MeasurementClassProperties Object

```vbnet
Set app = CreateObject("AgilentPNA835x.Application")
Set cap = app.Capabilities
Set measProps = cap.MeasurementClassProperties("SweptIMD")
```

**C++ Syntax**  

```
HRESULT put_MeasurementClassProperties(IMeasurementClassProperties *handle);
```

**Interface**  ICapabilities8
## MeasurementClass Property

<table>
<thead>
<tr>
<th>Description</th>
<th>Returns the measurement class name from the channel. Use <code>CreateCustomMeasurementEx</code> to create a measurement from a class other than standard S-Parameters.</th>
</tr>
</thead>
</table>

**VB Syntax**  
`class = chan.MeasurementClass`

**Variable**  
- **Type** - Description
  - `class` (string) - Variable to store the returned measurement class name.
  - `chan` Channel (object)

**Return Type**  
String

**Default**  
Not Applicable

**Examples**  
`class = chan.MeasurementClass 'Read For a standard S-Parameter channel, returns... "Standard"`

**C++ Syntax**  
`HRESULT get_MeasurementClass();`

**Interface**  
IChannel15
### Medium Property

<table>
<thead>
<tr>
<th>Description</th>
<th>Sets and Returns the media type of the calibration standard.</th>
</tr>
</thead>
<tbody>
<tr>
<td>VB Syntax</td>
<td><code>calsdt.Medium = value</code></td>
</tr>
<tr>
<td>Variable</td>
<td><strong>(Type) - Description</strong></td>
</tr>
<tr>
<td><code>calsdt</code></td>
<td>A CalStandard <strong>(object)</strong>. Use <code>calKit.GetCalStandard</code> to get a handle to the standard.</td>
</tr>
<tr>
<td><code>value</code></td>
<td><strong>(enum NACalStandardMedium)</strong> - Medium of the transmission line of the standard. Choose from:</td>
</tr>
<tr>
<td></td>
<td>0 - <strong>naCoax</strong> - Coaxial Cable</td>
</tr>
<tr>
<td></td>
<td>1 - <strong>naWaveGuide</strong></td>
</tr>
<tr>
<td>Return Type</td>
<td>Long Integer</td>
</tr>
<tr>
<td>Default</td>
<td>Not Applicable</td>
</tr>
<tr>
<td>Examples</td>
<td><code>calsdt.Medium = naCoax</code> <strong>Write</strong></td>
</tr>
<tr>
<td></td>
<td><code>stdMedium = calsdt.Medium</code> <strong>Read</strong></td>
</tr>
</tbody>
</table>

**Examples**

```vbnet
    calsdt.Medium = naCoax 'Write
    stdMedium = calsdt.Medium 'Read
```

**C++ Syntax**

```c++
    HRESULT get_Medium(tagNACalStandardMedium *pVal)
    HRESULT put_Medium(tagNACalStandardMedium newVal)
```

**Interface**

ICalStandard
## Memory Property

<table>
<thead>
<tr>
<th>Description</th>
<th>Set and return the memory trace color for nth trace in a window.</th>
</tr>
</thead>
<tbody>
<tr>
<td>VB Syntax</td>
<td><code>trace(n).Memory = value</code></td>
</tr>
<tr>
<td>Variable</td>
<td>(Type) - Description</td>
</tr>
<tr>
<td><code>trace(n)</code></td>
<td>One of the 8 <code>ComTraceColors</code> objects</td>
</tr>
<tr>
<td><code>value</code></td>
<td>(Long Integer) - RGB color of the Memory pen.</td>
</tr>
</tbody>
</table>

Convert the three RGB colors to an integer as follows:

\[
\text{RGB} = R + (G \times 2^8) + (B \times 2^{16})
\]

To find the three RGB values from the Display Colors dialog, click Change Color, then Define Custom Color.

<table>
<thead>
<tr>
<th>Return Type</th>
<th>Long</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default</td>
<td>Varies for each trace.</td>
</tr>
</tbody>
</table>

| Examples | R = 10  
G = 10  
B = 10  
RGB = 10+(10\times2^8)+(10\times2^{16})  
`trace1.Memory = RGB` 'Write  
`color = trace1.Memory` 'Read |
|----------|---------------------------------|

| C++ Syntax | HRESULT get_Memory(long* pVal);  
HRESULT put_Memory(long newVal); |
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Interface</td>
<td>ITraceColors</td>
</tr>
</tbody>
</table>
MemoryMarkers Property

Description
Set and return the color of memory trace markers for nth trace in a window.

VB Syntax
trace(n).MemoryMarkers = value

Variable
(Type) - Description
trace(n) One of the 8 ComTraceColors objects
value (Long Integer) - RGB color of the MemoryMarkers pen.

Convert the three RGB colors to an integer as follows:

RGB = R + (G*2^8) + (B*2^16)

To find the three RGB values from the Display Colors dialog, click Change Color, then Define Custom Color.

Return Type
Long

Default
Varies for each trace.

Examples
R = 10
G = 10
B = 10
RGB = 10+(10*2^8)+(10*2^16)
trace1.MemoryMarkers = RGB  'Write
color = trace1.MemoryMarkers  'Read

C++ Syntax
HRESULT get_MemoryMarkers(long* pVal);

HRESULT put_MemoryMarkers(long newVal);

Interface
ITraceColors
## MemShareEnabled Property

<table>
<thead>
<tr>
<th>Description</th>
<th>Enables/disables exporting data to shared memory, which is the fastest way to transfer data between applications.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>VB Syntax</strong></td>

</tr>
<tr>
<td>Interface</td>
<td>IApplication</td>
</tr>
</tbody>
</table>
## MinimumFrequency Property

**Description**
Sets and Returns the minimum frequency for the calibration standard.

**VB Syntax**
```
calstd.MinimumFrequency = value
```

**Variable**
(Type) - Description
- `value` (double) - Minimum frequency in Hertz.

**Return Type**
Double

**Default**
Not Applicable

**Examples**
```
calstd.MinimumFrequency = 300e3  'Write
minFrequency = calstd.MinimumFrequency  'Read
```

**C++ Syntax**
```
HRESULT get_MinimumFrequency(double *pVal)
HRESULT put_MinimumFrequency(double newVal)
```

**Interface**
ICalStandard
### MinimumFrequency Property

<td>A Capabilities (object)</td>
<td></td>
</tr>
<tr>
<td><code>n</code></td>
<td>(Long)</td>
<td>port number to query for minimum value of receiver attenuation</td>
</tr>
</tbody>
</table>

**Return Type**
Double

**Default**
Not Applicable

**Examples**
```vbnet
value = cap.MinimumReceiverStepAttenuator'Read
```

**C++ Syntax**
```csharp
HRESULT get_MinimumReceiverStepAttenuator(long portNumber, double *attenuation);
```

**Interface**
ICapabilities
MinimumSourceALCPower Property

**Description**
Returns a value indicating the minimum amount of source ALC power with 0 dB source attenuation.

To calculate the minimum amount of source ALC power with a different level of attenuation, subtract the amount source attenuation from this value.

**VB Syntax**
```vbnet
value = cap.MinimumSourceALCPower(n)
```

**Variable**
- `value` *(Double)* - Variable to store the returned minimum value of source ALC power.
- `cap` *A Capabilities (object)*
- `n` *(Long)* - source number to query for the minimum value of source ALC power.

**Return Type**
Double

**Default**
Not Applicable

**Examples**
```vbnet
value = cap.MinimumSourceALCPower
```

**C++ Syntax**
```c++
HRESULT get_MinimumSourceALCPower(long sourceNum, double * power);
```

**Interface**
ICapabilities
# MinOutput Property

Sets and returns the "Define Min As" value for an external DC Source.

**VB Syntax**

\[ extDC.MinOutput = value \]

**Variable**

- **Type** - Description
  - \( extDC \) A `ExternalDCDevice` (object)
  - \( value \) (Double) Minimum value for the external DC Source.

**Return Type** Double

**Default** -10 V

**Examples**

- `extDC.MinOutput = -10` 'Write
- `value = extDC.MinOutput` 'Read

**C++ Syntax**

```c++
HRESULT get_MinOutput( double* value);

HRESULT put_MinOutput( double value);
```

**Interface** IExternalDCDevice3
### MinOutputState Property

Sets and returns the "Define Min As" ON/OFF state for an external DC Source.

**VB Syntax**

```vbnet
extDC.MinOutputState = value
```

**Variable**

- **extDC**: An `ExternalDCDevice (object)`
- **value**: (Boolean) "Define Min As" ON/OFF state. Choose from:
  - **True**: Turn "Define Min As" ON
  - **False**: Turn "Define Min As" OFF

**Return Type**: Boolean

**Default**: True

**Examples**

```vbnet
extDC.MinOutputState = True 'Write
value = extDC.MinOutputState 'Read
```

**C++ Syntax**

```cpp
HRESULT get_MinOutputState(VARIANT_BOOL *value)
HRESULT put_MinOutputState(VARIANT_BOOL value)
```

**Interface**: IExternalDCDevice3
# MixerCharacterizationFile Property

**Description**  
Set the filename of the S2P file used to characterize the calibration mixer

**VB Syntax**  
```vbnet
smc.MixerCharacterizationFile = value
```

**Variable (Type) - Description**

- `smc`  
  An SMCType (object)

- `value`  
  (String) Full path, file name, and extension of the mixer characterization file.

**Return Type**  
String

**Default**  
Not applicable

**Example**  
```vbnet
SMC.MixerCharacterizationFile = "C:\Program Files(x86)\Keysight\Network Analyzer\Documents\default.S2P"
```

**C++ Syntax**  
```cpp
HRESULT put_MixerCharacterizationFile(BSTR Value);
```

**Interface**  
SMCType5
## Mode Property

**Description**
Sets the type of transform.

### VB Syntax
\[
\text{trans}.\text{Mode} = \text{value}
\]

### Variable
- **trans**: A Transform (object)
- **value**: (enum NATransformMode) - Choose from:
  - 0 - naTransformBandpassImpulse
  - 1 - naTransformLowpassImpulse
  - 2 - naTransformLowpassStep

### Return Type
NATransformMode

### Default
0 - naTransformBandpassImpulse

### Examples
- \[
\text{trans}.\text{Mode} = \text{naTransformLowpassStep} \quad \text{'Write}
\]
- \[
\text{transmode} = \text{trans}.\text{Mode} \quad \text{'Read}
\]

### C++ Syntax
- HRESULT get_Mode(tagNATransformMode *pVal)
- HRESULT put_Mode(tagNATransformMode newVal)

### Interface
ITransform
## Mode Property

<table>
<thead>
<tr>
<th>Description</th>
<th>Sets and returns the stimulus mode for balanced measurements.</th>
</tr>
</thead>
<tbody>
<tr>
<td>VB Syntax</td>
<td><code>balStim.Mode = value</code></td>
</tr>
<tr>
<td>Variable</td>
<td><em>(Type) - Description</em></td>
</tr>
<tr>
<td><code>balStim</code></td>
<td>A <code>BalancedStimulus</code> <em>(object)</em></td>
</tr>
</tbody>
</table>
| `value`     | *(Enum NABALSTIMulus) - Stimulus Mode. True modes are applicable only with Opt S93460A/B - iTMSA. When a True-Mode is selected, the Balanced port powers are automatically uncoupled. Choose from:*
|             | 0 - `naSEStim`: Single-Ended stimulus                       |
|             | 1 - `naTMStim`: True-Mode stimulus                          |
|             | 2 - `naFTMStim`: Forward only True-Mode stimulus            |
|             | 3 - `naRTMStim`: Reversed only True-Mode stimulus           |
| Return Type | `Enum`                                                      |
| Default     | 0 - `naSEStim`: Single-Ended stimulus                       |
| Examples    | `balStim.Mode = naTMStim 'Write`                           |
|             | `variable = balStim.Mode 'Read`                             |
| C++ Syntax  | HRESULT get_Mode(tagNABALSTIMulus *eVal );                  |
|             | HRESULT put_Mode(tagNABALSTIMulus eVal );                   |
| Interface   | IBalancedStimulus                                          |

</table>
Multiplier Property

Description
Sets and returns the multiplier value to be used when coupling this range to the primary range. Learn more about multiplier value.

This setting is valid only if this range is coupled to the primary range.

VB Syntax

```
FOMRange.Multiplier = value
```

Variable (Type) - Description

| object | An FOMRange (object) |
| value | (Double) - Multiplier value.- (Unitless) |

Return Type
Double

Default
1

Examples

```
fomRange.Multiplier = 2 'Write
Mult = fomRange.Multiplier 'Read
```

C++ Syntax

```
HRESULT get_Multiplier(double *pVal)
HRESULT put_Multiplier(double pVal)
```

Interface
IFOMRange
### MultiToneDataDisplay Property

**Description**  
Sets and returns the data display mode.

**VB Syntax**  
```
sa.coherence.MultiToneDataDisplay = value
```

**Variable**  
*sa.coherence A SpectrumAnalyzerCoherence (object)*

*value (enum NASACoherentDataDisplay)* - Choose from:

- **0** naSAShowAll: Legacy SA mode - all frequency points are displayed.
- **1** naSAZeroNonTones: All the frequencies that are not on the multi-tone coherence grid are set to 200 dBm before being displayed.

**Return Type**  
Enum as NASACoherentDataDisplay

**Default**  
naSAShowAll

**Examples**  
```
sa.coherence.MultiToneDataDisplay = naSAShowAll 'Write
DisplayMode = sa.coherence.MultiToneDataDisplay 'Read
```

**C++ Syntax**  
```
HRESULT get_MultiToneDataDisplay(tagNASACoherentDataDisplay* value)
HRESULT put_MultiToneDataDisplay(tagNASACoherentDataDisplay value)
```

**Interface**  
ICoherenceSA
MultiToneEnable Property

Description
Enables/disables multitone image rejection. When enabled, the window type is set to No Window and the list of RBW possible values is recomputed according to the multitone spacing. When disabled, the window type is set back to what it was before enabling and the RBW list is also set to the previous setting.

VB Syntax
```
sa.coherence.MultiToneEnable = value
```

Variable (Type) - Description
A SpectrumAnalyzerCoherence (object)
```
value (Boolean) Choose from:
```
- 0 - OFF - Multitone image rejection disabled.
- 1 - ON - Multitone image rejection enabled.

Return Type
Boolean

Default
OFF

Examples
```
sa.coherence.MultiToneEnable = ON 'Write
value = sa.coherence.MultiToneEnable 'Read
```

C++ Syntax
```
HRESULT get_MultiToneEnable(VARIANT_BOOL* enable)
HRESULT put_MultiToneEnable(VARIANT_BOOL enable)
```

Interface
ICoherenceSA
## MultiToneHarmonicRejection Property

**Description**  
Sets and returns the number of test signal harmonics you want to be protected against. This adds constraints to the list of LOs used to cover the span.

**VB Syntax**  
`sa.coherence.MultiToneHarmonicRejection = value`

**Variable**  
**Type** - Description

- `sa.coherence`  
  A `SpectrumAnalyzerCoherence` (object)

- `value`  
  (`Long`) Number of test signal harmonics to be protected. The more this number is increased, the more constraints are added on the span LOs setting.

**Return Type**  
`Long`

**Default**  
0

**Examples**  
```
   sa.coherence.MultiToneHarmonicRejection = 0     'Write
   value = sa.coherence.MultiToneHarmonicRejection  'Read
```

**C++ Syntax**  
```cpp
HRESULT put_MultiToneHarmonicRejection(long value);

HRESULT get_MultiToneHarmonicRejection(long* value);
```

**Interface**  
ICoherenceSA
### MultiToneNyquistProtection Property

**Description**
Sets and returns the Nyquist protection level. Avoids Nyquist images of the IF higher order signal to fall back on multitone frequencies. This setting can only be set > 1 if the tone spacing of the multitone is not an integer divider of 100 MHz.

**VB Syntax**
```
sa.coherence.MultiToneNyquistProtection = value
```

**Variable**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>sa.coherence</code></td>
<td>A SpectrumAnalyzerCoherence (object)</td>
</tr>
<tr>
<td><code>value</code></td>
<td>(Long) Nyquist protection level.</td>
</tr>
</tbody>
</table>

**Return Type**
Long

**Default**
0

**Examples**
```
sa.coherence.MultiToneNyquistProtection = 2  'Write
value = sa.coherence.MultiToneNyquistProtection  'Read
```

**C++ Syntax**
```
HRESULT put_MultiToneNyquistProtection(long value);
HRESULT get_MultiToneNyquistProtection(long* value);
```

**Interface**
ICoherenceSA2
## MultiTonePeriod Property

**Description**
Sets and returns the test signal repetition rate (in seconds). This value is 1/MultiToneImageRejectSpacing.

**VB Syntax**
```vb
sa.coherence.MultiTonePeriod = value
```

**Variable (Type) - Description**

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sa.coherence</td>
<td>A SpectrumAnalyzerCoherence (object)</td>
</tr>
<tr>
<td>value</td>
<td>(Double) Test signal repetition rate (in seconds)</td>
</tr>
</tbody>
</table>

**Return Type**
Double

**Default**
1E6

**Examples**
```vb
sa.coherence.MultiTonePeriod = 1E6 'Write
value = sa.coherence.MultiTonePeriod 'Read
```

**C++ Syntax**
```cpp
HRESULT put_MultiTonePeriod(double freqval);
HRESULT get_MultiTonePeriod(double* freqval);
```

**Interface**
ICoherenceSA
## MultiToneReference Property

**Description**  
Sets and returns the multitone image rejection offset frequency. If the multitone grid does not start from 0 Hz, this command is used to set its offset. To make this more convenient, this command accepts as well the frequency of any tone of the multitone grid (Hz).

**VB Syntax**  
```
sa.coherence.MultiToneReference = value
```

**Variable**  
(sa.coherence) - A `SpectrumAnalyzerCoherence` (object)

value - (Double) Offset frequency (in Hz)

**Return Type**  
Double

**Default**  
0

**Examples**  
```vbnet
sa.coherence.MultiToneReference = 0 'Write
value = sa.coherence.MultiToneReference 'Read
```

**C++ Syntax**  
```c++
HRESULT put_MultiToneReference(double freqval);
HRESULT get_MultiToneReference(double* freqval);
```

**Interface**  
ICoherenceSA
## MultitoneSettingsValid Property

<table>
<thead>
<tr>
<th>Description</th>
<th>Read the current multitone settings and determine if they are valid or not.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>VB Syntax</strong></td>
<td><code>value = sa.coherence.MultitoneSettingsValid</code></td>
</tr>
<tr>
<td><strong>Variable</strong></td>
<td><em>(Type)</em> - Description</td>
</tr>
<tr>
<td><code>sa.coherence</code></td>
<td>A <code>SpectrumAnalyzerCoherence</code> <em>(object)</em></td>
</tr>
<tr>
<td><code>value</code></td>
<td><em>(Long)</em> Variable to store the returned value. A &quot;1&quot; is valid and a &quot;0&quot; is invalid.</td>
</tr>
<tr>
<td><strong>Return Type</strong></td>
<td>Boolean</td>
</tr>
<tr>
<td><strong>Example</strong></td>
<td><code>value = sa.coherence.MultitoneSettingsValid  'Read</code></td>
</tr>
<tr>
<td><strong>C++ Syntax</strong></td>
<td><code>HRESULT get_MultitoneSettingsValid(VARIANT_BOOL* value);</code></td>
</tr>
<tr>
<td><strong>Interface</strong></td>
<td>ICoherenceSA2</td>
</tr>
</tbody>
</table>
## MultiToneSpacing Property

**Description**
Sets and returns the tone spacing of the multitone signal (in Hz). This value is \(1/\text{MultiToneImageRejectPeriod}\).

**VB Syntax**

```vbnet
sa.coherence.MultiToneSpacing = value
```

**Variable**

- **sa.coherence**
  - A `SpectrumAnalyzerCoherence` object
- **value**
  - `Double` Frequency spacing of multitone signal (in Hz)

**Return Type**
Double

**Default**
1000000

**Examples**

```vbnet
sa.coherence.MultiToneSpacing = 1E6 'Write
value = sa.coherence.MultiToneSpacing 'Read
```

**C++ Syntax**

```cpp
HRESULT put_MultiToneSpacing(double freqval);

HRESULT get_MultiToneSpacing(double* freqval);
```

**Interface**
ICoherenceSA
## Name Property

<table>
<thead>
<tr>
<th>Description</th>
<th>Sets or returns the Name of the Cal Set.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>VB Syntax</strong></td>
<td><code>CalSet.Name = value</code></td>
</tr>
<tr>
<td><strong>Variable</strong></td>
<td><em>(Type)</em> - Description</td>
</tr>
<tr>
<td><code>CalSet</code></td>
<td><em>(object)</em> - A Cal Set object</td>
</tr>
<tr>
<td><code>value</code></td>
<td><em>(string)</em> - Name of the Cal Set.</td>
</tr>
<tr>
<td><strong>Return Type</strong></td>
<td>String</td>
</tr>
<tr>
<td><strong>Default</strong></td>
<td>Not Applicable</td>
</tr>
</tbody>
</table>

### Examples

```vbnet
dim pna
set
pna=createobject("AgilentPNA835x.Application")

dim calsets
set calsets=pna.getcalmanager.calsets

dim c
for each c in calsets
wscript.echo c.name
'Changes the name of CalSet_1
if c.name="CalSet_1" then c.name="New"
next```

### C++ Syntax

```cpp
HRESULT get_Name(BSTR *name)

HRESULT put_Name(BSTR name);
```

### Interface

ICalSet4
# Name (CalKit) Property

<table>
<thead>
<tr>
<th>Description</th>
<th>Sets and Returns a name for the selected calibration kit.</th>

Name (PathConfig) Property

Description
Returns the name of the current configuration only if NO individual element settings had been changed since selecting or storing a configuration. When element settings change, the path configuration name is cleared.

VB Syntax

\[ name = pathConfig.Name \]

Variable

(name) Variable to store the returned configuration name.

pathConfig
A PathConfiguration (object)

Return Type
String

Default
'default' - name of the default factory configuration

Examples

\[ name=pathConf.Name \]

C++ Syntax

HRESULT get_Name(BSTR* ppName)

Interface
IPathConfiguration
### Name Property

# Name (Measurement) Property

**Description**: Sets (or returns) the Name of the measurement. Measurement names must be unique among the set of measurements. Measurement names cannot be an empty string.

**Note**: This is the same name as trace.Name; when one changes, the other changes.

**VB Syntax**
```
meas.Name = value
```

**Variable (Type) - Description**
- `meas`: A Measurement (object)
- `value`: (string) - A user defined name of the measurement

**Return Type**: String

**Default**: "CH1_S11_1" - name of the default measurement

**Examples**
```
meas.Name = "Filter BPass"  'Write
MName = meas.Name  'Read
```

**C++ Syntax**
```
HRESULT get_Name(BSTR *pVal)
HRESULT put_Name(BSTR newVal)
```

**Interface**: IMeasurement

### Name (trace) Property

**Description**
Sets or returns the name of the Trace. Use the trace name to identify the trace and refer to the trace in the collection.

**Note:** This is the same name as meas.Name; when one changes, the other changes.

**VB Syntax**

```vbnet
trac.Name = value
```

**Variable**

- **(Type)** - Description
- **trac** - A Trace **(object)**
- **value** - *(String)* Trace name

**Return Type**

String

**Default**

"CH1_S11_1" - name of the default measurement

**Examples**

```
trace.Name = "myTrace" 'Write
traceName = Name.Trace 'Read
```

**C++ Syntax**

```cpp
HRESULT put_Name(BSTR name)
HRESULT get_Name(BSTR *name)
```

NetworkPortMapD Property

Description
Read the port mapping of “out B” port for a 4-port SNP file to be embedded.

Use NetworkPortMap Method to set the port map for all four ports.

VB Syntax
value = fixture.NetworkPortMapD(network)

Variable (Type) - Description
value (Long) Variable to store the returned value.
fixture A Fixturing (object)
network (Integer) Network position. Choose from 1 or 2.
Default 4

Examples
value = fixture.NetworkPortMapD(1)

C++ Syntax
HRESULT get_NetworkPortMapD(short* Net);

Interface IFixturing6
# NoiseAverageFactor Property

**Description**
Sets and reads the averaging of the noise receiver.

**VB Syntax**

```vbnet
noise.NoiseAverageFactor = value
```

**Variable**

- **Type** - Description
- **noise** - A `NoiseFigure` *(object)*
- **value** - *(long integer)* - Averaging value. Choose a number between 1 and 99.

**Return Type**
Long Integer

**Default**
1

**Examples**

```vbnet
noise.NoiseAverageFactor = 10 'Write
AvgNoise = noise.NoiseAverageFactor 'Read
```

**C++ Syntax**

```csharp
HRESULT get_NoiseAverageFactor(long* pVal)

HRESULT put_NoiseAverageFactor(long newVal)
```

**Interface**
INOiseFigure
# NoiseAverageState Property

## Description
Turns Noise Averaging ON and OFF.

## VB Syntax

```vbnet
noise.NoiseAverageState = value
```

## Variable

<table>
<thead>
<tr>
<th>(Type)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>noise</code></td>
<td>A NoiseFigure (object)</td>
</tr>
<tr>
<td><code>value</code></td>
<td>(boolean) - Averaging state.</td>
</tr>
</tbody>
</table>

- **False** - Turns Noise Averaging OFF
- **True** - Turns Noise Averaging ON

## Return Type
Boolean

## Default
False

## Examples

```vbnet
noise.NoiseAverageState = OFF 'Write
NoiseAvgState = noise.NoiseAverageState 'Read
```

## C++ Syntax

```cpp
HRESULT get_NoiseAverageState(VARIANT_BOOL* on);
HRESULT put_NoiseAverageState(VARIANT_BOOL on);
```

## Interface
INoiseFigure
## NoiseBandwidth Property

**Description**  
Set the bandwidth of the noise receiver.

**VB Syntax**  
`noise.NoiseBandwidth = value`

**Variable**  
- **Type**
  - `noise`  
    - A `NoiseFigure` (object)
  - `value`  
    - (double) Bandwidth value.

For `NoiseReceiver = naNoiseReceiver` (Opt 029) choose from: 800 KHz, 2 MHz, 4 MHz, 8 MHz, or 24 MHz or the numerical equivalent, such as 8e6 and so forth. **NOTE:** The Receiver Characterization Method = "Power Meter" is NOT allowed when the Noise Bandwidth is 8 MHz or 24 MHz.

For `NoiseReceiver = naStandardReceiver` (Opt 028) choose from: 720 kHz or 1.2 MHz

If the value does not match one of these, it is rounded up to the next valid bandwidth value.

**Return Type**  
Double

**Default**  
4 MHz for `naNoiseReceiver`

1.2 MHz for `naStandardReceiver`

**Examples**  
```
noise.NoiseBandwidth = 2E6 'Write
NoiseBW = noise.NoiseBandwidth 'Read
```

**C++ Syntax**  
```c++
HRESULT get_NoiseBandwidth(double *pVal);
HRESULT put_NoiseBandwidth(double newVal);
```

**Interface**  
INoiseFigure
### NoiseFigureBW Property

<td><code>HRESULT put_NoiseFigureBW(double pVal);</code></td>
</tr>
<tr>
<td><strong>Interface</strong></td>
<td>ISegment4</td>
</tr>
</tbody>
</table>

1985
**NoiseFigureBWOption Property**

**Description**
Enables or disables noise figure bandwidth setting.

**VB Syntax**
```vbnet
segs.NoiseFigureBWOption = value
```

**Variable (Type) - Description**

- `segs` A `Segments` collection *(object)*
- `value` *(boolean)*
  - `True` - Enable noise figure bandwidth setting.
  - `False` - Disable noise figure bandwidth setting.

**Return Type**
Boolean

**Default**
False

**Examples**
- `segs.NoiseFigureBWOption = True 'Write`
- `IFBWstate = segs.NoiseFigureBWOption 'Read`

**C++ Syntax**
```csharp
HRESULT get_NoiseFigureBWOption(VARIANT_BOOL* pVal)
HRESULT put_NoiseFigureBWOption(VARIANT_BOOL pVal)
```

**Interface**
ISegments7
# NoiseReceiver Property

**Description**
Sets and returns the receiver to use for noise measurements.

**VB Syntax**
```vbnet
noise.NoiseReceiver = value
```

**Variable**
- **Type** - Description
  - `noise` A `NoiseFigure` (object)
  - `value` (Enum as `NANoiseReceiverMode`) Noise receiver. Choose from:
    - **0 - naStandardReceiver** The standard VNA receiver. (Opt 028 or 029)
    - **1 - naNoiseReceiver** The noise receiver. (Opt 029 ONLY)

**Return Type**
Enum

**Default**
1 - `naNoiseReceiver`

**Examples**
- ```vbnet
  noise.NoiseReceiver = naNoiseReceiver 'Write
  NoiseRec = noise.NoiseReceiver 'Read
  ```

**C++ Syntax**
```c++
HRESULT get_NoiseReceiver(tagNoiseReceiverMode *pVal);
HRESULT put_NoiseReceiver(tagNoiseReceiverMode newVal);
```

**Interface**
`INoiseFigure5`
# NoiseReceiverNoiseBWList Property

**Description**
Returns the list of supported Noise Bandwidths values when using a noise receiver (option 029). Learn more about Opt. 029.

**VB Syntax**

```vbnet
value = cap.NoiseReceiverNoiseBWList
```

**Variable** (Type) - Description

- `value` Variant containing one-dimensional array of long integers.
- `cap` A Capabilities (object)

**Default**
Not Applicable

**Examples**

```vbnet
value = cap.NoiseReceiverNoiseBWList  'Read
```

**C++ Syntax**

```c++
HRESULT get_NoiseReceiverNoiseBWList (Variant *list);
```

**Interface**
ICapabilities13
**NoiseReceiverSweepTime Property**

**Description**

Returns the APPROXIMATE time the channel will take to make one noise receiver sweep given the current setup. This, along with the sweep time for a standard receiver measurement and the following calculations, can tell you how long a “single” sweep would take so that you can set an appropriate "timeout" in your program.

Use **Sweep Time Property** to perform the standard sweep time query, shown as **SSwpTime** below.

**To calculate the total sweep time:**

Noise Figure on amplifiers (Vector Correction ON):

- \[ 2 \times SSwpTime + X \times \text{NoiseReceiverSweepTime} \]

- Where \( X \) = the number of noise receiver impedance state sweeps. (Default is 4).

Noise Figure on converters (NFX) correction on - increased number of sweeps due to extra mixer sweeps and source pulling:

- \[ 4 \times SSwpTime + X \times \text{NoiseReceiverSweepTime} \] (without source pulling)

- \[ 8 \times SSwpTime + X \times \text{NoiseReceiverSweepTime} \] (with source pulling)

- Where \( X \) = the number of noise receiver impedance state sweeps. (Default is 4).

**Note:** The number of sweeps to perform a noise measurement is annotated at the bottom of the Noise Figure screen.

**VB Syntax**

\[ swpTime = NF.NoiseReceiverSweepTime() \]

**Variable**

- **swpTime** Variable to store the returned sweep time value (in seconds).
- **NF** A **NoiseFigure** (object)

**Return Type**

Double

**Default**

Not Applicable

**Examples**

\[ swpTime = NF.NoiseReceiverSweepTime() \]

**C++ Syntax**

```cpp
HRESULT get_NoiseReceiverSweepTime (Double* SwpTime);
```

# NoiseGain Property

## Description
Sets and reads the gain state of the noise receiver. This setting is NOT used when \texttt{NoiseReceiver = naStandardReceiver (Opt 028)}.

## VB Syntax
\texttt{noise.NoiseGain = value}

## Variable
- \texttt{noise} (Type) - Description
  - A \texttt{NoiseFigure (object)}
- \texttt{value} (long integer) - Gain value. Choose from:
  - \texttt{0} Low Gain: select if the gain of your DUT is relatively high (>35 dB).
  - \texttt{15} Medium Gain: select if the gain of your DUT is about average (20 dB to 45 dB).
  - \texttt{30} High Gain: select if the gain of your DUT is relatively low (<30 dB).

If the value does not match one of these, it is rounded up to the next legal value.

Learn more about Noise Receiver Gain setting.

## Return Type
Long Integer

## Default
30

## Examples
\texttt{noise.NoiseGain = 30 'Write}

\texttt{GainNoise = noise.NoiseGain 'Read}

## C++ Syntax
\texttt{HRESULT get_NoiseGain(long* pVal)}

\texttt{HRESULT put_NoiseGain(long newVal)}

## Interface
INoiseFigure
### NoiseGainCTCheck

**Description**
Turns noise threshold checking ON and OFF.

**VB Syntax**

```vbnet
noise.NoiseGainCTCheck = value
```

**Variable**

- **noise**
  - A `NoiseFigure2` (object)
- **value**
  - (boolean) - Averaging state.

  - 0- Turns noise threshold checking OFF
  - 1- Turns noise threshold checking ON

**Return Type**
Boolean

**Default**
0 - OFF

**Examples**

```vbnet
noise.NoiseGainCTCheck = OFF 'Write
NoiseCT = noise.NoiseGainCTCheck 'Read
```

**C++ Syntax**

```cpp
HRESULT get_NoiseGainCTCheck(VARIANT_BOOL* on);
HRESULT put_NoiseGainCTCheck(VARIANT_BOOL on);
```

**Interface**
INoiseFigure3
## NoiseSourceCalKitType Property

**Description**
Set and read the Cal Kit that will be used for the Noise Source adapter.

An adapter is always necessary to connect a 346C Noise Source to the VNA port 2. Select a Cal Kit that is the same type and gender as the noise source connector.

If the Noise Source mates directly to VNA port 2, then set this type to "None".

**VB Syntax**

```
noise.NoiseSourceCalKitType = value
```

**Variable**

<table>
<thead>
<tr>
<th>(Type)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>noise</code></td>
<td>A NoiseCal (object)</td>
</tr>
<tr>
<td><code>value</code></td>
<td>(string) Cal Kit type. To read possible cal kit strings for the adapter:</td>
</tr>
</tbody>
</table>

1. Change the port connector type to that of the noise source using: `ConnectorType`
2. Then read the possible cal kit strings for that port using: `CompatibleCalKits`

**Return Type**

String

**Default**

Not applicable

**Examples**

```vbnet
noise.NoiseSourceCalKitType = "N4691-60004 ECAL"
```

```vbnet
calkit = noise.NoiseSourceCalKitType
```

**C++ Syntax**

```
HRESULT get_NoiseSourceCalKitType(BSTR* pValue)
```

```
HRESULT put_NoiseSourceCalKitType(BSTR pNewValue)
```

**Interface**

INoiseCal
# NoiseSourceCold Property

**Description**
Sets and returns the temperature of the noise source connector.

**VB Syntax**

```vbnet
noise.NoiseSourceCold = value
```

**Variable (Type) - Description**

- **noise**
  A NoiseCal (**object**)

- **value**
  (**double**) Noise source temperature in Kelvin.

**Return Type**
Double

**Default**
Not Applicable

**Examples**

```vbnet
noise.NoiseSourceCold = 295 'Write
temp = noise.NoiseSourceCold 'Read
```

**C++ Syntax**

```c++
HRESULT get_NoiseSourceCold(double* pTemp)
HRESULT put_NoiseSourceCold(double pNewTemp)
```

**Interface**
INoiseCal
# NoiseSourceConnectorType Property

**Description**  
Set and read the Noise Source connector type and gender.

The Keysight 346C has an "APC 3.5 male" connector.

**VB Syntax**  
```vbnet
noise.NoiseSourceConnectorType = value
```

**Variable**  
(Type) - Description  
- `noise`: A `NoiseCal` (object)  
- `value`: (string) Connector type. Use `ValidConnectorType` to return a list of valid connector types.

**Return Type**  
String

**Default**  
Not applicable

**Examples**  
```vbnet
noise.NoiseSourceConnectorType = "APC 3.5 male" 'Write
connector = noise.NoiseSourceConnectorType 'Read
```

**C++ Syntax**  
```cpp
HRESULT get_NoiseSourceConnectorType(BSTR* pConnectorType)
HRESULT put_NoiseSourceConnectorType(BSTR pConnectorType)
```

**Interface**  
`INoiseCal`
# NoiseSourceState Property

**Description**
Sets and reads the noise source (28V) ON and OFF.

**VB Syntax**

```vbnet
app.NoiseSourceState = state
```

**Variable**

- **app** - An Application (object)
- **state** - (boolean)

**Default**
For VNA models with a Noise Figure option (028/029/H29), the 28V line is ON at application start and after a preset. The ON/OFF state is also available from a VNA softkey menu.

For VNA models WITHOUT a Noise Figure option (028/029/H29), the 28V line is OFF at application start and its state is not affected by a preset. The ON/OFF state is NOT available from a VNA softkey menu.

**Examples**

```vbnet
app.NoiseSourceState = True 'Write
coupl = app.NoiseSourceState 'Read
```

**C++ Syntax**

```c++
HRESULT put_NoiseSourceState(VARIANT_BOOL bState)
HRESULT get_NoiseSourceState(VARIANT_BOOL *bState)
```

**Interface**
IAplication13
### NoiseTuner Property

<table>

</tr>
</tbody>
</table>
## NoiseTunerIn Property

**Description**
Sets and returns the port identifier of the ECal noise tuner that is connected to the VNA Source.

**VB Syntax**
`noise.NoiseTunerIn = value`

**Variable**
- `noise` (Type) - Description
  - A `NoiseFigure` (object)
- `value` (string) Noise Tuner port identifier that is connected to the VNA source, as it is labeled on the ECal module. For example, for 2-port ECal modules, choose either "A" or "B".

**ReturnType**
String

**Default**
Not Applicable

**Examples**
- `noise.NoiseTunerIn = "A"` 'Write
- `EcalPort = noise.NoiseTunerIn` 'Read

**C++ Syntax**
- `HRESULT get_NoiseTunerIn(BSTR* pValue)`
- `HRESULT put_NoiseTunerIn(BSTR pNewValue)`

**Interface**
INoiseFigure
### NoiseTunerOut Property

**Description**  
Sets and returns the port identifier of the ECal noise tuner that is connected to the DUT.

**VB Syntax**  
```
noise.NoiseTunerOut = value
```

**Variable (Type) - Description**
- `noise` (A NoiseFigure object)
- `value` (string) Noise Tuner port identifier that is connected to the DUT, as it is labeled on the ECal module. For example, for 2-port ECal modules, choose either "A" or "B".

**Return Type**  
String

**Default**  
Not Applicable

**Examples**
- `noise.NoiseTunerOut = "A"`  
- `EcalPort = noise.NoiseTunerOut`

**C++ Syntax**
- `HRESULT get_NoiseTunerOut(BSTR* pValue)`
- `HRESULT put_NoiseTunerOut(BSTR pNewValue)`

**Interface**  
INoiseFigure
### NominalIncidentPowerState Property

**Description**
Toggles the Nominal Incident Power setting ON and OFF. This setting is ONLY to be used with SMC measurements, not VMC. Learn more about Nominal Incident Power.

**VB Syntax**
```vbnet
mixer.NominalIncidentPowerState = bool
```

**Variable**
- **mixer** (Type) - Description
  - A Mixer (object)
- **bool** (boolean) - Nominal Incident Power State. Choose from:
  - 1 -(True) Turn nominal incident power ON
  - 0 -(False) Turn nominal incident power OFF

**Return Type**
Boolean

**Default**
0 -(False)

**Examples**
```vbnet
mixer.NominalIncidentPowerState = True 'sets NominalIncidentPowerState to ON
```

**C++ Syntax**
```cpp
HRESULT get_NominalIncidentPowerState(VARIANT_BOOL *pVal)
HRESULT put_NominalIncidentPowerState(VARIANT_BOOL val);
```

**Interface**
IMixer4
NormalizePoint Property

Description
Sets and returns the sweep data point around which to perform broadband and precise tuning.

VB Syntax
obj.NormalizePoint = value

Variable (Type) - Description
obj  An EmbeddedLO (object) or a ConverterEmbeddedLO (object)

value (Long) Mixer Sweep data point. Choose a data point number between 1 and the max number of data points in the sweep that has the least amount of expected noise.

Return Type (Long)

Default  Center point in the sweep span

Examples
embedLO.NormalizePoint = 101 'write
value = embedLO.NormalizePoint 'read

C++ Syntax
HRESULT get_NormalizePoint(long *point);
HRESULT put_NormalizePoint(long point);

Interface IEmbededLO
## NormalizePoint Property

<table>
<thead>
<tr>
<th>Description</th>
<th>Sets or returns the data point used for normalizing the phase measurement.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>VB Syntax</strong></td>
<td><code>obj.NormalizePoint = value</code></td>
</tr>
<tr>
<td><strong>Variable</strong></td>
<td><strong>(Type)</strong> - <strong>Description</strong></td>
</tr>
<tr>
<td><code>obj</code></td>
<td>A Mixer Interface pointer to the Measurement (object)</td>
</tr>
<tr>
<td></td>
<td>A Converter (Object)</td>
</tr>
<tr>
<td><code>value</code></td>
<td><strong>(Long)</strong> - Normalization data point. Choose a data point number between 1 and the max number of data points in the sweep that has the least amount of expected noise.</td>
</tr>
</tbody>
</table>

**Return Type**: Long Integer  
**Default**: Center point in the sweep  
**Examples**: `mixer.NormalizePoint = 101`  
**C++ Syntax**:  
```
HRESULT get_NormalizePoint(Long * val);
HRESULT put_NormalizePoint(Long val);
```
**Interface**: IMixer13
### Number (Measurement) Property

**Description**
Returns the Number of the measurement. Measurement numbers are assigned internally.

**Note**: Measurement numbers are NOT the same as their number in the Measurements collection. Measurement number is used to identify the measurement associated with an event.

This property is used to identify measurements when events occur through the OnMeasurementEvent callback. For example:

```vbnet
OnMeasurementEvent (naEventId_MSG_LIMIT_FAILED, 3)
```

<table>
<thead>
<tr>
<th>VB Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>measNum = meas.Number</code></td>
<td>variable to store the measurement number</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Variable (Type)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>measNum</code> (long)</td>
<td>A Measurement (object)</td>
</tr>
<tr>
<td><code>meas</code></td>
<td></td>
</tr>
</tbody>
</table>

**Return Type**: Long Integer

**Default**: "1" - number of the default measurement

**Examples**

```vbnet
measNum = meas.Number
```

**C++ Syntax**: `HRESULT get_Number(long *MeasurementNumber)`

**Interface**: IMeasurement
### Number Property

**Description**
Returns the number of the Auxiliary Trigger connector pair currently being used with the instance of the `AuxTrigger` object. Set the trigger pair with the `AuxTrig` object.

**VB Syntax**

```vbnet
value = auxTrig.Number
```

**Variable**

- `auxTrig` (Type) - Description
  - An `AuxTrigger` (object)

- `value` (Long Integer) - Connector pair. PNA-X returns 1 or 2. All other models that do not have the Aux trigger connector returns 1.

**Return Type**

Single

**Default**

Not Applicable

**Examples**

```vbnet
value = auxTrig.Number 'Read the value
```

**C++ Syntax**

```cpp
HRESULT get_Number(long *auxID);
```

**Interface**

IAuxTrigger
### NumberOfFrequencyPoints Property

<table>
<thead>
<tr>
<th>Description</th>
<th>Set and read the number of frequency points for a Gain Compression channel. Applies to all acquisition modes.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>VB Syntax</strong></td>
<td><code>gca.NumberOfFrequencyPoints = value</code></td>
</tr>
</tbody>
</table>
| **Variable (Type)** - Description | **gca** - A `GainCompression` **(object)**  
|  | **value** - **(integer)** - Frequency points. Do not exceed the max number of points. [Learn more](#) |
| **Return Type** | Integer                                                                                                          |
| **Default** | 201                                                                                                              |
| **Examples** | `gca.NumberOfFrequencyPoints = 101` 'Write'  
|  | `freqPts = gca.NumberOfFrequencyPoints` 'Read'                                                                     |
| **C++ Syntax** | HRESULT get_NumberOfFrequencyPoints(int* pVal)  
|  | HRESULT put_NumberOfFrequencyPoints(int newVal)                                                                     |
| **Interface** | IGainCompression                                                                                                   |
## NumberOfPoints (PowerCalRange) Property

**Description**
Sets and gets the number of points for range <m> for source port<n>.

**VB Syntax**

```
PwrrCalRange .NumberOfPoints = points
```

**Variable**
(Type) - Description

- `points` (Long) - Variable to store the returned number of points.

**PwrrCalRange**
A PowerCalRange **(object)**

**Return Type**
Long

**Default**
Not Applicable

**Example**

```
CalibrateAllChannels.IndependentPowerCalibration(3).PowerCalRange(1).NumberOfPoints = 7 'Write

points = CalibrateAllChannels.IndependentPowerCalibration(3).PowerCalRange(1).NumberOfPoints 'Read
```

**C++ Syntax**

```c
HRESULT get_NumberOfPoints(long* points);

HRESULT put_NumberOfPoints(long points);
```

**Interface**
IPowerCalRange
**NumberofPoints Property**

**Description**
Sets or returns the Number of Points of the channel.

Sets or returns the Number of Points of the segment.

**See Also**

- Measurement2 Interface to learn how this method differs from meas.NumberofPoints
- Gain Compression Number of Points.
- Swept IMD limitations

**VB Syntax**

```
object.NumberOfPoints = value
```

**Variable**

*object* (Type) - Description

- **object** Channel (object)

  or

  CalSet (object) - Read-only property

  *value* (long) - Number of Points.

  For channel, choose any number from 1 to the VNA max number of points.

  For segment, the total number of points in all segments cannot exceed the VNA maximum. A segment can have as few as 1 point.

**Return Type**

Long Integer

**Default**

201 for channel

21 for segment

**Examples**

```
chan.NumberOfPoints = 201 'sets the number of points for all measurements in the channel. -Write
numofpts = chan.NumberOfPoints 'Read
```

**C++ Syntax**

```
HRESULT get_NumberOfPoints(long *pVal)
HRESULT put_NumberOfPoints(long newVal)
```
Interface

IChannel
ISegment

```cpp
HRESULT get_NumberOfPorts(long *numberOfPorts);
```

**Interface**

ITestsetControl

IE5091Testset
### NumberOfPowerPoints Property

**Description**
Set and read the number of data points in each power sweep. Applies ONLY to 2D acquisition modes.

**VB Syntax**
```vbnet
gca.NumberOfPowerPoints = value
```

**Variable (Type) - Description**
- `gca` - A `GainCompression` object
- `value` - (integer) - Power points. Do not exceed the max number of points.

For 2D sweeps, total = frequency x power. Max = 20,001

For Smart sweep, total = frequency. Max = 10,000.

**Return Type**
Integer

**Default**
26

**Examples**
```vbnet
gca.NumberOfPowerPoints = 31 'Write
pwrPts = gca.NumberOfPowerPoints 'Read
```

**C++ Syntax**
```
HRESULT get_NumberOfPowerPoints(int* pVal)

HRESULT put_NumberOfPowerPoints(int newVal)
```

**Interface**
IGainCompression

<td>HRESULT get_OccupiedBandSpan(double* pVal)</td>
</tr>
<tr>
<td><strong>Interface</strong></td>
<td>IMarker7</td>
</tr>
</tbody>
</table>
### OccupiedBandState Property

**Description**
Sets and returns the occupied bandwidth on/off state.

**VB Syntax**

```vbnet
mkr.OccupiedBandState = value
```

**Variable (Type) - Description**

- **mkr**
  - A Marker (object)
- **value**
  - (Enum as NaStates) - Choose from:
    - **naOFF** (0) - Turns occupied bandwidth OFF.
    - **naON** (1) - Turns occupied bandwidth ON.

**Return Type**
Enum

**Default**
naOFF (0)

**Examples**

```vbnet
mkr.OccupiedBandState = naON 'Write
obwstate = mkr.OccupiedBandState 'Read
```

**C++ Syntax**

```cpp
HRESULT OccupiedBandState(tag NAStates* pState);
HRESULT OccupiedBandState(tag NAStates pState)
```

**Interface**
IMarker7

**Note:** If occupied band state is turned ON, then Band Power or Band Noise is turned OFF.
## Offset Property

Sets and returns the offset value to be used when coupling this range to the primary range.

This setting is valid only if the specified range is coupled to the primary range.

### VB Syntax

\[ \text{FOMRange.Offset} = \text{value} \]

### Variable

- **Object**: An FOMRange (object)
- **Value**: (Double) - Offset value. -(Unitless)

### Return Type

Double

### Default

0

### Examples

- `fomRange.Offset = 1e9` 'Write
- `Offs = fomRange.Offset` 'Read

### C++ Syntax

```
HRESULT get_Offset(double *pVal)
HRESULT put_Offset(double pVal)
```

### Interface

IFOMRange
### About Receiver Attenuation

**OffsetReceiverAttenuator Property**

<table>
<thead>
<tr>
<th>Description</th>
<th>Set and return whether to offset the reference receiver by the amount of receiver attenuation. <a href="#">Learn more.</a></th>
</tr>
</thead>
<tbody>
<tr>
<td>This setting remains until changed or until the hard drive is changed or reformatted.</td>
<td></td>
</tr>
</tbody>
</table>

**VB Syntax**

```
pref.OffsetReceiverAttenuator = value
```

**Variable**

- **Type** - **Description**
  - `pref` A Preferences *(object)*
  - `value` *(Boolean)* - Choose from:
    - **False** Do NOT offset the test port receivers.
    - **True** Offset the test port receivers.

**Return Type**

*Boolean*

**Default**

- **True** PNA-X models
- **False** E836xB and PNA-L models

**Examples**

```
pref.OffsetReceiverAttenuator = 1 'Write
Rcvroffset = pref.OffsetReceiverAttenuator 'Read
```

**C++ Syntax**

```
HRESULT get_OffsetReceiverAttenuator(VARIANT_BOOL * val);
HRESULT put_OffsetReceiverAttenuator(VARIANT_BOOL val);
```

**Interface**

*IPreferences6*
**OffsetSourceAttenuator Property**

**Description**
Set and return whether to mathematically offset the reference receivers by the amount of source attenuation. Learn more.

This setting remains until changed or until the hard drive is changed or reformatted.

**VB Syntax**
```
pref.OffsetSourceAttenuator = value
```

**Variable**
- **Type** - Description
- `pref` A Preferences (object)
- `value` (Boolean) - Choose from:
  - **False** Do NOT offset the reference receivers.
  - **True** Offset the reference receivers.

**Return Type**
Boolean

**Default**
- **True** PNA-X models
- **False** E836xB and PNA-L models

**Examples**
```
pref.OffsetSourceAttenuator = 1 'Write
Rcvroffset = pref.OffsetSourceAttenuator 'Read
```

**C++ Syntax**
```
HRESULT get_OffsetSourceAttenuator(VARIANT_BOOL * val);
HRESULT put_OffsetSourceAttenuator(VARIANT_BOOL val);
```

**Interface**
IPreferences6
**OmitIsolation Property - Superseded**

**Description**
This command is replaced with SetIsolationPaths and GetIsolationPaths. Sets and returns whether Isolation portion of the calibration will be performed or not.

**VB Syntax**
```
obj.OmitIsolation = bool
```

**Variable**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>obj</code></td>
<td>SMCType (object)</td>
</tr>
<tr>
<td>or</td>
<td>VMCType (object)</td>
</tr>
<tr>
<td><code>bool</code></td>
<td>(Boolean)</td>
</tr>
</tbody>
</table>

- **True** - Isolation is NOT performed
- **False** - Isolation is performed

**Return Type**
Boolean

**Default**
True

**Examples**
```
value = SMC.OmitIsolation
```

**C++ Syntax**
```
HRESULT put_OmitIsolation (VARIANT_BOOL bState)
HRESULT get_OmitIsolation (VARIANT_BOOL *bState)
```

**Interface**
SMCType

VMCType
**OneMarkerReadoutPerTrace Property - Superseded**

**Description**
Either show marker readout of only the active trace or all of the traces simultaneously.

**Note:** This method is replaced by MarkerReadoutsPerTrace Property

**VB Syntax**
```vbnet
win.OneReadoutPerTrace = state
```

**Variable**
- **(Type)** - Description
  - `win` - A NAWindow (object)
  - `value` - (boolean)

- **True** - Shows the readout of only the active marker for each trace.
- **False** - Shows up to 5 marker readouts per trace, up to 20 total readouts.

**Return Type**
Boolean

**Default**
False

**Examples**
```vbnet
win.OneMarkerReadoutPerTrace = True 'Write

State = app.ActiveNAWindow.OneMarkerReadoutPerTrace 'Read
```

**C++ Syntax**
- HRESULT get_OneMarkerReadoutPerTrace(VARIANT_BOOL *pVal)
- HRESULT put_OneMarkerReadoutPerTrace(VARIANT_BOOL newVal)

**Interface**
INAWindow
## Options Property

<table>
<thead>
<tr>
<th>Description</th>
<th>Returns a string identifying the analyzer option configuration. Refer to the option number differences between the common option numbers and those returned using this command.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>VB Syntax</strong></td>
<td><code>value = app.Options</code></td>
</tr>
<tr>
<td><strong>Variable</strong></td>
<td><strong>(Type)</strong> - Description</td>
</tr>
<tr>
<td>app</td>
<td>An Application <em>(object)</em></td>
</tr>
<tr>
<td>value</td>
<td><em>(string)</em> - variable to contain the returned string</td>
</tr>
<tr>
<td><strong>Return Type</strong></td>
<td>String</td>
</tr>
<tr>
<td><strong>Default</strong></td>
<td>Not Applicable</td>
</tr>
<tr>
<td><strong>Examples</strong></td>
<td><code>availOptions = app.Options</code></td>
</tr>
<tr>
<td><strong>C++ Syntax</strong></td>
<td>HRESULT Options(BSTR* OptionString)</td>
</tr>
<tr>
<td><strong>Interface</strong></td>
<td>IApplication</td>
</tr>
</tbody>
</table>
**OrientECALModule Property**

**Description**
Specifies if the VNA should perform orientation of the ECal module during calibration. Orientation is a technique by which the VNA automatically determines which ports of the module are connected to which ports of the VNA. Orientation begins to fail at very low power levels or if there is much attenuation in the path between the VNA and the ECal module.

**Note:** For guided calibrations where Orient is OFF and the same ECal module is used in more than one Connection Step, you are not allowed to specify how the ECal module is connected. Instead, the VNA determines the orientation. The VNA does not verify that you made the connection properly.

This setting remains until the VNA is restarted or this command is sent again.

This command, and `ECALPortMapEx`, can be used to perform ECal using the Guided Calibration interface.

**VB Syntax**
```
cal.OrientECALModule = value
```

**Variable (Type) - Description**
- `cal` A Calibrator (object)
- `value` (boolean)

- **False** – `DoECAL1PortEX` and `DoECAL2PortEx` methods will use the value of the `ECALPortMapEx` property to determine the port connections.

- **True** - `DoECAL1PortEX` and `DoECAL2PortEx` methods will use auto Orientation technique to determine port connections.

**Return Type**
Boolean

**Default**
True

**Examples**
```
Dim cal As Calibrator
Dim bOrient As Boolean

Set cal = PNAapp.ActiveChannel.Calibrator

cal.OrientECALModule = False 'Write
bOrient = cal.OrientECALModule 'Read
```
C++ Syntax
HRESULT put_OrientECALModule(VARIANT_BOOL bOrient);
HRESULT get_OrientECALModule(VARIANT_BOOL *bOrient);

Interface
ICalibrator3
# OutputChannel Property

<table>
<thead>
<tr>
<th>Description</th>

About Testset Control

OutputPort Property

Description

Switches an input to one of the valid outputs on the specified E5091A. The following are valid input/output combinations. If a combination other than these are sent, an “invalid argument” error will occur.

<table>
<thead>
<tr>
<th>Input</th>
<th>Valid Outputs</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>A</td>
</tr>
<tr>
<td></td>
<td>T1 - If Port 2 already is connected to T1, then Port 2 will be switched to T2.</td>
</tr>
<tr>
<td>2</td>
<td>T1 - If Port 1 already is connected to T1, then Port 1 will be switched to A.</td>
</tr>
<tr>
<td></td>
<td>T2</td>
</tr>
<tr>
<td>3</td>
<td>R1+</td>
</tr>
<tr>
<td></td>
<td>R2+</td>
</tr>
<tr>
<td></td>
<td>R3+ If option 007 (7port), R2 is selected.</td>
</tr>
<tr>
<td>4</td>
<td>R1-</td>
</tr>
<tr>
<td></td>
<td>R2-</td>
</tr>
<tr>
<td></td>
<td>R3- If option 007 (7port), R2 is selected.</td>
</tr>
</tbody>
</table>

Note: Do not confuse the similar Testset.OutputPorts Property, which sets or gets the port mapping for ALL ports.

VB Syntax

```
testsets(1).OutputPort (chNum,input) = output
```

Variable

(Type) - Description

*testsets(1)* An item from *Testsets (collection)*

Learn how to identify a testset in the collection.

*chNum* (Long) Channel number of the measurement.

*input* (Long) Testset Input port. Choose from 1|2|3|4.

*output* (Enum as NAE5091OutputPort) Output port to switch to specified Input. Choose from:

0 or naE5091PortA - Port A

1 or naE5091PortT1 - Port T1

2 or naE5091PortT2 - Port T2

2029
3 or **naE5091PortR1** - Port R1

4 or **naE5091PortR2** - Port R2

5 or **naE5091PortR3** - Port R3

**Return Type**  
Enum

**Default**  
Not Applicable

**Examples**  
See Example Program

**C++ Syntax**  
HRESULT get_OutputPort(long channelNum, long inputPort, E5091OutputPort *outPort);
HRESULT put_OutputPort(long channelNum, long inputPort, E5091OutputPort outPort);

**Interface**  
IE5091Testsets
**OutputPorts (Cal Set) Property**

<table>
<thead>
<tr>
<th>Description</th>
<th>Returns the port mapping for the Cal Set.</th>
</tr>
</thead>
</table>

**VB Syntax**  
`portMap = calset.OutputPorts`

**Variable**  
*(-Type) - Description*

`portMap`  
(String) Variable to store the returned string. The returned values are the physical ports. The POSITION of the returned values corresponds to the logical ports.

For example, with an N44xx test set, if the returned string is "PNA 1,TS 2,PNA 2, TS 4" this means:

- PNA 1 is assigned to logical port 1
- TS 2 is assigned to logical port 2
- PNA 2 is assigned to logical port 3
- TS 4 is assigned to logical port 4

**calset**  
A Cal Set object.

**Return Type**  
String

**Default**  
Depends on the test set.

**Example**  
`portMap = calset.OutputPorts`

**C++ Syntax**  
`HRESULT get_OutputPorts(BSTR *mapping);`

**Interface**  
ICalset5
OutputPorts Property

Description
Sets or gets the port mappings for ALL ports. An “invalid argument” error will occur if you attempt to set an illegal port combination.

Refer to your testset documentation for valid port combinations.

Note: Do not confuse the similar E5091.OutputPort Property, which sets or gets the port mapping for a single port.

VB Syntax
\[ tset.OutputPorts(chNum) = portList \]

Variable (Type) - Description

- **tset** A TestsetControl object.
- **chNum** (Long) Channel number of the measurement.
- **portList** (String) A comma-separated list of port mappings. Spaces are ignored at the beginning and end of this text, and before or after commas. Space characters in other locations are not ignored.

Return Type String

Default Not Applicable

Examples See External Testset Program

C++ Syntax

```cpp
HRESULT get_OutputPorts(long channelNum, BSTR *outPorts);
HRESULT put_OutputPorts(long channelNum, BSTR outPorts);
```

Interface ITestsetControl
OutputRangeMode Property

**Description**
Sets or returns the Output sweep mode.

If you are changing several mixer configuration settings, you can make all the changes first and then issue the Calculate and Apply commands as you would do from the user interface.

**Note:** There is also a OutputRangeMode Property on the Converter Object.

**VB Syntax**

```vbnet
obj.OutputRangeMode = value
```

**Variable**

<table>
<thead>
<tr>
<th>(Type)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>obj</td>
<td>A Mixer Interface pointer to the Measurement (object)</td>
</tr>
<tr>
<td>value</td>
<td>(Enum as MixerRangeMode) - Output sweep mode. Choose from:</td>
</tr>
</tbody>
</table>

0 - mixSwept

1 - mixFixed

**Return Type**
Enum

**Default**
0 - mixSwept

**Examples**

```vbnet
mixer.OutputRangeMode = mixSwept
```

**C++ Syntax**

```c++
HRESULT get_OutputRangeMode(long *pVal)

HRESULT put_OutputRangeMode(long newVal)
```

**Interface**
IMixer6
## OutputRangeMode Property

**Description**
Sets or returns the Output sweep mode.

If you are changing several mixer configuration settings, you can make all the changes first and then issue the *Calculate* and *Apply* commands as you would do from the user interface.

**Note:** There is also a `OutputRangeMode` Property on the Mixer Interface.

### VB Syntax

```vbnet
obj.OutputRangeMode = value
```

### Variable

**Type** - Description

| obj | A Converter Object |

<table>
<thead>
<tr>
<th>value</th>
<th>(Enum as NARangeMode) - Output sweep mode. Choose from:</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td><code>naSwept</code></td>
</tr>
<tr>
<td>1</td>
<td><code>naFixed</code></td>
</tr>
</tbody>
</table>

### Return Type

Enum

### Default

0 - `naSwept`

### Examples

```vbnet
conv.OutputRangeMode = naSwept
```

### C++ Syntax

```cpp
HRESULT get_OutputRangeMode(long *pVal)

HRESULT put_OutputRangeMode(long newVal)
```

### Interface

IConverter
### OutputSideband Property

**Description**  Specify whether to select the sum (High) or difference (Low) products.

- When one LO is used: Input (+ or -) LO1 = Output frequency.
- When two LO's are used: IF (+ or -) LO2 = Output frequency. See Also: **IFSideband Property**

If you are changing several mixer configuration settings, you can make all the changes first and then issue the **Calculate** and **Apply** commands as you would do from the user interface.

**VB Syntax**  

```
obj.OutputSideband = value
```

**Variable (Type) - Description**

- **obj**  A Converter Object
- **value**  *(enum as ConverterSideBand)*  - Choose from:
  - 0 - or **naLowSide**  Minus (-) on the Mixer setup dialog
  - 1 - or **naHighSide**  Plus (+) on the Mixer setup dialog

**Return Type**  Enum as ConverterSideBand

**Default**  naLowSide

**Examples**  

```
Print converter.OutputSideband 'prints the value of the OutputSideband
```

**C++ Syntax**

```
HRESULT get_OutputSideband(ConverterSideBand *pVal)

HRESULT put_OutputSideband(ConverterSideBand newVal)
```

**Interface**  IConverter
### OutputSideband Property

**Description**
Specify whether to select the sum (High) or difference (Low) products.

- When one LO is used: Input + or - LO1 = Output frequency
- When two LOs are used: IF1 + or - LO2 = Output frequency

Use **IFSideband_Property** when two LOs are used to determine the IF1 frequency.

If you are changing several mixer configuration settings, you can make all the changes first and then issue the **Calculate** and **Apply** commands as you would do from the user interface.

**Note:** There is also an **OutputSideband_Property** on the Converter Object.

**VB Syntax**

```
mixer.OutputSideband = value
```

**Variable** *(Type) - Description*

- **mixer** A **Mixer** *(object)*
- **value** *(FCASideBand)* -

Choose from:

- **0 - LOW**  Minus (-) on the Mixer setup dialog
- **1 - HIGH**  Plus (+) on the Mixer setup dialog

**Return Type**
Enum as FCASideBand

**Default**
LOW

**Examples**

```
Print mixer.OutputSideband  'prints the value of the OutputSideband
```

**C++ Syntax**

```
HRESULT get_OutputSideband(FCASideBand *pVal)
HRESULT put_OutputSideband(FCASideBand newVal)
```

**Interface**
IMixer
## OutputStartFrequency Property

### Description
Sets or returns the mixer output start frequency.

If you are changing several mixer configuration settings, you can make all the changes first and then issue the Calculate and Apply commands as you would do from the user interface.

### VB Syntax
```vbnet
obj.OutputStartFrequency = value
```

### Variable (Type) - Description
- **obj**: A Mixer Interface pointer to the Measurement (object)
  
  Or

  A Converter Object

- **value**: (double) - Output Start Frequency in Hertz.

### Return Type
Double

### Default
Not Applicable

### Examples
```vbnet
Print mixer.OutputStartFrequency 'prints the value of the OutputStartFrequency
```

### C++ Syntax
```cpp
HRESULT get_OutputStartFrequency(double *pVal)

HRESULT put_OutputStartFrequency(double newVal)
```

### Interface
- IMixer
- IConverter
OutputStopFrequency Property

Description
Sets or returns the mixer Output Stop frequency.

If you are changing several mixer configuration settings, you can make all the changes first and then issue the Calculate and Apply commands as you would do from the user interface.

VB Syntax
obj.OutputStopFrequency = value

Variable
(obj) - Description

obj
A Mixer Interface pointer to the Measurement (object)

Or

A Converter Object

value (double) - Output stop frequency in Hertz.

Return Type
Double

Default
Not Applicable

Examples
Print mixer.OutputStopFrequency 'prints the value of the OutputStopFrequency

C++ Syntax
HRESULT get_OutputStopFrequency(double *pVal)

HRESULT put_OutputStopFrequency(double newVal)

Interface
IMixer
IConverter
## Parameter Property

</table>
**Parent Property**

**Description**
Returns a handle to the parent object of the collection object being referred to in the statement. The parent property allows the user to traverse from an object back up the object hierarchy.

**VB Syntax**
```
collection.Parent
```

**Variable**
(Variable) - Description
- `collection`

**Return Type**
Object

**Default**
Not Applicable

**Examples**
```
parentobj = chans.Parent 'returns a handle to the parent object (Application) of the chans collection. -Read
```

**C++ Syntax**
```
HRESULT get_Parent(IApplication* *pApplication); //IChannels, IChannel, IMeasurements, INAWindows, and IExternalDevices
```
<table>

PassFailLogic Property

**Description**
Sets and reads the logic of the PassFail line on the HANDLER IO connector (pin 33). Learn more about Global Pass/Fail.

*Note:* This line is connected to both the Handler IO and Aux IO in the VNA. Therefore, this command will affect both of these connectors in the same way.

**VB Syntax**

```
object.PassFailLogic = value
```

**Variable** *(Type) - Description*

- **object** *(object)* - An Aux I/O or Handler I/O object
- **value** *(enum as NARearPanelIOLogic)* Choose from:

  0 - **naPositiveLogic** - Causes the PassFail line to have positive logic (high = pass, low = fail).

  1 - **naNegativeLogic** - Causes the PassFail line to have negative logic (high = fail, low = pass).

**Return Type**
Long Integer

**Default**
aPositiveLogic

**Examples**

```vbscript
aux.PassFailLogic = naNegativeLogic 'Write
Text1.Text = aux.PassFailLogic 'Read
```

**C++ Syntax**

```
HRESULT put_PassFailLogic ( tagNARearPanelIOLogic Mode );
HRESULT get_PassFailLogic ( tagNARearPanelIOLogic* Mode );
```

**Interface**

IHWAuxIO

IHWMaterialHandlerIO
**PassFailMode Property**

**Description**
Sets and reads the mode of the PassFail line on the HANDLER IO connector (pin 33). Learn more about Global Pass/Fail.

**VB Syntax**
```vbnet
object.PassFailMode = value
```

**Variable**
- **object** - An Aux I/O or Handler I/O object
- **value** - (enum as NAPassFailMode). Choose from:
  - **0 - naDefaultPassNoWaitMode** - the line stays in PASS state. When a device fails, then the line goes to fail IMMEDIATELY.
  - **1 - naDefaultPassWaitMode** - the line stays in PASS state. When a device fails, then the line goes to fail after the Sweep End line is asserted.
  - **2 - naDefaultFailWaitMode** - the line stays in FAIL state. When a device passes, then the line goes to PASS state after the Sweep End line is asserted.

**Return Type**
Long Integer

**Default**
0 - naDefaultPassNoWaitMode

**Examples**
```vbnet
HWAuxIO.PassFailMode = naDefaultPassNoWaitMode 'Write
mode = HWAuxIO.PassFailMode 'Read
```

**C++ Syntax**
```cpp
HRESULT put_PassFailMode ( tagNAPassFailMode Mode );
HRESULT get_PassFailMode ( tagNAPassFailMode* Mode );
```

**Interface**
IHWAuxIO
IHWMaterialHandlerIO
**PassFailPolicy Property**

<table>
<thead>
<tr>
<th>Description</th>
<th>Sets the policy used to determine how global pass/fail is computed. Learn more about Global Pass/Fail.</th>
</tr>
</thead>
<tbody>
<tr>
<td>VB Syntax</td>
<td><code>object.PassFailPolicy = value</code></td>
</tr>
<tr>
<td>Variable</td>
<td><strong>(Type)</strong> - Description</td>
</tr>
<tr>
<td></td>
<td><strong>object</strong> - An Aux I/O or Handler I/O object</td>
</tr>
<tr>
<td></td>
<td><strong>value</strong> - (enum as NAPassFailPolicy) Choose from:</td>
</tr>
<tr>
<td></td>
<td>0 - <strong>naPolicyAllTests</strong> - Pass/Fail Status returns PASS if all tests on all measurements pass.</td>
</tr>
<tr>
<td></td>
<td>1 - <strong>naPolicyAllMeas</strong> - Pass/Fail Status returns PASS if all measurements have associated tests, and all tests pass. FAIL is returned if even one measurement has no associated limit test. Only those measurements which are not in HOLD mode contribute to the pass/fail result.</td>
</tr>
<tr>
<td>Return Type</td>
<td>Long Integer</td>
</tr>
<tr>
<td>Default</td>
<td>naPolicyAllTests</td>
</tr>
<tr>
<td>Examples</td>
<td><code>matHndler.PassFailPolicy = naPolicyAllTests</code></td>
</tr>
<tr>
<td></td>
<td><code>policy = aux.PassFailPolicy</code></td>

<tr>
<td></td>
<td>IHWMaterialHandlerIO2</td>
</tr>
</tbody>
</table>
PassFailScope Property

Description
Sets and reads the Scope of the PassFail line on the HANDLER IO connector (pin 33). Learn more about Global Pass/Fail.

VB Syntax
object.PassFailScope = value

Variable
(object) - An Aux I/O or Handler IO object
(value) - Choose from:

0 - naChannelScope - The PassFail line returns to its default state before sweeps on the next channel start. (A channel measurement may require several sweeps.)

1 - naGlobalScope - The PassFail line returns to its default state before the sweeps for the next triggerable channel start.

The default state of the PassFail line before a measurement occurs and after a failure occurs is set by the PassFailMode property.

Return Type
enum NAPassFailScope

Default
1 - naGlobalScope

Examples
HWAuxIO.PassFailScope = naGlobalScope 'Write
scope = HWAuxIO.PassFailScope 'Read

C++ Syntax
HRESULT put_PassFailScope ( tagNAPassFailScope Scope );
HRESULT get_PassFailScope ( tagNAPassFailScope* Scope );

Interface
IHWAuxIO
IHWMaterialHandlerIO
Read-Only

PassFailStatus Property

**Description**
Returns the most recent pass/fail status value. Use this command as follows:

1. Set the VNA trigger scope to GLOBAL
2. Set the VNA trigger source to MANUAL or EXTERNAL.
3. Configure and enable Limit Testing
4. Trigger the VNA.
5. Use the *OPC? (with SCPIStringParser object) to determine when the sweep is complete.
6. Use the **PassFailStatus** property to obtain the global pass/fail result.

Learn more about Global Pass/Fail.

**VB Syntax**
```
var = object.PassFailStatus
```

**Variable**
- **Type** - Description
  - **var** (enum as NAPassFailStatus) Variable to store returned status. One of the following will be returned:
    - **0 - naStatusFail** - all measurements not in HOLD mode have been swept, and one or more limit tests failed according to the specified Pass/Fail policy.
    - **1 - naStatusPass** - all measurements not in HOLD mode have been swept, and all associated limit tests have passed.
    - **2 - naStatusNone** - status cannot be determined because measurements are in progress.

- **object** (object) - An Aux I/O or Handler I/O object

**Return Type**
- Long Integer

**Default**
- Not Applicable

**Examples**
```
status = aux.PassFailStatus 'Read
```

**C++ Syntax**
```
HRESULT get_PassFailPolicy ( tagNAPassFailStatus* status);
```

**Interface**
- IHWAuxIO4
- IHWMaterialHandlerIO2

PathCalMethod Property

**Description**

<table>
<thead>
<tr>
<th>Variable</th>
<th>(Type) - Description</th>
<th>Description</th>
</tr>
</thead>
</table>
| guidedCal | GuidedCalibration (object) | **Note:** This command replaces ThruCalMethod.  
(Read-Write) Specifies the calibration method for each port pair. |
| port1 | First port of the pair to be calibrated. | **Note:** Sending this command will overwrite the VNAs SmartCal determinations for the most accurate cal method for your connector settings and Cal Kits. Send this command ONLY if you have a deliberate reason for overwriting the SmartCal logic. You can send the query form of this command to learn the cal method determined by SmartCal. |
| port2 | Second port of the pair to be calibrated. | |
| "caltype1[,caltype2]" | (String) Cal types for 1st and 2nd ports of the pair, enclosed in a single pair of quotes. NOT case-sensitive. | See Thru Pairs Sequence to learn how to send this and other Thru commands. |

After sending this command, send the query form to be sure that the command was accepted. If not, then the chosen Cal method is not compatible with the specified Thru method. For example, if the specified Thru method is Unknown Thru, an attempt to set Enhanced Response Cal should be rejected.

See an example of a 4-port guided calibration using COM.

**VB Syntax**

```vbnet
guidedCal.PathCalMethod (port1, port2) = "caltype1[,caltype2]"
```

**caltype1** Cal type for the pair if caltype2 is not specified. Otherwise, Cal type for port 1. Choose from:

- “TRL”
- “SOLT”
- “QSOLTN”
- “EnhRespN”

For the last two arguments, replace N with the port to be used as the source port, which MUST be one of the port pair.
Optional argument. Use only when performing an adapter removal cal on the pair. This argument specifies the Cal Type on the second port; caltype1 then specifies the Cal Type of the first port.

Choose from the same arguments as caltype1.

**Return Type**  
**String** - Returns comma-separated cal types.

**Default**  
The most accurate cal method for the current cal.

**Example**

```
guidedCal.PathCalMethod(2,3) = "TRL" 'Write trl for port pair

guidedCal.PathCalMethod(1,4) = "TRL,SOLT" 'Write adapter removal cal, consisting of trl on port 1 and solt on port 4

calmethod = guided.PathCalMethod(1,4) 'Read previous example, returns: "TRL,SOLT"
```

**C++ Syntax**

```cpp
HRESULT get_PathCalMethod(long firstport, long secondport, BSTR *calMethod);

HRESULT put_PathCalMethod(long firstport, long secondport, BSTR calMethod);
```

**Interface**  
IGuidedCalibration3
PathConfigurationElement Property

Description  Allows you to set and return the Path Configuration settings for a Cal All calibration.

VB Syntax  \texttt{calAll.PathConfigurationElement(element).value} = \texttt{setting}

Variable  \begin{itemize}
  \item \texttt{calAll} - A \texttt{CalibrateAllChannels (object)}
  \item \texttt{element} - (String) Path configuration element to be set. \texttt{See a list of configurable RF Path elements.}
\end{itemize}

\textit{Is this also for IF Path configuration elements?}

\texttt{setting} - (String) Path configuration element setting.

Return Type  String

Default  Default settings vary with each element.

Examples  \texttt{calAll.PathConfigurationElement("Port1NoiseTuner").value = "Internal"}

\textquote{returns the PathConfigurationElement setting}

\texttt{value = calAll.PathConfigurationElement("Port1NoiseTuner").value}

C++ Syntax  \texttt{HRESULT put\_PathConfigurationElement(BSTR name, IPathElement** pElement);}

Interface  ICalibrateAllChannels
### PathElement Property

</tr>
</tbody>
</table>
**PathThruMethod Property**

**Description**

**Note:** This command replaces ThruCalMethod.

(Read-Write) Specifies the calibration THRU method for each port pair.

**Note:** Sending this command will overwrite the VNAs SmartCal determination for the thru method. Send this command ONLY if you have a deliberate reason for overwriting the SmartCal logic. You can send the query form of this command to learn the THRU method determined by SmartCal.

See Thru Pairs Sequence to learn how to send this and other Thru commands.

See an example of a 4-port guided calibration using COM.

**VB Syntax**

```
guidedCal.PathThruMethod (port1, port2) = "ThruType1[,ThruType2]"
```

**Variable (Type) - Description**

- `guidedCal` GuidedCalibration (object)
- `port1` First port of the pair to be calibrated.
- `port2` Second port of the pair to be calibrated.
- "ThruType1[,ThruType2]" (String) Thru methods for 1st and 2nd ports of the pair, enclosed in a single pair of quotes. NOT case-sensitive.

**thruType1** Calibration thru method for the pair if thruType2 is not specified. Otherwise, thru method for port 1.

Choose from:

- **“Defined Thru”** Measures a Thru for which there is a stored definition in the Cal Kit.
- **“Zero Thru”** Measures a Zero length Thru, also known as Flush-Thru.
- **“Undefined Thru”** A thru type for which there is NOT a stored definition in the Cal Kit. Also known as Unknown Thru. Valid ONLY for SOLT cal type.
- **“Undefined Thru using a Defined Thru”** (ECal modules ONLY) Measures the internal Thru as an Unknown Thru.
**ThruType2** (String) Optional argument. Use ONLY when Adapter Removal Cal is specified for the pair using PathCalMethod. When specifying ThruType2, this is the only valid argument: "**Defined Thru, Defined Thru**"

**Return Type**  **String** - Returns comma-separated ThruTypes.

Always returns two parts:

If the second part of the string is empty, adapter removal is NOT being performed.

If the string is "Defined Thru, Defined Thru", adapter removal IS being performed.

**Default** The most accurate THRU method for the current cal.

**Example**

```
guidedCal.PathThruMethod(2,3) = "Zero Thru"  'Write for port pair

guidedCal.PathThruMethod(1,4) = "Defined Thru, Defined Thru"  'Write for adapter removal cal.

calmethod = guided.PathThruMethod(1,4)  'Read previous example, return: "Defined Thru, Defined Thru"
```

**C++ Syntax**

```
HRESULT get_PathThruMethod(long firstport, long secondport, BSTR *thruMethod);

HRESULT put_PathThruMethod(long firstport, long secondport, BSTR thruMethod);
```

**Interface** IGuidedCalibration3
PeakExcursion Property

Description: Sets and reads the peak excursion value for the specified marker. The Excursion value determines what is considered a "peak".

VB Syntax: `mark.PeaekExcursion = value`

Variable (Type) - Description
- `mark`: A Marker (object)
- `value`: (single) - Peak Excursion. Choose any number between -500 and 500

Return Type: Single

Default: 3

Examples:
- `mark.PeakExcursion = 1 'Write`
- `PkExcur = mark.PeakExcursion 'Read`

C++ Syntax:
- `HRESULT get_PeakExcursion(float *pVal)`
- `HRESULT put_PeakExcursion(float newVal)`

Interface: IMarker
## PeakThreshold Property

**Description**
Sets peak threshold for the specified marker. If a peak (using the criteria set with PeakExcursion) is below this reference value, it will not be considered when searching for peaks.

**VB Syntax**
```vbnet
mark.PeerThreshold = value
```

**Variable**
- **Type** - Description
  - `mark` - A Marker (object)
  - `value` - Peak Threshold. Choose any number between -500 and 500

**Return Type**
Single

**Default**
-100db

**Examples**
```vbnet
mark.PeakThreshold = 1 'Write
PkThresh = mark.PeakThreshold 'Read
```

**C++ Syntax**
```cpp
HRESULT get_PeakThreshold(float *pVal)
HRESULT put_PeakThreshold(float newVal)
```

**Interface**
IMarker
### PeakToPeak Property

<td>IMeasurement</td>
</tr>
</tbody>
</table>
Percent Property

Description Sets group delay aperture using a percent of the channel frequency span.

VB Syntax `gdAperture.Percent = value`

Variable (Type) - Description

`gdAperture` A `GroupDelayAperture` (object)

`value` (Double) Percent of frequency span to use for the aperture setting. Choose between the equivalent of 2 points and 100 percent of the channel frequency span.

Return Type Double

Default Percent range that equates to 11 points.

This can be changed to two points with a preference setting.

Examples `gdAperture.Percent = 25` 'Write

`aperture = gdAperture.Percent` 'Read

C++ Syntax

`HRESULT get_Percent(double Percent *pVal)`

`HRESULT put_Percent(double Percent newVal)`

Interface `IGroupDelayAperture`

## PhaseAsFixture Property

**Description**
Sets and reads the state of phase offset as a fixture with True Mode balanced measurements. Learn more about iTMSA phase and power offset.

**VB Syntax**
```vb
balStim.PhaseAsFixture = value
```

**Variable**
- **balStim**: A BalancedStimulus (object)
- **value**: (Boolean) State of phase offset as a fixture.

**Return Type**
Boolean

**Default**
False

**Examples**
- `balStim.PhaseAsFixture = False` 'Write
- `var = balStim.PhaseAsFixture` 'Read

**C++ Syntax**
```cpp
HRESULT get_PhaseAsFixture (VARIANT_BOOL *bVal)

HRESULT put_PhaseAsFixture (VARIANT_BOOL bVal)
```

**Interface**
IBalancedStimulus
## PhaseControlMode Property

<table>
<thead>
<tr>
<th>Description</th>
<th>Write and read the Phase Control mode for the specified port.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>VB Syntax</strong></td>
<td><code>phase.PhaseControlMode(srcPort) = value</code></td>
</tr>
<tr>
<td><strong>Variable</strong></td>
<td>(Type) - Description</td>
</tr>
<tr>
<td><strong>phase</strong></td>
<td>A PhaseControl Object</td>
</tr>
<tr>
<td><strong>srcPort</strong></td>
<td>(Long Integer) Source port for which to make phase control settings.</td>
</tr>
</tbody>
</table>

**Note:** If the source port is defined by a string name, such as an external source, a balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model, then use `chan.getPortNumber` to translate the string into a port number. To learn more see [Remotely Specifying a Source Port](#).

<table>
<thead>
<tr>
<th><strong>value</strong></th>
<th>(Enum as NAPhaseControlMode) Choose from:</th>
</tr>
</thead>
<tbody>
<tr>
<td>0 - <strong>naPhaseControlOff</strong></td>
<td>Do NOT control the phase of <code>&lt;port&gt;</code>.</td>
</tr>
<tr>
<td>1 - <strong>naPhaseControlParameter</strong></td>
<td>Control the phase of <code>&lt;port&gt;</code>.</td>
</tr>
<tr>
<td>2 - <strong>naPhaseControlReference</strong></td>
<td>(READ-only) - reference port for a 'controlled' (parameter) Port.</td>
</tr>
<tr>
<td>3 - <strong>naPhaseControlOpenLoop</strong></td>
<td>Sets a raw phase value for either swept phase or fixed phase, but no receivers are used to control the phase.</td>
</tr>
</tbody>
</table>

| **Return Type** | Enum |
| **Default** | 0 - **naPhaseControlOff** |

**Examples**

```vbnet
phase.PhaseControlMode 1 = naPhaseControlParameter ' Write
value = phase.PhaseControlMode 2' Read
```

**C++ Syntax**

```c++
HRESULT get_PhaseControlMode(long port, enum NAPhaseControlMode* pVal);

HRESULT put_PhaseControlMode(long port, enum NAPhaseControlMode newVal);
```

**Interface**

`IPhaseControl`
# PhaseCorrectionData Property

**Description**
Write and read an array of phase offsets. Each phase offset is summed with each phase point to get new target value. The VNA attempts to set phase for each target value. The number of phase offset values must be the same as the number of data points.

**VB Syntax**
```
phase.PhaseCorrectionData(srcPort) = value
```

**Variable**
- `(Type) - Description`
- `phase` A `PhaseControl` Object
- `srcPort` (Long Integer) Source port for which to make phase control settings.

**Note:** If the source port is defined by a string name, such as an external source, a balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model, then use `chan.getPortNumber` to translate the string into a port number. To learn more see [Remotely Specifying a Source Port](#).

**Value**
(Long values) Phase offset data array.

**Return Type**
Long data array

**Default**
Not Applicable

**Examples**
- `phase.PhaseCorrectionData 1 = 10,11,12`  
  Write 3 phase offset values
- `value = phase.PhaseCorrectionData 2`  
  Read

**C++ Syntax**
```
HRESULT get_PhaseCorrectionData(long port, long* pVals);

HRESULT put_PhaseCorrectionData(long port, long newVals);
```

**Interface**
IPhaseControl
# PhaseCorrectionEnabled Property

**Description**  
Write and read whether to use the phase correction offset array. Use PhaseCorrectionData to write or read the offset data.

**VB Syntax**  
```
phase.PhaseCorrectionEnabled(srcPort) = value
```

**Variable**  
**Type** - Description
- `phase` A `PhaseControl` Object
- `srcPort` (Long Integer) Source port for which to make phase control settings.

**Note:** If the source port is defined by a string name, such as an external source, a balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model, then use `chan.getPortNumber` to translate the string into a port number. To learn more see Remotely Specifying a Source Port

- `value` (Boolean) Phase correction array state.
  - **True** – Apply phase correction offset array.
  - **False** – Do NOT apply phase correction offset array.

**Return Type**  
Boolean

**Default**  
False

**Examples**  
```
phase.PhaseCorrectionEnabled 1 = True ' Write
dis = phase.PhaseCorrectionEnabled 2' Read
```

**C++ Syntax**  
```
HRESULT get_PhaseCorrectionEnabled(long port, VARIANT_BOOL* pVal);

HRESULT put_PhaseCorrectionEnabled(long port, VARIANT_BOOL newVal);
```

**Interface**  
IPhaseControl
### PhaseDisplayMinLevel Property

**Description**
Set and read the phase display minimum level.

**VB Syntax**
```
sa.coherence.PhaseDisplayMinLevel = value
```

**Variable**

- `sa.coherence` (Type) - Description
  - A `SpectrumAnalyzerCoherence` object
- `value` (Double) - Phase display minimum level (in dBm).

**Return Type**
Double

**Default**
-50 dBm

**Examples**
```
sa.coherence.PhaseDisplayMinLevel = -50 dBm  'Write
value = sa.coherence.PhaseDisplayMinLevel  'Read
```

**C++ Syntax**
```
HRESULT put_PhaseDisplayMinLevel(double level);
HRESULT get_PhaseDisplayMinLevel(double* levell);
```

**Interface**
ICoherenceSA2
### PhaselIterationNumber Property

**Description**
Write and read the maximum number of background phase sweeps to perform.

**VB Syntax**

```vbnet
phase.PhaseIterationNumber(srcPort) = value
```

**Variable**

<table>
<thead>
<tr>
<th>(Type)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>phase</td>
<td>A PhaseControl Object</td>
</tr>
<tr>
<td>srcPort</td>
<td>(Long Integer) Source port for which to make phase control settings.</td>
</tr>
</tbody>
</table>

**Note:** If the source port is defined by a string name, such as an external source, a balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model, then use `chan.getPortNumber` to translate the string into a port number. To learn more see [Remotely Specifying a Source Port](#).

<table>
<thead>
<tr>
<th>(Type)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>value</td>
<td>(Double) Number of background sweep iterations. Choose a value between 1 and 25.</td>
</tr>
</tbody>
</table>

**Return Type**
Double

**Default**
5

**Examples**

```vbnet
phase.PhaseIterationNumber 1 = 15 ' Write
value = phase.PhaseIterationNumber 2' Read
```

**C++ Syntax**

```csharp
HRESULT get_PhaseIterationNumber(long port, double* pVal);

HRESULT put_PhaseIterationNumber(long port, double newVal);
```

**Interface**
IPhaseControl
## PhaseParameter Property

**Description**
Write and read the ratioed receivers (parameter) and paired port to use for phase control.

**VB Syntax**

```vbnet
phase.PhaseParameter(srcPort) = value
```

**Variable**

- **phase** (Type) - Description
  A PhaseControl Object

- **srcPort** (Long Integer) Source port for which to make phase control settings.

**Note:** If the source port is defined by a string name, such as an external source, a balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model, then use `chan.getPortNumber` to translate the string into a port number. To learn more see Remotely Specifying a Source Port

- **value** (String) Ratioed parameter. Choose any two VNA physical receivers. Use either standard receiver notation ("R/R3") or logical receiver notation ("a1/a3"). Separate the two receiver names by a forward slash '/'. For example: "a1/a3".

**Return Type**
String

**Default**
"a1/b1"

**Examples**

```vbnet
phase.PhaseParameter 1 = "a1/a3" ' Write
value = phase.PhaseParameter 2' Read
```

**C++ Syntax**

```cpp
HRESULT get_PhaseParameter(long port, BSTR* pVal);

HRESULT put_PhaseParameter(long port, BSTR newVal);
```

**Interface**
IPhaseControl
## PhaseParameterModes Property

**Description**
Returns the available phase control modes for the specified port. Use `PhaseControlMode` to set the Phase Control mode.

**VB Syntax**

```vbnet
phase.PhaseParameterModes(srcPort) = value
```

<table>
<thead>
<tr>
<th>Variable</th>
<th>(Type) - Description</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td><code>phase</code></td>
<td>A <code>PhaseControl</code> Object</td>
<td></td>
</tr>
<tr>
<td><code>srcPort</code></td>
<td>(Long Integer) Source port for which to make phase control settings.</td>
<td></td>
</tr>
</tbody>
</table>

**Note:** If the source port is defined by a string name, such as an external source, a balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model, then use `chan.getPortNumber` to translate the string into a port number.

To learn more see [Remotely Specifying a Source Port](#).

<table>
<thead>
<tr>
<th><code>value</code></th>
<th>(String) Choose from:</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Off&quot;</td>
<td>- Turn phase control OFF</td>
<td></td>
</tr>
<tr>
<td>&quot;Openloop&quot;</td>
<td>- Sets a raw phase value for either swept phase or fixed phase, but no receivers are used to control the phase.</td>
<td></td>
</tr>
<tr>
<td>&quot;Parameter&quot;</td>
<td>- Sets and controls the phase of the signal at &lt;port&gt;.</td>
<td></td>
</tr>
<tr>
<td>&quot;Reference&quot;</td>
<td>- Reference port for a controlled (parameter) port. Use <code>PhaseReferencePort</code> to set the reference port.</td>
<td></td>
</tr>
</tbody>
</table>

**Return Type** String

**Default** "Off"

**Example**

```vbnet
value = phase.PhaseParameterModes 2' Read
```

**C++ Syntax**

```c
HRESULT get_PhaseParameterModes(long port, BSTR* pVal);
```

**Interface** IPhaseControl
# PhaseProcessState Property

<table>
<thead>
<tr>
<th>Description</th>
<th>Enables/disables phase computing.</th>

<td>(String) Phase Reference ID name.</td>
</tr>
<tr>
<td><strong>Return Type</strong></td>
<td>String</td>
</tr>
<tr>
<td><strong>Default</strong></td>
<td>Not Applicable</td>
</tr>
</tbody>
</table>

**Examples**  
```
phase.PhaseReference = "MYPRT0001"
```

**See example program**

**C++ Syntax**  
```
HRESULT get_PhaseReference(BSTR PhaseReference* pVals);
HRESULT put_PhaseReference(BSTR PhaseReference newVals);
```  

**Interface**  
`IPhaseReferenceCalibration`
### PhaseReferencePort Property

</tbody>
</table>
## PhaseSwpAsFixture Property

**Description**
Sets and reads the state of phase offset as a fixture with True Mode balanced measurements.

**VB Syntax**
`balStim.PhaseAsFixture = value`

**Variable**
- **Type**: Description
- **balStim**: A BalancedStimulus (object)
- **value**: (Boolean) State of phase offset as a fixture.

**False**  Offset is applied but is NOT included as a fixture in the output calculations.

**True**  Offset is applied and included as a fixture in the output calculations.

**Return Type**
Boolean

**Default**
False

**Examples**
- `balStim.PhaseAsFixture = False`  'Write
- `var = balStim.PhaseAsFixture`  'Read

**C++ Syntax**
- HRESULT get_PhaseAsFixture (VARIANT_BOOL *bVal)
- HRESULT put_PhaseAsFixture (VARIANT_BOOL bVal)

**Interface**
IBalancedStimulus2
### PhaseSweepPoints Property

**Description**  
Set and read the number of phase points. For the tuning tone at the output, a phase sweep is done for each point.

**VB Syntax**  
```vbnet
HotS22.PhaseSweepPoints = value
```

**Variable**  
*Type* - Description  

| HotS22 | A `ActiveParametersApp` *(object)* |

| value | *(Long)* - Number of phase points. Do not exceed the max number of phase points (50). |

**Return Type**  
Long

**Default**  
8

**Examples**  
```vbnet
HotS22.PhaseSweepPoints = 201  'Write
value = HotS22.PhaseSweepPoints  'Read
```

**C++ Syntax**  
```c++
HRESULT get_PhaseSweepPoints(long* value)

HRESULT put_PhaseSweepPoints(long value)
```

**Interface**  
IActiveChannelSettings
### PhaseSwpState Property

**Description**
Sets and reads the state of phase sweep. **Sweep type** must be set to CWTime.

**VB Syntax**
```
balStim.PhaseSwpState = value
```

**Variable (Type) - Description**
- **balStim**
  A BalancedStimulus (object)
- **value**
  (Boolean) State of phase sweep.

  - **False**  Phase sweep disabled.
  - **True**  Phase sweep enabled.

**Return Type**
Boolean

**Default**
False

**Examples**
```vbnet
balStim.PhaseSwpState = False 'Write
var = balStim.PhaseSwpState 'Read
```

**C++ Syntax**
```
HRESULT get_PhaseSwpState (VARIANT_BOOL *bVal)
```
```
HRESULT put_PhaseSwpState (VARIANT_BOOL bVal)
```

**Interface**
IBalancedStimulus2
# PhaseTolerance Property

**Description**
Write and read the tolerance value to be used for background phase sweeps.

**VB Syntax**
```vbnet
phase.PhaseTolerance(srcPort) = value
```

**Variable**
- *(Type)* - Description
- **phase**
  A *PhaseControl* Object
- **srcPort**
  (Long Integer) Source port for which to make phase control settings.

**Note:** If the source port is defined by a string name, such as an external source, a balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model, then use `chan.getPortNumber` to translate the string into a port number. To learn more see Remotely Specifying a Source Port

**value**
(Double) Tolerance for background sweeps in degrees. Choose a value between 1 and 5.

**Return Type**
Double

**Default**
5 degrees

**Examples**
```vbnet
phase.PhaseTolerance 1 = 3 ' Write
value = phase.PhaseTolerance 2' Read
```

**C++ Syntax**
```c++
HRESULT get_PhaseTolerance(long port, double* pVal);
HRESULT put_PhaseTolerance(long port, double newVal);
```

**Interface**
IPhaseControl
## Pin Property

| Description | Returns the Pin result of a PNOP or PSAT marker search.  
|             | PNOP In = Marker 4 X-axis value  
|             | PSAT In = Marker 2 X-axis value  
| VB Syntax   | \( pIn = pMark.Pin \)  
| Variable    | (Type) - Description  
| \( pIn \)   | (double) - Variable to store returned value  
| \( pMark \) | A PNOP (object) or PSaturation (object)  
| Return Type | Double  
| Default     | Not applicable  
| Examples    | \( pIn = pMark.Pin \)  

See example program  

### C++ Syntax

```
HRESULT get_Pin(double* pNewVal)
```

### Interface

IPNOP or IPSaturation
### PinOffset Property

**Description**

Sets and returns the PinOffset value used to calculate various PNOP parameters.

Also set **BackOff Property**.

A sweep must be executed (single or continuous) and **SearchPowerNormalOperatingPoint Method** must be sent before reading marker results.

To turn off the PNOP markers, either turn them off individually or **DeleteAllMarkers**.

To search a **User Range** with the PNOP search, first activate marker 1. The user range used with the PNOP search only applies to marker 1 searching for the linear gain value. The other markers may fall outside the user range.

**VB Syntax**

```vbnet
pnop.PinOffset = value
```

**Variable**

*(Type) - Description*

<table>
<thead>
<tr>
<th>Variable</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>pnop</code></td>
<td>A PNOP (object)</td>
<td></td>
</tr>
<tr>
<td><code>value</code></td>
<td>(double)</td>
<td>PinOffset value in dB. Choose any number between:-500 and 500</td>
</tr>
</tbody>
</table>

**Return Type**

Double

**Default**

0 dB

**Examples**

```vbnet
pinOffs = pnop.PinOffset 'Read
```

See example program

**C++ Syntax**

```cpp
HRESULT put_PinOffset(double newVal);

HRESULT get_PinOffset(double* pNewVal)
```

**Interface**

IPNOP
**PMaxBackOff Property**

**Description**
Sets and returns the backoff value used to calculate various PSAT parameters.

A sweep must be executed (single or continuous) and `SearchPowerSaturation Method` must be sent before reading marker results.

To turn off the PSAT markers, either turn them off individually or `DeleteAllMarkers`.

To search a User Range with the PSAT search, first activate marker 1. The user range used with the PNOP search only applies to marker 1 searching for the linear gain value. The other markers may fall outside the user range.

**VB Syntax**

```vbnet
pSat.PMaxBackOff = value
```

**Variable (Type) - Description**

- `pSat` A `PSaturation (object)`
- `value` (double) - Backoff value in dB. Choose any number between -500 and 500

**Return Type**
Double

**Default**
0 dB

**Examples**

```vbnet
backoff = pSat.PMaxBackOff 'Read
```

See example program

**C++ Syntax**

```c++
HRESULT put_PMaxBackOff(double newVal);

HRESULT get_PMaxBackOff(double* pNewVal)
```

**Interface**
`IPSaturation`
# PMaxIn Property

<table>
<thead>
<tr>
<th>Description</th>
<th>Returns the PMaxIn result of a PNOP and PSAT marker search.</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMax In</td>
<td>Marker 3 X-axis value</td>
</tr>
</tbody>
</table>

## VB Syntax

```vb
pMaxIn = pMark.PMaxIn
```

## Variable

- **Type**: (double)
- **Description**: Variable to store returned value
- **pMaxIn**: A PNOP (object) or PSaturation (object)

## Return Type

Double

## Default

Not applicable

## Examples

```vb
pMaxIn = pMark.PMaxIn 'Read
```

See example program

## C++ Syntax

```cpp
HRESULT get_PMaxIn(double* pNewVal)
```

## Interface

IPNOP or IPSAT
### PMaxOut Property

**Description**

Returns the PMaxOut result of the PNOP and PSAT marker search.

\[ \text{PMaxOut} = \text{Marker 3 Y-axis value} \]

**VB Syntax**

\[ pMaxOut = pMark.PMaxOut \]

**Variable**

- **Type**: (double)
- Description: Variable to store returned value

- **pMark**: A PNOP (object) or PSaturation (object)

**Return Type**

Double

**Default**

Not applicable

**Examples**

```
pMaxOut = pMark.PMaxOut 'Read
```

See example program

**C++ Syntax**

```
HRESULT get_PMaxOut(double* pNewVal)
```

**Interface**

IPNOP or IPSaturation
## PointAveragingState Property

### Description
Turns point averaging ON or OFF for all measurements on the channel.

### VB Syntax
```vbnet
chan.PointAveragingState = state
```

### Variable
- **Type** - Description
  - **chan** A Channel (object)
  - **state** (Enun)

#### False
- Turns point averaging OFF

#### True
- Turns point averaging ON

### Return Type
Boolean

### Default
False

### Examples
```vbnet
chan.PointAveragingState = True 'Write
aver = chan.PointAveragingState 'Read
```

### C++ Syntax
```csharp
HRESULT get_PointAveragingState(BOOL *pVal)
HRESULT put_PointAveragingState(BOOL newVal)
```

### Interface
IChannel16
PointCmd Property

Description
Sets and returns the Point Read Commands for an external DC Meter or Point Set Commands for an external DC Source.

VB Syntax
extDC.PointCmd = value

Variable
extDC An ExternalDCDevice (object)
value (String)

For DC Source, sets the Point Set Commands. Use {\%f} to specify a double value and {\%d} to specify an integer.

For DC Meter, sets the Point Read Commands (for example, meas:volt?).

Return Type String

Default " " Empty String

Examples
extDC.PointCmd = "sour1:volt {%f}" 'Write
value = extDC.PointCmd 'Read

C++ Syntax
HRESULT get_PointCmd(BSTR* cmd)
HRESULT put_PointCmd(BSTR cmd)

Interface IExternalDCDevice3
### PointDwell Property

**Description**
Sets and returns the "Dwell Before/After Point" value for an external DC Device which can be configured as either a DC Meter or a DC Source.

**VB Syntax**
`extDC.PointDwell = value`

**Variable**
*extDC* - An *ExternalDCDevice* (object)

*value* - *(Double)*

For DC Meter, the dwell time (in seconds) before making a data point measurement.

For DC Source, the dwell time (in seconds) after making a data point setting.

**Return Type**
Double

**Default**
3 milliseconds

**Examples**
```
extDC.PointDwell = 10e-3 'Write
dwell = extDC.PointDwell 'Read
```

**C++ Syntax**

```
HRESULT get_PointDwell (double *pValue)
HRESULT put_PointDwell (double newVal)
```

**Interface**
IExternalDCDevice
### Points Property

**Description**
Sets group delay aperture using a fixed number of data points.

**VB Syntax**
```vbnet
gdAperture.Points = value
```

**Variable (Type) - Description**

<table>
<thead>
<tr>
<th>gdAperture</th>
<th>A GroupDelayAperture (object)</th>
</tr>
</thead>
<tbody>
<tr>
<td>value</td>
<td>(Double) Number of data points to use for the aperture setting. Choose between two points and the number of points in the channel.</td>
</tr>
</tbody>
</table>

**Return Type**
Double

**Default**
Points range that equates to 11 points.

This can be changed to two points with a preference setting.

**Examples**
```vbnet
gdAperture.Points = 25 'Write
aperture = gdAperture.Points 'Read
```

**C++ Syntax**
```cpp
HRESULT get_Points(double Points *pVal)  
HRESULT put_Points(double Points newVal)
```

**Interface**
IGroupDelayAperture
## PointSweepState Property

<table>

<tbody>
<tr>
<td><strong>VB Syntax</strong></td>
<td><code>portExt.Port1 = value</code></td>
</tr>
<tr>
<td><strong>Variable</strong></td>
<td><strong>(Type)</strong> - Description</td>
</tr>
<tr>
<td><code>portExt</code></td>
<td>A Port Extension <strong>(object)</strong></td>
</tr>
<tr>
<td><code>value</code></td>
<td><strong>(double)</strong> - Port Extension value in seconds. Choose any number between -10 and 10</td>
</tr>
<tr>
<td><strong>Return Type</strong></td>
<td>Double</td>
</tr>
<tr>
<td><strong>Default</strong></td>
<td>0</td>
</tr>
</tbody>
</table>
| **Examples** | `portExt.Port1 = 10e-6 'Write`  
`prt1 = portExt.Port1  'Read` |
| **C++ Syntax** |  
HRESULT get_Port1(double *pVal)  
HRESULT put_Port1(double newVal) |
| **Interface** | IPortExtension |
**Port2 Property  Superseded**

**Description**  This command is replaced by PortDelay property.

Sets a Port Extension value for Port 2

**VB Syntax**  
`portExt.Port2 = value`

**Variable**  
- `portExt` (Type) - Description
- `value` (double) - Port Extension value in seconds. Choose any number between -10 and 10

**Return Type**  Double

**Default**  0

**Examples**  
- `portExt.Port2 = 10e-6`  'Write
- `prt2 = portExt.Port2`  'Read

**C++ Syntax**  
- `HRESULT get_Port2(double *pVal)`
- `HRESULT put_Port2(double newVal)`

**Interface**  IPortExtension
Port3 Property  **Superseded**

Description  This command is replaced by *PortDelay property.*

Sets a Port Extension value for Port 3

VB Syntax  

```vbnet
portExt.Port3 = value
```

Variable  

<table>
<thead>
<tr>
<th>(Type)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>portExt</td>
<td>A Port Extension <em>(object)</em></td>
</tr>
<tr>
<td>value</td>
<td><em>(double)</em> - Port Extension value in seconds. Choose any number between -10 and 10</td>
</tr>
</tbody>
</table>

Return Type  Double

Default  0

Examples  

```vbnet
portExt.Port3 = 10e-6  'Write
prt3 = portExt.Port3  'Read
```

C++ Syntax  

```c++
HRESULT get_Port3(double *pVal)
HRESULT put_Port3(double newVal)
```

Interface  IPortExtension

Port2PdeembedCktModel Property

Description Select whether or not to load a 2-port De-embedding circuit model for the specified port number. Circuit model is applied when both "USER" is selected and the filename is specified. To set the filename, use strPort2Pdeembed_S2PFile Property

Note: This command affects ALL measurements on the channel.

VB Syntax  
```
fixture.Port2PdeembedCktModel(port) = value
```

Variable (Type) - Description
- `fixture` (A Fixturing (object))
- `port` (Integer) Port number to receive circuit model.
- `value` (Enum as NAFixturing2PdeembedCkt)
  0 `naFix2PD_USER` load a 2-port De-embedding circuit model
  1 `naFix2PD_NONE` no model

Return Type Long Integer

Default `naFix2PD_NONE`

Examples
```
fixture.Port2PdeembedCktModel(2) = naFix2PD_USER  'Write
value = fixture.Port2PdeembedCktModel(1)       'Read
```

C++ Syntax
```
HRESULT get_Port2PdeembedCktModel(short port tagNAfixturing2PdeembedCkt *pVal)
HRESULT put_Port2PdeembedCktModel(short port tagNAfixturing2PdeembedCkt newVal)
```

Interface IFixturing
### Port2PdeembedState Property

PortArbzImag Property

Description
Sets and returns the Imaginary portion of the impedance value for the specified single-ended port. Use PortArbzReal to set the real value. Or use PortArbzZ0 to set both values together.

VB Syntax
```
fixture.PortArbzImag(portNum) = value
```

Variable
(Type) - Description
-fixture (A Fixturing object)
-portNum (Integer) Single-ended port number to receive impedance value.
-value (Double) Real Impedance value. Choose a value between -1E18 and 1E18

Return Type
Double

Default
0

Examples
```
fixture.PortArbzImag(2) = 75 'Write
value = fixture.PortArbzImag(1) 'Read
```

C++ Syntax
```
HRESULT get_PortArbzImag( short portNum, double *pVal)
HRESULT put_PortArbzImag( short portNum, double newVal)
```

Interface
IFixturing3
PortArbzReal Property

Description
Sets and returns the Real portion of the impedance value for the specified single-ended port. Use PortArbzImag to set the imaginary value. Or use PortArbzZ0 to set both values together.

VB Syntax
```vbnet
fixture.PortArbzReal(portNum) = value
```

Variable
- `fixture` (Type) - Description
  - A Fixturing (object)
- `portNum` (Integer) - Single-ended port number to receive impedance value.
- `value` (Double) - Real Impedance value. Choose a value between 0 to 1E7

Return Type
- Double

Default
- 50

Examples
```vbnet
fixture.PortArbzReal(2) = 75 'Write
value = fixture.PortArbzReal(1) 'Read
```

C++ Syntax
```cpp
HRESULT get_PortArbzReal( short portNum, double *pVal)
HRESULT put_PortArbzReal( short portNum, double newVal)
```

Interface
- IFixturing3
### PortArbzState Property

**Description**
Turns Port Impedance ON or OFF for all ports on the channel.

**VB Syntax**
```vbnet
fixture.PortArbzState = value
```

**Variable (Type) - Description**
- **fixture** A Fixturing (object)
- **value** (Boolean)

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>False</td>
<td>Turns Port Impedance OFF</td>
</tr>
<tr>
<td>True</td>
<td>Turns Port Impedance ON</td>
</tr>
</tbody>
</table>

**Return Type**
Boolean

**Default**
False

**Examples**
```vbnet
fixture.PortArbzState = False 'Write
value = fixture.PortArbzState 'Read
```

**C++ Syntax**
- HRESULT get_PortArbzState(VARIANT_BOOL *pVal)
- HRESULT put_PortArbzState(VARIANT_BOOL newVal)

**Interface**
IFixturing
## PortArbzZ0 Property

**Description**
Sets and returns the Real portion of the impedance value for the specified single-ended port. The imaginary portion is automatically set to 0.0.

To set both values separately, use `PortArbzReal` and `PortArbzImag`.

**VB Syntax**

```vbnet
fixture.PortArbzZ0(portNum) = value
```

**Variable (Type) - Description**

<table>
<thead>
<tr>
<th>Variable</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>fixture</td>
<td>A Fixturing</td>
<td>(object)</td>
</tr>
<tr>
<td>portNum</td>
<td>(Integer)</td>
<td>Single-ended port number to receive impedance value.</td>
</tr>
<tr>
<td>value</td>
<td>(Double)</td>
<td>Impedance value. Choose a value between 0 to 1E7.</td>
</tr>
</tbody>
</table>

**Return Type**
Double

**Default**
50

**Examples**

```vbnet
fixture.PortArbzZ0(2) = 75 'Write
value = fixture.PortArbzZ0(1) 'Read
```

**C++ Syntax**

```csharp
HRESULT get_PortArbzZ0( short portNum, double *pVal)
HRESULT put_PortArbzZ0( short portNum, double newVal)
```

**Interface**
IFixturing3
### PortCatalog Property

<table>
<thead>
<tr>
<th>Description</th>
<th>Returns a comma-separated list of the Output port selections that are available for a given logical input port. Read the number of input ports for the test set using <code>NumberOfPorts</code> Property.</th>
</tr>
</thead>
<tbody>
<tr>
<td>VB Syntax</td>
<td><code>value = tset.PortCatalog(logPort)</code></td>
</tr>
<tr>
<td>Variable</td>
<td><strong>(Type)</strong> - Description</td>
</tr>
<tr>
<td><code>value</code></td>
<td>(String) Variable to store the returned information.</td>
</tr>
<tr>
<td><code>tset</code></td>
<td>A <code>TestsetControl</code> object.</td>
</tr>
<tr>
<td><code>logPort</code></td>
<td>(Long) Logical Input port number for which to return valid output ports.</td>
</tr>
<tr>
<td>Return Type</td>
<td><strong>String</strong></td>
</tr>
<tr>
<td>Default</td>
<td>Not Applicable</td>
</tr>
<tr>
<td>Examples</td>
<td><code>value = testset1.PortCatalog 2</code></td>
</tr>
<tr>
<td>C++ Syntax</td>
<td><code>HRESULT get_PortCatalog(long inputPort, BSTR *outPort);</code></td>
</tr>
<tr>
<td>Interface</td>
<td><code>ITestsetControl</code></td>
</tr>
</tbody>
</table>
# PortCLogic Property

Sets and reads the logic mode of Port C on the Handler IO connector.

## VB Syntax

```vbnet
AuxIO.PortCLogic = value
```

## Variable

<table>
<thead>
<tr>
<th>Description</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>AuxIO (object) - A Hardware Aux I/O object</td>
<td>value (Enum as NaRearPanelIOLogic) - Choose from:</td>
</tr>
<tr>
<td>0 - <code>naPositiveLogic</code> - The associated data line goes <strong>HIGH</strong> when writing a 1 to a PortC bit.</td>
<td>1 - <code>naNegativeLogic</code> - The associated data line goes <strong>LOW</strong> when writing a 1 to a PortC bit.</td>
</tr>
</tbody>
</table>

When Port C is in Output/Write mode, a change in logic causes the output lines to change state immediately. For example, Low levels change to High levels.

When Port C is in Input/Read mode, a change in logic will not cause the lines to change, but data read from Port C will reflect the change in logic.

## Return Type

Enum

## Default

1 - `naNegativeLogic`

## Examples

```vbnet
auxIO.PortCLogic = value 'Write
value = auxIo.PortCLogic 'Read
```

## C++ Syntax

```c++
HRESULT put_PortCLogic ( tagNARearPanelIOLogic Mode );
HRESULT get_PortCLogic ( tagNARearPanelIOLogic* Mode );
```

## Interface

IHWAuxIO
## PortCMode Property

<table>
<thead>
<tr>
<th>Description</th>
<th>Sets and reads whether Port C is setup for writing or reading data on the Handler IO connector.</th>

<tr>
<td><strong>Interface</strong></td>
<td>IHWAuxIO</td>
</tr>
</tbody>
</table>
## PortCoupleToSystemMedia Property

**Description**  
Sets and returns the state of coupling with the system Media type.

**VB Syntax**  
`fixture.PortCoupleToSystemMedia (port) = value`

**Variable** *(Type)* - Description  
- `fixture` A Fixturing Object  
- `value` (Boolean) Coupling state. Choose from:
  - **True** - Media type is coupled with the system setting.  
  - **False** - Media type is NOT coupled with the system setting.

**Return Type** Boolean

**Default** True

**Examples**
```vbnet
fixture.PortCoupleToSystemMedia = True
bool = fixture.PortCoupleToSystemMedia
```

**C++ Syntax**
```c
HRESULT get_PortCoupleToSystemMedia(VARIANT_BOOL *pVal);
HRESULT put_PortCoupleToSystemMedia(VARIANT_BOOL newVal);
```

**Interface** IFixturing4
### PortCoupleToSystemVelocity Property

Sets and returns the state of coupling with the system Velocity Factor.

**VB Syntax**

```vbnet
fixture.PortCoupleToSystemVelocity(port)= value
```

**Variable**

- **Type** - Description
- **fixture** A Fixturing Object
- **port** (Integer) Port Number that will receive the coupling change.
- **value** (Boolean) Coupling state. Choose from:
  - **True** - Velocity Factor is coupled with the system setting.
  - **False** - Velocity Factor is NOT coupled with the system setting.

**Return Type**

Boolean

**Default**

True

**Examples**

```vbnet
fixture.PortCoupleToSystemVelocity(2)= True
bool = fixture.PortCoupleToSystemVelocity(1)
```

**C++ Syntax**

```cpp
HRESULT get_PortCoupleToSystemVelocity(short portNum, VARIANT_BOOL *pVal);

HRESULT put_PortCoupleToSystemVelocity(short portNum, VARIANT_BOOL newValue);
```

**Interface**

IFixturing4
PortDelay Property

Description
Sets and returns the Port Extensions Delay value for the specified port number.

*Note:* This command affects ALL measurements on the channel.

This command replaces Port 1 Port 2 Port_3 Properties.

VB Syntax

```
fixture.PortDelay(port) = value
```

Variable (Type) - Description
- `fixture` A Fixturing (object)
- `port` (Integer) Port number to receive delay value.
- `value` (Double) Delay value in seconds. Choose a value between -1E18 and 1E18.

Return Type
Double

Default
0

Examples

```
fixture.PortDelay(2) = .002 'Write
value = fixture.PortDelay(1) 'Read
```

C++ Syntax

```
HRESULT get_PortDelay(short port double *pVal)
HRESULT put_PortDelay(short port double newVal)
```

Interface
IFixturing
PortDescription Property

Description  For each port of the ECal module that is going to be characterized, sets and reads the description of the adapters, cable, or fixture to be included in the user characterization. This description is stored with the characterization in the ECal module.

Set this description before sending Initialize or the default (empty string) will be used.

VB Syntax  

```
userChar.PortDescription (port)= value
```

Variable  (Type) - Description

- **userChar**: An ECalUserCharacterizer Object
- **port**: (Enum) ECal port for which description is to be set. Choose from:
  - 1 or naECalPort_A
  - 2 or naECalPort_B
  - 3 or naECalPort_C
  - 4 or naECalPort_D

- **value**: (String) Descriptive text, limited to 24 characters maximum.

Return Type  String

Default  "" (Empty String)

Examples  

```vbnet
userChar.PortDescription (naECalPort_C)= "3.5 mm adapter, SN 00001"
```

C++ Syntax  HRESULT get_PortDescription(NAECalPort port, *BSTR description);

HRRESULT put_PortDescription(NAECalPort port, BSTR description);

Interface  IECalUserCharacterizer
## PortDistance Property

<table>

### PortExtState Property

**Description**
Turns Port Extension ON or OFF for all ports on the channel.

**VB Syntax**
`fixture.PortExtState = value`

**Variable**
- **(Type)** - Description
- **fixture** - A Fixturing (object)
- **value** - (Boolean)

**Examples**
- `fixture.PortExtState = 0`  
  `value = fixture.PortExtState`

**Return Type**
Boolean

**Default**
False

**C++ Syntax**
- `HRESULT get_PortExtState(VARIANT_BOOL *pVal)`
- `HRESULT put_PortExtState(VARIANT_BOOL newVal)`

**Interface**
IFixturing
PortExtUse1 Property

Description
Sets and returns the Use1 ON/OFF state for the use of the PortLoss1 and PortFreq1 values for the specified port number.

**Note:** This command affects ALL measurements on the channel.

VB Syntax

```vbnet
fixture.PortExtUse1(port) = value
```

Variable

<table>
<thead>
<tr>
<th>(Type)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>fixture</td>
<td>A Fixturing (object)</td>
</tr>
<tr>
<td>port</td>
<td>(Integer)  Port number to receive Use1 ON / OFF state.</td>
</tr>
<tr>
<td>value</td>
<td>(Boolean)</td>
</tr>
</tbody>
</table>

- False - Turns Use1 OFF
- True - Turns Use1 ON

Return Type

Boolean

Default

False

Examples

```vbnet
fixture.PortExtUse1(2) = False 'Write
value = fixture.PortExtUse1(1) 'Read
```

C++ Syntax

```c
HRESULT get_PortExtUse1(short port VARIANT_BOOL *pVal)
HRESULT put_PortExtUse1(short port VARIANT_BOOL newVal)
```

Interface

IFixturing
PortExtUse2 Property

**Description**
Sets and returns the Use2 ON/OFF state for the use of the PortLoss2 and PortFreq2 values for the specified port number.

**Note:** This command affects ALL measurements on the channel.

**VB Syntax**
```vbnet
fixture.PortExtUse2(port) = value
```

**Variable (Type) - Description**
- `fixture`  A Fixturing (object)
- `port`  (Integer) Port number to receive Use2 ON / OFF state.
- `value`  (Boolean)
  - False - Turns Use1 OFF
  - True - Turns Use1 ON

**Return Type**
Boolean

**Default**
False

**Examples**
```vbnet
fixture.PortExtUse2(2) = False 'Write
value = fixture.PortExtUse2(1) 'Read
```

**C++ Syntax**
```csharp
HRESULT get_PortExtUse2(short port VARIANT_BOOL *pVal)
HRESULT put_PortExtUse2(short port VARIANT_BOOL newVal)
```

**Interface**
IFixturing
PortFreq1 Property

Description
Sets and returns Frequency1 value for the specified port number.

**Note:** This command affects ALL measurements on the channel.

VB Syntax

```
fixture.PortFreq1(port) = value
```

Variable

- **fixture** (Type) - Description
  A Fixturing (object)
- **port** (Integer) - Port number to receive extrapolated loss.
- **value** (Double) - Frequency1 value. Choose a frequency within the frequency span of the VNA.

Return Type

Double

Default

1 GHz

Examples

```
fixture.PortFreq1(2) = naFix2PD_USER 'Write
value = fixture.PortFreq1(1) 'Read
```

C++ Syntax

```
HRESULT get_PortFreq1(short port double *pVal)
HRESULT put_PortFreq1(short port double newVal)
```

Interface

IFixturing
PortFreq2 Property

**Description**  
Sets and returns Frequency2 value for the specified port number.

**Note:** This command affects ALL measurements on the channel.

**VB Syntax**  
`fixture.PortFreq2(port) = value`

**Variable**  

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>fixture</code></td>
<td>A Fixturing (object)</td>
</tr>
<tr>
<td><code>port</code></td>
<td>(Integer) Port number to receive extrapolated loss.</td>
</tr>
<tr>
<td><code>value</code></td>
<td>(Double) Frequency2 value. Choose a frequency within the frequency span of the PNA.</td>
</tr>
</tbody>
</table>

**Return Type**  
Double

**Default**  
1 GHz

**Examples**  
`fixture.PortFreq2(2) = 10E9 'Write`
`value = fixture.PortFreq2(1) 'Read`

**C++ Syntax**  
`HRESULT get_PortFreq2(short port double *pVal)`
`HRESULT put_PortFreq2(short port double newVal)`

**Interface**  
IFixturing
**PortIFBandwidth Property**

**Description**
Sets or returns the IF Bandwidth per port property of the Segment. Enable the IF bandwidth per port property using the `PortIFBandwidthOption Property` of the Segments collection.

**VB Syntax**
```vbnet
seg.PortIFBandwidth(port) = value
```

**Variable (Type) - Description**
- **seg** A `Segment (object)`
- **port** (Long) Port number.
- **value** (Double) IF bandwidth.

**Return Type**
Double

**Default**
1000

**Examples**
```vbnet
seg.PortIFBandwidth(1) = 1000 'Write
value = seg.PortIFBandwidth(1) 'Read
```

**C++ Syntax**
```cpp
HRESULT get_PortIFBandwidth(long port, double* pVal);
HRESULT put_PortIFBandwidth(long port, double pVal);
```

**Interface**
ISegment3
**PortIFBandwidthOption Property**

**Description**
Enables or disables IF Bandwidth per port per segment. Value is set using the `PortIFBandwidth` Property of a Segment.

**VB Syntax**

```vb
segs.PortIFBandwidthOption = value
```

**Variable**

- **segs** - A `Segments` collection (`object`)
- **value** - (boolean)
  - **True** - Enable port IF bandwidth.
  - **False** - Disable port IF bandwidth.

**Return Type**
Boolean

**Default**
False

**Examples**

```vb
segs.PortIFBandwidthOption = True 'Write
IFBWstate = segs.PortIFBandwidthOption 'Read
```

**C++ Syntax**

```cpp
HRESULT get_PortIFBandwidthOption(VARIANT_BOOL* pVal)

HRESULT put_PortIFBandwidthOption(VARIANT_BOOL pVal)
```

**Interface**
ISegments6

PortLogic Property

Description
Sets and returns the logic mode of data ports A-H on the HandlerIO connector. Port C of the Handler IO is connected internally to the Port C of the Aux IO connector. Therefore, it will have the same logic mode.

VB Syntax
handler.PortLogic = value

Variable (Type) - Description
handler (object) - A HandlerI/O object
value (enum as NaRearPanelIOLogic) - Choose from:

0 - naPositiveLogic - When a value of one is written, the associated line goes High
1 - naNegativeLogic - When a value of one is written, the associated line goes Low

For ports that are in output (write) mode, a change in logic causes the output lines to change state immediately. For example, Low levels change immediately to High levels.

For ports that are in input (read) mode (C,D,E only), a change in logic will be reflected when data is read from that port. For example, if a line read 0, the next read after a logic change will read 1.

Return Type
Long Integer

Default
1 - naNegativeLogic

Examples
handler.PortLogic = value 'Write
value = handler.PortLogic 'Read

C++ Syntax
HRESULT put_PortLogic( tagNARearPanelIOLogic Mode );

HRESULT get_PortLogic( tagNARearPanelIOLogic* Mode );

Interface
IHWMaterialHandlerIO
### PortLoss1 Property

**Description**
Sets and returns the Loss1 value for the specified port number.

**Note:** This command affects ALL measurements on the channel.

**VB Syntax**
```
fixture.PortLoss1(port) = value
```

**Variable**

- **fixture** (Type) - Description
  A Fixturing (object)
- **port** (Integer) - Port number to receive Loss value
- **value** (Double) - Loss1 value in dB. Choose a value between -90 and 90.

**Return Type**
Double

**Default**
0

**Examples**
```
fixture.PortLoss1(2) = .002 'Write
value = fixture.PortLoss1(1) 'Read
```

**C++ Syntax**
```
HRESULT get_PortLoss1(short port double *pVal)
HRESULT put_PortLoss1(short port double newVal)
```

**Interface**
IFixturing
# PortLoss2 Property

**Description**  Sets and returns the Loss2 value for the specified port number.

**Note:** This command affects ALL measurements on the channel.

**VB Syntax**  

```vbnet
fixture.PortLoss2(port) = value
```

**Variable**  

- **fixture**  A Fixturing (object)
- **port**  (Integer)  Port number to receive Loss value
- **value**  (Double)  Loss2 value in dB. Choose a value between -90 and 90.

**Return Type**  Double

**Default**  0

**Examples**  

```vbnet
gfixture.PortLoss2(2) = .002  'Write
value = fixture.PortLoss2(1)  'Read
```

**C++ Syntax**  

```c
HRESULT get_PortLoss2(short port double *pVal)
HRESULT put_PortLoss2(short port double newVal)
```

**Interface**  IFixturing
# PortLossDC Property

**Description**
Sets and returns the Loss value at DC for the specified port number.

Learn about Loss compensation values.

**Note:** This command affects ALL measurements on the channel.

**VB Syntax**

```vbnet
fixture.PortLossDC(port) = value
```

**Variable**

- **(Type)** - Description
- **fixture** - A Fixturing (object)
- **port** (Integer) - Port number to receive Loss value at DC.
- **value** (Double) - Loss value in ohms. Choose a value between -90 and 90

**Return Type**
Double

**Default**
0

**Examples**

```vbnet
fixture.PortLossDC(2) = .002  'Write
value = fixture.PortLossDC(1)  'Read
```

**C++ Syntax**

```csharp
HRESULT get_PortLossDC(short port double *pVal)
HRESULT put_PortLossDC(short port double newVal)
```

**Interface**
IFixturing
PortMatching_C Property

Description
Sets and returns the value for the 'C' (Capacitance) circuit element for a port matching circuit model to simulate on port 'n'. The port matching circuit model is selected using PortMatchingCktModel. You can specify C, C1, or C2 based on the selected port matching circuit model. Setting a value not used by the selected circuit will have no affect. Learn more.

There are three steps to set up a port matching circuit model simulation on a specified port:

1. Select the port matching circuit model to simulate using PortMatchingCktModel.
2. Set the values for R (Resistance), G (Conductance), C (Capacitance), and L (Inductance) corresponding to the selected port matching circuit model.
3. Turn the feature on using PortMatchingState to simulate the circuit and compute the measurement as if the circuit were attached to the port.

Note: This command affects ALL measurements on the channel.

VB Syntax
```
fixture.PortMatching_C(port) = value
```

Variable (Type) - Description
- `fixture` (A Fixturing (object))
- `port` (Integer) Port number to receive capacitance value
- `value` (Double) Capacitance value in farads. Choose a value between -1E18 to 1E18.

Return Type
Double

Default
0

Examples
```
fractionalPortMatching_C(2) = .00002 'Write
value = fixture.PortMatching_C(1) 'Read
```

C++ Syntax
```
HRESULT get_PortMatching_C(short port double *pVal)
HRESULT put_PortMatching_C(short port double newVal)
```

Interface
IFixturing7
PortMatching_G Property

Description
Sets and returns the value for the 'G' (Conductance) circuit element for a port matching circuit model to simulate on port 'n'. The port matching circuit model is selected using PortMatchingCktModel. You can specify G, G1, or G2 based on the selected port matching circuit model. Setting a value not used by the selected circuit will have no affect. Learn more.

There are three steps to set up a port matching circuit model simulation on a specified port:

1. Select the port matching circuit model to simulate using PortMatchingCktModel.
2. Set the values for R (Resistance), G (Conductance), C (Capacitance), and L (Inductance) corresponding to the selected port matching circuit model.
3. Turn the feature on using PortMatchingState to simulate the circuit and compute the measurement as if the circuit were attached to the port.

Note: This command affects ALL measurements on the channel.

VB Syntax
```
fixture.PortMatching_G(port) = value
```

Variable (Type) - Description
- `fixture` A Fixturing (object)
- `port` (Integer) Port number to receive conductance value.
- `value` (Double) Conductance value in siemens. Choose a value between -1E18 and 1E18.

Return Type Double
Default 0

Examples
```
fixture.PortMatching_G = .002 'Write
value = fixture.PortMatching_G 'Read
```

C++ Syntax
```
HRESULT get_PorMatching_G(short port double *pVal)
HRESULT put_PorMatching_G(short port double newVal)
```

Interface IFixturing7
PortMatching_L Property

Description
Sets and returns the value for the 'L' (Inductance) circuit element for a port matching circuit model to simulate on port 'n'. The port matching circuit model is selected using PortMatchingCktModel. You can specify L, L1, or L2 based on the selected port matching circuit model. Setting a value not used by the selected circuit will have no affect. Learn more.

There are three steps to set up a port matching circuit model simulation on a specified port:

1. Select the port matching circuit model to simulate using PortMatchingCktModel.
2. Set the values for R (Resistance), G (Conductance), C (Capacitance), and L (Inductance) corresponding to the selected port matching circuit model.
3. Turn the feature on using PortMatchingState to simulate the circuit and compute the measurement as if the circuit were attached to the port.

**Note:** This command affects ALL measurements on the channel.

**VB Syntax**

```vbnet
fixture.PortMatching_L(port) = value
```

**Variable Description**

- **fixture** (Fixturing object)
- **port** (Integer) Port number to receive inductance value
- **value** (Double) Inductance value in henries. Choose a value between -1E18 and 1E18.

**Return Type**
Double

**Default**
0

**Examples**

```vbnet
fixture.PortMatching_L = .002 'Write
value = fixture.PortMatching_L 'Read
```

**C++ Syntax**

```cpp
HRESULT get_PortMatching_L(short port double *pVal)
HRESULT put_PortMatching_L(short port double newVal)
```

**Interface**
IFixturing7
## PortMatching_R Property

**Description**
Sets and returns the value for the 'R' (Resistance) circuit element for a port matching circuit model to simulate on port 'n'. The port matching circuit model is selected using `PortMatchingCktModel`. You can specify R, R1, or R2 based on the selected port matching circuit model. Setting a value not used by the selected circuit will have no affect. Learn more.

There are three steps to set up a port matching circuit model simulation on a specified port:

1. Select the port matching circuit model to simulate using `PortMatchingCktModel`.
2. Set the values for R (Resistance), G (Conductance), C (Capacitance), and L (Inductance) corresponding to the selected port matching circuit model.
3. Turn the feature on using `PortMatchingState` to simulate the circuit and compute the measurement as if the circuit were attached to the port.

**Note:** This command affects ALL measurements on the channel.

### VB Syntax

```
fixture.PortMatching_R(port) = value
```

### Variable (Type) - Description

- **fixture**
  A Fixturing (object)
- **port**
  (Integer) Port number to receive resistance value.
- **value**
  (Double) Resistance value in ohms. Choose a value between -1E18 and 1E18.

### Return Type

Double

### Default

0

### Examples

```
fixture.PortMatching_R = .1  'Write
value = fixture.PortMatching_R  'Read
```

### C++ Syntax

```
HRESULT get_PortMatching_R(short port double *pVal)
HRESULT put_PortMatching_R(short port double newVal)
```

### Interface

IFixturing7
### PortMatchingCktModel Property

**Description:** Sets and returns the Port Matching circuit model for the specified port number.

**Note:** This command affects ALL measurements on the channel.

**VB Syntax**

```
fixture.PortMatchingCktModel(port) = value
```

**Variable**

Return Type  Boolean

Default  False

Examples  

```vbnet
define fixture.PortMatchingState = True 'Write
value = fixture.PortMatchingState 'Read
```

C++ Syntax  

```csharp
HRESULT get_PortMatchingState(VARIANT_BOOL *pVal)
HRESULT put_PortMatchingState(VARIANT_BOOL newVal)
```

Interface  IFixturing
PortMedium Property

Description  Sets and returns the media type of the added fixture or transmission line.

VB Syntax  fixture.PortMedium(port) = value

Variable  (Type) - Description

fixture  A Fixturing Object

port  (Integer) Port Number for which media type is being set.

value  (enum NACalStandardMedium) - Medium of the transmission line of the standard. Choose from:

0 - naCoax - Coaxial Cable

1 - naWaveGuide - Waveguide

Return Type  Enum

Default  0 - naCoax

Examples  fixture.PortMedium(2) = naCoax  'Write

value = fixture.PortMedium(2)  'Read

C++ Syntax  HRESULT get_PortMedium(short portNum, tagNACalStandardMedium* pVal);

HRESULT put_PortMedium(short portNum, tagNACalStandardMedium newVal);

Interface  IFixturing4
PortMode Property

Description
Sets and returns whether Port C or Port D is used for writing or reading data on the Handler IO connector. The Handler IO Port C is connected internally to the Port C of the Aux IO connector. Therefore, the Aux IO connector will have the same input/output mode.

VB Syntax
handler.PortMode (port) = value

Variable (Type) - Description
handler (object) - A Handler I/O object
port (enum as NAMatHandlerPort) Port to be changed. Choose from:
2 - naPortC
3 - naPortD

value (enum as NaPortMode) - Choose from:
0 - naInput - set the port for reading
1 - naOutput - set the port for writing

Return Type
Long Integer

Default
1 - naInput

Examples
handler.PortMode(naPortC) = naInput 'Write
value = handler.PortMode(naPortD) 'Read

C++ Syntax
HRESULT put_PortMode ( tagNAMatHandlerPort Port, tagNAPortMode Mode );

HRESULT get_PortMode ( tagNAMatHandlerPort Port, tagNAPortMode* Mode );

Interface
IHWMaterialHandlerI0
# PortNoiseEnabled Property

**Description**
Sets and returns the ON/OFF state of allowing noise data to contribute to the uncertainty of a calibration performed using Dynamic Uncertainty. Noise data must also be present for the ports at the time the calibration is performed.

**VB Syntax**

```vbnet
uncertMan.PortNoiseEnabled = value
```

**Variable (Type) - Description**

- `uncertMan` An `UncertaintyManager` Object
- `value` (Boolean) Noise contribution state. Choose from:
  - **True** - Noise uncertainty ON.
  - **False** - Noise uncertainty OFF.

**Return Type**
Boolean

**Default**
True

**Examples**

```vbnet
uncertMan.PortNoiseEnabled = True
```

See example program

**C++ Syntax**

```cpp
HRESULT get_PortNoiseEnabled([out,retval] VARIANT_BOOL* pState);
HRESULT put_PortNoiseEnabled([in] VARIANT_BOOL state);
```

**Interface**
`IUncertaintyManager`
## PortsNeedingDeltaMatch Property

**Description**
Returns the port numbers for which delta match correction is required. 0 (zero) is returned if the Cal does NOT require Delta Match correction for one of the following reasons:

- The Cal does NOT involve Unknown Thru or TRL. You specify this using `ThruCalMethod` Property.
- The Cal DOES involve Unknown Thru or TRL, but the delta match data can be calculated by the Unknown Thru or TRL Cal. Learn how this is possible. However, you can force the Cal to use the Delta Match data from a Cal Set.

**VB Syntax**
```vbnet
value = guided.PortsNeedingDeltaMatch
```

**Variable**
- **Type**: Variant
- **Description**: Variable to store the returned list of port numbers.

**guided**
GuidedCalibration (object)

**Return Type**
Variant

**Default**
Not Applicable

**Examples**
```vbnet
Dim ports As Variant
ports = guided.PortsNeedingDeltaMatch
```

**C++ Syntax**
```cpp
HRESULT get_PortsNeedingDeltaMatch (VARIANT* portList);
```

**Interface**
IGuidedCalibration2
PortNumber Property

Sets and reads the port number for power range data. When two sources are available in combiner mode, refer to the following table.

<table>
<thead>
<tr>
<th>Port Number property of power range object</th>
<th>Power returned for a two port instrument</th>
<th>Power returned for a four port instrument</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Port 1</td>
<td>Port 1</td>
</tr>
<tr>
<td>2</td>
<td>Port 2</td>
<td>Port 2</td>
</tr>
<tr>
<td>3</td>
<td>Src2-Out1(^1)</td>
<td>Port 3</td>
</tr>
<tr>
<td>4</td>
<td>Src2-Out2(^1)</td>
<td>Port 4</td>
</tr>
<tr>
<td>5</td>
<td>Port1-Src2(^1)</td>
<td>Port1-Src2(^1)</td>
</tr>
</tbody>
</table>

\(^1\) Indicates that the port requires option 224 or 423.

**VB Syntax**

`powerRange.PortNumber = value`

**Variable**

(Variable) - Description

`powerRange` A PowerRange (object)

`value` (Integer) Port number for power range data.

**Return Type**

Integer

**Default**

Not Applicable

`powerRange.PortNumber = 3 'Write value = powerRange.PortNumber 'Read`

**C++ Syntax**

HRESULT get_PortNumber(short* port);

HRESULT put_PortNumber(short port);

**Interface**

IPowreRange
## SourceStateProperty

<table>
<thead>
<tr>
<th>Description</th>
<th>Sets and reads the ON / OFF state of the source specified by <em>(port)</em>. At the top of the Source Configuration dialog this is the Source State setting.</th>

<tr>
<td>Interface</td>
<td>IDIQ</td>
</tr>
</tbody>
</table>
PortVelocityFactor Property

Description: Sets and returns the Port Extensions Velocity Factor value for the specified port number.

Note: This command affects ALL measurements on the channel.

VB Syntax: `fixture.PortVelocityFactor(port) = value`

Variable (Type) - Description:
- `fixture` A Fixturing (object)
- `port` (Integer) Port number to receive velocity factor value.
- `value` (Double) Velocity Factor value. Choose a number between: 0 and 10 (.66 polyethylene dielectric; .7 PTFE dielectric)

Return Type: Double

Default: 1

Examples:
- `fixture.PortVelocityFactor(2) = .6` 'Write
- `value = fixture.PortVelocityFactor(1)` 'Read

C++ Syntax:
- `HRESULT get_PortVelocityFactor(short port double *pVal)`
- `HRESULT put_PortVelocityFactor(short port double newVal)`

Interface: IFixturing4
## PortWGcutFFreqProperty

**Description**
Sets and returns the cuttoff (minimum) frequency of the added waveguide fixture or transmission line.

**VB Syntax**
```
fixture.PortWGcutFFreq(port) = value
```

**Variable**
- **fixture** - A Fixturing Object
- **port** - (Integer) Port Number for which media type is being set.
- **value** - (Double) Cutoff frequency in Hz.

This value is ignored when **PortMedium Property** is set to **COAX** for the same port.

**Return Type**
Double

**Default**
System Media Cutoff Frequency

**Examples**
```
fixture.PortWGcutFFreq(2) = 1e9 'Write
value = fixture.PortWGcutFFreq(2) 'Read
```

**C++ Syntax**
```
HRESULT get_PortWGcutFFreq(short portNum, double *pVal);
HRESULT put_PortWGcutFFreq(short portNum, double newVal);
```

**Interface**
IFixturing4
### POut Property

**Description**
Returns the POut result of the PNOP or PSAT marker search.

- PSAT Out = Marker 2 Y-axis value
- PNOPOut = Marker 4 Y-axis value

**VB Syntax**

```vbnet
pOut = pMark.POut
```

**Variable**

<table>
<thead>
<tr>
<th>Variable</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pOut</td>
<td>double</td>
<td>Variable to store returned value</td>
</tr>
<tr>
<td>pMark</td>
<td>A PNOP (Object) or PSaturation (Object)</td>
<td></td>
</tr>
</tbody>
</table>

**Return Type**
Double

**Default**
Not applicable

**Examples**

```vbnet
pOut = pMark.POut  'Read
```

See example program

**C++ Syntax**

```cpp
HRESULT get_POut(double* pNewVal)
```

**Interface**
IPNOP or IPSaturation
PowerSlope Property

Description: Sets or returns the Power Slope value. Power Slope function increases or decreases the output power over frequency. Units are db/GHz. For example: PowerSlope = 2 will increase the power 2db/1GHz.

VB Syntax: 
```
object.PowerSlope = value
```

Variable: (Type) - Description
- `object` Channel (object)

  or

- `CalSet (object)` - Read-only property

  `value` (double) - Power Slope. Choose any number between -2 and 2.
  No slope = 0

  Return Type: Double
  Default: 0

Examples: 
```
chan.PowerSlope = 2 'Write
pwrslp = chan.PowerSlope 'Read
```

C++ Syntax: 
```
HRESULT get_PowerSlope(double *pVal)
HRESULT put_PowerSlope(double newVal)
```

Interface: IChannel

| CalSet3 |
**PowerAcquisitionDevice Property**

**Description**

Returns the power sensor channel (A or B) that is currently selected for use at a specific frequency.

If `UsePowerSensorFrequencyLimits` is set to False, this property will return the sensor channel last used for a source power calibration. This setting corresponds to the **Use this sensor only** checkbox in the Power Sensor Settings dialog.

When performing an SMC calibration, use `SetPowerAcquisitionDevice Method` to set the power sensor channel.

**VB Syntax**

```
sensor = pwrCal.PowerAcquisitionDevice(dFreq)
```

**Variable**

* (Type) - Description

- `sensor` (enum NAPowerAcquisitionDevice) The currently selected sensor channel for the specified frequency. Choose from:
  - 0 – naPowerSensor_A
  - 1 – naPowerSensor_B

- `pwrCal` A SourcePowerCalibrator (object)
- `dFreq` (double) Frequency (Hz) for the power reading of interest.

**Return Type**

enum NAPowerAcquisitionDevice

**Default**

Not Applicable

**Examples**

```
selectedSensor = pwrCal.PowerAcquisitionDevice(1.E9) 'Write
```

**C++ Syntax**

```
HRESULT get_PowerAcquisitionDevice(double dFreq, tagNAPowerAcquisitionDevice* enumAcqDevice);
```

**Interface**

ISourcePowerCalibrator2
## PowerAsFixture Property

**Description**
Sets and reads the state of power offset as a fixture with True Mode balanced measurements. Learn more about iTMSA power and power offset.

**VB Syntax**
```
balStim.PowerAsFixture = value
```

**Variable (Type) - Description**
- **balStim** A BalancedStimulus (object)
- **value** (Boolean) State of power offset as a fixture.

- **False** Offset is applied but is NOT included as a fixture in the output calculations.
- **True** Offset is applied and included as a fixture in the output calculations.

**Return Type** Boolean

**Default** False

**Examples**
```
balStim.PowerAsFixture = False 'Write
var = balStim.PowerAsFixture 'Read
```

**C++ Syntax**
```
HRESULT get_PowerAsFixture (VARIANT_BOOL *bVal)
HRESULT put_PowerAsFixture (VARIANT_BOOL bVal)
```

**Interface** IBalancedStimulus
**PowerCalibrationLevel Property**

**Description**
Set and read the power level at which to perform the source cal during an Enhanced Power Cal or during the power cal portion of some Noise Figure Cals.

**VB Syntax**
```
object.PowerCalibrationLevel (port) = value
```

**Variable**
- **Type** - Description
  - `object`: A GuidedCalibration (Object)
  - `port`: (Long) VNA Port number to connect the power sensor.
  - `value`: (Double) - Power level in dB. Choose a value from +30 to (-30).

**Return Type**
Double

**Default**
0

**Examples**
```
cal.PowerCalibrationLevel(1) = -5 'Write
pLevel = nfx.PowerCalibrationLevel(1) 'Read

See enhanced power cal example
```

**C++ Syntax**
```
HRESULT get_PowerCalibrationLevel(long port, double* pVal)
HRESULT put_PowerCalibrationLevel(long port, double* pVal)
```

**Interface**
IGuidedCalibration6
### PowerCalibrationPowerLevel Property

**Description**
Set and read the power level at which to perform the source cal during an Guided Power Cal or during an NFX Cal.

When used with Guided Power Cal, first enable a power cal using PerformPowerCalibration Property.

**VB Syntax**
```
object.PowerCalibrationPowerLevel (port) = value
```

**Variable (Type) - Description**
- `object`: A GuidedCalibration (Object)
- `port`: (Long) VNA Port number to connect the power sensor.
- `value`: (Double) - Power level in dB. Choose a value from +30 to (-30).

**Return Type**
Double

**Default**
0

**Examples**
```
cal.PowerCalibrationPowerLevel(1) = -5 'Write
pLevel = nfx.PowerCalibrationPowerLevel(1) 'Read
```

**C++ Syntax**
```
HRESULT get_PowerCalibrationPowerLevel(long port, double* pVal)
HRESULT put_PowerCalibrationPowerLevel(long port, double* pVal)
```

**Interface**
IGuidedCalibration6
### PowerCalRange Property

PowerForBestAccuracy Property

Description
Returns the power level associated with the best accuracy for a specific power meter.

VB Syntax
plevel = pwrSensor.PowerForBestAccuracy

Variable
(Type) - Description
plevel (Double) - Frequency in Hertz.
pwrSensor A PowerSensorUncertainty (Object)

Return Type
(Double) Power in dBm.

Default
Not Applicable

Examples
plevel = pwrSensor.PowerForBestAccuracy

C++ Syntax
HRESULT PowerForBestAccuracy(double *plevel);

Interface
IPowerSensorUncertainty
### PowerLevel Property

#### Description
Set and read the power level at which to perform the Source Power Cal portion of a Gain Compression Calibration or a SweptIMD Cal.

#### VB Syntax
```
object.PowerLevel = value
```

#### Variable (Type) - Description
- `object` A GainCompressionCal (object)
- `A SweptIMDCal (object)`
- `value` (Double) - Power level in dB. Choose a value from +30 to (-30). Learn about choosing a power level.

#### Return Type
Double

#### Default
0

#### Examples
```
gca.PowerLevel = -5 'Write
pLevel = imd.PowerLevel 'Read
```

#### C++ Syntax
```
HRESULT get_PowerLevel(double* pVal)

HRESULT put_PowerLevel(double newVal)
```

#### Interface
- IGainCompressionCal
- ISweptIMDCal
PowerLevel (Cal All) Property

Description
Sets and returns the power level at which a Cal All calibration is to be performed.

VB Syntax
\[ \text{calAll}.\text{PowerLevel} \ (\text{port}) = \text{value} \]

Variable
(Type) - Description
- \text{calAll}: A \text{CalibrateAllChannels (object)}
- \text{port}: (Long) Source port number.
- \text{value}: (Double) Power level at which the calibration is to be performed.

Return Type
Double

Default

Examples
\[ \text{calAll}.\text{PowerLevel} = 0 \ '\text{Power Level of cal} \]
\[ \text{value} = \text{calAll}.\text{PowerLevel} \ '\text{returns the power level of the cal} \]

C++ Syntax
HRESULT get_PowerLevel (long port, double
\[ \text{val}) \];
HRESULT put_PowerLevel long port, double* newVal);

Interface
ICalibrateAllChannels

# PowerMeterGPIBAddress Property  

**About Source Power Cal**

<table>
<thead>
<tr>
<th>Description</th>
<th>This command is replaced with PowerMeterInterface Object.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Specifies the GPIB address of the power meter that will be referenced by the SourcePowerCalibrator object.</td>
<td></td>
</tr>
<tr>
<td>When performing a source power cal, the VNA will search VISA interfaces that are configured in the Keysight IO Libraries on the VNA.</td>
<td></td>
</tr>
</tbody>
</table>

**VB Syntax**

```vbnet
global powerCalibrator
powerCalibrator.PowerMeterGPIBAddress = value
```

**Variable (Type) - Description**

- `powerCalibrator` (**object**) - A SourcePowerCalibrator (object)
- `value` (**long integer**) – Power meter GPIB address. Choose any number between 0 and 30.

**Return Type**

Long integer

**Default**

13

**Examples**

```vbnet
Set powerCalibrator = pna.SourcePowerCalibrator
powerCalibrator.PowerMeterGPIBAddress = 13 'Write
pwrMtrAddress = powerCalibrator.PowerMeterGPIBAddress 'Read
```

**C++ Syntax**

```c++
HRESULT put_PowerMeterGPIBAddress(long newVal);
HRESULT get_PowerMeterGPIBAddress(long *pVal);
```

**Interface**

ISourcePowerCalibrator
### PowerMin Property

**Description**
Sets and returns the minimum power level for Safe Mode.

**VB Syntax**
```
RxLevel.PowerMin(srcPort) = value
```

**Variable**
- **RxLevel** - Description: A ReceiverLeveling Object
- **srcPort** - Description: (Long Integer) Source port for which to set the min power for Receiver Leveling.

**Note:** If the source port is defined by a string name, such as an external source, a balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model, then use `chan.getPortNumber` to translate the string into a port number. To learn more see [Remotely Specifying a Source Port](#).

**value**
- (Double) Minimum power level in dB.

**Return Type**
- (Double)

**Default**
- -95 dB

**Examples**
```
rxLevel.PowerMin (1) = -50 ' Write
value = rxLevel.PowerMin 2' Read
```

**C++ Syntax**
```
HRESULT get_PowerMin(long port, double* pVal);
HRESULT put_PowerMin(long port, double newVal);
```

**Interface**
- IReceiverLevelingConfiguration
PowerMtrReadingUncertainty Property

Description: Returns the power uncertainty associated with the specific power meter at the specified frequency and power.

VB Syntax: `pwrUnc = pwrSensor.PowerMtrReadingUncertainty(freq,power)`

Variable (Type) - Description:
- `pwrUnc` (Double): Variable to store the returned power meter reading uncertainty.
- `pwrSensor` (A PowerSensorUncertainty (Object))
- `freq` (Double): Frequency (Hz).
- `power` (Double): Power (dBm).

Return Type: Double (Watts)
Default: Not Applicable

Examples: `pwrUnc = pwrSensor.PowerMtrReadingUncertainty(10e9,0.0)`

C++ Syntax: `HRESULT PowerMtrReadingUncertainty(double freq, double power, double *pwrUnc);`

Interface: IPowerSensorUncertainty
### PowerOffset Property

**Description**  
Sets and returns the power level offset value.

**VB Syntax**  
```vb
RxLevel.PowerOffset(srcPort) = value
```

**Variable**  
**(Type) - Description**
- `RxLevel`  
  A `ReceiverLeveling` Object
- `srcPort`  
  (Long Integer) Source port for which to set the offset power for Receiver Leveling.

**Note:** If the source port is defined by a string name, such as an external source, a balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model, then use `chan.getPortNumber` to translate the string into a port number. To learn more see Remotely Specifying a Source Port

**value**  
(Double) Power level Offset in dB.

**Return Type**  
(Double)

**Default**  
0 dB

**Examples**  
```vb
rxLevel.PowerOffset (1) = 10 ' Write
value = rxLevel.PowerOffset 2' Read
```

**C++ Syntax**  
```c++
HRESULT get_PowerOffset(long port, double* pVal);
HRESULT put_PowerOffset(long port, double newVal);
```

**Interface**  
`IReceiverLevelingConfiguration`
PowerOffset (Cal All) Property

Description
Sets and returns the power offset value for a Cal All calibration.

Power Offset provides a method of compensating port power for added attenuation or amplification in the source path. The result is that power at the specified port reflects the added components.

VB Syntax
`calAll.PowerOffset (port) = value`

Variable (Type) - Description
- `calAll` A `CalibrateAllChannels` object
- `port` (Long) Source port number.
- `value` (Double) Power offset value in dB for a Cal All calibration.

- For amplification, use positive offset.
- For attenuation, use negative offset.

Return Type
Double

Default
0 (zero dB)

Examples
`calAll.PowerOffset = 0 'Power Level of cal`
`value = calAll.PowerOffset 'returns the power offset of the cal`

C++ Syntax
`HRESULT get_PowerOffset (long port, double val);`
`HRESULT put_PowerOffset long port, double* newVal);`

Interface
CalibrateAllChannels
## PowerOnDuringRetraceMode Property

<table>
<thead>

</tbody>
</table>
### PowerSensorCalKitType Property

**Description**
Set and read the cal kit to be used for calibrating at the reference plane when the power sensor connector is different from the DUT port.

When used with Guided Power Cal, first enable a power cal using PerformPowerCalibration Property.

**VB Syntax**

```
object.PowerSensorCalKitType (n) = value
```

**Variable**

<table>
<thead>
<tr>
<th>(Type)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>object</td>
<td>A GuidedCalibration (object)</td>
</tr>
<tr>
<td>n</td>
<td>(Long) VNA port number for which cal kit is specified.</td>
</tr>
<tr>
<td>value</td>
<td>(String) - Cal Kit. Use CompatibleCalKits Property to return a list of valid cal kits.</td>
</tr>
</tbody>
</table>

**Return Type**
String

**Default**
Not Applicable

**Examples**

```vbnet
gguided.PowerSensorCalkitType(1) = "85052B" 'Write
ctype =guided.PowerSensorCalkitType(1) 'Read
```

**C++ Syntax**

```
HRESULT get_PowerSensorCalkitType(long port, BSTR* Val)
HRESULT put_PowerSensorCalkitType(long port, BSTR  newVal)
```

**Interface**
IGuidedCalibration6
### PowerSensorCalkitType Property

**Description**  
Set and read the cal kit to be used for calibrating at the adapter when the power sensor connector is different from the DUT. Use `PowerSensorConnectorType` to specify the connector type of the adapter.

**VB Syntax**  
```vbnet
object.PowerSensorCalkitType = value
```

**Variable**  
*(Type)* - Description

- `object`  
  A `GainCompressionCal` (object)
  
  A `SweptIMDCal` (object)
  
  A `GuidedCalibrationPowerSensor` (object)

- `value`  
  *(String)* - Cal Kit. Use `CompatibleCalKits` Property to return a list of valid cal kits.

**Return Type**  
String

**Default**  
Not Applicable

**Examples**  
```vbnet
gca.PowerSensorCalkitType = "85052B" 'Write
ctype = imd.PowerSensorCalkitType 'Read
```

**C++ Syntax**  
```cpp
HRESULT get_PowerSensorCalkitType(BSTR* Val)
HRESULT put_PowerSensorCalkitType(BSTR newVal)
```

**Interface**  
`IGainCompressionCal2`

`ISweptIMD`

`IGuidedCalibrationPowerSensor`
## PowerSensorConnectorType Property

**Description**
Set and read the power sensor connector type which is used to perform the Source Power Cal. Use `PowerSensorCalKitType` to specify the Cal Kit to use for the cal.

**VB Syntax**
```vb
object.PowerSensorConnectorType = value
```

**Variable**
- **(Type)** - Description
  - `object` - A `GainCompressionCal` (object)
  - A `SweptIMDCal` (object)
  - A `GuidedCalibrationPowerSensor` (object)

- **value** - (String) - Power sensor connector type. Use `ValidConnectorType Property` to return a list of valid connector types.
  
  Select "Ignored" to NOT compensate for the adapter.

**Return Type**
String

**Default**
Not applicable

**Examples**
```vb
(gca.PowerSensorConnectorType = "APC3.5 male"  'Write
cType = imd.PowerSensorConnectorType  'Read
```

**C++ Syntax**
```cpp
HRESULT get_PowerSensorConnectorType(BSTR* Val)
HRESULT put_PowerSensorConnectorType(BSTR newVal)
```

**Interface**
- `IGainCompressionCal2`
- `ISweptIMDCal`
- `IGuidedPowerCalPowerSensor`
**PowerSensorConnectorType Property**

**Description**
Set and read the power sensor connector type which is used to perform a Power Cal during an S-parameter calibration or during an NFX Cal.

When used with Guided Power Cal, first enable a power cal using PerformPowerCalibration Property.

**VB Syntax**
```vbnet
guided.PowerSensorConnectorType (n) = value
```

**Variable**
*(Type) - Description*

- `guided` A GuidedCalibration *(object)*
- `n` *(Long)* VNA port number to connect power sensor to.
- `value` *(String)* - Power sensor connector type. Use ValidConnectorType Property to return a list of valid connector types.

Set to "Ignored" to NOT compensate for the adapter.

**Return Type**
String

**Default**
Not applicable.

**Examples**
```vbnet
guided.PowerSensorConnectorType(1) = "APC3.5 male" 'Write
cType = guided.PowerSensorConnectorType(1) 'Read
```

**C++ Syntax**
```cpp
HRESULT get_PowerSensorConnectorType (long port, BSTR* val);

HRESULT put_PowerSensorConnectorType (long port, BSTR newVal);
```

**Interface**
IGuidedCalibration6
# PowerSlopeState Property

**Description**
Turns point slope ON or OFF for all measurements on the channel. Use PowerSlope to set the slope value.

**VB Syntax**

```
chan.PowerSlopeState = state
```

**Variable (Type) - Description**

- `chan` *(A Channel (object))*
- `state` *(boolean)*

- **False** - Turns power slope OFF
- **True** - Turns point slope ON

**Return Type**
Boolean

**Default**
False

**Examples**

```
chan.PowerSlopeState = True  'Write
state = chan.PowerSlopeState  'Read
```

**C++ Syntax**

```
HRESULT get_PowerSlopeState(VARIANT_BOOL *pVal)
HRESULT put_PowerSlopeState(VARIANT_BOOL newVal)
```

**Interface**
IChannel18
PowerSpinResolution Property

Description
Sets and returns the resolution of the front panel knob when it is used to adjust Source Power manually.

VB Syntax

\[ disp.PowerSpinResolution = value \]

Variable
\( disp \) - A Display (object)
\( value \) - (Double) - Power level knob resolution. The range of acceptable values is 0.01 to 100.

Return Type
Double

Default
0.1

Examples

\[ app.disp.PowerSpinResolution = 0.01 \text{'Write - Every tick of the front panel knob will change the Power Level by 0.01 dBm.'} \]

\[ \text{resolution} = \text{app.disp.PowerSpinResolution} \text{'Read - Get the current knob resolution.'} \]

C++ Syntax

HRESULT get_PowerSpinResolution(double* resolution)
HRESULT put_PowerSpinResolution(double resolution)

Interface
IDisplay
PowerStep Property

Description: Sets and returns the safe mode power step value.

**VB Syntax**

\[ RxLevel.\text{PowerStep}(srcPort) = value \]

**Variable**

- **RxLevel** (Type) - Description
  - A ReceiverLeveling Object
- **srcPort** (Long Integer) - Source port for which to set the power step for Receiver Leveling.

**Note:** If the source port is defined by a string name, such as an external source, a balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model, then use `chan.getPortNumber` to translate the string into a port number. To learn more see Remotely Specifying a Source Port

**value** (Double) - Power step in dB.

**Return Type** (Double)

**Default** 1 dB

**Examples**

- `rxLevel.PowerStep (1) = 2` \(\text{'Write}\)
- `value = rxLevel.PowerStep 2` \(\text{'Read}\)

**C++ Syntax**

- `HRESULT get_PowerStep(long port, double* pVal);`
- `HRESULT put_PowerStep(long port, double newVal);`

**Interface** IReceiverLevelingConfiguration
## PowerStepsIn3DSweep Property

**Description**  
Set and read the number of power steps for a 3D sweep.

**VB Syntax**  
`HotS22.PowerStepsIn3DSweep = value`

**Variable**  
- **Type**: ActiveParametersApp (object)
- **value**:  
  - **(Long)** - Number of power steps. The range is 2 to 20001.

**Return Type**  
Long

**Default**  
201

**Examples**  
- `HotS22.PowerStepsIn3DSweep = 201 'Write`
- `value = HotS22.PowerStepsIn3DSweep 'Read`

**C++ Syntax**  
- `HRESULT get_PowerStepsIn3DSweep(long* value)`
- `HRESULT put_PowerStepsIn3DSweep(long value)`

**Interface**  
IActiveChannelSettings
# PowerSweepRetracePowerMode Property

**Description**  
At the end of a power sweep, while waiting to trigger the next sweep, maintain source power at either the start power level or at the stop power level.

**VB Syntax**  
`pref.PowerSweepRetracePowerMode = value`

**Variable**  
- **`pref`** - A Preferences (object)
- **`value`** - (Enum) - Choose from:
  
  0 - `naPowerSweepRetraceMode_Start` - maintain source at start power level.
  
  1 - `naPowerSweepRetraceMode_Stop` - maintain source at stop power level.

**Return Type**  
Enum

**Default**  
0 - `naPowerSweepRetraceMode_Start`

**Examples**  
```vbnet
 pref.PowerSweepRetracePowerMode = naPowerSweepRetraceMode_Start 'Write
psMode = pref.PowerSweepRetracePowerMode 'Read
```

**C++ Syntax**  
```c++
HRESULT get_PowerSweepRetracePowerMode (tagNAPowerSweepRetraceMode* preference);
HRESULT put_PowerSweepRetracePowerMode (tagNAPowerSweepRetraceMode val)
```

**Interface**  
IPreferences3
## PowerTableFilename Property

**Description**  
Loads a file that defines a power table to be used during a SMC Guided Power Cal or Cal All Channels on a mmWave system. This feature is available because power sensors are NOT typically available at mmWave frequencies. [Learn more.](#)

**VB Syntax**  
```
guided.PowerTableFilename (n) = value
```

**Variable**  
*Type* - Description

- `guided`  
  A GuidedCalibration *(object)*

- `n`  
  *(Long)*  
  Source port being calibrated.

- `value`  
  *(String)*  
  Full path and filename of a *.prn file that defines the power table. An error is returned if the file is not found.

**Return Type**  
String

**Default**  
Not applicable.

**Examples**
```
guided.PowerTableFilename(1) = "c:\powertable1.prn"  'Write
value = guided.PowerTableFilename(1)  'Read
```

**C++ Syntax**
```c++
HRESULT get_PowerTableFilename (long port, BSTR* val);
```
```
HRESULT put_PowerTableFilename (long port, BSTR newVal);
```

**Interface**  
IGuidedCalibration9
### PreciseTuningTolerance Property

<td><code>IEmbededLO</code></td>
</tr>
</tbody>
</table>
PreferInternalTriggerOnChannelSingle Property

Description
Set and read the preference for the chan.Single trigger behavior. This setting persists until changed.

These preferences are important when performing a Guided calibration, as the VNA uses the chan.Single trigger command to measure standards.

- set PreferInternalTriggerOnChannelSingle = False to use an External trigger sweep to measure a cal standard.
- set PreferInternalTriggerOnChannelSingle = True to use an External sweep for the measurement, but rely on the VNA to send Internal trigger signals for calibrating.

To set this preference for an Unguided Calibration, use PreferInternalTriggerOnUnguidedCal Property

The chan.Single trigger command NEVER respects the Trigger Source = Manual setting. It always switches to Internal for one trigger, then back to Manual, regardless of this preference command.

VB Syntax

```vbnet
pref.PreferInternalTriggerOnChannelSingle = bool
```

Variable (Type) - Description

pref A Preferences object

bool (Boolean) - Choose from:

- 0 - False - the Single trigger property does respect the Trigger Source = External setting. For example, if Trigger source = External, the single trigger method will wait for the External trigger signal and then allow only one sweep.

- 1 - True - the Single trigger command does NOT respect the Trigger Source = External setting. For example, when the Single method is sent, the VNA immediately switches to Internal sweep, responds to one trigger signal, then switches back to External.

Return Type
Boolean

Default
0 - False

Examples

```vbnet
pref.PreferInternalTriggerOnChannelSingle = False 'Write
prefer = pref.PreferInternalTriggerOnChannelSingle 'Read
```

C++ Syntax

```cpp
HRESULT put_PreferInternalTriggerOnChannelSingle( VARIANT_BOOL value )
```
HRESULT get_PreferredInternalTriggerOnChannelSingle(VARIANT_BOOL *bprefSingle)

Interface IPreferences2
## PreferInternalTriggerOnUnguidedCal Property

**Description**: Set and read the preference for the trigger behavior when performing an Unguided calibration.

**VB Syntax**: 
```
pref.PreferInternalTriggerOnUnguidedCal = bool
```

**Variable**
- **pref**: A `Preferences` object
- **bool**: A `Boolean`

**Return Type**: `Boolean`

**Default**: 0 - False

**Examples**
```
pref.PreferInternalTriggerOnUnguidedCal = False 'Write
prefer = pref.PreferInternalTriggerOnUnguidedCal 'Read
```

**C++ Syntax**
```
HRESULT put_PreferInternalTriggerOnUnguidedCal(VARIANT_BOOL bprefUnguided)

HRESULT get_PreferInternalTriggerOnUnguidedCal(VARIANT_BOOL *bprefUnguided)
```

**Interface**: `IPreferences2`

---

**Description**
- **0 - False**: The trigger behavior during an Unguided calibration DOES respect the setting of the `Trigger source` command. For example, during an Unguided Cal, when `Trigger source = External`, the VNA will wait for the External trigger signal and then allow only one sweep.

- **1 - True**: The trigger behavior during an Unguided calibration does NOT respect the `Trigger Source = External` setting. For example, during an Unguided Cal, when `Trigger source = External`, the VNA immediately switches to Internal sweep, measures the standard with one trigger signal, then switches back to External trigger.

**Note**: When `Trigger Source = Manual` during a calibration, the VNA ALWAYS switches to Internal for one trigger to measure a standard, then back to Manual, regardless of this preference command.
PreferSourcePowerCalFromCalset Property

**Description**
Specifies if the source power cal in the calset linked to a measurement cal should be enabled or disabled with that cal.

**VB Syntax**
```
pref.PREFERSOURCEPOWERCALFROMCALSET = bool
```

**Variable (Type) - Description**
- **pref**  A Preferences **(object)**
- **bool**  **(Boolean)** - Choose from:
  - **0 - False**  - Disable source power cal in calset.
  - **1 - True**  - Enable source power cal in calset.

**Return Type**
Boolean

**Default**
0 - False

**Examples**
```
pref.PREFERSOURCEPOWERCALFROMCALSET = False  'Write
prefer = pref.PREFERSOURCEPOWERCALFROMCALSET  'Read
```

**C++ Syntax**
```
HRESULT put_PREFERSOURCEPOWERCALFROMCALSET( VARIANT_BOOL prefPowerCal)
HRESULT get_PREFERSOURCEPOWERCALFROMCALSET( VARIANT_BOOL *prefPowerCal)
```

**Interface**
IPreferences
## PresetMaxFrequency Property

<table>
<thead>
<tr>
<th>Description</th>
<th>Returns the maximum specified frequency of the analyzer. Does not include any over-sweep. See also: MaximumFrequency Property.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>VB Syntax</strong></td>
<td><code>value = cap.PresetMaxFrequency</code></td>
</tr>
<tr>
<td><strong>Variable (Type) - Description</strong></td>
<td></td>
</tr>
<tr>
<td><code>value</code></td>

### PresetMinFrequency Property

<table>
<thead>
<tr>
<th>Description</th>
<th>Returns the minimum specified frequency of the analyzer. Does not include any over-sweep. See also: MinimumFrequency Property</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>VB Syntax</strong></td>
<td><code>value = cap.PresetMinFrequency</code></td>
</tr>
</tbody>
</table>

**Variable**

- **Value** (Double) Variable to store the returned value.
- **cap** A Capabilities (object)

**Default**

Not Applicable

**Examples**

`value = cap.PresetMinFrequency 'Read`

**C++ Syntax**

```cpp
HRESULT get_PresetMinFrequency(Double *value);
```

**Interface**

ICapabilities13
PresetPowerState Property

Description  Set and return the Preset Power ON/OFF state.

VB Syntax  \textit{\texttt{pref.PresetPowerState = value}}

Variable  \begin{itemize}
\item \texttt{pref} - A Preferences \texttt{(object)}
\item \texttt{value} - (Enum as NAPowerStates) - Choose from:
\end{itemize}

\begin{itemize}
\item \texttt{naPowerON (0)} - Instrument Preset always turns RF power ON.
\item \texttt{naPowerAUTO (1)}:
\begin{itemize}
\item When the current power setting is OFF, leave power OFF at Preset.
\item When the current power setting is ON, turn power ON at Preset.
\end{itemize}
\end{itemize}

Return Type  enum

Default  \texttt{naPowerON (0)}

Examples  \begin{itemize}
\item \texttt{pref.PresetPowerState = naPowerON} \texttt{'}Write\texttt{'}
\item \texttt{pwrState = pref.PresetPowerState} \texttt{'}Read\texttt{'}
\end{itemize}

C++ Syntax  \begin{itemize}
\item \texttt{HRESULT get_PresetPowerState(tagNAPowerStates* pVal)};
\item \texttt{HRESULT put_PresetPowerState(tagNAPowerStates pVal)};
\end{itemize}

Interface  IPreferences11
### PrimaryFrequency Property

**Description**
Sets the pulse repetition frequency (PRF) for ALL internal pulse generators.

This setting is equal to 1/period which is set with `PrimaryPeriod Property`.

**Note:** On the **Pulse Setup dialog**, this command is a "Basic" setting, intended to be used with the 'Auto' selections set to ON.

#### VB Syntax

```vbnet
pulse.PrimaryFrequency = value
```

#### Variable (Type) - Description
- `pulse` A `PulseMeasurementControl (object)`
- `value` (Double) PRF in Hz.

#### Return Type
Double

#### Default
1 kHz

#### Examples

```vbnet
pulse.PrimaryFrequency = 1e4 'Write
value = pulse.PrimaryFrequency 'Read
```

#### C++ Syntax

```cpp
HRESULT get_PrimaryFrequency(double* value);
HRESULT put_PrimaryFrequency(double value);
```

#### Interface
`IPulseMeasurementControl2`
**PrimaryMode Property**

**Description**
Sets and returns the primary (On/Off) setting of the external pulse generator. This setting allows the external pulse generator to set the primary clock frequency for the other pulse generators.

**VB Syntax**
`extPulseGen.PrimaryMode = value`

**Variable**
(Type) - Description
- `extPulseGen` An `ExternalPulseGenerator (object)`
- `value` (Boolean) Primary setting. Choose from:
  - **True** - Use the external pulse generator becomes the primary clock frequency.
  - **False** - Use the internal pulse generator as the primary clock frequency.

**Return Type**
Boolean

**Default**
False

**Examples**
```
extPulseGen.PrimaryMode = True 'Write
primary = extPulseGen.PrimaryMode 'Read
```

**C++ Syntax**
```
HRESULT get_PrimaryMode (VARIANT BOOL *pValue)
HRESULT put_PrimaryMode (VARIANT BOOL newVal)
```

**Interface**
`IExternalPulseGenerator2`
**PrimaryPeriod Property**

**Description**
Sets the period for ALL internal pulse generators.

This setting is equal to 1/PRF which is set with MasterFrequency Property.

*Note:* On the Pulse Setup dialog, this command is a 'Basic setting, which is intended to be used with the 'Auto' selections set to ON.

**VB Syntax**

```vbnet
pulse.PrimaryPeriod = value
```

**Variable (Type) - Description**

- `pulse` A PulseMeasurementControl Object *(object)*
- `value` *(Double)* Period in seconds.

**Return Type**

Double

**Default**

1 msec

**Examples**

```vbnet
pulse.PrimaryPeriod = 1e-4 'Write
value = pulse.PrimaryPeriod 'Read
```

**C++ Syntax**

```cpp
HRESULT get_PrimaryPeriod(double* Period);
HRESULT put_PrimaryPeriod(double Period);
```

**Interface**

IPulseMeasurementControl2
## PrimaryWidth Property

**Description**
Sets the pulse width for ALL internal pulse generators.

*Note:* On the Pulse Setup dialog, this command is a 'Basic setting, which is intended to be used with the 'Auto' selections set to ON.

**VB Syntax**

```vbnet
pulse.PrimaryWidth = value
```

**Variable**

- **pulse** (Type) - Description
  - A PulseMeasurementControl Object (Object)
- **value** (Double) - Pulse width in seconds.

**Return Type**
Double

**Default**
100 microseconds

**Examples**

```vbnet
pulse.PrimaryWidth = 1e-3 'Write

value = pulse.PrimaryWidth 'Read
```

**C++ Syntax**

```cpp
HRESULT get_PrimaryWidth(double* Width);
HRESULT put_PrimaryWidth(double Width);
```

**Interface**
IPulseMeasurementControl2

### PropertyNamesByMeasurementClass Property

**Description**  Returns the list of valid property names by measurement class.

> See a list of valid properties and values for each measurement class.

**VB Syntax**  
```vbnet
propNames = calAll.PropertyNamesByMeasurementClass (MeasurementClass)
```

**Variable**  
- **propNames**  (Variant Array) Variable to store the returned property names.
- **calAll**  A `CalibrateAllChannels (object)`

**MeasurementClass**  (String) Measurement class name for which valid names are to be returned.

**Return Type**  Variant Array

**Default**  Not Applicable

**Examples**  
```vbnet
props = calAll.PropertyNamesByMeasurementClass ("SMC")
```

**C++ Syntax**  
```cpp
HRESULT get_PropertyNamesByMeasurementClass(BSTR MeasurementClass, VARIANT* propNames);
```

**Interface**  `CalibrateAllChannels`
## PropertyValue Property

**Description**
Sets and returns the current property value for a specific property name.

See a list of valid properties and values for each measurement class.

Use `PropertyValues` to query a list of valid values.

### VB Syntax
```
calAll.PropertyValue (propName) = value
```

### Variable (Type) - Description
- **calAll**
  - A `CalibrateAllChannels` (object)
- **propName**
  - (String) Property name for which value is to be set or returned.
- **value**
  - (String) Property value.

### Return Type
String

### Default
Not Applicable

### Examples

**Example 1:**
calAll.PropertyValue ("Noise Cal Method") = "Scalar"

**Example 2:**
calAll.PropertyValue ("Enable Extra Power Cals") = "Port 1 Src2,Port3"

**Example 3:**
calAll.PropertyValue ("Port 1 Src2 Cal Power") = "-20"

### C++ Syntax
```
HRESULT get_PropertyValue (BSTR propName, BSTR* propValue);

HRESULT put_PropertyValue (BSTR propName, BSTR propValue);
```

### Interface
`CalibrateAllChannels`
### PropertyValues Property

**Description**
Returns the valid property values for a specific property name.

See a list of valid properties and values for each measurement class.

**VB Syntax**

```vbnet
props = calAll.PropertyValues (propName)
```

**Variable**

- **Type** - Description
- **props** (Variant Array) Variable to store the returned property values that can be set.
- **calAll** A CalibrateAllChannels *(object)*
- **propName** (String) Property name for which valid values are to be returned.

**Return Type**

- Variant Array
- **Default** Not Applicable

**Examples**

```vbnet
props = calAll.PropertyValues ("Noise Cal Method")
```

**C++ Syntax**

```cpp
HRESULT get_PropertyValues (BSTR propName, VARIANT* propValues);
```

**Interface**

- CalibrateAllChannels
Pulse4OutAsADCAcivity Property

**Description**
Turns pulse4 output ON and OFF. Enable pulse4 to use an oscilloscope connected to pin 13 of the PULSE I/O connector on the rear panel of the VNA to display when the ADC is making measurements.

**VB Syntax**
`pulse.Pulse4OutAsADCAcivity = value`

**Variable (Type) - Description**
- `pulse` A `PulseGenerator (object)`
- `value` (Boolean) Choose from:
  - **ON** (or 1) - Pulse 4 output pin indicates ADC activity.
  - **OFF** (or 0) - Pulse 4 output pin indicates legacy behavior (pulse generator number 4 output).

**Return Type**
Boolean

**Default**
False

**Examples**
- `pulse.Pulse4OutAsADCAcivity = True`  `'Write`
- `bool = pulse.Pulse4OutAsADCAcivity`  `'Read`

**C++ Syntax**
HRESULT get_Pulse4OutAsADCAcivity(VARIANT_BOOL* ADCActivity);
HRESULT put_Pulse4OutAsADCAcivityit (VARIANT_BOOL ADCActivity);

**Interface**
IPulseGenerator5
**PulseGeneratorID Property**

<table>
<thead>
<tr>
<th>Description</th>
<th>Returns the ID of the specified External Pulse Generator name. Use this ID number when setting properties on the PulseGenerator Object. Use PulseGeneratorNames to read the names of the internal and configured external pulse generators.</th>

<td>HRESULT get_PulseGeneratorNames (VARIANT *pNames)</td>
</tr>
<tr>
<td><strong>Interface</strong></td>
<td>IChannel</td>
</tr>
</tbody>
</table>
## PulseMeasMode Property

Sets the pulse measurement state for the channel.

**Description**

Sets the pulse measurement state for the channel.

**VB Syntax**

```vb
pulseMeas.PulseMeasMode = value
```

**Variable**

(Types) - Description

- `pulseMeas` A `PulseMeasurementControl` (object)
- `value` (Enum as `NAPulseMeasurementMode`) Choose from:
  - (0) `naPulseMeasurementOff` - Turn OFF pulse measurements.
  - (1) `naPulseStandardMeasurement` - Turn ON standard pulse measurements.
  - (2) `naPulseProfileMeasurement` - Turn ON pulse profile measurements.

**Return Type**

Enum

**Default**

(0) `naPulseMeasurementOff`

**Examples**

```vb
pulse.PulseMeasMode = naPulseProfileMeasurement 'Write
value = pulse.PulseMeasMode 'Read
```

**C++ Syntax**

```cpp
HRESULT get_PulseMeasMode(tagNAPulseMeasurementMode* pVal);
HRESULT put_PulseMeasMode(tagNAPulseMeasurementMode newVal);
```

**Interface**

`IPulseMeasurementControl`
## PulseOffAlcMode Property

<table>
<thead>
<tr>
<th><strong>Description</strong></th>
<th>Sets and returns ALC mode that the Pulse Setup will use when the pulse is turned off.</th>

</thead>
<tbody>
<tr>
<td><strong>VB Syntax</strong></td>
<td><code>pulseMeas.PulseOffAlcMode = value</code></td>
</tr>
</tbody>
</table>
| **Variable**    | `{**Type** - Description}

- `pulseMeas` A `PulseMeasControl` `object`

- `value` `{**Enum as NAALCLevelingMode} Choose from:}

  - `(0) naALCInternal` - Set ALC to internal when the pulse is turned off.
  - `(1) naALCOpenLoop` - Set ALC to open loop to use no ALC when the pulse is turned off.

<table>
<thead>
<tr>
<th><strong>Return Type</strong></th>
<th>Enum</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Default</strong></td>
<td><code>(0) naALCInternal</code></td>
</tr>
</tbody>
</table>

| **Examples** | `pulseMeas.PulseOffAlcMode = naALCOpenLoop` `Write`
|              | `value = pulseMeas.PulseOffAlcMode` `Read` |
| **C++ Syntax**| `HRESULT get_PulseOffAlcMode(tagNAALCLevelingMode* pVal);` |
|              | `HRESULT put_PulseOffAlcMode(tagNAALCLevelingMode newVal);` |
| **Interface** | IPulseMeasControl4 |
PulseProfileStart Property

Sets and returns the start time of the pulse. Pulse profile measurements provide a time domain (CW frequency) view of the pulse envelope. Profiling is performed using a measurement technique that "walks" a narrow receiver "snapshot" across the width of the pulse. This is analogous to using a camera to take many small snapshots of a wide image, then piecing them together to form a single, panoramic view.

**VB Syntax**

```
pulseMeas.PulseProfileStart = value
```

**Variable**

- *pulseMeas*: A PulseMeasurementControl (object)
- *value*: (double) - Start time in seconds.

**Note:** The start value cannot be negative.

**Return Type**

Double

**Default**

0

**Examples**

```
pulseMeas.PulseProfileStart = 3e-3 'Write
startprofile = pulseMeas.PulseProfileStart 'Read
```

**C++ Syntax**

```
HRESULT get_PulseProfileStart(double *pVal)
HRESULT put_PulseProfileStart(double pVal)
```

**Interface**

IPulseMeasControl3
PulseProfileStop Property

Description
Sets and returns the stop time of the pulse. Pulse profile measurements provide a time domain (CW frequency) view of the pulse envelope. Profiling is performed using a measurement technique that "walks" a narrow receiver "snapshot" across the width of the pulse. This is analogous to using a camera to take many small snapshots of a wide image, then piecing them together to form a single, panoramic view.

VB Syntax
pulseMeas.PulseProfileStop = value

Variable (Type) - Description
pulseMeas
A PulseMeasurementControl (object)
value (double) - Stop time in seconds.

Note: The stop value cannot be negative.

Return Type
Double

Default
N/A

Examples
pulseMeas.PulseProfileStop = 3e-3 'Write
startprofile = pulseMeas.PulseProfileStop 'Read

C++ Syntax
HRESULT get_PulseProfileStop(double *pVal)
HRESULT put_PulseProfileStop(double pVal)

Interface
IPulseMeasControl3
### RangeCount (Independent Power Cal Port) Property

<table>
<thead>
<tr>
<th>Description</th>
<th>Queries how many ranges are included in the calibration for source port ( &lt;n&gt; ).</th>
</tr>
</thead>
<tbody>
<tr>
<td>VB Syntax</td>
<td><code>value = IndependentPwrrCalPort.RangeCount</code></td>
</tr>
<tr>
<td>Variable</td>
<td><em>(Type)</em> - Description</td>
</tr>
<tr>
<td><code>value</code></td>
<td><em>(Long)</em> - Variable to store the returned range count.</td>
</tr>
<tr>
<td><code>IndependentPwrrCalPort</code></td>
<td>A <code>IndependentPowerCalibrationPort (object)</code></td>
</tr>
<tr>
<td>Return Type</td>
<td>Long</td>
</tr>
<tr>
<td>Default</td>
<td>Not Applicable</td>
</tr>
<tr>
<td>Example</td>
<td><code>value = CalibrateAllChannels.IndependentPowerCalibrationPort.RangeCount</code></td>
</tr>
<tr>
<td>C++ Syntax</td>
<td>HRESULT RangeCount(Int* ranges);</td>
</tr>
<tr>
<td>Interface</td>
<td>IIndependentPowerCalibrationPort</td>
</tr>
</tbody>
</table>
## RangeCount Property

<table>
<thead>
<tr>
<th><strong>Description</strong></th>
<th>Returns the number of ranges that are available in the VNA.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>To see the range names, query the Name property of each range in the FOM collection.</td>
</tr>
</tbody>
</table>

**VB Syntax**

```
value = FOM.RangeCount
```

**Variable**

<table>
<thead>
<tr>
<th><strong>(Type)</strong></th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>object</td>
<td>An FOM (collection object)</td>
</tr>
<tr>
<td>value</td>
<td>(long) - Variable to store the returned number of ranges.</td>
</tr>
</tbody>
</table>

**Return Type**

Long Integer

**Default**

Not Applicable

**Examples**

```vbnet
NumRanges = fom.RangeCount 'Read
```

**C++ Syntax**

```
HRESULT get_RangeCount(long *count)
```

**Interface**

IFOM
# rangeNumber Property

Returns the index number of the range within the FOM collection.

**VB Syntax**

```vbnet
value = FOMRange.rangeNumber
```

**Variable**

- **value** (Long) - Variable to store the returned range number.
- **object** An FOMRange (object)

**Return Type** Long

**Default** Not Applicable

**Examples**

```vbnet
num = fomRange.rangeNumber 'Read
```

**C++ Syntax**

```cpp
HRESULT get_rangeNumber(long *pVal)
```

**Interface** IFOMRange
RangeOffset Property

Sets and reads the frequency range number to be used as an offset. The frequencies of the range \(<n>\) will be offset from the 'coupled to' range by this frequency range. The RangeOffsetUp Property command determines whether the offset is positive or negative.

On the Frequency Range dialog under Coupling, this is the Offset setting.

VB Syntax

```vbnet
DIQ.RangeOffset (n) = value
```

Variable (Type) - Description

- **DIQ**: A Differential I/Q (object)
- **n**: (Long Integer) Frequency range number.
- **value**: (Long Integer) Offset range number. The resulting range must be within the frequency range of the analyzer.

Return Type

Long

Default

1

Examples

```vbnet
diq.RangeOffset 3 = 2 'Write, range 3 is offset from the 'coupled to' range by the frequencies defined by range 2
value = diq.RangeOffset 2 'Read
```

C++ Syntax

```c++
HRESULT get_RangeOffset(long range, long* RangeOffset);
HRESULT put_RangeOffset(long range, long RangeOffset);
```

Interface

IDIQ
**RangeOffsetUp Property**

**Description**
Sets and reads the state of the Up / Down conversion setting.

On the Frequency Range dialog under Coupling, this is the Up (On|Off) setting.

**VB Syntax**

```
DIQ.RangeOffsetUp (n) = value
```

**Variable**

- **DIQ** (Type) - Description
  - A Differential I/Q (object)
- **n** (Long Integer) Frequency range number.
- **value** (Boolean) Choose from the following:
  - True - The offset range is ADDED to the 'coupled to' frequency range.
  - False - The offset range is SUBTRACTED from the 'coupled to' frequency range.

**Return Type**
Boolean

**Default**
False

**Examples**

- `diq.RangeOffsetUp 2 = True` 'Write
- `value = diq.RangeOffsetUp 2` 'Read

**C++ Syntax**

```cpp
HRESULT get_RangeOffsetUp(long range, VARIANT_BOOL* RangeOffsetUp);

HRESULT put_RangeOffsetUp(long range, VARIANT_BOOL RangeOffsetUp);
```

**Interface**
IDIQ
# RangeStartFrequency Property

Sets and reads the start value for the specified frequency range.

On the **Frequency Range** dialog under **Frequency**, this is the **Start** setting.

**Description**

Sets and reads the start value for the specified frequency range.

**VB Syntax**

```vbnet
dIQ.RangeStartFrequency(n) = value
```

**Variable**

- `DIQ` - A Differential I/Q object
- `n` - Frequency range number. (Long)
- `value` - Frequency range start value. Choose a value within the frequency range of the analyzer. (Double)

**Return Type**

Double

**Default**

Start frequency of the analyzer.

**Examples**

```vbnet
diq.RangeStartFrequency(2) = 1e9 'Write
value = diq.RangeStartFrequency(1) 'Read
```

**C++ Syntax**

```cpp
HRESULT get_RangeStartFrequency(long range, double* RangeStartFrequency);

HRESULT put_RangeStartFrequency(long range, double RangeStartFrequency);
```

**Interface**

IDIQ
# RangeStartFrequency (PowerRange) Property

**Description**
Sets and reads the lower bound of the frequency range used for range based power min and max.

**VB Syntax**
```vbnet
powerRange.RangeStartFrequency = value
```

**Variable**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>powerRange</code></td>
<td>A PowerRange (object)</td>
</tr>
<tr>
<td><code>value</code></td>
<td>A (Double) Start frequency. Choose a number within the frequency limits of the analyzer. Units are Hz.</td>
</tr>
</tbody>
</table>

**Return Type**
Double

**Default**
Not Applicable

**C++ Syntax**
```cpp
HRESULT get_RangeStartFrequency(double* startfreq);
HRESULT put_RangeStartFrequency(double startfreq);
```

**Interface**
IPowerRange
**RangeStopFrequency Property**

**Description**
Sets and reads the Stop value for the specified frequency range.

On the Frequency Range dialog under Frequency, this is the Stop setting.

**VB Syntax**
```
DIQ.RangeStopFrequency (n) = value
```

**Variable (Type) - Description**
- **DIQ** (A Differential I/Q (object))
- **n** (Long) Frequency range number.
- **value** (Double) Frequency range stop value. Choose a value within the frequency range of the analyzer.

**Return Type**
Double

**Default**
Maximum frequency of the analyzer.

**Examples**
```
diq.RangeStopFrequency(2) = 1e9 'Write
value = diq.RangeStopFrequency(1) 'Read
```

**C++ Syntax**
```
HRESULT get_RangeStopFrequency(long range, double* RangeStopFrequency);
HRESULT put_RangeStopFrequency(long range, double RangeStopFrequency);
```

**Interface**
IDIQ
### RangeStopFrequency (PowerRange) Property

## RatioedPowerCorrectionData Property

**Description**  
Write and read an array of ratioed power offsets. This allows the setting of arbitrary impedance, which is used for active load applications. The number of offset values must be the same as the number of data points. Use RatioedPowerCorrectionEnabled to use the offset values.

**VB Syntax**  

```vbnet
phase.RatioedPowerCorrectionData(srcPort) = value
```

**Variable**  
*(Type)* - Description  

- `phase` A `PhaseControl` Object  
- `srcPort` (Long Integer) Source port for which to make phase control settings.

**Note:** If the source port is defined by a string name, such as an external source, a balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model, then use `chan.getPortNumber` to translate the string into a port number. To learn more see [Remotely Specifying a Source Port](#).

**value** (Long values) Ratioed amplitude offset data array.

**Return Type**  
Long data array

**Default**  
Not Applicable

**Examples**  

```vbnet
phase.RatioedPowerCorrectionData 1 = .1,.2,.3 ' Write 3 power offset values
value = phase.RatioedPowerCorrectionData 2 ' Read
```

**C++ Syntax**  

```c++
HRESULT get_RatioedPowerCorrectionData(long port, long* pVals);
HRESULT put_RatioedPowerCorrectionData(long port, long newVals);
```

**Interface**  
`IPhaseControl`
# RatioedPowerCorrectionEnabled Property

## Description
Write and read whether to use the ratioed power offset array. Use `RatioedPowerCorrectionData Property` to write or read the offset data.

## VB Syntax
```
phase.RatioedPowerCorrectionEnabled(srcPort) = value
```

## Variable
- **(Type) - Description**
  - **phase**: A `PhaseControl Object`
  - **srcPort**: (Long Integer) Source port for which to make phase control settings.

- **Note:** If the source port is defined by a string name, such as an external source, a balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model, then use `chan.getPortNumber` to translate the string into a port number. To learn more see [Remotely Specifying a Source Port](#).

- **value**: (Boolean) Ratioed power offset array state.
  - **True** – Apply offset array.
  - **False** – Do NOT apply offset array.

## Return Type
Boolean

## Default
False

## Examples
```
phase.RatioedPowerCorrectionEnabled 1 = True ' Write
value = phase.RatioedPowerCorrectionEnabled 2 ' Read
```

## C++ Syntax
```
HRESULT get_RatioedPowerCorrectionEnabled(long port, VARIANT_BOOL* pVal);

HRESULT put_RatioedPowerCorrectionEnabled(long port, VARIANT_BOOL newVal);
```

## Interface
`IPhaseControl`
## RcvCharMethod Property

**Description**  
Set and read the method used to characterize the noise receivers.

**VB Syntax**  

```vbscript
noise.RcvCharMethod = value
```

**Variable (Type) - Description**

- **noise**  
  A `NoiseCal (object)`

- **value**  
  (string) Receiver characterization method. NOT case-sensitive. Choose from:

  - **"NoiseSource"** - Use a noise source. This selection is NOT allowed when a standard VNA receiver is used as the noise receiver. (`noise.NoiseReceiver = naStandardReceiver`).

  - **“PowerMeter”** - Use a power meter.

  **NOTE:** The Power Meter selection is **NOT** allowed when the Noise Bandwidth is **8 MHz** or **24 MHz**.

**Return Type**  
String

**Default**  
"NoiseSource"

**Examples**

```vbscript
noise.RcvCharMethod = "PowerMeter" 'Write
receiverMethod = noise.RcvCharMethod 'Read
```

**C++ Syntax**  

```csharp
HRESULT get_RcvCharMethod(BSTR* pValue)
HRESULT put_RcvCharMethod(BSTR pNewValue)
```

**Interface**  
INoiseCal3
### ReadDCAtCompression Property

**Description**  Set and read the DC readings at the compression point in the last iteration of a smart sweep. Taking only these DC readings improves measurement speed.

**VB Syntax**  
\[ gca.ReadDCAtCompression = value \]

**Variable**  
- **Type** - Description
  - \( gca \)  A **GainCompression** (object)
  - \( value \)  (Boolean)  Choose from:
    - **True**  Enable reading DC value at compression point in the last iteration of a smart sweep.
    - **False**  Disable reading DC value at compression point in the last iteration of a smart sweep.

**Return Type**  Boolean

**Default**  False

**Examples**  
- \[ gca.ReadDCAtCompression = True \]  'Write
- \[ enable = gca.ReadDCAtCompression \]  'Read

**C++ Syntax**  
- `HRESULT get_ReadDCAtCompression(VARIANT_BOOL* enable)`
- `HRESULT put_ReadDCAtCompression(VARIANT_BOOL enable)`

**Interface**  IGainCompression5
R1inputPath Property

**Description**
All VNA models (except the N523xA models) have a switch in the test set that allows access to the port 1 reference receiver through the front panel Reference 1 connectors. This command throws that switch between the internal path to the receiver, or through the external connectors.

See other Frequency Offset properties.

**VB Syntax**
```vbnet
chan.R1InputPath = value
```

**Variable (Type) - Description**
- **chan** A Channel (object)
- **value** (Enum as naInputPath) - Choose from:
  - **naPathInternal** - (0) - internal path to the reference receiver
  - **naPathExternal** - (1) - path through external connectors

**Return Type**
Enum

**Default**
aPathInternal - (0)

**Examples**
```vbnet
chan.R1InputPath = naPathInternal 'Write
Inpath = chan.R1InputPath 'Read
```

**C++ Syntax**
```csharp
HRESULT get_R1InputPath (tag NAInputPath *pPath);
HRESULT put_R1InputPath (tag NAInputPath newPath);
```

**Interface**
IChannel2
ReadingsPerPoint Property

This command, along with ReadingsTolerance, allows for settling of the power sensor READINGS.

Specifies the maximum number of power readings that are taken at each stimulus point to allow for power meter settling. Each reading is averaged with the previous readings at that stimulus point. When this average meets the ReadingsTolerance value or this number of readings has been made, the average is returned as the valid reading.

VB Syntax

\[ \text{pwrSensor.ReadingsPerPoint} = \text{value} \]

Variable (Type) - Description

- \( \text{pwrCal} \): A SourcePowerCalibrator (Object) or A PowerSensorAsReceiver (Object)

- \( \text{value} \): (long integer) – Number of power readings. Choose any number between 3 and 100.

Return Type

Long Integer

Default

3

Examples

\[ \text{pwrSensor.ReadingsPerPoint} = 3 \] 'Write
\[ \text{numReadings} = \text{pwrSensor.ReadingsPerPoint} \] 'Read

C++ Syntax

HRESULT put_ReadingsPerPoint(long newVal);

HRESULT get_ReadingsPerPoint(long *pVal);

Interface

ISourcePowerCalibrator

IPowerSensorAsReceiver
ReadingsTolerance Property

Description
This command, along with ReadingsPerPoint Property allows for settling of the power sensor READINGS.

Each power reading is averaged with the previous readings at each stimulus point. When the average meets this tolerance value or the maximum ReadingsPerPoint has been made, the average is returned as the valid reading.

VB Syntax
`pwrSens.ReadingsTolerance = value`

Variable (Type) - Description
`pwrCal` A SourcePowerCalibrator (Object) or
A PowerSensorAsReceiver (Object)

`value` (Double) – Power meter settling tolerance value in dB. Choose any number between 0 and 5.

Return Type
Double

Default
.05 dB

Examples
`pwrSens.ReadingsTolerance = .1 'Write ReadTol = pwrSensor.ReadingsTolerance 'Read`

C++ Syntax
HRESULT get_ReadingsTolerance( double *pVal);
HRESULT put_ReadingsTolerance( double newVal);

Interface
ISourcePowerCalibrator3
IPowerSensorAsReceiver
### ReadyForTriggerPolarity Property

**Description**

Specifies the polarity of Ready for Trigger output.

All existing Ready for Trigger outputs for PNA-X and PNA-L models are configured simultaneously with this command. See Capabilities Summary.

The Ready for Trigger polarity can NOT be configured for E836x models.

**VB Syntax**

```vbnet
trigsetup.ReadyForTriggerPolarity = value
```

**Variable (Type) - Description**

- `trigsetup` A TriggerSetup (object)
- `value` (Enum as NALevel)

Choose from:

- **0 - naLow** - Outputs a TTL low when the VNA is ready for trigger.
- **1 - naHigh** - Outputs a TTL high when the VNA is ready for trigger.

**Return Type**

Enum

**Default**

0 - naLow

**Examples**

```vbnet
trigsetup.ReadyForTriggerPolarity = naLow 'Write
pol = trigsetup.ReadyForTriggerPolarity 'Read
```

**C++ Syntax**

```cpp
HRESULT get_ReadyForTriggerPolarity(tagNALevel *pVal);

HRESULT put_ReadyForTriggerPolarity(tagNALevel newVal);
```

**Interface**

ITriggerSetup3
Read/Write

About the Handler I/O Connector

ReadyForTriggerState Property

Description
Determines the control of Material Handler connector Pin 21.

VB Syntax
handler.ReadyForTriggerState = value

Variable
- **handler** *(object)* - A Handler I/O object
- **value** *(boolean)*

- False - Pin 21 is controlled by Output Port B7
- True - Pin 21 is controlled by the Ready for Trigger signal

Return Type
Boolean

Default
False

Examples
handler.ReadyForTriggerState = False 'Write
bState = handler.ReadyForTriggerState 'Read

C++ Syntax
HRESULT put_ReadyForTriggerState (BOOL *pVal);

HRESULT get_ReadyForTriggerState (BOOL newVal);

Interface
IHWMaterialHandlerIO2
ReadyForTriggerStatus Property

Description
Checks if the PNA is ready for a hardware trigger.

This command is not intended to be used in a dynamic triggering situation where the ready status is constantly changing. Instead, the expected use is a more static situation where you are expecting the PNA to transition from not ready to ready, and then wait for a trigger. The PNA is polled until it becomes ready and then an operation that triggers the PNA is performed.

Note: This command is only supported on the PNA-L, PNA, and PNA-X with DSP5 installed. Any other model will return an error.

VB Syntax
value = trigsetup.ReadyForTriggerStatus

Variable
(trigsetup) - A TriggerSetup (object)
(value) - (Enum as NATriggerReadyStatusSource)

Return Type
Boolean

Default
Not applicable

C++ Syntax
HRESULT get_ReadyForTriggerStatus(tagNATriggerReadyStatusSource whichTrigger, VARIANT_BOOL* val);

Interface
ITriggerSetup4
**RecallSoftkeysMostRecent Property**

**Description**
Set and return whether to list files for recall on softkeys by most-recently used or alphabetically.

**VB Syntax**

```
pref.RecallSoftkeysMostRecent = value
```

**Variable (Type) - Description**

- `pref` - A Preferences (object)
- `value` - (Boolean) – Choose from:
  - **True** – Recall softkeys show most recently-used files.
  - **False** – Recall softkeys show alphabetically-ordered files.

**Return Type**
Boolean

**Default**
False

**Examples**

```
pref.RecallSoftkeysMostRecent = False  'Write
recallPref = pref.RecallSoftkeysMostRecent 'Read
```

**C++ Syntax**

```c++
HRESULT get_RecallSoftkeysMostRecent(VARIANT_BOOL * pVal);
HRESULT put_RecallSoftkeysMostRecent(VARIANT_BOOL pVal);
```

**Interface**
IPreferences13
ReceiverAttenuator Property

Description  Sets or returns the value of the specified receiver attenuator control.

VB Syntax  

\[ \text{object.ReceiverAttenuator}(\text{rec}) = \text{value} \]

Variable  

\( \text{(Type)} \) - Description

- \( \text{object} \) Channel (object)

- \( \text{or} \)

CalSet (object) - Read-only property

- \( \text{rec} \) (long integer) - Receiver with attenuator control to be changed. Choose from any of the available receivers in your VNA
  1 - Receiver A
  2 - Receiver B
  3 - Receiver C
  4 - Receiver D

Receiver attenuation can not be set using logical receiver notation.

- \( \text{value} \) (double) - Attenuator value in dB. Choose any Long Integer between 0 and 35 in 5dB steps:

  If an invalid value is entered, the analyzer will select the next lower valid value. For example, if 19.9 is entered the analyzer will select 15 dB attenuation.

Return Type  Double

Default  0 db

Examples  

\begin{align*}
\text{chan.ReceiverAttenuator}(1) &= 5 \quad \text{\texttt{Write}} \\
\text{attn} &= \text{chan.ReceiverAttenuator}(2) \quad \text{\texttt{Read}}
\end{align*}

C++ Syntax  

\begin{verbatim}
HRESULT get_ReceiverAttenuator(long lport, double* pVal)
HRESULT put_ReceiverAttenuator(long lport, double newVal)
\end{verbatim}

Interface  IChannel

| CalSet3

2207
### ReceiverAttenuator (Cal All) Property

**Description**
Sets and returns the Receiver Attenuator setting for a Cal All calibration.

**VB Syntax**
```vbnet
calAll.ReceiverAttenuator (port) = value
```

**Variable (Type) - Description**
- `calAll` A `ICalibrateAllChannels` object
- `port` (Long) Receiver port number.
- `value` (Double) Attenuation value in dB for a Cal All calibration. Choose a valid value for the VNA model. See valid settings.

**Return Type**
Double

**Default**
0 (zero dB)

**Examples**
```vbnet
calAll.ReceiverAttenuator = 0 'Set value
value = calAll.ReceiverAttenuator 'Return value
```

**C++ Syntax**
```cpp
HRESULT get_ReceiverAttenuator (long port, double val);
HRESULT put_ReceiverAttenuator (long port, double* newVal);
```

**Interface**
ICalibrateAllChannels
### ReceiverCount Property

**Description**
Returns the number of receivers in the remote VNA. The returned number includes both test port receivers and reference receivers. See the number of reference receivers in your VNA.

**VB Syntax**
```
value = cap.ReceiverCount
```

**Variable**
- **Type**: Long
- **Description**: Variable to store the returned number of receivers.
- **value**: A Capabilities (object)

**Return Type**: Long

**Default**: Not Applicable

**Examples**
```
value = cap.ReceiverCount  'Read
```

**C++ Syntax**
```
HRESULT get_ReceiverCount(long * receiverCount);
```

**Interface**: ICapabilities
**ReceiverRatio Property**

**Description**
Sets and returns the receiver ratio pair to be used with Receiver Leveling.

To perform receiver leveling with a ratioed receiver, use `ReceiverRatio Property`.

**VB Syntax**

```
RxLevel.ReceiverRatio(srcPort) = value
```

**Variable**

- **RxLevel**: A `ReceiverLeveling` Object
- **srcPort**: (Long Integer) Source port for which to set the receiver for Receiver Leveling.

**Note:** If the source port is defined by a string name, such as an external source, a balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model, then use `chan.getPortNumber` to translate the string into a port number.

To learn more see [Remotely Specifying a Source Port](#).

**value**: (String) Receiver to use for the leveling sweeps. (Not case sensitive). Choose any receiver in your VNA. See the block diagram of your VNA, located at the bottom of all `Specs` documents.

**Return Type**: String

**Default**: Not applicable

**Examples**

```
rxLevel.ReceiverRatio (1) = "R1" ' Write

rxLevel.ReceiverRatio (1) = "b2" ' Write

value = rxLevel.ReceiverRatio 2' Read
```

**C++ Syntax**

```
HRESULT get_ReceiverRatio( long port, BSTR* pVal);

HRESULT put_ReceiverRatio( long port, BSTR newVal);
```

**Interface**

`IReceiverLevelingConfiguration`
**ReceiverStepAttenuatorStepSize Property**

<table>

### ReceiverTemperature Property

**Description:** Returns the current temperature on the VNA receiver board.

**VB Syntax:**

```vbnet
value = cap.ReceiverTemperature (unit)
```

**Variable**

- **value** *(Double)* - Variable to store the returned temperature value.
- **cap** A Capabilities *(object)*
- **unit** *(Enum as NATempScale)* - Units in which temperature is returned. Choose from:
  - 0 - naTempScale_Fahrenheit
  - 1 - naTempScale_Celsius

**Return Type:** Double

**Default:** Not Applicable

**Examples:**

```vbnet
value = cap.ReceiverTemperature naTempScale_Celsius 'Read
```

**C++ Syntax:**

```c
HRESULT get_ReceiverTemperature(NATempScale val, long temperature);
```

**Interface:** ICapabilities9
ReceivePort Property

Description
Returns the receiver (response) port number of measurement. To understand how this property is useful, see IMeasurement2 Interface.

Note: Returning a receiver port is only supported for S-Parameter measurements. If the measurement is not an S-Parameter, then E_NA_BAD_PARAMETER is returned.

VB Syntax
value = meas.ReceivePort

Variable (Type) - Description
value (Long) - Variable to store the returned value
meas A Measurement (object)

Return Type
Long Integer

Default
Not Applicable

Examples
rp = meas.ReceivePort

C++ Syntax
HRESULT ReceivePort(Long* revPort);

Interface IMeasurement2
### RecordSize Property

<table>
<thead>
<tr>
<th>Description</th>
<th>Read the current DFT record size. This value is based on the ForceADCRecordSize and dft.Type settings.</th>

ReferenceCalFactor Property

**Description**
Sets and returns the Cal Factor (%) for the 50 MHz reference signal associated with this power sensor. Use this property **only** if the power sensor does not contain cal factors in EPROM (for example, HP/Keysight 848x sensors).

**VB Syntax**
```
pwrSensor.ReferenceCalFactor = value
```

**Variable**
**(Type) - Description**
- `pwrSensor` A `PowerSensor` (Object)
- `value` *(double)* – Cal factor in units of percent. This can be any value between 1 and 150.

**Return Type**
Double

**Default**
100

**Examples**
```
pwrSensor.ReferenceCalFactor = 98 'R

RefFact = pwrSensor.ReferenceCalFactor 'Read
```

**C++ Syntax**
```
HRESULT put_ReferenceCalFactor(double newVal);

HRESULT get_ReferenceCalFactor(double *pVal);
```

# ReferenceReceiver Property

**Description**
Sets and returns the receiver to be used with Receiver Leveling.

To perform receiver leveling with a ratioed receiver, use `ReceiverRatio Property`.

<table>
<thead>
<tr>
<th>VB Syntax</th>
<th>RxLevel.<strong>ReferenceReceiver</strong>(srcPort) = value</th>
</tr>
</thead>
</table>

**Variable** *(Type) - Description*

- **RxLevel** A `ReceiverLeveling` Object
- **srcPort** (Long Integer) Source port for which to set the receiver for Receiver Leveling.

**Note:** If the source port is defined by a string name, such as an external source, a balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model, then use `chan.getPortNumber` to translate the string into a port number.

To learn more see [Remotely Specifying a Source Port](#).

**value** *(String) Receiver to use for the leveling sweeps. (Not case sensitive). Choose any receiver in your VNA. see the block diagram of your VNA, located at the bottom of all Specs documents.*

Receivers can also be referred to using logical receiver notation. This notation makes it easy to refer to receivers with an external test set connected to the VNA. You do not need to know which physical receiver is used for each test port. Learn more.

**Return Type** String

**Default** Not applicable

**Examples**

```vbnet
rxLevel.ReferenceReceiver (1) = "R1" ' Write

rxLevel.ReferenceReceiver (1) = "b2" ' Write

value = rxLevel.ReferenceReceiver 2 ' Read
```

**C++ Syntax**

```csharp
HRESULT get_ReferenceReceiver( long port, BSTR* pVal);

HRESULT put_ReferenceReceiver( long port, BSTR newVal);
```

**Interface** `IReceiverLevelingConfiguration`
ReferenceValue Property

Description: Sets or returns the value of the Y-axis Reference Level of the active trace.

VB Syntax: `tree.ReferenceValue = value`

Variable (Type) - Description:
- `tree` (object) - A Trace
- `value` (double) - Reference Value. Units and range depend on the current data format.

Return Type: Double

Default: Not applicable

Examples:
```
meas.ReferenceValue = 0 'Write
rlev = meas.ReferenceValue 'Read
```

C++ Syntax:
- `HRESULT get_ReferenceValue(double *pVal)`
- `HRESULT put_ReferenceValue(double newVal)`

Interface: ITrace
### ReferencePosition Property

<table>
<thead>
<tr>
<th>Description</th>
<th>Sets or returns the Reference Position of the active trace.</th>
</tr>
</thead>
</table>

**VB Syntax**

```vbnet
trace.ReferencePosition = value
```

**Variable (Type) - Description**

- `trace` A Trace (object)
- `value` (double) - Reference position on the screen measured in horizontal graticules from the bottom of the screen. Choose from any number between: 0 and 10.

**Return Type**

Double

**Default**

0

**Examples**

```vbnet
meas.ReferencePosition = 5 'Middle of the screen -Write
rpos = meas.ReferencePosition -Read
```

**C++ Syntax**

- HRESULT get_ReferencePosition(double *pVal)
- HRESULT put_ReferencePosition(double newVal)

**Interface**

ITrace
### RelativeExtractionToneLevel Property

**Description**: Set and read the tone power relative to the input power (dBc).

**VB Syntax**: `HotS22.RelativeExtractionToneLevel = level`

**Variable**
- **(Type)** - Description
  - `HotS22` A [ActiveParametersApp](#) *(object)*
  - `level` *(Double)* - Relative tone power level

**Return Type**: Double

**Default**: -15 dBc

**Examples**
- `HotS22.RelativeExtractionToneLevel = -5 'Write`
- `level = HotS22.RelativeExtractionToneLevel 'Read`

**C++ Syntax**
- `HRESULT get_RelativeExtractionToneLevel(double* level)`
- `HRESULT put_RelativeExtractionToneLevel(double level)`

**Interface**: IActiveChannelSettings
### RemoteCalStoragePreference Property

**Description**
Specifies the default manner in which calibrations performed using COM or SCPI are to be stored.

Cal data is always stored to the channel’s Cal Register regardless of this setting.

This setting survives instrument preset and reboot. It remains until changed by another invocation of this property.

**VB Syntax**

```vbnet
pref.RemoteCalStoragePreference = value
```

**Variable**

<table>
<thead>
<tr>
<th>(Type)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>cal</code></td>
<td>A Preferences (object)</td>
</tr>
<tr>
<td><code>value</code></td>
<td>(Enum) - Choose from:</td>
</tr>
</tbody>
</table>

- **0 - naPreferCalRegister** - Cal is saved ONLY to the channel’s Cal Register.

- **1 - naPreferNewUserCalSet** - Cal is automatically saved to a new User Cal Set file when performing a calibration using COM. The Cal Set name is automatically generated. This corresponds to pre-6.0 behavior. Use the Name property to change the name after the cal is complete.

- **2 - naPreferReuseCurrentCalSet** - The cal is saved to the Cal Set is that is currently selected on the specific channel. This could be the channel’s Cal Register. If the channel does not yet have a selected Cal Set, the cal will be saved to a new User Cal Set with an automatically-generated name.

**Return Type**

Enum

**Default**

0 - naPreferCalRegister

**Examples**

```vbnet
pref.RemoteCalStoragePreference = naPreferNewUserCalSet  'Write
calStorageMode = pref.RemoteCalStoragePreference  ' Read
```

**C++ Syntax**

```cpp
HRESULT get_RemoteCalStoragePreference(enum NARemoteCalStoragePreference* preference);

HRESULT put_RemoteCalStoragePreference(enum NARemoteCalStoragePreference val);
```

**Interface**

IPreferences7
## ReportReceiverOverload Property

**Description**
Set and return whether to display receiver overload warnings.

**VB Syntax**
```
pref.ReportReceiverOverload = value
```

**Variable**
- **pref**  
  A Preferences (object)
- **value**  
  (Boolean) - Choose from:
  - **True**  Display overload warnings.
  - **False**  Do NOT display overload warnings.

**Return Type**
Boolean

**Default**
True

**Examples**
```
pref.ReportReceiverOverload = True 'Write
value = pref.ReportReceiverOverload 'Read
```

**C++ Syntax**
```
HRESULT get_ReportReceiverOverload (VARIANT_BOOL PowerSweepRetraceMode* preference);
HRESULT put_ReportReceiverOverload (VARIANT_BOOL PowerSweepRetraceMode val)
```

**Interface**
IPreferences12
ResBWList Property

**Description**
Returns a list of Res BW values that are supported by the IM Spectrum apps.

**VB Syntax**
```vbnet
value = cap.ResBWList
```

**Variable**
- `(Type)` - Description
- `value` (Variant) - Variable to store the returned array of Res BW values
- `cap` A Capabilities (Object)

**Return Type**
Variant array

**Default**
Not Applicable

**Examples**
```
'Read the supported IFBW values
Set app = CreateObject("AgilentPNA835x.Application")
Set cap = app.Capabilities
list=cap.ResBWList
For i = 0 To UBound(list)
    msg = msg & list(i) & vbCrLf
Next
MsgBox msg
```

**C++ Syntax**
```c++
HRESULT get_ResBWList(Variant *value);
```

**Interface**
ICapabilities8
### ResBWListSA Property

**C++ Syntax**

```
HRESULT get_ResBWListSA(Variant *value);
```
ResBWList (Spectrum Analyzer) Property

Description
Read the list of all Resolution Bandwidth values currently supported with spectrum analyzer current settings.

VB Syntax
```
sa.ResBWList = value
```

Variable (Type) - Description
- `sa` A `SpectrumAnalyzer` (object)
- `value` (Variant) Variable to store the returned Resolution Bandwidth values.

Return Type
Variant array

Default
N/A

Examples
```
value = sa.ResBWList 'Read
```

C++ Syntax
```
HRESULT get_ResBWList(VARIANT* resolution);
```

Interface
ISpectrumAnalyzer5
### Resolution Property

<table>
<thead>
<tr>
<th>Description</th>
<th>Read the DFT resolution.</th>

</tbody>
</table>

- 60k | 100k | 150k | 300k, 600k | 1.0M | 3.0M

If an invalid number is specified, the VNA will round up to the closest valid number.

**Return Type**

Double

**Default**

600 kHz

**Examples**

```vbnet
ims.ResolutionBW = 150e3 'Write
value = ims.ResolutionBW 'Read
```

**C++ Syntax**

```cpp
HRESULT get_ResolutionBW(double *pVal)
HRESULT put_ResolutionBW(double newVal)
```

**Interface**

IIMSpectrum
## ResolutionBW Property

**Description**
Set and read the resolution bandwidth. Also set ResolutionBWMode to naManual.

**VB Syntax**

\[ sa\_ResolutionBW = value \]

**Variable**

1. **sa**
   - A SpectrumAnalyzer (object)
2. **value**
   - (Double) Choose a value between 6 Hz and 3 MHz. Attempting to set the bandwidth outside these bounds will force the bandwidth to the nearest bound.

**Learn about these settings.**

**Return Type**
Double

**Default**
100 kHz

**Examples**

\[ sa\_ResolutionBW = 1e6 \]  
\[ value = sa\_ResolutionBW \]

See an example program.

**C++ Syntax**

```c++
HRESULT put_ResolutionBW(double freq);
HRESULT get_ResolutionBW(double* freq);
```

**Interface**
ISpectrumAnalyzer
<table>
<thead>
<tr>
<th><strong>Description</strong></th>
<th>Read the maximum resolution bandwidth.</th>

</tbody>
</table>
## ResolutionBWMode Property

**Description**
Set and read how the resolution bandwidth is set. When ON, resolution bandwidth is set based on Span/RBW ratio.

**VB Syntax**

```vbnet
sa.ResolutionBWMode = value
```

**Variable**

- **Type**
  - `sa` A SpectrumAnalyzer (`object`)
  - `value` (`Enum as NAModes`) Choose from:
    - **1** - `naMANUAL` - Res. BW is set manually using `ResolutionBW` Property
    - **0** - `naAUTO` - Res. BW is set automatically and will not set resolution bandwidth above 300 kHz.

Learn about these settings.

**Return Type**
Enum

**Default**

- **0** - `naAUTO`

**Examples**

```vbnet
sa.ResolutionBWMode = 1 'Write
value = sa.ResolutionBWMode 'Read
```

See an example program.

**C++ Syntax**

```cpp
HRESULT put_ResolutionBWMode(tagNAModes mode);
HRESULT get_ResolutionBWMode(tagNAModes* mode);
```

**Interface**
ISpectrumAnalyzer
# ResolutionBWVideoBWRatio Property

<table>
<thead>
<tr>
<th>Description</th>
<th>Set and read the RBW / VBW ratio.</th>
</tr>
</thead>

</table>

ResponseCorrectedPorts Property

Description
Sets and returns the selected ports to be corrected with enhanced response calibration. Learn more.

Note: The CorrectionSubsettingState must be set to ON to enable the response command.

VB Syntax
value = corrMethods.ResponseCorrectedPorts

Variable
(value) - Description

value (Variant) Variable to store a comma separated list of ports to include for enhanced response correction.

corrMethods (Type) - CorrectionMethods (object)

Return Type
Variant

Default
All ports included

Examples
Example #1:
16-port VNA with an active 16-port calibration

corrMethods.CorrectionSubsettingState = True
fullportlist = Array(1,2,3,4,5,6)
fullportlist = corrMethods.FullyCorrectedPorts
responseportlist = Array(7,8)
responseportlist = corrMethods.ResponseCorrectedPorts

Result: Full correction on ports 1-6
Enhanced response corrected for parameters involving ports 7 and 8
No correction for ports 9-16

Example #2:
16-port VNA with an active 16-port calibration

corrMethods.CorrectionSubsettingState = True
fullportlist = Array(0)
fullportlist = corrMethods.FullyCorrectedPorts
responseportlist = Array(1,2,3,4,5,6,7,8,9,10,11,12,13,14,15,16)
responseportlist = corrMethods.ResponseCorrectedPorts

Result: Enhanced response correction for parameters involving any ports

C++ Syntax
HRESULT get_ResponseCorrectedPorts(VARIANT *portList);
HRESULT put_ResponseCorrectedPorts(VARIANT portList);
Interface  ICorrectionMethods2
### Reverse2PortAdapter Property

**Description**  
Set and read whether or not to reverse ports on a 2-port fixture or adapter to be de-embedded.

**VB Syntax**  
```
fixture.Reverse2PortAdapter (port) = bool
```

**Variable (Type) - Description**
- `fixture`  
  A Fixturing (object)
- `port`  
  VNA port number for which SNP file is to be de-embedded.
- `bool`  
  `True` - Reverse ports.
  
  `False` - Do NOT reverse ports.

**Return Type**  
Boolean

**Default**  
False

**Examples**
```
fixture.Reverse2PortAdapter = True
value = fixture.Reverse2PortAdapter  'Read
```

**C++ Syntax**
```
HRESULT get_Reverse2PortAdapter(short portNum, VARIANT_BOOL *pRev);
HRESULT put_Reverse2PortAdapter(short portNum, VARIANT_BOOL bRev);
```

**Interface**  
IFixturing6
### ReverseLinearPowerLevel Property

<table>
<thead>
<tr>
<th>Description</th>
<th>Set and read the reverse power level to the DUT. This is applied to the DUT output port when making reverse measurements like S22.</th>
</tr>
</thead>
<tbody>
<tr>
<td>VB Syntax</td>
<td><code>gca.ReverseLinearPowerLevel = value</code></td>
</tr>
<tr>
<td>Variable</td>
<td>(Type) A GainCompression (object) &lt;br&gt; (double) Reverse power level in dBm. Choose a value from +30 to (-30).</td>
</tr>
<tr>
<td>Return Type</td>
<td>Double</td>
</tr>
<tr>
<td>Default</td>
<td>-5</td>
</tr>
<tr>
<td>Examples</td>
<td><code>gca.ReverseLinearPowerLevel = -10 'Write</code> &lt;br&gt;<code>LinPwr = gca.ReverseLinearPowerLevel 'Read</code></td>
</tr>
<tr>
<td>C++ Syntax</td>
<td>HRESULT get_ReverseLinearPowerLevel(double* pVal) &lt;br&gt;HRESULT put_ReverseLinearPowerLevel(double newVal)</td>
</tr>
<tr>
<td>Interface</td>
<td>IGainCompression</td>
</tr>
</tbody>
</table>
### RFOffOnReceiverOverload Property

**Description**
Set and return whether to turn source power OFF when a receiver is overloaded.

**VB Syntax**
```vbnet
pref.RFOffOnReceiverOverload = value
```

**Variable**
- **pref** (Type) - Description
  - A Preferences (object)
- **value** (Boolean) - Choose from:
  - **True**  Turn OFF source power to ALL ports when a receiver is overloaded.
  - **False** Power remains ON when a receiver is overloaded.

**Return Type**
Boolean

**Default**
False

**Examples**
```vbnet
pref.RFOffOnReceiverOverload = True 'Write
value = pref.RFOffOnReceiverOverload 'Read
```

**C++ Syntax**
```cpp
HRESULT get_RFOffOnReceiverOverload (VARIANT_BOOL* preference);
HRESULT put_RFOffOnReceiverOverload (VARIANT_BOOL val)
```

**Interface**
IPreferences12
# RoleDevice Property

This command replaces AssignSourceToRole Method and GetSourceByRole Method. Set and return the source to be used in the specified role. For example, use this command to set a source name to be used as the RF2 tone for a Swept IMD channel.

**VB Syntax**

\[\text{chan.RoleDevice}(\text{role}) = \text{source}\]

**Variable (Type) - Description**

- **chan** (A Channel (object))
- **role** (String) Role of the source. Not context-sensitive. Use DefinedRoles to read the valid roles for the channel.
- **source** (String) Source name to be used in the specified role. Use extDevices.Items to read a list of configured sources.

**Return Type** String

**Default** Not Applicable

**Examples**

- \[\text{chan.RoleDevice}("RF2") = "MyEsg" \] 'Write
- \[\text{source} = \text{chan.RoleDevice}("RF2")\] 'Read

**C++ Syntax**

```cpp
HRESULT get_RoleDevice(BSTR role BSTR *source);
HRESULT put_RoleDevice(BSTR role BSTR source);
```

**Interface** IChannel22
### SADDataThreshold Property

**Description**
Sets or returns the SA data threshold.

**VB Syntax**

```vbnet
seg.SADDataThreshold = value
```

**Variable**
- **seg**: A Segment (object)
- **value**: (Double) Data threshold (in dBm).

**Return Type**
Double

**Default**
-60 dBm

**Examples**

```vbnet
seg.SADDataThreshold = -60 'Write
value = seg.SADDataThreshold 'Read
```

**C++ Syntax**

```cpp
HRESULT get_SADDataThreshold(double* pVal);
HRESULT put_SADDataThreshold(double pVal);
```

**Interface**
ISegment5
## SADDataThresholdOption Property

**Description**
Specifies whether SA Data Threshold can be set independently for each segment.

**VB Syntax**
```
segs.SADDataThresholdOption = value
```

**Variable**

- `segs` A Segments collection *(object)*
- `value` *(boolean)*

- **True** - turns SA Data Threshold control ON.
- **False** - turns SA Data Threshold control OFF.

**Return Type**
Boolean

**Default**
False

**Examples**
```
segs.SADDataThresholdOption = True 'Write
value = SADDataThresholdOption 'Read
```

**C++ Syntax**

- `HRESULT get_SADDataThresholdOption(VARIANT_BOOL *value)`
- `HRESULT put_SADDataThresholdOption(VARIANT_BOOL value)`

**Interface**
ISegments8
## SafeMode Property

**Description**
Sets and returns the state of Safe Mode.

**VB Syntax**
\[ RxLevel.SafeMode(srcPort) = value \]

**Variable**
(Type) - Description

- **RxLevel**
  A ReceiverLeveling Object

- **value**
  (Boolean) Choose from:

  - **True** - Safe mode ON
  - **False** - Safe mode OFF

**srcPort**
(Long Integer) Source port for which to set the Safe Mode state for Receiver Leveling.

**Note:** If the source port is defined by a string name, such as an external source, a balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model, then use `chan.getPortNumber` to translate the string into a port number. To learn more see [Remotely Specifying a Source Port](#).

**Return Type**
Variant Boolean

**Default**
False

**Examples**
\[
\begin{align*}
\text{rxLevel.SafeMode}(1) &= \text{True} \quad \text{Write} \\
\text{value} &= \text{rxLevel.SafeMode}(2) \quad \text{Read}
\end{align*}
\]

**C++ Syntax**

\[
\begin{align*}
\text{HRESULT get_SafeMode(long port, VARIANT_BOOL* pLevelingSafeMode);} \\
\text{HRESULT put_SafeMode(long port, VARIANT_BOOL LevelingSafeMode);} \\
\text{IReceiverLevelingConfiguration}
\end{align*}
\]
**SafeSweepDCParameter Property**

<table>

### SafeSweepEnable Property

**Description**
Set and read the (ON | OFF) state of Safe Sweep mode.

**VB Syntax**
```vbnet
gca.SafeSweepEnable = value
```

**Variable**
- `gca` A `GainCompression (object)`
- `value` (Boolean) Safe Sweep state. Choose from:
  - **False** - Disable Safe Sweep
  - **True** - Enable Safe Sweep

**Return Type**
Boolean

**Default**
False

**Examples**
```vbnet
gca.SafeSweepEnable = True 'Write
SSEnable = gca.SafeSweepEnable 'Read
```

**C++ Syntax**
```cpp
HRESULT get_SafeSweepEnable(VARIANT_BOOL* value)
HRESULT put_SafeSweepEnable(VARIANT_BOOL  value)
```

**Interface**
IGainCompression
<table>

### SafeSweepFineThreshold Property

**Description**  
Set and read the compression level at which Safe Sweep changes from the COARSE power adjustment to the FINE power adjustment.

**VB Syntax**  
gca.SafeSweepFineThreshold = value

**Variable**  
**gca** - GainCompression (object)  
**value** - (Double) Threshold setting in dBm. Choose a value from +30 to (-30).

**Return Type**  
Double

**Default**  
0.5 dBm

**Examples**  
gca.SafeSweepFineThreshold = 0.1  
SSThresh = gca.SafeSweepFineThreshold

**C++ Syntax**  
HRESULT get_SafeSweepFineThreshold(double* value)  
HRESULT put_SafeSweepFineThreshold(double value)

**Interface**  
IGainCompression
### SafeSweepMaximumDCLimit Property

<table>
<thead>
<tr>
<th>Description</th>
<th>Set and read the maximum limit of the external DC device.</th>

<td>IGainCompression6</td>
</tr>
</tbody>
</table>
### SafeSweepMaximumLimit Property

**Description**
When the VNA port that is connected to the DUT Output measures the specified value, the input power to the DUT is no longer incremented at that frequency.

**VB Syntax**
```vbnet
gca.SafeSweepMaximumLimit = value
```

**Variable**

<table>
<thead>
<tr>
<th>(Type)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>gca</code></td>
<td>A GainCompression (object)</td>
</tr>
<tr>
<td><code>value</code></td>
<td>(Double) Maximum power level in dBm. Choose a value from -100 to +100.</td>
</tr>
</tbody>
</table>

**Return Type**
Double

**Default**
100

**Examples**
```vbnet
gca.SafeSweepMaximumLimit = 23 'Write
maxPwr = gca.SafeSweepMaximumLimit 'Read
```

**C++ Syntax**
```cpp
HRESULT get_SafeSweepMaximumLimit(double* value)
HRESULT put_SafeSweepMaximumLimit(double value)
```

**Interface**
IGainCompression
**SAMTReference Property**

**Description**
Sets or returns the SA multitone reference.

**VB Syntax**
```vbnet
seg.SAMTReference = value
```

**Variable (Type) - Description**
- `seg` A Segment (object)
- `value` (Double) Multitone reference (in dBm).

**Return Type**
Double

**Default**
0

**Examples**
```vbnet
seg.SAMTReference = 0 'Write
value = seg.SAMTReference 'Read
```

**C++ Syntax**
```cpp
HRESULT get_SAMTReference(double* pVal);

HRESULT put_SAMTReference(double pVal);
```

**Interface**
ISegment4
## SAMTReferenceFreqOption Property

**Description**: Specifies whether SA Reference Tone can be set independently for each segment.

**VB Syntax**: `segs.SAMTReferenceFreqOption = value`

**Variable (Type) - Description**
- `segs` - A Segments collection (object)
- `value` - (boolean)
  - **True** - turns SA Reference Tone control ON.
  - **False** - turns SA Reference Tone control OFF.

**Return Type**: Boolean

**Default**: False

**Examples**
```
segs.SAMTReferenceFreqOption = True 'Write
value = SAMTReferenceFreqOption 'Read
```

**C++ Syntax**
```
HRESULT get_SAMTReferenceFreqOption(VARIANT_BOOL *value)
HRESULT put_SAMTReferenceFreqOption(VARIANT_BOOL value)
```

**Interface**: ISegments7
## SAResBWList Property

<table>
<thead>
<tr>
<th>Description</th>
<th>Returns a list of Res BW values that are supported by the Spectrum Analyzer app.</th>
</tr>
</thead>
<tbody>
<tr>
<td>VB Syntax</td>
<td><code>value = cap.SAResBWList</code></td>

## SaturationLevel Property

**Description**
Set and read the deviation dB from the maximum Pout. This is the point of saturation.

This value is used for **Compression Method**: Compression from Saturation.

**VB Syntax**

```vbnet
gca.SaturationLevel = value
```

**Variable**

<table>
<thead>
<tr>
<th><strong>Type</strong></th>
<th><strong>Description</strong></th>
</tr>

<tbody>
<tr>
<td><code>gca</code></td>
<td>A GainCompression <em>(object)</em></td>
</tr>
<tr>
<td><code>value</code></td>
<td><em>(Double)</em> - Saturation level in dB. Choose a value greater than 0.01 dB.</td>
</tr>
</tbody>
</table>

**Return Type**
Double

**Default**
.1 dB

**Examples**

```vbnet
gca.SaturationLevel = .5 'Write
satLevel = gca.SaturationLevel 'Read
```

**C++ Syntax**

```
HRESULT get_SaturationLevel(double* pVal)
HRESULT put_SaturationLevel(double newVal)
```

**Interface**
IGainCompression3
### SAVectorAverage Property

### SAVectorAverageOption Property

**Description**: Specifies whether SA Video Bandwidth can be set independently for each segment.

**VB Syntax**: `segs.SAVectorAverageOption = value`

**Variable**
- **Type**: Segment collection (`object`)
- **Value**: Boolean
  - `True` - turns SA Vector Averaging control ON.
  - `False` - turns SA Vector Averaging control OFF.

**Return Type**: Boolean

**Default**: False

**Examples**
- `segs.SAVectorAverageOption = True 'Write`
- `value = SAVectorAverageOption 'Read`

**C++ Syntax**
- `HRESULT get_SAVectorAverageOption(VARIANT_BOOL *value)`
- `HRESULT put_SAVectorAverageOption(VARIANT_BOOL value)`

**Interface**: ISegments7

### SB_BalPortNegative Property

**Description**  
With a Single-ended - Balanced topology, returns the VNA port number that is connected to the Negative side of the DUT's Balanced Port.

Use **SetSBPorts Method** to set the port mapping for a Single-Ended - Balanced topology.

**VB Syntax**  
```
var = balTopology.SB_BalPortNegative
```

**Variable (Type) - Description**  
- **var** (Long Integer) Variable to store the returned value.

**balTopology**  
A **BalancedTopology (object)**

**Return Type**  
Long Integer

**Default**  
Not Applicable

**Examples**  
```
variable = balTop.SB_BalPortNegative  'Read
```

**C++ Syntax**  
```
HRESULT get_SB_BalPortNegative(long *bVal)
```

**Interface**  
IBalancedTopology
SB_BalPortPositive Property

Description
With a Single-ended - Balanced topology, returns the VNA port number that is connected to the Positive side of the DUT's Balanced Port.

Use SetSBPorts Method to set the port mapping for a Single-Ended - Balanced topology.

VB Syntax
```vbnet
var = balTopology.SB_BalPortPositive
```

Variable (Type) - Description
- `var` (Long Integer) Variable to store the returned value.

`balTopology` A BalancedTopology (object)

Return Type Long Integer

Default Not Applicable

Examples
```vbnet
variable = balTop.SB_BalPortPositive  'Read
```

C++ Syntax
```c++
HRESULT get_SB_BalPortPositive(long *bVal)
```

Interface IBalancedTopology
**SB_SEPort Property**

<table>
<thead>

HRESULT get_SB_SEPort(long *bVal)
```

**Interface**

IBalancedTopology
 SBalMeasurement Property

**Description**
Sets and returns the measurement for the Single-Ended - Balanced topology.

**VB Syntax**

```vbnet
balMeas.SBalMeasurement = value
```

**Variable (Type) - Description**

- `balMeas` A `BalancedMeasurement` (object)
- `value` (String) - Single-ended - Balanced Measurement parameter. Not case-sensitive. Choose from:

<p>| | | |</p>
<table>

<td><code>win.ScaleCouplingMethod = naScaleCouplingWindow</code> 'Write</td>
</tr>
<tr>
<td></td>
<td><code>method = app.ActiveNAWindow.ScaleCouplingMethod</code> 'Read</td>
</tr>
<tr>
<td>C++ Syntax</td>
<td>HRESULT get_ScaleCouplingMethod(tagNAScaleCouplingMethod* couplingMethod);</td>
</tr>
<tr>
<td></td>
<td>HRESULT put_ScaleCouplingMethod(tagNAScaleCouplingMethod couplingMethod);</td>
</tr>
<tr>
<td>Interface</td>
<td>INAWindow2</td>
</tr>
</tbody>
</table>
## ScaleCouplingState Property

**Description**
Enables and disables scale coupling for the window.

Use `ScaleCouplingMethod` to select the coupling method.

**VB Syntax**

```vbnet
win.ScaleCouplingState = bool
```

**Variable**

- **(Type)** - Description
  - `win` - An `NAWindow` (object).
  - `bool` - (Boolean)
    - **False** - NO scale coupling for this window.
    - **True** - Scale coupling enabled for this window.

**Return Type**
Boolean

**Default**
True

**Examples**

```vbnet
win.ScaleCouplingState = false 'Write
coupled = app.ActiveNAWindow.ScaleCouplingState 'Read
```

**C++ Syntax**

```cpp
HRESULT get_ScaleCouplingState(VARIANT_BOOL *pVal);

HRESULT put_ScaleCouplingState(VARIANT_BOOL newVal)
```

**Interface**
INAWindow2
# Scope Property

**Description**
Sets or returns the scope of a trigger signal. This determines whether a trigger signal affects a single channel or all channels in the VNA.

**Note:** Trigger Modes Point and EverySweep require that Trigger.Scope be set to naChannelTrigger.

**VB Syntax**
```
trigsetup.Scope = value
```

<table>
<thead>
<tr>
<th>Variable</th>
<th>(Type) - Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>trigsetup</td>
<td>A TriggerSetup (object)</td>
</tr>
<tr>
<td>value</td>
<td>(enum NATriggerType) - Trigger type. Choose from:</td>
</tr>
<tr>
<td></td>
<td>0 - naGlobalTrigger - a trigger signal is applied to all triggerable channels</td>
</tr>
<tr>
<td></td>
<td>1 - naChannelTrigger - a trigger signal is applied to the current channel. The next trigger signal will be applied to the next channel; not necessarily the next channel in numeric sequence (1-2-3-4 and so forth).</td>
</tr>
<tr>
<td></td>
<td>2 - naActiveChannelTrigger - a trigger signal is sent only to the active channel.</td>
</tr>
</tbody>
</table>

**Return Type**
Long Integer

**Default**
naGlobalTrigger

**Examples**
```
trigsetup.Scope = naGlobalTrigger 'Write
trigtyp = trigsetup.Scope 'Read
```

**C++ Syntax**
```
HRESULT get_Scope(tagNATriggerType *pTrigger)
HRESULT put_Scope(tagNATriggerType trigger)
```

**Interface**
ITriggerSetup
SearchFunction Property

Description
Emulates the Tracking function in the marker search dialog box. The value you choose for SearchFunction will determine the type of search that takes place when the Tracking property is set true.

The tracking function finds the selected search function every sweep. In effect, turning Tracking ON is the same as executing one of the "Search..." methods (such as SearchMin, SearchMax) for every sweep.

VB Syntax
mark/SearchFunction = value

Variable
(mark) - Description
mark A Marker (object)
value (enum NAMarkerFunction) - search function. Choose from:

0 - naMarkerFunction_None
1 - naMarkerFunction_Min
2 - naMarkerFunction_Max
3 - naMarkerFunction_Target
4 - naMarkerFunction_NextPeak
5 - naMarkerFunction_PeakRight
6 - naMarkerFunction_PeakLeft
7 - naMarkerFunction_Compression

Return Type
Long Integer

Default
0 - naMarkerFunction_None

Examples
mark/SearchFunction = naMarkerFunction_Target 'When this marker is set to track, it will track the Target value.

searchfunction = mark/SearchFunction 'Read

C++ Syntax
HRESULT get_SearchFunction(tagNAMarkerFunction *pVal)
HRESULT put_SearchFunction(tagNAMarkerFunction newVal)

Interface
IMarker
SearchFailures Property

Description
Returns a comma-separated list of the frequency indexes that were out of
tolerance for SMART Sweep mode, or at the power limit for 2D Sweep mode.
Zero (0) is the first frequency data point.

Must be Single triggered. Invalid results occur if the GCA channel is
continuously sweeping.

VB Syntax
value = gca.SearchFailures

Variable (Type) - Description
value (Double) Variable to store the returned data.
gca A GainCompression (object)

Return Type
Returns a comma-separated list of frequency indexes.

Default
Not applicable

Examples
SFA = gca.SearchFailures 'Read

C++ Syntax
HRESULT get_SearchFailures(VARIANT* value)

Interface
IGainCompression
## SearchOccupiedBWMinFreq Property

**Description**  
Set and read the minimum search frequency to use during an Occupied BW search measurement. Power below this frequency is ignored.

**VB Syntax**  
`sas .SearchOccupiedBWMinFreq = value`

**Variable** (Type) - Description  
- `sa`  
  A `SpectrumAnalyzer` (object)
- `value`  
  `(Double)` Minimum search frequency value.

Learn about these settings.

**Return Type**  
Double

**Default**  
250 MHz

**Examples**  
- `sa .SearchOccupiedBWMinFreq = 300e6`  
  *Write*
- `value = sa .SearchOccupiedBWMinFreq`  
  *Read*

**C++ Syntax**  
```cpp
HRESULT put_SearchOccupiedBWMinFreq(double minfreq);
HRESULT get_SearchOccupiedBWMinFreq(double* minfreq);
```

**Interface**  
`ISpectrumAnalyzer4`

## SearchSummary Property

<table>
<thead>
<tr>
<th>Description</th>
<th>Returns the status of a compression search. This command can be used to indicate when a GCA search is complete.</th>
</tr>
</thead>
</table>

**Note:** The returned value reflects the current state of the GCA compression search which can vary when in continuous sweep. This command is intended to be used with `chan.Single` (trigger).

### VB Syntax

```vbnet
value = gca.SearchSummary
```

### Variable (Type) - Description

**value** *(Enum)* Variable to store the returned value.

- **0 - naSearchNotDone** - Acquisition is still in process.
- **1 - naSearchSucceeded** - Acquisition is complete and compression value found for all frequency points.
- **2 - naSearchFailed** - Acquisition is complete and unable to find the compression value at one or more frequency points.

### gca

A `GainCompression` *(object)*

### Return Type

Enum

### Default

Not Applicable

### Examples

```vbnet
sum = gca.SearchSummary
```

### C++ Syntax

```c++
HRESULT get_SearchSummary(enum naGCASearchSummary* value)
```

### Interface

`IGainCompression`
### SecurityLevel Property

**Description**
Controls the display of frequency information on the VNA screen and printouts.

**VB Syntax**
```vbnet
app.SecurityLevel value
```

**Variable**
- **Type** - Description
- **app** An Application (object)
- **value** (enum NASecurityLevel) - Choose from:
  - **0 - naNoSecurity** ALL frequency information is displayed.
  - **1 - naLowSecurity** NO frequency information is displayed. Frequency information can be redisplayed using the Security Setting dialog box or this command.
  - **2 - naHighSecurity** LOW setting plus GPIB console is disabled. Frequency information can be redisplayed ONLY by performing a Preset, recalling an instrument state with None or Low security settings, or using this command.
  - **3 - naExtraSecurity** HIGH setting plus:
    - ASCII data saving is disabled. Same method to redisplay frequency information as HIGH setting.
    - Mixer setup files (*.mxr) can NOT be saved.

**Return Type**
Long Integer

**Default**
0 - None

**Examples**
```vbnet
app.SecurityLevel = naLowSecurity 'Write
level = app.SecurityLevel 'Read
```

**C++ Syntax**
```cpp
HRESULT get_NASecurityLevel(tagNASecurityLevel *level);
HRESULT put_NASecurityLevel(tagNASecurityLevel level);
```

**Interface**
IApplication4
### SegmentNumber Property

</tbody>
</table>
SegmentFixedFrequency Property

Description
Set and read the CW Frequency for mixer segments. The specified SegmentRangeMode must be set to Fixed.

Send Apply before sending a query (read). Learn more.

VB Syntax

```
conv.SegmentFixedFrequency(index,range) = value
```

Variable (Type) - Description

- **conv** (A Converter Object)
- **index** (Long integer) Segment for which fixed frequency is being set. Choose a segment between 1 and the current segment count. Use SegmentCount Property to read the current count in the Applied Mixer.
- **range** (Enum as ConverterFrequencyRange) Range for which fixed frequency is being set. Choose from:
  - 0 - naInputFrequencies - set input frequency
  - 1 - naOutputFrequencies - set output frequency
  - 2 - naLO1Frequencies - set LO1 frequency
  - 3 - naLO2Frequencies - set LO2 frequency
  - 4 - naIFFrequencies - set IF frequency
- **value** (Double) CW Frequency. Choose a value within the frequency range of the VNA.

Return Type
Double

Default
Center frequency of the VNA

Examples
```
mxr.SegmentFixedFrequency(1,0)=1e9 'sets the input frequency to 1 GHz
```

See example program

C++ Syntax

```
HRESULT get_SegmentFixedFrequency(long index, tagConverterFrequencyRange range, double *value);

HRESULT put_SegmentFixedFrequency(long index, tagConverterFrequencyRange value, double value);
```
<table>
<thead>
<tr>
<th>Interface</th>
<th>IConverter5</th>
</tr>

2277
### SegmentFixedPower Property

**Description**  
Set and read the fixed power level for the mixer segment.

**VB Syntax**  
```vbnet
conv.SegmentFixedPower(index, range) = value
```

**Variable (Type) - Description**

- **conv**  
  A Converter Object

- **index**  
  (Long integer) Segment for which power is being set. Choose a segment between 1 and the current segment count. Use SegmentCount Property to read the current count in the Applied Mixer.

- **range**  
  (Enum as ConverterFrequencyRange) Range for which power is being set. Choose from:

  0 - naInputFrequencies - set input power

  1 - naOutputFrequencies - set output power

  2 - naLO1Frequencies - set LO1 power

  3 - naLO2Frequencies - set LO2 power

  4 - naIFFrequencies - set IF power

- **value**  
  (Double) Power level in dBm. Choose a value within the power/attenuation range of the VNA.

**Return Type**  
Double

**Default**

**Examples**  
```vbnet
mxr.SegmentFixedPower(1, 0) = 0 'sets the input power level to 0 dBm
```

**See example program**

**C++ Syntax**

```cpp
HRESULT get_SegmentFixedPower(long index, tagConverterFrequencyRange range, double *value);

HRESULT put_SegmentFixedPower(long index, tagConverterFrequencyRange value, double value);
```

**Interface**  
IConverter5
# SegmentIFBandwidth Property

Sets and returns the IF Bandwidth for the sweep segment.

Send **Apply** before sending a query (read). Learn more.

**VB Syntax**

```
conv.SegmentIFBandwidth(index, value)
```

**Variable (Type) - Description**

- **conv**: A Converter Object
- **index**: (Long integer) Segment for which IF Bandwidth is to be set. Choose a segment between 1 and the current segment count. Use **SegmentCount Property** to read the current count in the Applied Mixer.
- **value**: (Long integer) IF Bandwidth in Hz. The list of valid IF Bandwidths is different depending on the VNA model. See the lists. If an invalid number is specified, the analyzer will round up to the closest valid number.

**Return Type**: Long integer

**Default**: 100 kHz

**Examples**

```
mxr.SegmentIFBandwidth(1,3)=10e3 'Sets IFBW to 10 kHz
```

See example program

**C++ Syntax**

```
HRESULT get_SegmentIFBandwidth(long index, long * val);
HRESULT put_SegmentIFBandwidth(long index, long val);
```

**Interface**: IConverter5
## SegmentIsInputGreaterThanLO Property

**Description**
Set and read whether to use the Input frequency that is greater than the LO or less than the LO.

Send Apply before sending a query (read). Learn more.

**VB Syntax**
```vbnet
conv.SegmentIsInputGreaterThanLO(index, range) = value
```

**Variable**
- **conv**  
  A Converter Object
- **index**  
  (Long integer) Segment which is being set. Choose a segment between 1 and the current segment count. Use SegmentCount Property to read the current count in the Applied Mixer.
- **range**  
  (Enum as ConverterFrequencyRange) Range for which value is being set. Choose from:
  - 0 - **naInputFrequencies** - set input power
  - 1 - **naOutputFrequencies** - set output power
  - 2 - **naLO1Frequencies** - set LO1 power
  - 3 - **naLO2Frequencies** - set LO2 power
  - 4 - **naIFFrequencies** - set IF power
- **value**  
  (Boolean) - Choose from the following:
  - **True** - Use the Input that is Greater than the specified LO.
  - **False** - Use the Input that is Less than the specified LO.

**Return Type**
Boolean

**Default**
True

**Examples**
```vbnet
mxr.SegmentIsInputGreaterThanLO(1,2=1)'sets segment 1, LO1 to Input greater
```

**C++ Syntax**
```cpp
HRESULT get_SegmentIsInputGreaterThanLO(long index,  
tagConverterFrequencyRange range, VARIANT_BOOL *value);
```

```cpp
HRESULT put_SegmentIsInputGreaterThanLO(long index,  
tagConverterFrequencyRange range, VARIANT_BOOL *value);
```
tagConverterFrequencyRange value, VARIANT_BOOL value);

Interface IConverter5
### SegmentMixingMode Property

**Description**  
Set and read whether the mixing mode (high side or low side) for the mixer segment.

Send **Apply** before sending a query (read). Learn more.

**VB Syntax**  
`conv.SegmentMixingMode(index, range) = value`

**Variable (Type) - Description**

- **conv**  
  A Converter Object

- **index**  
  (Long integer) Segment for which mixing mode being set. Choose a segment between 1 and the current segment count. Use **SegmentCount Property** to read the current count in the Applied Mixer.

- **range**  
  (Enum as ConverterFrequencyRange) Range for which mixing mode is being set. Choose from:
  
  1 - **naOutputFrequencies** - sets output frequencies for 1-stage or 2-stage mixers.

  4 - **naIFFrequencies** - sets IF frequencies for the first LO in 2-stage mixers.

- **value**  
  (Enum as ConverterSideBand) Choose from:

  0 - **naLowSide**  
  Input minus LO

  1 - **naHighSide**  
  Input plus LO

**Return Type**  
Enum as ConverterSideBand

**Default**  
0 - **naLowSide**

**Examples**

```vbnet
mxr.SegmentMixingMode(1,1)=1 'sets segment 1 output frequencies to Highside mixing.
```

See example program

**C++ Syntax**

```cpp
HRESULT get_SegmentMixingMode(long index, tagConverterFrequencyRange range, tagConverterSideBand *value);

HRESULT put_SegmentMixingMode(long index, tagConverterFrequencyRange value, tagConverterSideBand value);
```

**Interface**  
IConverter5
# SegmentPoints Property

**Description**
Sets and returns the number of data points to be measured in the sweep segment.

Send Apply before sending a query (read). Learn more.

**VB Syntax**

```vbnet
conv.SegmentPoints(index) = value
```

**Variable** *(Type) - Description*

- **conv** A Converter Object
- **index** (Long integer) Segment for which points is to be set. Choose a segment between 1 and the current segment count. Use SegmentCount Property to read the current count in the Applied Mixer.
- **value** (Long integer) - Choose a value between 1 and the maximum number of data points allowed in the VNA. This is also the total number of points allowed for ALL segments.

**Return Type**
Long integer

**Default**
21

**Examples**

```vbnet
mxr.SegmentPoints(1)=3  'Sets 3 points for segment 1.
```

See example program

**C++ Syntax**

```cpp
HRESULT get_SegmentPoints(long index, long * val);

HRESULT put_SegmentPoints(long index, long val);
```

**Interface**
IConverter5
## SegmentRangeMode Property

**Description**
Sets or returns the segment sweep mode (Swept or Fixed) for the specified range (Input/LO/Output).

Send `Apply` before sending a query (read). [Learn more.](#)

### VB Syntax

```
conv.SegmentRangeMode(index,range) = value
```

### Variable *(Type) - Description*

- **conv**
  - A `Converter Object`

- **index**
  - (Long integer) Segment for which mixing mode being set. Choose a segment between 1 and the current segment count. Use `SegmentCount Property` to read the current count in the **Applied Mixer**.

- **range**
  - (Enum as `ConverterFrequencyRange`) Range for which sweep mode is being set. Choose from:
    - 0 - `naInputFrequencies` - set input sweep mode.
    - 1 - `naOutputFrequencies` - set output sweep mode.
    - 2 - `naLO1Frequencies` - set LO1 sweep mode.
    - 3 - `naLO2Frequencies` - set LO2 sweep mode.
    - 4 - `naIFFrequencies` - set IF sweep mode.

- **value**
  - (Enum as `NARangeMode`) Choose from:
    - 0 - `naSwept` Range is swept
    - 1 - `naFixed` Range is fixed.

### Return Type

Enum as `NARangeMode`

### Default

- Input and Output - `naSwept`
- LO (1 and 2) - `naFixed`

### Examples

```
mxr.SegmentRangeMode(1,1)=0  'sets segment 1 output range to swept.
```

[See example program](#)

### C++ Syntax

```
HRESULT get_SegmentRangeMode(long index, tagConverterFrequencyRange range, tagNARangeMode *value);
```
HRESULT put_SegmentRangeMode(long index,  
tagConverterFrequencyRange value, tagNARangeMode value);

Interface  IConverter5
### SegmentStartFrequency Property

**Description**
Set and read the start frequency for the mixer segment. The specified `SegmentRangeMode` must be set to Swept.

Send **Apply** before sending a query (read). Learn more.

**VB Syntax**

```vbnet
conv.SegmentStartFrequency(index, range) = value
```

**Variable (Type) - Description**

- **conv** (A Converter Object)
- **index** (Long integer) Segment for which start frequency is being set. Choose a segment between 1 and the current segment count. Use `SegmentCount Property` to read the current count in the Applied Mixer.
- **range** (Enum as `ConverterFrequencyRange`) Range for which start frequency is being set. Choose from:
  - 0 - naInputFrequencies - set input frequency
  - 1 - naOutputFrequencies - set output frequency
  - 2 - naLO1Frequencies - set LO1 frequency
  - 3 - naLO2Frequencies - set LO2 frequency
  - 4 - naIFFrequencies - set IF frequency
- **value** (Double) Start frequency. Choose a value within the frequency range of the VNA.

**Return Type**
Double

**Default**
Start frequency of the VNA

**Examples**

```vbnet
mxr.SegmentStartFrequency(1, 0)=1e9 'sets the input start frequency to 1 GHz
```

See example program

**C++ Syntax**

```c++
HRESULT get_SegmentStartFrequency(long index, tagConverterFrequencyRange range, double *value);

HRESULT put_SegmentStartFrequency(long index, tagConverterFrequencyRange value, double value);
```
Interface  IConverter5
## SegmentState Property

**Description**
Sets and returns the ON|OFF state of a sweep segment. Off segments are not included in a segment sweep. Send **Apply** before sending a query (read). Learn more.

**VB Syntax**

```
conv.SegmentState(index) = state
```

**Variable** (Type) - Description

<table>
<thead>
<tr>
<th>Variable</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>conv</code></td>
<td>A Converter Object</td>
<td></td>
</tr>
<tr>
<td><code>index</code></td>
<td>(Long integer) Segment to set ON or OFF. Choose a segment between 1 and the current segment count. Use SegmentCount Property to read the current count in the Applied Mixer.</td>
<td></td>
</tr>
<tr>
<td><code>state</code></td>
<td>(Boolean) - Choose from:</td>
<td></td>
</tr>
<tr>
<td></td>
<td><strong>True</strong> - Segment ON</td>
<td></td>
</tr>
<tr>
<td></td>
<td><strong>False</strong> - Segment OFF</td>
<td></td>
</tr>
</tbody>
</table>

**Return Type**
Boolean

**Default**
ON when added.

**Examples**

```vba
mxr.SegmentState(1)=False 'Turns segment 1 OFF.
```

See example program

**C++ Syntax**

```cpp
HRESULT get_SegmentState(long index, VARIANT_BOOL * val);

HRESULT put_SegmentState(long index, VARIANT_BOOL val);
```

**Interface**
IConverter5
**SegmentStopFrequency Property**

**Description**
Set and read the Stop frequency for the mixer segment. The specified `SegmentRangeMode` must be set to Swept.

Send **Apply** before sending a query (read). Learn more.

**VB Syntax**
```
conv.SegmentStopFrequency(index, range) = value
```

**Variable**
- **`conv`** - Description
  A Converter Object
- **`index`** - (Long integer) Segment for which Stop frequency is being set. Choose a segment between 1 and the current segment count. Use `SegmentCount Property` to read the current count in the Applied Mixer.
- **`range`** - (Enum as ConverterFrequencyRange) Range for which Stop frequency is being set. Choose from:
  - **0 - naInputFrequencies** - set input frequency
  - **1 - naOutputFrequencies** - set output frequency
  - **2 - naLO1Frequencies** - set LO1 frequency
  - **3 - naLO2Frequencies** - set LO2 frequency
  - **4 - naIFFrequencies** - set IF frequency
- **`value`** - (Double) Stop frequency. Choose a value within the frequency range of the VNA.

**Return Type**
Double

**Default**
Stop frequency of the VNA

**Examples**
```
mxr.SegmentStopFrequency(1,0)=1e9 'sets the input Stop frequency to 1 GHz
```

See example program

**C++ Syntax**
```
HRESULT get_SegmentStopFrequency(long index, tagConverterFrequencyRange range, double *value);

HRESULT put_SegmentStopFrequency(long index, tagConverterFrequencyRange value, double value);
```
Interface  IConverter5
SelectPort Property

Description
Sets and returns a port mapping for a single port. If this command creates a conflict with an existing port, the VNA will resolve the conflict.

Note: This command is currently not supported for the Z5623AK44.

VB Syntax
```vbnet
  tset.SelectPort(chNum, portNum) = portValue
```

Variable (Type) - Description
- `tset` A `TestsetControl` object.
- `chNum` (Long) Channel number of the measurement.
- `portNum` (Long) Physical port number to map.
- `portValue` (Long) Logical port value to assign

Return Type
Long

Default
Not Applicable

Examples
See External Testset Program

C++ Syntax
```cpp
  HRESULT get_SelectPort(long channelNum, long PortNum long *outPort);
  HRESULT put_SelectPort(long channelNum, long PortNum long outPort);
```

Interface
`ITestsetControl`
## SensorIndex Property

**Description**  
For dual sensor power meters, sets and returns the power sensor channel (1 or 2) to be used.

**VB Syntax**  
`pwrSensor.SensorIndex = value`

**Variable**  
**Type** - Description  
pwrSensor  
A `PowerSensor` (Object) or  
a `PowerSensorAsReceiver` (Object)  

**value**  
**Long** - Power Meter channel. Choose from:  
1 - Sensor A  
2 - Sensor B

**Return Type**  
Long

**Default**  
1

**Examples**  
`pwrSensor.SensorIndex = False` 'Write

`sensor = pwrSensor.SensorIndex` 'Read

**C++ Syntax**  
HRESULT put_SensorIndex(long newVal);

HRESULT get_SensorIndex(long* pVal);

**Interface**  
IPowerSensor  
IPowerSensorAsReceiver
## SeparatePowerCal Property

<table>
<thead>
<tr>
<th>Description</th>
<th>Specifies whether to use a Thru standard or to use two power sensor connections during the power cal of an SMC calibration. <a href="#">Learn more.</a></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>This command must be sent immediately after the Initialize command, but before all other calibration properties.</td>
</tr>
</tbody>
</table>

### VB Syntax

```vbnet
smc.SeparatePowerCal = bool
```

### Variable

**Type** - Description

- **smc**  
  An SMCType (object)

- **bool**  
  (Boolean)

**True** - Do NOT use a Thru, but instead perform separate power cals on Input and Output reference planes.

**False** - Perform Cal with Thru standard.

### Return Type

Boolean

### Default

False

### Example

```vbnet
FCAppLib.ISMCType4 SMC = (FCAppLib.ISMCType4)CalMgr.CreateCustomCal("SMC");
SMC.Initialize(chan, true);
if (separatePowerCalIsDesired)
    SMC.SeparatePowerCal = true;
```

### C++ Syntax

```cpp
HRESULT put_SeparatePowerCal(VARIANT_BOOL bValue);
HRESULT get_SeparatePowerCal(VARIANT_BOOL *bValue);
```

### Interface

SMCType4
### ShiftLO Property *(PNA does not support this setting)*

**Description** Sets or returns the Shift LO Property of a Segment. Enable the Shift LO Property setting using the `ShiftLOOption Property` of the Segments collection.

#### VB Syntax

```vbnet
seg.ShiftLO = value
```

#### Variable *(Type) - Description*

- **seg**
  - A Segment *(object)*
- **value** *(boolean)*
  - **True** - Enable shift LO state.
  - **False** - Disable shift LO state.

**Return Type** Boolean

**Default** False

#### Examples

- `seg.ShiftLO = True` *Write*
- `shiftstate = seg.ShiftLO` *Read*

#### C++ Syntax

- `HRESULT get_ShiftLO(VARIANT_BOOL* pVal)`
- `HRESULT put_ShiftLO(VARIANT_BOOL pVal)`

**Interface** ISegment3
ShiftLOOption Property (This command is not supported on PNA-L, PNA, PNA-X)

Description
Enables or disables ShiftLO per segment. Value is set using ShiftLO Property of a segment.

VB Syntax
```
segs.ShiftLOOption = value
```

Variable
(Type) - Description
```
segs  A Segments collection (object)
value (boolean)
  True - Enable shift LO state.
  False - Disable shift LO state.
```

Return Type
Boolean

Default
False

Examples
```
segs.ShiftLOOption = True 'Write
shiftstate = segs.ShiftLOOption 'Read
```

C++ Syntax
```
HRESULT get_ShiftLOOption(VARIANT_BOOL* pVal)
HRESULT put_ShiftLOOption(VARIANT_BOOL pVal)
```

Interface
ISegments6
## ShowKeysToolbarAtPowerOn Property

# ShowStatistics Property

**Description**
Displays and hides the measurement (Trace) statistics (peak-to-peak, mean, standard deviation) on the screen. To display measurement statistics for a narrower band of the X-axis, use `StatisticsRange`.

The analyzer will display either measurement statistics or Filter Bandwidth statistics; not both.

**VB Syntax**
```vbnet
meas.ShowStatistics = value
```

**Variable (Type) - Description**
- `meas` (A Measurement object)
- `value` (boolean) - Boolean value:
  - **True** - Show statistics
  - **False** - Hide statistics

**Return Type**
Boolean

**Default**
**False**

**Examples**
```vbnet
meas.ShowStatistics = True
```

**C++ Syntax**
```cpp
HRESULT put_ShowStatistics(VARIANT_BOOL bState)
```

**Interface**
IMeasurement
ShowProperties Property

Description: Turns ON and OFF the display of the test set control status bar. This status bar indicates the test set that is being controlled and the current port mappings. This setting is turned ON and OFF automatically when the test set is enabled or disabled.

VB Syntax: `tset.ShowProperties = value`

Variable (Type) - Description

- `tset` A TestsetControl object.
- OR
- An E5091Testset object.

- `value` (Boolean)
  - **True** - Turns display of testset properties ON.
  - **False** - Turns display of testset properties OFF.

Return Type: Boolean

Default: **False** (True when test set control is enabled.)

Examples:

- See E5091A Example Program
- See External Testset Program

C++ Syntax:

- `HRESULT get_ShowProperties(VARIANT_BOOL *state);`
- `HRESULT put_ShowProperties(VARIANT_BOOL state);`

Interface: IE5091Testsets

ITestsetControl
**ShowQuickStartOnPreset Property**

**Description**
This command controls the on/off state of the preference, "On PRESET show Quick Start dialog".

**VB Syntax**
```
pref.ShowQuickStartOnPreset = value
```

**Variable**

<table>
<thead>
<tr>
<th>(Type)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pref</td>
<td>A Preferences (object)</td>
</tr>
<tr>
<td>value</td>
<td>(Boolean) - Choose from:</td>
</tr>
<tr>
<td></td>
<td><strong>True</strong> - Display the Quick Start dialog on PRESET.</td>
</tr>
<tr>
<td></td>
<td><strong>False</strong> - Do not display the Quick Start dialog on PRESET.</td>
</tr>
</tbody>
</table>

**Return Type**
Boolean

**Default**
False

**Examples**
```
pref.ShowQuickStartOnPreset = True 'Write
value = pref.ShowQuickStartOnPreset 'Read
```

**C++ Syntax**
```
HRESULT get_ShowQuickStartOnPreset (VARIANT_BOOL* preference);
HRESULT put_ShowQuickStartOnPreset (VARIANT_BOOL val);
```

**Interface**
IPreferences13
SICL Property

Description Allows you to control the VNA via SICL (standard instrument control library). In this mode, the analyzer can receive SCPI commands from the LAN interface or from a program residing on the VNA itself. This command performs the same function as the SICL / GPIB dialog box - SICL Enabled checkbox. See Configuring the analyzer for SICL/VISA.

When SICL is enabled, the VNA VXI-11.2 interface is enabled, and if the VNA hard disk image is new enough to have the VXI-11.3 interface, it also enables that. Learn more about LXI / VXI.

With this method you can augment a test program written using SICL that resides on the VNA so that it will run unattended. An automation script can be written to start the VNA, enable SICL (using the SICL property), and then start the SICL based program.

VB Syntax

```vbnet
app.SICL value
```

Variable (Type) - Description

- **app** An Application (object)
- **value** (Boolean) Choose from:
  - **True** - enable SICL
  - **False** - disable SICL

Return Type Boolean

Default False

Examples

```vbnet
Dim Pna as AgilentPNA835x.Application
Dim siclState as Boolean
Set Pna = CreateObject("AgilentPNA835x.Application")
Pna.SICL = true 'write
siclState = Pna.SICL 'Read
```

C++ Syntax

```cpp
HRESULT get_SICL(VARIANT_BOOL *pVal)
HRESULT put_SICL(VARIANT_BOOL newVal)
```

Interface IApplication5
## SICLAddress Property

<table>
<thead>
<tr>
<th>Description</th>
<th>Sets and returns the VNA SICL address. This is the address used for SICL over LAN.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>VB Syntax</strong></td>
<td><code>app.SICLAddress = value</code></td>

</tbody>
</table>
# Simultaneous2PortAcquisition Property

## Description
Specifies whether a 2-port calibration will be done with a single set of standards (one port at a time) or with two sets of standards (simultaneously).

The `AcquireCalStandard2` command uses the same standard index for each calibration class. To specify the calibration standard gender for each port, you must first ensure that the order of calibration class accurately reflects the configuration of your DUT. For example, for a DUT with a male connector on port 1 and a female connector on port 2, order the devices within the S11 classes (A, B, and C) such that the MALE standards are first in the list. Then order the S22 classes specifying the FEMALE standards as the first in the list.

## VB Syntax
```vbnet
cal.Simultaneous2PortAcquisition = state
```

### Variable (Type) - Description
- **cal**: A Calibrator (object)
- **state**: (boolean) - Choose from:
  - **True**: measures 2 ports simultaneously
  - **False**: measures 1 port at a time

### Return Type
Boolean

### Default
True

### Examples
```vbnet
cal.Simultaneous2PortAcquisition = True
```

## C++ Syntax
```c++
HRESULT put_Simultaneous2PortAcquisition( VARIANT_BOOL bTwoSetsOfStandards)

HRESULT Simultaneous2PortAcquisition( VARIANT_BOOL *bTwoSetsOfStandards)
```

## Interface
ICalibrator
**SingleMarkerSearch Property**

**Description**
Set and return whether to use one marker for marker search.

**Enabled behavior:**

- Only one marker is used for bandwidth, notch, PNOP, and PSAT marker searches. The points of interest are marked with a notational UI element, i.e. a small triangle.

- Bandwidth, notch, PNOP, and PSAT marker searches are always tracking. Tracking cannot be disabled.

- One basic search and one advanced search may be set per marker.

- The advanced search is enabled until the user disables the search or a multi-peak or multi-target search is executed.

**Disabled behavior:**

- Bandwidth, notch, PSAT, and PNOP marker searches use multiple markers.

- One advanced marker search is allowed per trace.

- A marker may only perform a basic search or be part of an advanced search. Not both.

- If an advanced marker search is enabled on a trace and then the user performs a basic search, the advanced search is automatically disabled.

- Advanced searches may enable or disable tracking. Only one search may be tracked.

**VB Syntax**

```
pref.SingleMarkerSearch = bool
```

**Variable** *(Type)* - Description

`pref` A *Preferences* *(object)*
bool (boolean)
False - Disable single marker search.
True - Enable single marker search.

Return Type: Boolean
Default: False

Examples:
```c
pref.SingleMarkerSearch = True 'Write
prefer = pref.SingleMarkerSearch 'Read
```

C++ Syntax:
```cpp
HRESULT get_SingleMarkerSearch(VARIANT_BOOL *mkrState)
HRESULT put_SingleMarkerSearch(VARIANT_BOOL mkrState)
```

Interface: IPreferences18
**SmartSweepMaximumIterations Property**

**Description**
Set and read the maximum permitted number of iterations which SMART Sweep may utilize to find the desired compression level, to within the specified tolerance.

**VB Syntax**
```
gca.SmartSweepMaximumIterations = value
```

**Variable**
- **(Type)** - Description
  - `gca` A *GainCompression* (object)
  - `value` (integer) - Maximum number of iterations. Choose a value between 1 and 50.

**Return Type**
Integer

**Default**
20

**Examples**
```
gca.SmartSweepMaximumIterations = 10 'Write

iters = gca.SmartSweepMaximumIterations 'Read
```

**C++ Syntax**
- `HRESULT get_SmartSweepMaximumIterations(int* pVal)`
- `HRESULT put_SmartSweepMaximumIterations(int newVal)`

**Interface**
*IGainCompression*
About SMART Sweep

SmartSweepSettlingTime Property

Description
Set and read the amount of time SMART Sweep will dwell at the first point where the input power changes by the Backoff or X level.

Learn more.

VB Syntax
\texttt{\textit{gca}.SmartSweepSettlingTime = value}

Variable (Type) - Description
\textit{gca} - A GainCompression (object)
\textit{value} - (double) - Settling time in seconds. Choose any positive value.

Return Type
Double

Default
0

Examples
\texttt{\textit{gca}.SmartSweepSettlingTime = .01 \textasciitilde\textit{Write}}

\texttt{sTime = gca.SmartSweepSettlingTime \textasciitilde\textit{Read}}

C++ Syntax
HRESULT get_SmartSweepSettlingTime(double* pVal)

HRESULT put_SmartSweepSettlingTime(double newVal)

Interface
IGainCompression

### SmoothingAperture Property

**Description**: Specifies or returns the amount of smoothing as a ratio of the number of data points in the measurement trace.

There is no COM command for specifying smoothing by number of aperture points.

**VB Syntax**: `meas.SmoothingAperture = value`

**Variable**

- **meas**: A Measurement (object)
- **value**: (double) - Smoothing Aperture. A ratio of (aperture points / trace points). Choose any number between .01 and .25.

**Return Type**: Double

**Default**: .25

**Examples**:  
- `meas.SmoothingAperture = .10`  
- `saperture = meas.SmoothingAperture`

**C++ Syntax**:  
- `HRESULT get_SmoothingAperture(double *pVal)`  
- `HRESULT put_SmoothingAperture(double newVal)`

**Interface**: IMeasurement
## Smoothing Property

</table>
SnPFormat Property

Description  Specifies the format of .SnP files.

Use either app.Save (saves data to file) or meas.Get SnpDataWithSpecifiedPorts (reads
data into variant array).

VB Syntax  

```
pref.SnPFormat = value
```  

Variable (Type) - Description

- **pref** (A Preferences **object**)  
- **value** (Format of the .S1P, .S2P, .S3P, .S4P data. Choose from:
  - "MA" - Linear Magnitude / degrees
  - "DB" - Log Mag / degrees
  - "RI" - Real / Imaginary
  - "Auto" - Format in which the trace is already displayed. If other than Log Mag, Linear Magnitude, or Real/Imag, then the format will be in Real/Imag.

Return Type  String

Default  "Auto"

Examples

```  
prefer.SnPFormat = "MA"  'Write

format = prefer.SnPFormat  'Read
```  

C++ Syntax  

```
HRESULT get_SnPFormat(BSTR *Format)

HRESULT put_SnPFormat(BSTR Format)
```  

Interface  IPreferences
SoftwareGateState Property

Description
When set to OFF, the improved software gating sensitivity is turned OFF and all data outside the measurement band is zeroed. This setting is used for troubleshooting purposes. There is NO user-interface control for this setting.

VB Syntax
pulseMeas.SoftwareGateState = bool

Variable
pulseMeas A PulseMeasurementControl (object)
bool True - Turn ON software gating.
False - Turn OFF software gating.

Return Type
Boolean

Default
True

Examples
pulse.SoftwareGateState = True 'Write
value = pulse.SoftwareGateState 'Read

C++ Syntax
HRESULT get_SoftwareGateState(VARIANT_BOOL *pVal);
HRESULT put_SoftwareGateState(VARIANT_BOOL newVal);

Interface
IPulseMeasurementControl2
### SoundOnFail Property

**Description**
Turns ON or OFF the audio indicator for limit failures.

**VB Syntax**
```vbnet
limitst.SoundOnFail = state
```

**Variable**
- **Type**: Description
  - `limitst` (object)
  - `state` (boolean)

  - **False**: Turns the sound OFF
  - **True**: Turns the sound ON

**Return Type**
Long Integer

**Default**
`True`

**Examples**
- `Limttest.SoundOnFail = False` 'Write
- `sound = Limttest.SoundOnFail` 'Read

**C++ Syntax**
```c++
HRESULT get_SoundOnFail(VARIANT_BOOL *pVal)
HRESULT put_SoundOnFail(VARIANT_BOOL newVal)
```

**Interface**
ILimitTest
About Trigger Source

Source Property

Sets or returns the source of triggering on the VNA and PNA-X.

**VB Syntax**

```
trigSetup.Source = value
```

**Variable**

* (Type) - Description

- **trigSetup** A TriggerSetup (object)
- **value** (enum NATriggerSource) - Choose from:
  
  0 - **naTriggerSourceInternal** - free run
  
  
  2 - **naTriggerSourceExternal** - a trigger signal is generated when a signal is sensed on the appropriate external trigger input connector. Use ExternalTriggerConnectionBehavior to configure the characteristics of the external trigger signal.

This setting has implications on Calibration. Learn more.

**Return Type**

Long Integer

**Default**

naTriggerSourceInternal

**Examples**

```
trigSetup.Source = naTriggerSourceInternal 'Write
trigsource = trigSetup.Source 'Read
```

**C++ Syntax**

```
HRESULT get_Source(tagNATriggerSource *pTrigger);
HRESULT put_Source(tagNATriggerSource trigger);
```

**Interface**

ITriggerSetup
### SourceCWFrequency Property

**Description**  
Set and read the source CW frequency.

**VB Syntax**  
\[
\text{sa.SourceCWFrequency (source)} = \text{value}
\]

**Variable**  
**Type**  
- \text{sa}  
  A SpectrumAnalyzer (object)

- \text{source}  
  (String) Source name enclosed in quotes. Use \text{SourcePortNames} to read a list of available source port names. See also \text{Remotely Specifying a Source Port}.

- \text{value}  
  (Double) CW frequency in Hz. Choose a value within the frequency range of the analyzer.

**Return Type**  
Double

**Default**  
Center frequency of the analyzer.

**Examples**  
\[
\begin{align*}
\text{sa.SourceCWFrequency("Port 1")} & = 1e9 \quad \text{Write} \\
\text{value} & = \text{sa.SourceCWFrequency("Port 1")} \quad \text{Read}
\end{align*}
\]

See an example program.

**C++ Syntax**  
```c++
HRESULT put_SourceCWFrequency(BSTR sourcename, double frequency);

HRESULT get_SourceCWFrequency(BSTR sourcename, double* frequency);
```

**Interface**  
\text{ISpectrumAnalyzer}

</tr>
</tbody>
</table>
**SourceAttenuator Property**

**Description**
Sets and returns the Source Attenuator setting for the Phase Reference calibration.

**Note:** This setting MUST match the source attenuator setting at the mixer input port for subsequent SMC+Phase measurements.

**VB Syntax**
```
phasRef.SourceAttenuator = value
```

**Variable**
- **phasRef**: A PhaseReferenceCalibration Object
- **value**: Attenuation value in dB. Choose a valid value for the VNA model. See valid settings.

**Return Type**
Double

**Default**
10 dB

**Examples**
```
phase.SourceAttenuator = 0
```

**See example program**

**C++ Syntax**
```
HRESULT get_SourceAttenuator(Double* pVals);

HRESULT put_SourceAttenuator(Double pVals);
```

**Interface**
IPhaseReferenceCalibration
## SourceCount Property

</tr>
</tbody>
</table>
### SourceImpedance Property

**Description**: Sets and returns the source impedance of the pulse generator.

**VB Syntax**

```vbnet
extPulseGen.SourceImpedance = value
```

**Variable**

- `(Type)` - Description
- `extPulseGen` An `ExternalPulseGenerator` *(object)*
- `value` *(Double)* Pulse generator source impedance.

**Return Type**

- Double

**Default**

- 50

**Examples**

- `extPulseGen.SourceImpedance = 50` *'Write*
- `srcImp = extPulseGen.SourceImpedance` *'Read*

**C++ Syntax**

- `HRESULT get_SourceImpedance (double *pValue)`
- `HRESULT put_SourceImpedance (double newVal)`

**Interface**

- `IExternalPulseGenerator`
### Read-only

**SourcePort Property**

<table>
<thead>

### SourcePortCount Property

<table>
<thead>
<tr>
<th>Description</th>
<th>Returns the number of ports that can output a signal. To learn more, see <a href="#">Remotely Specifying a Source Port</a>.</th>
</tr>
</thead>
</table>

#### VB Syntax

```vbnet
value = object.SourcePortCount
```

#### Variable (Type) - Description

- **value** (Long) - Variable to store the returned integer value of the number of source ports.
- **object** A Channel (object) - always more complete than capabilities object.

A Capabilities (object) - use when a channel is not available, or to find the common ports across all channels.

#### Return Type

Long

#### Default

Not Applicable

#### Examples

```vbnet
value = chan.SourcePortCount 'Read
```

#### C++ Syntax

```cpp
HRESULT get_SourcePortCount(long * count);
```

#### Interface

IChannel13

ICapabilities4
# SourcePointCount Property

## SourcePortFixedFrequency Property

**Description**
Set and read the fixed frequency value for a specific port.

**VB Syntax**

```vbnet
chan.SourcePortFixedFrequency(port) = value
```

**Variable**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>chan</td>
<td>A SA Channel (object)</td>
</tr>
<tr>
<td>port</td>
<td>Source port number for which to set the fixed frequency value.</td>
</tr>
<tr>
<td>value</td>
<td>Fixed frequency value.</td>
</tr>
</tbody>
</table>

**Return Type**
double

**Default**
1

**Examples**

```vbnet
chan.SourcePortFixedFrequency(1) = 1e9  'Write
data = chan.SourcePortFixedFrequency(1)  'Read
```

**C++ Syntax**

```c++
HRESULT put_SourcePortFixedFrequency(long port, double value);
HRESULT get_SourcePortFixedFrequency(long port, double* value);
```

**Interface**

IChannel27
## SourcePortFrequencyOrder Property

**Description**
Set and read the source frequency domain’s order in the multi-dimensional sweep.

**VB Syntax**
```vbnet
md.SourcePortFrequencyOrder(port) = value
```

**Variable**
- **(Type)**: Description
  - `md` (MultiDimensionalSweep (object)) which belongs to a SA channel.
  - `port` (long) Source port number for which to set the source frequency order value.
  - `value` (long) Dimension order. Choose an integer value of 1 or higher.

**Return Type**
long

**Default**
1

**Examples**
```vbnet
md.SourcePortFrequencyOrder(0) = 2 'Write
value = md.SourcePortFrequencyOrder(1) 'Read
```

**C++ Syntax**
```cpp
HRESULT put_SourcePortFrequencyOrder(long port, long value);
HRESULT get_SourcePortFrequencyOrder(long port, long* value);
```

**Interface**
IMultiDimensionalSweep
### SourcePortFrequencyState Property

<table>
<thead>
<tr>
<th>Description</th>
<th>Set and read the source frequency domain’s ON/OFF state in the multi-dimensional sweep.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>VB Syntax</strong></td>
<td>( \text{md.SourcePortFrequencyState(port)} = \text{value} )</td>
</tr>
<tr>
<td><strong>Variable</strong></td>
<td>(Type) - Description</td>
</tr>
<tr>
<td>( \text{md} )</td>
<td>A <code>MultiDimensionalSweep (object)</code> which belongs to a SA channel.</td>
</tr>
<tr>
<td>( \text{port} )</td>
<td>(long) Source port number for which to set the source frequency state.</td>
</tr>
<tr>
<td>( \text{value} )</td>
<td>Boolean) Choose from:</td>
</tr>
<tr>
<td>0</td>
<td><strong>OFF</strong> - Disable the specified source frequency domain in multi-dimensional sweep.</td>
</tr>
<tr>
<td>1</td>
<td><strong>ON</strong> - Enable the specified source frequency domain in multi-dimensional sweep.</td>
</tr>
<tr>
<td><strong>Return Type</strong></td>
<td>Boolean</td>
</tr>
<tr>
<td><strong>Default</strong></td>
<td>0</td>
</tr>
<tr>
<td><strong>Examples</strong></td>
<td><code>md.SourcePortFrequencyStateOrder(0) = OFF</code> ( \text{Write} ) <code>value = md.SourcePortFrequencyStateOrder(1)</code> ( \text{Read} )</td>
</tr>
<tr>
<td><strong>C++ Syntax</strong></td>
<td><code>HRESULT put_SourcePortFrequencyState(long port, VARIANT_BOOL value);</code> <code>HRESULT get_SourcePortFrequencyState(long port, VARIANT_BOOL* value);</code></td>
</tr>
<tr>
<td><strong>Interface</strong></td>
<td>IMultiDimensionalSweep</td>
</tr>
</tbody>
</table>
SourcePortMode Property

Description  Sets the state of the VNA source for the specified port.

VB Syntax  

```vbnet
chan.SourcePortMode(sourcePort) = value
```

Variable  

<table>
<thead>
<tr>
<th>Variable Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>chan</td>
<td>object</td>
<td>A Channel object</td>
</tr>
<tr>
<td>sourcePort</td>
<td>long integer</td>
<td>The source port for which to make this setting.</td>
</tr>
</tbody>
</table>

Note: If the port is defined by a string name, such as an external source, a balanced port, or one of the Source 2 outputs on the 2-port 2-source VNA-x model, then you must use `chan.getPortNumber` to translate the string into a port number. To learn more see Remotely Specifying a Source Port.

value  (enum) - State of the source. Choose from:

0 - naSourcePortAuto  Port power is turned on when required for a measurement.

1 - naSourcePortOn  Port power is always ON, regardless of the measurement.

2 - naSourcePortOff  Port power is always OFF, regardless of the measurement.

3 - naSourcePortNOTUSE  Do not send OFF commands to the external sources. If an external source is in the OFF state, this option is used to stop sending OFF commands to the external source to increase sweep speed.

Return Type  Enum

Default  0 - naSourcePortAuto

Examples  

```vbnet
chan.SourcePortMode(1) = naSourcePortOn  'Write
state = chan.SourcePortMode(4)  'Read
```

C++ Syntax  

```c
HRESULT get_SourcePortMode(long sourcePort, enum NASourcePortMode*);
```

```c
HRESULT put_SourcePortMode(long sourcePort, enum NASourcePortMode);
```

Interface  IChannel9
SourcePortNames Property

Description

Returns the string names of ports that can output a signal.

The following is a list of string names for the PNA-X. Your VNA will NOT have all of these ports. Use GetPortNumber Method to return the correct port number for the specified port name.

- “Port 1”
- “Port 2”
- “Port 3”
- “Port 4”
- “Src2 Out1”
- “Src2 Out2”
- “Port 1 Src2”

For iTMSA (Opt S93460A/B)

- "Bal Port 1"
- "Bal Port 2"
- "SE Port1"
- "SE Port 2"

This command also lists the External Sources that are currently configured and selected.

To learn more, see Remotely Specifying a Source Port.

VB Syntax

value = object.SourcePortNames

Variable

value (Variant array) - Variable to store the returned list of source port names.

object A Channel (object) - always more complete than capabilities object.

A Capabilities (object) - use when a channel is not available, or to find the common ports across all channels.
<table>
<thead>
<tr>
<th>Return Type</th>

# SourcePortStartFrequency Property

Set and read the start frequency value for a specific port.

**VB Syntax**

```vbnet
chan.SourcePortStartFrequency(port) = value
```

**Variable (Type) - Description**

- `chan`: A SA Channel (object)
- `port`: Source port number for which to set the start frequency value.
- `value`: Start frequency value.

**Return Type**

double

**Default**

1

**Examples**

```vbnet
chan.SourcePortStartFrequency(1) = 1e9  'Write
value = chan.SourcePortStartFrequency(1)  'Read
```

**C++ Syntax**

```cpp
HRESULT put_SourcePortStartFrequency(long port, double value);
HRESULT get_SourcePortStartFrequency(long port, double* value);
```

**Interface**

IChannel27
### SourcePortStopFrequency Property

**Description**  
Set and read the stop frequency value for a specific port.

**VB Syntax**  
\[ \text{chan.SourcePortStopFrequency(port)} = \text{value} \]

**Variable (Type) - Description**
- **chan**: A SA Channel (object)
- **port**: (long) Source port number for which to set the stop frequency value.
- **value**: (double) Stop frequency value.

**Return Type**  
double

**Default**  
1

**Examples**

```vbnet
chan.SourcePortStopFrequency(1) = 1e9 'Write
value = chan.SourcePortStopFrequency(1) 'Read
```

**C++ Syntax**

```cpp
HRESULT put_SourcePortStopFrequency(long port, double value);
HRESULT get_SourcePortStopFrequency(long port, double* value);
```

**Interface**

IChannel27
SourcePower Property

Description: Set and read the source power level. This command applies to CW or linear sweep types.

VB Syntax: `sa.SourcePower(source) = value`

Variable (Type) - Description
- `sa` A SpectrumAnalyzer object
- `source` (String) Source name enclosed in quotes. Use `SourcePortNames` to read a list of available source port names. See also Remotely Specifying a Source Port.
- `value` (Double) Source power level in dBm. Choose a value within the power range of the source.

Return Type: Double

Default: Default of the source.

Examples:
- `sa.SourcePower("Port 1") = -5 'Write
- `value = sa.SourcePower("Port 1") 'Read

C++ Syntax:
- `HRESULT put_SourcePower(BSTR sourcename, double power);`
- `HRESULT get_SourcePower(BSTR sourcename, double* power);`

Interface: ISpectrumAnalyzer
## SourcePowerCalPowerOffset Property

**Description**
Sets or returns a power level offset from the VNA test port power. This can be a gain or loss value (in dB) to account for components you connect between the source and the reference plane of your measurement. For example, specify 10 dB to account for a 10 dB amplifier at the input of your DUT.

Cal power is the sum of the test port power setting and this offset value. Following the calibration, the VNA power readouts are adjusted to the cal power.

This property performs the same function as the power offset argument on the `SetCalInfoEx` Method, except that this property can read the offset value.

**VB Syntax**

```
chan.SourcePowerCalPowerOffset(sourcePort) = value
```

**Variable**

- **chan** *(object)* - A Channel object
- **sourcePort** *(long integer)* - The source port for which to set this power offset value.
- **value** *(double)* - Gain or loss value in dB. Choose a value between -200 and 200.

**Return Type**
Double

**Default**
0 dB

**Examples**

```
chan.SourcePowerCalPowerOffset(1) = 10 'Write
offset = chan.SourcePowerCalPowerOffset(2) 'Read
```

**C++ Syntax**

```
HRESULT get_SourcePowerCalPowerOffset(long sourcePort, double *pVal);

HRESULT put_SourcePowerCalPowerOffset(long sourcePort, double newVal);
```

**Interface**
IChannel4
SourcePowerCorrection Property

Description
Sets source power correction ON or OFF for a specific source port on this channel, or returns the current ON or OFF state of correction for that source port.

VB Syntax
chan.SourcePowerCorrection(srcPort) = value

Variable (Type) - Description
chan (object) – A Channel object
srcPort (long integer) – Source port for which to set or return the ON or OFF state of source power correction.

Note: If the port is defined by a string name, such as an external source, a balanced port, or one of the Source 2 outputs on the 2-port 2-source VNA-x model, then you must use chan.getPortNumber to translate the string into a port number. To learn more see Remotely Specifying a Source Port.

value (boolean)

False – Turns source power correction OFF for the source port.

True – Turns source power correction ON for the source port.

Return Type
Boolean

Default
False - Source power correction will turn correction ON

Examples
chan.SourcePowerCorrection(1) = False 'Write
calOnPort2 = chan.SourcePowerCorrection(2) 'Read

C++ Syntax
HRESULT put_SourcePowerCorrection(VARIANT_BOOL bState);
HRESULT get_SourcePowerCorrection(VARIANT_BOOL *bState);

Interface
IChannel
### SourcePowerPointCount Property

**Description**  Set and read the number of steps the source will make across the specified source power range. This setting is common to all sources.

**VB Syntax**  

```vbnet
sa.SourcePowerPointCount = value
```

**Variable**  

- **sa** (Type) - A SpectrumAnalyzer (object)
- **value** (Long) - Point count. Choose an integer value of 1 or higher.

**Return Type**  Long

**Default**  1

**Examples**  

```vbnet
sa.SourcePowerPointCount = 10 'Write
value = sa.SourcePowerPointCount 'Read
```

**C++ Syntax**  

```cpp
HRESULT put_SourcePowerPointCount(long points);
HRESULT get_SourcePowerPointCount(long* points);
```

**Interface**  ISpectrumAnalyzer
## SourcePowerRepeatCount Property

**Description**  
Set and read the number of SA (receiver) sweeps for each Source Step. This setting is common to all sources.

**VB Syntax**  
`sa.SourcePowerRepeatCount = value`

**Variable (Type) - Description**

- `sa`  
  A SpectrumAnalyzer (object)

- `value`  
  (Long) Repeat count. Choose an integer value of 1 or higher.

**Return Type**  
Long

**Default**  
1

**Examples**

```vbnet
sa.SourcePowerRepeatCount = 10 'Write
value = sa.SourcePowerRepeatCount 'Read
```

**C++ Syntax**

```c++
HRESULT put_SourcePowerRepeatCount(long count);
HRESULT get_SourcePowerRepeatCount(long* count);
```

**Interface**  
ISpectrumAnalyzer
SourcePowerOption Property

Description
Enables the source power to be set on individual sweep segments. This property must be set True before seg.TestPortPower = value is sent. Otherwise, the test port power command will be ignored.

VB Syntax
segs.SourcePowerOption = state

Variable (Type) - Description

segs A Segments collection (object)
state (boolean)

True - Enables variable TestPortPower to be set segment sweep
False - Disables variable TestPortPower to be set segment sweep

Return Type
Boolean

Default
False

Examples
segs.SourcePowerOption = True 'Write
powerOption = SourcePowerOption 'Read

C++ Syntax
HRESULT get_SourcePowerOption(VARIANT_BOOL *pVal)
HRESULT put_SourcePowerOption(VARIANT_BOOL newVal)

Interface ISegments
SourcePowerState Property

Description  Turns Source Power ON and OFF.

See note about source power state with instrument state save and recall.

VB Syntax  
```
app.SourcePowerState = state
```

Variable  
```
app
An Application (object)
```
```
state (boolean)
```

**False** - Turns Source Power OFF

**True** - Turns Source Power ON

Return Type  Boolean

Default  True

Examples  
```
app.SourcePowerState = True 'Write
```
```
pwr = app.SourcePowerState 'Read
```

C++ Syntax  
```
HRESULT get_SourcePowerState(VARIANT_BOOL *pVal)
HRESULT put_SourcePowerState(VARIANT_BOOL newVal)
```

Interface  IApplication

## SourceStartFrequency Property

**Description**  
Set and read the source start frequency.

**VB Syntax**  
\[ sa\.SourceStartFrequency\( source \) = value \]

**Variable (Type) - Description**

- \( sa \)  
  A SpectrumAnalyzer (object)

- \( source \)  
  (String) Source name enclosed in quotes. Use SourcePortNames to read a list of available source port names. See also Remotely Specifying a Source Port.

- \( value \)  
  (Double) Start frequency in Hz. Choose a value within the frequency range of the analyzer.

**Return Type**  
Double

**Default**  
Start frequency of the analyzer.

**Examples**

\[ sa\.SourceStartFrequency\("Port 1"\) = 1e9 \]  
'Write

\[ value = sa\.SourceStartFrequency\("Port 1"\) \]  
'Read

See an example program.

**C++ Syntax**

```
HRESULT put_SourceStartFrequency(BSTR sourcename, double frequency);
HRESULT get_SourceStartFrequency(BSTR sourcename, double* frequency);
```

**Interface**  
ISpectrumAnalyzer
SourceStartPower Property

Description: Set and read the source start power level. This command applies to Power or LF Power sweep types.

VB Syntax: `sa.SourceStartPower(source) = value`

Variable (Type) - Description

- `sa` A SpectrumAnalyzer (object)
- `source` (String) Source name enclosed in quotes. Use SourcePortNames to read a list of available source port names. See also Remotely Specifying a Source Port.
- `value` (Double) Start power level in dBm. Choose a value within the power range of the source.

Return Type: Double

Default: Default of the source.

Examples:

```vbnet
sa.SourceStartPower("Port 1") = -5 'Write
value = sa.SourceStartPower("Port 1") 'Read
```

C++ Syntax:

```c
HRESULT put_SourceStartPower(BSTR sourcename, double power);
HRESULT get_SourceStartPower(BSTR sourcename, double* power);
```

Interface: ISpectrumAnalyzer
SourceStepAttenuatorStepSize Property

Description
Returns a value indicating the step size of the source attenuator.

VB Syntax
value = cap.SourceStepAttenuatorStepSize (n)

Variable
(Type) - Description
- value (Double) - Variable to store the returned value of the attenuator step size.
- cap A Capabilities (object)
- n (Long) - port number to query for the value of the attenuator step size.

Return Type
Double

Default
Not Applicable

Examples
value = cap.SourceStepAttenuatorStepSize(1)

C++ Syntax
HRESULT get_SourceStepAttenuatorStepSize(long portNumber, double * stepSize);

Interface
ICapabilities5
### SourceStopFrequency Property

<table>
<thead>

</tr>
<tr>
<td>value</td>
<td>(Double) Stop frequency in Hz. Choose a value within the frequency range of the analyzer.</td>
</tr>
<tr>
<td>Return Type</td>
<td>Double</td>
</tr>
<tr>
<td>Default</td>
<td>Stop frequency of the analyzer.</td>
</tr>
<tr>
<td>Examples</td>
<td><code>sa.SourceStopFrequency(&quot;Port 1&quot;) = 1e9   'Write</code></td>
</tr>
<tr>
<td></td>
<td><code>value = sa.SourceStopFrequency(&quot;Port 1&quot;) 'Read</code></td>
</tr>
</tbody>
</table>

See an example program.

| C++ Syntax | HRESULT put_SourceStopFrequency(BSTR sourcename, double frequency); |
|            | HRESULT get_SourceStopFrequency(BSTR sourcename, double* frequency); |

Interface ISpectrumAnalyzer
**SourceStopPower Property**

**Description**  
Set and read the source stop power level. This command applies to Power or LFPower sweep types.

**VB Syntax**  
`sa.SourceStopPower(source) = value`

**Variable**  
`sa`  
A `SpectrumAnalyzer` object

`source`  
(String) Source name enclosed in quotes. Use `SourcePortNames` to read a list of available source port names. See also Remotely Specifying a Source Port.

`value`  
(Double) Stop power level in dBm. Choose a value within the power range of the source.

**Return Type**  
Double

**Default**  
Default of the source.

**Examples**  
`sa.SourceStopPower("Port 1") = 10`  
'Write

`value = sa.SourceStopPower("Port 1")`  
'Read

**C++ Syntax**  
`HRESULT put_SourceStopPower(BSTR sourcename, double power);`

`HRESULT get_SourceStopPower(BSTR sourcename, double* power);`

**Interface**  
ISpectrumAnalyzer
**SourceSweepFirstDimension Property**

**Description**
Set and read the sweep order. This command applies whenever frequency and power are being swept (sweep type set using the `SourceSweepType2` command). Otherwise, this setting is ignored. For example, if all the active sources are set to CW and/or linear sweep type, or if all the active sources are set to CW and/or power sweep type, the sweep order is ignored. If any active source is set to linear and power sweep type, or if an active source is set to linear sweep type and another active source is set to power sweep type, then the sweep order setting will be used.

**VB Syntax**

```vbnet
sa.SourceSweepFirstDimension (source) = value
```

**Variable (Type) - Description**

- `sa` A `SpectrumAnalyzer` (object)
- `value` (Enum as `NASASweepFirstTypes`) Choose from:
  - `0 - naSAFreqFirst` - Sweep from Start to Stop frequency first followed by a power sweep.
  - `1 - naSAPowerFirst` - Sweep power first then sweep from Start to Stop frequency.

**Return Type**
Enum

**Default**
`naSAFreqFirst`

**Examples**

```vbnet
sa.SourceSweepFirstDimension("Port 1") = naSAPowerFirst 'Write

value = sa.SourceSweepFirstDimension("Port 1") 'Read
```

**C++ Syntax**

```cpp
HRESULT put_SourceSweepFirstDimension(tagNASASweepFirstTypes first);

HRESULT get_SourceSweepFirstDimension(tagNASASweepFirstTypes* first);
```

**Interface**
`ISpectrumAnalyzer`

**Interface**

ISpectrumAnalyzer
SParameterCalPorts Property

Description
Read the final list of ports that will be fully calibrated by Calibrate All Channels. For the returned list of ports, specify connectors and cal kits for the calibration using the GuidedCal commands.

Ports to received ONLY a power cal (such as mixer LO ports) will NOT be on the returned list.

For each channel, specify the ports to be calibrated using CalibrationPorts Property

VB Syntax
ports = calAll.SParameterCalPorts

Variable (Type) - Description
ports (Variant Array) Ports to be calibrated.
calAll A CalibrateAllChannels (object)

Return Type Variant Array
Default Not Applicable

Examples
ports = calAll.SParameterCalPorts  'returns the ports to be cal'd

C++ Syntax
HRESULT SParameterCalPorts([out,retval] VARIANT* calports);

Interface ICalibrateAllChannels
## SpectrumCenterFrequency Property

Sets and returns the receiver Center frequency for the IM Spectrum measurement. Valid ONLY when Tracking is NOT enabled and when `Sweep Type` = Linear. Otherwise, this setting is ignored.

### Description

Sets and returns the receiver Center frequency for the IM Spectrum measurement. Valid ONLY when Tracking is NOT enabled and when `Sweep Type` = Linear. Otherwise, this setting is ignored.

### VB Syntax

```vbnet
ims.SpectrumCenterFrequency = value
```

### Variable

- **ims**: An IMSpectrum Object
- **value**: (Double) Center frequency in Hz. Choose a frequency within the range of the VNA.

### Return Type

Double

### Default

1.0 GHz

### Examples

```vbnet
ims.SpectrumCenterFrequency = 10e9 'Write
value = ims.SpectrumCenterFrequency 'Read
```

### C++ Syntax

```cpp
HRESULT get_SpectrumCenterFrequency(double *pVal)
HRESULT put_SpectrumCenterFrequency(double newVal)
```

### Interface

IIMSpectrum
### SpectrumSpanFrequency Property

**Description**
Sets and returns the Span of receiver frequencies for the IM Spectrum measurement. Valid ONLY when Tracking is NOT enabled and when *Sweep Type* = Linear. Otherwise, this setting is ignored.

**VB Syntax**
```
ims.SpectrumSpanFrequency = value
```

**Variable**

- **ims**
  An IMSpectrum Object
- **value**
  (Double) Frequency span in Hz. Choose a frequency within the range of the VNA.

**Return Type**
Double

**Default**
100 MHz

**Examples**
```
ims.SpectrumSpanFrequency = 10e9 'Write
value = ims.SpectrumSpanFrequency 'Read
```

**C++ Syntax**
```
HRESULT get_SpectrumSpanFrequency(double *pVal)
HRESULT put_SpectrumSpanFrequency(double newVal)
```

**Interface**
IIMSpectrum
### SpectrumStartFrequency Property

**Description**
Sets and returns the receiver Start frequency for the IM Spectrum measurement. Valid ONLY when Tracking is NOT enabled and when Sweep Type = Linear. Otherwise, this setting is ignored.

**VB Syntax**
```vbnet
ims.SpectrumStartFrequency = value
```

**Variable (Type) - Description**
- `ims` An IMSpectrum Object
- `value` (Double) Start frequency in Hz. Choose a frequency within the range of the VNA.

**Return Type**
Double

**Default**
950 MHz

**Examples**
```vbnet
ims.SpectrumStartFrequency = 10e9 'Write
value = ims.SpectrumStartFrequency 'Read
```

**C++ Syntax**
```cpp
HRESULT get_SpectrumStartFrequency(double *pVal)
HRESULT put_SpectrumStartFrequency(double newVal)
```

**Interface**
IIMSpectrum
**SpectrumStopFrequency Property**

**Description**
Sets and returns the receiver Stop frequency for the IM Spectrum measurement. Valid ONLY when Tracking is NOT enabled and when Sweep Type = Linear. Otherwise, this setting is ignored.

**VB Syntax**

```vbnet
ims.SpectrumStopFrequency = value
```

**Variable (Type) - Description**

- **ims** An IMSpectrum Object
- **value** (Double) Stop frequency in Hz. Choose a frequency within the range of the VNA.

**Return Type**
Double

**Default**
950 MHz

**Examples**

```vbnet
ims.SpectrumStopFrequency = 10e9 'Write
value = ims.SpectrumStopFrequency 'Read
```

**C++ Syntax**

```cpp
HRESULT get_SpectrumStopFrequency(double *pVal)
HRESULT put_SpectrumStopFrequency(double newVal)
```

**Interface**
IIMSpectrum
SSB_BalPortNegative Property

<table>
<thead>
<tr>
<th>Description</th>

</tr>
</tbody>
</table>
### SSB_BalPortPositive Property

**Description**  
With a Single-ended - Single-ended - Balanced topology, returns the VNA port number that is connected to the Positive side of the DUT's Balanced Port.

Use `SetSSBPorts Method` to set the port mapping for a Single-Ended - Single-Ended - Balanced topology.

**VB Syntax**  
```vbnet
var = balTopology.SSB_BalPortPositive
```

**Variable**  
`var` (Long Integer) Variable to store the returned value.

**balTopology**  
A `BalancedTopology (object)`

**Return Type**  
Long Integer

**Default**  
Not Applicable

**Examples**  
```vbnet
variable = balTopology.SSB_BalPortPositive 'Read
```

**C++ Syntax**  
```cpp
HRESULT get_SSB_BalPortPositive(long *bVal)
```

**Interface**  
`IBalancedTopology`
### SSB_SEPort1 Property

**Description**  
With a Single-ended - Single-ended - Balanced topology, returns the VNA port number that is connected to the DUT's Logical Port 1.

Use SetSSBPorts Method to set the port mapping for a Single-Ended - Single-Ended - Balanced topology.

**VB Syntax**  
```vbnet
var = balTopology.SSB_SEPort1
```

**Variable**  
*var* (Long Integer) Variable to store the returned value.

**balTopology**  
A `BalancedTopology` object

**Return Type**  
Long Integer

**Default**  
Not Applicable

**Examples**  
```vbnet
variable = balTopology.SSB_SEPort1 'Read
```

**C++ Syntax**  
```cpp
HRESULT get_SSB_SEPort1(long *bVal)
```

**Interface**  
IBalancedTopology

About PNA-X Pulsed Capabilities

Stage1Frequency Property

Description
Sets and returns the Numerically Controlled Oscillator (NCO) frequency of the Stage 1 filter. This command is only used when FilterMode Property is set to Manual.

VB Syntax

\[ spm4.Stage1Frequency = \text{value} \]

Variable

- **Type** - Description
  - \( spm4 \) A SignalProcessingModuleFour (object)
  - \( \text{value} \) (Double) Stage 1 Frequency. Min value = 0 Hz

Stage 1 Frequency. Min value = 0 Hz

With DSP 4 versions, Max value = 15 MHz.

With DSP 5 versions, Max value = 38 MHz.

Learn more about DSP versions.

Or programmatically use MinimumIFFrequency Property and MaximumIFFrequency Property to determine the range of settable values.

Return Type
Double

Default
Nominal IF Frequency. Learn more

Examples

\[ spm4.Stage1Frequency = 9E6 \quad \text{Write} \]
\[ \text{mode} = spm4.Stage1Frequency \quad \text{Read} \]

C++ Syntax

HRESULT get_Stage1Frequency(double *val);

HRESULT put_Stage1Frequency(double val);

Interface
ISignalProcessingModuleFour

**About PNA-X Pulsed Capabilities**

---

### Stage3FilterType Property

**Description**
Sets and returns the Stage 3 filter type. This command is only used when **FilterMode** is set to Manual.

**VB Syntax**
```
spm4.Stage3FilterType = value
```

**Variable (Type) - Description**
- `spm4` [A SignalProcessingModuleFour](object)
- `value` (String) Filter type. Chose from:
  - "RECT" Rectangular Window Filter
  - "TUKEY" Tukey Filter
  - "PWIN" Pulse window filter

**Default**
TUKEY

**Examples**
```
spm4.Stage3FilterType = "PWIN"
mode = spm4.Stage3FilterType 'Read
```

**C++ Syntax**
```
HRESULT get_Stage3FilterType(BSTR* pFType);
HRESULT put_Stage3FilterType(BSTR GType);
```

**Interface**
ISignalProcessingModuleFour
## Stage3FilterTypes Property

**Description**
Returns a list of strings for the currently supported filter types that can be used for the stage 3 filter. This command is only used when FilterMode is set to False (Manual). See `Stage3FilterType` for a list of currently supported filter types.

**VB Syntax**
```
values = spm4.Stage3FilterTypes
```

**Variable**
- **Type**: Description
- **value** *(Variant)* Variable to store the returned filter types.
- **spm4** A `SignalProcessingModuleFour` *(object)*

**Return Type**
Variant Array

**Default**
Not Applicable

**Examples**
```
mode = spm4.Stage3FilterTypes 'Read
```

**C++ Syntax**
```
HRESULT get_Stage3FilterTypes(VARIANT* pTypes);
```

**Interface**
`ISignalProcessingModuleFour`
# Stage3Parameter Property

## Description
Sets and returns the Stage 3 filter parameters.

Must first select the filter type using `Stage3FilterType` before setting these parameters.

Use `Stage3Parameters` to return a list of the available parameters for the currently selected filter type.

## VB Syntax
```
spm4.Stage3Parameter(param) = value
```

## Variable *(Type) - Description*

- `spm4` (A SignalProcessingModuleFour (object))
- `param` (String) Filter parameter. Choose from:
  - "C" - Tap count (Tukey, RECT, PWIN)
  - "P" - Period (PWIN ONLY)
  - "D" - Delay (PWIN ONLY)
  - "W" - Width (PWIN ONLY)
  - "R" - Ramp Count (PWIN ONLY)
  - "M" - Number of times to repeat the user-supplied array for each data point (COEF ONLY)
- `value` (String) Parameter Value for the specified stage 3 parameter. Use `Stage3ParameterMaximum` and `Stage3ParameterMinimum` to return a range of values for the specified parameter.

## Default
- RECT: C = 1
- PWIN: C=1E6, P=10ms, D=50us, W=50us, R=7
- TUKEY: C=1

## Examples
```
spm4.Stage3Parameter("C") = 2
mode = spm4.Stage3Parameter("pwin") 'Read
```

## C++ Syntax
```
HRESULT get_Stage3Parameter(BSTR pName, double* pVal);
HRESULT put_Stage3Parameter(BSTR pName, double pVal);
```

## Interface
ISignalProcessingModuleFour
### Stage3ParameterMaximum Property

<table>
<thead>
<tr>
<th>Description</th>

<td><code>HRESULT get_Stage3ParameterMaximum(BSTR pName, double* pVal);</code></td>
</tr>
<tr>
<td>Interface</td>
<td><code>ISignalProcessingModuleFour</code></td>
</tr>
</tbody>
</table>
Stage3ParameterMinimum Property

Description
Returns minimum parameter value for the current filter type.

VB Syntax
value = spm4.Stage3ParameterMinimum (parameter)

Variable (Type) - Description
value (Variant) Variable to store the minimum parameter value.

spm4 A SignalProcessingModuleFour (object)

parameter (String) Parameter name. See Stage3Parameter Property for a list of parameters.

Return Type Double

Default Not applicable

Examples
mode = spm4.Stage3ParameterMinimum ("c") 'Read

C++ Syntax
HRESULT get_Stage3ParameterMinimum(BSTR pName, double* pVal);

Interface ISignalProcessingModuleFour
### Stage3Parameters Property

**Description**
Returns the names of parameters for the current filter type. Use
Stage3FilterType Property to set the filter type.

**VB Syntax**

```vbnet
values = spm4.Stage3Parameters
```

**Variable**

- **value** *(Variant)* Variable to store the returned parameter names.
- **spm4** A SignalProcessingModuleFour *(object)*

**Return Type**
Variant

**Default**
Not Applicable

**Examples**

```vbnet
mode = spm4.Stage3Parameters
```

**C++ Syntax**

```c++
HRESULT get_Stage3Parameters(VARIANT* pNames);
```

**Interface**
ISignalProcessingModuleFour
## StandardDeviation Property

**Description**
Returns the standard deviation of the measurement.
To retrieve all 3 statistics value at the same time, use `meas.GetTraceStatistics`.

**VB Syntax**

```
stdev = meas.StandardDeviation
```

**Variable**

- `stdev` (single) - Variable to store standard deviation value
- `meas` - A Measurement (object)

**Return Type**
Single

**Default**
Not applicable

**Examples**

```
stdev = meas.StandardDeviation 'Read
```

**C++ Syntax**

```
HRESULT get_StandardDeviation(float* stdDeviation)
```

**Interface**
IMeasurement
StandardForClass Property - **Superseded**

**Description**  
Superseded  This command sets a single standard to a calibration class. Does NOT set or dictate the order for measuring the standards.

Use GetStandardForClass and SetStandardForClass. These commands allow up to seven standards to be assigned to a cal class.

**VB Syntax**  
`calKit.StandardForClass(class, portNum) = value`

**Variable**

<table>
<thead>
<tr>
<th>(Type) - Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>calKit</code></td>
<td>A CalKit (object). Use <code>calKit.GetCalStandard</code> to get a handle to the standard.</td>
</tr>
<tr>
<td><code>class</code></td>
<td>(enum NACalClass) Standard. Choose from:</td>
</tr>
<tr>
<td>1 - naClassA</td>
<td></td>
</tr>
<tr>
<td>2 - naClassB</td>
<td></td>
</tr>
<tr>
<td>3 - naClassC</td>
<td></td>
</tr>
<tr>
<td>4 - naClassD</td>
<td></td>
</tr>
<tr>
<td>5 - naClassE</td>
<td></td>
</tr>
<tr>
<td>6 - naReferenceRatioLine</td>
<td></td>
</tr>
<tr>
<td>7 - naReferenceRatioThru</td>
<td></td>
</tr>
</tbody>
</table>

**SOLT Standards**
1 - naSOLT_Open  
2 - naSOLT_Short  
3 - naSOLT_Load  
4 - naSOLT_Thru  
5 - naSOLT_Isolation

**TRL Standards**
1 - naTRL_Reflection  
2 - naTRL_Line_Reflection  
3 - naTRL_Line_Tracking  
4 - naTRL_Thru  
5 - naTRL_Isolation

**portNum** (long) - The port number the standard will be connected to. For example, you may have a 3.5mm connector designated for port 1, and Type N designated for port 2.
Parameter: **value** (long) - Calibration class number. Choose a number between 1 and 8. The <value> numbers are associated with the following calibration classes:

<table>
<thead>
<tr>
<th>&lt;value&gt;</th>
<th>Class</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>S11A</td>

</tr>
<tr>
<td>7</td>
<td>S22C</td>
<td>Reflection standard</td>
</tr>
<tr>
<td>8</td>
<td>S21T</td>
<td>Thru standard</td>
</tr>
</tbody>
</table>

**Return Type**: Long Integer

**Default**: Not Applicable

**Examples**

```cpp
calKit.StandardForClass(naSOLT_Short, 1) = 1
Kclass = calKit.StandardForClass(naSOLT_Short, 1)
```

**C++ Syntax**

```cpp
HRESULT put_StandardForClass (NACalClass item, long pNum);

HRESULT get_StandardForClass (NACalClass* item, long *pNum);
```

**Interface**: ICalKit

# StartFrequency (Cal Set) Property

**Description**
Returns the start frequency that is stored in the Cal Set.

**VB Syntax**

```vbnet
value = CalSet.StartFrequency(range)
```

**Variable**
- **value** *(double)* - returned Start frequency in Hertz.
- **CalSet** *(object)*
- **range** *(Long)* Choose: 0 (Source and receiver frequency)

**Return Type**
Double

**Default**
Not Applicable

**Examples**

```vbnet
start = calset.StartFrequency(0) 'Reads the start frequency stored in the cal set.
```

**C++ Syntax**

```cpp
HRESULT get_StartFrequency(long range, *pVal)
```

**Interface**
|CalSet3|
StartFrequency Property

Description
Sets or returns the start frequency of the channel. (Channel Object)

Sets or returns the start frequency of the segment. (Segment Object)

Sets or returns the start frequency of the FOM Range. (FOMRange Object)

Sets or returns the start frequency of the Power Sensor coverage (GuidedCalibrationPowerSensor Object)

See also Measurement2 interface

VB Syntax
object.StartFrequency = value

Variable (Type) - Description
object
Any of the following:

Channel (object)

Segment (object)

FOMRange (object)

GuidedCalibrationPowerSensor (object)

value (double) - Start frequency in Hertz. Choose any number between the minimum and maximum frequencies of the analyzer. If start frequency is set greater than the stop frequency, then the stop frequency is set to the start frequency + frequency span.

Return Type
Double

Default
Channel - Minimum frequency of the analyzer

Segment - 0

FOMRange - Minimum frequency of the analyzer

PowerSensor - Minimum frequency of the analyzer

Examples
chan.StartFrequency = 4.5e9 'sets the start frequency of a linear sweep for the channel object
startfreq = Chan.StartFrequency 'Read
C++ Syntax

HRESULT get_StartFrequency(double *pVal)

HRESULT put_StartFrequency(double newVal)

Interface

IChannel

ISegment

IFOMRange

IGuidedCalibrationPowerSensor
Write/Read

About Power Sweep

StartPower Property

Description
Sets the start power of the analyzer when sweep type is set to Power Sweep. Frequency of the measurement is set with chan.CWFrequency.

VB Syntax
object.StartPower = value

Variable (Type) - Description
object One of the following:

- Channel (object)
- CalSet (object) - Read-only property

value (double) - Start Power in dBm.

Note: The range of settable power values depends on the VNA model and if source attenuators are installed. To determine the range of values, use cap.MaximumSourceALCPower and cap.MinimumSourceALCPower

Auto attenuation is not allowed in Power Sweep.

Return Type
Double

Default
0

Examples
Chan.StartPower = -10 'Write
strtpwr = Chan.StartPower 'Read

C++ Syntax
HRESULT get_StartPower(double *pVal)
HRESULT put_StartPower(double newVal)

Interface
IChannel

|CalSet3
### Start Property

**Description**  
Sets or returns the start time of either Gating or Time Domain transform windows

**VB Syntax**  
`object.Start = value`

**Variable**  
- `(Type) - Description`
  - `object`  
    - `(object) As Gating`
    - `or`
    - `(object) As Transform`
  - `value`  
    - `(double) - Start time in seconds. Choose any number between: ± (number of points-1) / frequency span`

**Return Type**  
Double

**Default**  
-10ns

**Examples**

- `Trans.Start = 4.5e-9 'sets the start time of a transform window -Write`
- `Gate.Start = 4.5e-9 'sets the start time of a gating window -Write`

- `strt = Trans.Start 'Read`

**C++ Syntax**

- `HRESULT get_Start(double *pVal)`
- `HRESULT put_Start(double newVal)`

**Interface**  
ITransform
IGating
Start Property

Description: Returns the stimulus value of the first data point for the measurement. To understand how this property is useful, see IMeasurement2 Interface.

VB Syntax: `value = meas.Start`

Variable (Type) - Description

value (Double) - Variable to store the returned value

meas A Measurement (object)

Return Type: Double

Default: Not Applicable

Examples: `Print meas.Start 'prints the stimulus value of the first data point`

C++ Syntax: `HRESULT get_Start (double * Val);`

Interface: IMeasurement2
StartFrequency (PowerCalRange) Property

**Description**
Sets and gets the start frequency for range <m> for source port<n>.

**VB Syntax**
```
PwrrCalRange .StartFrequency = freq
```

**Variable**
(Type) - Description
```
freq (Long) - Variable to store the returned start frequency.
```

**PwrrCalRange**
A PowerCalRange (object)

**Return Type**
Double

**Default**
Not Applicable

**Example**
```
CalibrateAllChannels.IndependentPowerCalibration(3).PowerCalRange(1).StartFrequency = 20e9 'Write

freq = CalibrateAllChannels.IndependentPowerCalibration(3).PowerCalRange(1).StartFrequency 'Read
```

**C++ Syntax**
```
HRESULT get_StartFrequency(double* freq);
HRESULT put_StartFrequency(double freq);
```

**Interface**
IPowerCalRange

<tr>
<td>$name, port$</td>
<td>(String) Name of the &quot;DC source, port&quot;</td>
</tr>
</tbody>
</table>

Use **Source Property** to read a list of configured DC source names.

To set the DC source to be always ON, do NOT specify a port.

<table>
<thead>
<tr>
<th><strong>value</strong></th>
<th>(Double) DC Start value. Choose a value within the range of the DC source.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Return Type</strong></td>
<td>Double</td>
</tr>
<tr>
<td><strong>Default</strong></td>
<td>.5</td>
</tr>
</tbody>
</table>

**Examples**

'**Set AO1 to always ON**

dc.Start "AO1", 3

'**Read Start for MyDCSource, Port 1**

dc.Start? "MyDCSource,Port 1"

**C++ Syntax**

HRESULT get_Start(BSTR name, VARIANT_BOOL * pValue);

HRESULT put_Start(BSTR name, VARIANT_BOOL newValue);

**Interface**

IDCStimulus
StartFrequency Property

Description
Sets and returns the phase reference cal start frequency.

VB Syntax
phasRef.StartFrequency = value

Variable (Type) - Description
phasRef A PhaseReferenceCalibration Object
value Start frequency in Hz. Choose any frequency from 17.5 MHz to the stop frequency of the VNA.

Return Type
Double

Default
17.5e6

Examples
phase.StartFrequency = 20e6

See example program

C++ Syntax
HRESULT get_StartFrequency(Double* pVals);
HRESULT put_StartFrequency(Double pVals);

Interface
IPhaseReferenceCalibration
### StartPhase Property

**Description**: Write and read the start value of phase sweep. Must also send Sweep Type Property to put the analyzer into phase sweep mode.

**VB Syntax**: `phase.StartPhase(srcPort) = value`

**Variable (Type) - Description**

- **phase**: A PhaseControl Object
- **srcPort**: (Long Integer) Source port for which to make phase control settings.

**Note**: If the source port is defined by a string name, such as an external source, a balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model, then use `chan.getPortNumber` to translate the string into a port number. To learn more see Remotely Specifying a Source Port

- **value**: (Double) Start phase value in degrees. Choose a value between -360 and 360.

**Return Type**: Double

**Default**: 0 degrees

**Examples**

```
phase.StartPhase 1 = 60 ' Write
value = phase.StartPhase 2' Read
```

**C++ Syntax**

```c++
HRESULT get_StartPhase(long port, double* pVal);

HRESULT put_StartPhase(long port, double newVal);
```

**Interface**: IPhaseControl
StartPowerEx Property

Description
Sets and reads the power sweep start power value for a specific port. This allows uncoupled forward and reverse power sweep ranges. Must also set SweepType = naPowerSweep, Coupled = False (Off), and StopPowerEx.

VB Syntax

`chan.StartPowerEx (srcPort) = value`

Variable (Type) - Description
- `chan` A Channel (object)
- `srcPort` (long integer) – Source port for which to set the Start power value.
- `value` (double) - Start Power in dBm.

**Note:** If the port is defined by a string name, such as an external source, a balanced port, or one of the Source 2 outputs on the 2-port 2-source VNA-x model, then you must use `chan.getPortNumber` to translate the string into a port number. To learn more see Remotely Specifying a Source Port.

**Note:** The range of settable power values depends on the VNA model and if source attenuators are installed. To determine the range of values, use `cap.MaximumSourceALCPower` and `cap.MinimumSourceALCPower`.

Auto attenuation is not allowed in Power Sweep.

Return Type
Double

Default
-10 dBm

Examples

```
Chan.StartPowerEx 1 = -10 'Write
strtpwr = Chan.StartPowerEx 2 'Read
```

C++ Syntax

`HRESULT get_StartPowerEx(long port, double *pVal)`

`HRESULT put_StartPowerEx(long port, double newVal)`

Interface
IChannel13
### StartPowerIn3DSweep Property

**Description**  
Set and read the start power level for a 3D sweep.

**VB Syntax**  
```
HotS22.StartPowerIn3DSweep = level
```

**Variable**  
- **Type**: Description
- **HotS22** - A `ActiveParametersApp` object
- **level** - (Double) - Start power level in dBm. Choose a value from min power to max power of the hardware.

**Return Type**  
Double

**Default**  
-10 dBm

**Examples**  
```
HotS22.StartPowerIn3DSweep = 0 'Write
level = HotS22.StartPowerIn3DSweep 'Read
```

**C++ Syntax**  
```
HRESULT get_StartPowerIn3DSweep(double* level)
HRESULT put_StartPowerIn3DSweep(double level)
```

**Interface**  
IActiveChannelSettings
### StartRatioedPower Property

<table>
<thead>
<tr>
<th>Description</th>
<th>Write and read the start power ratioed value. Must also set SweepType to Power.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>VB Syntax</strong></td>
<td><code>phase.StartRatioedPower(srcPort) = value</code></td>
</tr>
<tr>
<td><strong>Variable</strong></td>
<td><em>(Type)</em> - Description</td>
</tr>
<tr>
<td><code>phase</code></td>
<td>A PhaseControl Object</td>
</tr>
<tr>
<td><code>srcPort</code></td>
<td>(Long Integer) Source port for which to make phase control settings.</td>
</tr>
<tr>
<td><strong>Note:</strong></td>
<td>If the source port is defined by a string name, such as an external source, a balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model, then use <code>chan.getPortNumber</code> to translate the string into a port number. To learn more see <a href="#">Remotely Specifying a Source Port</a>.</td>
</tr>
<tr>
<td><strong>Value</strong></td>
<td>(Double) Start power ratio value in dBc. Must be within the allowable range of the VNA.</td>
</tr>
<tr>
<td><strong>Return Type</strong></td>
<td>Double</td>
</tr>
<tr>
<td><strong>Default</strong></td>
<td>0 dBc</td>
</tr>
<tr>
<td><strong>Examples</strong></td>
<td><code>phase.StartRatioedPower 1 = -1 ' Write</code></td>
</tr>
<tr>
<td></td>
<td><code>value = phase.StartRatioedPower 2 ' Read</code></td>
</tr>
<tr>
<td><strong>C++ Syntax</strong></td>
<td>[ \text{HRESULT get_StartRatioedPower(long port, double* pVal);} ]</td>
</tr>
<tr>
<td></td>
<td>[ \text{HRESULT put_StartRatioedPower(long port, double newVal);} ]</td>
</tr>
<tr>
<td><strong>Interface</strong></td>
<td>IPhaseControl</td>
</tr>
</tbody>
</table>

---

**Note:** For a detailed explanation of the source port, see the linked documentation. The `chan.getPortNumber` function is used to convert a string source into a port number when using a balanced port, external source, or one of the Source 2 outputs on a PNA-X model.
## State (GPL) Property

<table>
<thead>
<tr>
<th>Description</th>
<th>Enables and disables Global Power Limiting for the specified port.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>VB Syntax</strong></td>
<td><code>gpl.State(port) = bool</code></td>
</tr>
<tr>
<td><strong>Variable</strong> (Type) - Description</td>
<td></td>
</tr>
<tr>
<td><code>gpl</code></td>
<td>A <code>GlobalPowerLimit</code> (object)</td>
</tr>
<tr>
<td><code>port</code> (Long)</td>
<td>Port number for which power limit state is to be set.</td>
</tr>
<tr>
<td><code>bool</code> (Boolean)</td>
<td>Choose from:</td>
</tr>
<tr>
<td><strong>True</strong></td>
<td>Power Limiting is enabled.</td>
</tr>
<tr>
<td><strong>False</strong></td>
<td>Power Limiting is disabled.</td>
</tr>
<tr>
<td><strong>Return Type</strong></td>
<td>Boolean</td>
</tr>
<tr>
<td><strong>Default</strong></td>
<td>False</td>
</tr>
<tr>
<td><strong>Examples</strong></td>
<td><code>gpl.State(1) = True</code> 'Write'</td>
</tr>
<tr>
<td></td>
<td><code>Limit = gpl.State(2)</code> 'Read'</td>
</tr>
<tr>
<td><strong>C++ Syntax</strong></td>
<td>HRESULT get_State(long port, VARIANT_BOOL *pVal)</td>
</tr>
<tr>

<td></td>
</tr>
<tr>
<td><strong>FIFO</strong></td>
<td></td>
</tr>
</tbody>
</table>

### Notes:

- \textbf{LimitTest.State} - If using Global Pass/Fail status, trigger the VNA AFTER turning Limit testing ON.
- \textbf{Segment.State} - At least ONE segment must be ON or \textit{Sweep Type} is automatically set to \textit{Linear}.

<table>
<thead>
<tr>
<th>value</th>
<th>(boolean) -</th>
</tr>
</thead>
<tbody>
<tr>
<td>\textbf{False}</td>
<td>Turns \textit{obj} OFF</td>
</tr>
<tr>
<td>\textbf{True}</td>
<td>Turns \textit{obj} ON</td>
</tr>
</tbody>
</table>

### Return Type

Boolean
Default  Depends on the object:

0 - FOM

0 - Gating

0 - InterfaceControl

0 - LimitTest

1 - Segment

0 - Transform

0 - Equation

0 - FIFO

Examples

Seg.State = 1 'Turns the segment object ON -Write

tran = Trans.State 'returns the state of Transform -Read

C++ Syntax

HRESULT get_State(VARIANT_BOOL *pVal)

HRESULT put_State(VARIANT_BOOL newVal)

Interface

ISegment

IInterfaceControl

ITransform

IGating

ILimitTest

IFOM

IEquation

IEmbeddedLO

IFIFO
# State Property

Sets and returns the ON / Off state of the specified DC source and port.

**VB Syntax**

```vbnet
dc.State(name, port) = state
```

**Variable (Type) - Description**

- **dc**
  - An DCStimulus (object)
- **name, port**
  - (String) Name of the "DC source, port"

Use **Source Property** to read a list of configured DC source names.

To set the DC source to be always ON, do NOT specify a port.

- **state**
  - Boolean. ON / Off state. Choose from:
    - True - DC source/port enabled.
    - False - DC source/port disabled.

**Return Type** Boolean

**Default** False

**Examples**

- "Set AO1 to always ON"
  ```vbnet
dc.State "AO1",True
  
  'Set MyDCSource to ON when the RF source for Port 1 is ON
  dc.State "MyDCSource,Port 1",ON
  
  'Read state for MyDCSource,Port 1
  dc.State? "MyDCSource,Port 1"
  ```

**C++ Syntax**

```c++
HRESULT get_State(BSTR name, VARIANT_BOOL * pValue);

HRESULT put_State(BSTR name, VARIANT_BOOL newValue);
```

**Interface** IDCStimulus
## About Receiver Leveling

### State (Rx Leveling) Property

<table>
<thead>
<tr>
<th>Description</th>
<th>Sets and reads the state of Receiver Leveling for a specific source port.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>VB Syntax</strong></td>
<td><code>RxLevel.State(srcPort) = value</code></td>
</tr>
<tr>
<td><strong>Variable</strong></td>
<td><strong>(Type)</strong> - Description</td>
</tr>
<tr>
<td><code>RxLevel</code></td>
<td>A ReceiverLeveling Object</td>
</tr>
<tr>
<td><code>value</code></td>
<td>(Boolean) Choose from:</td>
</tr>
<tr>
<td><strong>True</strong></td>
<td>Receiver leveling ON</td>
</tr>
<tr>
<td><strong>False</strong></td>
<td>Receiver leveling OFF</td>
</tr>
<tr>
<td><strong>srcPort</strong></td>
<td>(Long Integer) Source port for which to set the state of Receiver Leveling.</td>
</tr>
</tbody>
</table>

**Note:** If the source port is defined by a string name, such as an external source, a balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model, then use `chan.getPortNumber` to translate the string into a port number. To learn more see [Remotely Specifying a Source Port](#).

<table>
<thead>

</tbody>
</table>

| **Interface** | IReceiverLevelingConfiguration |
### State Property

<table>
<thead>
<tr>
<th>Description</th>
<th>Turns the specified pulse generator ON and OFF.</th>
</tr>
</thead>
<tbody>
<tr>
<td>VB Syntax</td>
<td><code>pulse.State(n) = value</code></td>
</tr>
<tr>
<td>Variable</td>
<td>(Type) - Description</td>
</tr>
<tr>
<td><code>pulse</code></td>
<td>A PulseGenerator (object)</td>
</tr>
<tr>
<td><code>n</code></td>
<td>(Integer) Pulse generator number. Choose from 0 to 4.</td>
</tr>
<tr>
<td></td>
<td>Or use PulseGeneratorID to refer to an external pulse generator.</td>
</tr>
<tr>
<td></td>
<td>0 is the generator that pulses the ADC.</td>
</tr>
<tr>
<td><code>value</code></td>
<td>True - turns pulse output ON.</td>
</tr>
<tr>
<td></td>
<td>False - turns pulse output OFF.</td>
</tr>
<tr>
<td>Return Type</td>
<td>Boolean</td>
</tr>
<tr>
<td>Default</td>
<td>False</td>
</tr>
<tr>
<td>Examples</td>
<td><code>pulse.State(1) = True</code>  <code>Write</code></td>
</tr>
<tr>
<td></td>
<td><code>value = pulse.State(4)</code>  <code>Read</code></td>
</tr>
<tr>
<td>C++ Syntax</td>
<td>HRESULT get_State(integer pulse, VARIANT_BOOL *pVal);</td>
</tr>
<tr>
<td></td>
<td>HRESULT put_State(integer pulse, VARIANT_BOOL newVal);</td>
</tr>
<tr>
<td>Interface</td>
<td>IPulseGenerator</td>
</tr>
</tbody>
</table>
### StatisticsRange Property

**Description**
Sets the User Range number for calculating measurement statistics. Set the start and stop values for a User Range with UserRangeMin and UserRangeMax.

There are 16 User Ranges per channel. User ranges are applied independently to any measurement.

**VB Syntax**

```vbnet
meas.StatisticsRange = value
```

<table>
<thead>
<tr>
<th>Variable</th>
<th>(Type) - Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>meas</td>
<td>A Measurement (object)</td>
</tr>
<tr>
<td>value</td>
<td>(long integer) - Range Number. Choose any number between 0 and 16</td>
</tr>
</tbody>
</table>

- 0 is Full Span
- 1 - 16 are user-defined ranges

**Return Type**
Long Integer

**Default**
0

**Examples**

```vbnet
meas.StatisticsRange = 2 'Write
statrange = meas.StatisticsRange 'Read
```

**C++ Syntax**

```cpp
HRESULT get_StatisticsRange(long* rangeNumber)
HRESULT put_StatisticsRange(long rangeNumber)
```

**Interface**
IMeasurement
### StatusAsString Property

<table>
<thead>
<tr>
<th>Description</th>
<th>Returns a string that describes the result of the last tuning sweeps.</th>
</tr>
</thead>
<tbody>
<tr>
<td>VB Syntax</td>
<td><code>value = embedLODiag.StatusAsString</code></td>
</tr>
<tr>
<td>Variable</td>
<td><strong>(Type)</strong> Description</td>
</tr>
<tr>
<td>value</td>
<td><strong>(String)</strong> Variable to store the returned data.</td>
</tr>
<tr>
<td>embedLODiag</td>
<td>An EmbeddedLODiagnostic <strong>(object)</strong></td>
</tr>
<tr>
<td>Return Type</td>
<td><strong>(String)</strong></td>
</tr>
<tr>
<td>Default</td>
<td>Not Applicable</td>
</tr>
<tr>
<td>Examples</td>
<td><code>data= embedLO.StatusAsString</code></td>
</tr>
<tr>
<td>C++ Syntax</td>
<td><code>HRESULT get_StatusAsString(BSTR* status);</code></td>
</tr>
<tr>
<td>Interface</td>
<td>IEmbeddedLODiagnostic</td>
</tr>
</tbody>
</table>
## StepRiseTime Property

**Description**
Sets or returns the Rise time of the stimulus in Low Pass Step Mode.

**VB Syntax**
```vba
trans.StepRiseTime = value
```

**Variable (Type) - Description**
- `trans` (object) - A Transform
- `value` (double) - Rise time in seconds. Choose any number between 5.0e-13 and 1.63e-14.

**Return Type**
Double

**Default**
0

**Examples**
```vba
trans.StepRiseTime = 1.0e-14 'sets the step rise time to 100 psec. -Write
rt = trans.StepRiseTime 'Read
```

**C++ Syntax**
```cpp
HRESULT get_StepRiseTime(double *pVal)
HRESULT put_StepRiseTime(double newVal)
```

**Interface**
ITransform
### StepData Property

**Description**
Returns an array of data from the specified tuning sweep.

**VB Syntax**

```vbnet
value = embedLODiag.StepData(n)
```

**Variable**

- **Type** - Description
  - **value** (Variant Array) Variable to store the returned data.
  - **embedLODiag** An EmbeddedLODiagnostic (object)
  - **n** (Long) Tuning sweep number. Use NumberOfSweeps to find the number of sweeps taken.

**Default**
Not Applicable

**Examples**

```vbnet
data= embedLO.StepData 3 'read
```

**C++ Syntax**

```csharp
HRESULT StepData(long sweep, VARIANT* pArray);
```

**Interface**
IEmbededLODiagnostic
### StepTitle Property

<table>
<thead>
<tr>
<th>Description</th>
<th>Returns the title of the specified tuning sweep.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>VB Syntax</strong></td>
<td>$value = embedLODiag.StepTitle(n)$</td>
</tr>
<tr>
<td><strong>Variable</strong></td>
<td><em>(Type)</em> - Description</td>
</tr>
<tr>
<td>$value$</td>
<td><em>(String)</em> Variable to store the returned data.</td>
</tr>
<tr>
<td><em>embedLODiag</em></td>
<td>An <em>EmbeddedLODiagnostic (object)</em></td>
</tr>
<tr>
<td>$n$</td>
<td><em>(Long)</em> Tuning sweep number. Use <em>NumberOfSweeps</em> to find the number of sweeps taken.</td>
</tr>
<tr>
<td><strong>Default</strong></td>
<td>Not Applicable</td>
</tr>
<tr>
<td><strong>Examples</strong></td>
<td><code>data= embedLO.StepTitle 3 'read</code></td>
</tr>
<tr>
<td><strong>C++ Syntax</strong></td>
<td><code>HRESULT StepTitle(long sweep, BSTR * title);</code></td>
</tr>
<tr>
<td><strong>Interface</strong></td>
<td>IEmbededLODiagnostic</td>
</tr>
</tbody>
</table>
### StimulusValues Property

<table>
<thead>
<tr>
<th>Description</th>
<th>Returns the specified X-axis FOM frequency range. The array contains one frequency value for each data point.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>VB Syntax</strong></td>
<td><code>value = calSet.StimulusValues (range)</code></td>
</tr>
<tr>
<td><strong>Variable</strong></td>
<td>(Type) - Description</td>
</tr>
<tr>
<td><code>calSet</code></td>
<td>CalSet (object) - Read-only property</td>
</tr>
</tbody>
</table>
| `range` | (Long) FOM frequency range to read.  
  - 0 - returns source frequencies.  
  - 1 - returns response frequencies.  
  - 2 - returns primary frequencies. |
| **Return Type** | 1-dimensional variant array |
| **Default** | Not Applicable |
| **Examples** | `array = CalSet.StimulusValues 'Read` |
| **C++ Syntax** | `HRESULT get_StimulusValues (long range, VARIANT* vals)` |
| **Interface** | ICalSet3 |
### Stop Property

Sets and returns Stop DC value for the specified DC source.

#### VB Syntax

```vbnet
dc.Stop (name, port) = value
```

#### Variable - Description

- **dc**: An DCStimulus (object)  
- **name, port**: (String) Name of the "DC source, port"

Use Source Property to read a list of configured DC source names.

To set the DC source to be always ON, do NOT specify a port.

- **value**: (Double) DC Stop value. Choose a value within the range of the DC source.

#### Return Type

Double

#### Default

1

#### Examples

- **Set AO1 to always ON**
  ```vbnet
dc.Stop "AO1", 3
  ```

- **Read Stop for MyDCSource, Port 1**
  ```vbnet
dc.Stop? "MyDCSource, Port 1"
  ```

#### C++ Syntax

```cpp
HRESULT get_Stop(BSTR name, VARIANT_BOOL * pValue);

HRESULT put_Stop(BSTR name, VARIANT_BOOL newValue);
```

#### Interface

IDCStimulus

---

**2416**
**StopFrequency Property**

**Description**
Sets or returns the stop frequency of the channel. (Channel Object)

Sets or returns the stop frequency of the segment. (Segment Object)

Sets or returns the stop frequency of the FOM Range. (FOMRange Object)

Sets or returns the stop frequency of the Power Sensor coverage (GuidedCalibrationPowerSensor Object)

Sets or returns the stop frequency of the Phase Reference Calibration.

See also Measurement2 interface.

**VB Syntax**

```
object.StopFrequency = value
```

<table>
<thead>
<tr>
<th>Variable</th>
<th>(Type) - Description</th>

StopFrequency (Cal Set) Property

Description
Returns the stop frequency that is stored in the Cal Set.

VB Syntax
value = CalSet.StopFrequency (range)

Variable (Type) - Description
value (double) - returned Stop frequency in Hertz.
CalSet (object)
range (Long) Choose: 0 (Source and receiver frequency)

Return Type
Double

Default
Not Applicable

Examples
stop = calset.StopFrequency(0) 'Reads the stop frequency stored in the cal set.

C++ Syntax
HRESULT get_StopFrequency(long range, double *pVal)

Interface |CalSet3
StopPower Property

Description
Sets the Stop Power of the analyzer when `sweep type` is set to Power Sweep. Frequency of the measurement is set with `chan.CWFrequency`.

VB Syntax

```vbnet
object.StopPower = value
```

Variable

(Type) - Description

`object` One of the following:

- `Channel` (object)
- `CalSet` (object) - Read-only property

`value` (double) - Stop Power in dB.

**Note:** The range of settable power values depends on the VNA model and if source attenuators are installed. To determine the range of values, use `cap.MaximumSourceALCPower` and `cap.MinimumSourceALCPower`.

Auto attenuation is not allowed in Power Sweep.

Return Type
Double

Default
0

Examples

```
Chan.StopPower = -10 'Write
stppwr = Chan.StopPower 'Read
```

C++ Syntax

```
HRESULT get_StopPower(double *pVal)
HRESULT put_StopPower(double newVal)
```

Interface

IChannel

|CalSet3
## Stop Property

**Description**
Sets or returns the Stop time of either Gating or Time Domain transform windows

**VB Syntax**
```
object.Stop = value
```

**Variable**
- **object** (Type) - Description
- **object** (object) As Gating
  or
- **object** (object) As Transform
- **value** (double) - Start time in seconds. Choose any number between:
  ± (number of points-1) / frequency span

**Return Type**
Double

**Default**
10 ns

**Examples**
- `Trans.Stop = 4.5e-9 'sets the stop time of a transform window - Write`
- `Gate.Stop = 4.5e-9 'sets the stop time of a gating window - Write`
- `stp = Trans.Stop 'Read`

**C++ Syntax**
```
HRESULT get_Stop(double *pVal)
HRESULT put_Stop(double newVal)
```

**Interface**
ITransform
IGating
## Stop Property

**Description**
Returns the stimulus value of the last data point for the measurement. To understand how this property is useful, see IMeasurement2 Interface.

**VB Syntax**

```vbnet
value = meas.Stop
```

**Variable (Type) - Description**

- `value` *(Double)* Variable to store the returned value
- `meas` A Measurement *(object)*

**Return Type**
Double

**Default**
Not Applicable

**Examples**

```vbnet
Print meas.Stop 'prints the stimulus value of the last data point
```

**C++ Syntax**

```cpp
HRESULT get_Stop(double * Val);
```

**Interface**
IMeasurement2
## StopFrequency (PowerCalRange) Property

<tr>
<td><strong>Variable</strong></td>
<td>(Type) - Description</td>
</tr>
<tr>
<td><code>phase</code></td>
<td>A <strong>PhaseControl</strong> Object</td>
</tr>
<tr>
<td><code>srcPort</code></td>
<td>(Long Integer) Source port for which to make phase control settings.</td>
</tr>
</tbody>
</table>

**Note:** If the source port is defined by a string name, such as an external source, a balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model, then use `chan.getPortNumber` to translate the string into a port number. To learn more see **Remotely Specifying a Source Port** |

| **Value** | (Double) Stop phase value in degrees. Choose a value between -360 and 360. |
| **Return Type** | Double |
| **Default** | 0 degrees |

**Examples**

```
phase.StopPhase 1 = 60 ' Write
value = phase.StopPhase 2 ' Read
```

**C++ Syntax**

```
HRESULT get_StopPhase(long port, double* pVal);
HRESULT put_StopPhase(long port, double newVal);
```

**Interface**

IPhaseControl
**StopPowerEx Property**

**Description**
Sets and reads the power sweep start power value for a specific port. This allows uncoupled forward and reverse power sweep ranges. Must also set `SweepType = naPowerSweep`, `Coupled = False (Off)`, and `StartPowerEx`.

**VB Syntax**

```vbnet
chan.StopPowerEx (srcPort) = value
```

**Variable (Type) - Description**

- `chan` A Channel (object)
- `srcPort` (long integer) – Source port for which to set the Stop power value.

**Note:** If the port is defined by a string name, such as an external source, a balanced port, or one of the Source 2 outputs on the 2-port 2-source VNA-x model, then you must use `chan.getPortNumber` to translate the string into a port number. To learn more see [Remotely Specifying a Source Port](#).

- `value` (double) - Stop Power in dBm.

**Note:** The range of settable power values depends on the VNA model and if source attenuators are installed. To determine the range of values, use `cap.MaximumSourceALCPower` and `cap.MinimumSourceALCPower`.

Auto attenuation is not allowed in Power Sweep.

**Return Type**
Double

**Default**
0 dBm

**Examples**

```csharp
Chan.StopPowerEx 1 = -10 'Write
stopPwr = Chan.StopPowerEx 2 'Read
```

**C++ Syntax**

```cpp
HRESULT get_StopPowerEx(long port, double *pVal)
HRESULT put_StopPowerEx(long port, double newVal)
```

**Interface**
IChannel13
**StopPowerIn3DSweep Property**

**Description**  Set and read the stop power level for a 3D sweep.

**VB Syntax**  
```
HotS22.StopPowerIn3DSweep = level
```

**Variable (Type) - Description**
- `HotS22`: A `ActiveParameterApp (object)`
- `level` (Double): Stop power level in dBm. Choose a value from min power to max power of the hardware.

**Return Type**  Double

**Default**  0 dBm

**Examples**  
- `HotS22.StopPowerIn3DSweep = 0`  'Write
- `level = HotS22.StopPowerIn3DSweep`  'Read

**C++ Syntax**  
- `HRESULT get_StopPowerIn3DSweep(double* level)`
- `HRESULT put_StopPowerIn3DSweep(double level)`

**Interface**  IActiveChannelSettings
## StopRatioedPower Property

<table>

</tr>
</tbody>
</table>

**Note:** If the source port is defined by a string name, such as an external source, a balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model, then use \( \text{chan.getPortNumber} \) to translate the string into a port number. To learn more see Remotely Specifying a Source Port

| value | (Double) Stop power ratio value in dBc. Must be within the allowable range of the VNA. |
| Return Type | Double |
| Default | 0 dBc |

### Examples

- `\text{phase.StopRatioedPower 1 = -1 }` \textit{Write}

- `\text{value = phase.StopRatioedPower 2 }` \textit{Read}

### C++ Syntax

- `\text{HRESULT get\_StopRatioedPower(long port, double* pVal);}`

- `\text{HRESULT put\_StopRatioedPower(long port, double newVal);} `

### Interface

- IPhaseControl
strPort2Pdeembed_S2PFile Property

Description
Sets and returns the 2 port De-embedding .S2P file name for the specified port number. Model is applied when both the file name is specified and User is specified using Port2PdeembedCktModel Property.

Learn more about S2P files.

Note: This command affects ALL measurements on the channel.

VB Syntax
 fixture.strPort2Pdeembed_S2PFile(port) = value

Variable (Type) - Description
fixture A Fixturing (object)
port (Integer) Port number to receive circuit model.
value (String) Full path, file name, and extension (.s2P) of the de-embedding circuit.

Files are typically stored in "D:\".

Return Type String
Default Not Applicable

Examples
 fixture.strPort2Pdeembed_S2PFile(2) = "D:\myFile.s2p" 'Write
value = fixture.strPort2Pdeembed_S2PFile(1) 'Read

C++ Syntax
HRESULT get_strPort2Pdeembed_S2PFile(short port BSTR *bstrFile)
HRESULT put_strPort2Pdeembed_S2PFile(short port BSTR bstrFile)

Interface IFixturing
strPortMatch_S2PFile Property

Description
Sets and returns the Port Matching 'S2P' file name for the specified port number. Model is applied when both the file name is specified and User is specified using PortMatchingCktModel Property.

Learn more about S2P files.

Note: This command affects ALL measurements on the channel.

VB Syntax
```vbnet
fixture.strPortMatch_S2PFile(port) = value
```

Variable (Type) - Description
- `fixture` (A Fixturing object)
- `port` (Integer) Port number to receive circuit model.
- `value` (String) Full path, file name, and extension (.s2P) of the matching circuit.

Files are typically stored in "D:\".

Return Type String

Default Not Applicable

Examples
```vbnet
fixture.strPortMatch_S2PFile(2) = "D:\myFile.s2p" 'Write
value = fixture.strPortMatch_S2PFile(1) 'Read
```

C++ Syntax
```cpp
HRESULT get_strPortMatch_S2PFile(short port BSTR *bstrFile)
HRESULT put_strPortMatch_S2PFile(short port BSTR bstrFile)
```

Interface IFixturing
### SubPointTrigger Property

**Description**  Enables / Disables subpoint triggering. When enabled and performing Point Averaging, each rising edge of P0 triggers a subpoint (one of N acquisitions in an N point average). Must also enable the P0 generator using pulse.State(n).

**VB Syntax**  

```
pulse.SubPointTrigger(n) = value
```

**Variable**  

- **pulse**  A PulseGenerator (object)
- **n**  (Integer) Pulse generator number. **Must be 0** as this is the generator that triggers the ADC.
- **value**  (Boolean) Enable or disable SubPointTrigger

- **True** - turns subpoint triggering ON.
- **False** - turns subpoint triggering OFF.

**Return Type**  Boolean

**Default**  False

**Examples**  

```
pulse.SubPointTrigger(0) = True 'Write
bool = pulse.SubPointTrigger(0) 'Read
```

**C++ Syntax**  

```c++
HRESULT get_SubPointTrigger (integer pulse, VARIANT_BOOL* on_off);
HRESULT put_SubPointTrigger (integer pulse, VARIANT_BOOL on_off);
```

**Interface**  IPulseGenerator2
### SupportedParameters Property

<table>
<thead>
<tr>
<th>Description</th>
<th>Returns a list of supported parameters for the specified measurement class.</th>
</tr>
</thead>
<tbody>
<tr>
<td>VB Syntax</td>
<td><code>value = measClassProps.ProperSupportedParameters</code></td>
</tr>
<tr>
<td>Variable</td>
<td><em>(Type)</em> - Description</td>
</tr>
<tr>
<td><code>value</code></td>
<td>(Variant) - Variable to store the returned array of parameters.</td>
</tr>
<tr>
<td><code>measClassProps</code></td>
<td>A <em>MeasurementClassProperties</em> (Object)</td>
</tr>
<tr>
<td>Return Type</td>
<td>Variant array</td>
</tr>
<tr>
<td>Default</td>
<td>Not Applicable</td>
</tr>
</tbody>
</table>

**Examples**

```vbscript
'Access the MeasurementClassProperties Object

Set app = CreateObject("AgilentPNA835x.Application")
Set cap = app.Capabilities
Set measProps = cap.MeasurementClassProperties("Swept IMD")

'Read the supported parameters

list=measProps.SupportedParameters

dim i
For i = 0 To UBound(list)
    msg = msg & list(i) & vbCrLf
Next
MsgBox msg
```

**C++ Syntax**

```c++
HRESULT get_SupportedParameters(Variant *value);
```

**Interface**

ICapabilities8
# Sweep Delay Property

**Description**
Specifies the time to wait just before acquisition begins for each sweep. This delay is in addition to Dwell Time and the following two External Trigger delays if enabled.

- TriggerDelay (global scope)
- ExternalTriggerDelay (channel scope)

**VB Syntax**

```vbnet
chan.SweepDelay = value
```

**Variable (Type) - Description**

<table>
<thead>
<tr>
<th>chan</th>
<th>Channel (object)</th>
</tr>
</thead>
<tbody>
<tr>
<td>value</td>
<td>(double) - Sweep delay in seconds.</td>
</tr>
</tbody>
</table>

**Return Type**
Double

**Default**
0

**Examples**

```vbnet
chan.SweepDelay = 3e-3 'Write
swpdelay = chan.SweepDelay 'Read
```

**C++ Syntax**

```cpp
HRESULT get_SweepDelay(double *pVal)
```

```cpp
HRESULT put_SweepDelay(double newVal)
```

**Interface**
IChannel
# SweepDwell Property

**Description**  Sets and returns the "Dwell Before Sweep" value for an external DC Device which can be configured as either a DC Meter or a DC Source.

**VB Syntax**  

\[ extDC.SweepDwell = value \]

**Variable**  

- **(Type)** - Description
- **extDC**  An ExternalDCDevice (object)
- **value**  (Double) The dwell time (in seconds) before making a new sweep.

**Return Type**  Double

**Default**  1 milliseconds

**Examples**  

- \[ extDC.SweepDwell = 10e-3 \] \( \text{Write} \)
- \[ dwell = extDC.SweepDwell \] \( \text{Read} \)

**C++ Syntax**  

- HRESULT get_SweepDwell (double *pValue)
- HRESULT put_SweepDwell (double newVal)

**Interface**  IExternalDCDevice
## Read/Write

### SweepEndMode Property

**Description**
Sets and reads the event that will cause the Sweep End line to go to a low state. The line will return to a high state after the appropriate calculations are complete.

*Note:* This line is connected to the HANDLER IO connector.

**VB Syntax**
```vbnet
object.SweepEndMode = value
```

**Variable (Type) - Description**
- `object` *(object)* - A HandlerIO or AuxIO object
- `value` *(enum as NASweepEndMode)* - Choose from:
  - 0 - `naSweep` - the line goes low when each sweep is complete
  - 1 - `naChannelSweep` - the line goes low when all the sweeps for each channel is complete.
  - 2 - `naGlobalSweep` - the line goes low when all sweeps for all triggerable channels are complete.

**Return Type**
Long Integer

**Default**
0 - `naSweep`

**Examples**
```
HWAuxIO.PassFailMode = naSweep 'Write
```
```
value = HWAuxIO.PassFailMode 'Read
```

**C++ Syntax**
```cpp
HRESULT put_SweepEndMode ( tagNASweepEndMode Mode );
```
```
HRESULT get_SweepEndMode ( tagNASweepEndMode* Mode );
```

**Interface**
IHWAuxIO

IHWMaterialHandlerIO
## SweepHoldOff Property

**Description**
Returns a boolean that represents the state of SweepHoldoff line (pin2) of the External Test Set connector.

**VB Syntax**
```
value = ExtIO.SweepHoldOff
```

**Variable (Type) - Description**
- **value** *(boolean)* - Variable to store the returned data
- **ExtIO** *(object)* - An External IO object

**Return Type**
boolean

- **False** - indicates the line is being held at a TTL Low
- **True** - indicates the line is being held at a TTL High

**Default**
Not Applicable

**Examples**
```
value = ExtIO.SweepHoldOff
```

**C++ Syntax**
```cpp
HRESULT get_SweepHoldOff( VARIANT_BOOL* bValue);
```

**Interface**
IHWEexternaTestSetIO
### SweepMode Property

</table>
SweepOrder Property

Description  Sets and returns the order number of IM products to view when SweepType = NTH is specified. This actually sets the frequency span to DeltaF * N (this command value).

VB Syntax  

\[ ims.SweepOrder = value \]

Variable  (Type) - Description

- \( ims \) An IMSpectrum Object
- \( value \) (Integer) Order number of IM product.

Return Type  Long Integer

Default  9

Examples  

\[ ims.SweepOrder = 5 \ 'Write \]
\[ value = ims.SweepOrder \ 'Read \]

C++ Syntax  

HRESULT get_SweepOrder(long *pVal)
HRESULT put_SweepOrder(long newVal)

Interface  IIMSpectrum
**SweepSpeedMode Property**

**Description**  
Sets and returns the sweep speed mode: FastSweep or Normal.

**VB Syntax**  
`chan.SweepSpeedMode = value`

**Variable**  
*Type* - Description
- `chan` - A Channel (object)
- `value` - (enum as NASweepSpeedMode) - Choose from:
  - 0 - `naSweepSpeedModeNormal` - Standard VNA sweep mode
  - 1 - `naSweepSpeedModeFast` - Fast sweep mode

**Return Type**  
Enum

**Default**  
0 - `naSweepSpeedModeNormal`

**Examples**
- `chan.SweepSpeedMode = naSweepSpeedModeNormal`  
  `'Write`
- `swpSpeed = chan.SweepSpeedMode`  
  `'Read`

**C++ Syntax**
- `HRESULT get_SweepSpeedMode(tagNASweepSpeedModes* pVal)`
- `HRESULT put_SweepSpeedMode(tagNASweepSpeedModes newVal)`

**Interface**  
IChannel14
SweepGenerationMode Property

**Description**
Sets the method used to generate a sweep: continuous ramp (analog) or discrete steps (stepped).

**VB Syntax**

```
object.SweepGenerationMode = value
```

**Variable**

- **object**: Channel (object)

or

- **CalSet (object)**: Read-only property

**value**

- **(enum NASweepGenerationModes)**: Choose either:

  0 - **naSteppedSweep** - source frequency is CONSTANT during measurement of each displayed point. More accurate than Analog. Dwell time can be set in this mode.

  1 - **naAnalogSweep** - source frequency is continuously RAMPING during measurement of each displayed point. Faster than Stepped. Sweep time (not dwell time) can be set in this mode.

**Return Type**
Long Integer

**Default**
Analog

**Examples**

```
Chan.SweepGenerationMode = naAnalogSweep 'Write
swpgen = Chan.SweepGenerationMode 'Read
```

**C++ Syntax**

```
HRESULT get_SweepGenerationMode(tagNASweepGenerationModes* pVal)
HRESULT put_SweepGenerationMode(tagNASweepGenerationModes newVal)
```

**Interface**
IChannel

Write/Read

About Sweep Time

SweepTime Property

Description: Sets the Sweep time of the analyzer. If sweep time accuracy is critical, use ONLY the values that are attained using the up and down arrows next to the sweep time entry box.

See Sweep Time.

VB Syntax:

```vbnet
object.SweepTime = value
```

Variable (Type) - Description

- **object**: Channel (object)
- or
- **object**: Segment (object) first set SweepTimeOption to true.
- or
- **CalSet (object)** - Read-only property

- **value**: (double) - Sweep time in seconds. The maximum sweep time of the VNA is 86400 seconds (1 day).

To set the fastest sweep speed possible, set this value to 0.

Return Type: Double

Default: 0

Examples:

```vbnet
chan.SweepTime = 3e-3 'Write
swptme = chan.SweepTime 'Read
```

C++ Syntax:

```c++
HRESULT get_SweepTime(double *pVal)
HRESULT put_SweepTime(double newVal)
```

Interface:

- IChannel
- CalSet3
- ISegment2
### SweepTimeOption Property

**Description**
Enables the Sweep time or Dwell time to be set on individual sweep segments. This property must be set True **before** the sweep or dwell time commands are sent. Otherwise, those commands will be ignored.

**VB Syntax**
```
segs.SweepTimeOption = state
```

**Variable**
- **Type** - Description
  - `segs` A `Segments` collection *(object)*
  - `state` *(boolean)*

  **True** - Enables Sweep or Dwell time to be set independently.
  
  **False** - Disables Sweep or Dwell time from being set independently.

**Return Type**
Boolean

**Default**
False

**Examples**
```
segs.SweepTimeOption = True 'Write
timeOption = SweepTimeOption 'Read
```

**C++ Syntax**
```
HRESULT get_SweepTimeOption(VARIANT_BOOL *pVal)
HRESULT put_SweepTimeOption(VARIANT_BOOL newVal)
```

**Interface**
ISegments3
SweepType Property (IMD Opt S93087A/B)

Description
Sets and returns the type of sweep for a Swept IMD measurement.

See a list of commands that are relevant for each sweep type.

VB Syntax
\[ \text{imd.SweepType} = \text{value} \]

Variable (Type) - Description
\- \textit{imd} A SweptIMD Object
\- \textit{value} (Enum as naSweepTypes) - Choose from:

\- 0 - naIMDToneCWSweep The main tone frequencies (F1 and F2) and power levels (P1 and P2) are held constant. Measurements are taken for the specified number of points.

\- 1 - naIMDTonePowerSweep The main tone frequencies are specified as either F1 and F2, or as FC and DeltaF. These frequencies are held constant while the power of each tone is varied from the Start Power to Stop Power.

\- 2 - naIMDToneCenterFreqSweep Maintaining a constant tone spacing (DeltaF) and tone powers (P1 and P2), the center frequency (FC) is swept from Start to Stop, or can also be specified as Center and Span.

\- 3 - naIMDDeltaFrequencySweep The center frequency (FC) is held constant. The tone spacing is increased from Start DeltaF to Stop DeltaF.

\- 4 - naIMDToneSegmentSweep Same as FCenter sweep, except that the center frequencies for the sweep are constructed using the standard segment sweep commands. (NOT valid for IMDx)

\- 5 - naLOPowerSweep All frequencies are fixed while the LO power is swept. (IMDx ONLY)

Return Type
Enum

Default
2 - naIMDToneCenterFreqSweep

Examples
\texttt{imd.SweepType = naIMDToneCWSweep \ 'Write}
\texttt{swptyp = imd.SweepType \ 'Read}

C++ Syntax
HRESULT get_SweepType(tagNASweepTypes* pVal)
HRESULT put_SweepType(tagNASweepTypes newVal)

Interface
ISweptIMD
SweepType Property (IMSpectrum Opt S93087A/B)

**Description**
Sets and returns the type of sweep for an IMSpectrum measurement.

**VB Syntax**

```vbnet
ims.SweepType = value
```

**Variable (Type) - Description**

- **ims**
  An IMSpectrum Object
- **value**
  (Enum as NAIMSSweepType) - Choose from:

  - **0 - naIMSLinearSpan**
    When Tracking is enabled, allows tuning the Response Settings (receiver) to any values within the frequency range of the VNA. When Tracking is NOT enabled also allows setting the Stimulus (sources) to any values within the frequency range or the VNA.

  - **1 - naIMSSecondOrderSpan**
    The receiver is tuned to view the 2nd order products \((f_2 - f_1\) and \(f_1 + f_2\)) of the main tones that are currently specified in Stimulus Settings. When Tracking is enabled, the main tones are specified in the Swept IMD channel.

  - **2 - naIMSThirdOrderSpan**
    The receiver is tuned to view the 3rd order products \((2f_1 - f_2\) and \(2f_2 - f_1\)) of the main tones that are currently specified in Stimulus Settings. When Tracking is enabled, the main tones are specified in the Swept IMD channel.

  - **3 - naIMSNthOrderSpan**
    The frequency range is set to \(N \times \Delta F\). This algorithm will NOT tune the receivers to see the EVEN order products.

**Return Type**
Enum

**Default**
3 - naIMSNthOrderSpan

**Examples**

```vbnet
ims.SweepType = naIMSNthOrderSpan 'Write
swptyp = ims.SweepType 'Read
```

**C++ Syntax**

```cpp
HRESULT get_SweepType(tagNAIMSSweepType* pVal)
HRESULT put_SweepType(tagNAIMSSweepType newVal)
```

**Interface**
IMSpectrum
Write/Read

**About Sweep Types**

### SweepType Property

**Description**
Sets and returns the type of sweep. First set SweepType, then set sweep parameters such as frequency or power settings.

**VB Syntax**
```
object.SweepType = value
```

**Variable**
**(Type) - Description**
- **object** One of the following:
  - **Channel** (object)
  - **FOMRange** (object) Must be an **UNCOUPLED** range.
  - **CalSet** (object) - Read-only property

**value** *(enum NASweepTypes)* - Choose from:
- 0 - **naLinearSweep**
- 1 - **naLogSweep**
- 2 - **naPowerSweep**
- 3 - **naCWTimeSweep**
- 4 - **naSegmentSweep**
- 5 - **naPhaseSweep**

**Note**: Sweep type cannot be set to Segment sweep if there are no segments turned ON. A segment is automatically turned ON when a application is created.

**Return Type**
Long Integer

**Default**
**naLinearSweep**

**Examples**
```
chan.SweepType = naPowerSweep 'Write
swptyp = chan.SweepType 'Read
```

**C++ Syntax**
```
HRESULT get_SweepType(tagNASweepTypes* pVal)
HRESULT put_SweepType(tagNASweepTypes newVal)
```
Interface  IChannel
|CalSet3
IFOMRange
# SweepType Property

**Description**  
Set and read the sweep type.

**VB Syntax**  
```vbnet
HotS22.SweepType = value
```

**Variable**  
*Type* - Description

- **HotS22**  
  A `ActiveParametersApp (object)`

- **value**  
  (Enum as NAHOTSweepType) - Choose from:
  
  - **0 - naHOTS22LinearFrequencySweep**  
    Frequency linear sweep.
  
  - **1 - naHOTS22LogFrequencySweep**  
    Frequency log sweep.
  
  - **2 - naHOTS22PowerSweep**  
    Power sweep.
  
  - **3 - naHOTS22MultiSweep**  
    Multiple sweep. Sweeps frequency with fixed power and has several sweeps with different power values. This is called a 3D sweep: frequency, power, and phase.

**Return Type**  
Enum

**Default**  
0

**Examples**  
```vbnet
HotS22.SweepType = naHOTS22LinearFrequencySweep 'Write
value = HotS22.SweepType 'Read
```

**C++ Syntax**  
```cpp
HRESULT get_SweepType(tagNAHOTSweepType* value)
HRESULT put_SweepType(tagNAHOTSweepType value)
```

**Interface**  
IActiveChannelSettings
# SystemImpedanceZ0 Property

Sets and returns the impedance for the analyzer.

**VB Syntax**

```vbnet
app.SystemImpedanceZ0 = value
```

**Variable**

**TargetValue Property**

**Description**
Sets the target value for the marker when doing Target Searches (SearchTargetLeft, SearchTarget, SearchTargetRight).

**VB Syntax**
```
mark.TargetValue = value
```

**Variable (Type) - Description**

- **mark** A Marker (object)
- **value** (single) - Target value. Choose any number between: -500 and 500

**Return Type**
Single

**Default**
0

**Examples**
```
mark.TargetValue = 10.5 'Write

target = mark.TargetValue 'Read
```

**C++ Syntax**
```
HRESULT get_TargetValue(float *pVal)
HRESULT put_TargetValue(float newVal)
```

### TestPortPower Property

**Description**
Sets or returns the RF power level for the channel or
Sets or returns the RF power level of the segment.

**VB Syntax**
```
object.TestPortPower(srcPort) = value
```

**Variable**
- **object**
  - A Channel (object) - to set coupled power, use chan.CouplePorts. If CouplePorts = False, then each port power can be set independently. Otherwise, chanTestPortPower (1) = value sets power level at both ports.
  - or
  - A CalSet (object)
  - or
  - A Segment (object)

- **srcPort**
  - (long integer) - Source Port number.

- **value**
  - (double) - RF Power in dBm.

**Note:** If the port is defined by a string name, such as an external source, a balanced port, or one of the Source 2 outputs on the 2-port 2-source VNA-x model, then you must use chan.getPortNumber to translate the string into a port number. To learn more see Remotely Specifying a Source Port.

**Note:** The range of settable power values depends on the VNA model and if source attenuators are installed. To determine the range of values, use cap.MaximumSourceALCPower and cap.MinimumSourceALCPower

Actual achievable leveled power depends on frequency.

**Return Type**
Double

**Default**
0

**Examples**
```
chan.TestPortPower(1) = 5 'sets the port 1 RF power level for the channel object -Write
```
```
powerlev = Chan.TestPortPower(1) 'Read
```

**C++ Syntax**
```
HRESULT get_TestPortPower(long port, double *pVal)
HRESULT put_TestPortPower(long port, double newVal)
```

**ThruCalMethod Property - Superseded**

**Description**
This command is replaced by PathThruMethod Property.

Sets and returns the method for performing the thru portion of the calibration.

**VB Syntax**

```vbnet
obj.ThruCalMethod = value
```

**Variable**

<table>
<thead>
<tr>
<th>(Type) - Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>obj</td>
</tr>
</tbody>
</table>

*SMCType (object)*

or

*VMCType (object)*

**value**

(String) Specifies the Thru method. Case insensitive - include spaces. Choose from:

"Default"

"Flush Thru" or "FLUSH"

"Unknown Thru" or "UNKN"

"Adapter Removal" or "ADAP"

**Return Type**

String

**Default**

Default

**Examples**

```vbnet
SMC.ThruCalMethod = "UNKN"
```

**C++ Syntax**

```csharp
HRESULT put_ThruCalMethod(enum NAThruCalMethod thruMethod);

HRESULT get_ThruCalMethod(enum NAThruCalMethod *thruMethod);
```

**Interface**

SMCType

VMCType
## ThruCalMethod Property  Superseded

<table>
<thead>
<tr>
<th>Description</th>
<th>This command is replaced by PathThruMethod Property.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Sets and returns the method for performing the Cal Method and the THRU portion of the calibration.</td>
</tr>
</tbody>
</table>

### VB Syntax

```vbnet
guidedCal ThruCalMethod = value
```

### Variable (Type) - Description

- **guidedCal**: GuidedCalibration (object)
- **value**: (Enum as NATruCalMethod) Choose from:

  0 - **naDefaultCalMethod** - allow the VNA to choose the best possible method (from the following) depending on whether the device or ECal module is insertable or non-insertable and given the model number of the VNA. (default selection if omitted.)
  1 - **naAdapterRemoval** - Perform Adapter removal calibration.
  2 - **naFlushThru** - Perform Flush Thru calibration.
  3 - **naDefinedThru** - Perform Defined Thru calibration. If performing an ECal, this is the Thru standard in the ECal module.
  4 - **naUnknownThru** - Perform Unknown Thru calibration.
  5 - **naSOLT** - Perform SOLT calibration
  6 - **naTRL** - Perform TRL calibration
  7 - **naQSOLT** - Perform QSOLT calibration.

### Return Type

Enum

### Default

0 - naDefaultCalMethod

### Examples

```vbnet
guided.ThruCalMethod = naDefinedThru
```

### C++ Syntax

```cpp
HRESULT get_ThruCalMethod(enum NAThruCalMethod *thruMethod);
HRESULT put_ThruCalMethod(enum NAThruCalMethod thruMethod);
```

### Interface

IGuidedCalibration
### ThruPortList Property

**Description**

**Note:** Do NOT send this command to rely on SmartCal to determine the most accurate Thru port pairs for the cal. You can send the query form of this command to learn the port pairs determined by SmartCal.

Sets and returns the Thru connection port pairs for the calibration. Send the query form of this command to learn the Thru pairs determined by SmartCal.

See **Thru Pairs Sequence** to learn how to send this and other Thru commands.

Learn more about Thru method and port pairings.

See an example of a 4-port guided calibration using COM.

### VB Syntax

```vb
guidedCal.ThruPortList = t1a, t1b, t2a, t2b, t3a, t3b
```

### Variable (Type) - Description

- **guidedCal** GuidedCalibration (object)
- **t1a, t1b...** (Variant) Port numbers in pairs - a one-dimensional array of Long integers.
  - t1a, t1b (Thru1 - port A and port B)
  - t2a, t2b (Thru2 - port A and port B)
  - t3a, t3b (Thru3 - port A and port B)

### Return Type

**Variant** - a one-dimensional array of Long integers.

### Default

The most accurate port pairs for the cal.

### Example

```vb
thruList = Array(1,2,1,3,1,4)
guided.ThruPortList = thruList
```

Sets the following three thru connections for a 4-port calibration:

- Thru 1 - ports 1 and 2
- Thru 2 - ports 1 and 3
- Thru 3 - ports 1 and 4

### C++ Syntax

```cpp
HRESULT get_ThruPortList(VARIANT* portList);
HRESULT put_ThruPortList(VARIANT portList);
```

### Interface

IGuidedCalibration

## Title Property

**Description**
Writes or reads a custom title for the window. Newer entries replace (not append) older entries. Turn the title ON and OFF with TitleState.

**VB Syntax**
```
win.Title = string
```

**Variable (Type) - Description**
- `win` (A NaWindow (object))
- `string` (long) - Title limited to 50 characters.

**Return Type**
String

**Default**
Null

**Examples**
```
win.Title = "Hello World" 'Write

titl = win.Title 'Read
```

**C++ Syntax**
- HRESULT get_Title(BSTR *title)
- HRESULT put_Title(BSTR title)

**Interface**
INAWindow
## Title (Channel) Property

</tbody>
</table>

- **True** - Title ON
- **False** - Title OFF

**Return Type**
Boolean

**Default**
False

**Examples**
```
win.TitleState = True 'Write

titlestate = win.TitleState 'Read
```

**C++ Syntax**
```
HRESULT get_TitleState(VARIANT_BOOL* bState)
HRESULT put_TitleState(VARIANT_BOOL bState)
```

**Interface**
INAWindow
# Tolerance Property

Sets and returns the tolerance value for leveling sweeps.

**VB Syntax**

```plaintext
RxLevel.Tolerance(srcPort) = value
```

**Variable** 

- **RxLevel** - A ReceiverLeveling Object
- **srcPort** (Long Integer) Source port for which to set the tolerance value for Receiver Leveling.

**Note:** If the source port is defined by a string name, such as an external source, a balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model, then use `chan.getPortNumber` to translate the string into a port number. To learn more see [Remotely Specifying a Source Port](#).

- **value** (Double) Tolerance level in dB.

**Return Type** (Double)

**Default** .1 dB

**Examples**

```plaintext
rxLevel.Tolerance (1) = .5  ' Write
value = rxLevel.Tolerance 2' Read
```

**C++ Syntax**

```c++
HRESULT get_Tolerance(long port, double* pVal);
HRESULT put_Tolerance(long port, double newVal);
```

**Interface** IReceiverLevelingConfiguration
**TonePower Property**

**Description**
Sets and returns the power level of the Main Tones. Use with IMD sweep types:

- `naIMDToneCWSweep`
- `naIMDToneCenterFreqSweep`
- `naIMDDeltaFrequencySweep`

When tone power is coupled, setting either F1 or F2 power sets both.

**VB Syntax**

```vbnet
object.TonePower (tone) = value
```

**Variable**

<table>
<thead>
<tr>
<th>(Type)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>object</code></td>
<td>A SweptIMD or IMSpectrum Object</td>
</tr>
<tr>
<td><code>tone</code></td>
<td>(Enum as NAIMDTonePowerID) Choose from:</td>
</tr>
<tr>
<td>0 - <code>naIMDF1Power</code></td>
<td>F1 tone</td>
</tr>
<tr>
<td>1 - <code>naIMDF2Power</code></td>
<td>F2 tone</td>
</tr>
</tbody>
</table>

| `value` | (Double) Tone power level in dBm. Choose a value between +30 dBm and -30 dBm. |

**Return Type**
Double

**Default**
-20 dBm

**Examples**

```vbnet
imd.TonePower(naIMDF1Power) = 0 'Write
value = imd.TonePower(naIMDF2Power) 'Read
```

**C++ Syntax**

```c
HRESULT get_TonePower(tagNAIMDTonePowerID naIMDF1, double * pVal);
HRESULT put_TonePower(tagNAIMDTonePowerID naIMDF1, double newVal);
```

**Interface**
ISweptIMD
IMSpectrum
**TonePowerSetAt Property - Superseded**

**Description**

Note: This command is replaced with LevelingMethod Property

Sets and returns whether tone power is specified at the DUT input or output.

**VB Syntax**

```
object.TonePowerSetAt = value
```

**Variable (Type) - Description**

- `object` A SweptIMD Object or IMSpectrum Object
- `value` (Enum as NAPortMode)

- **0 - naInput** - Specified power level is set at the DUT input.
- **1 - naOutput** - Specified power level is set at the DUT output.

**Return Type**

Enum

**Default**

0 - naInput

**Examples**

```
imd.TonePowerSetAt = naOutput 'Write
value = ims.TonePowerSetAt 'Read
```

**C++ Syntax**

```
HRESULT get_TonePowerSetAt(tagNAPortMode *pVal)
HRESULT put_TonePowerSetAt(tagNAPortMode pVal)
```

**Interface**

ISweptIMD2

IImsSpectrum2
### TonePowerStart Property

**Description**
Sets and returns the start power level of the Main tones. Use with IMD sweep type= `naIMDTonePowerSweep`.

When tone power is coupled, setting either F1 or F2 power sets both.

**VB Syntax**

```
object.TonePowerStart (tone) = value
```

**Variable (Type) - Description**

- `object` A SweptIMD or IMSpectrum Object
- `tone` (Enum as NAIMDTonePowerID) Choose from:
  - `0` - `naIMDF1Power` - F1 tone
  - `1` - `naIMDF2Power` - F2 tone
- `value` (Double) Start power in dBm. Choose a value between +30 dBm and -30 dBm.

**Return Type**
Double

**Default**
-20 dBm

**Examples**

```
imd.TonePowerStart(NAIMDF1Power) = 0 'Write
value = imd.TonePowerStart(NAIMDF2Power) 'Read
```

**C++ Syntax**

```
HRESULT get_TonePowerStart(tagNAIMDTonePowerID naIMDF1, double * pVal);
HRESULT put_TonePowerStart(tagNAIMDTonePowerID naIMDF1, double newVal);
```

**Interface**
ISweptIMD
IMSpectrum
# TonePowerStop Property

**Description**
Sets and returns the stop power level of the Main tones. Use with IMD sweep type=`naIMDTonePowerSweep`.

When tone power is coupled, setting either F1 or F2 power sets both.

**VB Syntax**

```vb
object.TonePowerStop (tone) = value
```

**Variable (Type) - Description**

- **object**
  A SweptIMD or IMSSpectrum Object
- **tone**
  (Enum as NAIMDTonePowerID) Choose from:
  - 0 - `naIMDF1Power` - F1 tone
  - 1 - `naIMDF2Power` - F2 tone
- **value**
  (Double) Stop power in dBm. Choose a value between +30 dBm and -30 dBm.

**Return Type**
Double

**Default**
-20 dBm

**Examples**

```vb
imd.TonePowerStop (naIMDF1Power) = 0 'Write
value = imd.TonePowerStop (naIMDF2Power) 'Read
```

**C++ Syntax**

```cpp
HRESULT get_TonePowerStop (tagNAIMDTonePowerID naIMDF1, double * pVal);
HRESULT put_TonePowerStop (tagNAIMDTonePowerID naIMDF1, double newVal);
```

**Interface**
ISweptIMD
IMSSpectrum
## TotalIterations Property

</table>

**Return Type**

Integer

**Default**

5226 (201 * 26)

**Example**

```
totPoints = gca.TotalNumberOfPoints 'Read
```

**C++ Syntax**

```
HRESULT get_TotalNumberOfPoints(int* pVal)
```

**Interface**

IGainCompression
### Touchscreen Property

**Description**
Sets and reads the state of the PNA-X Touchscreen (ON and OFF).

This setting remains until changed again from the front-panel or remote command.

**VB Syntax**

```vbnet
app.Touchscreen = state
```

**Variable**

- **app** (Type) - Description
  - An Application (object)
- **state** (boolean)
  - **False** (0) - Disables use of Touchscreen
  - **True** (1) - Enables use of Touchscreen

**Return Type**

Boolean

- **False** - OFF
- **True** - ON

**Default**

**TRUE** when shipped from factory.

**Examples**

- `app.Touchscreen = True 'Write`
- `coupl = app.Touchscreen 'Read`

**C++ Syntax**

- `HRESULT put_Touchscreen(VARIANT_BOOL bState)`
- `HRESULT get_Touchscreen(VARIANT_BOOL *bState)`

**Interface**

IApplication12
### TraceHoldType Property

</tbody>
</table>
TraceMath Property

Description: Performs math operations on the measurement object and the trace stored in memory. (There MUST be a trace stored in Memory to perform math. See Meas.DataToMemory method.)

VB Syntax: `meas.TraceMath = value`

Variable (Type) - Description
- `meas`: A Measurement (object)
- `value`: (enum NAMathOperation) - Choose from:
  - 0 - naDataNormal
  - 1 - naDataMinusMemory
  - 2 - naDataPlusMemory
  - 3 - naDataDivMemory
  - 4 - naDataTimesMemory

Return Type: NAMathOperation

Default: Normal (0)

Examples:
- `meas.TraceMath = naDataMinusMemory`  
  (Write)
- `mathOperation = meas.TraceMath`  
  (Read)

C++ Syntax:
- `HRESULT get_TraceMath(tagNAMathOperation* pMathOp)`
- `HRESULT put_TraceMath(tagNAMathOperation mathOp)`

Interface: I Measurement
### TraceMax Property

**Description**
Maximizes (isolates) or restores the active trace in the active window. When TraceMax is ON, the active trace is the ONLY trace on the display. All other traces are hidden.

**VB Syntax**
\[ meas.TraceMax = state \]

**Variable**
- \( meas \) - A Measurement (object)
- \( state \) - (boolean) - Choose from:
  - **True** - Maximizes / isolates the active trace in the window.
  - **False** - Restores other traces to be viewed in the window.

**Return Type**
Boolean

**Default**
False

**Examples**
\[ meas.TraceMax = True \]
\[ state = meas.TraceMax \]

**C++ Syntax**
- HRESULT get_TraceMax(VARIANT_BOOL bState)
- HRESULT put_TraceMax(VARIANT_BOOL* bState)

**Interface**
IMeasurement10
# TraceTitle Property

**Description**  Writes and reads data for the trace title area.

The trace title is embedded in the trace status field. [Learn more about Trace Titles](#). The title is turned ON and OFF using TraceTitleState.

**VB Syntax**

```
meas.TraceTitle = value
```

**Variable (Type) - Description**

- `meas` A Measurement *(object)*
- `value` *(string)* - Title to be displayed. Any characters (no spaces), enclosed with quotes.

**Return Type**  String

**Default**  Not Applicable

**Examples**

```vbscript
meas.TraceTitle = "My new s11 measurement"
```

**C++ Syntax**

```
HRESULT get_TraceTitle(BSTR *title);
HRESULT put_TraceTitle(BSTR title);
```

**Interface**  IMeasurement8
## TraceTitleState Property

**Description**  
Turns display of the Trace Title ON or OFF. When turned OFF, the previous trace title returns. Create a trace title using `TraceTitle Property`.

**VB Syntax**  
`meas.TraceTitleState = value`

**Variable**  
- **Type** - Description  
  - `meas`  
  - A Measurement *(object)*
  - `value`  
  - *(boolean)* - Choose from:
    - **True** - Turns the trace title ON
    - **False** - Turns the trace title OFF

**Return Type**  
Boolean

**Default**  
False

**Examples**  
```
meas.TraceTitleState = False
```
```
title = TraceTitleState 'Read
```

**C++ Syntax**  
```
HRESULT get_TraceTitleState(VARIANT_BOOL *isTitleON);
HRESULT put_TraceTitleState(VARIANT_BOOL isTitleON);
```

**Interface**  
IMeasurement8
Tracking Property

Description: This property, when on, executes the search function (marker.SearchFunction) every sweep.

In effect, turning Tracking ON is the same as executing one of the immediate, one-time, "Search..." methods (such as SearchMin, SearchMax) for every sweep.

VB Syntax: mark.Tracking = state

Variable Description:
- **mark**: A Marker (object)
- **state**: (boolean) - Tracking state. Choose from:
  - **False**: Tracking OFF
  - **True**: Tracking ON

Return Type: Boolean

Default: False

Examples:
- `mark.Tracking = False` 'Write
- `markTracking = mark.Type` 'Read

C++ Syntax:
- HRESULT put_Tracking(VARIANT_BOOL bOn)
- HRESULT get_Tracking(VARIANT_BOOL * pbOn)

Interface: IMarker
### TrackingChannel Property

**Description**
Sets and returns the IMD channel number to which the IM Spectrum channel is coupled. Use `TrackingEnable` to enable tracking.

**VB Syntax**
```vbnet
ims.TrackingChannel = value
```

**Variable**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>ims</code></td>
<td>An <code>IMSpectrum</code> Object</td>
</tr>
<tr>
<td><code>value</code></td>
<td>(Integer) Existing IMD channel number to which frequency and power settings are coupled.</td>
</tr>
</tbody>
</table>

**Return Type**
Long Integer

**Default**
First existing IMD channel

**Examples**
```vbnet
ims.TrackingChannel = 1 'Write
value = ims.TrackingChannel 'Read
```

**C++ Syntax**
```c++
HRESULT get_TrackingChannel(long *pVal)
HRESULT put_TrackingChannel(long newVal)
```

**Interface**
`IIMSpectrum`
### TrackingEnable Property

**Description**  
When an IMD channel exists, allows the IM Spectrum frequency and power setting to track (couple with) the IMD channel settings. Use `TrackingChannel` to set the channel number to track.

**VB Syntax**  
```vb
ims.TrackingEnable = value
```

**Variable**  
*ims* - An IMSpectrum Object  
*value* - (Boolean) Tracking state. Choose from:

- **True** - IM Spectrum frequency and power settings track the IMD channel settings.
- **False** - IM Spectrum frequency and power settings are specified in the IMS channel.

**Return Type**  
Boolean

**Default**  
False

**Examples**  
```vb
ims.TrackingEnable = True 'Write
value = ims.TrackingEnable 'Read
```

**C++ Syntax**  
```cpp
HRESULT get_TrackingEnable(VARIANT_BOOL* bValue)
HRESULT put_TrackingEnable(VARIANT_BOOL newVal)
```

**Interface**  
IIMSpectrum
## TrackingManualStepEnable Property

**Description**
Sets and returns the step sweep mode for the IM Spectrum channel.

**VB Syntax**
```vbnet
ims.TrackingManualStepEnable = value
```

**Variable**
- **ims** (Type): An IMSpectrum Object
- **value** (Boolean): Choose from:
  - **False** - Automatic Step
  - **True** - Manual Step

**Return Type**
Boolean

**Default**
False - Automatic Step

**Examples**
```vbnet
ims.TrackingManualStepEnable = True 'Write
value = ims.TrackingManualStepEnable 'Read
```

**C++ Syntax**
```c++
HRESULT get_TrackingManualStepEnable(VARIANT BOOL *bVal)
HRESULT put_TrackingManualStepEnable(VARIANT BOOL newVal)
```

**Interface**
IIMSpectrum
### TrackingStepIndex Property

**Description**  
When `TrackingManualStepEnable = True` (Manual step), sets and returns the data point number at which the IM spectrum measurement occurs.

**VB Syntax**  
`ims.TrackingStepIndex = value`

**Variable**  
- **Type** - Description  
  - `ims` An IMSpectrum Object  
  - `value` (Integer) Existing IMD channel number to which frequency and power settings are coupled.

**Return Type**  
Long Integer

**Default**  
1

**Examples**  
- `ims.TrackingStepIndex = 50`  
- `value = ims.TrackingStepIndex`

**C++ Syntax**  
- `HRESULT get_TrackingStepIndex(long *pVal)`  
- `HRESULT put_TrackingStepIndex(long newVal)`

**Interface**  
IIMSpectrum
### TreatMkr10AsReference Property

**Description**
Set and return whether to treat marker 10 as a reference marker.

**VB Syntax**
```
pref.TreatMkr10AsReference = value
```

**Variable**
- **(Type)**: Preference
  - **pref**: A Preferences (object)
- **value**: (Boolean) - Choose from:
  - **True**: Marker 10 is always a reference marker (Pre A.10.40 behavior).
  - **False**: Marker 10 is just another marker. See Reference Marker commands

**Return Type**
Boolean

**Default**
True

**Examples**
```
pref.TreatMkr10AsReference = True 'Write
value = pref.TreatMkr10AsReference 'Read
```

**C++ Syntax**
```
HRESULT get_TreatMkr10AsReference (VARIANT_BOOL* preference);
HRESULT put_TreatMkr10AsReference (VARIANT_BOOL val)
```

**Interface**
IPreferences15
## TriggerSignal Property - Superseded

**Description**  
Note: This command has been replaced by Source Property

Sets or returns the trigger source.

**VB Syntax**  
`app.TriggerSignal = value`

**Variable**  
*(Type)* - Description
- `app`: An Application *(object)*
- `value`: *(enum NATriggerSignal)* - Choose from:
  1. **naTriggerInternal** - free run
  2. **naTriggerExternalPositive** - a trigger signal is generated when a TTL high is sensed on the external trigger pin of the Aux IO connector
  3. **naTriggerExternalNegative** - a trigger signal is generated when a TTL low is sensed on the external trigger pin of the Aux IO connector.
  4. **naTriggerExternalHigh** - a trigger signal is generated when a TTL high is sensed on the external trigger pin of the Aux IO connector
  5. **naTriggerExternalLow** - a trigger signal is generated when a TTL low is sensed on the external trigger pin of the Aux IO connector

**Return Type**  
Long Integer

**Default**  
naTriggerInternal

**Examples**  
- `app.TriggerSignal = naTriggerExternalPositive` *Write*
- `trigsig = app.TriggerSignal` *Read*

**C++ Syntax**  
`HRESULT get_TriggerSignal(tagNATriggerSignal *pSignal)`
`HRESULT put_TriggerSignal(tagNATriggerSignal signal)`

**Interface**  
IApplication
### TriggerType Property - Superseded

**Description**  
**Note:** This property has been replaced with `Scope` Property.

Sets or returns the trigger type which determines the scope of a trigger signal.

**VB Syntax**  
```
app.TriggerType = value
```

**Variable (Type) - Description**
- `app` An Application `(object)`
- `value` `(enum NATriggerType)` - Trigger type. Choose from:
  - 0 - `naGlobalTrigger` - a trigger signal is applied to all triggerable channels
  - 1 - `naChannelTrigger` - a trigger signal is applied to the current channel. The next trigger signal will be applied to the next channel; not necessarily channel 1-2-3-4.

**Return Type**  
Long Integer

**Default**  
`naGlobalTrigger`

**Examples**
```
app.TriggerType = naGlobalTrigger  'Write
trigtyp = app.TriggerType  'Read
```

**C++ Syntax**
```
HRESULT get_TriggerType(tagNATriggerType *pTrigger)
HRESULT put_TriggerType(tagNATriggerType trigger)
```

**Interface**  
`IApplication`
# TriggerADCLevelState Property

**Description**  
Set and read the ON/OFF state of a measurement trigger event that will occur whenever the ADC level is greater than the value specified using the TriggerADCLevelValue command.

**VB Syntax**  
```
sa.TriggerADCLevelState = value
```

**Variable**  
- `sa` *(Type)* - Description  
  - A SpectrumAnalyzer *(object)*
- `value` *(Boolean)* - Choose from:
  - 0 - OFF - ADC measurement trigger OFF.
  - 1 - ON - ADC measurement trigger ON.

Learn about these settings.

**Return Type**  
Boolean

**Default**  
0

**Examples**  
```
sa.TriggerADCLevelState = OFF   Write
value = sa.TriggerADCLevelState  'Read
```

See an example program.

**C++ Syntax**  
```
HRESULT put_TriggerADCLevelState(VARIANT_BOOL bEnable);
HRESULT get_TriggerADCLevelState(VARIANT_BOOL* bEnable);
```

**Interface**  
ISpectrumAnalyzer
# TriggerADCLevelValue Property

<table>
<thead>
<tr>
<th>Description</th>
<th>Set and read the ADC trigger level.</th>

See an example program.

**C++ Syntax**

- `HRESULT put_TriggerADCLevelValue(long val);`
- `HRESULT get_TriggerADCLevelValue(long* val);`

**Interface**

ISpectrumAnalyzer
Write/Read

**TriggerDelay Property**

**Description**
Sets and reads the trigger delay for all measurements (GLOBAL). This delay is only applied while in `app.Source = naTriggerSourceExternal` and `trigsetup.Scope = naGlobalTrigger`. After an external trigger is applied, the start of the sweep is delayed for the specified delay value plus any inherent latency.

To apply a trigger delay for a channel only, use the `ExternalTriggerDelay Property`.

**VB Syntax**
```vbnet
app.TriggerDelay = value
```

**Variable (Type) - Description**
- `app` An Application (object)
- `value` Double - Trigger delay value in seconds. Range is from 0 to 3.

**Return Type**
Double

**Default**
0

**Examples**
```vbnet
app.TriggerDelay = .003  'Write
delay = app.TriggerDelay  'Read
```

**C++ Syntax**
```c++
HRESULT get_TriggerDelay(double *delay);
HRESULT put_TriggerDelay(double delay)
```

**Interface**
IApplication
TriggerInPin Property

Description: When Trigger mode is set to Hardware List for SMU devices, this command sets and returns the B2900 Digital IO pin to use for Trigger IN.

VB Syntax:  
```vbnet
extDC.TriggerInPin = value
```

Variable (Type) - Description:
- `extDC` An `ExternalDCDevice` (object)
- `value` (Long) Pin number for Trigger IN. Choose a pin number from 1 to 14.

Return Type: Long

Default: 1

Examples:
```vbnet
extDC.TriggerInPin = 3 'Write
bool = extDC.TriggerInPin 'Read
```

C++ Syntax:
```cpp
HRESULT get_TriggerInPin (Long *pValue)
HRESULT put_TriggerInPin (long newVal)
```

Interface: IExternalDCDevice2
**TriggerInPolarity Property**

**Description**
Specifies the polarity of the trigger IN signal.

- **AuxTrigger Object** - Sets the polarity to which the rear-panel AuxTrig IN responds.
- **PulseGenerator Object** - Sets the polarity of trigger to which the internal pulse generators will respond when being externally triggered. **Note:** This feature requires DSP version: **4.0 FPGA:34** or higher. Learn more.

**Note:** Used on PNA-X ONLY.

**VB Syntax**

```vbnet
object.TriggerInPolarity = value
```

**Variable** *(Type)* - Description

- `object` An AuxTrigger (object) or
  A PulseGenerator (object)

- `value` *(enum NATriggerPolarity)* - Choose from:
  - `naTriggerPositive` VNA responds to rising edge or HIGH level
  - `naTriggerNegative` VNA responds to falling edge or LOW level.

Set Edge or Level triggering using **TriggerInType Property**

**Return Type**
Enum

**Default**
AuxTriggerIn Object - naTriggerNegative

PulseGenerator Object - naTriggerPositive. Also the polarity used when the PNA-X does not have the required DSP hardware

**Examples**

```vbnet
obj.TriggerInPolarity = naTriggerPositive 'Write
value = obj.TriggerInPolarity 'Read the value
```

**C++ Syntax**

```c++
HRESULT get_TriggerInPolarity(enum NATriggerPolarity *val);
HRESULT put_TriggerInPolarity(enum NATriggerPolarity val);
```

**Interface**
IAuxTrigger

IPulseGenerator3
## TriggerInType Property

**Description**
Specifies the type of trigger input being supplied to the VNA.

- **AuxTrigger Object** - Sets the type to which the rear-panel AuxTrig IN responds.
- **PulseGenerator Object** - Sets the type of trigger to which the internal pulse generators will respond when being externally triggered. **Note:** This feature requires DSP version: 4.0 FPGA:34 or higher. Learn more.

**Note:** Use on PNA-X ONLY.

### VB Syntax

```
obj.TriggerInType = value
```

### Variable

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>obj</td>
<td>An AuxTrigger (object) or</td>
</tr>
<tr>
<td></td>
<td>A PulseGenerator (object)</td>

<td>to the edge (rising or falling) of a signal</td>
</tr>
<tr>
<td></td>
<td>naTriggerLevel VNA responds</td>
</tr>
<tr>
<td></td>
<td>to the level (HIGH or LOW) of a signal</td>
</tr>
<tr>
<td></td>
<td>Use TriggerInPolarity to set Positive or Negative polarity.</td>
</tr>
</tbody>
</table>

### Return Type

Enum

### Default

**naTriggerLevel** - Also the type used for the PulseGenerator Object when the PNA-X does not have the required DSP hardware

### Examples

```
obj.TriggerInType = naTriggerEdge 'Write
value = obj.TriggerInType 'Read the value
```

### C++ Syntax

```
HRESULT get_TriggerInType(enum NATriggerSignalType *val);
HRESULT put_TriggerInType(enum NATriggerSignalType val);
```

### Interface

IAuxTrigger

IPulseGenerator3
**TriggerMode (ExtendedProperties) Property**

- **Description**: Sets and returns the trigger mode for an external source.

  - **VB Syntax**: `extSource.TriggerMode = value`  
  - **Variable** *(Type)* - Description  
    - `extSource` An ExternalSource Object *(object)*  
    - `value` *(enum NAExtDevTriggerMode)* - Choose from:  
      - 0 - `naExtDevTriggerModeCW`  
      - 1 - `naExtDevTriggerModeHW`  

- **Return Type**: Enum  
  - **Default**: 0 - `naExtDevTriggerModeCW`  

- **Examples**:  
  - `extSource.TriggerMode = naExtDevTriggerModeCW` *(Write)*  
  - `tm = extSource.TriggerMode` *(Read)*  

- **C++ Syntax**:  
  - `HRESULT get_TriggerMode (tagNAExtDevTriggerMode *pMode)`  
  - `HRESULT put_TriggerMode (tagNAExtDevTriggerMode newMode)`  

- **Interface**: IExternalSource
# TriggerOutDuration Property

**Description**  
Specifies the width of the output pulse, which is the time that the Aux trigger output will be asserted.

**VB Syntax**  
`auxTrig.TriggerOutDuration = value`

**Variable**  
- **Type** - Description
- **Type** - An AuxTrigger (object)
- **Value** - (single) - Duration value in seconds. Choose a value between 1E-6 and 1.

**Return Type**  
Double

**Default**  
1E-6 sec

**Examples**  
- `auxTrig.TriggerOutDuration = 1e-3`  
- `value = auxTrig.TriggerOutDuration`

**C++ Syntax**  
- HRESULT get_TriggerOutDuration(double *val);
- HRESULT put_TriggerOutDuration(double val);

**Interface**  
IAuxTrigger
## TriggerOutInterval Property

# TriggerOutPosition Property

**Description**  
Specifies whether the Aux trigger out signal is sent Before or After the acquisition.

**VB Syntax**  
```
auxTrig.TriggerOutPosition = value
```

**Variable**  
*(Type)* - Description

- `auxTrig` An AuxTrigger (object)
- `value` (enum NATriggerPosition) Choose from:

  - **naTriggerOutBeforeAcquire**  
    Use if the external device needs to be triggered before the data is acquired, such as a power meter.

  - **naTriggerOutAfterAcquire**  
    Use if the external device needs to be triggered just after data has been acquired, such as an external source. This could be more efficient since it allows the external device to get ready for the next acquisition at the same time as the VNA.

**Return Type**  
Enum

**Default**  
**naTriggerOutAfterAcquire**

**Examples**  
```
auxTrig.TriggerOutPosition = naTriggerOutAfterAcquire  'Write
value = auxTrig.TriggerOutPosition  'Read the value
```

**C++ Syntax**  
```
HRESULT get_TriggerOutPosition(enum NATriggerPosition *val);
HRESULT put_TriggerOutPosition(NATriggerPosition val);
```

**Interface**  
IAuxTrigger
### TriggerOutputEnabled Property - Superseded

**Description**

Use `AUX.Enable` to enable AUXI/O triggering.

Use `Trigger Source= External` to enable Meas Trig Ready output.

Enables the VNA to send trigger signals out the rear-panel TRIGGER OUT connector.

**VB Syntax**

```
trigsetup.TriggerOutputEnabled = boolean
```

**Variable**

- **Type**
  - `A TriggerSetup2 (object)`
  - `boolean`

Choose from:

- **False** - VNA does NOT send output trigger signals.
- **True** - VNA sends output trigger signals.

**Return Type**

`Boolean`

**Default**

`False`

**Examples**

```
trigsetup.TriggerOutputEnabled = True 'Write
atba = trigsetup.TriggerOutputEnabled 'Read
```

**C++ Syntax**

```cpp
HRESULT get_TriggerOutputEnabled( BOOL *pVal);
HRESULT put_TriggerOutputEnabled( BOOL newVal);
```

**Interface**

`ITriggerSetup2`
**TriggerPeriodicCounterState Property**

**Description**
Set and read the ON/OFF state of a measurement trigger event based on the specified period set using the TriggerPeriodicCounterValue command.

**VB Syntax**

```
sa.TriggerPeriodicCounterState = value
```

**Variable (Type) - Description**

- `sa` A SpectrumAnalyzer (object)
- `value` (Boolean) Choose from:
  - 0 - OFF - Periodic counter OFF.
  - 1 - ON - Periodic counter ON.

**Learn about these settings.**

**Return Type**
Boolean

**Default**
0

**Examples**

```
sa.TriggerPeriodicCounterState = OFF   Write
value = sa.TriggerPeriodicCounterState 'Read
```

See an example program.

**C++ Syntax**

```c++
HRESULT put_TriggerPeriodicCounterState(VARIANT_BOOL bEnable);
HRESULT get_TriggerPeriodicCounterState(VARIANT_BOOL* bEnable);
```

**Interface**
ISpectrumAnalyzer
### TriggerPeriodicCounterValue Property

**Description**  Set and read the periodic counter value. This command initiates a measurement trigger event based on the specified period.

**VB Syntax**  
```
sa.TriggerPeriodicCounterValue = value
```

**Variable**  
- `sa`  A `SpectrumAnalyzer` *(object)*
- `value` *(Long)* Choose a value between 0 and 2147483647.

Learn about these settings.

**Return Type**  Long

**Default**  256

**Examples**  
```
sa.TriggerPeriodicCounterValue = 256  'Write

value = sa.TriggerPeriodicCounterValue 'Read
```

See an example program.

**C++ Syntax**  
```c++
HRESULT put_TriggerPeriodicCounterValue(long val);

HRESULT get_TriggerPeriodicCounterValue(long* val);
```

**Interface**  ISpectrumAnalyzer

## TuningMode Property

**Description**  
Sets and returns the method used to determine the embedded LO Frequency.

**VB Syntax**  
`obj.TuningMode = value`

**Variable**  
*(Type)* - Description

- `obj` An EmbeddedLO *(object)* or  
  A ConverterEmbeddedLO *(object)*

- `value` *(Enum as NAEembeddedLOTuningMode)*
  Tuning mode. Choose from:
  
  - 0 - naEmbeddedLOTuningMode_Broadband_And_Precise
  - 1 - naEmbeddedLOTuningMode_Precise_Only
  - 2 - naEmbeddedLOTuningMode_None

**Return Type** *(Enum)*

**Default**  
0 - naEmbeddedLOTuningMode_Broadband_And_Precise

**Examples**

```vbnet
eembedLO.TuningMode = naEmbeddedLOTuningMode_None 'write
value = embedLO.TuningMode 'read
```

**C++ Syntax**

```csharp
HRESULT get_TuningMode(enum NAEembeddedLOTuningMode* mode);

HRESULT put_TuningMode(enum NAEembeddedLOTuningMode mode);
```

**Interface**  
IEmbededLO
# TuningSweepInterval Property

**Description**
Set how often a tuning sweep is performed.

**VB Syntax**
```vbnet
obj.TuningSweepInterval = value
```

**Variable**
<table>
<thead>
<tr>
<th>(Type)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>obj</code></td>

**Return Type**
**(Long)**

**Default**
1

**Examples**
```vbnet
eMBEDLO.TuningSweepInterval = 3 'write .. tuning is performed every third measurement sweep
value = EMBEDLO.TuningSweepInterval 'read
```

**C++ Syntax**
```cpp
HRESULT get_TuningSweepInterval(long* interval);

HRESULT put_TuningSweepInterval(long interval);
```

**Interface**
**IEmbeddedLO**
# TwoPointGroupDelayAperture Property

**Description**  
Sets the default group delay aperture setting.

**VB Syntax**  
`pref.TwoPointGroupDelayAperture = value`

**Variable**  
- **Type** - Description
  - `pref` A Preferences (object)
  - `value` (Boolean) - Choose from:
    - True - Set the default group delay aperture setting to two points.
    - False - Set the default group delay aperture setting to 11 points.

**Return Type**  
Boolean

**Default**  
False

**Examples**  
- `pref.TwoPointGroupDelayAperture = True`  
- `gda = pref.TwoPointGroupDelayAperture`

**C++ Syntax**  
- `HRESULT get_TwoPointGroupDelayAperture(VARIANT_BOOL* pVal);`
- `HRESULT put_TwoPointGroupDelayAperture(VARIANT_BOOL pVal);`

**Interface**  
IPreferences11
### TriggerMode Property

**Description**  
These settings determine what EACH signal will trigger.

**Note:** Setting Point and EverySweep mode forces \( \text{Trigger.Scope} = \text{naChannelTrigger} \).

**VB Syntax**  
\[ \text{chan.TriggerMode} = \text{value} \]

**Variable**  
- **chan**  
  A Channel (object)

- **value**  
  (enum NATriggerMode) - Choose from:

  0 - **naTriggerModePoint** - Each Manual or External trigger signal causes one data point to be measured.

  1 - **naTriggerModeMeasurement** (superseded - still works but replaced with a more descriptive enum)

  1 - **naTriggerModeChannel** - Each trigger signal causes ALL traces in that channel to be swept.

  2 - **naTriggerModeEverySweep** - Each Manual or External trigger signal causes ALL traces that share a source port to be swept.

  3 - **naTriggerModeTrace** - Allowed ONLY when \( \text{PointSweepState} \) is enabled. Each trigger signal causes two identical measurements to be triggered separately - one trigger signal is required for each measurement. Other trigger mode settings cause two identical parameters to be measured simultaneously.

**Return Type**  
Long Integer

**Default**  
1 - **naTriggerModeChannel**

**Examples**  
\[ \text{chan.TriggerMode} = \text{naTriggerModePoint} \ 'Write} \]

\[ \text{trigtyp} = \text{chan.TriggerMode} \ 'Read} \]

**C++ Syntax**  
HRESULT get_TriggerMode (tagNATriggerMode *pMode)  
HRESULT put_TriggerMode (tagNATriggerMode newMode)

**Interface**  
IChannel
### Type (calstd) Property

<table>
<thead>
<tr>
<th>Description</th>
<th>Sets and Returns the type of calibration standard.</th>

</tr>
</tbody>
</table>
## Type (DFT) Property

**Description**: Sets and returns the DFT record size type. The DFT `RecordSize` is based on the `ForceADCRrecordSize` and the DFT record size type. The DFT record size is always equal or larger than the ADC record size.

**VB Syntax**: `sa.dft.Type = value`

**Variable**

- **(Type)** - Description

  - `sa.dft` A `SpectrumAnalyzerDFT (object)`
  - `value` *(enum NASADFTSizeMode)* - Choose from:
    
    0  naSADFT2ToN: (Power of 2) Sets the DFT record size to the next power of 2 greater than or equal to the current ADC record size.
    
    1  naSADFTOptimizeRadix: (Optimized Radix) Sets the DFT record to the next integer number that can be decomposed with 2,3,5,7,11,13 radixes.
    
    2  naSADFTArbitrary: (Arbitrary) Sets DFT record size equal to the ADC record size. If the current ADC record size is a large prime number, then the DFT can be very slow.
    
    3  naSADFTOptimizeSpeed: (Fastest) Sets the DFT record size as close as possible to the ADC record size (larger or equal) while optimizing processing speed.

**Return Type**: Enum as NASADFTSizeMode

**Default**: naSADFTOptimizeSpeed

**Note**: In previous releases the default was naSADFT2ToN (Power of 2).

**Examples**

```vbnet
sa.dft.Type = naSADFTOptimizeRadix 'Write
DFTType = sa.dft.Type 'Read
```

**C++ Syntax**

```c++
HRESULT get_Type(tagNASADFTSizeMode* pVal)
HRESULT put_Type(tagNASADFTSizeMode newVal)
```

**Interface**: ISpectrumAnalyzerDFT
### Type (testset) Property

<table>

</tr>
</tbody>
</table>
### TZReal Property

**Description**
Sets and Returns the TZReal value (the real Terminal Impedance value) for the calibration standard. Only applicable when "Type" is set to **naArbitraryImpedance**.

To set the other resistance values, use **TZImag**

**VB Syntax**
```
calstd.TZReal = value
```

**Variable (Type) - Description**
- `calstd` A CalStandard (**object**). Use calKit.GetCalStandard to get a handle to the standard.
- `value` **(single)** - Value for TZReal in Ohms

**Return Type**
Single

**Default**
Not Applicable

**Examples**
```
calstd.TZReal = 15  'Write the value of TZReal to 15 Ohms
imp0 = calstd.TZReal  'Read the value of TZReal
```

**C++ Syntax**
```
HRESULT get_TZReal(float *pVal);
HRESULT put_TZReal(float newVal);
```

**Interface**
ICalStandard2
About Dynamic Uncertainty

**UncertaintyEnabled Property**

| Description | Sets and returns the ON/OFF state which determines if the calibration that is about to be performed will support Dynamic Uncertainty for S-Parameters (Opt. S93015A/B).

Dynamic Uncertainty for S-Parameters is supported ONLY for calibrations on standard S-Parameter channels. Calibrations performed with that feature enabled do NOT support the use of ALL traditional Guided calibration commands.

These existing commands are used for the performing of the calibration:

- CalKitType
- Initialize
- GenerateSteps
- GetStepDescription
- AcquireStep
- GenerateErrorTerms

These commands might also optionally be used in performing the cal:

- GetCompatibleCalKits
- OrientECALModule
- ECALPortMapEx

Dynamic Uncertainty must be enabled using this command before starting the calibration procedure because this command controls the way connectors and calkits are assigned to ports during calibration. Therefore, this command must be enabled before any of the following commands to ensure that the connector and calkit settings will be setqueried correctly:

- CalKitType
- GetCompatibleCalKits
- ConnectorType
**VB Syntax**

`guidedCal.UncertaintyEnabled = value`

**Variable**

*guidedCal* - An *GuidedCalibration* Object

*value* - (Boolean) Enable state. Choose from:

- **True** - The next calibration initialized for the channel will support Dynamic Uncertainties for S-Parameters.
- **False** - The next calibration initialized for the channel will NOT support Dynamic Uncertainties for S-Parameters.

**Return Type**

Boolean

**Default**

False

**Examples**

`guided.UncertaintyEnabled = True`

See example program

**C++ Syntax**

`HRESULT get_UncertaintyEnabled(VARIANT_BOOL* pState);`

`HRESULT put_UncertaintyEnabled(VARIANT_BOOL state);`

**Interface**

`IGuidedCalibration1`
### UncertaintyFile Property

**Description**
Sets and returns a custom model uncertainty file containing all of the power meter uncertainty properties. When this command is executed, the model name is automatically set to "CustomFile".

**VB Syntax**
```vba
pwrSensor.UncertaintyFile = value
```

**Variable (Type) - Description**
- `pwrSensor` - A PowerSensorUncertainty (Object)
- `value` - (String) - Custom file name.

**Return Type**
String

**Default**
Not Applicable

**Examples**
```vba
pwrSensor.UncertaintyFile = "C:\U8485A_MY55140018.dat" 'Write

value = pwrSensor.UncertaintyFile 'Read
```

**C++ Syntax**
```cpp
HRESULT put_UncertaintyFile(BSTR *pVal);

HRESULT get_UncertaintyFile(BSTR pVal);
```

**Interface**
IPowerSensorUncertainty
UncertaintyModel Property

Description
Sets and returns the name assigned to a specific power meter model among those available for uncertainty (see UncertaintyModelCatalog).

VB Syntax
pwrSensor.UncertaintyModel = value

Variable
(Type) - Description
pwrSensor - A PowerSensorUncertainty (Object)
value - (String) - Name of power meter model.

Return Type
String

Default
Not Applicable

Examples
pwrSensor.UncertaintyModel = "N8488A" 'Write
value = pwrSensor.UncertaintyModel 'Read

C++ Syntax
HRESULT put_UncertaintyModel(BSTR pVal);

HRESULT get_UncertaintyModel(BSTR *pVal);

Interface
IPowerSensorUncertainty
UncertaintyModelCatalog Property

**Description**
Returns a list of available power meters that have power uncertainty.

**VB Syntax**
```vbnet
pwrMtrs = pwrSensor.UncertaintyModelCatalog
```

**Variable**
- **Type**: Description
- **pwrMtrs**: (Variant) Variable to store the returned power meters.
- **pwrSensor**: A PowerSensorUncertainty (Object)

**Return Type**
Array of strings

**Default**
Not Applicable

**Examples**
```vbnet
pwrMtrs = pwrSensor.UncertaintyModelCatalog
```

**C++ Syntax**
```cpp
HRESULT UncertaintyModelCatalog(VARIANT *pwrMtrs);
```

**Interface**
IPowerSensorUncertainty
**Read-only**

### UnusedChannelNumbers Property

</tbody>
</table>
### UsePowerSensorFrequencyLimits Property

**Description**
Specifies if subsequent calls to the `AcquirePowerReadings` method will observe frequency values of the `MinimumFrequency` and `MaximumFrequency` properties.

**VB Syntax**
```
pwrCal.UsePowerSensorFrequencyLimits = value
```

**Variable**
- **Type**: A `SourcePowerCalibrator` (object)
- **Description**

**Value**
- **Boolean**

**False** – Do not use power sensor frequency limits. An acquisition will use just one power sensor for the entire sweep, regardless of frequency.

**True** – Use power sensor frequency limits. A requested acquisition will only succeed for those frequency points which fall between the `MinimumFrequency` and `MaximumFrequency` values of that PowerSensor. An acquisition will pause in mid-sweep if the frequency is about to exceed the `MaximumFrequency` value. When the sweep is paused in this manner, a sensor connected to the other channel input of the power meter can be connected to the measurement port in place of the previous sensor, and then the sweep completed by another call to `AcquirePowerReadings`. However, the `MaximumFrequency` specified for the second sensor would need to be sufficient for the sweep to complete.

**Return Type**
- **Boolean**

**Default**
- **False**

**Examples**
- Set `powerCalibrator = pna.SourcePowerCalibrator`
- `powerCalibrator.UsePowerSensorFrequencyLimits = True`  
  ```vbnet
  'Write
  FreqCheck = powerCalibrator.UsePowerSensorFrequencyLimits  
  'Read
  ```

**C++ Syntax**
```
HRESULT put_UsePowerSensorFrequencyLimits(VARIANT_BOOL bState);
HRESULT get_UsePowerSensorFrequencyLimits(VARIANT_BOOL *bState);
```

**Interface**
- `ISourcePowerCalibrator`
## UserCalsetPrefix Property

**Description**
Sets and returns the prefix to be used when saving User Cal Sets that result from the Cal All session. The Meas Class and channel number are appended to this prefix for each calibrated channel.

Use [GeneratedCalsets](#) to read the saved cal set names.

If a Cal Set prefix is NOT set, the cal data for each channel will be saved only to cal registers.

### VB Syntax

```vbnet
calAll.UserCalsetPrefix = prefix
```

### Variable
- **Type** - Description
- **calAll** - A `ICalibrateAllChannels` object
- **prefix** - (String) User CalSet prefix.

### Return Type
String

### Default
Not Applicable

### Examples

```vbnet
calAll.UserCalsetPrefix = "MyCalSet" 'Set
```

```vbnet
csPrefix = calAll.UserCalsetPrefix 'Returns the CalSet prefix
```

### C++ Syntax

```cpp
HRESULT get_UserCalsetPrefix (BSTR calsetPrefix);

HRESULT put_UserCalsetPrefix (BSTR* calsetPrefix);
```

### Interface
- `ICalibrateAllChannels`
UserRange Property

Description
Assigns the marker to the specified User Range. This restricts the marker's x-axis travel to the User Range span, specified with Start and Stop values.

- Each channel has 16 user ranges.
- Markers and trace statistics can be restricted to any user range.
- More than one marker can occupy a user range.
- User ranges can overlap. For example:
  - User range 1: 3 GHz to 5 GHz
  - User range 2: 4 GHz to 6 GHz

Note: User ranges are especially useful in restricting marker searches to specific areas of the measurement.

VB Syntax
mark.UserRange = value

Variable (Type) - Description
mark (A Marker (object))
value (long integer) - User Range. Choose any number between 0 and 16 (0=Full Span)

Return Type
Long Integer

Default
0 - Full Span

Examples
mark.UserRange = 1 'Write
UserRange = mark.UserRange 'Read

C++ Syntax
HRESULT get_UserRange(long *pRangeNumber)
HRESULT put_UserRange(long lRangeNumber)

Interface
IMarker
### UserRangeMax Property

**Description**

Note: This property on the Channel Object is superseded by the same property on the Measurement Object.

Sets the stimulus stop value for the specified User Range.

**VB Syntax**

```vbnet
chan=UserRangeMax(domainType,Rnum) = value - Superseded
meas.UserRangeMax(Rnum) = value
mark.UserRangeMax(Rnum) = value
```

**Variable (Type) - Description**

- `chan` A Channel (object) - Superseded
- `meas` A Measurement (object)
- `mark` A Marker (object)

To assign a marker to a User Range, use the UserRange Property.

**domainType**

This argument is no longer required. The domain type is inferred by the measurement or marker.

- (enum NADomainType) - Choose from:
  - 0 - naDomainFrequency
  - 1 - naDomainTime
  - 2 - naDomainPower

**Rnum (long integer)** - User Range number. Choose any number between 1 and 16 (0=Full Span)

**value (double)** - Stop value. Choose any number within the full span of the channel.

**Return Type**

Double

**Default**

The current stimulus setting for the channel

- `mark.UserRangeMax(1) = 3e9` 'Write
- `meas.UserRangeMax(1) = 3e9` 'Write
- `UseRngeMax = mark.UserRangeMax(1)` 'Read
- `UseRngeMax = meas.UserRangeMax(2)` 'Read
C++ Syntax

HRESULT put_UserRangeMax(long rangeNumber, double maxValue)

HRESULT get_UserRangeMax(long rangeNumber, double *maxValue)

Interface

IMeasurement

IMarker
## UserRangeMin Property

**Description**  
Sets the stimulus start value for the specified User Range.  
This property uses different arguments for the channel and marker objects.

**VB Syntax**  
```vb  
chan.UserRangeMin(domainType, range) = value  
```

or

```vb  
mark.UserRangeMin(range) = value  
```

**Variable**  

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>chan</td>
<td>A Channel (object)</td>
</tr>
<tr>
<td>mark</td>
<td>A Marker (object)</td>
</tr>
</tbody>
</table>

To assign a marker to a User Range, use the UserRange Property.

**domainType**  

*(enum NADomainType)*  
Type of sweep currently implemented on the channel - Choose from:

- 0 - naDomainFrequency
- 1 - naDomainTime
- 2 - naDomainPower
- 3 - naDomainPhase

**range**  
*(long)* - User Range number. Choose any number between 1 and 16 (0=Full Span)

**value**  
*(double)* - Start value. Choose any number within the full span of the analyzer

**Return Type**  
Double

**Default**  
The current stimulus setting for the channel

**Examples**

```plaintext  
mark.UserRangeMin(1) = 3e9 'Write  
chan.UserRangeMin(naDomainFrequency, 1) = 3e9 'Write  

UseRngeMin = mark.UserRangeMin 'Read  
UseRngeMin = chan.UserRangeMin 'Read  
```
**C++ Syntax**

HRESULT put_UserRangeMin(tagNADomainType domain, long rangeNumber, double minValue)

HRESULT get_UserRangeMin(tagNADomainType domain, long rangeNumber, double *minValue)

**Interface**

IChannel
### UserDescriptionOfPNA Property

**Description**  
Sets and reads a description of the VNA used to perform the User Characterization. This description is stored with the characterization in the ECal module.

Set this description before sending `Initialize` or the default (empty string) will be used.

**VB Syntax**  
`userChar.UserDescriptionOfPNA = value`

**Variable**  
*(Type)* - Description

*userChar*  
An `IECalUserCharacterizer` Object

*value*  
(String) Descriptive text, limited to 14 characters maximum.

**Return Type**  
String

**Default**  
"" (Empty String)

**Examples**  
`userChar.UserDescriptionOfPNA = "My PNA"`

**C++ Syntax**  
HRESULT get_UserDescriptionOfPNA(BSTR *info);

HRESULT put_UserDescriptionOfPNA(BSTR info);

**Interface**  
IECalUserCharacterizer
**UserName Property**

**Description**
Sets and reads the description of the person and/or company who is producing the ECal user characterization. This description is stored with the characterization in the ECal module.

Set this description before sending `Initialize` or the default (empty string) will be used.

**VB Syntax**

```
userChar.UserName = value
```

**Variable**

*userChar* - An `ECalUserCharacterizer` Object  
value - (String) Descriptive text, limited to 19 characters maximum.

**Return Type**

String

**Default**

"" (Empty String)

**Examples**

```
userChar UserName = "John Doe, Acme Inc."
```

**C++ Syntax**

```cpp
HRESULT get_UserName(BSTR *name);

HRESULT put_UserName(BSTR name);
```

**Interface**

`IECalUserCharacterizer`
Write/Read

About User Preset

UserPresetEnable Property

Description
'Checks' and 'clears' the enable box on the User Preset dialog box. This only affects subsequent Presets from the front panel user interface.

Regardless of the state of the User Preset Enable checkbox, the app.Preset command will always preset the VNA to the factory preset settings, and app.UserPreset will always perform a User Preset.

VB Syntax

```vbnet
app.UserPresetEnable = state
```

Variable (Type) - Description

- **app**: An Application (object)
- **state**: (boolean) Front Panel User Preset State. Choose from:

  - False – User Preset OFF
  - True – User Preset ON

Return Type

Boolean

Default

False

Examples

```vbnet
app.UserPresetEnable = True  'Write
upreset = app.UserPresetEnable  'Read
```

C++ Syntax

```cpp
HRESULT get_UserPresetEnable(VARIANT_BOOL *pVal)
HRESULT put_UserPresetEnable(VARIANT_BOOL newVal)
```

Interface

IApplication6
### Valid Property

<table>
<thead>
<tr>
<th>Description</th>
<th>Returns a boolean value to indicate if the current equation on the measurement is valid. For equation processing to occur, the equation must be valid and ON.</th>
</tr>

| **Variable** | *(Type)* - Description  
*good* *(Boolean)* Variable to store the returned value.  
**True** (1) - equation is valid  
**False** (0) - equation is NOT valid  
*eq* MeasurementEquation *(object)* |
| **Return Type** | Boolean |
| **Default** | Not Applicable |
| **Examples** | `IsValid = eq.Valid` 'Read' |
| **C++ Syntax** | `HRESULT get_Valid(Boolean *equation)` |
| **Interface** | IMeasurementEquation |

ValidConnectorTypes Property

**Description**
Returns a list of all connector types for which there are calibration kits. Looks for connector types in mechanical cal kits, within VNA disk memory, and within the attached ECal Module memory.

Here are the more common connector types:

<table>
<thead>
<tr>
<th>Type of Connector</th>
<th>Type</th>
<th>Female/Male</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>W-band waveguide</td>
<td>Type B</td>
<td>1.00 mm female</td>
<td></td>
</tr>
<tr>
<td>V-band waveguide</td>
<td>Type A (50) female</td>
<td>1.00 mm male</td>
<td></td>
</tr>
<tr>
<td>U-band waveguide</td>
<td>Type A (50) male</td>
<td>1.85 mm male</td>
<td></td>
</tr>
<tr>
<td>R-band waveguide</td>
<td>Type F (75) female</td>
<td>1.85 mm female</td>
<td></td>
</tr>
<tr>
<td>Q-band waveguide</td>
<td>Type F (75) male</td>
<td>2.92 mm female</td>
<td></td>
</tr>
<tr>
<td>K-band waveguide</td>
<td>Type N (75) female</td>
<td>2.92 mm male</td>
<td></td>
</tr>
<tr>
<td>P-band waveguide</td>
<td>Type N (75) male</td>
<td>APC 2.4 female</td>
<td></td>
</tr>
<tr>
<td>X-band waveguide</td>
<td>Type N (50) female</td>
<td>APC 2.4 male</td>
<td></td>
</tr>
<tr>
<td>7-16 female</td>
<td>Type N (50) male</td>
<td>APC 3.5 female</td>
<td></td>
</tr>
<tr>
<td>7-16 male</td>
<td>Type N (50) male</td>
<td>APC 3.5 male</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>APC 7</td>
<td></td>
</tr>
</tbody>
</table>

**VB Syntax**

```vbnet
value = obj.ValidConnectorTypes
```

**Variable**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>value</td>
<td>(Variant) List of connector types</td>
</tr>
<tr>
<td>obj</td>
<td>Any of the following:</td>

</tr>
</tbody>
</table>
ValidPorts Property

Description Queries available ports for independent power calibration.

VB Syntax

```
value = IndependentPwrrCal.ValidPorts
```

Variable (Type) - Description

```
value (Variant) - Variable to store the returned ports.
```

IndependentPwrrCal A IndependentPowerCalibration (object)

Return Type Variant

Default Not Applicable

Example

```
value = CalibrateAllChannels.IndependentPowerCalibration.ValidPorts
'Read
```

C++ Syntax

```
HRESULT ValidPorts(VARIANT* ports);
```

Interface IIndependentPowerCalibration
Value Property

Description
Write or read a value (setting) for the current element.

This command is used to set both RF and IF Path Configuration.

- See RF Path Configuration (elements, value)
- See IF Path Configuration (elements, value)

VB Syntax

```
pathElement.Value = value
```

Variable

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pathElement</td>
<td>A PathElement (object)</td>
</tr>
<tr>
<td>value</td>
<td>(String) Value for the element. Use pathElement.Values to return a list of valid settings for this element.</td>
</tr>
</tbody>
</table>

Return Type
String

Default
Not Applicable

Examples
See Examples:

- IFPathConfiguration Setup
- RF PathConfiguration Example

C++ Syntax

```
HRESULT get_Value( BSTR* pValue );

HRESULT put_Value( BSTR value );
```

Interface
IPathElement
## Values Property

**Description**
Returns an array of valid settings that can be used with the element object.

See a list of configurable elements and settings for various VNA models.

**VB Syntax**
```
values = pathElement.Values
```

**Variable**

<table>
<thead>
<tr>
<th>(Type) - Description</th>
<th>value</th>
</tr>
</thead>
<tbody>
<tr>
<td>(Variant array)</td>
<td>Variable to store the array of valid settings for the element.</td>
</tr>
</tbody>
</table>

**pathElement**
A PathElement (object)

**Return Type**
Variant array

**Default**
Not Applicable

**Examples**
```
settings=pathElement.Values
```

**C++ Syntax**
```
HRESULT Values(VARIANT* pValues);
```

**Interface**
IPathElement
About Vector Averaging

VectorAverageEnable Property

**Description**
Set and read the ON/OFF state of the vector averaging.

**VB Syntax**

```vbnet
sa.coherence.VectorAverageEnable = value
```

**Variable (Type) - Description**

- **sa.coherence** → A SpectrumAnalyzerCoherence (object)
- **value** → (Boolean) Choose from:
  - **0** - OFF - Vector averaging is set to OFF.
  - **1** - ON - Vector averaging is set to ON.

Learn about these settings.

**Return Type**
Boolean

**Default**
0

**Examples**

```vbnet
sa.coherence.VectorAverageEnable = OFF 'Write
value = sa.coherence.VectorAverageEnable 'Read
```

**C++ Syntax**

```cpp
HRESULT put_VectorAverageEnable(VARIANT_BOOL bEnable);
HRESULT get_VectorAverageEnable(VARIANT_BOOL* bEnable);
```

**Interface**
ICoherenceSA
## VectorAverageValue Property

<table>
<thead>
<tr>
<th>Description</th>
<th>Set and read the vector averaging value.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>VB Syntax</strong></td>
<td><code>sa.coherence.VectorAverageValue = value</code></td>
</tr>
<tr>
<td><strong>Variable (Type)</strong> - Description</td>
<td></td>
</tr>
<tr>
<td><code>sa.coherence</code></td>
<td>A <code>SpectrumAnalyzerCoherence</code> (object)</td>
</tr>
<tr>
<td><code>value</code></td>
<td>(Double) Choose a value between 0 and 65536.</td>
</tr>
</tbody>
</table>

Learn about these settings.

<table>
<thead>
<tr>
<th>Return Type</th>
<th>Double</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Default</strong></td>
<td>1 (no averaging)</td>
</tr>
</tbody>
</table>

### Examples

```vbnet
sa.coherence.VectorAverageValue = 1 'Write
value = sa.coherence.VectorAverageValue 'Read
```

See an example program.

### C++ Syntax

```cpp
HRESULT put_VectorAverageValue(double val);
HRESULT get_VectorAverageValue(double* val);
```

### Interface

ICoherenceSA
## VectorAverageValueMax Property

<table>
<thead>
<tr>
<th>Description</th>
<th>Read the current maximum available vector averaging value.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>VB Syntax</strong></td>
<td><code>value = sa.coherence.VectorAverageValueMax</code></td>
</tr>
<tr>
<td><strong>Variable</strong></td>
<td><em>(Type)</em> - Description</td>
</tr>
<tr>
<td><code>sa.coherence</code></td>
<td>A <code>SpectrumAnalyzerCoherence</code> <em>(object)</em></td>
</tr>
<tr>
<td><code>value</code></td>
<td><em>(Long)</em> Variable to store the returned value.</td>
</tr>
<tr>
<td><strong>Return Type</strong></td>
<td>Long</td>
</tr>
<tr>
<td><strong>Example</strong></td>
<td><code>value = sa.coherence.VectorAverageValueMax</code></td>
</tr>
<tr>
<td><strong>C++ Syntax</strong></td>
<td><code>HRESULT get_VectorAverageValueMax(long* val);</code></td>
</tr>
<tr>
<td><strong>Interface</strong></td>
<td><code>ICoherenceSA</code></td>
</tr>
</tbody>
</table>
VelocityFactor Property

Description
Sets the velocity factor to be used with Electrical Delay, Port Extensions, and Time Domain marker distance calculations.

VB Syntax
app.VelocityFactor = value

Variable (Type) - Description

app   An Application (object)
value (double) - Velocity factor. Choose a number between: 0 and 10 (.66 polyethylene dielectric; .7 PTFE dielectric)

Return Type
Double

Default
1

Examples
app.VelocityFactor = .66 'Write
RelVel = app.VelocityFactor 'Read

C++ Syntax
HRESULT get_VelocityFactor(double *pVal)
HRESULT put_VelocityFactor(double newVal)

Interface
IApplication
### VideoAveragingCount Property

<table>
<thead>
<tr>
<th>Description</th>
<th>Reads the number of video bandwidth sweeps that are averaged together. This readout is displayed on the SA setup page.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>VB Syntax</strong></td>
<td>value = sa.VideoAveragingCount</td>
</tr>
<tr>
<td><strong>Variable</strong></td>
<td>(Type) - Description</td>
</tr>
<tr>
<td>value</td>
<td>(Long) Variable to store the returned averaging count.</td>
</tr>
<tr>
<td>sa</td>
<td>A SpectrumAnalyzer (object)</td>
</tr>
<tr>
<td><strong>Return Type</strong></td>
<td>Long</td>
</tr>
<tr>
<td><strong>Default</strong></td>
<td>N/A</td>
</tr>
<tr>
<td><strong>Examples</strong></td>
<td>value = sa.VideoAveragingCount 'Read</td>
</tr>
</tbody>
</table>

See an example program.

**C++ Syntax**

```cpp
HRESULT get_VideoAveragingCount(long* count);
```

**Interface**

ISpectrumAnalyzer
VideoAveragingType Property

Description
Set and read the video averaging type.

VB Syntax

\[
sa.VideoAveragingType = value
\]

Variable (Type) - Description

\[
sa \quad \text{A SpectrumAnalyzer (object)}
\]

\[
value \quad \text{(Enum as NASAVideoAveragingType) Choose from:}
\]

0 - naPower
1 - naLog
2 - naVoltage
3 - naVoltageMax
4 - naVoltageMin

Learn about these settings.

Return Type
Enum

Default
0 - naPower

Examples

\[
\begin{align*}
\text{sa.VideoAveragingType} & = \text{naLog} \quad \text{\texttt{\textcolor{teal}{\textbf{\textit{Write}}}}} \\
\text{value} & = \text{sa.VideoAveragingType} \quad \text{\texttt{\textcolor{teal}{\textbf{\textit{Read}}}}}
\end{align*}
\]

See an example program.

C++ Syntax

HRESULT put_VideoAveragingType(tagNASAVideoAveragingType type);
HRESULT get_VideoAveragingType(tagNASAVideoAveragingType* type);

Interface
ISpectrumAnalyzer
### VideoBWMax

<table>
<thead>
<tr>
<th>Description</th>
<th>Read the maximum video bandwidth.</th>
</tr>
</thead>
<tbody>
<tr>
<td>VB Syntax</td>
<td><code>value = sa.VideoBWMax</code></td>
</tr>
<tr>
<td>Variable</td>
<td><code>sa</code> - A SpectrumAnalyzer (object)</td>
</tr>
<tr>
<td>Return Type</td>
<td>Double</td>
</tr>
<tr>
<td></td>
<td><code>value = sa.VideoBWMax</code></td>
</tr>
</tbody>
</table>

See an example program.

**C++ Syntax**

```
HRESULT get_VideoBWMax(tagNASAVideoBWMax* maxbw);
```

**Interface**

I SpectrumAnalyzer
**VideoBWMin**

<table>
<thead>
<tr>
<th>Description</th>
<th>Read the minimum video bandwidth.</th>
</tr>
</thead>
<tbody>
<tr>
<td>VB Syntax</td>
<td><code>value = sa.VideoBWMin</code></td>
</tr>
<tr>
<td>Variable</td>
<td><em>(Type)</em> - Description</td>
</tr>
<tr>
<td></td>
<td><code>sa</code> A SpectrumAnalyzer <em>(object)</em></td>
</tr>
<tr>
<td>Return Type</td>
<td>Double</td>
</tr>
<tr>
<td></td>
<td><code>value = sa.VideoBWMin 'Read</code></td>
</tr>
</tbody>
</table>

See an example program.

**C++ Syntax**

```cpp
HRESULT get_VideoBWMin(tagNASAVideoBWMin* minbw);
```

**Interface**

`ISpectrumAnalyzer`
## VideoBW Property

<table>
<thead>
<tr>
<th>Description</th>
<th>Set and read the Video bandwidth. Also set VideoBWMODE to naManual.</th>
</tr>
</thead>
<tbody>
<tr>
<td>VB Syntax</td>
<td>\texttt{sa.VideoBW = value}</td>
</tr>
<tr>
<td>Variable</td>
<td>\texttt{sa} \quad \textbf{A SpectrumAnalyzer (object)}</td>
</tr>
<tr>
<td>\textit{value}</td>
<td>\textbf{(Double)} \quad \text{Choose a value between 3 Hz and 3 MHz. Going outside this range places the trace into a hold mode.}</td>
</tr>
<tr>
<td>Learn about these settings.</td>
<td></td>
</tr>
<tr>
<td>Return Type</td>
<td>\textbf{Double}</td>
</tr>
<tr>
<td>Default</td>
<td>100 kHz</td>
</tr>
<tr>
<td>Examples</td>
<td>\texttt{sa.VideoBW = 1e5} \quad \textbf{Write}</td>
</tr>
<tr>
<td></td>
<td>\texttt{value = sa.VideoBW} \quad \textbf{Read}</td>
</tr>
<tr>
<td>C++ Syntax</td>
<td>\texttt{HRESULT put_VideoBW(double freq);}</td>
</tr>
<tr>
<td></td>
<td>\texttt{HRESULT get_VideoBW(double* freq);}</td>
</tr>
<tr>
<td>Interface</td>
<td>\texttt{ISpectrumAnalyzer}</td>
</tr>
</tbody>
</table>

See an example program.
## VideoBWMode Property

**Description**  
Set and read how the video bandwidth is set. When ON, video bandwidth is set based on RBW/VBW ratio.

**VB Syntax**  
`sa.VideoBWMode = value`

**Variable**  
- **(Type)** - Description
  - `sa` (Type) - A SpectrumAnalyzer (object)
  - `value` (Enum as NAModes) Choose from:
    - **1 - naMANUAL** - Video BW is set manually using VideoBW Property
    - **0 - naAUTO** - Video BW is set automatically.

Learn about these settings.

**Return Type**  
Enum

**Default**  
0 - naAUTO

**Examples**  
- `sa.VideoBWMode = naMANUAL`  Write
- `value = sa.VideoBWMode`  Read

See an example program.

**C++ Syntax**  
- `HRESULT put_VideoBWMode(tagNAModes mode);`
- `HRESULT get_VideoBWMode(tagNAModes* mode);`

**Interface**  
ISpectrumAnalyzer
## View Property

<table>
<thead>
<tr>
<th>Description</th>
<th>Sets (or returns) the type of trace displayed on the screen.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>VB Syntax</strong></td>
<td><code>meas.View = value</code></td>
</tr>
<tr>
<td><strong>Variable</strong></td>
<td>(Type) - Description</td>
</tr>
<tr>
<td><code>meas</code></td>
<td>A measurement (object)</td>
</tr>
<tr>
<td><code>value</code></td>
<td>(enum NAView) - Type of trace. Choose from:</td>
</tr>
<tr>
<td></td>
<td>0 - naData</td>
</tr>
<tr>
<td></td>
<td>1 - naDataAndMemory</td>
</tr>
<tr>
<td></td>
<td>2 - naMemory</td>
</tr>
<tr>
<td></td>
<td>3 - naNoTrace</td>
</tr>
</tbody>
</table>

**Note:** The **naData** trace may reflect the result of a **TraceMath** operation.

<table>
<thead>
<tr>
<th>Return Type</th>
<th>NAView</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Default</strong></td>
<td>naData</td>
</tr>
<tr>
<td><strong>Examples</strong></td>
<td><code>meas.View = naData</code> <em>Write</em></td>
</tr>
<tr>
<td></td>
<td><code>trceview = meas.View</code> <em>Read</em></td>
</tr>
</tbody>
</table>

| **C++ Syntax** | HRESULT `get_View(tagNAView* pView)` |
| | HRESULT `put_View(tagNAView newView)` |
| **Interface** | IMeasurement |
### Visible Property

**Description**  
Makes the Network Analyzer application visible or not visible. In the Not Visible state, the analyzer cycle time for making measurements can be significantly faster because the display does not process data.

**VB Syntax**  
```
app.Visible = state
```

**Variable**  
 *(Type) - Description*

- **app**  
  An Application *(object)*

- **state**  
  *(boolean)*

  - **False** - Network Analyzer application NOT visible
  - **True** - Network Analyzer application IS visible

**Return Type**  
Boolean

**Default**  
True

**Examples**
```
app.Visible = False 'Write
vis = app.Visible 'Read
```

**C++ Syntax**  
```
HRESULT get_Visible(VARIANT_BOOL * bVisible)
HRESULT put_Visible(VARIANT_BOOL bVisible)
```

**Interface**  
IApplication
VoltageLimit Property

Description
Sets and returns the maximum output voltage value of the external DC Source. This command supports Keysight B2900A and N6700 series devices only.

VB Syntax
`extDC.VoltageLimit (devicename) = value`

Variable (Type) - Description
- `extDC` (A ExternalDCDevice (object))
- `devicename` (String) Name of the device.
- `value` (Double) Voltage limit value.

Return Type
Double

Default
0

Examples
- `extDC.VoltageLimit("myDCDevice") = 4` 'Write
- `limit = extDC.VoltageLimit("myDCDevice")` 'Read

C++ Syntax
- `HRESULT get_VoltageLimit(BSTR devicename, double *vLimit)`
- `HRESULT put_VoltageLimit(BSTR devicename, double newLimit)`

Interface
IEternalDCDevice2
### vsa.ADCDither Property

<table>
<thead>
<tr>
<th>Description</th>
<th>Set and read the dither state.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>VB Syntax</strong></td>
<td><code>vsa.ADCDither = state</code></td>
</tr>
<tr>
<td><strong>Variable</strong></td>
<td><strong>(Type)</strong> - <strong>Description</strong></td>
</tr>
<tr>
<td><code>vsa</code></td>
<td>A <strong>VSA (object)</strong></td>
</tr>
<tr>
<td><code>value</code></td>
<td><strong>(Boolean)</strong> Choose from:</td>
</tr>
<tr>
<td></td>
<td><strong>False</strong> - Turn dithering off.</td>
</tr>
<tr>
<td></td>
<td><strong>True</strong> - Turn dithering on.</td>
</tr>
<tr>
<td><strong>Return Type</strong></td>
<td>Boolean</td>
</tr>
<tr>
<td><strong>Default</strong></td>
<td>True</td>
</tr>
<tr>
<td><strong>Examples</strong></td>
<td><code>vsa.ADCDither = False</code> <em>Write</em></td>
</tr>
<tr>
<td></td>
<td><code>value = vsa.ADCDither</code> <em>Read</em></td>
</tr>
<tr>
<td><strong>C++ Syntax</strong></td>
<td><code>HRESULT put_Dithering(VARIANT_BOOL bEnable);</code></td>
</tr>
<tr>
<td></td>
<td><code>HRESULT get_Dithering(VARIANT_BOOL* bEnable);</code></td>
</tr>
<tr>
<td><strong>Interface</strong></td>
<td>IVSA</td>
</tr>
</tbody>
</table>
vsa.ADCFilter Property

**Description**
Sets and reads the ADC filter width. The entered frequency value is rounded to the closest value supported by the VNA (11 MHz or 38 MHz).

**VB Syntax**
vsa.ADCFilter = mode

**Variable**
(Type) - Description
vsa (object) - A VSA object
value (Double) Choose 11 MHz or 38 MHz.

Learn about these settings.

**Return Type**
Double

**Default**
38 MHz

**Examples**
vsa.ADCFilter = 11e6  'Write
value = vsa.ADCFilter  'Read

**C++ Syntax**
HRESULT get_ADCFilter(double* cutfreq);
HRESULT put_ADCFilter(double cutfreq);

**Interface**
IVSA
### vsa.ADCSampleRate Property

**Description**  
Sets or returns the ADC sampling frequency setting. The entered frequency is rounded to the closest value supported by the VNA (25 MHz or 100 MHz).

**VB Syntax**  
```vb
vsa.ADCSampleRate = value
```

**Variable (Type) - Description**
- **vsa** A VSA (object)
- **value** (Double) Choose from 100 MHz or 25 MHz.

Learn about these settings.

**Return Type**  
Double

**Default**  
100 MHz

**Examples**
- `vsa.ADCSampleRate = 100MHz`  
  `value = vsa.ADCSampleRate`  

**C++ Syntax**
- `HRESULT get_ADCSampleRate(double* rate)`
- `HRESULT put_ADCSampleRate(double rate)`

**Interface**  
IVSA
### vsa.ADCStacking Property

**Description**
Sets or returns the ADC stack range. If unspecified, value is set to 0 (no stacking).

**VB Syntax**
```vba
vsa.ADCStacking = value
```

**Variable (Type) - Description**

- `vsa` A VSA (object)
- `value` (Long) - Value of stacking number.

Learn about these settings.

**Return Type**
Long

**Default**
0

**Examples**
```
vsa.ADCStacking = 100  'Write
value = vsa.ADCStacking  'Read
```

**C++ Syntax**
```
HRESULT get_ADCStacking(double *StackVal)
HRESULT put_ADCStacking(double StackVal)
```

**Interface**
IVSA

---

---
# vsa.CenterFrequency Property

Sets or returns the VSA center frequency which determines the LO Freq (LO Freq = VSA Center Freq ± IF Offset) and the center frequency of the VNA and VSA.

## VB Syntax

```vbnet
vsa.CenterFrequency = value
```

## Variable (Type) - Description

<table>
<thead>
<tr>
<th>Variable</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>vsa</td>
<td>VSA (object)</td>
<td></td>
</tr>
<tr>
<td>value</td>
<td>double</td>
<td>Center frequency in Hertz. Choose any number between the minimum and maximum frequencies of the analyzer.</td>
</tr>
</tbody>
</table>

Learn about these settings.

## Return Type

Double

## Default

3.021e9

## Examples

```vbnet
vsa.CenterFrequency = 3.024e9 'sets the center frequency - Write
value = vsa.CenterFrequency 'Read
```

## C++ Syntax

```cpp
HRESULT get_CenterFrequency(double *pVal)
HRESULT put_CenterFrequency(double newVal)
```

## Interface

IVSA
## vsa.IFOffset Property

Sets or returns the IF offset used to calculate the LO frequency.

### VB Syntax

```vbnet
vsa.IFOffset = value
```

### Variable (Type) - Description

- **vsa**: A **VSA** (object)
- **value**: A **double** - IF offset value in Hertz. The range is 0 Hz to 21 MHz.

Learn about these settings.

### Return Type

Double

### Default

21e6

### Examples

```vbnet
vsa.IFOffset = 20e6  'Write
value = vsa.IFOffset 'Read
```

### C++ Syntax

```cpp
HRESULT get_IFOffset(double *pVal)
HRESULT put_IFOffset(double newVal)
```

### Interface

IVSA
vsa.LOSide Property

Description
Sets and reads the LO side.

VB Syntax
vsa.LOSide = mode

Variable
(Type) - Description
vsa (object) - A VSA object
value (Enum as NALevel)

Choose from:
0 - naLow
1 - naHigh

Learn about these settings.

Return Type
Enum

Default
Low

Examples
vsa.LOSide = naHigh 'Write

value = vsa.LOSide 'Read

C++ Syntax
HRESULT get_LOSide(tagNALevel* pVal);

HRESULT put_LOSide(tagNALevel pVal);

Interface
IVSA
### vsa.StreamDataToFile Property

<table>
<thead>
<tr>
<th><strong>Description</strong></th>
<th>Set and read the save data state.</th>
</tr>
</thead>
<tbody>
<tr>

# Write/Read

## About PNA-X Pulsed Capabilities

### Width Property

**Description**
Sets the pulse width - the amount of time that the pulse is ON.

**VB Syntax**

\[
pulse.Width(n) = value
\]

**Variable**

- **pulse** (Type) - Description
  A PulseGenerator (object)
  
- **n** (Integer) Pulse generator number. Choose from 0 to 4.
  
  0 is the generator that pulses the ADC.

- **value** (Double) Pulse width in seconds. Choose a value from about 33ns to about 70 seconds.

**Return Type**
Double

**Default**
1e-4 sec

**Examples**

- `pulse.Width = 1ms` 'Write
- `value = pulse.Width` 'Read

**C++ Syntax**

- `HRESULT get_Width(integer pulse, double* width);`
- `HRESULT put_Width(integer pulse, double width);`

**Interface**
IPulseGenerator
## WindowNumber Property

### Description
Returns the window number. You might use this property to identify a particular window so that you can create a new Measurement in that window.

### VB Syntax
```
value = win.WindowNumber
```

### Variable
- **`win`** *(Type) - Description*
  - A NAWindow (object)
- **`value`** *(long integer) - Variable to store the returned window number*

### Return Type
Long Integer

### Default
Not Applicable

### Examples
```
value = app.ActiveNAWindow.WindowNumber
```

### C++ Syntax
```
HRESULT (long* windowNumber);
```

### Interface
INAWindow
About Arranging Windows

**WindowState Property**

**Description**
Sets or returns the window setting of Maximized, Minimized, or Normal. To arrange all of the windows, use `app.ArrangeWindows`.

**VB Syntax**
```vbnet
object.WindowState = value
```

**Variable**
- **(Type)** - Description
  - `object` - An Application (object) - main window or
    - A NaWindow (object) - data windows
  - `value` - (enum NAWindowStates) - The window state. Choose from:
    - 0 - naMinimized - Minimizes the window to an Icon on the lower toolbar
    - 1 - naMaximized - Maximizes the window
    - 2 - naNormal - changes the window size to the user defined setting (between Max and Min).

**Return Type**
Long Integer

**Default**
naMaximized

**Examples**
```vbnet
app.WindowState = naMinimized 'changes the Network Analyzer application window to an icon. -Write
win.WindowState = naNormal 'changes the window defined by the win object variable to user defined settings. -Write
winstate = app.WindowState 'Read
```

**C++ Syntax**
```cpp
HRESULT get_WindowState(tagNAWindowStates *pVal)
HRESULT put_WindowState(tagNAWindowStates newVal)
```

**Interface**
INAWindow
IApplication
### XAxisAnnotation Property

<table>

# XAxisDomain Property

**Description**
Sets and returns the X-Axis domain of the selected DIQ measurement.

**VB Syntax**
```vbnet
Meas.XAxisDomain = value
```

**Variable**
- **(Type)** - Description
  - `Meas` a Measurement (object)
  - `value` String - Domain that is displayed on the X-axis.

<table>
<thead>
<tr>
<th>Choose one of these:</th>
<th>Then set X-Axis Source (XAxis Property) using one of these as the argument.</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Frequency&quot;</td>
<td>&quot;F1&quot;, &quot;F2&quot;, etc.</td>

<td>DC Source: &quot;AO1&quot;, &quot;AO2&quot;</td>
</tr>
<tr>
<td>&quot;Points&quot;</td>
<td>&quot;Points&quot;</td>
</tr>
</tbody>
</table>

**Example**
1. `Meas.XAxisDomain = "Frequency"
2. `Meas.XAxis = "F2"

```csharp
domain = Meas.XAxisDomain 'Read
```

**C++ Syntax**
```csharp
HRESULT put_XAxisDomain(BSTR domain);
HRESULT get_XAxisDomain(BSTR *domain);
```

**Interface**
IMeasurement17
**XAxisPointSpacing Property**

<table>
<thead>
<tr>
<th>Description</th>
<th>Sets X-axis Point Spacing for the display traces measured with segment sweeps on the active channel.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>VB Syntax</strong></td>
<td><code>chan.XAxisPointSpacing = value</code></td>

</tbody>
</table>
# XAxis Property

**Description**  
Sets the X-axis of the selected measurement to a DC Source. This command does not change the default setting for new traces.

**VB Syntax**  
```vb  
Meas.XAxisSource = value  
```

**Variable** (Type) - Description

- **Meas**  
  A Measurement (object)

- **value**  
  (String) - Not case-sensitive. For all channels EXCEPT DIQ, choose from the following:

  - "Default" - The default X-axis setting for the selected measurement. For Application measurements, the X-Axis domain is set with specific commands.
  - "AO1" - Internal DC source #1
  - "AO2" - Internal DC source #2

**Note:** For DIQ channels, see XAxisDomain Property

**Example**  
```vb  
Meas.XAxis = "Default" 'Write  
value = Meas.XAxis 'Read  
```

**C++ Syntax**  
```c++  
HRESULT put_XAxis(BSTR source);  
HRRESULT get_XAxis(BSTR* source);  
```

**Interface**  
IMeasurement17
## XAxisStart Property

<table>

<tr>
<td><strong>Examples</strong></td>
<td>\text{data}= \text{embedLO.XAxisStart 3 'read}</td>
</tr>
<tr>
<td><strong>C++ Syntax</strong></td>
<td>HRESULT XAxisStart (long sweep, double* start);</td>
</tr>
<tr>
<td><strong>Interface</strong></td>
<td>IEmbededLODiagnostic</td>
</tr>
</tbody>
</table>
### XAxisStop Property

**Description**  
Returns the X-Axis stop value of the specified tuning sweep.

**VB Syntax**  
```
value = embedLODiag.XAxisStop (n)
```

**Variable (Type) - Description**

<table>
<thead>
<tr>
<th>Variable</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>value</td>
<td>Double</td>
<td>Variable to store the returned data.</td>
</tr>
</tbody>
</table>

**embedLODiag**  
An EmbeddedLODiagnostic (object)

**n** (Long) Tuning sweep number. Use NumberOfSweeps to find the number of sweeps taken.

**Default**  
Not Applicable

**Examples**  
```
data= embedLO.XAxisStop 3 'read
```

**C++ Syntax**  
```
HRESULT XAxisStop (long sweep, double* start);
```

**Interface**  
IEmbededLODiagnostic
# YAxisAnnotation Property

<table>
<thead>
<tr>
<th>Description</th>
<th>Returns the Y-Axis annotation of the specified tuning sweep.</th>

<td>Interface</td>
<td>IEmbededLODiagnostic</td>
</tr>
</tbody>
</table>
YScale Property

Description: Sets or returns the Y-axis Per-Division value of the active trace.

VB Syntax: `trace.YScale = value`

Variable (Type) - Description:
- `trace` A Trace (object)
- `value` (double) - Scale /division number. Units and range depend on the current data format.

Return Type: Double

Default: 10 (db)

Examples:
- `trac.YScale = 5` 'Write
- `yscl = trac.YScale` 'Read

C++ Syntax:
- `HRESULT get_YScale(double *pVal)`
- `HRESULT put_YScale(double newVal)`

Interface: ITrace
**Z0 Property**

<table>
<thead>
<tr>

4. naClassD
5. naClassE
6. naReferenceRatioLine
7. naReferenceRatioThru

**SOLT Standards**

1. naSOLT_Open
2. naSOLT_Short
3. naSOLT_Load
4. naSOLT_Thru
5. naSOLT_Isolation

**TRL Standards**

1. naTRL_Reflection
2. naTRL_Line_Reflection
3. naTRL_Line_Tracking
4. naTRL_Thru
5. naTRL_Isolation

| `index` | *(long integer)* number of the standard. Optional argument - Used if there is more than one standard required to cover the necessary frequency range. If unspecified, value is set to 1. |

*Note* The behavior has changed with VNA revisions as follows:
Before 6.01: Accepted 0 and changed it to 1

6.01 to 6.04: Did NOT accept 0

6.04.11 and higher: Accepts 0 and changes it to 1

Return Type
None

Default
Not Applicable

Examples
`Cal.AcquireCalStandard naSOLT_Thru 'Write`

C++ Syntax
`HRESULT AcquireCalStandard(tagNACalClass enumClass, short standardNumber)`

Interface
ICalibrator
Write-only

About Calibration Standards

AcquireCalStandard2 Method

Description
Measures the specified standard from the selected calibration kit. The calibration kit is selected using app.CalKitType.

For 2-port calibration, it is also necessary to specify direction with AcquisitionDirection.

To omit Isolation from a 2-port calibration, do not Acquire a cal standard for naSOLT_Isolation.

For using two sets of standards, see Simultaneous2PortAcquisition Property.

Note: This command replaces AcquireCalStandard. This command provides for the acquisition of a sliding load cal. All other functionality is identical.

VB Syntax
`cal.AcquireCalStandard2 std[,index][,slide]`

Variable (Type) - Description

*cal*  A Calibrator (object)

*std*  (enum NACalClass) Standard to be measured. Choose from:

1 - naClassA
2 - naClassB
3 - naClassC
4 - naClassD
5 - naClassE
6 - naReferenceRatioLine
7 - naReferenceRatioThru

**SOLT Standards**
1 - naSOLT_Open
2 - naSOLT_Short
3 - naSOLT_Load
4 - naSOLT_Thru
5 - naSOLT_Isolation

**TRL Standards**
1 - naTRL_Reflection
2 - naTRL_Line_Reflection

2583
3 - naTRL_Line_Tracking
4 - naTRL_Thru
5 - naTRL_Isolation

[index] (long integer) Number of the standard. Optional argument - Used if there is more than one standard required to cover the necessary frequency range. If unspecified, value is set to 1.

Note The behavior has changed with VNA revisions as follows:

- Before 6.01: Accepted 0 and changed it to 1
- 6.01 to 6.04: Did NOT accept 0
- 6.04.11 and higher: Accepts 0 and changes it to 1

[slide] (enum as NACalStandardSlidingState) Optional argument. State of the sliding load. The slide should be set a minimum of five times. Seven is the maximum that can be stored. Choose from:

0 - naNotSlidingStd - not using a sliding load - Default if not specified.
1 - naSlideIsSet - slide is set for acquisition
2 - naSlideIsDone - this next acquisition will be the last. Calculations will then be performed.

Return Type None
Default Not Applicable
Examples

C++ Syntax

<td></td>
</tr>
</tbody>
</table>

Interface ICalibrator

[2584]
# AcquireCalConfidenceCheckECALEx Method

**Description**

This method replaces AcquireCalConfidenceCheckECAL

Transfers confidence data from the specified ECAL module into the measurement's memory trace. The data is transferred to the specified S-parameter on the same channel as this Calibrator object.

The characterization within the ECAL module that the confidence data will be read from is specified by ECALCharacterizationEx. The default value is 0.

**Note:** A confidence check can NOT be performed remotely from User Characterizations that are stored on the VNA disk.

**VB Syntax**

```vbnet
cal.AcquireCalConfidenceCheckECALEx Sparam [,ecalModule]
```

**Variable**

<table>
<thead>
<tr>
<th>(Type) - Description</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>cal</td>
<td>A Calibrator (object)</td>
</tr>
<tr>
<td>Sparam</td>
<td>S-parameter to transfer confidence data to. This parameter must be present on the same channel as the calibrator object.</td>
</tr>
<tr>
<td>ecalModule</td>
<td>(Integer) – Optional argument. ECAL module.</td>
</tr>
</tbody>
</table>

Choose from modules **1** through **8**

Use IsECALModuleFoundEx to determine the number of modules connected to the VNA

Use GetECALModuleInfoEx to return the model and serial number of each module.

**Return Type**

None

**Default**

Not applicable

**Examples**

Cal.AcquireCalConfidenceCheckECALEx "S11", 2

**C++ Syntax**

```cpp
HRESULT AcquireCalConfidenceCheckECALEX(BSTR strParameter, long moduleNumber = 1);
```

**Interface**

ICalibrator4
### AcquirePowerReadingsEx Method

<table>
<thead>
<tr>
<th>Description</th>
<th>This command replaces AcquirePowerReadings Method</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Initiates a source power cal acquisition.</td>
</tr>
</tbody>
</table>

**VB Syntax**

```vbnet
powerCalibrator.AcquirePowerReadingsEx calMethod, acqdevice [,sync]
```

**Variable**

- **powerCalibrator** *(object)* - A `SourcePowerCalibrator` object
- **calMethod** *(enum NASourcePowerCalMethod)* Selects the calibration method to be used for the source power cal acquisition.
  - 0 – **naPowerMeter** Use power meter for all readings.
  - 1 - **naPowerMeterAndReceiver** Power meter for the first iteration; then use the reference receiver for remaining readings if necessary.
  - 2 - **naReceiver** Use VNA measurement receiver for all readings.
- **acqdevice** *(String)* The specific acquisition device to be used. NOT case sensitive. Choose from:
  - If `calMethod` = **naPowerMeter** or **naPowerMeterAndReceiver**, choose from:
    - “ASEN” – Sensor on power meter channel A.
    - “BSEN” – Sensor on power meter channel B.
    - To use the sensor that currently corresponds to the frequency of interest, use the value from the `PowerAcquisitionDevice` property.
  - If `calMethod` = **naReceiver**, choose from:
    - The receiver names for your specific VNA using either physical receiver notation or logical receiver notation. For example, "a1" or "A".
    - Any configured PMAR device name. Learn more about PMAR Devices. See PMAR commands
- **[sync]** *(boolean)* Optional argument. If not specified, value is set to False. Choose from:
  - **True (1)** – The method does not return until this acquisition has completed (the program calling this method is halted while waiting for the method to return).
False (0) – The method initiates an acquisition then returns immediately (while the acquisition still proceeds). The program calling this method can then perform other operations during the acquisition.

| Return Type | None |
| Default     | Not Applicable |
| Examples    |
|             | `powerCalibrator.AcquirePowerReadingsEx naPowerMeter, "asen", True` |
|             | `powerCalibrator.AcquirePowerReadingsEx naReceiver, "b2"` |
|             | `powerCalibrator.AcquirePowerReadingsEx naReceiver, "MyPMAR"` |

**C++ Syntax**

```
HRESULT AcquirePowerReadingsEx (tagNASourcePowerCalMethod enumCalMethod, BSTR bstrAcqDevice, VARIANT_BOOL bSync);
```

**Interface**

ISourcePowerCalibrator4

Activate Method

Description
Makes an object the Active Object. When making a measurement active, the channel and window the measurement is contained in becomes the active channel and active window.

In order to change properties on any of the active objects, you must first have a "handle" to the active object using the Set command. For more information, See Getting a Handle to an Object.

You do not have to make an object "Active" to set or read its properties remotely. But an object must be "Active" to change its values from the front panel.

VB Syntax

object.Activate

Variable
(Type) - Description

object Measurement (object)
or
Marker (object)

Return Type
Not Applicable

Default
Not Applicable

Examples
meas.Activate
mark.Activate

C++ Syntax

HRESULT Activate()

Interface
IMeasurement
IMarker
## About Markers

**ActivateMarker Method**

<table>
<thead>
<tr>
<th>Description</th>
<th>Makes a marker the Active Marker. Use <code>meas.ActiveMarker</code> to read the number of the active marker.</th>

</tr>
<tr>
<td><strong>Remarks</strong></td>
<td>Use <code>ReferenceMarkerState</code> to control the Reference marker.</td>
</tr>
</tbody>
</table>
ActivateWindow Method

**Description**
Makes a window object the Active Window.

In order to change properties on any of the active objects, you must first have a "handle" to the active object using the **Set** command. For more information, See Programming the Analyzer Object Model.

You do not have to make an object "Active" to set or read its properties remotely. But an object must be "Active" to change its values from the front panel.

**VB Syntax**
```
app.ActivateWindow n
```

**Variable**
(Type) - Description

**app**
An **Application** (**object**)  

**n**
(**long**) Number of the window to make active

**Return Type**
Window Object

**Default**
Not Applicable

**Examples**
```
app.ActivateWindow 4
```

**C++ Syntax**
```
HRESULT ActivateWindow(long WindowNumber)
```

**Interface**
IApplication

See the VNA Object Model
Add (channels) Method

Description  Creates a channel and returns a handle to it. If the channel already exists, it returns the handle to the existing channel.

VB Syntax  

```vbnet
chans.Add (item)
```

Variable  

<table>
<thead>
<tr>
<th>(Type)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>chans</code></td>
<td>A Channel collection (object)</td>
</tr>
<tr>
<td><code>item</code></td>
<td>(variant) - Channel number.</td>
</tr>
</tbody>
</table>

Return Type  Channel

Default  Not Applicable

Examples  

```vbnet
chans.Add 3 'Creates channel 3
```

C++ Syntax  

```cpp
HRESULT Add(VARIANT numVal, IChannel** pChannel)
```

Interface  IChannels
Add (measurement) Method

Description: Adds a Measurement to the collection.

**Note:** This command is supported ONLY in a standard measurement channel.

Measurements can be added to ALL measurement class types using `CreateCustomMeasurementEx` Method.

VB Syntax:

```vbnet
meas.Add channel,param,source[,window]
```

- **meas** A Measurements collection (object)
- **channel** (long) - Channel number of the new measurement.
- **param** (string) - New parameter. Case insensitive.

**For S-parameters:**

Any S-parameter that can be measured by your VNA.

Single-digit port numbers can be separated by "_" (underscore). For example: "S21" or "S2_1"

Double-digit port numbers MUST be separated by underscore. For example: "S10_1"

**For Ratioed measurements:**

Any two receivers in your VNA separated by "/". For example: "A/R1"

See the block diagram showing the receivers in YOUR VNA.

**For Unratioed (absolute power) measurements:**

Any receiver in the VNA. For example: "A"

See the block diagram showing the receivers in YOUR VNA.

**Ratioed** and **Unratioed** measurements can also use **logical receiver notation** to refer to receivers. This notation makes it easy to refer to receivers with an external test set connected to the VNA. You do not need to know which physical receiver is used for each test port. Learn more.

**For ADC measurements**

Any ADC receiver in the VNA followed by a comma, then the source port.
For example: "AI1_2" indicates the Analog Input1 with source port of 2.

Learn more about ADC receiver measurements.

For Balanced S-parameter measurements:

"topology:Sabxy"

**topology** - Choose from:

- **sbal** - single-ended to balanced
- **ssb** - single-ended / single-ended to balanced
- **bbal** - balanced to balanced

**Sabxy** -

Where

- **a** - device output (receive) mode
- **b** - device input (source) mode

(choose from the following for both **a** and **b**):

- **d** - differential
- **c** - common
- **s** - single ended

- **x** - device output (receive) logical port number
- **y** - device input (source) logical port number

For example: "**sbal:sdd42**"

See an example program

For **Imbalance** and **Common Mode Rejection** measurements:

"topology:parameter" Choose from:
<table>
<thead>
<tr>
<th>Choose this:</th>
<th>To get this:</th>
<th>Parameter</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;SBAL:IMBSB&quot;</td>
<td>single-ended to balanced</td>
<td>imbalance</td>
</tr>
<tr>
<td>&quot;SBAL:CMRRSB1&quot;</td>
<td>single-ended to balanced</td>
<td>common mode rejection (Sds21/Scs21)</td>
</tr>
<tr>
<td>&quot;SBAL:CMRRSB2&quot;</td>
<td>single-ended to balanced</td>
<td>common mode rejection (Ssd12/Ssc12)</td>
</tr>
<tr>
<td>&quot;SSB:IMB1SSB&quot;</td>
<td>single-ended / single-ended to balanced</td>
<td>imbalance 1</td>
</tr>
<tr>
<td>&quot;SSB:IMB2SSB&quot;</td>
<td>single-ended / single-ended to balanced</td>
<td>imbalance 2</td>
</tr>
<tr>
<td>&quot;SSB:CMRRSSB1&quot;</td>
<td>single-ended / single-ended to balanced</td>
<td>common mode rejection (Sds31/Scs31)</td>
</tr>
<tr>
<td>&quot;SSB:CMRRSSB2&quot;</td>
<td>single-ended / single-ended to balanced</td>
<td>common mode rejection (Sds32/Ssc32)</td>
</tr>
<tr>
<td>&quot;BBAL:IMB1BB&quot;</td>
<td>balanced to balanced</td>
<td>imbalance 1</td>
</tr>
<tr>
<td>&quot;BBAL:IMB2BB&quot;</td>
<td>balanced to balanced</td>
<td>imbalance 2</td>
</tr>
<tr>
<td>&quot;BBAL:CMRRBB&quot;</td>
<td>balanced to balanced</td>
<td>common mode rejection (Sdd21/Scc21)</td>
</tr>
</tbody>
</table>

**source** *(long integer)* - Source port number; if unspecified, value is set to 1. Only used for non-s-parameter measurements; ignored if s-parameter.

**window** *(long integer)* - Optional argument. Window number of the new measurement. If unspecified, the S-Parameter will be created in the Active Window. Choose between 1 and the maximum number of windows allowed on the VNA. If unspecified, the measurement will be created in the Active Window.

See also Traces, Channels, and Windows on the VNA

Return Type: None  
Default: None  
Examples: `meass.Add 3, "A/R1", 1, 1` - Adds A/R1 measurement to channel 3 in window 1
C++ Syntax

HRESULT Add(long ChannelNum, BSTR strParameter, long srcPort, VARIANT_BOOL bNewWindow)

Interface

Add (PowerLossSegment) Method

**Description**

Adds a PowerLossSegment to the PowerLossSegments collection. Also, adds a PowerLossSegmentPMAR to the PowerLossSegmentsPMAR collection.

To ensure predictable results, it is best to remove all segments before defining a new list of segments. For each segment in the collection, do a seg.Remove.

Segments and values can also be added using the CharacterizeAdaptor Macro.

**VB Syntax**

```vb
segs.Add (item [ size])
```

**Variable**

<table>
<thead>
<tr>
<th>(Type)</th>
<th>- Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>segs</code></td>
<td>A PowerLossSegments collection</td>
</tr>
<tr>
<td></td>
<td>A PowerLossSegmentsPMAR collection.</td>

<tr>
<td><code>item</code></td>
<td>(variant) - Number of the new segment. If it already exists, a new segment is inserted at the requested position.</td>
</tr>
<tr>
<td><code>size</code></td>
<td>(long integer) - Optional argument. The number of segments to add, starting with item. If unspecified, value is set to 1. Add up to 9999 segments.</td>
</tr>
</tbody>
</table>

**Return Type**

None

**Default**

Not Applicable

**Examples**

```vb
segs.Add 1, 4 'Adds segments 1,2,3 and 4
```

**C++ Syntax**

```cpp
HRESULT Add(VARIANT index, long size);
```

**Interface**

IPowerLossSegments
Add (PowerSensorCalFactorSegment) Method

Description
Adds a PowerSensorCalFactorSegment to the CalFactorSegments collection. Also
adds a PowerSensorCalFactorSegmentPMAR to the CalFactorSegmentsPMAR collection.

To ensure predictable results, it is best to remove all segments before defining a new list of segments. For each segment in the collection, do a seg.Remove.

VB Syntax
segs.Add (item [ size])

Variable (Type) - Description
segs - A CalFactorSegments (collection) or a CalFactorSegmentsPMAR (collection)
item - (variant) - Number of the new segment. If it already exists, a new segment is inserted at the requested position.
size - (long integer) - Optional argument. The number of segments to add, starting with item. If unspecified, value is set to 1.

Return Type
None

Default
Not Applicable

Examples
segs.Add 1, 4 'Adds segments 1,2,3 and 4

C++ Syntax
HRESULT Add(VARIANT index, long size);

Interface
ICalFactorSegments
ICalFactorSegmentsPMAR
## Add (segment) Method

**Description**  Adds segments to the Segments collection, but does not turn the segments ON.

**VB Syntax**  

```vb
segs.Add (item, [size])
```

- `segs`  A segments collection *(object)*
- `item`  *(variant)* Number of the new segment. If it already exists, a new segment is inserted at the requested position.
- `size`  *(long integer)* Optional argument. The number of segments to add, starting with `item`. If unspecified, value is set to 1.

**Return Type**  None

**Default**  None

**Examples**  

```vb
Segs.Add 1, 4 'Adds segments 1, 2, 3, and 4. (does NOT automatically turn segments ON)
```

**C++ Syntax**  

```c++
HRESULT Add(VARIANT index, long size);
```

**Interface**  ISegments

**Remarks**  To ensure predictable results, it is best to remove all segments before defining a segment list. For each segment in the collection, do a `seg.Remove`. 
### Add (External Device) Method

**Description**  
Adds an external device to the system. This is the same as clicking the **New** button and editing the name on the Configure an External Device dialog.  

Upon creation, all settings on the new device are set to the defaults. The device is not active until set using `Ext.Dev.Active`.

**VB Syntax**  
`extDevices.Add name`

**Variable**  
*(Type)* - Description

- `extDevices`  
  An `ExternalDevices` *(collection)*
- `name`  
  *(String)* - Name of the new external device.

**Return Type**  
Not Applicable

**Default**  
Not Applicable

**Examples**  
`extDevices.Add 'MySource'`  
*Creates a new external device*

**C++ Syntax**  
`HRESULT Add (BSTR name)`

**Interface**  
`IExternalDevices`
### Add (GuidedPowerSensors) Method

<table>
<thead>
<tr>
<th>Description</th>
<th>Adds a power sensor name and item number to be used during a source power calibration. Use when multiple power sensors are to be used to calibrate the entire frequency span. The Name is used to recognize the sensor in the User Interface.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Item numbers in the GuidedCalibrationPowerSensors collection are used to refer to the power sensor remotely. Use the Count Property to return the number of power sensor items that are configured for use on the channel.</td>
</tr>
<tr>
<td></td>
<td>The port number to be calibrated is set using the PerformPowerCalibration Property.</td>
</tr>
<tr>
<td>VB Syntax</td>
<td><code>sensors.Add (name)</code></td>
</tr>
<tr>
<td>Variable</td>
<td><strong>sensors</strong> (Type) - Description</td>
</tr>
<tr>
<td></td>
<td><strong>name</strong> (String) - Name of the power sensor to add. The power sensor must be already configured as a PMAR device using this name. Learn how to remotely configure a PMAR device.</td>
</tr>
<tr>
<td>Return Type</td>
<td>Not Applicable</td>
</tr>
<tr>
<td>Default</td>
<td>Not Applicable</td>
</tr>
<tr>

</tr>
<tr>
<td><code>model</code></td>
<td>(String) Model of the testset to be added, NOT case-sensitive.</td>
</tr>
</tbody>
</table>

There is no COM command to read a list of currently-supported test sets. However, the following SCPI command can be used with the following format:

```vbnet
string = SCPIStringParser.Execute("SENSe:MULTiplexer:CATalog?")
```

<table>
<thead>
<tr>
<th><strong>address</strong></th>
<th>(Integer) Address of the testset to be added.</th>
</tr>
</thead>
</table>

| **Return Type** | Not Applicable |
| **Default** | Not Applicable |

| **Examples** | `testsets.Add("Z5623AK66",12) ' add Z5623AK66 test at address 12 to testsets collection` |

See an example program

| **C++ Syntax** | HRESULT Add(BSTR typename, long address) |
| **Interface** | IExternalTestsets |
AddPowerCalRange Method

<table>
<thead>
<tr>
<th>Description</th>
<th>This command adds a power cal range for a specific port &lt;n&gt;. Note that external sources are valid and specifying a source port is the same as remote commands. By default this will create a range with the preset start/stop frequency and 201 points. The maximum number of ranges that can be added is 100 (same as the maximum number of segments).</th>

<td><code>IIndependentPowerCalibrationPort</code></td>
</tr>
</tbody>
</table>
### AddSegment Method

**Description**  
Adds the specified number of segments to the scratch mixer at the index position. All segments are added with default settings.

**VB Syntax**  
`conv.AddSegment index,count`

**Variable**  
<table>
<thead>
<tr>
<th>(Type) - Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>conv</code></td>
</tr>
<tr>
<td><code>index</code></td>
</tr>
<tr>
<td><code>count</code></td>
</tr>
</tbody>
</table>

**Return Type**  
Not Applicable

**Default**  
Not Applicable

**Examples**  
`mxr.AddSegment 1,5 'Adds 5 segments beginning at the first position.`

See example program

**C++ Syntax**  
`HRESULT AddSegment(long index, long count);`

**Interface**  
IConverter5
## AllowAllEvents Method

<table>
<thead>
<tr>
<th>Description</th>
<th>Sets event filtering to monitor all events in the analyzer. This is the default setting when subscribing to events. This could slow the measurement speed of the analyzer significantly.</th>
</tr>

</tr>
<tr>
<td><strong>C++ Syntax</strong></td>
<td><code>HRESULT AllowAllEvents()</code></td>
</tr>
<tr>
<td><strong>Interface</strong></td>
<td>IApplication</td>
</tr>
</tbody>
</table>
### AllowChannelToSweepDuringCalAcquisition Method

**Description**
Specifies the channel to sweep during a Calibration.

When this command is sent, the `SwpChan` channel is 'flagged' to be swept during calibration. The flag is cleared when the channel is deleted, if the Measurement Class is changed, or if all measurements are deleted from the channel. If the same channel number is recreated, this command must be sent again to sweep the channel during a calibration. The flag is NOT saved with an instrument state.

A Preset or Instrument State Recall deletes the channel.

**VB Syntax**

```vb
calMgr.AllowChannelToSweepDuringCalAcquisition (CalChan, SwpChan, State)
```

**Variable (Type) - Description**

- **`calMgr` (object)** - A `CalManager` object
- **`CalChan` (long)** - Channel to be calibrated.
- **`SwpChan` (long)** - The channel to sweep when waiting to measure a standard.
- **`state` (Boolean)** - Channel sweep state. Choose from:
  - **True** - Sweep the channel during calibration.
  - **False** - Do NOT sweep the channel during calibration.

**Return Type**
Not Applicable

**Default**
Not Applicable

**Example**

```vb
calMgr.AllowChannelToSweepDuringCalAcquisition 2,1,True
```

See example using this command

**C++ Syntax**

```c++
HRESULT AllowChannelToSweepDuringCalAcquisition ( long CalChannel, long SwpChannel, VARIANT_BOOL bVal);
```

**Interface**
ICalManager5
AllowEventCategory Method

**Description**
Sets event filtering to monitor a category of event.

**VB Syntax**
`app.AllowEventCategory, category, state`

**Variable**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>app</td>
<td>An Application (object)</td>
</tr>
<tr>
<td>category</td>
<td>Category to monitor. Choose from list in Working with the Analyzer's Events</td>
</tr>
<tr>
<td>state</td>
<td>(boolean)</td>
</tr>
<tr>
<td></td>
<td>True - monitor</td>
</tr>
<tr>
<td></td>
<td>False - do not monitor</td>
</tr>
</tbody>
</table>

**Return Type**
Not Applicable

**Default**
Not Applicable

**Examples**
`app.AllowEventCategory`

**C++ Syntax**
`HRESULT AllowEventCategory(tagNAEventCategory category, VARIANT_BOOL bAllow )`

**Interface**
IApplication
AllowEventMessage Method

Description  Sets event filtering to monitor specific events.

VB Syntax  

\[ app.\text{AllowEventMessage} \text{ event} \]

Variable  

(Type) - Description

\( app \)  An Application (object)

\( event \)  Event to monitor. Refer to list in Working with the Analyzer's Events

\( state \)  (boolean)

True - monitor

False - do not monitor

Return Type  Not Applicable

Default  Not Applicable

Examples  

\[ app.\text{AllowEventMessage} \]

C++ Syntax  

\[
\text{HRESULT AllowEventMessage( tagNAEventID eventID, VARIANT_BOOL bAllow) }
\]

Interface  IApplication
### AllowEventSeverity Method

**Description**  
Sets event filtering to monitor levels of severity.

**VB Syntax**  
```vb
app.AllowEventSeverity severity, state
```

**Variable (Type) - Description**

- `app` An Application (object)
- `severity` (enum `naEventSeverity`)  
  - Choose from: `naEventSeverityERROR`
  - `naEventSeverityINFORMATIONAL`
  - `naEventSeveritySUCCESS`
  - `naEventSeverityWARNING`
- `state` (boolean)  
  - `True` - monitor
  - `False` - do not monitor

**Return Type**  
Not Applicable

**Default**  
Not Applicable

**Examples**  
`app.AllowEventSeverity`

**C++ Syntax**  
```cpp
HRESULT AllowEventSeverity(tagNAEventSeverity severity, VARIANT_BOOL bAllow)
```

**Interface**  
IApplication
## Apply Method

<table>
<thead>
<tr>
<th>Description</th>
<th>Applies the mixer setup and turns the channel ON. (Performs the same function as the Apply button on the mixer setup dialog box.) Learn about the Scratch and Applied mixer properties</th>

ApplyDeltaMatchFromCalSet Method

Description

Specifies a Cal Set as a source of delta match correction.

If ‘GUID’ is not supplied then the Global Delta Match Cal Set is assumed. An error is returned if the specified Cal Set does not meet the following Delta Match criteria. The Global Delta Match Cal can ALWAYS be applied.

- Must have been performed using ECal or as a guided mechanical cal (not Unguided).
- Must have the same start freq, stop freq, and number of points as the channel being calibrated.
- Must calibrate the ports that are required by the TRL or Unknown Thru Cal as indicated by PortsNeedingDeltaMatch Property.

Learn more about Delta Match calibration.

VB Syntax

guided.ApplyDeltaMatchFromCalSet [GUID]

Variable (Type) - Description

**guided** GuidedCalibration (object)

**GUID** Optional Argument. GUID of the Cal Set to use. If unspecified, the Global Delta Match Cal Set is used.

Return Type Not Applicable

Default Not Applicable

Examples

```vbnet
guided.ApplyDeltaMatchFromCalSet "{2B893E7A-971A-11d5-8D6C-00108334AE96}"
```

C++ Syntax

HRESULT ApplyDeltaMatchFromCalSet(BSTR calsetGUID);

Interface IGuidedCalibration2
# ApplyPowerCorrectionValuesEx Method

**Description**

This command replaces `ApplyPowerCorrectionValues Method`. Applies the array of power correction values to the channel memory and turns correction ON. Perform after completing a source power cal acquisition sweep.

This command does NOT save the correction values. To save correction values, save an instrument / calibration state (*.cst file) after performing a source power cal.

 Optionally, as part of the source power calibration, perform calibration of the reference receiver used in the power calibration. Learn more.

**VB Syntax**

```vbnet
powerCalibrator.ApplyPowerCorrectionValuesEX [rRec]
```

**Variable (Type) - Description**

- `powerCalibrator` *(object)* - A `SourcePowerCalibrator` object
- `rRec` *(Enum as NASourcePowerApplyCorrectionOption)* Optional argument. Choose from:
  - **0 - naSourcePowerApplyCorrectionDefault** Do NOT perform and save a calibration of the reference receiver. (Default if not specified).
  - **1 - naIncludeReferenceReceiverPowerCal** Perform and save a calibration of the reference receiver. The Cal Set, which includes only the reference receiver cal, is saved to the destination specified by `RemoteCalStoragePreference`.

**Return Type**

None

**Default**

Not Applicable

**Examples**

```vbnet
powerCalibrator.ApplyPowerCorrectionValuesEX
powerCalibrator.ApplyPowerCorrectionValuesEX (naIncludeReferenceReceiverPowerCal)
```

**C++ Syntax**

```cpp
HRESULT ApplyPowerCorrectionValuesEx(enum NASourcePowerApplyCorrectionOption option);
```

**Interface**

`ISourcePowerCalibrator`
About Source Power Calibration

ApplySourcePowerCalibrationTo Method

Description
Copies and applies an existing Source Power Calibration to another channel.

VB Syntax
`chan.ApplySourcePowerCalibrationTo (fromPortNum, targetChan, targetPortNum);`

Variable (Type) - Description
- `chan` - A Channel (object)
- `fromPortNum` - (Long) Port number of the existing source power correction.
- `targetChan` - (Long) Channel number to which the source power correction will be copied.
- `targetPortNum` - (Long) Port number to which the source power correction will be applied.

Return Type
Not Applicable

Default
Not Applicable

Examples
`chan.ApplySourcePowerCalibrationTo 1, 2, 1`

C++ Syntax
`HRESULT ApplySourcePowerCalibrationTo (long fromPortNumber, long otherChannelNumber, long portNumber);`

Interface
IChannel11
AssignSourceToRole Method

Description
Assigns a configured source to the specified role.

Use chan.RoleDevice for non-converter channels.

VB Syntax
conv.AssignSourceToRole role, source

Variable (Type) - Description
conv A Converter Object
role (String) Role to which the external source is assigned. Choose from:

For IMDX and IMSX, choose from:
"RF2"
"LO1"
"LO2"

For all other converter applications, choose from:
"LO1"
"LO2"

source (String) Source name from Source Configuration dialog.

Return Type Not Applicable
Default Not Applicable

Examples conv.AssignSourceToRole "LO1", "LO1Name"

C++ Syntax HRESULT AssignSourceToRole(BSTR roleID, BSTR deviceName);

IFixturing2
AutoPortExtReset Method

Description: Clears old port extension delay and loss data in preparation for acquiring new data. Send this command prior to sending a new series of measurements using AutoPortExtMeasure Method. If acquiring both OPEN and SHORT standards, do not send this command between those acquisitions.

VB Syntax: `fixture.AutoPortExtReset`

Variable: `(Type) - Description`

- `fixture`: A `Fixturing (object)`

Return Type: Not Applicable

Default: Not Applicable

Examples: `fixture.AutoPortExtReset`

C++ Syntax: `HRESULT AutoPortExtReset();`

Interface: `IFixturing2`
## Autoscale Method

<table>
<thead>
<tr>
<th>Description</th>
<th>Trace Object - Autoscales only the ONE trace on which Autoscale is being called.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>NAWindow Object - Scales ALL of the traces to fit in the same window. This is equivalent to &quot;Autoscale All&quot; from the front panel.</td>
</tr>
<tr>
<td></td>
<td>Autoscale (both trace and window) behaves differently when scale coupling is enabled. How it behaves depends on the scale coupling method. Learn more.</td>
</tr>
</tbody>
</table>

### VB Syntax

```vbnet
object.Autoscale
```

### Variable

- **(Type)** - Description
- **object**  
  - Trace *(object)*
  - or
  - NAWindow *(object)*

### Return Type

Not Applicable

### Default

Not Applicable

### Examples

- Trac.Autoscale 'Autoscales the trace
- Win.Autoscale 'Autoscales all the traces in the window

### C++ Syntax

```cpp
HRESULT AutoScale()
```

### Interface

INAWindow
ITrace
## AveragingRestart Method

# BuildHybridKit Method

**Description**
Use this method when you have different port connectors. This is a convenient way to combine two kits that match the connectors on your DUT.

**VB Syntax**
```vb
app.BuildHybridKit port1Kit, p1sex, port2Kit, p2sex, adapter, user kit
```

**Variable**

<table>
<thead>
<tr>
<th>Variable</th>
<th>(Type)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>app</code></td>
<td>object</td>
<td>An Application</td>
</tr>
<tr>
<td><code>port1Kit</code></td>
<td>enum NACalKit</td>
<td>Specifies the two kits to be used to build the hybrid kit. Choose from:</td>
</tr>
<tr>
<td><code>port2Kit</code></td>
<td></td>
<td>Choose from:</td>
</tr>
<tr>
<td><code>p1sex</code></td>
<td>enum NAPortSex</td>
<td>Specifies the sex of the connector at that port. Choose from:</td>

<tr>
<td><code>p2sex</code></td>
<td></td>
<td></td>
</tr>
<tr>
<td><code>adapter</code></td>
<td>enum NAAdapter</td>
<td>Choose from:</td>
</tr>
<tr>
<td><code>userKit</code></td>
<td>enum NACalKit</td>
<td>The Hybrid kit - Choose from the previous list of kits</td>
</tr>
</tbody>
</table>

**Return Type**
Not Applicable

**Default**
Not Applicable

**Examples**
```vb
app.BuildHybridKit
naCalKit_85033E_3_5, naMale, naCalKit_85038A_7_16,
naFemale, naUserkit, naCalKit_User8
```
C++ Syntax

HRESULT BuildHybridKit(tagNACalKit port1Kit, tagNAPortSex port1Sex, tagNACalKit port2Kit, tagNAPortSex port2Sex, tagNAAdapter adapter, tagNACalKit userKit)

Interface

IApplication
### CalculateErrorCoefficients Method

**Description**
This method is the final call in a calibration process. It calculates error-correction terms, turns error-correction ON and saves the error-correction terms to the channel’s Cal Register or a User Cal Set.

Do NOT use this command during an ECAL.

**Note:** The destination (Cal Register or User Cal Set) is determined by the setting of the RemoteCalStoragePreference property.

**VB Syntax**
```
cal.CalculateErrorCoefficients
```

**Variable (Type) - Description**
- **cal** Calibrator (object)

**Return Type**
Not Applicable

**Default**
Not Applicable

**Examples**
```
Cal.CalculateErrorCoefficients
```

**C++ Syntax**
```
HRESULT CalculateErrorCoefficients()
```

**Interface**
ICalibrator
#### Calculate Method

**Description**
Calculates the Input or Output frequencies of the mixer setup, applies the mixer setup to the mixer object, and turns the channel ON.

**Note:** There is also a Calculate Method on the Converter Object

**VB Syntax**

\[
\text{obj}.\text{Calculate} \ (\text{port})
\]

**Variable**

Type - Description

- **obj**  A Mixer Interface pointer to the Measurement (object)
- **port** (enum as MixerCalculation) Port of the mixer for which to calculate start and stop frequencies. Choose from:

<table>
<thead>
<tr>
<th>enum</th>
<th>1st or only stage requires:</th>
<th>In addition, 2nd stage requires:</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>

### ChangeParameter Method

<table>
<thead>
<tr>
<th>Description</th>
<th>Changes the parameter of the measurement.</th>
</tr>
</thead>
<tbody>
<tr>
<td>VB Syntax</td>
<td><code>meas.ChangeParameter(param,src)</code></td>
</tr>
<tr>
<td>Variable</td>
<td>(Type) - Description</td>
</tr>
<tr>
<td>meas</td>
<td>A Measurement (object)</td>
</tr>
<tr>
<td>param</td>
<td>(string) - New parameter. Case insensitive.</td>
</tr>
</tbody>
</table>

For **S-parameters and Applications parameters**:

Single-digit port numbers can be separated by "_" (underscore). For example: "S21" or "S2_1"

Double-digit port numbers MUST be separated by underscore. For example: "S10_1"

For **Ratioed receiver measurements**:

Any two receivers in your VNA separated by "/". For example: "A/R1"

See the block diagram showing the receivers in YOUR VNA.

For **Unratioed (absolute power) measurements**:

Any receiver in the VNA. For example: "A"

See the block diagram showing the receivers in YOUR VNA.

**Ratioed** and **Unratioed** measurements can also use **logical receiver notation** to refer to receivers. This notation makes it easy to refer to receivers with an external test set connected to the VNA. You do not need to know which physical receiver is used for each test port. Learn more.

For **ADC measurements**

Any ADC receiver in the VNA.

For example: "AI1" indicates the Analog Input1.

Learn more about ADC receiver measurements.

For **Balanced S-parameter measurements**:
"topology:Sabxy"

topology - Choose from:

- **sbal** - single-ended to balanced
- **ssb** - single-ended / single-ended to balanced
- **bbal** - balanced to balanced

Sabxy -

Where

- **a** - device output (receive) mode
- **b** - device input (source) mode

(choose from the following for both a and b:)

- **d** - differential
- **c** - common
- **s** - single ended

- **x** - device output (receive) logical port number
- **y** - device input (source) logical port number

For example: "sbal:sdd42"

See an example program

For Imbalance and Common Mode Rejection measurements:

"topology:parameter" Choose from:
<table>
<thead>
<tr>
<th>Choose this:</th>
<th>To get this:</th>
<th>Parameter</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;SBAL:IMBSB&quot;</td>
<td>single-ended to balanced</td>
<td>imbalance</td>
</tr>
<tr>
<td>&quot;SBAL:CMRRSB1&quot;</td>
<td>single-ended to balanced</td>
<td>common mode rejection (Sds21/Scs21)</td>
</tr>
<tr>
<td>&quot;SBAL:CMRRSB2&quot;</td>
<td>single-ended to balanced</td>
<td>common mode rejection (Ssd12/Ssc12)</td>
</tr>
<tr>
<td>&quot;SSB:IMB1SSB&quot;</td>
<td>single-ended / single-ended to balanced</td>
<td>imbalance</td>
</tr>
<tr>
<td>&quot;SSB:IMB2SSB&quot;</td>
<td>single-ended / single-ended to balanced</td>
<td>imbalance</td>
</tr>
<tr>
<td>&quot;SSB:CMRRSSB1&quot;</td>
<td>single-ended / single-ended to balanced</td>
<td>common mode rejection (Sds31/Scs31)</td>
</tr>
<tr>
<td>&quot;SSB:CMRRSSB2&quot;</td>
<td>single-ended / single-ended to balanced</td>
<td>common mode rejection (Sds32/Scs32)</td>
</tr>
<tr>
<td>&quot;BBAL:IMB1BB&quot;</td>
<td>balanced to balanced</td>
<td>imbalance</td>
</tr>
<tr>
<td>&quot;BBAL:IMB2BB&quot;</td>
<td>balanced to balanced</td>
<td>imbalance</td>
</tr>
<tr>
<td>&quot;BBAL:CMRRBB&quot;</td>
<td>balanced to balanced</td>
<td>common mode rejection (Sdd21/Scc21)</td>
</tr>
</tbody>
</table>

**src** (long integer)

- Ignored if `param` is an S-Parameter

- Source port if `param` is a ratioed or unratioed receiver measurement (including ADC measurements).

**Note:** If the port is defined by a string name, such as an external source, a balanced port, or one of the Source outputs on the 2-port VNA-x model with multiple sources, then you must use `chan.getPortNumber` to translate the string.
into a port number. To learn more see Remotely Specifying a Source Port.

Return Type  Not Applicable
Default       Not Applicable
Examples
meas.ChangeParameter "S11",2 '2 is ignored
meas.ChangeParameter "VC21",1 '1 is ignored
meas.ChangeParameter "A/R1",2 '2 is the source port
meas.ChangeParameter "a1/b1",1 '1 is the source port
meas.ChangeParameter "R1",2 '2 is the source port

'to change to a parameter with a string name
Dim app
Set app = CreateObject("Agilentpna835x.application")
Dim capabilities
Set capabilities = app.Capabilities
Dim portnum
Portnum = Capabilities.GetPortNumber("Src2 Out1")
App.activemeasurement.ChangeParameter "A", portnum

C++ Syntax HRESULT ChangeParameter (BSTR parameter, long lPort)
Interface IMeasurement
CheckPower Method

**Description**
Measures power at a specified frequency. Use this method to test power level before and/or after applying a source power calibration.

**VB Syntax**
```vbnet
pow = pwrCal.CheckPower(device, freq [,unit])
```

**Variable**
- **pow** *(double)* Variable to store power value returned by this method.
- **pwrCal** *(SourcePowerCalibrator)*
- **device** *(enum NAPowerAcquisitionDevice)* The specific sensor on the power meter to be used for the acquisition. Choose from:
  - 0 – naPowerSensor_A
  - 1 – naPowerSensor_B

To use the sensor that currently corresponds to the frequency of interest, use the value from the `PowerAcquisitionDevice` property.

- **freq** *(double)* Frequency (Hz) at which the sensor is to read the power.

- **unit** *(enum NAPowerUnit)* Optional argument. Choose from:
  - `naDBM` – Returns the power in dBm. (default)
  - `naWATT` – Returns the power in Watts.

**Return Type**
Double

**Default**
Not Applicable

**Examples**
```vbnet
watt = powerCalibrator.CheckPower(naPowerSensor_A, 1E9, naWATT)
```

**C++ Syntax**
```cpp
HRESULT put_CheckPower(tagNAPowerAcquisitionDevice enumAcqDevice, double dFreq, tagNAPowerUnit enumPowerUnit, double *pdPower);
```

**Interface**
ISourcePowerCalibrator2
## Clear Method

</tr>
</tbody>
</table>
CloseCalSet Method  **Superseded**

**Description**
This command is no longer necessary. The CalSet.get... and put... commands that required this command have been replaced.

Closes read/write access to the Cal Set.

See OpenCalSet for an explanation of gaining access to the Cal Set.

When you are finished reading and writing data from or to the Cal Set, close the Cal Set. Subsequent read/writes will require a new OpenCal Set call.

Reading and writing Cal Set data is performed with the PutStandard, GetStandard, PutErrorTerm, GetErrorTerm method calls. These methods are provided by the ICal Set and ICalData2 interfaces.

**VB Syntax**
```vbnet
CalSet.CloseCalSet
```

**Variable**  
(Type) - Description

*CalSet*  
(object) - A Cal Set object

**Return Type**  
Not Applicable

**Default**  
Not Applicable

**Examples**

CSet.CloseCalSet

**C++ Syntax**
```cpp
HRESULT CloseCalSet
```

**Interface**  
ICalSet
## Close Method

**Description**  Closes the specified remote VISA session. VISA sessions should always be closed when you are finished communicating with the remote device. Use this command to close (end) each VISA session that was opened successfully using the Open method. If you have more than one open session, and need to close them all at the same time, it may be faster and easier to use the Reset method.

**VB Syntax**  

```vbnet
Vpassthru.Close visaID
```

**Variable (Type) - Description**

- **Vpassthru**  *(object)* - A VISAPassthrough object
- **visaID**  *(long)* - VISA session number (see Open method).

**Return Type**  Not Applicable

**Default**  Not Applicable

**Examples**  

```vbnet
Vpassthru.Close 2
```

**C++ Syntax**  

```cpp
HRESULT Close(long session_num)
```

**Interface**  IVISAPassthrough
About Cal Sets

**ComputeErrorTerms Method**

<table>
<thead>
<tr>
<th>Description</th>
<th>Computes error terms for the caltype specified by a preceding OpenCal Set call.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>The Cal Set must first be opened using OpenCalSet. If this call has not been made, the following error is issued:</td>
</tr>
<tr>
<td></td>
<td>E_NA_Cal Set_ACCESS_DENIED</td>
</tr>
<tr>
<td></td>
<td>The standards data required for the CalType must be available in the Cal Set or this error will be returned: E_NA_STANDARD_NOT_FOUND.</td>
</tr>
</tbody>
</table>

**Note:** Error term computation requires data for the actual calibration kit standards from the current kit definition. ComputeErrorTerms assumes that the standards were acquired using only one standard per class.

**VB Syntax**  
`CalSet.ComputeErrorTerms`

**Variable**  
- **CalSet** (object) - A Cal Set object

**Return Type**  
Not Applicable

**Default**  
Not Applicable

**Examples**  
`CalSet.ComputeErrorTerms`

**C++ Syntax**  
`HRESULT ComputeErrorTerms()`  
**Interface**  
ICalSet
**ConfigEnhancedNB2 Method**

**Description**

Note: This command replaces ConfigEnhancedNB Method.

This subroutine determines, then returns, the proper configuration for pulsed measurements on the PNA-X ONLY using the spectral nulling technique. The configuration returned needs to be sent to the VNA and any other related external equipment.

The routine will take a desired Pulse Repetition Frequency (PRF) and measurement IFBW and return a possibly modified PRF and IFBW for proper pulsed operation on the VNA.

Note: If an error is returned suggesting that nulling has not been found, add a small offset to the PRF (for example, 2.1 MHz instead of 2 MHz) or set Fixed PRF to False.

**VB Syntax**

```vbnet
Pulsed.ConfigEnhancedNB2 (PRF, BW, PhysicalIF, NCO, ClockFreq, Stage1TapArray, Stage2TapArray, Stage3TapArray, FixedPRF, GateDelay, GateWidth, SWGateDelay, SWGateWidth, SWGateRamp)
```

**Variable**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pulsed</td>
<td>(interface) An interface to the agilentpnapulsed.dll application interface.</td>
</tr>
<tr>
<td>PRF</td>
<td>(Double) The Pulse Repetition Frequency.</td>
</tr>
<tr>

<td>[out] The pulse repetition frequency that has been optimized for use with the</td>
</tr>
<tr>
<td></td>
<td>VNA. NOTE: This value may be different from the value requested.</td>
</tr>
<tr>
<td></td>
<td>[in] The desired pulse repetition frequency.</td>
</tr>
<tr>
<td>BW</td>
<td>(Long) The VNA IF Bandwidth.</td>
</tr>
<tr>
<td></td>
<td>[out] The VNA IF bandwidth that has been optimized for use with the VNA.</td>
</tr>
<tr>
<td></td>
<td>NOTE: This value may be different from the value requested. Zero (0) is</td>
</tr>
<tr>
<td></td>
<td>returned if no solution is found for the specified PRF and BW.</td>
</tr>
<tr>
<td></td>
<td>[in] The desired VNA IF bandwidth.</td>
</tr>
<tr>
<td>PhysicalIF</td>
<td>(Double)</td>
</tr>
<tr>
<td></td>
<td>[out] Returns physical intermediate frequency.</td>
</tr>
</tbody>
</table>
NCO (Double)

[out] Returns numeric controlled oscillator frequency.

ClockFreq (Double)

[out] Returns the clock frequency (in Hz) of the PNA-X.

Stage1TapArray (Long array)

[out] Returns the stage 1 filter coefficients

Stage2TapArray (Long array)

[out] Returns the stage 2 filter coefficients

Stage3TapArray (Long array)

[out] Returns the stage 3 filter coefficients

FixedPRF (Boolean)

[in]

- 1 (True) Signals the .DLL routine to NOT adjust the PRF value; rather adjust ONLY the IF Bandwidth. This is the default setting.
- 0 (False) Adjust both the PRF and IF Bandwidth values as necessary.

GateDelay (Double)

[in] Highest delay value in seconds used in any of the receiver gates.

GateWidth (Double)

[in] Widest pulse width value in seconds used in any of the receiver gates.

SWGateDelay (Double)

[out] Returns the SW gate delay in seconds.

SWGateWidth (Double)

[out] Returns the SW Gate width in seconds.

SWGateRamp (Long)

[out] Returns the SW Gate ramp

ReturnType Not Applicable

Default Not Applicable
Example  See an example using this command.

**C++ Syntax**

```c++
HRESULT ConfigEnhancedNB2(double *pPRF, long *pBW, double *pIF, double *pNCO, double *clock, double *pStg1, double *pStg2, double *pStg3, VARIANT_BOOL fixPRF, double gateDelay, double gateWidth, double *SWgateDelay, double *SWgateWidth, long *SWgateRamp)

ConfigNarrowBand3 Method

Description

Note: This method replaces ConfigNarrowBand2 Method. The BW argument now returns 0 if no solution is found for the specified PRF and BW. In addition, adjustments were made to the filter finder algorithm.

This subroutine determines, then returns, the proper configuration for pulsed measurements on the VNA using the spectral nulling technique. The configuration returned needs to be sent to the VNA and any other related external equipment such as pulse generators. The routine will take a desired Pulse Repetition Frequency (PRF) and measurement IFBW and return a possibly modified PRF and IFBW for proper pulsed operation on the VNA. The routine will also return the Sample Rate, Number of Taps, and Offset that must be sent to the VNA to configure it in pulsed mode using the spectral nulling technique.

Although the example below uses COM programming to communicate with the VNA, these commands can be replaced with SCPI equivalents.

Note: The pulsed application may set the offset frequency (option S93080A/B) of the VNA to some value other than zero (the default value). If the stop frequency is set to the maximum of the VNA model, then an error message may appear on the VNA stating that the response frequency has exceeded the maximum allowed frequency. To fix this, set the stop frequency to a value that is at least 2 KHz less than the maximum allowed.

For example, if you have a 20 GHz VNA, and the stop frequency is set to 20 GHz, and the error message appears, then set the stop frequency to 19.999998 GHz.

VB Syntax

Pulsed ConfigNarrowBand (PRF, NumTaps, BW, OffSet, SampleRate, Precision, FixedPRF, PG81110)

Variable (Type) - Description

Pulsed (interface) An interface to the agilentpnapulsed.dll application interface.

PRF (Double) The Pulse Repetition Frequency.

[out] The pulse repetition frequency that has been optimized for use with the VNA. NOTE: This value may be different from the value requested.

[in] The desired pulse repetition frequency.

NumTaps (Long) The number of taps to send to the VNA for pulsed operation.
**BW** *(Long)* The VNA IF Bandwidth.

[out] The VNA IF bandwidth that has been optimized for use with the VNA. NOTE: This value may be different from the value requested. Zero (0) is returned if no solution is found for the specified *PRF* and *BW*.

[in] The desired VNA IF bandwidth.

**Offset** *(Double)* The offset value to send to the VNA for pulsed operation. The offset value is used to adjust the VNA for the two different possible sample rates that may be returned.

**SampleRate** *(Double)*

[out] The sample rate to send to the VNA for pulsed operation.

[in] Passing a value of 6.2 us will make sure that the offset frequency is not shifted and therefore could be used with converter measurements. Otherwise enter 0.

**Precision** *(Double)* The precision variables sets the precision that will be used to decrement the PRF when running the configuration routines. This variable can be set to the precision required by the external pulse generators so that the configuration routine will not return a PRF that is not within the precision limits of the pulse generators.

**FixedPRF** *(Boolean)*

1 (True) Signals the .DLL routine to NOT adjust the PRF value; rather adjust ONLY the IF Bandwidth. This is the default setting.

0 (False) Adjust both the PRF and IF Bandwidth values as necessary.

**PG81110** *(Boolean)*

1 (True) You are using an Keysight 81110 as the pulse generator. This allows increased accuracy in adjustments for offset and PRF.

0 (False) Not using an Keysight 81110.

**Return Type** Not Applicable

**Default** Not Applicable

**Example** Removed example from help file.

**C++ Syntax**

HRESULT ConfigNarrowBand(double *pPRF, long *pNumTaps, long *pBW, double *pOffset, double *pSampleRate, int Precision)

**Interface** AgilentPNAPulsed.Application
## Configure Method

**Description**
Restarts as an "N-port" VNA using the specified multiport test set.

See other commands to configure multiport test sets.

**VB Syntax**
```vbnet
app.Configure (model, address)
```

**Variable**

<table>
<thead>
<tr>
<th>(Type)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>app</td>
<td>An Application (object)</td>
</tr>
<tr>
<td>model</td>
<td>String - Model of the test set with which to restart. Use &quot;Native&quot; to restart without a test set.</td>
</tr>
<tr>
<td>address</td>
<td>Integer - GPIB Address of the test set. Use 0 for native restart.</td>
</tr>
</tbody>
</table>

**Return Type**
Not Applicable

**Default**
Not Applicable

**Examples**

```vbnet
app.Configure ("N44xx",18)
```

**C++ Syntax**
```cpp
HRESULT Configure(BSTR model, long address);
```

**Interface**
IApplication10
## Continuous Method

<table>
<thead>
<tr>
<th>Description</th>
<th>The channel continuously responds to trigger signals.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Note:</strong></td>
<td>This command does <strong>NOT</strong> change TriggerSignal to Continuous.</td>
</tr>

</tbody>
</table>

**Copy Method**

**Description**
Creates a new Cal Set and copies the current Cal Set data into it. Therefore, you now have a clone Cal Set with a different ID. Use this command to manipulate data on a Cal Set without corrupting the original cal data.

**VB Syntax**

```
CalSet.Copy
```

**Variable**

- *(Type)* - Description
  - `CalSet` - A Cal Set object

**Return Type**
Not Applicable

**Default**
Not Applicable

**Examples**

```vbs
Dim mgr As CalManager
Dim ocalset As CalSet
Dim newcalset As CalSet
Set mgr = pna.GetCalManager

'Create a new (empty) Cal Set.
Set ocalset = mgr.CreateCalSet(1)
oCalset.Description = "original calset"
pna.Channel(1).SelectCalSet ocalset.GetGUID, True

'Launch the cal wizard and allow the user to perform the calibration.
If pna.LaunchCalWizard(False) Then
  'If the Launch returns true then the calibration finished.
  ocalset.Save

  'Copy the Cal Set to the new one.
  Set newcalset = ocalset.Copy
  newcalset.Description = "copy of original calset"
Else
  'If the cal doesn't finish, delete the old Cal Set
  'so it isn't taking up unnecessary memory.
  mgr.DeleteCalSet ocalset.GetGUID
End If
```

As a result, the programmer can manipulate the data in the new Cal Set and always revert back to the old Cal Set as needed.

**C++ Syntax**

```
HRESULT Copy( ICalSet** pCalSet);
```

**Interface**

ICalSet
CopyFrom Method

Description
Copies the mechanical switch and attenuator settings from the specified channel to the calling channel.

To avoid potential conflicts, all port couplings in the calling channel will be turned OFF and all port attenuator settings will be set to manual before copying the switch or attenuator settings. The two channels CAN be of different measurement classes.

Use CopyToChannel to copy ALL settings from one channel to another.

VB Syntax

```
pathConfig.CopyFrom (chanNum)
```

Variable (Type) - Description

| pathConfig | A PathConfiguration (object) |
| chanNum    | (long integer) Channel number to copy to the calling channel. |

Return Type
None

Default
Not Applicable

Examples

```
Dim chan, pathConfig
Set chan = app.ActiveChannel
Set pathConfig = chan.PathConfiguration
pathConfig.CopyFrom 2
```

C++ Syntax

```
HRESULT CopyFrom(long chanNum);
```

Interface
IPathConfiguration2

Last modified:

New topic
CopyToChannel Method

Description
Copies ALL settings from this channel to the specified channel.

Use CopyFrom to copy ONLY the mechanical switch and attenuator settings.

VB Syntax
`chan.CopyToChannel(lChanNum)`

Variable (Type) - Description

`chan` A Channel (object)

`IChanNum` (long integer) – Number of the channel to become a copy of <chan>.

Return Type
None

Default
Not Applicable

Examples
```vba
Dim chan
Set chan = PNAapp.ActiveChannel
chan.CopyToChannel 2
```

C++ Syntax
`HRESULT CopyToChannel(long lChanNum);`

Interface
IChannel2
# CreateS-Parameter Method

**Description**  
This method creates a new S-Parameter measurement in an existing or new window.

**VB Syntax**  
```vbnet
app.CreateSParameter chan,receiver,source,[window]
```

**Variable (Type) - Description**

<table>
<thead>
<tr>
<th>Variable</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>app</code></td>
<td>Application (object)</td>
<td></td>
</tr>
<tr>
<td><code>chan</code></td>
<td>long integer</td>
<td>Channel number of the new measurement</td>
</tr>
<tr>
<td><code>receiver</code></td>
<td>long integer</td>
<td>Port number of the receiver (1 or 2)</td>
</tr>
<tr>
<td><code>source</code></td>
<td>long integer</td>
<td>Port number of the source (1 or 2)</td>
</tr>
<tr>
<td><code>window</code></td>
<td>long integer</td>
<td>Optional argument. Window number of the new measurement. Choose 1 to 4. If unspecified, the S-Parameter will be created in the Active Window.</td>
</tr>
</tbody>
</table>

**Return Type**  
Not Applicable

**Default**  
Not Applicable

**Examples**

- `app.CreateSParameter 1,2,1,1` 'Creates a new S21 measurement in channel 1 and New window(1)
- `app.CreateSParameter 1,2,1` 'Creates a new S21 measurement in channel 1 and in the active window

**C++ Syntax**  
```cpp
HRESULT CreateSParameter(long ChannelNum, long RcvPort, long SrcPort, long windowNumber)
```

**Interface**  
IApplication
CreateCalSet Method

Description

Creates a new Cal Set.

The new cal set is initialized with the stimulus settings from the channel whose number is passed as the argument to this method. Stimulus settings include frequency, bandwidth, number of points, and so forth.

Use this method when you want to manually upload data to the Cal Set using the returned ICal Set interface handle.

The channel number does not restrict the usage of this Cal Set on any other channel. It simply provides a link to the originating channel so that the stimulus values can be stored in the Cal Set.

Note: Be sure to SAVE the CalSet you are creating. Use ICalSet::Save.

VB Syntax

```vbnet
calMgr.CreateCalSet(chan)
```

Variable

- **Type**: Description
- **calMgr**: (object) - A CalManager object
- **chan**: (long) - channel number of the new Cal Set.

Return Type

ICal Set Interface

Default

Not Applicable

Example

```
calMgr.CreateCalSet 1
```

C++ Syntax

```c
HRESULT CreateCalSet( long ChannelNumber, ICal Set** pCal Set);
```

Interface

ICalManager
### CreateCustomCal Method

**Description**
Creates a custom cal object.

**VB Syntax**
```vba
calMgr.CreateCustomCal(CalType)
```

**Variable (Type) - Description**
- `calMgr` Cal Manager (Object)
- `CalType` (String) Name of the calibration. Choose from:
  - "VMC" or "VectorMixerCal.VMCType"
  - "SMC" or "ScalarMixerCal.SMCType"

**See Also**
- SMCType Object
- VMCType Object

**Return Type**
Not Applicable

**Default**
Not Applicable

**Examples**
```vba
Dim CalMgr As ICalManager2
Dim SMC As ISMCType
Set SMC = CreateCustomCal("SMC")
```

See SMC and VMC examples using this command.

**C++ Syntax**
```cpp
HRESULT CreateCustomCal( BSTR CustomCal)
```

**Interface**
ICalManager2
CreateCustomCalEx Method

**Description**

Returns IGuidedCalibration for the specified channel.

With a handle to the IGuidedCalibration interface, you can query it for the following objects for properties appropriate to the calibration setup for the particular meastype (channel).

IGuidedCalibration interface is used to configure a calibration (specify connectors, cal kits, and so forth). It is also used to access any custom calibration properties required for unique application channels like Noise Figure or Gain Compression. To access these special properties, make this call on the IGuidedCalibration interface:

```
CustomInterface = IGuidedCalibration.CustomCalConfiguration();
```

The interface returned by this call can be used to set and get the custom properties on the following application cal objects:

- NoiseCal Object
- GainCompressionCal Object
- SweptIMDCal Object

**Note:** Use CreateCustomCal_Ex Method to create FCA calibration objects.

**VB Syntax**

calmgr.CreateCustomCalEx (chan)

**Variable (Type) - Description**

- `calMgr` Cal Manager (Object)
- `chan` (long integer) Channel number in which to create the Cal object.

**Return Type**

IGuidedCalibration

**Default**

Not Applicable

**Examples**

```vbnet
Dim guidedcal
Set guidedcal = CalManager.CreateCustomCalEx(1)
```

**See Also**

- Noise Figure example
- Gain Compression example
C++ Syntax  HRESULT CreateCustomCalEx(long channel, IDispatch** ppObject);

Interface  ICalManager5
**CreateCustomMeasurementEx Method**

**Description**
Creates a new custom measurement or a new 'standard' S-Parameter measurement.

**VB Syntax**
```vb
app.CreateCustomMeasurementEx chanNum, MeasClass, MeasName [, window]
```

**Variable (Type) - Description**
- **app** (object) - An Application object
- **chanNum** (long) - Channel number used by the new measurement; can exist or be a new channel.
- **MeasClass** (string) - Measurement class of the new custom measurement object. The Measurement Class must be installed and registered on the VNA.

Choose from the following (click or scroll down to view valid MeasNames for each MeasClass):

- "Standard"
- "Active Hot Parameters"
- "Vector Mixer/Converter"
- "Scalar Mixer/Converter"
- "Gain Compression"
- "Gain Compression Converters"
- "Modulation Distortion"
- "Noise Figure Cold Source"
- "Noise Figure Converters"
- Phase Noise
- "Swept IMD"
- "IM Spectrum"
- "Swept IMD Converters"
- "IM Spectrum Converters"
- "Differential I/Q"
**Spectrum Analyzer**

**MeasName** (variant) Measurement names to create:

<table>

</table>

**window** *(long)* Optional argument. Number of the window the new custom measurement will be placed in. Choose between 1 and the maximum number of windows allowed on the VNA.. If unspecified, the measurement is placed in the active window.

**Return Type** IMeasurement

**Default** Not Applicable

**Examples**

```
To create a scalar mixer measurement in channel 2:
Dim MyMeas as Agilent835x.Measurement
Set MyMeas = app.CreateCustomMeasurementEx (2, "Scalar Mixer/Converter", "SC21")
```
To create a vector mixer measurement in channel 2:
Dim MyMeas as Agilent835x.Measurement
Set MyMeas = app.CreateCustomMeasurementEx (2, "Vector Mixer/Converter", "VC21")

C++ Syntax
HRESULT put_CreateCustomMeasurementEx (long ChannelNum, BSTR guid, VARIANT initData, long windowNumber, IMeasurement** ppMeasurement );

Interface
IApplication3
CreateMeasurement Method

Description: Creates a new measurement.

VB Syntax: `app.CreateMeasurement chanNum, param, IPort[, window]`

<table>
<thead>
<tr>
<th>Variable</th>
<th>(Type) - Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>app</code></td>
<td>Application (object)</td>
</tr>
<tr>
<td><code>chanNum</code></td>
<td>(long) - Channel number of the new measurement; can exist or be a new channel</td>
</tr>
<tr>
<td><code>param</code></td>
<td>(string) - New parameter. Case insensitive.</td>
</tr>
</tbody>
</table>

For S-parameters:

- Any S-parameter that can be measured by your VNA.
- Single-digit port numbers can be separated by "_" (underscore). For example: "S21" or "S2_1"
- Double-digit port numbers MUST be separated by underscore. For example: "S10_1"

For Ratioed measurements:

- Any two receivers in your VNA separated by "/". For example: "A/R1"

See the block diagram showing the receivers in YOUR VNA.

For Unratioed (absolute power) measurements:

- Any receiver in the VNA. For example: "A"

See the block diagram showing the receivers in YOUR VNA

**Ratioed** and **Unratioed** measurements can also use **logical receiver notation** to refer to receivers. This notation makes it easy to refer to receivers with an **external test set** connected to the VNA. You do not need to know which physical receiver is used for each test port. Learn more.

For ADC measurements

- Any ADC receiver in the VNA.

For example: "AI1" indicates the Analog Input1.
Learn more about ADC receiver measurements.

For **Balanced S-parameter measurements**:

"topology: Sabxy"

**topology** - Choose from:

- **sbal** - single-ended to balanced
- **ssb** - single-ended / single-ended to balanced
- **bbal** - balanced to balanced

**Sabxy** -

Where

- **a** - device output (receive) mode
- **b** - device input (source) mode

(choose from the following for both a and b:)

- **d** - differential
- **c** - common
- **s** - single ended

- **x** - device output (receive) logical port number
- **y** - device input (source) logical port number

For example: "**sbal:sdd42**"

See an example program

For **Imbalance and Common Mode Rejection measurements**:

"topology: parameter" Choose from:
<table>
<thead>
<tr>

</table>

**IPort (long)**

- **Ignored** if `param` is an S-Parameter, balanced, imbalance, or CMRR parameter.
- **Source port** if `param` is ratioed or unratioed (including ADC) measurements.
- Use 0 for N5264B.

**Note:** If the port is defined by a string name, such as an external source, a
balanced port, or one of the Source 2 outputs on the 2-port 2-source VNA-x model, then you must use `chan.getPortNumber` to translate the string into a port number. To learn more see Remotely Specifying a Source Port.

**Deembed Method**

**Description**
De-embeds a fixture from an existing Cal Set based on an S2P file. A new Cal Set is created with the effects of the fixture removed.

When the new Cal Set is applied to a channel, the effects of the fixturing are removed from the measurement data. Do NOT enable fixturing. The effects of the fixture are removed when the new Cal Set is selected and correction is turned ON.

**VB Syntax**
```
calMgr.Deembed (cs1,cs2,s2p,port, compPwr,extrap)
```

**Variable (Type) - Description**
- **calMgr** *(object)* - A CalManager object
- **cs1** *(String)* - Name of an existing Cal Set which resides on the VNA.
- **cs2** *(String)* - Name of new Cal Set which contains updated error terms with fixture de-embedded.
- **s2p** *(String)* - Name of the S2P file which characterizes the adapter/fixture.
- **port** *(Long Integer)* - Port number from which fixture will be de-embedded.
- **compPwr** *(Boolean)*
  - **True** - When the Cal Set contains a power correction array for the fixture port, that array will be compensated for the fixture loss.
  - **False** - Do not compensate for loss in source power through the fixture.
- **extrap** *(Boolean)*
  - **True** - Applies a simple extrapolation when the S2P file has a narrower frequency range than the Cal Set. The values for the first and last data points are extended in either direction to cover the frequency range of the Cal Set.
  - **False** - Extrapolation is NOT performed (default setting).

**Return Type**
Not Applicable

**Default**
Not Applicable

**Example**
```
calMgr.Deembed
"MyCalSet","MyNewCalSet","Fixture.s2p",1,True,True
```
C++ Syntax    HRESULT Deembed (BSTR srcSet, BSTR destSet, BSTR s2p, long port, BOOL compPwr, BOOL extrap);

Interface    ICalManager8
# DefineParameter Method

**Description**  
Create a new parameter for Differential IQ channel. Use **CreateCustomMeasurementEx Method** to create a new trace with the new parameter.

Use **Change Parameter Method** to change the parameter of one of the existing traces to the new parameter.

**VB Syntax**  
```vbnet
DIQ.DefineParameter (name, expression)
```

**Variable**  
- **(Type)** - **Description**
  - **DIQ** (A DIQ Object)
  - **name** (String) Parameter name.

**Note:** Do not use underscores in the parameter name. For example, b2_f1 cannot be used as a parameter name. However, b2f1 is a valid parameter name.

**expression** (String) Parameter expression using receiver names and mathematical expressions.

**Return Type**  
Not Applicable

**Default**  
Not Applicable

**Examples**  
```vbnet
diq.DefineParameter "myNewParam","(a1_F1+b1_F2)/c1"
app.ActiveMeasurement.ChangeParameter "myNewParam",1
```

See example program

**C++ Syntax**  
```cpp
HRESULT DefineParameter(BSTR name,BSTR expression);
```

**Interface**  
IDIQ

<td>HRESULT DeleteAllSegments()</td>
</tr>
<tr>
<td>Interface</td>
<td>IConverter5</td>
</tr>
</tbody>
</table>
DeleteCalSet Method

**Description**
Deletes a Cal Set from the set of available Cal Sets. This method immediately updates the Cal Set file on the hard drive. If the Cal Set is currently being used by a channel or does not exist, this request will be denied and an error is returned.

Using the Cal Sets collection is a convenient way to manage Cal Sets.

**VB Syntax**
```vbnet
calMgr.DeleteCalSet (calset)
```

**Variable**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>calMgr</code></td>
<td>A CalManager object</td>
</tr>
<tr>
<td><code>calset</code></td>
<td>Cal Set to be deleted. Specify the Cal Set by GUID or Name. Use EnumerateCalSets to list the available Cal Sets by name.</td>
</tr>
</tbody>
</table>

**Return Type**
Not Applicable

**Default**
Not Applicable

**Example**
```vbnet
Set pna=CreateObject("AgilentPNA835x.Application")
Set cmgr = pna.GetCalManager
cmgr.DeleteCalSet ("MyCalSet")
```

**C++ Syntax**
```cpp
HRESULT DeleteCalSet( BSTR strCalset);
```

**Interface**
ICalManager
### DeleteConfiguration Method

**Description**
Deletes the specified configuration name from the VNA. The factory configurations cannot be deleted. This is the only method of programmatically distinguishing a factory configuration from a user-named configuration.

**VB Syntax**
```
pathMgr.DeleteConfiguration name
```

**Variable**
*Type* - Description

- `pathMgr` PathConfigurationManager *(object)*
- `name` *(String)* Configuration name to be deleted.

**Return Type**
Not Applicable

**Default**
Not Applicable

**Examples**
```
path.DeleteConfiguration "myMixer"
```

**C++ Syntax**
```
HRESULT StoreConfiguration (long channelNum, BSTR configName);
```

**Interface**
IPathConfigurationManager
### DeleteParameter Method

<table>
<thead>
<tr>
<th>Description</th>
<th>Deletes the named parameter.</th>
</tr>
</thead>
<tbody>
<tr>
<td>VB Syntax</td>
<td><code>DIQ.DeleteParameter(name)</code></td>
</tr>
<tr>
<td>Variable</td>
<td>(Type) - Description</td>
</tr>
<tr>
<td><code>DIQ</code></td>
<td>A DIQ Object</td>
</tr>
<tr>
<td><code>name</code></td>
<td>(String) Parameter name that was used when the parameter was created.</td>
</tr>
<tr>
<td>Return Type</td>
<td>Not Applicable</td>
</tr>
<tr>
<td>Default</td>
<td>Not Applicable</td>
</tr>
<tr>
<td>Examples</td>
<td><code>diq.DeleteParameter &quot;myNewParam&quot;</code></td>
</tr>
<tr>
<td>C++ Syntax</td>
<td>HRESULT DeleteParameter (BSTR name);</td>
</tr>
<tr>
<td>Interface</td>
<td>IDIQ</td>
</tr>
</tbody>
</table>
### DeleteSegment Method

**Description**  
Removes the specified number of segments from the scratch mixer starting at the index position.

**VB Syntax**  
`conv.DeleteSegment index,count`

**Variable** *(Type)* - Description
- **conv**  
  A Converter Object
- **index**  
  (Long integer) Position at which to start removing segments. Valid index range is between 1 and the current segment count. Use `SegmentCount Property` to read the current count in the Applied Mixer.
- **count**  
  (Long integer) Optional argument. Number of segments to remove. If unspecified, 1 segment is removed.

**Return Type**  
Not Applicable

**Default**  
Not Applicable

**Examples**  
`mxr.DeleteSegment 1,5 'Removes 5 segments beginning at the first position.`

See example program

**C++ Syntax**  
`HRESULT DeleteSegment(long index, long count);`

**Interface**  
IConverter5
# DeleteShortCut Method

**Description**  
Removes a macro from the list of macros in the analyzer. Does not remove the file.

**Note:** There are always 25 macro positions. They do not have to be sequential. For example, you can have number 7 but not numbers 1 to 6.

<table>
<thead>
<tr>
<th>VB Syntax</th>
<th>app.DeleteShortCut item</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Variable</strong></td>
<td></td>
</tr>
<tr>
<td>app</td>
<td>An Application (object)</td>

</tr>
</tbody>
</table>
About Cal Window

DisplayNAWindowDuringCalAcquisition Method

**Description**
Set the 'show' state of the window to be displayed during a calibration.

When this command is sent, the specified window is 'flagged' to be shown during calibration. The flag is cleared when the window is closed. A Preset or Instrument State Recall also closes the window. If the same window number is reopened, this command must be sent again to show the window during a calibration. The flag is NOT saved with an instrument state.

Send this command for each additional window to show during a calibration.

**VB Syntax**
```
calMgr.DisplayNAWindowDuringCalAcquisition (winNum, State)
```

**Variable**
- **(Type)** - Description
  - *calMgr* (object) - A CalManager object
  - *winNum* (long) - Window number to show during a calibration. The calibration window will also be shown with this window.

  The window must already be created.

  Use `NaWindows.count` or `app.WindowNumber` to read existing window numbers.

  - **state** (Boolean) Window state. Choose from:
    - **True** - Show the specified window during calibration.
    - **False** - Do NOT show the specified window during calibration.

**Return Type**
Not Applicable

**Default**
Not Applicable

**Example**
```
calMgr.DisplayNAWindowDuringCalAcquisition 2,True
```

See example using this command

**C++ Syntax**
```
HRESULT DisplayNAWindowDuringCalAcquisition( long WinNum, VARIANT_BOOL bVal);
```

**Interface**
ICalManager5
### DisplayOnlyCalWindowDuringCalAcquisition Method

**Description**
Clears the flags for windows to be shown during calibrations other than the Cal Window. To flag a window to be shown see `DisplayNAWindowDuringCalAcquisition`.

**VB Syntax**
```
calMgr.DisplayOnlyCalWindowDuringCalAcquisition
```

**Variable**
- **Type** - Description
- **calMgr** - A `CalManager` object

**Return Type**
Not Applicable

**Default**
Not Applicable

**Example**
```
calMgr.DisplayOnlyCalWindowDuringCalAcquisition
```

See example using this command

**C++ Syntax**
```
HRESULT DisplayOnlyCalWindowDuringCalAcquisition()
```

**Interface**
`ICalManager5`
**DoPrint Method**

<table>
<thead>
<tr>
<th>Description</th>
<th>Prints the screen to the default Printer.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>VB Syntax</strong></td>
<td><code>app.DoPrint</code></td>
</tr>
<tr>
<td><strong>Variable</strong></td>
<td><em>(Type)</em> - Description</td>
</tr>
<tr>
<td><code>app</code></td>
<td>An Application <em>(object)</em></td>
</tr>
<tr>
<td><strong>Return Type</strong></td>
<td>Not Applicable</td>
</tr>
<tr>
<td><strong>Default</strong></td>
<td>Not Applicable</td>
</tr>
<tr>
<td><strong>Examples</strong></td>
<td><code>app.DoPrint</code></td>
</tr>
<tr>
<td><strong>C++ Syntax</strong></td>
<td><code>HRESULT DoPrint()</code></td>
</tr>
<tr>
<td><strong>Interface</strong></td>
<td><code>IApplication</code></td>

</tbody>
</table>
### DoECAL1PortEx Method

**Description**

This method replaces DoECAL1Port Method.

Does a 1-Port calibration using an ECAL module. You must first have a 1-port measurement active to perform the calibration.

The characterization within the ECAL module that will be used for the calibration is specified by ECALCharacterizationEx. The default value is 0.

**VB Syntax**

```vbnet
cal.DoECAL1PortEx [port][,module]
```

<table>
<thead>
<tr>
<th>Variable</th>
<th><strong>Type</strong></th>
<th><strong>Description</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>cal</td>
<td>object</td>
<td>A Calibrator</td>
</tr>
<tr>
<td>port</td>
<td>long integer</td>
<td>Optional argument - Port number to calibrate. Choose from:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>1 - Calibrate port 1 (default if unspecified)</td>
</tr>
<tr>
<td></td>
<td></td>
<td>2 - Calibrate port 2</td>
</tr>
<tr>
<td>module</td>
<td>long integer</td>
<td>Optional argument. ECAL module.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Choose from modules 1 through 8</td>
</tr>
</tbody>
</table>

Use IsECALModuleFoundEx to determine the number of modules connected to the VNA.

Use GetECALModuleInfoEx to returns the model and serial number of each module.

**Return Type** None

**Default** Not Applicable

**Examples**

```vbnet
cal.DoECAL1PortEx,2,2
```

**C++ Syntax**

```cpp
HRESULT DoECAL1PortEx(long port, long moduleNumber = 1);
```

**Interface** ICalibrator4
**DoECAL2PortEx Method**

**Description**  
This method replaces DoECAL2Port Method.  

Does a 2-port calibration using an ECal module.  

2-port refers to the number of ports to calibrate; NOT to the number of ECal module ports.  

You must first have a measurement active to perform the calibration.  

The characterization within the ECal module that will be used for the calibration is specified by ECalCharacterizationEx. The default value is 0.

**VB Syntax**  
`cal.DoECAL2PortEx [portA],[portB],[module]`

**Variable** *(Type)* - Description  
`cal` A Calibrator *(object)*  

`portA` *(long integer)* Optional argument - Number of the receive port to calibrate.  
Choose from:  
1 - Calibrate port 1 (default, if unspecified)  
2 - Calibrate port 2  
3 - Calibrate port 3  

And so forth for all available VNA / test set ports.  

`portB` *(long integer)* Optional argument - Number of the source port to calibrate.  
Choose from:  
1 - Calibrate port 1  
2 - Calibrate port 2 (default, if unspecified)  
3 - Calibrate port 3  

And so forth for all available VNA / test set ports.  

`module` *(long integer)* Optional argument. ECal module.  
Choose from modules 1 through 8

Use IsECALModuleFoundEx to determine the number of modules connected to the VNA  

Use GetECALModuleInfoEx to returns the model and serial number of each module.
<table>
<thead>
<tr>
<th><strong>Return Type</strong></th>
<th>None</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Default</strong></td>
<td>Not Applicable</td>

</tbody>
</table>
**DoReceiverPowerCal Method**

**Description**

*Note: This command replaces DataToDivisor, LogMagnitudeOffset, Normalization, InterpolateNormalization.*

Immediately performs a receiver power calibration. The connection to the receiver must be in place when this command is sent.

A Receiver Power Cal requires that the active measurement be an Unratioed power measurement.

**VB Syntax**

`cal.DoReceiverPowerCal(param, srcPort [,pwrOffset])`

**Variable**

- **cal** *(object)* — A Calibrator
- **param** *(string)* — Receiver to be calibrated. Choose any receiver in your VNA. See a block diagram of your VNA.
- **srcPort** *(long integer)* — Number of the port which will supply source power to the receiver during this cal.

Receivers can also be referred to using **logical receiver notation**. This notation makes it easy to refer to receivers with an external test set connected to the VNA. You do not need to know which physical receiver is used for each test port. Learn more.

- **pwrOffset** *(double)* — Optional argument. Offset value in dB. Adjusts a receiver power cal to account for components or adapters that are added between the source port and receiver while performing this cal. Specify loss as a negative number; and gain as a positive number.

**Return Type**

None

**Default**

Not Applicable

**Examples**

`cal.DoReceiverPowerCal "B", 1, -10`

**C++ Syntax**

`HRESULT DoReceiverPowerCal(BSTR parameter, long lSrcPort, double dPowerOffset);`
Interface  ICalibrator5
# DoResponseCal Method

**Description**
Performs and immediately applies a Response cal. Same as selecting **Normalize** from the Unguided Cal - Measure Standards page. Learn more.

**VB Syntax**
```
cal.DoResponseCal (measParam),(SourcePort)
```

**Variable**
- **Type** - Description
- **cal** A **Calibrator (object)**
- **measParam** (String) Measurement parameter to correct. It is NOT necessary for this measurement to be present.
- **SourcePort** (long integer) Source port number to calibrate. Optional for S-parameter measurements. Choose from:
  0 - N5264B Measurement Receiver (no source ports).
  1 - Calibrate port 1
  2 - Calibrate port 2 (default, if unspecified)
  3 - Calibrate port 3
  And so forth for all available VNA / test set ports.

**Return Type**
None

**Default**
Not Applicable

**Examples**
```
cal.DoResponseCal "A/R",1
```

**C++ Syntax**
```
HRESULT DoResponseCal(BSTR param, long SourcePort);
```

**Interface**
ICalibrator9
**Embed Method**

**Description**
Embeds a fixture (usually a matching network) into an existing Cal Set based on an S2P file. A new Cal Set is created with the effects of the matching network included in the correction data.

When the new Cal Set is applied to a channel, the effects of the fixture are included in the measurement data. Do NOT enable fixturing. The effects of the matching network are included when the new Cal Set is selected and correction is turned ON.

**VB Syntax**
\[ \text{calMgr.Embed } (cs1, cs2, s2p, port, compPwr, extrap) \]

Variable *(Type) - Description*

- **calMgr** *(object) - A CalManager object*
  - *cs1* *(String)* Name of an existing Cal Set which resides on the VNA.
  - *cs2* *(String)* Name of new Cal Set which contains updated error terms with fixture embedded.
  - *s2p* *(String)* Name of the S2P file which characterizes the adapter/fixture.
  - *port* *(Long Integer)* Port number from which fixture will be embedded.
  - *compPwr* *(Boolean)*
    - **True** - Increase the source power to compensate for the loss through the fixture. The result is that the specified power level will be correct at the DUT input.
    - **False** - Do not compensate for loss in source power through the matching network.
  - *extrap* *(Boolean)*
    - **True** - Applies a simple extrapolation when the S2P file has a narrower frequency range than the Cal Set. The values for the first and last data points are extended in either direction to cover the frequency range of the Cal Set.
    - **False** - Extrapolation is NOT performed (default setting).

**Return Type** Not Applicable

### EnumerateItems Method

**Description**
Returns a list of all name-value pairs (items) in the Cal Set.

**See Also**
- Item Property (Learn about Name-Value pairs.)
- RemoveItem Method

**VB Syntax**
```vbnet
names = CalSet.EnumerateItems
```

<table>
<thead>
<tr>
<th>Variable</th>
<th>(Type) - Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>names</td>
<td>(Variant array) List of string names.</td>
</tr>
<tr>
<td>CalSet</td>
<td>(object) - A CalSet object</td>
</tr>
</tbody>
</table>

**Return Type**
Variant

**Default**
Not Applicable

**Examples**
See example

**C++ Syntax**
```cpp
HRESULT EnumerateItems (VARIANT* itemNames);
```

**Interface**
ICalSet6
**Execute Method**

<table>
<thead>
<tr>
<th>Description</th>
<th>Allows the use of COM to send a SCPI command.</th>

</tr>
</tbody>
</table>

**VB Syntax**

Scpi.Execute *(SCPI_Command)*

**Variable**

<table>
<thead>
<tr>
<th>(Type)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><em>scpi</em></td>
<td>A ScpiStringParser <em>(Object)</em></td>
</tr>
</tbody>
</table>

**SCPI_Command**

| (String) | Any valid SCPI command |

**Return Type**

String

**Default**

Not Applicable

**Examples**

```
Dim scpi As ScpiStringParser
Set scpi = app.ScpiStringParser
scpi.Execute("SYST:PRES");
ErrorString = scpi.Execute("SYST:ERROr");
```

**C++ Syntax**

Execute(BSTR SCPI_Command, BSTR * pQueryResponse);

**Interface**

IScpiStringParser2
## ExecuteShortcut Method

<table>
<thead>
<tr>
<th>Description</th>
<th>Executes a Macro (shortcut) stored in the analyzer. Use <code>app.getShortcut</code> to list existing macros. Use <code>app.putShortcut</code> to associate the macro number with the file.</th>
</tr>
</thead>

<td><code>app.ExecuteShortcut 1</code></td>
</tr>
<tr>
<td><strong>C++ Syntax</strong></td>
<td>HRESULT <code>ExecuteShortcut</code> (long <code>index</code>)</td>
</tr>
<tr>
<td><strong>Interface</strong></td>
<td>IAApplication</td>
</tr>
</tbody>
</table>

## Exists Method

**Description**
Returns whether or not the specified Cal Set exists on the VNA.

**VB Syntax**
```
calsets.Exists (string)
```

**Variable**
- **calsets**: A Calsets (collection)
- **string**: (String) Name or GUID of the Cal Set enclosed in quotes.

**Return Type**
Boolean

- **True** - Cal Set exists
- **False** - Cal Set does NOT exist

**Default**
Not Applicable

**Examples**
```
dim check
check=calsets.Exists ("MyCalset")
or
check=calsets.Exists ("7C4EEA5E-40D2-4D70-A048-33BFFE704163")
```

**C++ Syntax**
```
HRESULT Exists(BSTR nameOrGuid, VARIANT_BOOL * exists)
```

**Interface**
ICalSets2
# ExportCSVfile Method

<table>
<thead>
<tr>
<th>Description</th>
<th>Exports segment data to a CSV file.</th>
</tr>
</thead>
<tbody>
<tr>
<td>VB Syntax</td>
<td><code>segs.ExportCSVfile(bstrFile)</code></td>
</tr>
<tr>
<td>Variable</td>
<td>(Type) - Description</td>
</tr>
<tr>
<td><code>segs</code></td>
<td>A Segments collection (object)</td>
</tr>
<tr>
<td><code>bstrFile</code></td>
<td>(string) - Full path, file name, and extension of the file.</td>
</tr>
<tr>
<td>Return Type</td>
<td>Not Applicable</td>
</tr>
<tr>
<td>Default</td>
<td>Not Applicable</td>
</tr>
<tr>
<td>Examples</td>
<td><code>segs.ExportCSVfile(&quot;D:\MyFile.csv&quot;)</code></td>
</tr>
<tr>
<td>C++ Syntax</td>
<td>HRESULT ExportCSVfile(BSTR bstrFile)</td>
</tr>
<tr>
<td>Interface</td>
<td>ISegments6</td>
</tr>
</tbody>
</table>

Find Method

Description
Returns a list of either VISA address strings or VISA address aliases.

VB Syntax
value = Vpassthru.Find (regex, findmode)

Variable (Type) - Description

value (Variant) - Variable to store the list of addresses or aliases.

Vpassthru (object) - A VISAPassthrough object

regex (String) VISA regular expressions are expressions defined by the user to find devices that have been set up on the VISA interface. The following are examples of VISA regular expressions:

<table>
<thead>
<tr>
<th>Interface</th>
<th>Expression</th>
</tr>
</thead>
<tbody>
<tr>
<td>GPIB</td>
<td>GPIB[0-9]*::?*INSTR</td>
</tr>
<tr>
<td>PXI</td>
<td>PXI?*INSTR</td>
</tr>
<tr>
<td>VXI</td>
<td>VXI?*INSTR</td>
</tr>
<tr>
<td>GPIB-VXI</td>
<td>GPIB-VXI?*INSTR</td>
</tr>
<tr>
<td>GPIB and GPIB-VXI</td>
<td>GPIB?*INSTR</td>
</tr>
<tr>
<td>All VXI</td>
<td>?<em>VXI[0-9]</em>::?*INSTR</td>
</tr>
<tr>
<td>ASRL</td>
<td>ASRL[0-9]*::?*INSTR</td>
</tr>
<tr>
<td>All</td>
<td>?<em>INSTR or ?</em></td>
</tr>
</tbody>
</table>

Note that using "INSTR" in the VISA regular expression finds "instruments." To search all interfaces, use "?*".

findmode (enum as NAVISAFindMode) - Find mode determines the type of return values. Choose from:

0 - naAddresses: return VISA address names

1 - naAliases: return VISA address aliases

Note: The list of aliases may have lessor more entries than the list of addresses because not all addresses will have aliases, and one address can have more than one alias.

Return Type Variant
Default Address

Examples

C++ Syntax HRESULT Find(string reg_expression, enum NAVISAFindMode)

Interface IVISAPassthrough

value=Vpassthru.Find("?*",1) 'Finds list of aliases
## FrequencyAutoTune Method

<table>
<thead>
<tr>
<th>Description</th>
<th>Auto tunes and zooms in on a signal within a SA sweep.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>VB Syntax</strong></td>
<td><code>sa.FrequencyAutoTune</code></td>

<tr>
<td><strong>C++ Syntax</strong></td>
<td><code>HRESULT FrequencyAutoTune();</code></td>
</tr>
<tr>
<td><strong>Interface</strong></td>
<td>ISpectrumAnalyzer4</td>
</tr>
</tbody>
</table>
### FrequencySpanFullMethod

**Description**
Sets the frequency span to the entire frequency span of the analyzer.

**VB Syntax**
`chan.FrequencySpanFull`

**Variable**
`chan` *(object)* - A `Channel` object

**Return Type**
None

**Default**
Maximum frequency span of the analyzer

**Examples**
`chan.FrequencySpanFull`

**C++ Syntax**
`HRESULT FrequencySpanFull();`

**Interface**
`IChannel25`
**GenerateGlobalDeltaMatchSequence Method**

<table>
<thead>
<tr>
<th>Description</th>
<th>Initiates a global delta match calibration.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Learn more about Delta match calibration.</td>
</tr>
<tr>
<td></td>
<td>See example of a complete Delta Match calibration.</td>
</tr>
</tbody>
</table>

**VB Syntax**

```vbnet
numSteps = guided.GenerateGlobalDeltaMatchSequence conn, cKit
```

**Variable**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>numSteps</td>
<td>Long Integer</td>
<td>Variable to store the returned number of connection steps required by the Global Delta Match Cal.</td>

<tr>
<td>conn</td>
<td>String</td>
<td>Connector Type for port 1.</td>
</tr>
<tr>
<td>cKit</td>
<td>String</td>
<td>Cal Kit for all ports.</td>
</tr>
</tbody>
</table>

**Return Type**

Not Applicable

**Default**

Not Applicable

**Examples**

```vbnet
guided.GenerateGlobalDeltaMatchSequence "APC 3.5 female","85052B"
```

**C++ Syntax**

```cpp
HRESULT GenerateGlobalDeltaMatchSequence(BSTR port_1_conn, BSTR cal_kit, long *num_steps);
```

**Interface**

IGuidedCalibration2
GenerateErrorTerms Method

**Description**  
Generates the error terms for the specified calibration type, stores the error terms in a Cal Set, saves the Cal Set, and returns the Cal Set GUID.

If ALL the data for the cal type has NOT been acquired an error message is returned.

**Note:** The manner in which the calibration is assigned to a Cal Set (Cal Register or User Cal Set) is determined by the setting of `RemoteCalStoragePreference`.

**VB Syntax**  
```vbnet
value = obj.GenerateErrorTerms
```

**Variable**  
<table>
<thead>
<tr>
<th>(Type)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>value</td>
<td>(String) - Variable to store the returned GUID or error message.</td>
</tr>
<tr>
<td>obj</td>
<td>Any of the following:</td>
</tr>
<tr>
<td></td>
<td>GuidedCalibration (object)</td>
</tr>
<tr>
<td></td>
<td>SMCType (object)</td>
</tr>
<tr>
<td></td>
<td>VMCType (object)</td>
</tr>
</tbody>
</table>

**Return Type**  
String

**Default**  
Not Applicable

**Examples**  
```vbnet
string = SMC.GenerateErrorTerms
```

**C++ Syntax**  
```c++
HRESULT GenerateErrorTerms(BSTR* calsetGUID);
```

**Interface**  
IGuidedCalibration

SMCType

VMCType
# GenerateSteps Method

**Description**

Returns the number of steps required to complete the calibration.

For an ECal User Characterization this generate steps for the ECal User Characterization process. The channel must already be calibrated using the same, or greater number of VNA ports as the ECal module. Also, the VNA ports must begin with Port 1 and use sequential port numbers.

After this command is executed, subsequent commands can be used to query the number of measurement steps, issue the acquisition commands, query the connection description strings, and subsequently complete a User Characterization calibration.

**VB Syntax**

```vbnet
value = obj.GenerateSteps
```

**Variable**

- **value** (long) - Variable to store the returned number of steps
- **obj** Any of the following:
  - `GuidedCalibration` (object)
  - `SMCType` (object)
  - `VMCType` (object)
  - `ECalUserCharacterizer` (object)

**Return Type**

Long

**Default**

Not Applicable

**Examples**

```vbnet
value = SMC.GenerateSteps
```

**C++ Syntax**

```cpp
HRESULT put_GenerateSteps(long* steps);
```

**Interface**

- `IGuidedCalibration`
- `SMCType`
- `VMCType`
- `IECalUserCharacterizer`
### GetAllSegments Method

**Description**  
Downloads a segment table from the VNA.

**VB Syntax**  
```vbnet
segdata = Segs.GetAllSegments
```

**Variable**  
- **(Type)** - Description  
- `segs` A `Segments (Collection)`  
- `segdata` (Variant) A 2-dimensional array of Segment data:
  
  - Dimension 0 is the number of elements in each segment.
  - Dimension 1 is the number of segments that will be used.

All elements in the returned array are Variant. The type inside each Variant will be as is listed below.

The returned array will contain values for all elements regardless of the settings of `IFBandwidthOption`, `SweepTimeOption`, `SourcePowerOption` and `CouplePorts` properties. Ignore the values for the properties that are set to false.

The following is a list of dimension 0 elements for each segment:

- 0 = Segment state (Boolean True or False)
- 1 = Number of Points in this segment (Integer)
- 2 = Start Freq (Double)
- 3 = Stop Freq (Double)
- 4 = IFBW (Double)
- 5 = Dwell Time (Double)
- 6 + N = Power (Double) where N is the number of source ports of the VNA. For example, with a 4-port, 1-source VNA, indices 6 through 9 correspond to the per-segment power levels for Ports 1 to 4. Use `SourcePortCount Property` and `SourcePortNames Property` to see the available source ports for the VNA.

**Return Type**  
Variant, containing an array.

**Default**  
Not Applicable

**Examples**  
See a VB example using this command
| **C++ Syntax** | HRESULT GetAllSegments (VARIANT *pSegments ); |
| **Interface**   | ISegments5 |
### GetAuxIO Method

**Description**  
This method returns the **IAuxIO** interface.

**VB Syntax**  
```vbnet
app.GetAuxIO
```

**Variable** *(Type) - Description*

- **app**  
  An **Application** *(object)*

**Return Type**  
**IHWAuxIO**

**Default**  
Not Applicable

**Example**
```vbnet
Dim app As AgilentPNA835x.Application
Dim aux As IHWAuxIO
Set aux = app.GetAuxIO
```

**C++ Syntax**  
```cpp
HRESULT GetAuxIO (IHWAuxIO **pAux);
```

**Interface**  
**IApplication**
## GetCalStandard Method

<table>
<thead>
<tr>
<th>Description</th>
<th>Returns a handle to a calibration standard for modifying its definitions. To select a standard for performing a calibration (use Calibrator.AquireCalStandard).</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>VB Syntax</strong></td>
<td><code>calkit.GetCalStandard(index)</code></td>
</tr>
<tr>
<td><strong>Variable</strong></td>
<td><em>(Type)</em> - Description</td>
</tr>
<tr>
<td><code>calkit</code></td>
<td>A calKit <em>(object)</em></td>
</tr>
<tr>
<td><code>index</code></td>
<td><em>(long)</em> - Number of calibration standard. Choose 1 to 30; (there are 30 cal standards in every kit).</td>
</tr>
<tr>
<td><strong>Return Type</strong></td>
<td>calStandard</td>
</tr>
<tr>
<td><strong>Default</strong></td>
<td>Not Applicable</td>
</tr>
</tbody>
</table>
| **Examples** | Dim short As CalStandard  
Set short = calKit.getCalStandard(1)  
short.label = "myShort" |
| **C++ Syntax** | HRESULT GetCalStandard(long standardNumber, ICalStandard **pCalStd) |
| **Interface** | ICalKit |
**GetCalKitTypeString Method**

<table>
<thead>
<tr>
<th>Description</th>
<th>Returns ECal module model number and serial number based on the index number of the attached ECal modules.</th>
</tr>
</thead>
<tbody>
<tr>
<td>VB Syntax</td>
<td>[ECalID = cal.GetCalKitTypeString (module)]</td>
</tr>
<tr>
<td>Variable</td>
<td>(Type) - Description</td>
</tr>
<tr>
<td>ECalID</td>
<td>(string) - variable to store the returned ECal module ID information.</td>
</tr>
<tr>
<td>cal</td>
<td>A Calibrator (object)</td>
</tr>
<tr>
<td>module</td>
<td>(long integer) ECal module.</td>
</tr>
<tr>
<td>Return Type</td>
<td>String</td>
</tr>
<tr>
<td>Default</td>
<td>Not Applicable</td>
</tr>
<tr>
<td>Examples</td>
<td>[info = cal.GetCalKitTypeString(2)]</td>
</tr>
</tbody>
</table>

**Example return string:**

"N4691-60003 ECal 01234"

**C++ Syntax**

```cpp
HRESULT GetCalKitTypeString(long moduleNumber, BSTR* info);
```

**Interface**

ICalibrator8
GetCompatibleCalKits Method

**Description**

**Note:** This command replaces CompatibleCalKits Property

Returns a comma-separated list of valid kits that use the specified connector type. This includes mechanical cal kits, applicable characterizations found within ECal modules currently connected to the VNA, and all user characterizations stored in VNA disk memory.

For ECal modules, the returned list includes the serial numbers.

See the ECalUserCharacterizer Object.

Use items in the list to select the kit to be used with the CalKitType Property

**VB Syntax**

```vbnet
value = guidCal.GetCompatibleCalKits (connectorType)
```

**Variable** (Type) - Description

- **value** (Variant) - Variable to store the returned list of cal kits. One-dimensional array of string values.
- **guidCal** A GuidedCalibration (object)
- **connectorType** (String) Connector type for which compatible cal kits will be returned.

Use ValidConnectorType to return a list of connector type strings.

Use ConnectorType to set the connector type for each port to be calibrated.

**Return Type**

Variant – Containing one-dimensional array of strings.

**Default**

Not Applicable

**Examples**

```vbnet
Dim kits As Variant
kits = guidedCal.GetCompatibleCalKits "Type N (50) male"
```

**C++ Syntax**

```c
HRESULT GetCompatibleCalKits(BSTR connector, VARIANT* Kits);
```

**Interface**

IGuidedCalibration5
### GetCalManager Method

<table>
<thead>
<tr>
<th>Description</th>
<th>This method returns the <strong>ICalManager</strong> interface.</th>
</tr>
</thead>
<tbody>
<tr>
<td>VB Syntax</td>
<td><code>app.GetCalManager()</code></td>
</tr>
<tr>
<td>Variable</td>
<td>(Type) - Description</td>
</tr>
<tr>
<td><code>app</code></td>
<td>An Application <em>(object)</em></td>
</tr>
<tr>
<td>Return Type</td>
<td>ICalManager*</td>
</tr>
<tr>
<td>Default</td>
<td>Not Applicable</td>
</tr>
<tr>
<td>Example</td>
<td><code>dim app as AgilentPNA835x.Application</code>&lt;br&gt;   <code>dim mgr as CalManager</code>&lt;br&gt;   <code>set mgr = app.GetCalManager()</code></td>
</tr>
<tr>
<td>C++ Syntax</td>
<td><code>HRESULT GetCalManager( ICalManager **mgr);</code></td>
</tr>
<tr>
<td>Interface</td>
<td>IApplication</td>
</tr>
</tbody>
</table>
## Get CalSetByGUID Method

**Description**
Requests a Cal Set by GUID. Returns an ICal Set interface.

**VB Syntax**
`calMgr.GetCalSetByGUID (GUID)`

<table>
<thead>
<tr>
<th>Variable</th>
<th>(Type) - Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>calMgr</code></td>
<td>(object) - A CalManager object</td>
</tr>
<tr>
<td><code>GUID</code></td>
<td>(string) - GUID of the Cal Set being requested.</td>
</tr>
</tbody>
</table>

**Return Type**
Interface object

**Default**
Not Applicable

**Example**
`calMgr.GetCalSetByGUID (2B893E7A-971A-11d5-8D6C-00108334AE96)`

**C++ Syntax**
```cpp
HRESULT GetCalSetByGUID( BSTR* strGUID, ICal Set* pCalSet);
```

**Interface**
ICalManager
### GetCalSetCatalog Method - Superseded

**Description**
This method is replaced with **EnumerateCalSets**

Returns a string containing a list of comma-separated GUIDs in the following format:

- `{FD6F863E-9719-11d5-8D6C-00108334AE96},
- `{1B03B2CE-971A-11d5-8D6C-00108334AE96},
- `{2B893E7A-971A-11d5-8D6C-00108334AE96}

**VB Syntax**

```
value = calMgr.GetCalSetCatalog
```

**Variable (Type) - Description**

- `value` *(string)* - Variable to store the returned GUID list
- `calMgr` *(object)* - A CalManager object

**Return Type** String

**Default** Not Applicable

**Example**

```
value = calMgr.GetCalSetCatalog
```

**C++ Syntax**

```
HRESULT GetCalSetCatalog( BSTR);  
```

**Interface** ICalManager
### GetCalSetUsageInfo Method

**Description**

Returns a string identifying the Cal Set currently in use by the specified channel.

This method identifies the Cal Set being used by returning its GUID.

This method also identifies the "Error Term set" within the Cal Set.

Error term sets are identified by integers, with set 0 belonging to the original (non-interpolated) terms. As stimulus values for a channel are changed causing interpolation to be required, a new Error Term set is constructed within the Cal Set to hold the interpolated Error Terms. The sets are sequentially numbered 1, 2, 3, and so forth. These Error Term sets are destroyed when they are no longer being used.

If there is no Cal Set in use for the given channel, the <GUID> argument is set to the empty string.

**VB Syntax**

```vbnet
calMgr.GetCalSetUsageInfo chan, GUID, setNumber
```

**Variable (Type) - Description**

- **calMgr**: `object` - A CalManager object
- **chan**: `long` - channel of the Cal Set being requested
- **GUID**: `string` - variable to store the GUID of the Cal Set being requested. If there is no Cal Set in use for the given channel, the <GUID> argument is set to the empty string.
- **setNumber**: `long` - variable to store the error term ID being requested. If the returned argument is greater than 0, the set is being interpolated.

**Return Type**

String, Long Integer

**Default**

Not Applicable

**Example**

```vbnet
calMgr.GetCalSetUsageInfo 1,GUID,EtermID
```

**C++ Syntax**

```cpp
HRESULT GetCalSetUsageInfo (long lChannel, BSTR* CalSetGUID, long* etermSetID);
```

**Interface**

ICalManager
**GetCalTypes Method**

**Description**
Returns a list of available calibration types known to the VNA. The Standard CalTypes are the same on all VNA's, but the Custom CalTypes are not necessarily the same. They are dependent on the custom measurement in the VNA. Learn more about applying Cal Types.

See also CalibrationTypeID to apply a Cal Type containing in a Cal Set.

**VB Syntax**

```vbnet
v = mgr.GetCalTypes
```

**Variable**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>mgr</td>
<td>A CalManager (Object)</td>
</tr>
<tr>
<td>v</td>
<td>Name/GuidPair that contains the calibration type name and associated GUID for each cal type known to the VNA.</td>
</tr>
</tbody>
</table>

**Return Type** (variant) Two dimensional array.

**Default** Not Applicable

**Examples**

```vbnet
v = CalManager.GetCalTypes
```

**C++ Syntax**

```c++
HRESULT GetCalTypes( VARIANT * NameGuidPair )
```

**Interface** ICalManager2
GetComplex Method

Description
Retrieves complex data from the specified location.

See also getNAComplex, getData, and getPairedData Methods

VB Syntax
measData.getComplex location, numPts, real(), imag()

Variable (Type) - Description
measData An IArrayTransfer interface which supports the Measurement object

location (enum NADataStore - IArrayTransfer) - Where the data you want is residing. Choose from:

0 - naRawData
1 - naCorrectedData
2 - naMeasResult
3 - naRawMemory
4 - naMemoryResult
5 - naDivisor - When reading data from, or writing data to, the normalization divisor, you must first create a divisor trace using DataToDivisor Method.

numPts (long integer) - Number of data points requested
[out] - specifies number of data elements returned
[in] - specifies the data being requested or the capacity of the arrays

real (single) - Array to store the real values
imag (single) - Array to store the imaginary values

Return Type Single

Default Not Applicable

Examples
Dim real(201) As Single
Dim imag(201) As Single
Dim pts as Integer
Dim measData As IArrayTransfer
Set measData = app.ActiveMeasurement
measData.getComplex naCorrectedData, pts, real(0), imag(0)

C++ Syntax
IArrayTransfer - HRESULT getComplex(tagNADataStore DataStore, long* pNumValues, float* pReal, float* pImag)
Interface IArrayTransfer
### GetConnectedPhaseReferences Method

<table>
<thead>
<tr>
<th>Description</th>
<th>Reads the ID strings of the phase references that are currently connected to the VNA USB.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>VB Syntax</strong></td>
<td><code>refs = phaseRef.GetConnectedPhaseReferences</code></td>
</tr>
<tr>
<td><strong>Variable</strong></td>
<td><strong>(Type) - Description</strong></td>
</tr>
<tr>
<td><em>phaseRef</em></td>
<td>A PhaseReferenceCalibration (object)</td>
</tr>
<tr>
<td><strong>Return Type</strong></td>
<td>Not Applicable</td>
</tr>
<tr>
<td><strong>Default</strong></td>
<td>Not Applicable</td>
</tr>
<tr>
<td><strong>Examples</strong></td>
<td><code>ref = phaseRef.GetConnectedPhaseReferences()</code></td>
</tr>
<tr>
<td><strong>See example program</strong></td>
<td></td>
</tr>
<tr>
<td><strong>C++ Syntax</strong></td>
<td>HRESULT GetConnectedPhaseReferences()</td>
</tr>
<tr>
<td><strong>Interface</strong></td>
<td>IPhaseReferenceCalibration</td>
</tr>
</tbody>
</table>
### GetConverter Method

**Description**
This method returns a handle to a `Converter` object.

**VB Syntax**
`chan.GetConverter()`

**Variable**
(Type) - Description
- `chan` - A Channel (object)

**Return Type**
IConverter

**Default**
Not Applicable

**Example**
```vbnet
dim app as AgilentPNA835x.Application
set app = createobject("AgilentPNA835x.Application")
dim chan as IChannel
set chan = app.ActiveChannel
dim convert
set convert = chan.GetConverter()
```

**C++ Syntax**
`HRESULT GetConverter( IConverter **obj);`

**Interface**
IChannel17
**GetDataBuffer Method**

**Description**
Retrieves trace data (Y data) from the modulation distortion measurement.

**VB Syntax**
```
data = meas.GetDataBuffer DataBufferName
```

**Variable**
- `data` *(variant)* - Array to store the data.
- `meas` *(object)* - A `Measurement` object

**DataBufferName** *(string)* – Name of the buffer to be read.

**Note:** The following names assume a 2-port VNA. Also, by default, the parameter names assume that VNA Port 1 is connected to the DUT input and VNA Port 2 is connected to the DUT output. If the RF Path settings are changed from the default, the names will change accordingly. For example, if the VNA has 4 ports and Port 4 is connected to the DUT output, the names will change to "PIn1", "POut4", "S11", "S41", etc.

Choose from:

"POut2" - Power Out

"PIn1" - Power In

"MSig2" - Modulation Signal Out

"MDist2" - Modulation Distortion Out

"MGain21" - Modulation Gain

"MComp21" - Modulation Compression

"PGain21" - Power Gain

GetDataBufferCompact Method

**Description**
Retrieves compact signal trace data (Y data) from the modulation distortion measurement.

**VB Syntax**
\[ data = meas.GetDataBufferCompact DataBufferName \]

**Variable**
(Type) - Description

- **data** (variant) - Array to store the data.
- **meas** (object) - A Measurement object

**DataBufferName** (string) – Name of the buffer to be read.

**Note:** The following names assume a 2-port VNA. Also, by default, the parameter names assume that VNA Port 1 is connected to the DUT input and VNA Port 2 is connected to the DUT output. If the RF Path settings are changed from the default, the names will change accordingly. For example, if the VNA has 4 ports and Port 4 is connected to the DUT output, the names will change to "PIn1", "POut4", "S11", "S41", etc.

Choose from:

- "POut2" - Power Out
- "PIn1" - Power In
- "MSig2" - Modulation Signal Out
- "MDist2" - Modulation Distortion Out
- "MGain21" - Modulation Gain
- "MComp21" - Modulation Compression
- "PGain21" - Power Gain
- "S11" - Linear Input Match
- "S21" - Linear Gain
- "LPin1" - Linear Power In
"LPOut1" - Linear Reflected Power In

"LPOut2" - Linear Power Out

getDataByString Method

**Description**
Retrieves variant data from the specified location in your choice of formats.

The VNA returns complex trace data which is ratioed if required by the measurement parameter, such as S11 or A/B. Otherwise it is raw receiver data, such as A or B.

**Equation Editor Notes:**

- When equation editor is active on a trace in a standard S-parameter channel, GetData returns the data from the parameter on the trace that was measured last. For example, for the equation "S22 + S33 + S11", then S33 is the last measured parameter because it uses source port 3.

- In applications, if equation editor is active and the original parameter for the trace is not requested anywhere in the channel, then zeros are returned. If the original parameter is being measured within the channel, then data for the original parameter is returned.

- In general, if an equation contains no measurement parameters, then data for the original parameter is returned.

**VB Syntax**

```vbnet
data = meas.getDataByString location, format```

**Variable**

- **data** (variant) - Array to store the data.
- **meas** (object) - A Measurement object
- **location** (string) – Name of the buffer to be read. Choose from:
  - "naRawData"
  - "naCorrectedData"
  - "naMeasResult"
  - "naRawMemory"
  - "naMemoryResult"
  - "naDivisor" - When reading data from, or writing data to, the normalization divisor, you must first create a divisor trace using DataToDivisor Method.

See Data Access Map
format (enum NADataFormat) - Format in which you would like the data. It does not have to be the displayed format. Choose from:

0 - naDataFormat_LinMag
1 - naDataFormat_LogMag
2 - naDataFormat_Phase
3 - naDataFormat_Polar
4 - naDataFormat_Smith
5 - naDataFormat_Delay
6 - naDataFormat_Real
7 - naDataFormat_Imaginary
8 - naDataFormat_SWR
9 - naDataFormat_PhaseUnwrapped
10 - naDataFormat_InverseSmith
11 - naDataFormat_Kelvin
12 - naDataFormat_Fahrenheit
13 - naDataFormat_Centigrade

Learn more about Data Format.

* Specify Smith or Polar formats to obtain complex data pairs, which require a two-dimensional array varData (numpts, 2) to accommodate both real and imaginary data.

All scalar formats return a single dimension varData(numpts).

Return Type Variant array
Default Not Applicable
Examples meas.getDataByString "naMeasResult", naDataFormat_Phase
C++ Syntax HRESULT getDataByString( BSTR location, tagDataFormat dataFormat, VARIANT * pData );
Interface IMeasurement
**GetData Method**

**Description**
Retrieves variant data from the specified location in your choice of formats. To get smoothed data from any of the specified locations, the format must be the same as the displayed format.

The VNA returns complex trace data which is ratioed if required by the measurement parameter, such as S11 or A/B. Otherwise it is raw receiver data, such as A or B.

This method returns a variant which is less efficient than methods available on the IArrayTransfer interface.

If you plan to **Put** this data back into analyzer, **putDataComplex** (variant data) method requires complex, two-dimensional data. Therefore, request the data in **Polar** format.

**Equation Editor Notes:**

- When equation editor is active on a trace in a standard S-parameter channel, **GetData** returns the data from the parameter on the trace that was measured last. For example, for the equation \( S22 + S33 + S11 \), then S33 is the last measured parameter because it uses source port 3.

- In **applications**, if equation editor is active and the original parameter for the trace is not requested anywhere in the channel, then zeros are returned. If the original parameter is being measured within the channel, then data for the original parameter is returned.

- In general, if an equation contains no measurement parameters, then data for the original parameter is returned.

**VB Syntax**

```vbnet
data = meas.GetData(location, format)
```

**Variable** *(Type) - Description*

- **data**: Variant array to store the data.
- **meas**: A Measurement *(object)*
- **location**: *(enum NADataStore)* - Where the data you want is residing. See Data Access Map. Choose from:
  - 0 - naRawData
  - 1 - naCorrectedData
5 - naDivisor When reading data from, or writing data to, the normalization divisor, you must first create a divisor trace using DataToDivisor Method.

*format (enum NADataFormat) - Format in which you would like the data. It does not have to be the displayed format. Choose from:

0 - naDataFormat_LinMag
1 - naDataFormat_LogMag
2 - naDataFormat_Phase
3 - naDataFormat_Polar*
4 - naDataFormat_Smith*
5 - naDataFormat_Delay
6 - naDataFormat_Real
7 - naDataFormat_Imaginary
8 - naDataFormat_SWR
9 - naDataFormat_PhaseUnwrapped
10 - naDataFormat_InverseSmith
11 - naDataFormat_Kelvin
12 - naDataFormat_Fahrenheit
13 - naDataFormat_Centigrade

Learn more about Data Format.

* Specify Smith or Polar formats to obtain complex data pairs, which require a two-dimensional array varData (numpts, 2) to accommodate both real and imaginary data.

All scalar formats return a single dimension varData(numpts).
**Example Data Format**

**naDataFormat_Phase** and **naDataFormat_PhaseUnwrapped** return degrees. However, **putDataScalar** method accepts data in radians (not degrees) and displays in degrees.

<table>
<thead>
<tr>
<th>Return Type</th>
<th>Variant array - automatically dimensioned to the size of the data</th>

**Examples**

```vbs
Dim varData As Variant
varData = meas.GetData(naMeasResult, naDataFormat_Phase)
'Print Data
For i = 0 to chan.NumberOfPoints-1
    Print varData(i)
Next i
```

See a C# example.

**C++ Syntax**

```cpp
HRESULT getData(tagNADataStore DataStore, tagDataFormat DataFormat, VARIANT *pData)
```

**Interface**

IMeasurement
GetECALModuleInfoEx Method

Description
This property replaces GetECALModuleInfo Method.

Returns the following information about the connected ECAL module: model number, serial number, connector type, calibration date, min and max frequency.

The characterization within the ECAl module that this information will be read from is specified by ECALCharacterizationEx. The default value is 0.

VB Syntax
moduleInfo = cal.GetECALModuleInfoEx(module)

Variable
moduleInfo (string) - variable to store the module information

cal A Calibrator (object)

module (long integer) ECal module.

Choose from modules 1 through 8

Use IsECALModuleFoundEx to determine the number of modules connected to the VNA

Return Type
String

Default
Not Applicable

Examples
info = cal.GetECALModuleInfoEx(2)

Example return string:

ModelNumber: 85092-60007, SerialNumber: 01386, ConnectorType: N5FN5F, PortAConnector: Type N (50) female, PortBConnector: Type N (50) female, MinFreq: 30000, MaxFreq: 9100000000, NumberOfPoints: 250, Calibrated: July 4 2002

C++ Syntax
HRESULT GetECALModuleInfoEx(long moduleNumber, BSTR* info);

Interface
ICalibrator4
### GetEcalUserCharacterizer Method

**Description**  
This method returns a handle to an ECalUserCharacterizer object.

**VB Syntax**  
`calMgr.GetEcalUserCharacterizer()`

**Variable**  
*(Type) - Description*

- `calMgr`  
  A CalManager Object *(object)*

**Return Type**  
IEcalUserCharacterizer

**Default**  
Not Applicable

**Example**  
```vbnet
Dim mgr as ICalManager
Set mgr = app.GetCalManager
Dim ecalCharacterizer
Set ecalCharacterizer = mgr.GetEcalUserCharacterizer()
```

**C++ Syntax**  
```c++
HRESULT GetEcalUserCharacterizer( IECalUserCharacterizer **obj);
```

**Interface**  
ICalManager6
### GetENRData Method

**Description**
Read the ENR calibration data from VNA memory.

**VB Syntax**

```vbnet
vData = enr.GetENRData()
```

**Variable**

- **vData**
  Variable to store the returned ENR data. Frequency value in Hz, followed by corresponding ENR value in dB.

- **enr**
  An ENRFile (object)

**Return Type**
Variant Array

**Default**
Not Applicable

**Examples**
See example program

**C++ Syntax**

```c++
HRESULT GetENRData(VARIANT vdata);
```

**Interface**
IENRFFile
### GetErrorCorrection Method

**Description**

Reads the error correction state for the channel.

Use **ErrorCorrection Property** to set this value.

When this command returns true, some measurements on the channel MAY not have error correction ON. This is because the Cal Set currently in place may not contain the appropriate calibration data. To read the error correction state for a measurement, use **Error Correction Property**.

**VB Syntax**

```vbnet
bool = chan.GetErrorCorrection
```

**Variable**

*(Type)* - Description

- *boolean*

  *(boolean)* Variable to store the returned value.

  **False** - Error correction has been set OFF

  **True** - Error correction has been set ON

**chan**

A **Channel (object)**

**Return Type**

Boolean

**Default**

About Error Correction

**Examples**

```vbnet
value = chan.GetErrorCorrection
```

**C++ Syntax**

```cpp
HRESULT GetErrorCorrection (VARIANT_BOOL *bState)
```

**Interface**

IChannel8
### GetErrorTerm Method - Superseded

**Description**

Note: This command is replaced by Get ErrorTermByString Method

Retrieves error term data that is used for error correction. The data is complex pairs. Memory for the returned Variant is allocated by the server. The server returns a variant containing a two-dimensional safe Array.

This method returns a variant which is less efficient than getErrorTermComplex on the ICalData interface.

**Note:** When performing an ECal, send SetCalInfoEx Method BEFORE calling GetErrorTerm method.

Learn about reading and writing Calibration data.

#### VB Syntax

```vbnet
data = cal.getErrorTerm term, rcv src
```

#### Variable (Type) - Description

- **data** Variant array to store the data.
- **cal** A Calibrator (object)
- **term** (enum As NaErrorTerm). Choose from:
  - naErrorTerm_Directivity_Isolation
  - naErrorTerm_Match
  - naErrorTerm_Tracking
- **rcv** (long integer) - Receiver Port
- **src** (long integer) - Source Port

GetErrorTermByString Method

Description
Returns error term data from the Cal Set by specifying the string name of the error term.

- Learn more about Reading and Writing Cal Data
- See examples of Reading and Writing Cal Set Data
- See GetCalSetUsageInfo to determine the setNumber.

VB Syntax
```
pdata = calset.GetErrorTermByString(setNumber, errorTerm)
```

Variable (Type) - Description

pdata (Variant) Two-dimensional safe array to store the returned data. Memory for the returned Variant is allocated by the VNA and must be released by client.

**Note:** See also getErrorTermComplexByString on the ICalData3 interface to avoid using the variant data type.

calset A Cal Set (object)

setNumber (Long) Set number of the required Cal Set data.

See GetCalSetUsageInfo to determine the setNumber.

- SetNumber 0 contains the original "primary" set of error terms for a Cal Set.
- SetNumbers > 0 refers to the VNA channel number that contains the error terms. When retrieving channel error terms, Correction must be ON.

The channel error term data contains interpolation, fixturing, and port extension data if each is ON.

- For Balanced Measurements, interpolation, fixturing, and port extensions can be ON independently.
- For Standard S-parameters, to get port extension data, both fixturing and port extensions must be ON.

errorTerm (String) The string name used to identify a particular error term in the Cal Set. An example string for port 3 directivity in a full 2 port cal might be "Directivity(3,3)". To determine the string names of error terms, see GetErrorTermList2.
Return Type: Variant
Default: Not Applicable
Examples: See an Example
C++ Syntax: HRESULT GetErrorTermByString (long SetNumber, BSTR bufferName, VARIANT* pdata);
Interface: ICalSet2
GetErrorTermComplex Method  **Superseded**

**Description**

This command has been replaced by GetErrorTermComplexByString

Retrieves error term data from the error correction buffer. The data is in complex pairs.

**Note:** When performing an ECal, send SetCalInfoEx Method BEFORE calling GetErrorTermComplex method.

Learn more about reading and writing Cal Data using COM.

This method exists on a non-default interface. If you cannot access this method, use the GetErrorTerm Method on ICalibrator.

**VB Syntax**

```vbnet
eData.GetErrorTermComplex term, rcv, src, numPts, real(), imag()
```

**Variable**

(Type) - Description

- `eData`  
  An ICalData pointer to the Calibrator object

- `term`  
  (enum NAErrorTerm) - The error term to be retrieved. Choose from:

  - `naErrorTerm_Directivity_Isolation`
  - `naErrorTerm_Match`
  - `naErrorTerm_Tracking`

- `rcv`  
  (long integer) - Receiver Port

- `src`  
  (long integer) - Source Port

- `numPts`  
  (long integer) - on input, max number of data points to return; on output: indicates the actual number of data points returned.

- `real()`  
  (single) - array to accept the **real** part of the error-term. One-dimensional for the number of data points.

- `imag()`  
  (single) - array to accept the **imaginary** part of the error-term. One-dimensional for the number of data points.

Return Type: Single
Default: Not Applicable
Examples:
```vbnet
ReDim rel(numpts)
ReDim img(numpts)
Dim eData As ICalData
Set eData = chan.Calibrator
eData.getErrorTermComplex naErrorTerm_Directivity_Isolation, 1, 1, 201, rel(0), img(0)
```

C++ Syntax:
```cpp
HRESULT raw_getErrorTermComplex(tagNAErrorTerm ETerm, long ReceivePort, long SourcePort, long* pNumValues, float* pReal, float* pImag)
```

Interface: ICalData
GetErrorTermComplex Method  **Superseded**

Description

This command is replaced with Get ErrorTermComplexByString

Returns error term data from the Cal Set. The data is in complex pairs.

Learn more about Reading and Writing Cal Data

See examples of Reading and Writing Cal Set Data

**Note:** This method exists on a non-default interface. If you cannot access this method, use the GetErrorTerm Method on ICal Set.

VB Syntax

```vbnet
iCalData2.GetErrorTermComplex setNumber, term, rcv, src, numPts, real(), imag()
```

Variable

<table>
<thead>
<tr>
<th>(Type)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>iCalData2</code></td>
<td>An ICalData2 pointer to the Cal Set object</td>
</tr>
<tr>
<td><code>setNumber</code></td>
<td>(Long) There can be more than one set of error terms in a Cal Set.</td>
</tr>
</tbody>
</table>

- `setNumber 0` contains the original set of error terms for a Cal Set.
- `setNumbers > 0` contain Interpolated error terms. Interpolated error terms are generated when interpolation is required and destroyed when no longer used. Learn about Interpolation.
- To determine the setNumber in use by a channel, see GetCalSetUsageInfo

`term` (enum NAEErrorTerm2) - The error term to be retrieved. Choose from:

- 0 - naET_Directivity
- 1 - naET_SourceMatch
- 2 - naET_ReflectionTracking
- 3 - naET_TransmissionTracking
- 4 - naET_LoadMatch
- 5 - naET_Isolation

`rcv` (Long) - Receiver Port

`src` (Long) - Source Port
**numPts** *(Long)* An In/Out parameter.

On the way **in**, you specify the **max** number of values being requested.

On the way **out**, the VNA returns number of values actually returned.

**real()** *(single)* - array to accept the **real** part of the error-term. One-dimensional for the number of data points.

**imag()** *(single)* - array to accept the **imaginary** part of the error-term. One-dimensional for the number of data points.

**Return Type** Single

**Default** Not Applicable

**Examples**
```
dim numpts as long
numpts = ActiveChannel.NumberOfPoints
ReDim r(numpts) ' real part
ReDim i(numpts) ' imaginary part
Dim CalSet as CalSet
set CalSet = pna.GetCalManager.GetCalSetByGUID( txtGUID )
Dim eData As ICalData2
Set eData = CalSet
eData.getErrorTermComplex 0, naET_LoadMatch, 1, 2, numpts, r(0), i(0)
```

**C++ Syntax**
```
HRESULT getErrorTermComplex(long setID, tagNAErrorTerm2 ETerm, long ReceivePort, long SourcePort, long* pNumValues, float* pReal, float* pImag)
```

<td>This method exists on a non-default interface. If you cannot access this method, use GetErrorTermByString</td>
</tr>
</tbody>
</table>

#### VB Syntax

```vbnet
ICalData3.GetErrorTermComplexByString setNumber, errorTerm, numPoints, real(0), imag(0)
```

#### Variable (Type) - Description

- **ICalData3** (Object)
- **setNumber** (Long)
  - There can be more than one set of error terms in a Cal Set.
  - setNumber 0 contains the original set of error terms for a Cal Set.
  - setNumbers > 0 contain Interpolated error terms. Interpolated error terms are generated when interpolation is required and destroyed when no longer used. [Learn about Interpolation](#).
  - To determine the setNumber in use by a channel, see [GetCalSetUsageInfo](#)
- **errorTerm** (String)
  - The string name of error term in the Cal Set. An example string for port 3 directivity in a full 2 port cal might be "Directivity(3,3)".
  - For a list error term string names, use [Get ErrorTermList2](#)
- **numPoints** (Long)
  - An In/Out parameter.
  - On the way in, you specify the max number of values being requested.
  - On the way out, the VNA returns number of values actually returned.
- **real** (Single)
  - The real component of the complex data.
- **imag** (Single)
  - The imaginary component of the complex data.

### Return Type

- Single

### Default

- Not Applicable

### Examples

See example
C++ Syntax

HRESULT GetErrorTermComplexByString(long etermSetID, BSTR bufferName, long* lnumPoints, single* real, single* imag);

Interface

ICalData3
GetErrorTermList Method  **Superseded**

**Description**  
*Note:* This command is replaced by `CalSet.getErrorTermList2`

Returns the list of Error Terms contained in this Cal Set for the CalType specified in the `OpenCal Set` method. Learn more about reading and writing Cal Data using COM.

The list is a comma separated, textual representation of the error terms with the term name followed by the port path in parentheses:

- Term (n, n),
- Term (m,n)

Before calling this method you must open the Cal Set with `OpenCal Set`. If the Cal set is not open, this method returns E_NA_Cal Set_ACCESS_DENIED.

Use `StringToNAErrorTerm2` to convert the list entries to values that can be used with `GetErrorTerm` and `PutErrorTerm`.

*Note:* The port path designation (m n) indicates the ports that contribute to the error being compensated. Directivity, source match and reflection tracking are single port characteristics, designated in this list by (n n) where n equals the port being characterized.

Other terms characterize the interaction between ports. For example, the load match term is describing the match at port (m) while looking into port (n). Thus the notation (m n) indicates the two ports that contribute to the loadmatch error.

**VB Syntax**

```vbnet
CalSet.GetErrorTermList (SetID, count, strList)
```

**Variable (Type) - Description**

- *CalSet* (object) - A Cal Set object
- *SetID* (long) - specifies the error term set to query. Use 0 for the primary set.
- *count* (long) - the number of error terms in the returned list
- *strList* (string) - comma separated list of error terms found in Cal Set

**Return Type**  
Not Applicable

**Default**  
Not Applicable

**Examples**

```vbnet
dim count as Integer
dim list as string
OpenCalSet (naCalType_TwoPortSOLT 1, 2)
GetErrorTermList( 0, count, list)
```
CloseCalSet()  

Assuming the cal set contained the full set of error terms for this two-port Cal, the returned list would be:

"Directivity(1 1),SourceMatch(1 1),ReflectionTracking(1 1),TransmissionTracking(2 1),LoadMatch(2 1),Isolation(2 1),Directivity(2 2),SourceMatch(2 2),ReflectionTracking(2 2),TransmissionTracking(1 2),LoadMatch(1 2),Isolation(1 2)"

**C++ Syntax**  
HRESULT GetErrorTermList (long etermSetID, long* count, BSTR* strList);

**Interface**  
ICalSet
GetErrorTermList2 Method

Description
Returns a list of error terms found in the Cal Set containing the specified text filter.

Learn more about Reading and Writing Cal Data
See examples of Reading and Writing Cal Set Data

VB Syntax
`list = CalSet.GetErrorTermList2(setNumber, filter)`

Variable (Type) - Description

`list` (Variant) Variant containing a string array of error term names.

`CalSet` (object) - A CalSet object

`setNumber` (Long) There can be more than one set of error terms in a Cal Set.

- `setNumber 0` contains the original set of error terms for a Cal Set.
- `setNumbers > 0` contain Interpolated error terms. Interpolated error terms are generated when interpolation is required and destroyed when no longer used. Learn about Interpolation.
- To determine the `setNumber` in use by a channel, see `GetCalSetUsageInfo`

`filter` (String) This string is used as a filter so that only the error term names of interest are returned. If the filter is empty, all terms are returned. The string is case-insensitive. Here are some examples:

- "" (empty string)- returns all error term names for the identified Cal Set and `setNumber`
- "TRACKING" - returns all error term names that include the substring "tracking," such as ResponseTracking(S21) and TransmissionTracking(S21)
- "(s21)" - returns all error term names that end with (S21)

Return Type Variant
Default Not Applicable
Examples See an Example
**C++ Syntax**

HRESULT GetErrorTermList2 (long SetNumber, BSTR filter, VARIANT* list)

**Interface**

ICalSet2
### GetErrorTermStimulus Method

**Description**  
Returns the stimulus values over which the specific error term was acquired. For example, with mixer channels, you may get a different set of values for Directivity at the input port versus Directivity at the output port.

- Learn more about [Reading and Writing Cal Data](#)  
- See examples of [Reading and Writing Cal Set Data](#)  
- See [GetCalSetUsageInfo](#) to determine the setNumber.  
- See [PutErrorTermStimulus Method](#).

**VB Syntax**  
`pdata = calset.GetErrorTermStimulus(setNumber, bufferName)`

**Variable**  
<table>
<thead>
<tr>
<th>(Type) - Description</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td><code>pdata</code> (Variant)</td>
<td>The VNA will allocate the memory for the returned variant. The data is returned as a SafeArray of Variant elements. Each element is of VarType double.</td>
</tr>
<tr>
<td><code>calset</code> A Cal Set (object)</td>
<td></td>
</tr>
<tr>
<td><code>setNumber</code> (Long)</td>
<td>Set number of the required Cal Set data. See <a href="#">GetCalSetUsageInfo</a> to determine the setNumber.</td>
</tr>
<tr>
<td><code>bufferName</code> (String)</td>
<td>The string name used to identify a particular error term in the Cal Set. An example string for port 3 directivity in a full 2 port cal might be &quot;Directivity(3,3)&quot;. To determine the string names of error terms, see <a href="#">GetErrorTermList2</a>.</td>
</tr>
</tbody>
</table>

**SetNumber**  
- SetNumber 0 contains the original "primary" set of error terms for a Cal Set.  
- SetNumbers > 0 refers to the VNA channel number that contains the error terms. When retrieving channel error terms, Correction must be ON. The channel error term data may be interpolated and may also be compensating for a fixture if that feature is on.  
  - For Balanced Measurements, interpolation, fixturing, and port extensions can be ON independently.  
  - For Standard S-parameters, to get port extension data, both fixturing and port extensions must be ON.

**bufferName** (String)  
The string name used to identify a particular error term in the Cal Set. An example string for port 3 directivity in a full 2 port cal might be "Directivity(3,3)". To determine the string names of error terms, see [GetErrorTermList2](#).

**Return Type**  
Variant
The sequence is:

```csharp
complexData = calset1.GetErrorTermByString(0, BufferName)

frequencyData = calset1.GetErrorTermStimulus(0, BufferName)

// manipulate complex data here

Calset2.PutErrorTermByString(BufferName, manipulatedComplexData)

Calset2.PutErrorTermStimulus(BufferName, frequencyData);
```

See an Example

**C++ Syntax**

```c++
HRESULT GetErrorTermStimulus (long SetNumber, BSTR bufferName,
VARIANT* pdata);
```

**Interface**

ICalSet7
### GetExtendedCalInterface Method

<table>
<thead>
<tr>
<th>Description</th>
<th>Returns an interface that exposes the properties of Noise Calibration.</th>

</tr>
<tr>
<td><code>interface</code></td>
<td>(object) Returns a handle to the specified interface. Choose from '</td>
</tr>
<tr>
<td></td>
<td>&quot;NoiseCal&quot;</td>
</tr>
</tbody>
</table>

**Return Type**

**Default**

**Example**

```vbnet
dim noiseCal
dim noiseCalExtensions
set noiseCal= Get Calmanager?.CreateCustomCalEx("NoiseCal")
set noiseCalExtensions =
noiseCal.GetExtendedCalInterface("INoiseCal")
```

**C++ Syntax**

`HRESULT GetExtendedCalInterface();`

**Interface**

ICalibrate2
### Get ExternalTestSetIO Method

<table>
<thead>
<tr>
<th>Description</th>
<th>This method returns the IExternalTestSetIO interface.</th>
</tr>
</thead>
<tbody>

</tr>
</tbody>
</table>
GetFilterStatistics Method

Description
Returns all four Filter Statistics resulting from a SearchFilterBandwidth. These statistics are useful for determining the bandwidth, center frequency, loss, and Q factor (Center Frequency / Bandwidth) of resonators. To retrieve individual filter statistics, use meas.FilterCF, meas.FilterBW, meas.FilterLoss, meas.FilterQ properties.

VB Syntax
meas.GetFilterStatistics cf,bw,loss,q

Variable
(Type) - Description
meas A Measurement (object)
cf,bw,loss,q Dimensioned variables to store the returned values

Return Type
(double) cf
(single) bw,loss,q

Default Not Applicable

Examples
' Dimension variables
Dim cf as Double
Dim bw as Single
Dim loss as Single
Dim q as Single

meas.GetFilterStatistics cf,bw,loss,q

C++ Syntax
HRESULT GetFilterStatistics(double* centerFreq, float* bw, float* loss, float* quality)

Interface IMeasurement
GetGuid Method

Description
Returns a string containing the GUID identifying this Cal Set. Each Cal Set is assigned a GUID (global unique ID). GUIDs are used to retrieve and select Cal Sets on the VNA. Learn more about reading and writing Cal Data using COM.

VB Syntax

```
value = CalSet.GetGuid
```

Variable (Type) - Description

- **value** (string) - Variable to store the returned GUID
- **CalSet** (object) - A Cal Set object

Return Type
String

Default
Not Applicable

Examples

```
guid = CalSet.GetGuid 'Read
```

C++ Syntax

```
HRESULT GetGUID( BSTR* pGUIDString);
```

Interface
ICalSet
# InputVoltageEX Property

This command replaces `get InputVoltage` Method

Reads the ADC voltage from the specified location.

## VB Syntax

```vbnet
volts = AuxIO.InputVoltageEX loc
```

## Variable

- **volts** *(double)* - variable to store the return value
- **AuxIO** *(object)* - A Hardware Auxiliary Input / Output object
- **loc** *(Long)* - Location from which to read data.

## For PNA-X models:

- 1 Reads voltage on Analog In 1 port (pin 7).
- 2 Reads voltage on Analog In 2 port (pin 8).
- 3 Reads voltage on GndSens (pin 6).
- 4 Reads voltage on Analog Out 1 port (pin 3).
- 5 Reads voltage on Analog Out 2 port (pin 4).

## For all other VNA models:

- 1 Reads voltage on the Analog IN (pin 14) of the AUX IO connector.
- 4 Reads voltage on Analog Out 1 port (pin 3).
- 5 Reads voltage on Analog Out 2 port (pin 2).

## Return Type

Double

## Default

Not Applicable

## Examples

```vbnet
Dim aux as HWAuxIO
Set aux = PNA.getAuxIO
volts = aux.InputVoltageEX 1
'for PNA-X, read voltage on PowerI/O pin 7
'for all other models, reads voltage on Aux I/O Analog In (pin 14)
```

## C++ Syntax

```c_cpp
HRESULT get_InputVoltageEX (long muxLoc, double* vtVoltage);
```
Interface HWAuxIO2
### Description
Reads a hardware latch that captures high to low transitions on Input1 of the Material Handler IO. Reading the latch causes it to reset and is ready for the next transition. The hardware latch is only capable of capturing one transition per query. Additional transitions are ignored until after the next query.

Momentarily driving Input1 high, then low, causes a transition to be detected and latched.

### VB Syntax
```vbnet
inp1 = handlerIo.get_Input1
```

### Variable (Type) - Description
- **inp1** *(variant)* - A variable to store the return value
- **handlerIo** *(object)* - A HandlerIO object

### Return Type
- **Variant**
  - **0** - a high to low transition occurred at Input1 since the last time it was queried.
  - **1** - no high to low transition occurred.

### Default
Not Applicable

### Examples
```vbnet
input1 = handlerIo.get_Input1 'Read
```

### C++ Syntax
```cpp
HRESULT get_Input1 (VARIANT* Data);
```

### Interface
IHWMaterialHandlerIO
GetIPConfigurationStruct Method

**Description**
Returns an NA_IPConfiguration data structure which contains information about the current status of the VNA’s computer networking configuration. This is the same set of information that is returned in a single string by the LANConfiguration property.

**VB Syntax**
```vbnet
value = app.GetIPConfigurationStruct
```

**Variable**

<table>
<thead>
<tr>
<th><strong>Type</strong></th>
<th><strong>Description</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td><code>value</code></td>
<td>(NA_IPConfiguration) Variable to receive the VNA IP (LAN) configuration information.</td>
</tr>
<tr>
<td><code>app</code></td>
<td>An Application (object)</td>
</tr>
</tbody>
</table>

**Return Type**
NA_IPConfiguration

**Default**
Not Applicable

**Examples**
```vbnet
Dim networkConfigInfo As NA_IPConfiguration
networkConfigInfo = app.GetIPConfigurationStruct()

MsgBox “Host name = ” & networkConfigInfoHostException
MsgBox “Domain name = ” & networkConfigInfo.DomainName
MsgBox “IP address = ” & networkConfigInfo.IPAddress

If Not networkConfigInfo.DHCPEnabled Then
    MsgBox “IP address is static”
Else
    MsgBox “IP address is dynamic”
End If

MsgBox “Subnet mask = ” & networkConfigInfo.SubNet
MsgBox “Gateway = ” & networkConfigInfo.DefaultGateway
MsgBox “Primary DNS server = ” & networkConfigInfo.DNSServer1
MsgBox “Secondary DNS server = ” & networkConfigInfo.DNSServer2
MsgBox “First suffix in DNS suffix search order = ” & networkConfigInfo.DNSSuffix1
MsgBox “Second suffix in DNS suffix search order = ” & networkConfigInfo.DNSSuffix2
MsgBox “Primary WINS server = ” &
```
networkConfigInfo.PrimaryWINSServer

MsgBox "Secondary WINS server = " & networkConfigInfo.SecondaryWINSServer

MsgBox "Network adapter device ID = " & networkConfigInfo.DeviceID

MsgBox "Description of network adapter = " & networkConfigInfo.Description

MsgBox "MAC address = " & networkConfigInfo.MacAddress

C++ Syntax  HRESULT GetIPConfigurationStruct (tagNA_IPConfiguration * pIPConfig);

Interface  IApplication14
**GetIsolationPaths Method**

</table>
GetLicenses Method

Description
Returns the list of licenses. See a list of common licenses.

VB Syntax
app.Licenses(type)

Variable (Type) - Description
app An Application (object)
type (Enum as NALicenseSet) Choose the type of licenses to be recalled:

0 - naValidLicenses - Return a list of licenses which have enabled VNA software features.

1 - naAllLicenses - Return a list of all installed licenses including the ones not related to the VNA software.

2 - nalIgnoredLicenses - Return a list of VNA software licenses which are either invalid or ignored. This can occur when a transportable license is transported to an instrument that does not support the license feature. In addition, this can occur when multiple licenses for the same base feature are installed and only the least restrictive license is used (the more restrictive licenses are ignored). For example, when transporting multiple Spectrum Analyzer licenses to the same instrument, the license with the greatest frequency range is used and the other licenses are ignored.

Note: Licenses not related to the VNA software but installed on the instrument are not reported as ignored when using nalIgnoredLicenses.

Return Type String
Default Not Applicable

Examples
app.Licenses(naAllLicenses)
"N5242B-423,N5242B-020,N5242B-021,N5242B-022,S93029A/B-1FP"

C++ Syntax
HRESULT Licenses(tagNALicenseSet type, BSTR* LicenseString)

Interface IApplication23
### Get MaterialHandlerIO Method

<table>
<thead>
<tr>
<th>Description</th>
<th>This method returns the MaterialHandlerIO interface.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>VB Syntax</strong></td>
<td><code>app.GetMaterialHandlerIO</code></td>
</tr>
<tr>
<td><strong>Variable</strong></td>
<td><strong>(Type)</strong> - Description</td>
</tr>
<tr>
<td><code>app</code></td>
<td>An Application (<code>object</code>)</td>
</tr>
<tr>
<td><strong>Return Type</strong></td>
<td>IHWMaterialHandlerIO</td>
</tr>
<tr>
<td><strong>Default</strong></td>
<td>Not Applicable</td>
</tr>
</tbody>
</table>
| **Example** | `Dim app As AgilentPNA835x.Application`  
`Dim hand As HWMaterialHandlerIO`  
`Set hand = app.GetMaterialHandlerIO` |
| **C++ Syntax** | `HRESULT GetMaterialHandlerIO (IHWMaterialHandlerIO **phand);` |
| **Interface** | IApplication |
GetNAComplex Method

Description
Retrieves complex data from the specified location. See also getComplex and getData Method.

VB Syntax
`measData.getNAComplex location, numPts, data`

Variable (Type) - Description
`measData`  An IArrayTransfer interface which supports the Measurement object
`location`  (enum NADataStore) - Where the data you want is residing. Choose from:
- 0 - naRawData
- 1 - naCorrectedData
- 2 - naMeasResult
- 3 - naRawMemory
- 4 - naMemoryResult
- 5 - naDivisor - When reading data from, or writing data to, the normalization divisor, you must first create a divisor trace using DataToDivisor Method.

`numPts`  (long integer) - Number of data points requested
[out] - specifies number of data elements returned
[in] - specifies the data being requested or the capacity of the dComplex array

`data`  (NAComplex) - A one-dimensional array of NaComplex to store the data.

Return Type
NAComplex

Default
Not Applicable

Examples
Dim dComplex(201) As NaComplex
Dim measData As IArrayTransfer
Dim pts as Long
Set measData = app.ActiveMeasurement
measData.getNAComplex naCorrectedData, pts, dComplex(0)

Notes
The data is stored as Real and Imaginary (Re and Im) members of the NaComplex user defined type. You can access each number individually by iterating through the array.

For i = 0 to NumPts-1
    dReal (i) = dcomplex (i).Re
    dImg (i) = dcomplex (i).Im
C++ Syntax
HRESULT getNAComplex(tagNADataStore DataStore, long* pNumValues, TsComplex* pComplex)

Interface
IArrayTransfer
### GetNumberOfGroups Method

**About Trigger**

Read-only

2776
## get_Output Method

**Description**  
Type 1 and Type2 configurations: Returns the last value written to the selected output pin.

Type3 configuration: Returns the current state of the selected output pin. If an Input1 trigger occurs, the state may not be the same value as was written.

All configurations: Data is written using put_Output Method.

### VB Syntax

```vb
data = handlerIo.get_Output(pin)
```

### Variable (Type) - Description

- **data** *(variant)*  - A variable to store the return value. The returned value will be one of the following:
  - 0 - TTL Low
  - 1 - TTL High

- **handlerIo** *(object)*  - A HandlerIO object

- **pin** *(enum as NAMatHandlerOutput)*  - output to read. Choose from:
  - naOutput1 (0)
  - naOutput1User (1)
  - naOutput2 (2)
  - naOutput2User (3)

**Learn about User Output**

### Return Type

Variant

### Default

Not Applicable

### Examples

```vb
data = handlerIo.get_Output(naOutput1)
```

### C++ Syntax

```c++
HRESULT get_Output ( tagNAMatHandlerOutput Output, VARIANT* Data );
```

### Interface

IHWMaterialHandlerIO
**get_OutputVoltage Method**

**Description**

**E836x and PNA-L:** Reads voltages on the DAC/Analog Output 1|2 of the Auxiliary IO connector.

**PNA-X:** Reads voltage on the Power I/O connector AnalogOut1|2.

**VB Syntax**

```vbnet
globals = AuxIO
volts = globals.get_OutputVoltage (output)
```

**Variable**

- **volts** *(double)* - variable to store the return value
- **AuxIO** *(object)* - A Hardware Auxiliary Input / Output object
- **output** *(variant)* - Number of the output DAC from which to read voltage. Choose from:
  1. Output 1 (Aux I/O pin 3) and (Power I/O pin 3)
  2. Output 2 (Aux I/O pin 2) and (Power I/O pin 4)

**Return Type**

Double

**Default**

Not Applicable

**Examples**

```vbnet
Dim aux as HWAuxIO
Set aux = PNA.getAuxIO
volts = aux.get_OutputVoltage(1)
' read voltage from Analog Out 1 (Aux I/O pin3) or (Power I/O pin 3)
```

**C++ Syntax**

```c++
HRESULT get_OutputVoltage(VARIANT Output, double* Voltage);
```

**Interface**

IHWAuxIO
get OutputVoltageMode Method

**Description**
This command returns the mode of the selected "Analog Out" line on the Power I/O connector. The modes give the user the option to have the requested voltage applied immediately or not until the sweep is done. To set the mode, use put_OutputVoltageMode Method.

**VB Syntax**
```
mode = auxIo.get_OutputVoltageMode (output)
```

**Variable (Type) - Description**

<table>
<thead>
<tr>
<th>Variable</th>
<th>(Type)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>mode</td>
<td>(enum NAOutputVoltageMode)</td>
<td>variable to store the returned mode.</td>
</tr>
<tr>
<td></td>
<td>naWaitEOS</td>
<td>While in this mode any voltage changes sent to the selected analog out will only get applied to the output between sweeps.</td>
</tr>
<tr>
<td></td>
<td>naNoWait</td>
<td>While in this mode any voltage changes sent to the selected analog out will occur right away without waiting until the end of a sweep, the voltage gets applied immediately.</td>
</tr>
</tbody>
</table>

| auxIo      | (object)       | A Hardware Auxiliary Input / Output object                                   |
| output     | (double)       | Analog Output. Choose from 1 or 2                                            |

**Return Type**
enum as NAOutputVoltageMode

**Default**
naWaitEOS

**Examples**
```
vOutMode = auxIo.get_OutputVoltageMode (1)
```

**C++ Syntax**
```
HRESULT get_OutputVoltageMode(VARIANT Output, 
tagNAOutputVoltageMode* pMode);
```

**Interface**
IHWAuxIO
GetPairedData Method

Description
Retrieves pairs of data from the specified location.

Note: This method exists on a non-default interface. If you cannot access this method, use the Get Data Method on IMeasurement.

VB Syntax
measData.getPairedData location, format, numPts, d1, d2

Variable
(Type) - Description
measData - An IArrayTransfer interface which supports the Measurement object
location (enum NADataStore) - Where the data you want is residing. Choose from:

0 - naRawData
1 - naCorrectedData
2 - naMeasResult
3 - naRawMemory
4 - naMemoryResult
5 - naDivisor - When reading data from, or writing data to, the normalization divisor, you must first create a divisor trace using DataToDivisor Method.

See Data Access Map

format (enum NApairedDataFormat) - Format in which you would like the Paired data. Choose from:

0 - naLogMagPhase - Log magnitude and phase
1 - naLinMagPhase - Linear magnitude and phase
2 - naRealImaginary - Real and Imaginary

Note: Selecting naRealImaginary format is the same as using the getComplex method

numPts (long integer) - Number of data points requested
[out] - specifies number of data elements returned
[in] - specifies the data being requested or the capacity of the dPaired array

d1 (single) - Array to store the magnitude / real values
(single) - Array to store the phase / imaginary values

**Return Type**
Two Single arrays

**Default**
Not Applicable

**Examples**
```vba
Dim logm() As Single
Dim phase() As Single
Public measData As IArrayTransfer
Set measData = app.ActiveMeasurement
Dim numpts As Long
numPoints = app.ActiveChannel.NumberOfPoints
ReDim logm(numPoints)
ReDim phase(numPoints)
measData.getPairedData naCorrectedData, naLogMagPhase,
numPoints, logm(0), phase(0)

Print values(0), values(1)
```

**C++ Syntax**
```c
HRESULT getPairedData(tagNADataStore DataStore,
tagNAPairedDataFormat PairFormat, long* pNumValues, float* pReal, float* pImag)
```

**Interface**
IArrayTransfer
**get_Port Method**

**Description**
Returns the value from the specified "readable" port.

**VB Syntax**
```vbnet
data = handlerIo.get_Port(port)
```

**Variable**

<table>
<thead>
<tr>
<th><strong>data</strong></th>
<th>(variant) - A variable to store the return value. The following table shows what the returned data represents:</th>
</tr>
</thead>
</table>

<table>
<thead>
<tr>
<th>Port</th>
<th>MSB...........................................LSB</th>
</tr>
</thead>
<tbody>
<tr>
<td>C</td>
<td>C3...C0</td>
</tr>
<tr>
<td>D</td>
<td>D3...D0</td>
</tr>
<tr>
<td>E</td>
<td>D3...D0 + C3...C0</td>
</tr>
</tbody>
</table>

**handlerIo** (object) - A HandlerIO object

**port** (enum as NAMatHandlerPort) - port to get data from. Choose from:

- **naPortC** - (2)
- **naPortD** - (3)
- **naPortE** - (4)

**Note**: Reading data from the Write-only ports (A,B,F,G,H) will return an error. Ports C and D must be put in Read mode before reading from C, D, or E using PortMode Property.

**Return Type**
Variant

**Default**
0

**Examples**
```vbnet
data = handlerIo.get_Port(naPortC)
```

**C++ Syntax**
```cpp
HRESULT get_Port ( tagNAMatHandlerPort Port, VARIANT* Data );
```

**Interface**
IHWMaterialHandlerIO
Read-only

**get PortCData Method**

<table>
<thead>
<tr>

GetPortNumber Method

**Description**

Returns the port number that is associated with the specified port name. These numbers are used with several commands to specify a VNA port.

To learn more, see [Remotely Specifying a Source Port](#).

**VB Syntax**

```vbnet
value = object.GetPortNumber (portName)
```

**Variable (Type) - Description**

- `value` *(Long)* - Variable to store the returned Port Number integer value.
- `object` - A Channel *(object)* - always more complete than capabilities object.
- `portName` *(String)* - Name of the VNA port.

- Use [SourcePortNames Property](#) to return a list of VNA port (string) names.
- If an external source is selected, specify the external source name that is used in the [Select an External Source dialog](#).

**Return Type**

Long Integer

**Default**

Not Applicable

**Examples**

```vbnet
value = chan.GetPortNumber ("Src2 Out1") 'Read
```

**C++ Syntax**

```c++
HRESULT GetPortNumber(BSTR name, long *number);
```

**Interface**

IChannel13

ICapabilities4
GetRaw2DData Method

Description

Returns raw data at all frequency and power data points for any GCA sweep. Previously 2D sweep only.

- When using SMART sweep, ALL data is returned including ALL background iteration sweeps. Use TotalIterations to determine the number of iteration sweeps. The number of data points that are returned is always the number of frequency points times the number of iteration sweeps.

- When using 2D sweeps, ALL data is returned. The number of data points returned / freq may vary. Learn more.

Use the standard "get data" commands to return just the displayed data results (not the background sweeps).

A compression parameter must be present. Learn more.

VB Syntax

```vbnet
data = gca.GetRaw2DData location, format, param
```

Variable (Type) - Description

- `data` Variant array in which to store returned measurement data.
- `gca` A GainCompression (object)
- `location` (enum NADataStore) - Where the data you want is residing. Choose from:
  - 0 - naRawData
  - 1 - naCorrectedData
- `format` (enum NADataFormat) - Format in which you would like the data. It does not have to be the displayed format. Choose from:
  - 0 - naDataFormat_LinMag
  - 1 - naDataFormat_LogMag
  - 2 - naDataFormat_Phase
  - 3 - naDataFormat_Polar*
  - 4 - naDataFormat_Smith*
  - 5 - naDataFormat_Delay -- Not valid for this command.
  - 6 - naDataFormat_Real
7 - naDataFormat_Imaginary
8 - naDataFormat_SWR
9 - naDataFormat_PhaseUnwrapped
10 - naDataFormat_InverseSmith

Learn more about Data Format.

* Specify Smith or Polar formats to obtain complex data pairs, which require a two-dimensional array \textit{varData} (numpts, 2) to accommodate both real and imaginary data.

All scalar formats return a single dimension \textit{varData(numpts)}.

\textit{naDataFormat\_Phase} and \textit{naDataFormat\_PhaseUnwrapped} returns degrees.

\textit{param} \textbf{(String)} Parameter of data to return. Not case-sensitive. The specified parameter need NOT be displayed. However, a compression parameter must be present. Learn more.

Choose from:

- "pin" - (Compln21) Input power at the compression point.
- "pout" - (CompOut21) Output power at the compression point.
- "gain" - (CompGain21) Device gain (S21) at the compression point.
- "inputmatch" - (CompS11) Input match at the compression point.
- "DeltaGain" - (DeltaGain21) Measured Gain (watts) / Ref Gain (watts). Learn more.
- "AI1" and "AI2" - ADC measurements at the specified compression level. Learn more.

\textbf{Return Type} Variant Array
\textbf{Default} Not Applicable
\textbf{Examples} \texttt{data = gca.GetRaw2DData naRawData, naDataFormat\_Real, "pin"}
\textbf{C++ Syntax} HRESULT GetRaw2DData(tagNADataStore location, tagNADataFormat format, BSTR data\_name, VARIANT* pData);

\textbf{Interface} IGainCompression
## GetDataIm Method

**Description**
For a specified data point, returns the imaginary part of the specified Gain Compression data. If correction is on, corrected data are returned. Otherwise, raw data are returned. Can be used with Smart and 2D sweeps.

- For SMART sweep, the number of data points that are returned is always going to be the number of iteration sweeps. Use `naIterationSweeps` to determine the number of iteration sweeps.
- For 2D sweeps, the number of data points returned / freq may vary. Learn more.

**VB Syntax**
```
data = gca.GetDataIm stim, dPoint, param```

**Variable (Type) - Description**

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>

</tbody>
</table>

**Return Type**
Variant Array

**Default**
Not Applicable
Examples
For the fifth frequency data point, returns 'Power Output' imaginary (phase) data from all power stimulus values. If there are 30 power sweep points, 30 values are returned.

```c
data = gca.GetDataIm naFrequencySelect, 5, "pout"
```

For the 30th stimulus power data point, returns 'Power Output' imaginary (phase) data from all frequency stimulus values. If there are 201 frequency sweep points, 201 values are returned.

```c
data = gca.GetDataIm naPowerSelect, 30, "pout"
```

Note: For 2D sweeps, the number of data points returned / freq may vary.

Learn more.

C++ Syntax
HRESULT GetDataIm(tagNAGCAIndexSelect index_select, int index,BSTR data_name, VARIANT* pData);

Interface
IGainCompression
GetDataRe Method

Description
Reads the REAL part of the data acquired from any GCA sweep. Previously 2D sweep only.

**Note:** For 2D sweeps, the number of data points returned / freq may vary. Learn more.

VB Syntax
`data = gca.GetDataRe stim, dPoint, param`

Variable (Type) - Description

- **data** Variant array in which to store returned measurement data.
- **gca** A GainCompression object
- **stim** (NAGCAIndexSelect)
  - **naFrequencySelect** - for the specified frequency data point, returns all of the measured data for each power stimulus.
  - **naPowerSelect** - for the specified power data point, returns all of the measured data for each frequency stimulus.
- **dPoint** Data point (Frequency or Power) for which data is returned.
- **param** Parameter of data to return. Not case-sensitive. Choose from:
  - "pin" - input power at each data point.
  - "pout" - output power at each data point.
  - "gain" - device gain (S21) at each data point.
  - "inputmatch" - input match (S11) at each data point.
  - "DeltaGain" - Measured Gain (watts) / Ref Gain (watts). Learn more.
  - "AI1" and "AI2" - ADC measurements at the specified compression level. Learn more.

Return Type
Variant Array

Default
Not Applicable

Examples
For the fifth frequency data point, returns 'Power Output' REAL data from all power stimulus values. If there are 30 power sweep points, 30 values are returned.

`data = gca.GetDataRe naFrequencySelect, 5, "pout"`
For the 30th stimulus power data point, returns 'Power Output' REAL data from all frequency stimulus values. If there are 201 frequency sweep points, 201 values are returned.

```csharp
data = gca.GetDataRe naPowerSelect, 30, "pout"
```

**Note:** For 2D sweeps, the number of data points returned / freq may vary. Learn more.

**C++ Syntax**

```c
HRESULT GetDataRe(tagNAGCAIndexSelect index_select, int index, BSTR data_name, VARIANT* pData);
```

**Interface**

GetRxLevelingConfiguration Method

Description  This method returns a handle to a RxLevelingConfiguration object.

VB Syntax  

```
chan.GetRxLevelingConfiguration()  
```

Variable  (Type) - Description

```
chan  A Channel (object)  
```

Return Type  IRxLevelingConfiguration

Default  Not Applicable

Example  

```
dim app as AgilentPNA835x.Application
dim mgr as RxLevelingConfiguration
set mgr = app.GetRxLevelingConfiguration()  
```

C++ Syntax  

```
HRESULT GetRxLevelingConfiguration( IRxLevelingConfiguration **mgr);  
```

Interface  IChannel17
## GetSourceByRole Method

**Description**
Returns the name of a source that is assigned to the specified role.

*Note:* For non-converter channels, use `chan.RoleDevice`

**VB Syntax**
```vbnet
source = conv.GetSourceByRole (role)
```

**Variable**
- **source** (String) Source name, from Source Configuration dialog, that is assigned to the specified role.
- **conv** A Converter Object
- **role** (String) Role for which the source name will be returned. Use `GetSourceRoles` for a list of valid roles.

**Return Type**
Not Applicable

**Default**
Not Applicable

**Examples**
```vbnet
RF2Source = conv.GetSourceByRole ("RF2")
```

**C++ Syntax**
```cpp
HRESULT GetSourceByRole(BSTR roleID, BSTR deviceName);
```

**Interface**
IConverter

Write-only

GetRequiredEtermNames

Description

Returns an array of strings specifying the error terms required by the caltype's correction algorithm in order to correct the specified parameter.

This function interrogates a specific caltype (caltypeGUID) for the list of error terms it would need in order to correct the specified parameter. All the standard S Parameter calibration types embed port specifiers in the error term name. The specific port information is gleaned from the passed parameter.

For example, to query the error term requirements specific to a two port cal on ports 1 and 3, issue this with a parameter of S13 or S31. The buffer names returned will be formatted in this way:

Full 1 Port SOLT(1,3):TransmissionTracking(3,1)

VB Syntax

EtermNames = GetRequiredEtermNames(CalTypeGUID As String, Parameter As String)

Variable (Type) - Description

caltypeGUID: [in] the GUID of the desired calibration type

parameter [in] string specifying the parameter to be corrected

EtermNames [out] array of strings containing the error term names.

Note: In C++ Allocated by server. Must be freed by caller using SysFreeString.

Return Type

Not Applicable

Default

Not Applicable

Examples

enames = GetRequiredEtermNames(ctGUID, Parm)

C++ Syntax

HRESULT GetRequiredEtermNames( BSTR caltypeGUID, BSTR parameter, VARIANT* EtermNames )

Interface

ICalManager2
GetScalar Method

Description
Retrieves scalar data (ONE number per data point) from the specified location.

**Note:** This method exists on a non-default interface. If you cannot access this method, use the Get Data Method on IMeasurement.

**VB Syntax**
```vbnet
measData.getScalar location, format, numPts, data
```

**Variable**

- **measData** (Variable) - An IArrayTransfer interface which supports the Measurement object
- **location** (Type: enum NADATAStore) - Where the data you want is residing. Choose from:
  - 0 - naRawData
  - 1 - naCorrectedData
  - 2 - naMeasResult
  - 3 - naRawMemory
  - 4 - naMemoryResult
  - 5 - naDivisor - When reading data from, or writing data to, the normalization divisor, you must first create a divisor trace using DataToDivisor Method.
- **format** (Type: enum NADATFormat) - Format in which you would like the data. Choose from:
  - 0 - naDataFormat_LinMag
  - 1 - naDataFormat_LogMag
  - 2 - naDataFormat_Phase
  - 3 - naDataFormat_Polar
  - 4 - naDataFormat_Smith
  - 5 - naDataFormat_Delay
  - 6 - naDataFormat_Real
  - 7 - naDataFormat_Imaginary
8 - naDataFormat_SWR
9 - naDataFormat_PhaseUnwrapped
10 - naDataFormat_InverseSmith
11 - naDataFormat_Kelvin
12 - naDataFormat_Fahrenheit
13 - naDataFormat_Centigrade

**Note:** Polar, Smith, and Inverse Smith are invalid formats for this command. See Get Complex Method.

Learn more about Data Format.

\[
numPts \quad (\text{long integer}) \quad - \quad \text{Number of data points requested}
\]

[out] - specifies number of data elements returned

[in] - specifies the data being requested or the capacity of the \textit{dScalar} array

\[
data \quad (\text{single}) \quad - \quad \text{Array to store the scalar data.}
\]

**Return Type** Single

**Default** Not Applicable

**Examples**

```vbnet
Dim dScalar() As Single
Dim measData As IArrayTransfer
Set measData = app.ActiveMeasurement
Dim numpts as Long
numpts = app.ActiveChannel.NumberOfPoints
ReDim dScalar(numPoints)
measData.getScalar naCorrectedData, naDataFormat_LogMag, numpts, dScalar(0)
Print dScalar(0), dScalar(1)
```

**C++ Syntax**

```c++
HRESULT getScalar(tagNADataStore DataStore, tagNADataFormat DataFormat, long* pNumValues, float* pVals)
```

**Interface** IArrayTransfer
## GetShortcut Method

### Description
From the index (line number in the user interface) returns the Title, Path, and optional argument strings, of the specified Macro (shortcut). Use this method to list the titles and paths of macros in the analyzer.

### VB Syntax
```vbnet
app.GetShortcut index, title, path, arguments
```

### Variable
**(Type)** - Description

- **app** - An Application **(object)**
- **index** - **(long)** - Number of the macro. Use a number between 1 and 25.
- **title** - **(string)** - Title of the specified macro. (Appears in the softkey label)
- **path** - **(string)** - Pathname of the specified macro.
- **arguments** - **(string)** - Arguments for the specified macro

### Return Type
String

### Default
Not Applicable

### Example
```vbnet
Dim t As String
Dim p As String
Dim arg As String
Dim i As Integer
For i = 1 to 25
    app.GetShortcut i, t, p, arg
    Print t, p
Next
```

### C++ Syntax
```cpp
HRESULT GetShortcut(long Number, BSTR* title, BSTR* pathname, BSTR* arguments)
```

### Interface
IApplication

### Remarks
Shortcuts can also be defined and accessed using the macro key on the front panel. However, the benefit of this feature is primarily for the interactive user.
GetSnPData Method  **Superseded**

**Description**

**Note:** this command is replaced by Get SnpDataWithSpecifiedPorts Method.

Reads SnP data from the selected measurement. Learn more about SnP that is returned from the VNA.

**VB Syntax**

```vbnet
data = meas.GetSnPData type
```

**Variable**

*data* Variant array to store the data.

*meas* A Measurement *(object)*

*type* *(string)* - Type of SnP data to return. If unspecified, <n> is set to 2. Choose from:

- "S1P" returns 1-Port data for the active measurement if the active measurement is a reflection parameter such as S11 or S22. The behavior is UNDEFINED if the active measurement is a transmission parameter such as an S21.

- "S2P" returns data for the current 2-port measurement (4 S-parameters).

- "S3P" returns data for the current 3 port measurement (9 S-parameters). Valid only on instruments with 3 ports or more.

- "S4P" returns data for the current 4 port measurement (16 S-parameters). Valid only on instruments with 4 ports or more.

SnP data can be output using several data formatting options. See SnPFormat Property

**Return Type**

Variant - 3 dimensional array.

- First dimension size is number of parameters returned.

- Second dimension size is number of points in the channel

- Third dimension size is 2 (real,imaginary)

For example:

Data(0,5,1) returns the imaginary value of the fifth data point of S11 (if the s2p
request includes port #1)

<table>
<thead>
<tr>
<th>Default</th>
<th>Not Applicable</th>
</tr>
</thead>
<tbody>
<tr>
<td>Examples</td>
<td><code>snp = meas.GetSnPData(&quot;slp&quot;)</code></td>
</tr>
<tr>
<td>C++ Syntax</td>
<td><code>HRESULT GetSnPData( BSTR snptype, VARIANT * response)</code></td>
</tr>
<tr>
<td>Interface</td>
<td>IMeasurement3</td>
</tr>
</tbody>
</table>
### Description

**Note:** This command replaces Get SnPData. This command is more explicit regarding the data to be returned, and works for VNAs with multiport test sets.

Reads SnP data for the measurement by specifying the VNA port numbers. Learn more about SnP that is returned from the VNA.

### VB Syntax

```vbnet
data = meas.GetSnPDataWithSpecifiedPorts ports
```

### Variable **(Type) - Description**

- **data** *(Variant)* array to store the data.
- **meas** A Measurement *(object)*
- **ports** *(Variant Array)* One-dimensional array containing the list of port numbers for which data is required.

### Return Type

Variant - 3 dimensional array.

- First dimension size is number of parameters returned.
- Second dimension size is number of points in the channel
- Third dimension size is 2; format of the data is specified with SnPFormat Property.

For example:

Data(0,5,1) returns the imaginary part of the fifth data point of S11 (if the s2p request includes port #1)

### Default

Not Applicable

### Example

'This VBScript example can be pasted into a notepad file and run on the VNA as a macro. Learn how.

```vbnet
Dim pna
Dim meas
Dim param
Dim point
Dim snp
Dim ports
'List the port numbers for required data
```
ports = Array(3,4)
Set pna = CreateObject("AgilentPnA835x.application")
Set meas = pna.ActiveMeasurement
' limit amount of data to display
set chan=pna.ActiveChannel
chan.NumberOfPoints=2
snp = meas.GetSnPDataWithSpecifiedPorts (ports)
' returns a 3 dimensional array
' snp(param,point,data pair)
'-------------------------------------
' show me the data
For param = LBound(snp, 1) To UBound(snp, 1)
  MsgBox ("Parameter: ", (param + 1))
  For point = LBound(snp, 2) To UBound(snp, 2)
    MsgBox "Point:" , (point + 1) , " ", snp(param, point, 0) , " ", , & , snp(param, point, 1)
  Next
Next

---

**C++ Syntax**

```c++
HRESULT GetSnpDataWithSpecifiedPorts(VARIANT portsToMeasure, VARIANT* response);
```

**Interface**

```c++
IMeasurement7
```
**getSourcePowerCalDataEx Method**

**Description**

*Note:* This method replaces `getSourcePowerCalData Method`

Retrieves (as variant data type) source power calibration data, if it exists, from the channel.

If the channel is sweeping the source backwards, then the first data point is the highest frequency value; the last data point is the lowest. Use the `Get X-Axis Values` command to return the X-axis values in the displayed order.

*Note:* This method returns a variant which is less efficient than methods available on the ISourcePowerCalData interface

**VB Syntax**

```vbnet
data = chan.getSourcePowerCalDataEx (buffer, srcPort)
```

**Variable**

<table>
<thead>
<tr>
<th>(Type)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>data</td>
<td>(variant) – Array to store the data.</td>
</tr>
<tr>
<td>chan</td>
<td>(object) – A Channel object</td>
</tr>
<tr>
<td>buffer</td>
<td>(enum NASourcePowerCalBuffer) - The requested source power cal data buffer.</td>
</tr>
</tbody>
</table>

0 - **naCorrectionValues**  Last iteration of Cal data

1 - **naPriorIterationCorrectionValues**  Prior iteration of Cal data. This argument can be used to determine the final power reading at each point of the power cal, for a cal that did not pass tolerance limits.

The following formula can be used to determine the power reading (in dB):

\[
\text{Power reading} = \text{Target power at the source port} + \text{specified power cal offset value} + \text{‘prior’ iteration corr value} – \text{actual power corr value.}
\]

The "actual" value in this equation is returned with **naCorrectionValues**.

**srcPort**  (long integer) – The source port for which calibration data is being requested.

*Note:* If the port is defined by a string name, such as an external source, a balanced port, or one of the Source 2 outputs on the 2-port 2-source VNA-x model, then you must use `chan.getPortNumber` to translate the string into a port number. To learn more see [Remotely Specifying a Source Port](#).

**Return Type**

Variant array – automatically dimensioned to the size of the data.
Examples

Dim varData As Variant
Const port1 As Long = 1
varData = chan.getSourcePowerCalDataEx (naCorrectionValues, port1)
'Print the data
For i = 0 to chan.NumberOfPoints - 1
 Print varData(i)
Next i

C++ Syntax

HRESULTgetSourcePowerCalDataEx(tagNASourcePowerCalBuffer
bufSelect, long sourcePort, VARIANT *pData);
getDescriptionPowerCalDataScalarEx Method

**Description**

Note: This method replaces `getDescriptionPowerCalDataScalar` Method

Retrieves (as scalar values) source power calibration data, if it exists, from this channel.

If the channel is sweeping the source backwards, then the first data point is the highest frequency value; the last data point is the lowest. Use the Get X-Axis Values2 command to return the X-axis values in the displayed order.

Note: This method exists on a non-default interface. If you cannot access this method, use the `getDescriptionPowerCalDataEx` Method on IChannel4.

**VB Syntax**

```vbnet
chanData.getDescriptionPowerCalDataScalarEx buffer, srcPort, numValues, data
```

**Variable (Type) - Description**

- **chanData** (interface) – An ISourcePowerCalData2 interface on the Channel object.
- **buffer** (enum NASourcePowerCalBuffer) - The requested source power cal data buffer.
  - 0 - `naCorrectionValues` Last iteration of Cal data.
  - 1 - `naPriorIterationCorrectionValues` Prior iteration of Cal data. This argument can be used to determine the final power reading at each point of the power cal, for a cal that did not pass tolerance limits.

The following formula can be used to determine the power reading (in dB):

Power reading = Target power at the source port + specified power cal offset value + ‘prior’ iteration corr value – actual power corr value.

The "actual" value in this equation is returned with `naCorrectionValues`.

- **srcPort** (long integer) – The source port for which calibration data is being requested.

Note: If the port is defined by a string name, such as an external source, a balanced port, or one of the Source 2 outputs on the 2-port 2-source VNA-x model, then you must use `chan.getPortNumber` to translate the string into a port number. To learn more see Remotely Specifying a Source Port.

- **numValues** (long integer) – Number of data values.
[out] – specifies number of data values returned.

[in] – specifies number of values being requested (this must not be larger than the capacity of the data array).

**data** (single) – Array to store the data.

**Return Type** Single

**Default** Not Applicable

**Examples**

```vba
Dim numValues As Long
Dim scalarCalValues() As Single
Dim chanData As ISourcePowerCalData2
Const port1 As Long = 1
numValues = app.ActiveChannel.NumberOfPoints
ReDim scalarCalValues(numValues)
Set chanData = app.ActiveChannel

chanData.getSourcePowerCalDataScalarEx naCorrectionValues, port1, numValues, scalarCalValues(0)

'Print the data
For i = 0 to numValues - 1
Print scalarCalValues(i)
Next I
```

**C++ Syntax**

```c++
HRESULT getSourcePowerCalDataScalarEx(tagNASourcePowerCalBuffer bufSelect, long sourcePort, long *pNumValues, float *pData);
```

**Interface** ISourcePowerCalData2
GetStandard Method **Superseded**

**Description**
This command has been replaced with Get StandardByString

Returns standard acquisition data from the Cal Set. The returned data is complex pairs.

Learn more about Reading and Writing Cal Data

See examples of Reading and Writing Cal Set Data

**VB Syntax**

```
data = CalSet.getStandard (standard, rcv, src)
```

**Variable**

<table>
<thead>
<tr>
<th>(Type)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><em>data</em></td>
<td>(Variant) Two-dimensional safe array to store the returned data. Memory for the returned Variant is allocated by the VNA and must be released by client.</td>
</tr>
</tbody>
</table>

**Note:** See also getStandardComplex on the ICalData2 interface to avoid using the variant data type.

**CalSet**

A Cal Set (object)

**standard**

(enum NACalClass) Standard data to be read. Choose from:

1 - naClassA  
2 - naClassB  
3 - naClassC  
4 - naClassD  
5 - naClassE  
6 - naReferenceRatioLine  
7 - naReferenceRatioThru

**SOLT Standards**

1 - naSOLT_Open  
2 - naSOLT_Short  
3 - naSOLT_Load  
4 - naSOLT_Thru  
5 - naSOLT_Isolation

**TRL Standards**

1 - naTRL_Reflection  
2 - naTRL_Line_Reflection
3 - naTRL_Line_Tracking
4 - naTRL_Thru
5 - naTRL_Isolation

\[ rcv \ (long) \ - \text{Receiver Port} \]
\[ src \ (long) \ - \text{Source Port} \]

Return Type \textbf{(variant)}

Default Not Applicable

Examples
\begin{verbatim}
Dim varStd As Variant
Dim varStd2 As Variant
Cal Set.OpenCalSet( naCalType_TwoPortSOLT, 1, 2)
varStd = CalSet.getStandard(naSOLT_Thru,2,1)
varStd2 = CalSet.getStandard(naSOLT_Thru,1,2)
Cal Set.CloseCalSet( )
\end{verbatim}

C++ Syntax
\begin{verbatim}
HRESULT getStandard(tagNACalClass stdclass, long ReceivePort, long SourcePort, VARIANT* pData)
\end{verbatim}

Interface ICalSet
GetStandardByString Method

Description
Returns standard acquisition data from the Cal Set. The returned data is complex pairs.

Learn more about Reading and Writing Cal Data

See examples of Reading and Writing Cal Set Data

VB Syntax
\[
data = \text{calSet}.\text{GetStandardByString}(\text{stdName})
\]

Variable (Type) - Description

\[
data \quad \text{(Variant)} \quad \text{Two-dimensional safe array to store the returned data. Memory for the returned Variant is allocated by the VNA and must be released by client.}
\]

\[\text{Note: See also Get StandardComplexByString on the ICalData2 interface to avoid using the variant data type.}\]

\[\text{calSet} \quad \text{A CalSet (Object)}\]

\[\text{stdName} \quad \text{(String)} \quad \text{The string used to identify a particular standard in the Cal Set. An example string requesting the data for the Load standard in a full 2 port cal might be "S11C(3,3)".}\]

Return Type
Variant

Default
Not Applicable

Examples
See an example

C++ Syntax
\[
\text{HRESULT GetStandardByString( BSTR bufferName, VARIANT* pData)}
\]

Interface
ICalSet2
**GetStandardComplex Method Superseded**

**Description**  
This command is replaced with Get StandardComplexByString

Returns standard acquisition data from the Cal Set. The returned data is complex pairs.

Learn more about Reading and Writing Cal Data

See examples of Reading and Writing Cal Set Data

**Note:** This method exists on a non-default interface. If you cannot access this method, use the GetStandard Method on ICal Set

### VB Syntax

```
ICalData2.getStandardComplex class, rcv, src, numPts, real(), imag()
```

### Variable

**Type** - Description

- **ICalData2** An ICalData2 pointer to the Cal Set object
- **class** (*enum NACalClass*) Standard data to be read. Choose from:
  1. naClassA
  2. naClassB
  3. naClassC
  4. naClassD
  5. naClassE
  6. naReferenceRatioLine
  7. naReferenceRatioThru

**SOLT Standards**

1. naSOLT_Open
2. naSOLT_Short
3. naSOLT_Load
4. naSOLT_Thru
5. naSOLT_Isolation

**TRL Standards**

1. naTRL_Reflection
2. naTRL_Line_Reflection
3. naTRL_Line_Tracking
4. naTRL_Thru
5 - naTRL_Isolation

recv (long) - Receiver Port

csrc (long) - Source Port

numPts (Long) An In/Out parameter.

On the way in, you specify the max number of values being requested.

On the way out, the VNA returns number of values actually returned.

real() (single) - array to accept the real part of the calibration data. One-dimensional for the number of data points.

imag() (single) - array to accept the imaginary part of the calibration data. One-dimensional for the number of data points.

Return Type (single)

Default Not Applicable

Examples

Dim numpts as long
numpts = ActiveChannel.NumberOfPoints
ReDim r(numpts) ' real part
ReDim i(numpts) ' imaginary part
Dim Cal Set as Cal Set
set Cal Set = pna.GetCalManager.GetCal SetByGUID( txtGUID )
Dim sData As ICalData2
Set sData = Cal Set
sdata.getStandardComplex naSOLT_Open, 1, 1, numpts, r(0), i(0)

C++ Syntax

HRESULT getStandardComplex(tagNACalClass stdclass, long ReceivePort, long SourcePort, long* pNumValues, float* pReal, float* pImag)

Interface ICalData2
GetStandardComplexByString Method

Description
Returns standard acquisition data from the Cal Set.

Learn more about Reading and Writing Cal Data

See examples of Reading and Writing Cal Set Data

VB Syntax
ICalData3.GetStandardComplexByString stdName, lnumPoints, real(0), imag(0)

Variable (Type) - Description

ICalData3 An ICalData3 pointer to a CalSet (Object)

stdName (String) The string used to identify a particular standard in the Cal Set. An example string requesting the data for the Load standard in a full 2 port cal might be "S11C(3,3)".

lnumPoints (Long) An In/Out parameter.

On the way in, you specify the max number of values being requested.

On the way out, the VNA returns number of values actually returned.

real (Single) The real component of the complex data.

imag (Single) The imaginary component of the complex data.

Return Value
Single

Default Not Applicable

Examples See example

C++ Syntax
HRESULT GetStandardComplexByString( BSTR bufferName, long* lnumPoints, float* real, float* imag);

Interface ICalData3
About Cal Sets

GetStandardsList Method  Superseded

Description

**Note:** This command is replaced by `CalSet.getStandardList2`.

Returns the list of Standards contained in this Cal Set for the CalType specified in the `OpenCal Set` method. Learn more about reading and writing Cal Data using COM.

The list is a comma separated, textual representation of the error terms with the term name followed by the port path in parentheses.

- Standard (n, n),
- Standard (m, n)

Before calling this method you must open the Cal Set with `OpenCal Set`. If the Cal Set is not open, this method returns `E_NA_Cal Set_ACCESS_DENIED`.

Use `StringToNA CalClass` to convert the list entrees to values that can be used with `GetStandard` and `PutStandard`.

**Note:** The port path designation (m n) indicates the receive and source ports for the measurement. Shorts, opens and loads are single port devices, designated in this list by (n n) where n equals the port to which the device is connected. These devices are all characterized by reflection measurements. The dual port thru device is characterized by both transmission and reflection measurements in order to compensate for load match and tracking terms. The notation (n n) indicates the reflection measurement for this device. The notation (m n) indicates the transmission measurement, where the source and receive ports are different.
**VB Syntax**  
*CalSet.GetStandardsList (count, list)*

**Variable (Type) - Description**

- **CalSet (object) -** A Cal Set object
- **count (long [out]) -** indicates the number of items returned in the list
- **list (string) -** Variable to store the returned Comma separated list of items.

**Return Type**  
String

**Default**  
Not Applicable

**Examples**

```vbnet
Dim count As Integer
Dim list As String
OpenCalSet (naCalType_TwoPortSOLT, 1, 2)
GetStandardsList( count, list)
CloseCalSet( )
```

Assuming the Cal Set contained the full set of standards for this two port cal,  
the returned list would be:

"Open(1 1),  
Short(1 1),  
Load(1 1),  
Thru(1 1),  
Isolation(2 1),  
Open(2 2),  
Short(2 2),  
Load(2 2),  
Thru(2 2),  
Isolation(1 2)  
Thru(2 1),  
Thru(1 2)"

**C++ Syntax**  
`HRESULT GetStandardsList( long* count, BSTR* list);`

**Interface**  
ICalSet
## GetStandardList2 Method

**Description**
Returns a list of standards names found in the Cal Set object for the specified text filter.

**Note:** The “Standards data” container in the calset is intended for internal use only. External access is provided for use in diagnosing calibration problems. Users should not form any expectations as to the presence of the data or the naming conventions used.

### VB Syntax
```vbnet
list = calset.GetStandardList2(standard filter)
```

### Variable (Type) - Description
- **calset** (object) - A CalSet object
- **list** (Variant) Variant containing a string array of standards for the specified filter.
- **standard filter** (String) This string is used as a filter so that only the standards of interest are returned. If the filter is empty, all standards are returned. The string is case-insensitive. Here are some examples:
  - “” (empty string) - returns all standard names for the identified Cal Set
  - “THR” - returns all standard names that include the substring “thr,” such as Thru(1,1) and Thru(1,2), etc.
  - “(1,2)” - returns all standards that contain “(1,2),” such as “Isolation(1,2)” and “Thru(1,2).”

### Return Type
Variant

### Default
Not Applicable

### Examples
See an example

### C++ Syntax
```cpp
HRESULT GetStandardList2 (BSTR filter, VARIANT* list)
```

### Interface
ICalSet2
**GetStandardsForClass Method**

**Description**  
Get the calibration standard numbers for a specified calibration class. To set the calibration number use `SetStandardsForClass` Method.

**VB Syntax**  
`calkit.GetStandardsForClass(calclassorder, std1, std2, std3, std4, std5, std6, std7)`

**Variable**  
*(Type)* - Description

- **calKit** A CalKit *(object)*
- **calclassorder** *(enum NACalClassOrder)* Choose from:
  
  0 - naRefl_1_S11  
  1 - naRefl_2_S11  
  2 - naRefl_3_S11  
  3 - naTran_1_S21  
  4 - naRefl_1_S22  
  5 - naRefl_2_S22  
  6 - naRefl_3_S22  
  7 - naTran_1_S12  
  8 - naRefl_1_S33  
  9 - naRefl_2_S33  
  10 - naRefl_3_S33  
  11 - naTran_1_S32  
  12 - naTran_1_S23  
  13 - naTran_1_S31  
  14 - naTran_1_S13  
  15 - naTRL_T  
  16 - naTRL_R  
  17 - naTRL_L

- **std1…std7** *(long)* Calibration Standard Number. Nominal values from *1* through *30*. *0* indicates that a standard number has not been selected.

### GetSupportedALCModes Method

**Description**
Returns the valid ALC Modes for the VNA.

See `ALCLevelingMode` for a list of supported ALC Modes.

**VB Syntax**

```vbnet
value = chan.GetSupportedALCModes(sourcePort)
```

**Variable (Type) - Description**

- `value` (Variant Array) - variable to store the returned valid ALC Modes.
- `chan` (object) - A Channel object
- `sourcePort` (long integer) - Source port.

**Note:** If the port is defined by a string name, such as an external source, a balanced port, or one of the Source 2 outputs on the 2-port 2-source VNA-x model, then you must use `chan.getPortNumber` to translate the string into a port number. To learn more see `Remotely Specifying a Source Port`.

**Return Type**
Variant array

**Default**
Not Applicable

**Examples**
```
modes = chan.GetSupportedALCModes(4) 'Read
```

**C++ Syntax**

```c++
HRESULT GetSupportedALCModes(long port, VARIANT * ALCModes);
```

**Interface**
IChannel9
GetTestResult Method

Description
Returns the result of limit line testing. There are three ways to use this command:

- If neither optional parameter is specified, limit results for ALL data is returned.
- If one parameter is specified (`start`), the limit result for that data point is returned.
- If both parameters are specified, limit results are returned beginning with `start`, and ending with `(start+size)-1`

**Note:** In 'strongly-typed' languages such as C#, all parameters must be specified.

**VB Syntax**
```
testRes = limts.GetTestResult [start,size]
```

**Variable**

<table>
<thead>
<tr>
<th>(Type)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>testRes</code></td>
<td>(<code>enum NALimitTestResult</code>) - A dimensioned variable to store test results. If a limit line is not tested, a PASS is returned.</td>
</tr>
<tr>
<td><code>limts</code></td>
<td>A LimitTest (<code>object</code>)</td>
</tr>
<tr>
<td><code>start</code></td>
<td>(<code>long</code>) - Optional argument. A start data point number to return limit test results.</td>
</tr>
<tr>
<td><code>size</code></td>
<td>(<code>long</code>) - Optional argument. Number of data points from <code>start</code> to return limit test results.</td>
</tr>
</tbody>
</table>

**Return Type**
Long Integer

**Default**
Not Applicable

**Examples**
```
Dim testRes As NALimitTestResult
testRes = limts.GetTestResult
Select Case testRes
    Case 1
        Print "Fails"
    Case 2
        Print "Pass"
End Select
```
**C++ Syntax**  
HRESULT GetTestResult(long lStart, long lSize, tagNALimitTestResult *pVal)

**Interface**  
ILimitTest
GetTraceStatistics Method

Description
Returns all four Trace Statistics. To retrieve individual Trace statistics, use Mean, PeakToPeak, StandardDeviation properties. Use ShowStatistics to display the statistics of the screen.

VB Syntax
meas.GetTraceStatistics pp, mean, stdev

Variable
meas (Type) - Description
A Measurement (object)

pp, mean, stdev (double) - Dimensioned variables to store the returned values

Return Type
Double

Default
Not Applicable

Examples
'Dimension variables
Dim pp As Double
Dim mean As Double
Dim stdv As Double
meas.GetTraceStatistics pp, mean, stdv

C++ Syntax
HRESULT GetTraceStatistics(double* pp, double* mean, double* stdDeviation)

Interface
IMeasurement
GetXAxisValues2 Method

Description
Returns the channel's X-axis values into a dimensioned Typed array. GetXAxisValues2 is a convenient method for determining the frequency of each point when the points are not linearly spaced - as in segment sweep.

Note: This method will fail if called using a scripting client such as VBScript or Keysight Vee, (see remarks)

Note: In Segment Sweep, chan.NumberofPoints will return the total number of data points for the combined segments.

VB Syntax
chan.GetXAxisValues2 numPts, data

Variable (Type) - Description
chan (object) - A Channel object
numPts (long integer) - Number of data points in the channel
data (double) Single dimensioned array of data matching the number of points in the channel.

Return Type double
Default Not applicable

Examples
Dim App As Application
Set App = New Application
Dim numPoints As Long
Dim values() As Double
numPoints = App.ActiveChannel.NumberOfPoints
ReDim values(numPoints)
App.ActiveChannel.GetXAxisValues2 numPoints, values(0)
Print values(0), values(1)

C++ Syntax
HRESULT GetXAxisValues2(long* pNumValues, double* stimulus)

Interface IChannel

Remarks:
This method will fail if called using a scripting client such as VBScript or Keysight Vee. Use the GetXAxisValues method as a replacement for these COM environments.

This method also cannot be called using late-bound typing in Visual Basic. For instance, if, in the example above, the first line were replaced with "Dim App as Object", then this method would fail.
GetXAxisValues Method

Description
Returns the stimulus values for the measurement. To understand how this property is useful, see IMeasurement2 Interface.

VB Syntax
\[
data = meas.GetXAxisValues
\]

Variable
(Type) - Description

*data* (Variant) Array to store the data.

*meas* A Measurement (object)

Return Type
Variant

Default
Not Applicable

Examples
```vbnet
Dim varData As Variant
Dim i As Integer
varData = meas.GetXAxisValues
'Print Data
For i = 0 To meas.NumberOfPoints - 1
Print varData(i)
Next i
```

See C++ example

C++ Syntax
```cpp
HRESULT GetXAxisValues(VARIANT* xData);
```

Interface
IMeasurement2
GetXAxisValues Method

**Description**
Returns the channel's X-axis values. GetXAxisValues is a convenient method for determining the frequency of each point when the points are not linearly spaced - as in segment sweep.

See the Measurement2 Interface to learn how this method differs from meas.GetXAxisValues.

**Note:** This method returns a variant which is less efficient than GetXAxisValues2.

**Note:** In Segment Sweep, chan.NumberofPoints will return the total number of data points for the combined segments.

**VB Syntax**
```
data = chan.GetXAxisValues
```

**Variable**
- **(Type) - Description**
  - `data`: Variant array to store the data.
  - `chan`: A Channel (object)

**Return Type**
Variant

**Default**
Not Applicable

**Examples**
```
Dim varData As Variant
Dim i As Integer
varData = chan.GetXAxisValues
'Print Data
For i = 0 To chan.NumberOfPoints - 1
    Print varData(i)
Next i
```

**C++ Syntax**
```
HRESULT GetXAxisValues (VARIANT* xData)
```

**Interface**
IChannel
GetXDataBuffer Method

<table>
<thead>
<tr>
<th>Description</th>
<th>Retrieves frequency tone data from the modulation distortion measurement.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>VB Syntax</strong></td>
<td><code>data = meas.GetXDataBuffer DataBufferName</code></td>
</tr>
<tr>
<td><strong>Variable</strong></td>
<td>(Type) - Description</td>
</tr>
<tr>
<td><code>data</code></td>
<td>(variant) - Array to store the data.</td>
</tr>
<tr>
<td><code>meas</code></td>
<td>(object) - A <code>Measurement</code> object</td>
</tr>
<tr>
<td><code>DataBufferName</code></td>
<td>(string) – Name of the buffer to be read.</td>
</tr>
</tbody>
</table>

**Note:** The following names assume a 2-port VNA. Also, by default, the parameter names assume that VNA Port 1 is connected to the DUT input and VNA Port 2 is connected to the DUT output. If the RF Path settings are changed from the default, the names will change accordingly. For example, if the VNA has 4 ports and Port 4 is connected to the DUT output, the names will change to "PIn1", "POut4", "S11", "S41", etc.

Choose from:

"POut2" - Power Out

"PIn1" - Power In

"MSig2" - Modulation Signal Out

"MDist2" - Modulation Distortion Out

"MGain21" - Modulation Gain

"MComp21" - Modulation Compression

"PGain21" - Power Gain

"S11" - Linear Input Match

"S21" - Linear Gain

"LPin1" - Linear Power In

"LPOut1" - Linear Reflected Power In

GetXDataBufferCompact Method

Description
Retrieves compact signal frequency tone data from the modulation distortion measurement.

VB Syntax
\[ \text{data} = \text{meas}.\text{GetXDataBufferCompact} \ \text{DataBufferName} \]

Variable
\begin{itemize}
  \item \textit{data} \ (\text{variant}) - Array to store the data.
  \item \textit{meas} \ (\text{object}) - A Measurement object
  \item \textit{DataBufferName} \ (\text{string}) – Name of the buffer to be read.
\end{itemize}

Note: The following names assume a 2-port VNA. Also, by default, the parameter names assume that VNA Port 1 is connected to the DUT input and VNA Port 2 is connected to the DUT output. If the RF Path settings are changed from the default, the names will change accordingly. For example, if the VNA has 4 ports and Port 4 is connected to the DUT output, the names will change to "PIn1", "POut4", "S11", "S41", etc.

Choose from:

"POut2" - Power Out

"PIn1" - Power In

"MSig2" - Modulation Signal Out

"MDist2" - Modulation Distortion Out

"MGain21" - Modulation Gain

"MComp21" - Modulation Compression

"PGain21" - Power Gain

"S11" - Linear Input Match

"S21" - Linear Gain

"LPin1" - Linear Power In
"**LPOut1**" - Linear Reflected Power In

"**LPOut2**" - Linear Power Out

### GetVISATimeout Method

**Description**
Returns the timeout value (in milliseconds) for pass-through commands for the specified VISA session.

**VB Syntax**
```vbnet
value = Vpassthru.GetVISATimeout(visaID)
```

**Variable (Type) - Description**
- **value** *(long)* - Variable to store the returned value of the timeout.
- **Vpassthru** *(object)* - A VISAPassthrough object
- **visaID** *(long)* - VISA session number (see Open method).

**Return Type**
Long

**Default**
Not Applicable

**Examples**
```vbnet
value = Vpassthru.GetVISATimeout(2)
```

**C++ Syntax**
```c
HRESULT GetVISATimeout(long session_num)
```

**Interface**
IVISAPassthrough
HasCalType Method

Description
Verifies that the Cal Set object contains the error terms required to perform the specified correction (CalType) to an appropriate measurement.

The argument list includes specifiers for up to 3 ports. The number of arguments required depends on the CalType specified. The value for each port is set to 0 if not specified.

VB Syntax
`check = CalSet.HasCalType(calType, p1, p2, p3)`

Variable (Type) - Description
- **check** (boolean) - variable to store the returned value
  - **TRUE (1)** - Cal Set has all of the error terms necessary to apply the specified correction CalType.
  - **FALSE(0)** - Cal Set DOES NOT have all of the error terms necessary to apply the specified CalType.
- **CalSet** (object) - A Cal Set object
- **calType** (enum as naCalType) - type of correction to be applied. Choose from:
  
<table>
<thead>
<tr>
<th>Caltype</th>
<th>p arguments required</th>
</tr>
</thead>
<tbody>
<tr>

</tbody>
</table>
  * order of port arguments is significant for these CalTypes

- **p1** (long) - required. This argument must be specified.

This specifies either:
- the one significant port for an open/short response cal or a 1 port cal.

- or one of the ports involved in a 2, 3, or 4 port cal

- or the **receive** port for a thru response / thru-isolation cal.

\[ p^2 \text{ (long)} \] - required for any CalType involving more than one port

This specifies either:

- one of the ports involved in a 2, 3, or 4 port cal (order independent)

- or the **source** port for a thru response / thru-isolation cal

\[ p^3 \text{ (long)} \] - required for 3 and 4-port cal

This specifies one of the ports involved in a 3 or 4 port cal (order independent)

### Hold (channels) Method

**Description**  
Places ALL channels in hold mode.

To resume all channels sweeping, use `chans.Resume`. (Must be the same instance of `chans`).

To place a single channel in hold mode, use `channel.Hold` Method.

**VB Syntax**  
`chans.Hold`

**Variable**  
`chans`  
A Channel collection *(object)*

**Return Type**  
Not Applicable

**Default**  
Not Applicable

**Examples**  
`chans.Hold`

**C++ Syntax**  
`HRESULT Hold();`

**Interface**  
IChannels2
### ImportCSVfile Method

<table>

| **Default** | Not Applicable |
| **Examples** | `segs.ImportCSVfile("D:\MyFile.csv")` |
| **C++ Syntax** | `HRESULT ImportCSVfile(BSTR bstrFile)` |
| **Interface** | ISegments6 |
### ImportDataSet Method

**Description**  
Imports the Guided Power Cal Set (from an existing SMC Cal) or Phase Reference Cal into the current SMC calibrations.

**For the Guided Power Cal:**

The port of the mixer input must have the same source attenuator setting between the SMC channel and the Guided Power Cal Set. The frequencies of the Guided Power Cal must include all the mixer frequencies. Interpolation will be applied to the Guided Power Cal frequencies if they do not exactly match.

**For the Phase Reference Cal:**

The port of the mixer input must have the same source attenuator setting as used in the phase reference cal. The phase reference cal must include all the mixer frequencies. Interpolation will be applied to the phase reference cal frequencies if they do not exactly match. Learn more about Phase Reference Cal.

The following error message may appear (it is not written to the VNA Error Log):

**Interpolation target is out of range. Cannot interpolate** when incompatible frequency ranges occur.

**VB Syntax**  
```
smc.ImportDataSet (calset, dataName)
```

**Variable (Type) - Description**

- **smc**  
  SMCType (object)

- **calset**  
  (String) Name of existing SMC Cal Set from which cal data is imported.

- **dataName**  
  (String) Name of the data set. Choose from:

  - "POWER_STEP" - Import Guided Power Cal data.
  
  - "POWER_AND_PHASE" - Import the Phase Reference + power cal data. When this command is sent, the SMC Cal Method is automatically set to Use Phase Reference Cal Set. Learn more. There is no other command to set this.

**Return Type**  
Not Applicable

**Default**  
Not Applicable
<table>

### Initialize Method

**Description**
Begins a calibration.

**Note:** `chan` must be the active channel.

For ECal User Characterization, use Initialize (ECal).

**VB Syntax**

```vbnet
obj.Initialize(chan, useCalStorPref)
```

**Variable** (Type) - Description

- `obj` Any of the following:
  - `GuidedCalibration` (object)
  - `SMCType` (object)
  - `VMCType` (object)

- `chan` (Long) Channel number to calibrate.

- `useCalStorPref` (boolean)
  - True or 1 - Assignment of Cal Set will be based on the setting of the `RemoteCalStoragePreference` COM property.
  - False or 0 – If the channel currently has a selected Cal Set, the calibration will be stored to that Cal Set. Otherwise, the assignment of Cal Set is based upon the setting of the `RemoteCalStoragePreference` COM property.

**Return Type** Not Applicable

**Default** Not Applicable

**Examples**

```vbnet
smc.Initialize(2,True)
```

**C++ Syntax**

```cpp
HRESULT put_Initialize(long channelnumber, VARIANT_BOOL bCalPref);
```

**Interface**

- `IGuidedCalibration`
- `SMCType`
- `VMCType`
About ECal User Characterization

InitializeEx Method

**Description**: This property replaces Initialize (ECal) Method.

Initiates a User Characterization of an ECal module. The specified channel number must be an S-parameter measurement channel. The channel must already be calibrated using the same, or greater number of VNA ports as the ECal module. Also, the calibrated VNA ports must begin with Port 1 and use sequential port numbers.

For characterizations that are to be saved to the ECal module, the User Characterization number must already be set before issuing this command using CharacterizationNumber Property. For characterizations that are to be saved to the VNA disk memory, setting the User Characterization number is not necessary.

After this command is executed, subsequent commands can be used to query the number of measurement steps, issue the acquisition commands, query the connection description strings, and subsequently complete an Ecal User characterization.

**VB Syntax**: `userChar.InitializeEx(chan,bool)`

**Variable (Type) - Description**

- **userChar**: ECalUserCharacterizer (object)
- **chan**: (Long) Channel number of a calibrated S-parameter channel.
- **bool**: (Boolean) Choose from:
  - **True**: Check ECal memory to ensure that a new characterization with the channel’s current number of points will fit in the module memory. Select for User Characterizations to be stored in internal ECal memory.
  - **False**: Skip the check. Select for User Characterizations is to be stored to VNA disk memory.

**Return Type**: Not Applicable

**Default**: Not Applicable

**Examples**: `userchar.InitializeEx(2,True)`

**C++ Syntax**: `HRESULT put_InitializeEx(long chanNum,VARIANT_BOOL bCheck);`

**Interface**: IECalUserCharacterizer2
### Initialize Method Superseded

**Description**

Note: This command is replaced with InitializeEx Method

Initiates a User Characterization of an ECal module. The specified channel number must be an S-parameter measurement channel. The User characterization number must already be set before issuing this command using CharacterizationNumber Property.

**VB Syntax**

```
userChar.Initialize(chan)
```

**Variable (Type) - Description**

- `userChar`  ECalUserCharacterizer (object)
- `chan` (Long) Channel number of a calibrated S-parameter channel.

**Return Type**

Not Applicable

**Default**

Not Applicable

**Examples**

```
userchar.Initialize(2)
```

**C++ Syntax**

```
HRESULT put_Inititalize(long chanNum);
```

**Interface**

IECalUserCharacterizer
## IsLibraryImported Method

**Description**  
Returns whether a DLL has been imported into the VNA.

**VB Syntax**  

```vbnet
flag = equation.IsLibraryImported location
```

**Variable**  
(Types) - Description

- `flag` *(Boolean)*
  - **True** - DLL has been imported.
  - **False** - DLL has NOT been imported.

- `equation` *(MeasurementEquation object)*
- `location` *(string)* – Full path and filename of the *.dll.

**Return Type**  
Variant boolean

**Default**  
Not Applicable

**Examples**

```vbnet
flag = equation.IsLibraryImported "C:\Program Files(x86)\Keysight\Network Analyzer\UserFunctions\Expansion.dll"
```

**C++ Syntax**  

```c++
HRESULT IsLibraryImported( BSTR filename, VARIANT_BOOL* pImported);
```

**Interface**  
IMeasurementEquation
**Item Method**

<table>
<thead>
<tr>
<th>Description</th>
<th>Returns an object from the collection of objects.</th>
</tr>
</thead>
</table>

**Notes**

- The order of objects within a collection cannot be assumed.
- Most, but not all, VNA Collections are ‘1-based’

**VB Syntax**

```vbnet
Object[.Item](n)
```

**Variable**

*(Type) - Description*

**Object**

Any of the following *(collections)*:

- Cables Collection
- CalFactorSegments collection
- CalFactorSegmentsPMAR Collection
- Cal Sets collection
- Channels collection
- E5091Testset collection
- ECalModules Collection
- ExternalDevices Collection
- ExternalTestsets collection
- FOM Collection
- GuidedCalibrationPowerSensors Collection
- LimitTest collection
- Measurements collection
- NaWindows collection
- Ports Collection
- PowerLossSegments collection
- PowerLossSegmentsPMAR_Collection
- PowerSensors collection
- Segments collection
- Traces collection
- PowerMeterInterfaces Collection

Learn more about collections in the VNA

**.Item** Optional - Item is the default property of a collections object and therefore can be called implicitly. For example, the following two commands are equivalent:

```
Channels.Item(3).Averaging = 1
Channels(3).Averaging = 1
```

\( n \) (variant) - Number of the item in the collection.

In addition, the following collections allow you to specify the name of the item as a string:

- The Measurements, Traces, and FOM collections. For example:
  ```
  measCollection("CH_S11_1").InterpolateMarkers
  ```

- The Cal Sets collection. For example:
  ```
  Calsets("MyCalSet").Description = "New Description"
  ```

- The ExternalDevices Collection. For example:
  ```
  Set extDev = externalDevices.Item("NewPMAR")
  ```

- The GuidedCalibrationPowerSensors Collection. For example:
  ```
  Set PowerSensor = GuidedCalibrationPowerSensors.Item.Name = "26GHzPowerSensor"
  ```

**Return Type** *(Object)*

**Default** Not Applicable

**Examples**

```
For i = 1 to Traces.Count 1
    Traces.Item(i).YScale = .5dB
Next i
```

**C++ Syntax**

```c++
HRESULT Item(VARIANT index, <interface>** pItem)
```

**Interfaces**

All listed above.
### Item (Independent Power Calibration Port) Method

<table>
<thead>

LANConfigurationInitialize Method

Description: Performs an initialization (reset) of the VNA’s LAN configuration, as dictated by Section 8.14 of the LAN eXtensions for Instrumentation (LXI) standard (Version 1.1). This performs the same operation as pressing the LAN Reset button on the VNA LAN Status dialog.

VB Syntax: app.LANConfigurationInitialize

Variable: (Type) - Description

app An Application (object)

Return Type: Not Applicable

Default: Not Applicable

Examples: app.LANConfigurationInitialize

C++ Syntax: HRESULT LANConfigurationInitialize();

Interface: IApplication13
# LaunchCalWizard Method

<table>
<thead>
<tr>
<th>Description</th>
<th>Launches the S-parameter Cal Wizard on the VNA and does not return until the Cal Wizard is dismissed.</th>
</tr>
</thead>
<tbody>
<tr>
<td>To launch the Cal Wizard for a VNA Application, use the <strong>LaunchDialog Method</strong>.</td>
<td></td>
</tr>
<tr>
<td><strong>Note:</strong> The Cal Wizard operates on the active measurement. Therefore, activate the measurement to be calibrated before launching the Cal Wizard.</td>
<td></td>
</tr>
</tbody>
</table>

## VB Syntax

```vb
success = app.LaunchCalWizard(newCS)
```

## Variable *(Type)* - Description

<table>
<thead>
<tr>
<th>success</th>
<th>(boolean) - variable to store the returned value</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>True</strong></td>
<td>The Cal was completed</td>
</tr>
<tr>
<td><strong>False</strong></td>
<td>The Cal was canceled without completing the calibration.</td>

</tbody>
</table>

<table>
<thead>
<tr>
<th>app</th>
<th>An Application <em>(object)</em></th>
</tr>
</thead>
</table>

<table>
<thead>
<tr>
<th>newCS</th>
<th>(boolean)</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>True</strong></td>
<td>Cal will be performed on a new Cal Set.</td>
</tr>
<tr>
<td><strong>False</strong></td>
<td>Cal will be performed using the existing Cal Set assigned to the channel. If no Cal Set is found, a new Cal Set will be created.</td>
</tr>
</tbody>
</table>

## Return Type

Boolean

## Default

Not Applicable

## Example

```vb
dim bSuccess as boolean
dim bNewCalset as boolean
bNewCalSet = false
bSuccess = app.LaunchCalWizard( bNewCalSet)
```

## C++ Syntax

```c++
HRESULT LaunchCalWizard(VARIANT_BOOL bCalsuccess)
```

## Interface

IAplication
LaunchDialog Method

Description

Launches the specified dialog box.

The Calibration Wizard dialog that appears depends on the active channel. For example, if a Gain Compression channel is active, then the GCA Cal Wizard appears. Use meas.Activate to activate a measurement and channel.

Remote operation returns after the dialog is dismissed.

To invoke the Cal Wizard and have it return immediately, then use Syst:Corr:Wiz with the SCPI Parser object.

VB Syntax

```
app.LaunchDialog dialog, [data]
```

Variable (Type) - Description

- `app` An Application (object)
- `dialog` (String) Dialog box to launch. Choose from:
  - "SourcePowerCal" See this dialog.
  - "PowerMeterSettings" See this dialog.
  - "PathConfiguration" See this dialog.
  - "CalibrationWizard" Depends on the channel
  - "CalibrationSelection" See this dialog.
  - "CalibrateAll" launches the Cal All wizard dialog.
  - "ConfigurePowerSensors" Starts the external device dialog for configuring power sensors for use with PMAR

[data] (Optional argument) Reserved for future use.

Return Type

Not Applicable

Default

Not Applicable

Examples

```
app.LaunchDialog "SourcePowerCal"
```

C++ Syntax

```
LaunchDialog( BSTR dialog, [defaultvalue(0)] VARIANT dialogData)
```

Interface

IAplication11

See the VNA Object Model
LaunchPowerMeterSettingsDialog Method

<table>
<thead>

LoadConfiguration Method

Description

Loads the named configuration onto the specified channel.

**Note:** Loading a stored configuration will over-write MANY RF and IF path configuration settings. Make your measurement settings AFTER recalling a stored configuration, NOT before.

Use Configurations Method to return the configuration names that are stored on the VNA.

VB Syntax

`pathMgr.LoadConfiguration ch, name`

Variable (Type) - Description

- `pathMgr` PathConfigurationManager (object)
- `ch` (Long) Channel number of the configuration to be saved.
- `name` (String) Configuration name. "Default" is the default factory configuration.

Return Type

Not Applicable

Default

Not Applicable

Examples

`path.LoadConfiguration 2, "myMixer"`

C++ Syntax

`HRESULT LoadConfiguration (long channelNum, BSTR configName );`

Interface

IPathConfigurationManager
### LoadENRFile Method

<table>
<thead>
<tr>
<th>Description</th>
<th>Loads an ENR file from disk into VNA memory. This file is typically provided by the manufacturer of the noise source.</th>

</tbody>
</table>
LoadFile Method

Description
Loads a previously-configured mixer attributes file (.mxr)

**VB Syntax**  
`obj.LoadFile(filename)`

**Variable (Type) - Description**

- `obj`  
  A Mixer Interface pointer to the Measurement (object)

  Or

  A Converter Object

- `filename`  
  (String) Full path, file name, and .mxr extension of the mixer attributes file.

  Files are typically stored in "C:\Program Files(x86)\Keysight\Network Analyzer\Documents".

**Return Type**  
String

**Default**  
Not Applicable

**Examples**
```
mixer.LoadFile("D:\myMixer.mxr")
```

**C++ Syntax**  
`HRESULT LoadFile(BSTR newVal)`

**Interface**  
IMixer

IConverter
# LoadTheme Method

<table>
<thead>
<tr>
<th>Description</th>
<th>Load a color theme from a disc file.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>VB Syntax</strong></td>
<td><code>colors.LoadTheme (filename)</code></td>

</tbody>
</table>

# ManualTrigger Method

**Description**  
Triggers the analyzer when `TriggerSetup.Source = naTriggerManual`.  

*Note:* An SMC Fixed Output measurement cannot be triggered using this command. For more information, see the example program.

**VB Syntax**  
```vbnet
app.ManualTrigger [sync],[timeout]
```

**Variable**  
<table>
<thead>
<tr>
<th>(Type)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>app</code></td>
<td>An Application (object)</td>
</tr>
<tr>
<td><code>[sync]</code></td>
<td>(boolean) - Optional argument. A variable set to either True or False.</td>
</tr>
</tbody>
</table>

**timeout**  
(long) - Optional argument.  
If `sync` is true, `timeout` sets the amount of time the VNA will wait until continuing program execution. Units are milliseconds. A value of -1 (the default setting) causes the VNA to wait indefinitely.

If `sync` is False, the timeout setting is ignored.

**Return Type**  
Not Applicable

**Default**  
Not Applicable

**Examples**  
'After Manual trigger is executed, the VNA will wait 1 second to continue program execution'  
Dim `wait` as Boolean  
`wait = True`  
`app.ManualTrigger wait, 1000`

**C++ Syntax**  
```cpp
HRESULT ManualTrigger(VARIANT_BOOL bSynchronize, long timeout)
```

**Interface**  
IApplication
## Move Method

<tr>
<td><strong>Interface</strong></td>
<td>ITrace3</td>
</tr>
</tbody>
</table>
# NetworkPortMap Method

<table>
<thead>
<tr>
<th>Description</th>
<th>Set the port mapping for a 4-port SNP file to be embedded. To read port mapping, use <code>NetworkPortMapA</code>, <code>NetworkPortMapB</code>, <code>NetworkPortMapC</code>, <code>NetworkPortMapD</code>.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>VB Syntax</strong></td>
<td><code>fixture.NetworkPortMap network, inA, inB, outA, outB</code></td>
</tr>
</tbody>
</table>
| **Variable** | **(Type)** - **Description**  
  - `fixture` A Fixturing (object)  
  - `network` Network position. Choose from 1 or 2.  
  - `inA, inB, outA, outB` Port Mapping. Use four port numbers in any order. |
| **Return Type** | Not Applicable. |
| **Default** | 1,2,3,4 |
| **Examples** | `fixture.NetworkPortMap 1,1,3,2,4` |
| **Interface** | `IFixturing6` |
# NextIFBandwidth Method

**Description**  
A function that returns the Next higher IF Bandwidth value. Use to retrieve the list of available IFBandwidth settings.

**VB Syntax**  
`chan.Next_IFBandwidth bw`

**Variable**  
*(Type)* - Description  
- `chan`: A Channel *(object)*  
- `bw`: *(double)* - The argument that you use to send an IFBandwidth. The function uses this argument to return the Next higher IFbandwidth.

**Return Type**  
Double

**Default**  
Not Applicable

**Examples**  
Public `pnbw` As Double 'declare variable outside of procedure  

```
    pnBW = chan.IFBandwidth 'put the current IFBW in pnBW  
    chan.Next_IFBandwidth pnBW 'function returns the Next higher IFBandwidth.  
    chan.IFBandwidth = pnBW 'set IFBW to the Next value
```

**C++ Syntax**  
`HRESULT Next_IFBandwidth (double *pVal)`

**Interface**  
IChannel
**NumberofGroups Method**

**Description**
Sets the number of trigger signals the channel will receive. After the channel has received that number of trigger signals, the channel switches to Hold mode.

**VB Syntax**
`chan.NumberOfGroups num, sync`

**Variable (Type) - Description**
- `chan` A Channel (object)
- `num` (long integer) Number of trigger signals the channel will receive. Choose any number greater than 0.
- `sync` (boolean)

Variable set to either:

- **True** - subsequent commands are not processed until the groups are complete. Do not use with manual trigger.
- **False** - subsequent commands are processed immediately.

**Return Type**
Not Applicable

**Default**
Not Applicable

**Examples**
`chan.NumberOfGroups 5,False`

**C++ Syntax**
`HRESULT NumberOfGroups(long count, VARIANT_BOOL bWait)`

**Interface**
IChannel
This command is no longer necessary. The CalSet.get... and put... commands that required this command have been replaced.

Open the Cal Set to read/write a particular CalType. Learn more about reading and writing Cal Data using COM.

This method is a prerequisite to several other Cal Set methods.

A Cal Set can contain more than one CalType. This method opens the Cal Set and allows access to a particular set of terms. Subsequent commands like getErrorTerm use this information to access the correct error terms in the Cal Set. For example:

```vbnet
cset.OpenCalSet (naCalType_TwoPortSOLT, 3, 2)
cset.PutErrorTerm (naDirectivity, 1, 1, Buffer)
```

The directivity error term for port 1 could belong to any number of caltypes: Full1Port (S11), Full2Port (12), Full2Port (13) or Full3Port (123). The CalType and port specifiers in OpenCalSet directs the uploaded directivity term to the correct set of error terms.

To close the Cal Set, see CloseCalSet.

**VB Syntax**

```vbnet
calset.OpenCalSet (CalType, p1, p2, p3)
```

**Variable (Type) - Description**

- `calset` (object) - A Cal Set object
- `CalType` (enum as naCalType) - type of correction to be applied. Choose from:
Caltype

0 - naCalType_Response_Open
1 - naCalType_Response_Short
2 - *naCalType_Response_Thru
3 - *naCalType_Response_Thru_And_Isol
4 - naCalType_OnePort
5 - naCalType_TwoPort_SOLT
6 - naCalType_TwoPortTRL
7 - naCalType_None
8 - naCalType_ThreePort_SOLT
9 - Custom
10 - naCalType_FourPort_SOLT

* order of port arguments is significant for these CalTypes

p1 (long) - required. This argument must be specified.

This specifies either:
- the one significant port for an open/short response cal or a 1 port cal.
- or one of the ports involved in a 2 or 3 port cal
- or the receive port for a thru response / thru-isolation cal.

p2 (long) - required for any caltype involving more than one port

This specifies either:
- one of the ports involved in a 2 or 3 port cal (order independent)
- or the source port for a thru response / thru-isolation cal

p3 (long) - required only for 3 port cal

This specifies either:
- one of the ports involved in a 3 port cal (order independent)

Return Type
None

Default
Not Applicable

Examples
CalSet.OpenCalSet naCalType_ThreePort_SOLT, 3,2,1
C++ Syntax
HRESULT OpenCalSet ( naCalType, port1, [optional] port2, [optional] port3);

Interface
ICalSet
Open Method

Description
Initiates a VISA pass-through session for a device, and returns a unique session ID to be used whenever communicating with that device. Pass-through sessions can be closed by using the Close method, the Reset method, or by properly shutting down the instrument or the analyzer application. Presetting the instrument will not close existing pass-through sessions.

**Note:** When opening a socket session (addresses of type: “TCPIP[board]::host address::port::SOCKET”), you must use the appropriate VISA Address for the identifier argument. Using an alias to open a socket session is not currently supported. Aliases are allowed for all other types of supported sessions.

**VB Syntax**

```vbnet
value = Vpassthru.Open(identifier, timeoutVal)
```

**Variable (Type) - Description**

- `value` (long) - Variable to store the returned session ID.
- `Vpassthru` (object) - A VISAPassthrough object
- `identifier` (string) - VISA address, or VISA alias of the device to be controlled.
- `timeoutVal` (long) - The amount of time (in milliseconds) to wait for a response from the remote device after sending a command. A "timeout" error is displayed after this time has passed without a response.

**Return Type**
Long

**Default**
Not Applicable

**Examples**

```vbnet
value=Vpassthru.Open("TCPIP0::A-N5242A-10096::hislip1::INSTR",1000)
```

```vbnet
value=Vpassthru.Open("MyAlias",5000)
```

**C++ Syntax**

```c
HRESULT Open(BSTR visaIdentifier, long timeOut, long* sessionID)
```

**Interface**
IVISAPassthrough
## OutputSNPFromECal Method

**Description**
Read S parameter of ECal Thru from the ECal memory and save it as s2p file.

**VB Syntax**
```vbnet
ecalMdls.OutputSNPFromECal (kit, ecalstate, snpfile)
```

**Variable (Type) - Description**
- `ecalMdls` (object) - A ECalModules correction
  - `kit` (String) ECal Model, User char name + " ECal", and serial number of the ECal module used for the characterization, separated by spaces. See examples below.
- `ecalstate` (String) ECal transmission path. Choose from AB, AC, AD, BA, BC, BD, CA, CB, CD, DA, DB or DC.
- `snpfile` (String) Path and filename of the output s2p file name.

**Return Type**
IECalModules Set Interface

**Default**
Not Applicable

**Example**
```vbnet
ecalMdls.OutputSNPFromECal ("N4433A ECal 00001", "BC", "D:\ecalthru.s2p")
```

**C++ Syntax**
```cpp
HRESULT OutputSNPFromECal (BSTRkit, BSTR ecalstate, BSTR snpfile);
```

**Interface**
IECalModules2
## Parse Method

<table>
<thead>
<tr>
<th>Description</th>
<th>Allows the use of COM to send a SCPI command. See a C++ example of how to return error information when using this command.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Note:</strong></td>
<td>The SCPIStringParser Methods can NOT be used with SCPI Status Reporting. However, the *OPC? will work.</td>
</tr>
</tbody>
</table>

### VB Syntax

```
scpi.Parse("SCPI command")
```

### Variable

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>scpi</code></td>
<td>A ScpiStringParser (object)</td>
</tr>
<tr>
<td><code>SCPI command</code></td>
<td>(string) - Any valid SCPI command</td>
</tr>
</tbody>
</table>

### Return Type

String

### Default

Not Applicable

### Examples

```vbnet
Dim scpi As ScpiStringParser
Set scpi = app.ScpiStringParser
Dim startfreq As Double
startfreq = 100e6
's
scpi.Parse "Sens:Freq:Start " & startfreq'Write

Dim str As String
str = scpi.Parse ("Sens:Freq:Start?")'Read
```

### C++ Syntax

```
HRESULT Parse(BSTR SCPI_Command, BSTR *pQueryResponse)
```

### Interface

IScpiStringParser
### Preset Method

<table>
<thead>
<tr>
<th>Description</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Application Object:</strong> Deletes all traces and windows. In addition, resets the analyzer to factory defined default settings and creates an S11 measurement named &quot;CH1_S11_1&quot; in window 1.</td>
<td></td>
</tr>
<tr>
<td><strong>Channel Object:</strong> Resets the channel (object) to factory defined default settings. Does NOT delete the current measurements or add a new measurement.</td>
<td></td>
</tr>
</tbody>
</table>

**VB Syntax**

```vbnet
app.Preset
chan.Preset
```

**Variable**

- **app** An Application (object)
- **chan** A Channel (object)

**Return Type** Not Applicable

**Default** Not Applicable

**Examples**

```vbnet
app.Preset
```

**C++ Syntax**

```c++
HRESULT Preset()
```

**Interface**

IApplication
IChannel
### PreviousIFBandwidth Method

**Description**
A function that returns the previous IF Bandwidth value. Use to retrieve the list of available IFBandwidth settings.

**VB Syntax**
```
chan.Previous_IFBandwidth bw
```

**Variable**
- **(Type)** - Description
  - `chan` A Channel (object)
  - `bw` (double) - The argument that you use to send an IFBandwidth. The function uses this argument to return the previous IFBandwidth.

**Return Type**
Double

**Default**
Not Applicable

**Examples**
```
Public pnbw As Double 'declare variable outside of procedure
PreBW = chan.IFBandwidth 'put the current IFBW in PreBW
chan.Previous_IFBandwidth PreBW 'function returns the Previous IFBandwidth of the current one.
chan.IFBandwidth = PreBW 'set IFBW to the previous value
```

**C++ Syntax**
```
HRESULT Previous_IFBandwidth (double *pVal)
```

**Interface**
IChannel
## PrintToFile Method

<table>
<thead>
<tr>
<th>Description</th>
<th>Saves the screen image to a bitmap file.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>VB Syntax</strong></td>
<td><code>app.PrintToFile filename</code></td>
</tr>
</tbody>
</table>

### Variable (Type) - Description

- **app** An Application *(object)*
- **filename (string)** Full path, file name, and extension of the screen image file.

Files are typically stored in "D:\".

Use one of the following extensions:

- .bmp - not recommended due to large file size
- .jpg - not recommended due to poor quality
- .png - recommended

### Return Type

Not Applicable

### Default

Not Applicable

### Examples

```vbnet
app.PrintToFile "D:\myfile.png"
```

### C++ Syntax

`HRESULT PrintToFile(BSTR bstrFile)`

### Interface

IAplication
### PutComplex Method

**Description**

Puts real and imaginary data into the specified location. This method forces the channel into Hold mode to prevent the input data from being overwritten. Learn more about [reading and writing Cal Data using COM](#).

Data put in the raw data store will be **re-processed** whenever a change is made to the measurement attributes such as format or correction.

Data put in the measurement results store will be **overwritten** by any measurement attribute changes.

See also [putNAComplex](#)

**VB Syntax**

```
measData.putComplex location, numPts, real(), imag(), [format]
```

<table>
<thead>
<tr>
<th>Variable</th>
<th>(Type) - Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>measData</td>
<td>An IArrayTransfer interface which supports the Measurement object</td>
</tr>
<tr>
<td>location</td>
<td>(enum NADataStore) Where the Data will be put. Choose from:</td>

</tr>
<tr>
<td></td>
<td>2 - naMeasResult</td>
</tr>
<tr>
<td></td>
<td>3 - naRawMemory</td>
</tr>
<tr>
<td></td>
<td>4 - naMemoryResult</td>
</tr>
<tr>
<td></td>
<td>5 - naDivisor - When reading data from, or writing data to, the normalization divisor, you must first create a divisor trace using DataToDivisor Method.</td>
</tr>
<tr>
<td>numPts</td>
<td>(long integer) - Number of data points in the channel</td>
</tr>
<tr>
<td>real()</td>
<td>(single) - Array containing real data values</td>
</tr>
<tr>
<td>imag()</td>
<td>(single) - Array containing imaginary data values</td>
</tr>
<tr>
<td>format</td>
<td>(enum NADataFormat) optional argument - display format of the real and imaginary data. Only used if destination is naMeasResult or naMemoryResult buffer. If unspecified, data is assumed to be in naDataFormat_Polar</td>
</tr>
<tr>
<td></td>
<td>0 - naDataFormat_LinMag</td>
</tr>
<tr>
<td></td>
<td>1 - naDataFormat_LogMag</td>
</tr>
</tbody>
</table>
Learn more about Data Format.

**Return Type**
Not Applicable

**Default**
Not Applicable

**Examples**
Dim measData As IArrayTransfer
Set measData = app.ActiveMeasurement
measData.putComplex naMemoryResult, 201, 
real(0), imag(0), naDataFormat_SWR

**C++ Syntax**
HRESULT putComplex( tagNADataStore DataStore, long lNumValues, float* pReal, float* pImag, tagDataFormat displayFormat)

**Interface**
IArrayTransfer
PutDataComplex Method

Description
Puts complex data into the specified location. This method forces the channel into Hold mode to prevent the input data from being overwritten.

VB Syntax
meas.putDataComplex location, data

Variable (Type) - Description
meas A measurement (object)
location (enum NADataStore) Where the Data will be put. Choose from:

0 - naRawData
1 - naCorrectedData
2 - naMeasResult - Valid ONLY when the display format is either Polar or Smith Chart.
3 - naRawMemory - See note below.
4 - naMemoryResult
5 - naDivisor - When reading data from, or writing data to, the normalization divisor, you must first create a divisor trace using DataToDivisor Method.

Note: When putting data into 3 - naRawMemory:

1. Put the analyzer in hold mode
2. Call DataToMemory to initialize a memory buffer
3. Call putDataComplex(naRawMemory, data)

This ensures that the memory buffer is appropriately initialized before receiving new data.

data (variant) - A two-dimensional variant array.

Note: All buffers except naMeasResult and naMemoryResult require Complex data

Return Type Not Applicable
Examples

' Put 201 points worth of raw (complex) data into the measurement
' Note that an array of complex numbers is represented by a 2-D array where the first rank is the number of points, and the 2nd rank is always size 2 (max index 1) representing the Real and Imag parts of the complex number.

' complex array of data (2nd dimension of size 2 represents Re/Im
Dim data(200,1) 
For i = 0 to 200
' Set Real part of data point i
data(i,0) = i/200;
' Set Imag part of data point i
data(i,1) = i/200;
Next
app.ActiveMeasurement.putDataComplex naRawData, data

C++ Syntax
HRESULT putDataComplex(tagNADataStore DataStore, VARIANT complexData)

Interface
IMeasurement
### PutENRData Method

PutErrorTerm Method - Superseded

Description

Note: This command is replaced by PutErrorTermByString

Puts variant error term data into the error-correction buffer. If this command is being used to modify a calset that is currently in use by the channel, you must send the following commands to see the effects of the change:

Calset::Save
Channel::ErrorCorrection = false
Channel::ErrorCorrection = true

Learn about reading and writing Calibration data.

VB Syntax

```
cal.putErrorTerm(term,rcv, src, data)
```

Variable (Type) - Description

- `cal` A Calibrator (object)
- `term` (enum As NaErrorTerm)
- `rcv` (long integer) - Receiver Port
- `src` (long integer) - Source Port
- `data` (variant) Error term data in a two-dimensional array (0:1, 0:numpts-1).
<table>

</table>

**Return Type**: Not Applicable

**Default**: Not Applicable

**Examples**

```vbnet
Dim varError As Variant
varError = cal.putErrorTerm(naErrorTerm_Tracking, 2, 1, VarData)
```

**C++ Syntax**

```cpp
HRESULT putErrorTerm(tagNAErrorTerm ETerm, long ReceivePort, long SourcePort, VARIANT varData)
```

**Interface**

ICalibrator
### PutErrorTerm Method **Superseded**

**Description**

This command is replaced with **PutErrorTermByString**

Puts error term data into the Cal Set.

Learn more about Reading and Writing Cal Data

See examples of Reading and Writing Cal Set Data

**VB Syntax**

```
CalSet.putErrorTerm (term, rcv, src, data)
```

**Variable (Type) - Description**

- **CalSet** (Object) A CalSet Object
- **term** (enum As NaErrorTerm2) Error Term. Choose from:
  0 - naET_Directivity  (src = rcv)
  1 - naET_SourceMatch  (src = rcv)
  2 - naET_ReflectionTracking (src = rcv)
  3 - naET_TransmissionTracking (src ≠ rcv)
  4 - naET_LoadMatch (src ≠ rcv)
  5 - naET_Isolation (src ≠ rcv)
- **rcv** (long integer) - Receiver Port
- **src** (long integer) - Source Port
- **data** (variant) Error term data in a two-dimensional array (0:1, 0:numpts-1). The data must be complex pairs.

**Note:** See also **PutErrorTermComplex** on the ICalData2 interface to avoid using the variant data type.

**Return Type**

Not Applicable

**Default**

Not Applicable

**Examples**

See an Example

**C++ Syntax**

```
HRESULT putErrorTerm(tagNAErrorTerm2 ETerm, long ReceivePort, long SourcePort, VARIANT varData)
```

**Interface**

ICalSet
PutErrorTermByString Method

Description
Puts error term data into the Cal Set. If this command is being used to modify a calset that is currently in use by the channel, you must send the following commands to see the effects of the change:

Calset::Save
Channel::ErrorCorrection = false
Channel::ErrorCorrection = true

Learn more about Reading and Writing Cal Data
See examples of Reading and Writing Cal Set Data

VB Syntax
`calSet.PutErrorTermByString(errorName, vdata)`

Variable (Type) - Description
- `calSet` (Object) A CalSet Object
- `errorName` (String) The string name used to identify a particular error term in the Cal Set. An example string for port 3 directivity in a full 2 port cal might be "Directivity(3,3)". To determine the string names of error terms, see GetErrorTermList2.
- `vdata` (Variant) This data array is usually two dimensional. Each element is a type single. The two elements represent the real and imaginary parts of a complex pair.

Note: This structure is compatible with scripting clients who can only use variants. For alternative methods that use typed arrays, see ICalData3.

Return Type
Not Applicable

Default
Not Applicable

Examples

Default  Not Applicable

Examples  

```
Dim eData As ICalData2
Set eData = app.GetCalManager.Cal Sets.Item(1)
eData.putErrorTermComplex naET_LoadMatch, 1, 2, numpts, rel(0), img(0)
```
C++ Syntax
HRESULT putErrorTermComplex(tagNAErrorTerm2 ETerm, long ReceivePort, long SourcePort, long* pNumValues, float* pReal, float* pImag)

Interface
ICalData2
PutErrorTermComplexByString Method

Description
Puts error term data into the Cal Set.

Learn more about Reading and Writing Cal Data

See examples of Reading and Writing Cal Set Data

VB Syntax
ICalData3.PutErrorTermComplexByString errorName, InumPoints, real(0), imag(0)

Variable (Type) - Description

ICalData3 An ICalData3 pointer to a Cal Set object.

errorName (String) The string name used to identify a particular error term in the Cal Set.
An example string for port 3 directivity in a full 2 port cal might be "Directivity(3,3)". To determine the string names of error terms, see GetErrorTermList2.

InumPoints (Long) The number of data points in the real and imaginary arrays.

real (Single) The real component of the complex data.

imag (Single) The imaginary component of the complex data.

Note: The size of the real and imaginary arrays should be the same.

Return Value Not Applicable

Default Not Applicable

Examples See example

C++ Syntax
HRESULT PutErrorTermComplexByString( BSTR bufferName, long InumPoints, float* real, float* imag);

Interface ICalData3
**PutErrorTermStimulus Method**

**Description**
Adds stimulus data to the specified buffer. The size of vdata must agree with the size of the complex data already attached to the buffer or an error will be generated.

See Also: GetErrorTermStimulus Method

Learn more about Reading and Writing Cal Data

See examples of Reading and Writing Cal Set Data

**VB Syntax**

```vbnet
calSet.PutErrorTermStimulus(bufferName, vdata)
```

**Variable**

- **calSet** *(Object)* - A CalSet Object
- **bufferName** *(String)* - The string name used to identify a particular error term in the Cal Set. An example string for port 3 directivity in a full 2 port cal might be "Directivity(3,3)". To determine the string names of error terms, see GetErrorTermList2.
- **vdata** *(Variant)* - Safearray of variants (doubles).

**Return Type**
Not Applicable

**Default**
Not Applicable

**Examples**

The sequence is:

```vbnet
complexData = calset1.GetErrorTermByString(0, BufferName)
frequencyData = calset1.GetErrorTermStimulus(0,BufferName)
// manipulate complex data here
Calset2.PutErrorTermByString(BufferName, manipulatedComplexData)
Calset2.PutErrorTermStimulus(BufferName, frequencyData);
```

**C++ Syntax**

```cpp
HRESULT PutErrorTermStimulus (BSTR bufferName, VARIANT vardata)
```

**Interface**
ICalSet7
PutScalar Method

Description
Puts Scalar data in the Measurement Result buffer. The putScalar array is not processed by the analyzer; it is just displayed. Any change to the measurement state (changing the format, for example) will cause the putScalar data to be overwritten with the data processed from the raw data buffer.

VB Syntax
measData.putScalar, format, numPts, data

Variable (Type) - Description

measData
An IArrayTransfer interface which supports the Measurement object.

format (enum NADeataFormat) Format of the data. Choose from:

0 - naDataFormat_LinMag
1 - naDataFormat_LogMag
2 - naDataFormat_Phase
3 - naDataFormat_Polar
4 - naDataFormat_Smith
5 - naDataFormat_Delay

9 - naDataFormat_PhaseUnwrapped
10 - naDataFormat_InverseSmith
11 - naDataFormat_Kelvin
12 - naDataFormat_Fahrenheit
13 - naDataFormat_Centigrade

Learn more about Data Format.
**Note:** Smith, InverseSmith, and Polar formats are not allowed.

- **numPts** *(integer)* - Number of values. Usually the number of points in the trace (chan.NumberOfPoints).

- **data** *(single)* - A one-dimensional array of Scalar data matching the number of points in the current measurement.

**Return Type** Not Applicable

**Default** Not Applicable

**Examples**

```vbnet
Dim measData As IArrayTransfer
Set measData = app.ActiveMeasurement
measData.putScalar naDataFormat_LogMag, 201, dScalar(0)
```

**C++ Syntax**

```cpp
HRESULT putScalar(tagDataFormat eFormat, long lNumValues, float* pArrayOfScalar)
```

**Interface** IArrayTransfer
PutNAComplex Method

Description
Puts complex data into the specified location. This method forces the channel into Hold mode to prevent the input data from being overwritten. The data is processed and displayed.

Data put in the naRawData store will be **re-processed** whenever a change is made to the measurement attributes such as format or correction.

Data put in the naMeasResult store will be **overwritten** by any measurement attribute changes (such as moving a marker).

**Note:** This method uses NAComplex which is a user-defined data type. If you cannot or prefer not to use this data type, use the **putComplex** method.

### VB Syntax

```vbnet
measData.putNAComplex location, numPts, data, [format]
```

### Variables

- **measData** (An IArrayTransfer interface which supports the Measurement object)
- **location** (enum **NADataStore**) Where the Data will be put. Choose from:
  - 0 - naRawData
  - 1 - naCorrectedData
  - 2 - naMeasResult
  - 3 - naRawMemory
  - 4 - naMemoryResult
  - 5 - naDivisor - When reading data from, or writing data to, the normalization divisor, you must first create a divisor trace using **DataToDivisor** Method.
- **numPts** (long integer) - Number of data points in the channel
- **data** (NAComplex) - A one-dimensional array of Complex data matching the number of points in the current measurement.
- **format** (enum **NADataFormat**) - Optional argument. Format of the data. If unspecified, naDataFormat_Polar is assumed. Only used when the destination store is naMeasResult or naMemoryResult.
  - 0 - naDataFormat_LinMag
1 - naDataFormat_LogMag
2 - naDataFormat_Phase
3 - naDataFormat_Polar
4 - naDataFormat_Smith
5 - naDataFormat_Delay
6 - naDataFormat_Real
7 - naDataFormat_Imaginary
8 - naDataFormat_SWR
9 - naDataFormat_PhaseUnwrapped
10 - naDataFormat_InverseSmith
11 - naDataFormat_Kelvin
12 - naDataFormat_Fahrenheit
13 - naDataFormat_Centigrade

Learn more about Data Format.

Return Type  Not Applicable
Default       Not Applicable
Examples
Dim measData As IArrayTransfer
Set measData = app.ActiveMeasurement
measData.putNAComplex naMemoryResult, 201, dRawComplex(0)

C++ Syntax  HRESULT putNAComplex(tagNADataStore DataStore, long lNumValues, TsComplex* pArrayOfComplex, tagDataFormat displayFormat)

Interface  IArrayTransfer
**put_Output Method**

**Description**
Writes a TTL HI or TTL Low to output pins 3 or 4 of the Material Handler IO connector.

Each pin also has a latched output which is written to with USER. With the latched (USER) outputs, the value is not applied to the associated pin until a positive edge is detected at INPUT1 (pin 2).

**VB Syntax**

```vbnet
handlerIo.put_Output (pin) = value
```

**Variable (Type) - Description**

- **handlerIo** *(object)* - A HandlerIO object
- **pin** *(enum as NAMatHandlerOutput)* - pin to write data to. Choose from:
  - `naOutput1` - (0) - pin3
  - `naOutput1User` - (1) - pin3 latched (applied to pin 3 on positive edge of Input1-pin2)
  - `naOutput2` - (2) - pin4
  - `naOutput2User` - (3) - pin4 latched (applied to pin 4 on positive edge of Input1-pin2)
- **value** *(Variant)* - Value to write to the selected pin. Choose from
  - 0 - TTL LOW
  - 1 - TTL HIGH

**Return Type**
Not Applicable

**Default**
0

**Examples**
```
handlerIo.put_Output(naOutput1)= 1
```

**C++ Syntax**

```
HRESULT put_Output ( tagNAMatHandlerOutput Output, VARIANT Data );
```

**Interface**
IHWMaterialHandlerIO
## put_OutputVoltage Method

**Description**

**E836x and PNA-L:** Sets voltages on the DAC/Analog Output 1|2 of the Auxiliary IO connector.

**PNA-X:** Sets voltage on the Power I/O connector AnalogOut1|2.

Read output voltages using `get_OutputVoltage Method`.

**Note:** The 9-pin PWR I/O (Power I/O) D connector on the rear-panel replaces much of the functionality of the AUX I/O connector on older VNA models. The Power I/O voltages can be set using the following methods:

- **CONTrol:AUXiliary:OUTPut:VOLTage** or `put_OutputVoltage Method` (no GUI equivalent, global scoped, and settings not saved as part of the instrument state)
- **SOURce:DC:START** and **SOURce:DC:STOP** (DC Source dialog is the GUI equivalent, channel scoped, and settings saved as part of the instrument state)
- **Interface Control dialog** (no remote equivalent, channel scoped, and settings saved as part of the instrument state)

To avoid unexpected behavior, choose one method only to set the Power I/O voltages.

### VB Syntax

```vb
AuxIO.put_OutputVoltage output, voltage
```

### Variable (Type) - Description

- **AuxIO** *(object)* - A Hardware Auxiliary Input / Output object
- **output** *(variant)* - Number of the output DAC to write voltage to. Choose from:
  - 1 Output 1 (Aux I/O pin 3) and (Power I/O pin 3)
  - 2 Output 2 (Aux I/O pin 2) and (Power I/O pin 4)
- **voltage** *(double)* - Voltage to write to the output DAC. Choose a voltage from -10 to 10

### Return Type

None

### Default

None

### Examples

```
HWAuxIO.put_OutputVoltage 1, 9 'set Analog Out1 to +9v
```

### C++ Syntax

```cpp
HRESULT put_OutputVoltage (VARIANT Output, double Voltage );
```

### Interface

IHWAuxIO
Write-only

put_OutputVoltageMode Method

<table>
<thead>
<tr>
<th>Description</th>
<th>This command sets the mode of the selected &quot;Analog Out&quot; line on the Power I/O connector. The modes give the user the option to have the requested voltage applied immediately or not until the sweep is done. To read the mode on each output use get_OutputVoltageMode Method.</th>

**put_Port Method**

**Description**
Writes a value to the specified port. Use the `get_Port` Method to read the settings from the "readable" ports (C, D, E).

**VB Syntax**
```vb
handlerIo.put_Port (port, value)
```

**Variable**

- **handlerIo** *(object)* - A HandlerIO object
- **port** *(enum as NAMatHandlerPort)* - port to put data into. Choose from:
  - `naPortA` - (0)
  - `naPortB` - (1)
  - `naPortC` - (2)
  - `naPortD` - (3)
  - `naPortE` - (4)
  - `naPortF` - (5)
  - `naPortG` - (6)
  - `naPortH` - (7)
- **value** The number of the data bits to set. The following table shows what the `value` represents:

  **Note:** When writing to port G, port C must be set to output mode
  When writing to port H, both port C and port D must be set to output mode. Use Port Mode Property

</tbody>
</table>

**Return Type**
Not Applicable

**Default**
Not Applicable

**Examples**
handlerIo.put_Port(naPortB, 1)

**C++ Syntax**
HRESULT put_Port ( tagNAMatHandlerPort Port, VARIANT Data );

**Interface**
IHWMaterialHandlerIO
Write-only

**put_PortCData Method**

**Description**
Writes a 4-bit value to Port C on the Aux I/O connector (pins 22-25) and the Material Handler IO (pins 21-24 Anritsu) - (pins 22-25 Avantest).

**Note:** These lines are connected to both the Handler IO and Aux IO in the VNA. Therefore, this command will affect both of these connectors in the same way.

**VB Syntax**

```
AuxIO.put_PortCData num
```

**Variable**

- **AuxIO** *(object)* - A Hardware Auxiliary Input / Output object
- **num** *(variant)* - 4 bit binary value. Choose from 0-15

**Return Type**
None

**Default**
None

**Examples**

```
HWAuxIO.put_PortCData 15  'If Positive Logic, Port C lines C0, C1, C2, C3 go High. If Negative Logic, they go Low.
```

**C++ Syntax**

```
HRESULT put_PortCData( VARIANT Data );
```

**Interface**
IHWAuxIO
PutDataScalar Method

Description

Puts formatted variant scalar data into the measurement result buffer. The data will be immediately processed and displayed. Subsequent changes to the measurement state will be reflected on the display.

Always precede this command by setting the format on the measurement to be consistent with the format of the data being sent to the analyzer. In this way, the display annotation will be correct.

Execution of this command does not change the display format.

VB Syntax

`meas.putDataScalar format, data`

Variable (Type) - Description

meas A measurement (object)

format (enum NADataFormat) Format of the data. This value is presently ignored by the VNA. Data is always presented in the current format.

Choose from:

0 - naDataFormat_LinMag
1 - naDataFormat_LogMag
2 - naDataFormat_Phase
3 - naDataFormat_Polar
4 - naDataFormat_Smith
5 - naDataFormat_Delay
6 - naDataFormat_Real
7 - naDataFormat_Imaginary
8 - naDataFormat_SWR
9 - naDataFormat_PhaseUnwrapped
10 - naDataFormat_InverseSmith
11 - naDataFormat_Kelvin
12 - naDataFormat_Fahrenheit
13 - naDataFormat_Centigrade

**Notes:**

- The `getData` (variant) method includes a "format" argument, which allows scalar (one-dimensional) data. To put data back into the "raw" data buffer using this (putDataComplex) method, specify Polar format when using the `getData` method.

- **Phase** format accepts data in radians (not degrees) and displays in degrees. To convert to degrees: radians * (57.29577951308233) = degrees. The `getData` method returns degrees if the request is for phase data.

`data` (variant) - A 1-dimension array of single precision floating point numbers.

**Return Type** Not Applicable

**Default** Not Applicable

**Examples**

```
' Put 201 points worth of scalar data into the measurement
' 200 is max index, so 0 to 200 is 201 points
Dim data(200) ' array of 201 (scalar) data points
' Fill the array
For i = 0 to 200
data(i) = i/200
Next
app.ActiveMeasurement.putDataScalar 0, data
```

**C++ Syntax**

```cpp
HRESULT putDataScalar(tagNADataStore DataStore, VARIANT scalarArray)
```

**Interface** I Measurement
PutShortcut Method

Description
Defines a Macro (shortcut) file in the analyzer. This command links a file name and path to the Macro file. The file must be put in the VNA at the location indicated by this command.

VB Syntax

```vbnet
app.PutShortcut index,title,path, arguments
```

Variable

<table>
<thead>
<tr>
<th>Variable</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>app</td>
<td>An Application (object)</td>
<td></td>
</tr>
<tr>
<td>index</td>
<td>(long)</td>
<td>Number of the macro to be stored in the analyzer. Use a number between 1 and 25. If the index number already exists, the existing macro is replaced with the new macro.</td>
</tr>
<tr>
<td>title</td>
<td>(string)</td>
<td>The name to be assigned to the macro</td>
</tr>
<tr>
<td>path</td>
<td>(string)</td>
<td>Full path, file name, and extension of the existing macro &quot;executable&quot; file.</td>
</tr>
<tr>
<td>arguments</td>
<td>(string)</td>
<td>Arguments that may be required for the specified macro to run.</td>
</tr>
</tbody>
</table>

Return Type
Not Applicable

Default
Not Applicable

Examples
```vbnet
app.PutShortcut 1,"Test","C:/Automation/MyTest.vbs",""
```

C++ Syntax

```cpp
HRESULT PutShortcut(long Number, BSTR title, BSTR path, BSTR arguments)
```

Interface
IApplication
putSourcePowerCalDataEx Method

Description

**Note:** This method replaces putSourcePowerCalData Method

Inputs source power calibration data (as variant data type) to this channel for a specific source port.

The effect from this command on the channel is immediate. Do NOT send ApplyPowerCorrectionValuesEX after this command as it may invalidate the uploaded data.

If the channel is sweeping the source backwards, then the first data point is the highest frequency value; the last data point is the lowest. Use the Get X-Axis Values command to return the X-axis values in the displayed order.

The calibration is not valid if the current number of points on the channel is not equal to the number of values that were input.

**Note:** This method sends variant data which is less efficient than methods available on the ISourcePowerCalData interface.

VB Syntax

```vbnet
chan.putSourcePowerCalDataEx buffer, srcPort, data
```

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>chan</td>
<td>(object) – A Channel object</td>
</tr>
<tr>
<td>buffer</td>
<td>(enum NASourcePowerCalBuffer) - The source power cal data buffer to write to.</td>
</tr>
<tr>
<td>srcPort</td>
<td>(long integer) – The source port for which calibration data is being requested.</td>
</tr>
<tr>
<td>data</td>
<td>(variant) – Array of source power cal data being input.</td>
</tr>
</tbody>
</table>

Return Type  None

Default Not Applicable

Examples

```vbnet
chan.putSourcePowerCalDataEx naCorrectionValues, 1, varData
```
C++ Syntax  HRESULT putSourcePowerCalDataEx(tagNASourcePowerCalBuffer bufSelect, long sourcePort, VARIANT varData);

Interface  IChannel4
putSourcePowerCalDataScalarEx Method

Description

Note: This method replaces putSourcePowerCalDataScalar Method

Inputs source power calibration data (as scalar values) to this channel for a specific source port.

The effect from this command on the channel is immediate. Do NOT send ApplyPowerCorrectionValuesEX after this command as it may invalidate the uploaded data.

If the channel is sweeping the source backwards, then the first data point is the highest frequency value; the last data point is the lowest. Use the Get X-Axis Values2 command to return the X-axis values in the displayed order.

VB Syntax

```vbnet
chanData.putSourcePowerCalDataScalarEx buffer, srcPort, numValues, data
```

Variable (Type) - Description

**chanData** (interface) – An ISourcePowerCalData2 interface on the Channel (object)

**buffer** (enum NASourcePowerCalBuffer) - The source power cal data buffer to write to.

- **0 - naCorrectionValues** This is the only buffer currently available.

**srcPort** (long integer) – The source port for which calibration data is being input.

Note: If the port is defined by a string name, such as an external source, a balanced port, or one of the Source 2 outputs on the 2-port 2-source VNA-x model, then you must use chan.getPortNumber to translate the string into a port number. To learn more see Remotely Specifying a Source Port.

**numValues** (long integer) – Number of data values being input.

Note: If this does not equal the current number of points on the channel, the calibration will not be valid.

**data** (single) – Array of source power cal data being input.

Return Type

None

Default

Not Applicable
Dim chanData As ISourcePowerCalData2
Set chanData = app.ActiveChannel
chanData.putSourcePowerCalDataScalarEx naCorrectionValues, 1, 201, scalarCalValues(0)

HRESULT putSourcePowerCalDataScalarEx(tagNASourcePowerCalBuffer bufSelect, long sourcePort, long numValues, float *pData);

Interface ISourcePowerCalData2
PutStandard Method  **Superseded**

**Description**

This command is replaced with PutStandardByString

Puts standard acquisition data into the Cal Set.

Learn more about Reading and Writing Cal Data

See examples of Reading and Writing Cal Set Data.

**VB Syntax**

`CalSet.putStandard class, rcv, src, data`

**Variable (Type) - Description**

*CalSet* (object) - A Cal Set object

*class* (enum NACalClass) Standard. Choose from:

1 - naClassA
2 - naClassB
3 - naClassC
4 - naClassD
5 - naClassE
6 - naReferenceRatioLine
7 - naReferenceRatioThru

**SOLT Standards**

1 - naSOLT_Open
2 - naSOLT_Short
3 - naSOLT_Load
4 - naSOLT_Thru
5 - naSOLT_Isolation

**TRL Standards**

1 - naTRL_Reflection
2 - naTRL_Line_Reflection
3 - naTRL_Line_Tracking
4 - naTRL_Thru
5 - naTRL_Isolation

*rcv* (long) - Receiver Port
**src** (long) - Source Port

**data** (variant) Error term data in a two-dimensional array (0:1, 0:numpts-1). The data must be complex pairs.

**Note:** See also Put Standard Complex on the ICalData2 interface to avoid using the variant data type.

**Return Type** Not Applicable

**Default** Not Applicable

**Examples** See an Example

**C++ Syntax** HRESULT putStandard(tagNACalClass stdclass, long ReceivePort, long SourcePort, VARIANT varData)

**Interface** ICalSet
PutStandardByString

**Description**  Puts standard acquisition data into the Cal Set.

Learn more about Reading and Writing Cal Data

See examples of Reading and Writing Cal Set Data.

**VB Syntax**  

```
PutStandardByString(stdName, vdata)
```

**Variable**

**stdName**  (String)  The string used to identify a particular standard in the Cal Set. An example string requesting the data for the Load standard in a full 2 port cal might be "S11C(3,3)".

**vdata**  (Variant)  The variant containing a safearray of variants. This data is usually two dimensional.

**Note:** The vardata array is a safearray of variants wrapped in a variant. This structure is compatible with scripting clients who can only use variants. For alternative methods that used typed arrays, see ICalData3.

**Return Type**  Not Applicable

**Default**  Not Applicable

**Examples**  See an Example

**C++ Syntax**  

```
HRESULT PutStandardByString(BSTR bufferName, VARIANT vdata);
```

**Interface**  ICalSet2
PutStandardComplex Method  **Superseded**

**Description**
This command is replaced with **PutStandardComplexByString**

Puts standards acquisition data into the Cal Set.

Learn more about Reading and Writing Cal Data

See examples of Reading and Writing Cal Set Data

**VB Syntax**

```
ICalData2.putStandardComplex class, rcv, src, numPts, real(), imag()
```

**Variable**

- **ICalData2** An ICalData2 pointer to the Cal Set object
- **class** (enum NACalClass) Standard. Choose from:
  1 - naClassA
  2 - naClassB
  3 - naClassC
  4 - naClassD
  5 - naClassE
  6 - naReferenceRatioLine
  7 - naReferenceRatioThru

**SOLT Standards**
  1 - naSOLT_Open
  2 - naSOLT_Short
  3 - naSOLT_Load
  4 - naSOLT_Thru
  5 - naSOLT_Isolation

**TRL Standards**
  1 - naTRL_Reflection
  2 - naTRL_Line_Reflection
  3 - naTRL_Line_Tracking
  4 - naTRL_Thru
  5 - naTRL_Isolation

- **rcv** (long) - Receiver Port
**src** (long) - Source Port

**numPts** (long) - The number of data points in the real and imaginary arrays.

**real()** (single) - one-dimensional array containing the real part of the acquisition data. (0:points-1)

**imag()** (single) - one-dimensional array containing the imaginary part of the acquisition data. (0:points-1)

**Return Type** Not Applicable

**Default** Not Applicable

**Examples**

```cpp
Dim sdata As ICalData2
Set sdata = calmanager.CreateCal Set( 1 )
sdata.putStandardComplex naSOLT_Open, 1, 1, numpts, rel(0),
    img(0)
```

**C++ Syntax**

```cpp
HRESULT putStandardComplex(tagNACalClass stdclass, long ReceivePort,
    long SourcePort, long lNumValues, float* pReal, float* pImag)
```

**Interface** ICalData2
PutStandardComplexByString

**Description**

Puts standard acquisition data into the Cal Set.

Learn more about [Reading and Writing Cal Data](#).

See examples of [Reading and Writing Cal Set Data](#).

**VB Syntax**

```vbnet
ICalData3.PutStandardComplexByString(stdName, lnumPoints, real(o), imag(0))
```

**Variable**

| **Variable** | *(Type) - Description*  
  *value (variant) - Variable to store the returned data.*  
  *Vpassthru (object) - A VISAPassthrough object*  
  *visaID (long) VISA session number (see Open method).* |
| **Return Type** | Safe Array of variants |
| **Default** | Not Applicable |
| **Examples** | `value=Vpassthru.ReadBinary(1)` |
| **C++ Syntax** | `HRESULT ReadBinary(long session_num)` |
| **Interface** | IVISAPassthrough |
## ReadBinaryCompact Method

**Description**
Reads binary data the same as the `ReadBinary` method, but returns the data in a more compact form of Safe Array. This is significantly faster but is not supported in all client environments. Note that binary data transfers over sockets are not supported.

**VB Syntax**

```vbnet
value = Vpassthru.ReadBinaryCompact(visaID)
```

**Variable**

- `value` *(variant)* - Variable to store the returned data.
- `Vpassthru` *(object)* - A VISAPassthrough object
- `visaID` *(long)* - VISA session number (see Open method).

**Return Type**
Safe Array of variants

**Default**
Not Applicable

**Examples**

```vbnet
value = Vpassthru.ReadBinaryCompact(1)
```

**C++ Syntax**

```cpp
HRESULT ReadBinaryCompact(long session_num)
```

**Interface**

About the ExtTestSetIO connector

ReadData Method

Description  Reads a 13-bit data word from the specified address. Data is read using the AD0 through AD12 lines of the external test set connector. The instrument generates the appropriate timing signals. It automatically controls timing signals LDS, LAS and RLW to strobe the address, and then read the data, from the external test set. See the timing diagram for Address and Data I/O read.

VB Syntax  

    value = ExtIO.ReadData (address)

Variable  

    value  (variant) - Variable to store the returned data
    ExtIO  (object) - An ExternalTestSetIO object
    address  (variant) - address to read data from.

Return Type  Variant

Default  Not Applicable

Examples  

    value = ExtIO.ReadData (15)

C++ Syntax  

    HRESULT ReadData (VARIANT Address, VARIANT* Data);

Interface  IHWExternaTestSetIO
ReadRaw Method

Description
Reads a 16-bit value from the external test set. The 16-bit value is comprised of lines AD0 - AD12, Sweep Holdoff In and Interrupt In (inverted).

When this command is used the analyzer does NOT generate the appropriate timing signals; it simply reads the lines. The user needs to first use the WriteRaw method to do the initial setup. The RLW line (pin25) must be set to the appropriate level in order to read the test set connected.

Below is the format of data that is read with ReadRaw:

<table>
<thead>
<tr>
<th>Pin</th>
<th>Bit</th>
<th>Signal name</th>
</tr>
</thead>
<tbody>
<tr>
<td>22</td>
<td>0</td>
<td>AD0*</td>
</tr>
<tr>
<td>23</td>
<td>1</td>
<td>AD1*</td>
</tr>
<tr>
<td>11</td>
<td>2</td>
<td>AD2*</td>
</tr>
<tr>
<td>10</td>
<td>3</td>
<td>AD3*</td>
</tr>
<tr>
<td>9</td>
<td>4</td>
<td>AD4*</td>
</tr>
<tr>
<td>21</td>
<td>5</td>
<td>AD5*</td>
</tr>
<tr>
<td>20</td>
<td>6</td>
<td>AD6*</td>
</tr>
<tr>
<td>19</td>
<td>7</td>
<td>AD7*</td>
</tr>
<tr>
<td>6</td>
<td>8</td>
<td>AD8*</td>
</tr>
<tr>
<td>5</td>
<td>9</td>
<td>AD9*</td>
</tr>
<tr>
<td>4</td>
<td>10</td>
<td>AD10*</td>
</tr>
<tr>
<td>17</td>
<td>11</td>
<td>AD11*</td>
</tr>
<tr>
<td>3</td>
<td>12</td>
<td>AD12*</td>
</tr>
<tr>
<td>2</td>
<td>13</td>
<td>Sweep Holdoff In</td>
</tr>
<tr>
<td>13</td>
<td>14</td>
<td>Interrupt In (inverted internally)</td>
</tr>
<tr>
<td>na</td>
<td>15</td>
<td>Always Zero, grounded internally</td>
</tr>
</tbody>
</table>
*These lines are dependent on the state of RLW (pin25). Writing a 0(low) to RLW will set lines AD0-AD12 to write mode. Writing a 1(high) to RLW will set lines AD0-AD12 to read mode.

**VB Syntax**

```
value = ExtIO.ReadRaw (address)
```

<table>
<thead>
<tr>
<th>Variable</th>
<th>(Type) - Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>value</td>
<td>(variant) - Variable to store the returned data</td>
</tr>
<tr>
<td>ExtIO</td>
<td>(object) - An External IO object</td>
</tr>
<tr>
<td>address</td>
<td>(variant) - Address to read data from</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Return Type</th>
<th>Real</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default</td>
<td>Not Applicable</td>
</tr>
</tbody>
</table>

**Examples**

```
value = ExtIO.ReadRaw (address)
```

**C++ Syntax**

```c++
HRESULT ReadRaw( VARIANT* Input );
```

**Interface**

IHWEternalTestSetIO
### ReadString Method

<table>
<thead>
<tr>
<th>Description</th>
<th>Returns data from the VISA pass-through device.</th>

</table>

See example program
Recall Method

Description: Recalls a measurement state, calibration state, or both, from the hard drive into the analyzer.

Use app.Save to save files.

VB Syntax: app.Recall (filename.ext)

Variable (Type) - Description

- app: An Application (object)
- filename.ext: (string) - Full path, file name, and extension, of the file.

Files are typically stored in "D:" Use one of the following extensions:

- .sta - Instrument State
- .cal - Calibration file
- .cst - Both Instrument State and Calibration reference
- .cti - Citifile (data will always be formatted. See Recalling Citifiles Using the VNA)
- .csa - Instrument state and calibration data (not a reference pointer).

Return Type: Not Applicable

Default: Not Applicable

Examples: app.Recall ("D:\MyState.cst") 'Recalls "mystate.cst" from the specified folder

C++ Syntax: HRESULT Recall(BSTR bstrFile)

Interface: IApplication
## Recall Kits Method

<table>
<thead>
<tr>
<th>Description</th>
<th>Recalls the calibration kits definitions that were stored with the SaveKits command.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>VB Syntax</strong></td>
<td><code>app.RecallKits</code></td>
</tr>
</tbody>
</table>

### Variable

<table>
<thead>
<tr>
<th>(Type)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>app</code></td>
<td>An Application (object)</td>
</tr>
</tbody>
</table>

### Return Type

Not Applicable

### Default

Not Applicable

<table>
<thead>
<tr>
<th>Examples</th>
<th><code>app.RecallKits</code></th>
</tr>
</thead>
</table>

### C++ Syntax

`HRESULT RecallKits()`

### Interface

`IApplication`
Recall Method

<table>
<thead>
<tr>
<th>Description</th>
<th>Loads an uncertainty ‘workspace’ (*.ml4) file into the Uncertainty Manager.</th>
</tr>
</thead>
<tbody>
<tr>
<td>VB Syntax</td>
<td><code>uncertMan.Recall(fileName)</code></td>
</tr>
<tr>
<td>Variable</td>
<td>(Type) - Description</td>
</tr>
<tr>
<td><code>uncertMan</code></td>
<td>An UncertaintyManager Object</td>
</tr>
<tr>
<td><code>fileName</code></td>
<td>(String). Filename and *.ml4 extension of the Uncertainty Manager workspace file to load.</td>
</tr>
<tr>
<td>Return Type</td>
<td>Not Applicable</td>
</tr>
<tr>
<td>Default</td>
<td>Not Applicable</td>
</tr>
<tr>
<td>Examples</td>
<td><code>uncertMan.Recall&quot;MyWorkspace.ml4&quot;</code></td>
</tr>
<tr>
<td>C++ Syntax</td>
<td>HRESULT Recall([in] BSTR fileName);</td>
</tr>
<tr>
<td>Interface</td>
<td>IUncertaintyManager</td>

</tbody>
</table>

See example program
Remove Method

**Description**
Removes an item from a collection of objects.

**VB Syntax**
```
Object.Remove item
```

**Variable**
*(Type) - Description*

**Object**
Any of the following *(objects)*

- CalFactorSegments collection
- CalFactorSegmentsPMAR Collection
- Cal Sets collection
- Channels Collection
- ExternalDevices Collection
- GuidedCalibrationPowerSensors Collection
- Measurements collection
- NAWindows collection
- PowerLossSegments collection
- PowerLossSegmentsPMAR Collection
- Segments collection

**Note:** Segments, CalFactorSegments, and PowerLossSegments have an OPTIONAL argument `[size]` referring to the number of segments to remove, starting with the *item* parameter.

**Note:** Segments - When ALL segments are deleted, SweepType is automatically set to Linear because there are no segments to sweep.

**item** *(variant)* - Collection Item number to be removed.

**Note:** The ExternalDevices Collection requires that you specify *item* as the string name of the device. For example:
```
extDevices.Remove ('mySource')
```

**Return Type**
Not Applicable

**Default**
Not Applicable
Examples

Measurements.Remove 3 'Removes the third measurement in the collection

segments.Remove 2,20 'Removes 20 segments (2 - 21)

C++ Syntax

HRESULT Remove(VARIANT index); //Measurements
HRESULT Remove(VARIANT index); //Cal Sets
HRESULT Remove(long windowNumber); //NAWindows
HRESULT Remove(VARIANT index, long size); //Segments
HRESULT Remove(VARIANT index, long size); //CalFactorSegments(PMAR)
HRESULT Remove(VARIANT index, long size); //PowerLossSegments(PMAR)
HRESULT Remove(BSTR name) //ExternalDevices
HRESULT Remove(VARIANT index) //Channels - specify collections index, not the channel number.
HRESULT Remove(VARIANT index); //GuidedCalibrationPowerSensors

Interface

All listed above
## RemoveAll Method

<table>
<thead>
<tr>
<th>Description</th>
<th>Removes ALL power sensors from the GuidedCalibrationPowerSensors Collection</th>
</tr>
</thead>
<tbody>
<tr>
<td>VB Syntax</td>
<td><code>guidedSensors.RemoveAll</code></td>
</tr>
<tr>
<td>Variable</td>
<td><em>(Type)</em> - Description</td>
</tr>
<tr>
<td><code>guidedSensors</code></td>
<td>A GuidedCalibrationPowerSensors Collection</td>
</tr>
<tr>
<td>Return Type</td>
<td>Not Applicable</td>
</tr>
<tr>
<td>Default</td>
<td>Not Applicable</td>
</tr>
<tr>
<td>Examples</td>
<td><code>sensors.RemoveAll</code></td>
</tr>
<tr>
<td>C++ Syntax</td>
<td><code>HRESULT RemoveAll();</code></td>
</tr>
<tr>
<td>Interface</td>
<td>IGuidedCalibrationPowerSensors</td>

<tr>
<th>Description</th>
<th>Removes a name-value pair from the Cal Set. Send the Save (CalSet) Method to save the edited CalSet to the VNA.</th>
</tr>
</thead>
</table>

**See Also**

EnumerateItems Method

Item Property (Learn about name-value pairs)

**VB Syntax**

```vbnet
CalSet.RemoveItem(name)
```

**Variable**

- **Type** - Description
  - `CalSet` - A CalSet object
  - `name` - (String) Name of the item.

**Return Type**

Not Applicable

**Default**

Not Applicable

**Examples**

See example

**C++ Syntax**

```c++
HRESULT RemoveItem (VARIANT* itemNames);
```

**Interface**

ICalSet6
### RemoveLibrary Method

<table>
<thead>
<tr>
<th>Description</th>
<th>Removes an imported an Equation Editor DLL from the VNA.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>VB Syntax</strong></td>
<td><code>equation.RemoveLibrary location</code></td>

<td>IColors</td>
</tr>
</tbody>
</table>
# ResetTuningParameters Method

**Description**  
Resets the tuning parameters to their default values.

**VB Syntax**  
`obj.ResetTuningParameters`

**Variable**  
(Description)

- `obj`  
  An EmbeddedLO (object) or
  A ConverterEmbeddedLO (object)

**Default**  
Not Applicable

**Examples**  
`embedLO.ResetTuningParameters`  

**C++ Syntax**  
`HRESULT ResetTuningParameters();`

**Interface**  
IEmbededLO
## RestoreCalKitDefaults Method

**Description**
Restores the original properties of the specified Cal Kit, overwritting the last definition with the factory defaults.

**NOTE:** ONLY works with VNA releases 1.0 through 1.6.

**VB Syntax**
```vbnet
app.RestoreCalKitDefaults (calKit)
```

**Variable (Type) - Description**

- **app** An Application (object)
- **calKit** (enum NAcalKit) - Calibration Kit to restore. Choose from:

  1 - naCalKit_85032F_N50
  2 - naCalKit_85033E_3_5
  3 - naCalKit_85032B_N50
  4 - naCalKit_85033D_3_5
  5 - naCalKit_85038A_7_16
  6 - naCalKit_85052C_3_5_TRL
  7 - naCalKit_User7
  8 - naCalKit_User8
  9 - naCalKit_User9
  10 - naCalKit_User10

**Return Type**
Not Applicable

**Default**
Not Applicable

**Examples**
```vbnet
app.RestoreCalKitDefaults naCalKit_MechKit10
```

**C++ Syntax**
```cpp
HRESULT RestoreCalKitDefaults/(tagNACalKit kit)
```

**Interface**
IApplication
### RestoreCalKitDefaultsAll Method

<table>
<thead>
<tr>
<th>Description</th>
<th>Restores the original properties of ALL of the Cal Kits, overwriting the last definitions with the factory defaults.</th>
</tr>
</thead>
<tbody>
<tr>

Save Method

Description
Saves the appropriate content to the hard drive depending on the extension that is provided.

Some saved files can be recalled using app.Recall. depending on the content.

VB Syntax
app.Save(filename.ext)

Variable (Type) - Description
app An Application (object)
filename.ext (string) - Full path, file name, and extension of the file.

Files are typically stored in "D:".
Use one of the following extensions:

- .cst - Saves both Instrument State and Cal Set reference - Recalls a calibrated measurement. (Recallable)
- .sta - Saves Instrument State only - recalls the instrument state without calibration. (Recallable)
- .cal - Calibration file – saves the active Cal Sets currently in use by any channel. Use this mode for archival purposes only. All Cal Sets are saved to a Cal Set data file. This mode provides a method of safeguarding calibration data. This data can be restored to the list of Cal Sets available in the instrument. (Recallable)
- .csa - Saves both instrument state AND actual calibration data, not a reference pointer to the Cal Set.
- .prn - Saves active trace in comma-separated format (not recallable)
- .bmp - Saves a Bitmap of the screen (not recallable)
- .s1p - Saves 1-port measurement data
- .s2p - Saves 2-port measurement data
- .s3p - Saves 3-port measurement data
- .s4p - Saves 4-port measurement data

Return Type Not Applicable
Default Not Applicable
<table>
<thead>

<td>ICalSet</td>
</tr>
</tbody>
</table>
This command is replaced by ICalSet::Save which saves the data for only the current Cal Set to the disk.

Writes new or changed Cal Sets to disk. All Cal Sets are saved in a single file. This file is updated at the following times:

- When a Cal Set has been deleted.
- When a calibration has been performed through the front panel interface.
- When this method is called.
- When ICalSet::Save is called.

SaveCitiDataMethod - **Superseded**

**Description**
This command is replaced with **SaveData Method**

Saves UNFORMATTED trace data to .cti file. [Learn more about citifiles](#).

**VB Syntax**
```vbnet
app.SaveCitiDataData(filename.cti)
```

**Variable**

- `app` (Type) - Description
  - **app** An Application (object)

- `filename.cti` (Type) - Full path, file name, and .cti extension of the file.
  - Files are typically stored in "D:\".

**Return Type**
Not Applicable

**Default**
Not Applicable

**Examples**
```vbnet
app.SaveCitiDataData("C:\Program Files(x86)\Keysight\Network Analyzer\Documents\myDDCitifile.cti") 'Saves "myDDCitifile.cti" to the specified folder
```

**C++ Syntax**
```cpp
HRESULT SaveCitiDataData (BSTR bstrFile)
```

**Interface**
IApplication5
**SaveCitiFormattedData Method - Superseded**

<table>
<thead>
<tr>
<th>Description</th>
<th>This command is replaced with SaveData Method</th>
</tr>
</thead>
<tbody>
<tr>
<td>Saves FORMATTED trace data to .cti file. Learn more about citifiles.</td>
<td></td>
</tr>
</tbody>
</table>

**VB Syntax**

```vbnet
app.SaveCitiFormattedData(filename.cti)
```

**Variable**

- **app** (Type) - Description
  - An Application (object)

- **filename.cti** (string) - Full path, file name, and .cti extension of the file.

  Files are typically stored in "D:\"

**Return Type**

Not Applicable

**Default**

Not Applicable

**Examples**

```vbnet
app.SaveCitiFormattedData ("C:\Program Files(x86)\Keysight\Network Analyzer\Documents\Newfolder\myFDCitifile.cti") 'Saves "myFDCitifile.cti" to the specified folder
```

**C++ Syntax**

```cpp
HRESULT SaveCitiFormattedData (BSTR bstrFile)
```

**Interface**

IApplication5
**SaveData Method**

**Description**
Stores trace data to the following file types: *.prn, *.cti, *.csv, *.mdf

To save snp files, use `WriteSnpFileWithSpecifiedPorts`

To save instrument state and calibration files, use `Save`.

This command replaces the following:

- `SaveCitiDataData Method`
- `SaveCitiFormattedData Method`
- `CitiContents Property`
- `CitiFormat Property`

Some saved files can be recalled using `app.Recall`, depending on the content.

**VB Syntax**

```
app.SaveData filename, type, scope, format, selector
```

**Variable (Type) - Description**

- `app` An Application (object)
- `filename` (string) - Full path, file name, and extension of the file.

Files are typically stored in "D:\"

Choose from the following valid parameter combinations for ALL measurement classes:

<table>
<thead>
<tr>
<th>Type of file to save</th>
<th>Parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td>*.prn</td>
<td>&lt;type&gt; (String)</td>
</tr>
<tr>
<td>&quot;PRN Trace Data&quot;</td>
<td>&quot;Trace&quot;</td>
</tr>
</tbody>
</table>

Example: `app.SaveData "myData.prn","PRN Trace Data","Trace","Displayed",2`
<table>
<thead>
<tr>
<th>File Extension</th>
<th>Description</th>
<th>Trace or Auto</th>
<th>RI or MA or DB</th>
<th>Displayed</th>
<th>Measurement Number</th>
</tr>
</thead>
<tbody>
<tr>
<td>*.cti (unformatted)</td>
<td>Citifile Data Data</td>
<td>&quot;Trace&quot; or &quot;Auto&quot;</td>
<td>&quot;RI&quot;</td>
<td>&quot;RI&quot;</td>
<td>Number</td>
</tr>
<tr>
<td>Example:</td>
<td>app.SaveData &quot;myData.cti&quot;,&quot;Citifile Data Data&quot;,&quot;AUTO&quot;,&quot;RI&quot;,3</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>*.cti (unformatted)</td>
<td>Citifile Data Data</td>
<td>&quot;Displayed&quot;</td>
<td>&quot;RI&quot;</td>
<td>-1</td>
<td></td>
</tr>
<tr>

<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>*.cti (formatted)</td>
<td>Citifile Formatted Data</td>
<td>&quot;Trace&quot; or &quot;Auto&quot;</td>
<td>&quot;RI&quot; or &quot;MA&quot; or &quot;DB&quot;</td>
<td>Measurement</td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td>app.SaveData &quot;myData.cti&quot;,&quot;Citifile Formatted Data&quot;,&quot;AUTO&quot;,&quot;MA&quot;,3</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>*.cti (formatted)</td>
<td>Citifile Formatted Data</td>
<td>&quot;Displayed&quot;</td>
<td>&quot;RI&quot; or &quot;MA&quot; or &quot;DB&quot; or &quot;Displayed&quot;</td>
<td>-1</td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td>app.SaveData &quot;myData.cti&quot;,&quot;Citifile Formatted Data&quot;,&quot;DISPLAYED&quot;,&quot;MA&quot;,-1</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>*.csv</td>
<td>CSV Formatted Data</td>
<td>&quot;Trace&quot; or &quot;Auto&quot;</td>
<td>&quot;RI&quot; or &quot;MA&quot; or &quot;DB&quot; or &quot;Displayed&quot;</td>
<td>Measurement</td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td>app.SaveData &quot;myData.csv&quot;,&quot;CSV Formatted Data&quot;,&quot;Trace&quot;,&quot;DB&quot;,3</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>*.csv</td>
<td>CSV Formatted Data</td>
<td>&quot;Displayed&quot;</td>
<td>&quot;RI&quot; or &quot;MA&quot; or &quot;DB&quot;</td>
<td>-1</td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td>app.SaveData &quot;myData.csv&quot;,&quot;CSV Formatted Data&quot;,&quot;displayed&quot;,&quot;RI&quot;,-1</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>*.mdf</td>
<td>MDIF Data</td>
<td>&quot;Trace&quot; or &quot;Auto&quot;</td>
<td>&quot;RI&quot; or &quot;Displayed&quot;</td>
<td>Measurement</td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td>app.SaveData &quot;myData.mdf&quot;,&quot;MDIF Data&quot;,&quot;trace&quot;,&quot;displayed&quot;,1</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>*.mdf</td>
<td>MDIF Data</td>
<td>&quot;Displayed&quot;</td>
<td>&quot;RI&quot; or &quot;Displayed&quot;</td>
<td>-1</td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td>app.SaveData &quot;myData.mdf&quot;,&quot;MDIF Data&quot;,&quot;displayed&quot;,&quot;displayed&quot;,-1</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Notes (for above file types)
Use `meas.Number` to read the measurement number of a trace.

**Scope:**

"Trace" - specified measurement number only.

"Channel" - all measurements that are in the channel in which the selected measurement reside are saved.

"Displayed" - all displayed measurements.

"Auto" - for all Standard Meas Class (S-parameter) channels:

- When correction is OFF, saves the specified trace
- When correction is ON, saves all corrected parameters associated with the calibrated ports in the Cal Set.

"Auto" - for all other channels:

- When correction is OFF or ON, saves the specified trace

The following parameter combinations save *.csv files in specific formats for GCA and Swept IMD classes:

<table>
<thead>
<tr>
<th>Parameters</th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;type&gt;</td>
<td>(String)</td>
<td>&lt;scope&gt;</td>
<td>(String)</td>
</tr>
<tr>
<td>GCA channels ONLY:</td>
<td>&quot;GCA Sweep Data&quot;</td>
<td>&quot;Auto&quot;</td>
<td>&quot;DB&quot;</td>
</tr>
<tr>
<td>Swept IMD channels ONLY:</td>
<td>&quot;IMD Sweep Data&quot;</td>
<td>&quot;Auto&quot;</td>
<td>&quot;DB&quot;</td>
</tr>
</tbody>
</table>

Example: `app.SaveData "myData.csv","GCA Sweep Data","Auto","db",1`

Example: `app.SaveData "myData.csv","IMD Sweep Data","Auto","db",1`

**Return Type** Not Applicable

**Default** Not Applicable
| **C++ Syntax** | HRESULT SaveData(BSTR File, BSTR Type, BSTR Scope, BSTR Format, Long selector); |
| **Interface**  | IApplication18 |
### SaveENRFFile Method

</tr>
</thead>
</table>
SearchPowerSaturation Method

Description

Initiates a Power Saturation marker search.

Turns on and sets markers 1, 2, and 3 to calculate various Power Saturation parameters.

First set PMaxBackOff.

To turn off the Power Saturation markers, either turn them off individually or use DeleteAllMarkers Method.

To search a User Range with the PSAT search, first activate marker 1 and set the desired User Range. Then send this command. The user range used with the PSAT search only applies to marker 1 searching for the linear gain value. The other markers may fall outside the user range.

VB Syntax  
```
psat. SearchPowerSaturation()
```

Variable  

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>psat</td>
<td>A PSaturation (object)</td>
</tr>
</tbody>
</table>

Return Type  
Not Applicable

Default  
Not Applicable

Examples  
```
psat. SearchPowerSaturation
```

See example program

C++ Syntax  
```
HRESULT SearchPowerSaturation()
```

Interface  
IPSaturation
SearchFilterBandwidth Method

**Description**

Searches the measurement data with the current BandwidthTarget (default is -3). To continually track the filter bandwidth, use BandwidthTracking.

This feature uses bandwidth markers 1-4 to determine the bandwidth, center frequency, loss, and Q factor (Center Freq / Bandwidth). If not already, they are activated. To turn off these markers, either turn them off individually or DeleteAllMarkers.

The bandwidth statistics are displayed on the analyzer screen. To get the bandwidth statistics, use either GetFilterStatistics or FilterBW, FilterCF, FilterLoss, or FilterQ.

The analyzer screen will show either Bandwidth statistics OR Trace statistics; not both.

To search a UserRange with the bandwidth search, first activate marker 1 and set the desired UserRange. Then send the SearchFilterBandwidth command. The user range used with bandwidth search only applies to marker 1 searching for the max value. The other markers may fall outside the user range.

**VB Syntax**

```
meas.SearchFilterBandwidth
```

**Variable (Type) - Description**

- `meas` A Measurement (object)

**Return Type**

Not Applicable

**Default**

Not Applicable

**Examples**

```
meas.SearchFilterBandwidth
```

**C++ Syntax**

```
HRESULT SearchFilterBandwidth()
```

**Interface**

IMeasurement
# SearchMax Method

SegmentCalculate Method

**Description**
Calculates the specified parameter for the segment.

**VB Syntax**
```
conv.SegmentCalculate index, param
```

**Variable** *(Type) - Description*
- `conv` A Converter Object
- `index` (Long integer) Segment for which calculation is performed. Choose a segment between 1 and the current segment count. Use `SegmentCount Property` to read the current count in the Applied Mixer.
- `param` (Enum as ConverterCalculation) Mixer port for which to calculate start and stop frequencies. Choose from:

<table>

- IF sideband (High or Low)
- Output sideband (High or Low)
SelectCalSet Method

Description
Selects and applies a Cal Set to the specified channel.

Note: Error Correction is not automatically applied as a result of this command being issued. If there is more than one Cal Type in the Cal Set, you must explicitly choose the Cal Type you want to apply. (See meas.Caltype)

VB Syntax
channel.SelectCalSet calSet, restore

Variable
(Type) - Description

(channel) - A Channel object
(calSet) - Cal Set to make active. Specify the Cal Set by GUID or Name. Use EnumerateCalSets to list the available Cal Sets.

(restore) -
True (1) - The stimulus stored with the cal set will be applied to the channel.
False (0) - If a conflict is detected between the existing channel settings and the Cal Set stimulus settings, then the following will occur:

If interpolation is ON, then interpolation will be attempted. This may fail if the channel frequency is outside the range of the Cal Set.

If interpolation is OFF, the selection will be abandoned and an error is returned: E_NA_CAL_STIMULUS_VALUES_EXCEEDED

Return Type
Not Applicable

Default
Not Applicable

Example
channel.SelectCalSet GUID, 1
chan.SelectCalSet "MyCalSet", 0

C++ Syntax
HRESULT SelectCalSet (BSTR strCset, bool bRestore);

Interface
IChannel
SetAllSegments Method

Description
Uploads a segment table to the VNA replacing any existing segment table.

Segments must be ascending in frequency and non-overlapping. If they are not, the segments are 'adjusted' as they are from the User Interface control. The total number of points for all segments cannot exceed the VNA maximum number of points for a sweep.

VB Syntax
`Segs.SetAllSegments (segdata)`

Variable (Type) - Description

<table>
<thead>
<tr>
<th>Variable</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>segs</td>
<td>Segments (Collection)</td>
<td></td>
</tr>
<tr>
<td>segdata</td>
<td>Variant</td>
<td>A 2-dimensional array of Segment data:</td>
</tr>
</tbody>
</table>

- dimension 0 is the number of elements in each segment.
- dimension 1 is the number of segments that will be used.

The following is a list of dimension 0 elements for each segment:

**Note:** All elements must be **dimensioned** as either ALL Double or ALL Variant.

- 0 = Segment state (Boolean True or False)
- 1 = Number of Points in this segment (Integer)
- 2 = Start Freq (Double)
- 3 = Stop Freq (Double)
- 4 = IFBW (Double) optional
- 5 = Dwell Time (Double) optional
- 6 + = Power (Double) optional; see table below.

The first four data elements must always be supplied. After those values, data must be supplied for successive optional elements. For example, to set dwell time values, you must also supply IFBW values, because IFBW (#4) precedes dwell time (#5) in the array order.

The **IFBandwidthOption**, **SweepTimeOption**, and **SourcePowerOption** settings
do NOT affect the order in which elements are interpreted.

The number of elements to supply for Power depends on the following two settings:

1. **SourcePowerOption** = True allows segments to have independent power levels.
2. **CouplePorts** = False allows different power levels for each test port.

<table>
<thead>
<tr>
<th>CouplePorts</th>
<th>SourcePowerOption</th>
<th>Number of Elements</th>
</tr>
</thead>
<tbody>
<tr>
<td>False</td>
<td>False</td>
<td>Each port has its own channel-wide power setting, which is set using <strong>TestPortPower</strong>. Provide exactly 7 elements per segment. The last element (power) is ignored.</td>
</tr>
<tr>
<td>False</td>
<td>True</td>
<td>Provide 6 elements + total number of ports. The first 7 elements are still interpreted the same. The remaining elements (in-order) are interpreted as the power levels to set on that segment for Ports 2 through N, where N is the total number of ports currently enabled for the VNA or for a VNA with multiport external test set.</td>
</tr>
<tr>
<td>True</td>
<td>False</td>
<td>Provide exactly 7 elements per segment. The last element (power) is ignored.</td>
</tr>
<tr>
<td>True</td>
<td>True</td>
<td>Provide exactly 7 elements per segment. The last element (power) is honored.</td>
</tr>
</tbody>
</table>

**Return Type** Not Applicable

**Default** Not Applicable

**Examples**

See a VB example using this command

See a C++ example using this command

**C++ Syntax**

```
HRESULT SetAllSegments (VARIANT Segments);
```
| Interface | ISegments2 |
### SetBBPorts Method

<table>
<thead>
<tr>
<th>Description</th>
<th>For a Balanced - Balanced device type, maps the VNA ports to the DUT ports. Set the Balanced device type using the DUTTopology Property.</th>
</tr>
</thead>
<tbody>
<tr>
<td>VB Syntax</td>
<td><code>balTopology.SetBBPorts p1Pos, p1Neg, p2Pos, p2Neg</code></td>

<td><strong>balTopology</strong> - A BalancedTopology (object) <strong>p1Pos, p1Neg, p2Pos, p2Neg</strong> (Long Integer) VNA port number that connects to each of the following DUT ports:</td>
</tr>
<tr>
<td>Return Type</td>
<td>Not applicable - To read port mappings, use the BalancedTopology properties.</td>
</tr>
<tr>
<td>Default</td>
<td>Not Applicable</td>
</tr>
<tr>
<td>Examples</td>
<td><code>balTop.SetBBPorts 1,2,3,4</code></td>
</tr>
<tr>
<td>C++ Syntax</td>
<td>HRESULT SetBBPorts (long p1Pos, long p1Neg, long p2Pos, long p2Neg)</td>
</tr>
<tr>
<td>Interface</td>
<td>IBalancedTopology</td>
</tr>
</tbody>
</table>

![Diagram of port connections](image)
### SetBPort Method

**Description**
For a single port balanced device type, maps the VNA ports to the DUT ports.

Set the Balanced device type using the `DUTTopology Property`

**VB Syntax**
`balTopology.SetBPort balanced_pos, balanced_neg`

**Variable**

<table>
<thead>
<tr>
<th>(Type)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>balTopology</code></td>
<td>A <code>BalancedTopology</code> (object)</td>
</tr>
<tr>
<td><code>balanced_pos</code>, <code>balanced_neg</code></td>
<td>(Long Integer) VNA port number that connects to each of the following DUT ports:</td>
</tr>
</tbody>
</table>

![Bal Port 1](image)

**Return Type**
Not applicable - To read port mappings, use the `BalancedTopology` properties.

**Default**
Not Applicable

**Examples**
`balTopology.SetBPort 1,2`

**C++ Syntax**
`HRESULT SetBPort(long Pos, long Neg)`

**Interface**
`IBalancedTopology3`
SetBSPorts Method

**Description**
For a Balanced-Single-ended device type, maps the VNA ports to the DUT ports.

Set the Balanced-Single-ended device type using the `DUTTopology Property`.

**VB Syntax**
```
balTopology.SetBSPorts bPos, bNeg, se
```

**Variable (Type) - Description**
- `balTopology`: A `BalancedTopology` (object)
- `bPos, bNeg, se`: VNA port number that connects to each of the following DUT ports:

![Diagram of VNA ports connected to DUT ports]

**Return Type**
Not applicable - To read port mappings, use the `BalancedTopology` properties.

**Default**
Not Applicable

**Examples**
```
balTop.SetBSPorts 1,2,3
```

**C++ Syntax**
```
HRESULT SetBSPorts (long bPos, long bNeg, long se)
```

**Interface**
`IBalancedTopology2`
SetBSSPorts Method

**Description**
For a Balanced-Single-ended - Single-ended device type, maps the VNA ports to the DUT ports.

Set the Balanced-Single-ended - Single-ended device type using the DUTTopology Property

**VB Syntax**
```vbnet
balTopology.SetBSSPorts balanced_Pos, balanced_Neg, singleEnded1, singleEnded2
```

**Variable (Type) - Description**
- **balTopology**
  A `BalancedTopology` (object)
- **balanced_Pos, balanced_Neg, singleEnded1, singleEnded2**
  VNA port number that connects to each of the DUT ports:

**Return Type**
Not applicable - To read port mappings, use the `BalancedTopology` properties.

**Default**
Not Applicable

**Examples**
```vbnet
balTop.SetBSSPorts 1,2,3,4
```

**C++ Syntax**
```cpp
HRESULT SetBSPorts (long balanced_Pos, long balanced_Neg, long singleEnded1, long singleEnded2)
```

**Interface**
IBalancedTopology4
SetCalInfo Method

Description
Specifies the type of Unguided calibration. This method should be the first method called on the calibrator object. It prepares the internal state for the rest of the calibration.

Note: You can NOT perform a 3 or 4-port cal using SetCalInfo even though there is enumCalTypes. You must use the GuidedCalibration object.

Learn more about reading and writing Cal data using COM

The analyzer can measure both ports simultaneously, assuming you have two of each standard type. For a 2-port cal, See cal.Simultaneous2PortAcquisition

VB Syntax
```
cal.SetCalInfo (type,rcvPort,srcPort)
```

Variable
(Variable) - Description
```
cal       A Calibrator (object)

type      (enum NACalType) - Calibration type. Choose from:
           0  - naCalType_Response_Open
           1  - naCalType_Response_Short
           2  - naCalType_Response_Thru
           3  - naCalType_Response_Thru_And_Isol
           4  - naCalType_OnePort
           5  - naCalType_TwoPort_SOLT
           6  - naCalType_TwoPort_TRL
           7  - naCalType_None
           8  - naCalType_ThreePort_SOLT
           9  - Custom
           10 - naCalType_FourPort_SOLT
```

Note: For 1-port cals, the source port = receiver port. For 2, 3,4-port SOLT and TRL, it doesn't matter which port is specified as source and receiver

rcvPort    (long integer) - Receiver Port
srcPort    (long integer) - Source Port

Return Type NACalType

Default 7- naCalType_None
Examples

```
cal.setCalInfo(naCalType_Response_Open,1,1)
```

C++ Syntax

```
HRESULT SetCalInfo(tagNACalType calType, long portA, long portB)
```

Interface

ICalibrator
### SetCalInfoEx Method (for source power cals)

**Description**

This command replaces SetCalInfo2 Method.

Specifies the channel and the source port to be used for the source power calibration about to be performed.

**VB Syntax**

```vbnet
powerCalibrator.SetCalInfoEx channel, srcPort, [powerOffset,] [display]
```

**Variable (Type) - Description**

- `powerCalibrator` *(object)* - A `SourcePowerCalibrator` object
- `channel` *(long integer)* - Number of the VNA channel (not power meter channel) on which the source power cal will be performed. If the channel does not already exist, it will be created.
- `srcPort` *(long integer)* - Port number on which the source power cal will be performed.
- `[powerOffset]` *(double)* - Optional argument. Sets or returns a power level offset from the VNA test port power. This can be a gain or loss value (in dB) to account for components you connect between the source and the reference plane of your measurement. For example, specify 10 dB to account for a 10 dB amplifier at the input of your DUT. Following the calibration, the VNA power readouts are adjusted by this value. This argument performs the same function as `chan.SourcePowerCalPowerOffset Property`
- `[display]` *(boolean)* Optional argument. Enables and disables the display of power readings on the VNA screen. After the source power cal data is acquired, this setting is reset to ON. If unspecified, value is set to ON.
  - **True** - Display of power readings is ON
  - **False** - Display of power readings is OFF

**Return Type**

None

**Default**

Not Applicable

**Examples**

```vbnet
powerCalibrator.SetCalInfoEx 1, 1, -10, True
```

**C++ Syntax**

```cpp
HRESULT SetCalInfoEx( long Channel, long SourcePort, double PowerOffset = 0., VARIANT_BOOL bDisplay = VARIANT_TRUE);
```
<table>
<thead>
<tr>
<th>Interface</th>
<th>ISourcePowerCalibrator4</th>
</tr>
</thead>

2990
SetCustomDUTTopology Method

**Description**
Maps the physical VNA ports to a device of balanced and single-ended logical ports for multi-port systems with greater than 4 ports.

The device type is set using the following commands:

- **SetBPort** - single balanced port DUT topology.
- **SetBBPorts** - balanced - balanced DUT topology.
- **SetBSPorts** - balanced - single-ended DUT topology.
- **SetSBPorts** - single-ended - balanced DUT topology.
- **SetSSBPorts** - single-ended - single-ended - balanced DUT topology.

The **Parameter** command returns the list of parameters available for the currently selected topology.

**VB Syntax**
```
balTopology.SetCustomDUTTopology (portTypeSequence, physicalPortsSequence)
```

**Variable**

- **balTopology** *(Type)* - Description
  A BalancedTopology *(object)*

- **portTypeSequence** *(String)* - Device type for the balanced measurement. ‘B’ means the Balanced port; ‘S’ means the Single-ended port. Choose from:
  - B – 1 port balanced device (2 ports)
  - BB – Balanced - Balanced device (4 ports)
  - BS – Balanced - Single-ended device (3 ports)
  - SB – Single-ended - Balanced device (3 ports)
  - SSB – Single-ended - Single-ended - Balanced device (4 ports)

- **physicalPortsSequence** *(Variant)* - Physical port numbers mapped to the logical ports, separated by ‘,’.
  - ‘B’ (Balanced) requires 2 physical port numbers: <nPos>, <nNeg>.
  - ‘S’ (Single-ended) requires 1 physical port number.
Return Type: Not applicable - To read port mappings, use the BalancedTopology properties.

Default: Not Applicable

Examples:
The following example sets up 8 physical ports into 6 logical ports:

Logical port 1 is a single ended port mapped to physical port 1
Logical port 2 is a single ended port mapped to physical port 2
Logical port 3 is a balanced port mapped to physical ports 3 and 4
Logical port 4 is a single ended port mapped to physical port 5
Logical port 5 is a single ended port mapped to physical port 6
Logical port 6 is a balanced port mapped to physical ports 7 and 8

Int portlist[] = {1,2,3,4,5,6,7,8}
balTopology.SetCustomDUTTopology ("SSBSSB", portlist)

C++ Syntax: HRESULT SetCustomDUTToplogy(BSTR portTypeSequence, VARIANT physicalPortsSequence)

Interface: IBalancedTopology3
### SetCenter Method

<table>
<thead>
<tr>
<th>Description</th>
<th>Changes the center stimulus to the stimulus value of the marker. The start stimulus stays the same and the stop is adjusted.</th>
</tr>

</tbody>
</table>
About Marker Functions

SetCWFreq Method

Description
Sets the CW frequency to the frequency of the active marker. Does NOT change sweep type.

Use ONLY when the current sweep type is sweeping frequency - NOT available in CW or Power Sweep.

Use this command to first set the CW Frequency to a value that is known to be within the current calibrated range, THEN set Sweep Type to naPowerSweep or naCWTimesSweep.

VB Syntax
mark.SetCWFreq

Variable (Type) - Description
mark A Marker (object)

Return Type
Not Applicable

Default
Not Applicable

Examples
mark.SetCWFreq

C++ Syntax
HRESULT SetCWFreq()

Interface IMarker3
## SetDutPorts Method

**Description**  
Sets the VNA to DUT port map for FCA measurements. Use DeviceInputPort and DeviceOutputPort to read these values.

Changing the ports may limit your ability to use an internal second source. If a selected port is shared by one of the sources, then that source will not be available as an LO source. Learn more about Internal second sources.

**VB Syntax**  
`mixer.SetDUTPorts (inputPort,outputPort)`

**Variable**  
**Type** - Description

- `mixer`  
  A IMixer Interface pointer to the Meas object

- `inputPort`  
  (Long) VNA port to be connected to the DUT input.
  
  - For SMC, choose any unused VNA port.
  - For VMC, set to 1

- `outputPort`  
  (Long) VNA port to be connected to the DUT output. Choose any unused port for SMC and VMC.

**Return Type**  
Not Applicable

**Default**  
1,2

**Examples**  
`mixer.SetDUTPorts =2,1`

**C++ Syntax**  
`HRESULT SetDutPorts(long inputPort,long OutputPort);`

**Interface**  
IMixer8
### SetElectricalDelay Method

<table>
<thead>
<tr>
<th>Description</th>
<th>Changes the measurement's electrical delay to the marker's delay value.</th>
</tr>
</thead>

<td><code>mark.SetElectricalDelay</code></td>
</tr>
<tr>
<td><strong>C++ Syntax</strong></td>
<td><code>HRESULT SetElectricalDelay()</code></td>
</tr>
<tr>
<td><strong>Interface</strong></td>
<td>IMarker</td>
</tr>
</tbody>
</table>
SetFailOnOverRange Method

Description
When set TRUE, configures the analyzer to report outOfRange conditions with an error code. Any overrange error will return E_NA_LIMIT_OUTFRANGE_ERROR.

Note: This method is for the benefit of VB clients. The analyzer automatically adjusts overrange conditions to the closest acceptable setting. The VB user will not see that an overrange occurred because the HRESULT is not returned if it has a success code. For more information, see Events/OverRange.

VB Syntax
```
app.SetFailOnOverRange state
```

Variable
(through - Description

```
app An Application (object)
state (boolean) -
True (1) - Overrange conditions report an error code
False (0) - Overrange conditions report a success code
```

Return Type
Not Applicable

Default
False (0)

VB Example
```
app.SetFailOnOverRange TRUE
On Error Goto ERRHANDLER
' the following overrange will cause ERRHANDLER to be invoked
channel.StartFrequency = 9.9 GHZ
exit
```
```
ERRHANDLER:
    print "something failed"
```

C++ Syntax
```
HRESULT put_SetFailOnOverRange(VARIANT_BOOL mode)
```

Interface
IApplication
### SetIsolationPaths Method

<table>
<thead>
<tr>
<th><strong>Description</strong></th>
<th>Adjusts the list of paths (port pairings) for which isolation standards will be measured during calibration.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>VB Syntax</strong></td>
<td><code>guidedCal.SetIsolationPaths specifier, pathList</code></td>
</tr>
<tr>
<td><strong>Variable</strong></td>
<td>(Type) - Description</td>
</tr>
<tr>

</tr>
<tr>
<td></td>
<td>GuidedCalibration (object)</td>
</tr>
<tr>
<td><code>specifier</code></td>
<td>(Enum) - Choose from:</td>
</tr>
<tr>
<td></td>
<td>0 - naPathsAll - Measure isolation on all pairings of the ports that are to be calibrated.</td>
</tr>
<tr>
<td></td>
<td>1 - naPathsNone - Do not measure isolation on any pairing of the ports to be calibrated.</td>
</tr>
<tr>
<td></td>
<td>2 - naPathsAdd - Add one or more specific pairings of ports to the list of port pairings for which isolation will be measured.</td>
</tr>
<tr>
<td></td>
<td>3 - naPathsRemove - Remove one or more specific pairings of ports from the list of port pairings for which isolation will be measured.</td>
</tr>
<tr>
<td><code>pathlist</code></td>
<td>(Variant) port numbers in pairs. One-dimensional array of Long Integers.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> <code>pathList</code> is evaluated only when <code>specifier</code> is <code>naPathsAdd</code> or <code>naPathsRemove</code>. For <code>naPathsAll</code> and <code>naPathsNone</code>, <code>pathList</code> is ignored.</td>
</tr>
<tr>
<td><strong>Return Type</strong></td>
<td>Not Applicable</td>
</tr>
<tr>
<td><strong>Default</strong></td>
<td>Not Applicable</td>
</tr>
<tr>
<td><strong>Examples</strong></td>
<td>```vbnet</td>
</tr>
<tr>
<td></td>
<td>'selecting to measure isolation on all possible paths for the ports about to be calibrated</td>
</tr>
<tr>
<td></td>
<td>guidedCal.SetIsolationPaths naPathsAll, pathList</td>

Interface IGuidedCalibration3
SetIPConfiguration Method

Description
Modifies settings of the VNA computer networking configuration.

VB Syntax
app.SetIPConfiguration AutoIPAddress, DNSServer1, DNSServer2, HostName, DomainName, IPAddress, SubNet, Gateway, DNSSuffix1, DNSSuffix2

or
retStr = app.SetIPConfiguration (AutoIPAddress, DNSServer1, DNSServer2, HostName, DomainName, IPAddress, SubNet, Gateway, DNSSuffix1, DNSSuffix2)

Variable (Type) - Description

app An Application (object)

AutoIPAddress (boolean) - Choose either:

True - VNA is assigned an IP address by a DHCP server, or will use AutoIP (Dynamic Link-Local Addressing) if DHCP server not found.

False – VNA will use the static IP address value specified by IPAddress.

DNSServer1 (string) IP address of primary DNS server.

When AutoIPAddress = True and an empty string is specified for DNSServer1, the VNA will attempt to obtain the addresses of primary and secondary DNS servers automatically.

When AutoIPAddress = False, an IP address must be specified for DNSServer1 and/or DNSServer2 or else the VNA’s host name will not be resolvable on the computer network.

DNSServer2 (string) IP address of secondary DNS server. When specifying an empty string for DNSServer1, then specify an empty string here also.

HostName (string) DNS host name (computer name) to be assigned to this VNA.

Note: If specifying a name different than the VNA’s current host name, the change will not take effect until after you reboot the VNA.

DomainName (string) DNS domain name associated with this VNA.

IPAddress (string) Static IP address to assign to this VNA when AutoIPAddress = False. When AutoIPAddress = True, the value of IPAddress is ignored.
**SubNet** *(string)* Subnet mask value to assign to the VNA network configuration.

**Gateway** *(string)* Gateway address to assign to the VNA network configuration.

**DNSSuffix1** *(string)* Primary suffix to set in the VNA DNS suffix search order. An empty string is allowed.

**DNSSuffix2** *(string)* Secondary suffix to set in the VNA DNS suffix search order. An empty string is allowed.

**retStr** *(string)* String returned by this method should be ignored. It is intended for Keysight diagnostic use.

**Return Type** String

**Default** Not Applicable

**Examples**

```c
app.SetIPConfiguration True, "", "", "MyHostName", "MyRegion.MyCompany.com", "", "255.255.255.0", "123.45.67.890", "", ""
```

```c
app.SetIPConfiguration False, "123.456.78.90", "234.56.78.901", "MyHostName", "MyRegion.MyCompany.com", "123.456.789.0", "255.255.255.0", "123.45.67.890", "MyCompany.com", ""
```

**C++ Syntax**

```c
HRESULT SetIPConfiguration(VARIANT_BOOL AutoIPAddress, BSTR DNSServer1, BSTR DNSServer2, BSTR HostName, BSTR DomainName, BSTR IPAddress, BSTR SubNet, BSTR Gateway, BSTR DNNSuffix1, BSTR DNNSuffix2, BSTR *pRetStr);
```

**Interface** IApplication14
SetPowerAcquisitionDevice Method

Description
Sets the power sensor channel (A or B) to be used. This performs the same function as the **Use this sensor only** checkbox in the Power Sensor Settings dialog.

**Note:** This method is only necessary when performing an SMC calibration.

VB Syntax

```
pwrCal.SetPowerAcquisitionDevice sensor
```

Variable (Type) - Description

- **pwrCal** (Object) A SourcePowerCalibrator object
- **sensor** (enum NAPowerAcquisitionDevice) The power sensor channel. Choose from:
  
  - 0 – naPowerSensor_A
  - 1 – naPowerSensor_B

Default
Not Applicable

Examples

```
pwrCal.SetPowerAcquisitionDevice naPowerSensor_A
```

C++ Syntax

```
HRESULT SetPowerAcquisitionDevice(
    tagNAPowerAcquisitionDevice enumAcqDevice);
```

Interface

ISourcePowerCalibrator3

SetPortMap Method

Description
Set the DUT-to-VNA port mapping for the Noise Figure, Gain Compression, IMD, IMDx, IMS, or IMSx measurement. Use the DeviceInputPort and DeviceOutputPort commands to read the DUT input and output ports.

For Noise Figure:
Port mapping is allowed without restriction when the standard PNA receiver is used (NoiseReceiver is set to naStandardReceiver). When the low-noise receiver is selected (NoiseReceiver is set to naNoiseReceiver) the following restrictions apply:

- If the low-noise receiver is selected, the DUT output port must be port 2.

On high-frequency PNAs that have an internal tuner on port 1, the input port must be port 1 if the internal tuner is selected as the noise tuner. Conversely, if the input port is something other than 1, the internal tuner cannot be selected.

For PNAs that have a maximum frequency of 26.5 GHz or less, any port can be selected as the DUT input port.

- If a vector calibration is desired, the tuner must be connected to the selected input port.

When setting IMD and IMS channels:

- When input is 1, output can be 2 or 4.
- When input is 3, output must be 4.
- This setting is necessary only when using the limited port mapping feature.

Learn more.

VB Syntax
obj.SetPortMap in,out

Variable (Type) - Description

obj
A GainCompression (object) or
A SweptIMD (object) or
An IMSpectrum (object)
A NoiseFigure (object) - See example program

in VNA port which is connected to the DUT input.
out  VNA port which is connected to the DUT output.

Return Type  Not Applicable

To read port map, use:

DeviceInputPort Property

DeviceOutputPort Property

Default  1,2

Examples  gca.SetPortMap 2,1

C++ Syntax  HRESULT SetPortMap(long input_port,long output_port);

Interface  IGainCompression

ISweptIMD

IMSpectrum

INoiseFigure6
### SetReferenceLevel Method

</tbody>
</table>
### SetSBPorts Method

**Description**  
For a Single-ended - Balanced device type, maps the VNA ports to the DUT ports.

Set the Single-ended - Balanced device type using the `DUTTopology` Property.

**VB Syntax**  
`balTopology.SetSBPorts se, bPos, bNeg`

**Variable**  
- `balTopology`: A `BalancedTopology` (object)
- `se, bPos, bNeg`: VNA port number that connects to each of the following DUT ports:

```
Single-end Port 1               Bal Port 2
<se>                             <bPos>
<se>                             <bNeg>
```

**Return Type**  
Not applicable - To read port mappings, use the `BalancedTopology` properties.

**Default**  
Not Applicable

**Examples**  
`balTop.SetSBPorts 1,2,3`

**C++ Syntax**  
`HRESULT SetSBPorts (long se, long bPos, long bNeg)`

**Interface**  
`IBalancedTopology`
### SetSSBPorts Method

**Description**
For a Single-ended - Single-ended - Balanced device type, maps the VNA ports to the DUT ports.

Set the Single-ended - Single-ended - Balanced device type using the DUTTopology Property.

**VB Syntax**
```vbnet
dim balTopology as BalancedTopology
balTopology.SetSSBPorts se, se2, bPos, bNeg
```

**Variable**
- **balTopology**: A BalancedTopology (object)
- **se, se2, bPos, bNeg**: VNA port number that connects to each of the following DUT ports:

![Diagram of port connections: Single-end Port 1 (<se1>, <se2>) to DUT to Bal Port 3 (<bPos>, <bNeg>), Single-end Port 2 (se2)]

**Return Type**
Not applicable - To read port mappings, use the BalancedTopology properties.

**Default**
Not Applicable

**Examples**
```vbnet
balTop.SetSSBPorts 1,2,3,4
```

**C++ Syntax**
```cpp
HRESULT SetSSBPorts (long se, long se2, long bPos, long bNeg)
```

**Interface**
IBalancedTopology
About Cal Window

SetupMeasurementsForStep Method

Description
Show the Cal Window, and optionally one or more other specific windows, before acquiring a Cal standard. This command will cause the Cal Window to display the specific measurements that are to be made for that particular Cal standard.

See custom Cal window commands.

VB Syntax
`guidedCal.SetupMeasurementsForStep (n)`

Variable (Type) - Description
`guidedCal` A GuidedCalibration (object)

`n` Step number in the calibration process.

Use `GenerateSteps` to determine the total number of steps.

Use `GetStepDescription` to read the description of each step.

Return Type
Not Applicable

Default
Not Applicable

Examples
`guidedCal.SetupMeasurementsForStep 3`

See example using this command

C++ Syntax
`HRESULT SetupMeasurementsForStep(long step);`

Interface
IGuidedCalibration4
# SetStandardsForClass Method

**Description**
Set the calibration standard numbers for a specified calibration class. To read the cal standard numbers use `GetStandardsForClass` Method.

**VB Syntax**
```vbnet
calKit.SetStandardsForClass (calclassorder, std1, std2, std3, std4, std5, std6, std7)
```

**Variable**
- **calKit** (Type) - A CalKit (object)
- **calclassorder** (enum NACalClassOrder) - Cal. Class. Choose from:
  - 0 - naRefl_1_S11
  - 1 - naRefl_2_S11
  - 2 - naRefl_3_S11
  - 3 - naTran_1_S21
  - 4 - naRefl_1_S22
  - 5 - naRefl_2_S22
  - 6 - naRefl_3_S22
  - 7 - naTran_1_S12
  - 8 - naRefl_1_S33
  - 9 - naRefl_2_S33
  - 10 - naRefl_3_S33
  - 11 - naTran_1_S32
  - 12 - naTran_1_S23
  - 13 - naTran_1_S31
  - 14 - naTran_1_S13
  - 15 - naTRL_T
  - 16 - naTRL_R
  - 17 - naTRL_L

- **std1…std7** (long) - Calibration Standard Number. Choose from 1 through 30. Std2 through Std7 are optional.

**Return Type**
Not applicable

**Default**
Not applicable
Examples

calkit.SetStandardsForClass naRefl_3_S11, 3, 5, 6

calkit.SetStandardsForClass naTran_1_S21, 4

C++ Syntax

HRESULT SetStandardsForClass(NACalClassOrder calclassorder, long std1, long std2, long std3, long std4, long std5, long std6, long std7)

Interface

ICalKit
### SetStart Method

**Description**  Changes the start stimulus to the stimulus value of the marker. The stop stimulus stays the same and the span is adjusted.

This command does not work with channels that are in **CW** or **Segment Sweep** mode.

**VB Syntax**  
```
mark.SetStart
```

**Variable (Type) - Description**

- **mark**  A Marker (object)

**Return Type**  Not Applicable

**Default**  Not Applicable

**Examples**  
```
mark.SetStart
```

**C++ Syntax**  
```
HRESULT SetStart()
```

**Interface**  IMarker
### SetStop Method

<table>
<thead>
<tr>
<th>Description</th>
<th>Changes the stop stimulus to the stimulus value of the marker. The start stimulus stays the same and the span is adjusted.</th>
</tr>
</thead>
<tbody>
<tr>
<td>This command does not work with channels that are in CW or <strong>Segment Sweep</strong> mode.</td>
<td></td>
</tr>
</tbody>
</table>

**VB Syntax**  
`mark.SetStop`

**Variable**  
`mark`  
A Marker *(object)*

**Return Type**  
Not Applicable

**Default**  
Not Applicable

**Examples**  
`mark.SetStop`

**C++ Syntax**  
`HRESULT SetStop()`

**Interface**  
IMarker
### SetVISATimeout Method

**Description**
Sets the timeout value (in milliseconds) for subsequent pass-through commands for the specified VISA session.

**VB Syntax**
```vbnet
Vpassthru.SetVISATimeout visaID, timeoutVal
```

**Variable**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Vpassthru</td>
<td>A VISAPassthrough object</td>
</tr>
<tr>
<td>visaID</td>
<td>(long) VISA session number (see Open method).</td>
</tr>
<tr>
<td>timeoutVal</td>
<td>(long) Timeout value for the specified session identification number that is used when communicating with this device.</td>
</tr>
</tbody>
</table>

**Default**
2000

**Examples**
```
Vpassthru.SetVISATimeout 2,6000
```

**C++ Syntax**
```cpp
HRESULT SetVISATimeout(long session_num, long timeout)
```

**Interface**
IVISAPassthrough
ShowMarkerReadout Method

Description
Shows and Hides the Marker readout for the active marker in the upper-right corner of the window.

VB Syntax
`win.ShowMarkerReadout state`

Variable
(Type) - Description
`win` A NAWindow (object)
`state` (boolean) -
True (1) - Show the Marker readout
False (0) - Hide the Marker readout

Return Type
Not Applicable

Default
Not Applicable

Examples
`win.ShowMarkerReadout True`

C++ Syntax
`HRESULT ShowMarkerReadout(VARIANT_BOOL bState)`

Interface
INAWindow
ShowStatusBar Method

Description
Shows and Hides the Status Bar. The Status Bar is located across the bottom of the display. The following information is shown for the active measurement:

- Channel number
- Parameter
- Correction On or Off
- Remote or Local operation

VB Syntax

```vbnet
app.ShowStatusBar state
```

Variable

<table>
<thead>
<tr>
<th>(Type)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>app</code></td>
<td>An Application (object)</td>
</tr>
<tr>
<td><code>state</code></td>
<td>(boolean) -</td>
</tr>
<tr>
<td>True (1)</td>
<td>Show the Status Bar</td>
</tr>
<tr>
<td>False (0)</td>
<td>Hide the Status Bar</td>
</tr>
</tbody>
</table>

Return Type
Not Applicable

Default
Not Applicable

Examples

```
app.ShowStatusBar True
```

C++ Syntax

```
HRESULT ShowStatusBar (VARIANT_BOOL bState)
```

Interface
IApplication
ShowStimulus Method

**Description**
Shows and Hides the Stimulus (X-axis) information located at the bottom of the display. The start and stop stimulus values are shown for the active measurement.

**VB Syntax**
```
app.ShowStimulus state
```

**Variable**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>app</td>
<td>An Application (object)</td>
</tr>
<tr>
<td>state</td>
<td>(boolean) -</td>
</tr>
<tr>
<td></td>
<td>True (1) - Show the Stimulus information</td>
</tr>
<tr>
<td></td>
<td>False (0) - Hide the Stimulus information</td>
</tr>
</tbody>
</table>

**Return Type**
Not Applicable

**Default**
Not Applicable

**Examples**
```
app.ShowStimulus True
```

**C++ Syntax**
```
HRESULT ShowStimulus(VARIANT_BOOL bState)
```

**Interface**
IApplication
**ShowTable Method**

**Description**
Shows or Hides the specified table for the window's active measurement in the lower part of the window.

**VB Syntax**
win.ShowTable value

**Variable**
- **(Type) - Description**
  - **win** A NAWindow (object)
  - **value** (enum naTable) - The table to show or hide. Choose from:
    - 0 - naTable_None
    - 1 - naTable_Marker
    - 2 - naTable_Segment
    - 3 - naTable_Limit

**Return Type** Not Applicable

**Default** Not Applicable

**Examples**
win.ShowTable naTable_limit

**C++ Syntax**
HRESULT ShowTable (tagNATableType table)

**Interface** INAWindow
ShowTitleBars Method

Description: Shows and hides the Title Bars. The Title Bars are across the top of the Network Analyzer Window and each of the measurement windows. The Window name is shown in the Title Bar.

VB Syntax: `app.ShowTitleBars state`

Variable: 
- **app** (Type) - Description
  - An Application (object)
- **state** (boolean)
  - **True (1)** - Show the Title Bars
  - **False (0)** - Hide the Title Bars

Return Type: Not Applicable

Default: Not Applicable

Examples: `app.ShowTitleBars True`

C++ Syntax: `HRESULT ShowTitleBars(VARIANT_BOOL bState)`

Interface: IApplication
# ShowToolbar Method

**Description**
Shows and Hides the specified Toolbar.

**VB Syntax**
```
app.ShowToolbar toolbar, state
```

**Variable**

<table>
<thead>
<tr>
<th>Variable</th>
<th>(Type) - Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>app</td>
<td>An Application (object)</td>
</tr>
<tr>
<td>toolbar</td>
<td>(enum NAToolbarType) - The toolbar to show or hide. Choose from:</td>
</tr>
<tr>
<td></td>
<td>0 - naToolbar_None</td>
</tr>
<tr>
<td></td>
<td>1 - naToolbar_ActiveEntry</td>
</tr>
<tr>
<td></td>
<td>2 - naToolbar_Markers</td>
</tr>
<tr>
<td></td>
<td>3 - naToolbar_Measurement - OBSOLETE</td>
</tr>
<tr>
<td></td>
<td>4 - naToolbar_Stimulus - OBSOLETE</td>
</tr>
<tr>
<td></td>
<td>5 - naToolbar_SweepControl - OBSOLETE</td>
</tr>
<tr>
<td></td>
<td>6 - naToolbar_Transform</td>
</tr>
<tr>
<td></td>
<td>7 - naToolbar_PortExtensions</td>
</tr>
<tr>
<td></td>
<td>8 - naToolbar_Keys</td>
</tr>
<tr>
<td>state</td>
<td>(boolean) -</td>
</tr>
<tr>
<td></td>
<td>True (1) - Show the specified toolbar</td>
</tr>
<tr>
<td></td>
<td>False (0) - Hide the specified toolbar</td>
</tr>
</tbody>
</table>

**Return Type**
Not Applicable

**Default**
1 - naToolbar_ActiveEntry showing; all others hiding.

**Examples**
```
app.ShowToolbar 1,1 'shows the active entry toolbar
```

**C++ Syntax**
```
HRESULT ShowToolbar(tagNAToolbarType toolbar, VARIANT_BOOL bState)
```

**Interface**
IAplication
**Single Method**

**Description**
Sets the trigger count to 1 which will cause the channel to respond once to the trigger source.

**How** the channel responds to a single trigger depends on the trigger mode (point, trace, and so forth.)

With the exception of the 'sync' argument, this command behaves like the channel 'single' setting from the user interface.

This setting has implications on Calibration. Learn more.

**VB Syntax**
```vbnet
chan.Single [sync]
```

**Variable**

- **(Type) - Description**
  - `chan` A Channel *(object)*
  - `[sync]` *(boolean)* - Optional argument.

- **True** - The VNA waits (blocks execution) until the entire acquisition process is completed.

- **False** - The VNA returns immediately - does NOT wait for acquisition to complete (non-blocking). Default setting.

When trigger source is set to Manual:

- with `sync = True`, trigger source automatically changes to Internal which sends AND allows one trigger signal, then changes back to Manual.

- with `sync = False`, a trigger signal must also be sent using `app.ManualTrigger Method`.

**Return Type** Not Applicable

**Default** Not Applicable

**Examples**
```vbnet
sync = True
chan.Single sync
```

**C++ Syntax**
```cpp
HRESULT Single(VARIANT_BOOL bWait)
```

**Interface** IChannel
### Store Method

**Description**  
Saves the path configuration currently associated with channel (`ch`) to the specified configuration name.

This command is identical to `PathConfigurationManager.StoreConfiguration` Method

**VB Syntax**  
`pathMgr.StoreConfiguration ch, name`

**Variable**  
<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>pathMgr</code></td>
<td><code>PathConfigurationManager (object)</code></td>
</tr>
<tr>
<td><code>ch</code></td>
<td><code>Long</code> Channel number of the configuration to be saved.</td>
</tr>
<tr>
<td><code>name</code></td>
<td><code>String</code> Configuration name. Factory configurations can NOT be overwritten. Specifying the name of a pre-defined factory configuration will result in an error.</td>
</tr>
</tbody>
</table>

**Return Type**  
Not Applicable

**Default**  
Not Applicable

**Examples**  
`path.StoreConfiguration(2) "myMixer"`

**C++ Syntax**  
`HRESULT StoreConfiguration( long channelNum, BSTR configName );`

**Interface**  
`IPathConfigurationManager`
### StoreConfiguration Method

## StringToNACalClass Method

**Description**
Converts the returned strings from `GetStandardsList` into the enumeration (NACalClass) and the port numbers required for `PutStandard` and `GetStandard` methods that transmit data in and out of the Cal Set.

Learn more about reading and writing Cal data using COM

**VB Syntax**
```
CalSet.StringToNACalClass (list, std, rcv, src)
```

**Variable (Type) - Description**

- **CalSet** *(object)* - A Cal Set object
- **list** *(string)* - a string containing the textual description of the standard.
- **std** *(enum NACalClass)* Choose from:
  1 - naClassA
  2 - naClassB
  3 - naClassC
  4 - naClassD
  5 - naClassE
  6 - naReferenceRatioLine
  7 - naReferenceRatioThru
- **rcv** *(long)* - port number of the receiver

**SOLT Standards**
1 - naSOLT_Open
2 - naSOLT_Short
3 - naSOLT_Load
4 - naSOLT_Thru
5 - naSOLT_Isolation

**TRL Standards**
1 - naTRL_Reflection
2 - naTRL_Line_Reflection
3 - naTRL_Line_Tracking
4 - naTRL_Thru
5 - naTRL_Isolation
$src$ - (long) - port number of the source

Return Type          Not Applicable
Default             Not Applicable
Examples
        guid = CalSet.StringToNACalClass(list, std, rcv, src)

C++ Syntax
        HRESULT StringtoNACalClass (BSTR* str, NACalClass* item, long *rcv, long *src);

Interface            ICalSet
StringtoNAErrorTerm2 Method

Description
Converts the returned strings from GetErrorTermList into the enumeration (NAErrorTerm2) and the port numbers required for PutErrorTerm and GetErrorTerm methods that transmit data in and out of the Cal Set.

Learn more about reading and writing Cal data using COM

VB Syntax
CalSet.StringToNAErrorTerm2 (list, eterm, rcv, src)

Variable (Type) - Description
 Cal Set (object) - A Cal Set object
   list (string) - a string containing the textual description of the error term.
   eterm (enum As NaErrorTerm2). Choose from:
     0 - naET_Directivity          (rcv = src)
     1 - naET_SourceMatch         (rcv = src)
     2 - naET_ReflectionTracking (rcv = src)
     3 - naET_TransmissionTracking (rcv != src)
     4 - naET_LoadMatch           (rcv != src)
     5 - naET_Isolation           (rcv != src)

   rcv (long) - port number of the receiver
   src (long) - port number of the source

Return Type Not Applicable
Default Not Applicable
Examples CalSet.StringToNAErrorTerm2 str, term, rcv, src

C++ Syntax
HRESULT StringToNAErrorTerm2 (BSTR* str, NAErrorTerm2* item, long *rv, long *src);

Interface ICalSet
### SweepOnlyCalChannelDuringCalAcquisition Method

**Description**
Clears ALL flags for channels to sweep during calibration except the Cal channel. To flag a channel, see AllowChannelToSweepDuringCalAcquisition Method

**VB Syntax**
```vb
calMgr.SweepOnlyCalChannelDuringCalAcquisition
```

**Variable**

- **(Type)** - Description
- **calMgr** *(object)* - A CalManager object

**Return Type**
Not Applicable

**Default**
Not Applicable

**Example**
```vb
calMgr.SweepOnlyCalChannelDuringCalAcquisition
```

See example using this command

**C++ Syntax**
```cpp
HRESULT SweepOnlyCalChannelDuringCalAcquisition()
```

**Interface**
ICalManager5
## TestsetCatalog Method

<table>
<thead>
<tr>
<th>Description</th>
<th>Returns a list of supported testsets.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>VB Syntax</strong></td>
<td>( \text{data} = 	ext{Tsets.TestsetCatalog} )</td>

</table>
UserPreset Method

**Description**
Performs a User Preset. There must be an active User Preset state file (see UserPresetLoadFile and UserPresetSaveState) or an error will be returned.

Regardless of the state of the User Preset Enable checkbox, the app.Preset command will always preset the VNA to the factory preset settings, and app.UserPreset will always perform a User Preset.

**VB Syntax**
```vbnet
app.UserPreset
```

**Variable**

```
app
```
An Application (object)

**Return Type**
Not Applicable

**Default**
Not Applicable

**Examples**
```vbnet
app.UserPreset
```

**C++ Syntax**
```cpp
HRESULT UserPreset();
```

**Interface**
IApplication6
### UserPresetLoadFile Method

**Description**

Loads an existing instrument state file (.sta or .cst) to be used for User Preset. Subsequent execution of `app.UserPreset` will cause the VNA to assume this instrument state.

Regardless of the state of the User Preset Enable checkbox, the `app.Preset` command will always preset the VNA to the factory preset settings, and `app.UserPreset` will always perform a User Preset.

**VB Syntax**

```vbnet
app.UserPresetLoadFile (file)
```

**Variable**

- **(Type)** - Description
  - `app` An Application (object)
  - `file` (String) Full path, name, and extension of the file to be loaded.

**Return Type**

Not Applicable

**Default**

Not Applicable

**Examples**

```vbnet
app.UserPresetLoadFile ("C:\Program Files\Keysight\Network Analyzer\Documents\10MHzto20GHz.sta")
```

**C++ Syntax**

```cpp
HRESULT UserPresetLoadFile (BSTR bstrFile)
```

**Interface**

IApplication6
**UserPresetSaveState Method**

**Description**
Saves the current instrument settings as UserPreset.sta. Subsequent execution of `app.UserPreset` will cause the VNA to assume this instrument state.

Regardless of the state of the User Preset Enable checkbox, the `app.Preset` command will always preset the VNA to the factory preset settings, and `app.UserPreset` will always perform a User Preset.

**VB Syntax**

```vbscript
app.UserPresetSaveState
```

**Variable**

- **Type** - Description
- **app** - An Application (object)

**Return Type**
Not Applicable

**Default**
Not Applicable

**Examples**

`app.UserPresetSaveState`

**C++ Syntax**

```csharp
HRESULT UserPresetSaveState()
```

**Interface**
IApplication6
**Write-only**

**About VISAPassthrough**

## WriteBinary Method

**Description**
Sends binary data to the VISA pass-through device. Note that binary data transfers over sockets are not supported.

**VB Syntax**

```vbnet
Vpassthru.WriteBinary visalD, bin_data
```

**Variable**

<table>
<thead>
<tr>
<th>(Type) - Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>Vpassthru</code> (object) - A VISAPassthrough object</td>
</tr>
<tr>
<td><code>visalD</code> (long) VISA session number (see Open method).</td>
</tr>
<tr>
<td><code>bin_data</code> (variant) Data to be sent to the VISA pass-through device.</td>
</tr>
</tbody>
</table>

**Return Type**
Not Applicable

**Default**
Not Applicable

**Examples**

```vbnet
Vpassthru.WriteBinary 2,"*IDN?"
```

**C++ Syntax**

```cpp
HRESULT WriteBinary(long session_num, variant bin_data)
```

**Interface**
IVISAPassthrough
**Write-only**

### About the ExtTestSetIO connector

#### WriteData Method

**Description**
Writes a 13-bit value to the specified address using the AD0 through AD12 lines of the external test set connector. The VNA generates the appropriate timing signals. It automatically controls timing signals LDS, LAS and RLW to strobe the address, then the data, to the external test set. See the timing diagram for Address and Data I/O read.

**VB Syntax**

```
ExtIO.WriteData address, value
```

**Variable**

- `ExtIO` *(object)* - An External IO object
- `address` *(variant)* - Address to be written to.
- `value` *(variant)* - 13-bit word to write

**Return Type**
Not Applicable

**Default**
Not Applicable

**Examples**

```
ExtIO.WriteData 15,12
```

**C++ Syntax**

```c++
HRESULT WriteData(VARIANT Address, VARIANT Data);
```

**Interface**

IHWExtTestSetIO
WriteRaw Method

Description  Writes a 16-bit value to the external test set connector lines AD0 - AD12, RLW, LAS and LDS. The analyzer does NOT generate the appropriate timing signals. The user has control of all 16 lines using this write method.

Note: When RLW (pin25) is set to 1 (high) it causes lines AD0 - AD12 to float. It disables their output latches and sets the hardware for reading. LDS and LAS are not affected by this behavior.

Below is the format of data that is written with WriteRaw:

* This Output will float if RLW (bit-13) is set high

HRESULT WriteSnPData(BSTR data, BSTR filename);
```

**Interface**

```plaintext
INoiseFigure7
```
WriteSnpFileWithSpecifiedPorts Method

Description  Note: This command replaces app.Save (.snp). This command is more explicit regarding the data to be saved, and works for VNAs with multiport test sets.

Saves SNP data to the specified file. Learn more about SNP data.

VB Syntax  

```vbnet
data = meas.WriteSnpFileWithSpecifiedPorts ports, filename
```

Variable (Type) - Description

- `data` (Variant) array to store the data.
- `meas` A Measurement (object)
- `ports` (Variant Array) One dimensional array containing a list of port numbers for which snp data is requested.
- `filename` (string) - Full path, filename, and suffix to store the data.

The suffix is not checked for accuracy. If saving 2 ports, specify "filename.s2p"; If saving 3 ports, specify "filename.s3p." and so forth.

SNP data can be output using several data formatting options. See SNPFormat Property

Return Type  Variant array - automatically dimensioned to the size of the data.

Default  Not Applicable

Examples

' This VBScript example can be pasted into a notepad file and run on the VNA as a macro. Learn how.

```vbnet
Set pna = CreateObject("AgilentPnA835x.application")
Set meas = pna.ActiveMeasurement

' List the port numbers for required data
ports = Array(1,2,4)

' specify where to save the data
filename="C:\Program Files(x86)\Keysight\Network Analyzer\Documents\MyData.s3p"
meas.WriteSnpFileWithSpecifiedPorts ports, filename
```

C++ Syntax  HRESULT WriteSnpFileWithSpecifiedPorts(VARIANT portsToMeasure,BSTR filename);
# WriteString Method

<table>
<thead>
<tr>
<th>Description</th>
<th>Sends ASCII string data to the VISA pass-through device.</th>

### WriteUncertaintyFile Method

**Description**
Saves uncertainty data for the specified ports in three different formats.

**VB Syntax**
\[
data = \text{ uncert.} \text{WriteUncertaintyFile} \text{ ports, filename}
\]

<table>
<thead>
<tr>
<th>Variable</th>
<th>(Type) - Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>data</td>
<td>(Variant) array to store the data.</td>
</tr>
<tr>
<td>uncert</td>
<td>An Uncertainty (object)</td>
</tr>
<tr>
<td>ports</td>
<td>(Variant Array) One dimensional array containing a list of port numbers for which data is requested.</td>
</tr>
<tr>
<td>filename</td>
<td>(string) - Path, filename, and suffix of location to store the uncertainty data, enclosed in quotes. The suffix is not checked for accuracy.</td>
</tr>
</tbody>
</table>

- **(*.u*p) S-parameter Uncertainty File** - If saving 2 ports, specify "filename.u2p"; If saving 4 ports, specify "filename.u4p.", and so forth.

- **(*.dsd) S-parameter Data Standard Definition file** - Data for ONLY one or two ports is allowed.

- **(*.sdatcv) METAS S-parameter Covariance File.**

**Return Type**
Not Applicable

**Default**
Not Applicable

**Examples**
This VBScript example can be pasted into a notepad file and run on the VNA as a macro. Learn how.

```vbnet
Dim app As AgilentPNA835x.Application
Set app = CreateObject("AgilentPNA835x.Application", <analyzerName>)

Dim oUncert as Uncertainty
Set oUncert = app.ActiveMeasurement.Uncertainty

'List the port numbers for required data
ports = Array(1,2)

'specify where to save the data and data suffix
'remove comment for one of the following:
filename="D:\MyData.u2p"
```
```c++
HRESULT WriteUncertaintyFile(VARIANT portsToMeasure, BSTR filename);
```

**Interface**

IUncertainty

The following example uses the smart pointer created by Microsoft Visual Studio. The calls to CoInitialize and CoUninitialize open and close the COM libraries.

Also notice that the pointers local to the main routine are explicitly released. When smart pointers go out of scope, they will perform this duty implicitly. However, we are calling CoUninitialize before they have the chance to be destroyed, so we are obliged to release them.

```c++
// An example program to illustrate the use of #import to bind to the
// PNA type library.

#ifdef _UNICODE
# define _UNICODE
#endif

#include "stdafx.h"
#include "stdio.h"
#include "math.h"

/////////////////////////////////////////////
// import the network analyzer type library
/////////////////////////////////////////////
#import "C:\Program Files\Common Files\Keysight\Pna\835x.tlb" no_namespace,
   named_guids
/////////////////////////////////////////////
// include the error definitions for the PNA so we can implement
// error handling.
/////////////////////////////////////////////
#include "C:\Program Files\Common Files\Keysight\Pna\errorsystemmessage.h"

IAplicationPtr pNA; // top level application pointer

' But you will only be prompted once for each connection type

For i = 1 to Numsteps
    step = "Step " + CStr(i) + " of " + CStr(Numsteps)
    strPrompt = guidedCal.GetStepDescription(i)
    value = MsgBox(strPrompt, vbOKOnly, step)
    guidedCal.AcquireStep i
Next

guidedCal.GenerateErrorTerms
The following program creates a Split Cal which applies to SMC and GCX channels only. If selected, these channels will perform their own calibrations, performing two 1-port calibrations (no thru).

This VBScript (*.vbs) program can be run as a macro in the PNA. To do this, copy the following code into a text editor file such as Notepad and save it on the PNA hard drive as BalancedCOM.vbs. Learn how to setup and run the macro.

```vbs
Dim host: host = "localhost"
Dim pna: set pna = createobject("Agilentpna835x.application", host)
wscript.echo pna.idstring
pna.preset
pna.CreateCustomMeasurementEx 2, "Scalar Mixer/Converter", "SC12", 1
Set scpi = pna.ScpiStringParser
Dim mgr
Set mgr = pna.GetCalManager
Dim CalAll
Set CalAll = mgr.CalibrateAllChannels
CalAll.Reset
'Perform calibration on Channel 2 SMC:
CalAll.Channels = Array(2)
CalAll.PropertyValue("Include Power Calibration") = "true"
CalAll.PropertyValue("Split Cal") = "true"
CalAll.PowerLevel(1) = -5
Dim guidedcal
set guidedcal = calAll.GuidedCalibration
' Specify the DUT connectors
guidedcal.ConnectorType(1) = "APC 3.5 male"
guidedcal.ConnectorType(2) = "APC 3.5 female"
guidedcal.ConnectorType(3) = "Not used"
```
guidedcal.ConnectorType(4) = "Not used"
guidedCal.CalKitType(1) = "85052D"
guidedCal.CalKitType(2) = "85052D"
Numsteps = guidedcal.GenerateSteps
wscript.echo "Numsteps: " + cstr(Numsteps)

'Note that this performs two one-port calibrations

'So the power sensor will be prompted to connect on P1 and P2

For i = 1 to Numsteps
    step = "Step " + CStr(i) + " of " + CStr(Numsteps)
    strPrompt = guidedCal.GetStepDescription(i)
    value = MsgBox(strPrompt, vbOKOnly, step)
    guidedCal.AcquireStep i
Next

guidedCal.GenerateErrorTerms
This example iterates over the entire collection of Cal Sets that currently reside in the VNA. It reads the entire list of error term strings from each Cal Set and queries the data for each term. It then does the same for the standards data.

Learn more about Reading and Writing Calibration data using COM.

Learn more about Cal Sets.

See example: Writing Cal Set Data using COM

This VBScript (*.vbs) program can be run as a macro in the VNA. To do this, copy the following code into a text editor file such as Notepad and save on the VNA hard drive as CalSets.vbs. Learn how to setup and run the macro.

```vbs
Dim pna
Dim cset
Dim calsets

' create the pna object
' to run on a remote PC, substitute 'name' for the full computer name of your VNA
' to run as a macro on the VNA, remove "name"
Set pna = CreateObject("AgilentPNA835x.Application", "name")

wscript.echo pna.IDString

' obtain the calset collection
Set calsets = pna.GetCalManager.calsets

' loop thru the calsets
Dim c
For c = 1 To calsets.count
    Set cset = calsets.Item(c)
    wscript.echo "calset = ", cset.GetGUID, cset.Description

    ' iterate through error terms data
    Dim vterms,fdata
    vterms = cset.GetErrorTermList2(0, "")
    if (Not IsEmpty(vterms)) then
        For i = LBound(vterms) To UBound(vterms)

wscript.echo vterms(i)
vdata = cset.GetStandardByString( vterms(i) )
wscript.echo vdata(1,0), vdata(1,1)
Next
end if
Next
Getting Trace Data from the Analyzer

This Visual Basic program:

- Retrieves Scalar Data from the Analyzer and plots it.
- Retrieves Paired Data from the Analyzer and plots it.
- Retrieves Complex Data from the Analyzer and plots it.

To use this code, prepare a form with the following:

- Two MSCharts named **MSChart1** and **MSChart2**
- Three buttons named **GetScalar**, **GetPaired**, **GetComplex**

**Note:** You can get MSChart in Visual Basic by clicking Project / Components / Microsoft Chart Control

```
'Put this in a module
Public dlocation As NADataStore
Public numpts As Long
Public fmt As NADataFormat
Public app As Application
Public measData As IArrayTransfer
Public chan As Channel

Sub Form_Load()
    'Change analyzerName to your analyzer's full computer name
    Set app = CreateObject("AgilentPNA835x.Application", "analyzerName")

    Set measData = app.ActiveMeasurement
    Set chan = app.ActiveChannel

    'To pick a location to get the data from remove the comment from one of these
dlocation = naRawData
    'dlocation = naCorrectedData
    'dlocation = naMeasResult
    'dlocation = naRawMemory
    'dlocation = naMemoryResult

    'setup MSChart1 and MSChart2
    'right click on the chart and select:
    '- line chart
    '- series in rows
```
Sub GetComplex_Click()
ReDim Data(numpts) As NAComplex
Dim Real(201) As Single
Dim Imag(201) As Single
numpts = chan.NumberOfPoints

' You cannot change the format of Complex Data
Call trigger
' get data
measData.GetNAComplex dlocation, numpts, Data(0)
' plot data
Dim i As Integer
For i = 0 To numpts - 1
    Real(i) = Data(i).Re
    Imag(i) = Data(i).Im
Next i
MSChart1 = Real()
MSChart2.Visible = True
MSChart2 = Imag()
Call Sweep
End Sub

Sub GetPaired_Click()
ReDim Real(numpts) As Single
ReDim Imag(numpts) As Single
numpts = chan.NumberOfPoints

' To pick a format, remove the comment from one of these
fmt = naLogMagPhase
'fmt = naLinMagPhase
Call trigger
' Get data
measData.getPairedData dlocation, fmt, numpts, Real(0), Imag(0)
' Plot Scalar
MSChart1 = Real()
MSChart2.Visible = True
MSChart2 = Imag()
Call Sweep
End Sub

Sub GetScalar_Click()
ReDim Data(numpts) As Single
numpts = chan.NumberOfPoints

Perform a Source Power Cal using COM

This program can be run in either Visual Basic 6 or as a VBScript program. The VNA can run *.vbs programs as macros.

This program demonstrates:

- Performing a source power calibration of Port 2 for Channel 1.
- Reading the calibration data.

Learn more about Power Calibrations

See an example that Uploads a Source Power Cal

See Other COM Example Programs

To run this program, you need:

- One of the following power meters connected to the VNA through GPIB: E4416A, E4417A, E4418A/B, E4419A/B, 437B, 438A, EPM-441A, EPM-442A

**Note:** If your power meter is other than these, you can create your own Power Meter Driver using our template.

- Your PC and VNA both connected to a LAN (for communicating with each other).

To make this program work in VBS, save the following code in a text editor file such as Notepad and save as *.vbs.

To make this program work in Visual Basic 6:

1. Create a new project
2. Click **Project, Add New Module**, click **Open**.
3. Paste the following code into the code window.
4. Delete the first two lines (comment and Main)
5. Click **Project**, **Properties**. Under **Startup Object**, select **Sub Main**

6. Click **Project**, **References**, and select the Keysight PNA Series Type Library.

```vba
' Run the Main subroutine
Main
Public Sub Main()
    Dim PNA, chan, pwrcal ' VNA COM objects
    Const naPowerMeter = 0, naPowerMeterAndReceiver = 1 ' enum NASourcePowerCalMethod
    Const naPowerSensor_A = 0 ' enum NAPowerAcquisitionDevice
    Const naCorrectionValues = 0 ' enum NASourcePowerCalBuffer
    Const port = 2 ' VNA port #2 as source port
    Const offset = 0 ' cal power offset value
    Const bDisplay = True ' whether to display data during acquire
    Dim stimulus, calvalues, strResult

    ' Instantiate our VNA COM objects
    Set PNA = CreateObject("AgilentPNA835x.Application")
    Set chan = PNA.Channels(1)
    Set pwrcal = PNA.SourcePowerCalibrator

    ' Set the number of sweep points to 21 on Channel 1.
    chan.NumberOfPoints = 21

    ' Specify the GPIB address of the power meter
    ' that will be used in performing the calibration.
    pwrcal.PowerMeterGPIBAddress = 13

    ' Turn use of the loss table OFF (this assumes there is
    ' virtually no loss in the RF path to the power sensor
    ' due to a splitter, coupler or adapter).
    pwrcal.UsePowerLossSegments = False

    ' Turn frequency checking OFF (so one power sensor is used for the entire cal
    ' acquisition sweep regardless of frequency span).
    pwrcal.UsePowerSensorFrequencyLimits = False

    ' Specify a nominal power accuracy tolerance (IterationsTolerance) in dB for the
    ' calibration, and the maximum number of iterations to adjust power at each point,
    ' attempting to achieve within tolerance of the desired power. If at any stimulus
    ' point the power fails to reach within the set tolerance of the desired power
    ' after the maximum number of iterations, the power at that point will be set to the
    ' value determined by the last iteration (the Source Power Cal dialog box will
    ' indicate the FAIL, but we can still apply the cal if desired when it's complete).
    ' Each iteration is based upon a SETTLED power reading (see comments preceding the
    ' next two properties below).
    pwrcal.IterationsTolerance = 0.1
    pwrcal.MaximumIterationsPerPoint = 3

    ' The worst-case window of power uncertainty (for a calibration which meets
    ' tolerance) is the sum of the iteration tolerance and the power meter settling
```
At each stimulus point, the VNA takes power meter readings and determines when they have settled by comparing the magnitude difference between consecutive readings versus a nominal dB tolerance limit (ReadingsTolerance) on that magnitude difference. When consecutive readings are within tolerance of each other, or if they are not within tolerance but we’ve taken a maximum number of readings (ReadingsPerPoint), the VNA does a weighted average of the readings taken at that stimulus point and that is considered our settled power reading.

```
pwrcal.ReadingsTolerance = 0.1
pwrcal.ReadingsPerPoint = 5
```

Setup of information pertaining to this specific cal acquisition. Includes the method (type of devices) that will be used to perform the cal -- choose either naPowerMeter or naPowerMeterAndReceiver. naPowerMeterAndReceiver uses the power meter for the first iteration of each point and the VNA’s reference receiver for subsequent iterations, so is much faster than using power meter only naPowerMeter).

But the power meter accounts for compression when calibrating at the output of an active device, whereas the reference receiver cannot unless it is coupled to the cal reference plane (on a VNA which allows direct access to the receivers).

'offset' specifies if the cal power level is offset (positive value for a gain, negative value for a loss) from the VNA port power setting on the channel when no source power cal is active. This is to account for components between the VNA test port and cal reference plane. In this example, we will calibrate at the VNA test port, so there is no offset (it is zero).

'bDisplay' indicates whether to display the source power cal dialog during the source power cal acquisition (the dialog will chart the corrected power readings).

```
pwrcal.SetCalInfo2 naPowerMeter, chan.channelNumber, port, offset, bDisplay
```

Perform synchronous source power cal acquisition sweep using the sensor attached to Channel A of the power meter. This assumes that the power sensor is already connected to Port 2 of the VNA.

```
pwrcal.AcquirePowerReadings naPowerSensor_A, True
```

Conclude the calibration. This applies the cal data to VNA channel memory, and turns the correction ON for Port 2 on Channel 1, but does NOT save the calibration.

```
pwrcal.ApplyPowerCorrectionValues
```

At this point, if you choose to save the instrument state as a ".CST" file, the calibration will be saved with the instrument state in that file.

Read the stimulus values from Channel 1.

```
stimulus = chan.GetXAxisValues
```

Read the source power correction data.

```
calvalues = chan.getSourcePowerCalDataEx(naCorrectionValues, port)
```

Print the data using a message box (here, Chr returns the ASCII characters for Tab (9) and Linefeed (10)).

```
strResult = "Stimulus" & Chr(9) & Chr(9) & "Cal Value" & Chr(10)
For i = 0 To UBound(stimulus)
strResult = strResult & stimulus(i) & Chr(9) & calvalues(i) & Chr(10)
```

3087
Next
MsgBox strResult
End Sub
Independent Power Calibration

The following program creates an independent power calibration over a specified frequency span when performing a Cal All.

This VBScript (*.vbs) program can be run as a macro in the PNA. To do this, copy the following code into a text editor file such as Notepad and save it on the PNA hard drive as BalancedCOM.vbs. Learn how to setup and run the macro.

```vbs
Dim host: host = "K-N5222B-10034"

Perform an Unknown Thru or TRL Cal

The following program performs either a 2-port SOLT Unknown Thru Cal or a 2-port TRL Cal. The 85052C Cal Kit used in this program contains both types of standards. This program can be run on 2-port or 4-port VNAs. When run on select PNA-L models, a Delta Match Cal is required. See Delta Match Cal example program.

This VBScript (*.vbs) program can be run as a macro in the VNA. To do this, copy the following code into a text editor file such as Notepad and save it on the VNA hard drive as Unknown.vbs. Learn how to setup and run the macro.

```
Sub PerformUnknownThruOrTRLCal()
    ' Create / Get the VNA application.
    Set app = CreateObject("AgilentPNA835x.Application")
    ' Get the cal manager object
    Set calMgr = app.GetCalManager
    ' Get the guided cal object
    Set guidedCal = calMgr.GuidedCalibration
    Set chan = app.ActiveChannel
    chanNum = chan.ChannelNumber

    ' Initialize guided cal to be performed on the active channel.
    ' The boolean argument of True specifies the creation of a new calset
    ' for storing the new calibration.
    guidedCal.Initialize chanNum, True

    ' Specify connectors for Ports 1 and 2
    guidedCal.ConnectorType(1) = "APC 3.5 female"
    guidedCal.ConnectorType(2) = "APC 3.5 male"

    ' If your VNA has more than 2 ports, uncomment one or both of
    ' these next two lines, to explicitly specify this is
    ' just a 2-port cal.
    'guidedCal.ConnectorType(3) = "Not used"
    'guidedCal.ConnectorType(4) = "Not used"

    ' Specify cal kit for Ports 1 and 2
    guidedCal.CalKitType(1) = "85052C"
    guidedCal.CalKitType(2) = "85052C"

    ' Since the 85052C cal kit contains SOLT standards and also TRL
    ' standards, these next lines determine whether the cal becomes
    ' unknown thru (SOLT), or TRL.
    ' Specify cal and Thru method
    guidedCal.PathThruMethod (1,2) = "Undefined Thru"

End Sub
```
' To set up the cal as TRL, comment the previous line and uncomment this next line.
The Thru method is set by default.
guidedCal.PathCalMethod (1,2) = "TRL"

' Always send Initialize after modifying the SmartCal logic
guidedCal.Initialize chanNum, True
numSteps = guidedCal.GenerateSteps
MsgBox "Number of steps is " + CStr(numSteps)

' Query the list of ports that need delta match
portList = guidedCal.PortsNeedingDeltaMatch
' If portList contains just one element and it's value is 0, then that indicates
' none of the ports being calibrated require delta match data.
' If each testport on the VNA has it's own reference receiver (R channel),
' then delta match is never needed, so portList will always be just 0.
lowerBound = LBound(portList)
If (UBound(portList) <> lowerBound) Or (portList(lowerBound) <> 0) Then
' Delta match data is required for at least one port.
' For this example, we assume a Global Delta Match Cal has previously been
' performed so the Global Delta Match CalSet exists.
' Supplying an empty string to ApplyDeltaMatchFromCalSet indicates to use
' the Global Delta Match CalSet.
guidedCal.ApplyDeltaMatchFromCalSet ""
End If

' Measure the standards
For i = 1 To numSteps
step = "Step " + CStr(i) + " of " + CStr(numSteps)
strPrompt = guidedCal.GetStepDescription(i)
retVal = MsgBox(strPrompt, vbOKCancel, step)
If retVal = vbCancel Then Exit Sub
guidedCal.AcquireStep i
Next

' Conclude the calibration
guidedCal.GenerateErrorTerms
MsgBox "Cal is done!"

End Sub
Perform Global Delta Match Cal

The following program performs a Global Delta Match Calibration. This is required when performing an Unknown Thru cal or TRL cal on VNAs without a reference receiver for each test port. See example.

This VBScript (*.vbs) program can be run as a macro in the VNA. To do this, copy the following code into a text editor file such as Notepad and save it on the VNA hard drive as Delta.vbs. Learn how to setup and run the macro.

```vbs
Sub PerformGlobalDeltaMatchCal()
    ' Create / Get the VNA application.
    Set app = CreateObject("AgilentPNA835x.Application")
    ' Get cal manager object
    Set calMgr = app.GetCalManager
    ' Get guided cal object
    Set guidedCal = calMgr.GuidedCalibration

    ' Initiate a Global Delta Match calibration, choosing connector and cal kit
    numSteps = guidedCal.GenerateGlobalDeltaMatchSequence("APC 3.5 female", "85033D/E")
    MsgBox "Number of steps is " + CStr(numSteps)

    ' Measure the standards
    For i = 1 To numSteps
        step = "Step " + CStr(i) + " of " + CStr(numSteps)
        strPrompt = guidedCal.GetStepDescription(i)
        retVal = MsgBox(strPrompt, vbOKCancel, step)
        If retVal = vbCancel Then Exit Sub
        guidedCal.AcquireStep i
    Next

    ' Conclude the calibration
    guidedCal.GenerateErrorTerms
    MsgBox "Cal is done!"
End Sub
```
Perform a Guided Cal with C#

The following example performs a 2-port or 4-port Guided Cal using C#.

**Note:** Replace `<remote host name>` with the full computer name of your VNA.

**Learn more about using .NET with the VNA**

```csharp
AgilentPNA835x.IApplication pna;

Perform an ECal using COM

This example uses the GuidedCalibration interface to perform a 2-port ECal calibration.

Learn more about Reading and Writing Calibration data using COM.

See Other COM Example Programs

This VBScript (*.vbs) program can be run as a macro in the VNA. To do this, copy the following code into a text editor file such as Notepad and save on the VNA hard drive as ECal.vbs. Learn how to setup and run the macro.

```vbs
Set pna = CreateObject("AgilentPNA835x.Application")
Set calMgr = pna.GetCalManager
Set guidedCal = calMgr.GuidedCalibration
Set chan = pna.ActiveChannel
chanNum = chan.ChannelNumber
' Initialize guided cal to be performed on the active channel.
' The boolean argument of True indicates to create a new calset
guidedCal.Initialize chanNum, True
' To perform 3-port cal, Uncomment the following
' Then comment the 2-port cal

' Do 2-port cal
TwoPortGuidedCal

' Do 3-port cal
' ThreePortGuidedCal

Sub TwoPortGuidedCal()
'Change the following to match the connectors on your ECal module
guidedCal.ConnectorType(1) = "APC 3.5 female"
guidedCal.ConnectorType(2) = "APC 3.5 female"
For i = 3 To pna.NumberOfPorts
    guidedCal.ConnectorType(i) = "Not used"
Next
value = MsgBox("Connectors defined for Ports 1 and 2")

' Select the ECal module for each port being calibrated.

' Replace N4691-60004 with your own ECAL model followed by 'ECal'.

' Your ECal module must already be connected
```
' via USB to the VNA.

guidedCal.CalKitType(1) = "N4691-60004 ECal"
guidedCal.CalKitType(2) = "N4691-60004 ECal"

' Non-factory characterizations are specified as follows:

'guidedCal.CalKitType(1) = "N4691-60004 User 1 ECal"

' When two or more ECal modules with the same model number are connected
' also specify the serial number as follows:

'guidedCal.CalKitType(1) = "N4691-60004 ECal 01234"

' When Disk Memory ECal user characterizations are used,
' specify both the User char and the serial number as follows:

'guidedCal.CalKitType(1) = "N4691-60004 MyDskChar ECal 01234"

' Turn on auto orientation for the ECal (default behavior).

'guidedCal.AutoOrient = 1'

MsgBox("Cal kits defined for Ports 1 and 2")

' Initiate the calibration and query the number of steps

        value = MsgBox(strPrompt, vbOKOnly, step)
        guidedCal.AcquireStep i
    Next

    ' Conclude the calibration
    guidedCal.GenerateErrorTerms
    MsgBox("Cal is done!")
End Sub
Perform an ECal User Characterization

This example performs a user-characterization and stores it to both the ECal module memory and VNA disk memory.

It then performs two 2-port cals: the first using the characterization from module memory, then using the characterization from disk memory.

**Note:** This example requires that channel 1 be already calibrated.

This VBScript (*.vbs) program can be run as a macro in the VNA. To do this, copy the following code into a text editor file, such as Notepad, and save it on the VNA hard drive as ECal.vbs.

- About User Characterization

```vbnet
Option Explicit

Dim pna
Set pna = CreateObject("AgilentPNA835x.Application")

Dim calMgr
Set calMgr = pna.GetCalManager

' Get ECal User Characterizer COM object
Dim ecalCharacterizer
Set ecalCharacterizer = calMgr.GetECalUserCharacterizer

' Substitute here the model number and serial number of your own ECal.
' Note that this example corresponds to a 4-port ECal module with
' serial number 00001. If instead you have a 2-port ECal module,
' their model numbers are '5x5' numbers -- for example, 'N4691-60001'.
```
Dim ecalModelNum
ecalModelNum = "N4433A"
Dim ecalSerialNum
ecalSerialNum = "00001"
ecalCharacterizer.ECalID = ecalModelNum & "," & ecalSerialNum
MsgBox "ECal module to be characterized is: " & ecalCharacterizer.ECalID

' Set which user characterization number (1-12) the new characterization
' will be stored to in the ECal module when it is done.  If you intend to
' store your user characterization just to VNA Disk Memory and NOT the
' ECal module's memory, then omit the setting of this property.
ecalCharacterizer.CharacterizationNumber = 1

' The following commented-out lines of code show how you can access
' the list of connector type names you can set for the ports of an
' ECal when you user-characterize it.  However, please note that if
' you are writing the user characterization to the ECal module's memory,
' as of yet only the Factory Defined set of connector choices will work
' properly (see the ValidConnectorType property).
'
' If you will be saving your characterization to just
' VNA Disk Memory only, then all connector names returned by this call
' will work, user-defined connector names as well as factory-defined.
'
'Dim connTypeArray
'connTypeArray = ecalCharacterizer.ValidConnectorTypes
'MsgBox connTypeArray(1)

' Access element 1 in the string array
' For each port of the ECal module, specify which connector type
' is at the end of the adapter (or cable or fixture) that is
' connected to that port of the ECal for the characterization
' (must be one of the connector types that is included in the
list that the ValidConnectorTypes method returns). The default
is "No adapter", which assumes you are characterizing that port
of the ECal "as is" (nothing attached to it). So in this example,
Ports C and D of the ECal are being characterized to just the
ECal's connectors.

ecalCharacterizer.ConnectorType(1) = "APC 3.5 male" ' ECal Port A
ecalCharacterizer.ConnectorType(2) = "APC 3.5 male" ' ECal Port B

As with the connector types, the information set in these next
few properties also gets stored within the characterization.
Set the name of the person and/or company that is producing
this characterization.

ecalCharacterizer.UserName = "John Doe, Acme Inc."

Set user-specified description of the VNA being used.

ecalCharacterizer.UserDescriptionOfPNA = "SN US12345678"

Set descriptions of what you have connected to the ECal module's
ports for the characterization.

ecalCharacterizer.PortDescription(1) = "3.5 mm adapter, SN 00001" ' Port A of the
ECal
ecalCharacterizer.PortDescription(2) = "3.5 mm adapter, SN 00002" ' Port B of the
ECal

Begin a user characterization on Channel 1.

If you will be storing this characterization to the ECal module's memory, then
the boolean argument to this command should be set to True. If you will be storing
this characterization to VNA disk memory ONLY, then you should specify False for
that argument. In this example we will be storing the characterization to both
module memory and VNA disk memory, so we use True.

ecalCharacterizer.InitializeEx 1, True

Generate the measurement steps for the user characterization.
Dim numSteps

numSteps = ecalCharacterizer.GenerateSteps

' Measure the steps.
' You must ensure you have already applied the appropriate calibration to the channel
' already, or else an error will be thrown indicating that.

ECAL Confidence Check

This Visual Basic program:

- Initializes the VNA objects.
- Performs a complete ECAL confidence check

Before using this code:

- The active channel must contain an S11 measurement with a 1-port or N-port calibration
- Prepare a form with two buttons named cmdRun and cmdQuit

Note: A confidence check can NOT be performed remotely from User Characterizations that are stored on the VNA disk.

```vba
Private oPNA As AgilentPNA835x.Application
Private oChan As Channel
Private oCal As Calibrator
Private oMeas As Measurement

Private Sub cmdRun_Click()
Dim iMeasIndex As Integer

Set oPNA = CreateObject("AgilentPNA835x.Application", "MachineName")
Set oChan = oPNA.ActiveChannel
Set oCal = oChan.Calibrator

iMeasIndex = 1

' Loop through measurements until an S11 on the active channel
' is found, or the end of the measurement collection is reached.
```
Do
  Set oMeas = oPNA.Measurements(iMeasIndex)
  If oMeas.Parameter = "S11" And _
    oMeas.channelNumber = oChan.channelNumber Then Exit Do
  iMeasIndex = iMeasIndex + 1
  If iMeasIndex > oPNA.Measurements.Count Then
    MsgBox "No S11 measurement found on the active channel." _
    " Create an S11 measurement, then try again."
    Exit Sub
  End If
Loop

' Set up trace view so we are viewing only the data trace.
oMeas.View = naData

' Acquire the S11 confidence check data from ECal Module A
' into the memory buffer.
oCal.AcquireCalConfidenceCheckECALEx "S11", 1

' Turn on trace math so the trace shows data divided by memory.
' You can be confident the S11 calibration is reasonably good if
' the displayed trace varies no more than a few tenths of a dB
' from 0 dB across the entire span.
oMeas.TraceMath = naDataDivMemory
End Sub

Sub cmdQuit_Click()
' Turn off trace math
' in case someone clicks Quit without having clicked Run
If oMeas <> Nothing Then oMeas.TraceMath = naDataNormal
' Conclude the confidence check to set the ECal module
' back to it's idle state.
If oCal <> Nothing Then oCal.DoneCalConfidenceCheckECAL
' End the program
    End
End Sub

This VBScript (*.vbs) program can be run as a macro in the VNA. To do this, copy the following code into a text editor file such as Notepad and save on the VNA hard drive as CalSetsWrite.vbs. Learn how to setup and run the macro.

```vbs
Dim pna
Dim v
Set pna = CreateObject("AgilentPNA835x.Application")
InitPhonyData
PutPhonyData
' This sub creates phony data
Sub InitPhonyData()
Dim i
Dim numpts
wscript.echo "init phony"
umpts = pna.ActiveChannel.NumberOfPoints
ReDim v(numpts - 1, 1)
For i = 0 To numpts - 1
v(i, 0) = i
v(i, 1) = 0
Next
End Sub
' This sub creates a Cal Set, then writes the phony data to it
Sub PutPhonyData()
Dim cmgr
Dim cset
wscript.echo "putphony"
Set cmgr = pna.GetCalManager
Set cset = cmgr.CreateCalSet(1)
cset.OpenCalSet naCalType_OnePort, 1
const directivity = 0
const sourcematch = 1
```

---
const reflectiontracking =2

cset.putErrorTerm directivity, 1, 1, v

cset.putErrorTerm sourcematch, 1, 1, v

cset.putErrorTerm reflectiontracking, 1, 1, v

cset.CloseCalSet

cset.Description = "Phony One Port"

cset.save

End Sub
Upload a Source Power Cal using COM

This program can be run in either Visual Basic 6 or as a VBScript program. The VNA can run *.vbs programs as macros.

This program demonstrates:

- Uploading a source power calibration of Port 2 for Channel 1.
- Reading the calibration data.

Learn more about Power Calibrations

See Other COM Example Programs

To run this program you need:

- Your PC and VNA both connected to a LAN (for communicating with each other).

To make this program work in VBS, save the following code in a text editor file such as Notepad and save as *.vbs.

To make this program work in Visual Basic 6:

1. Create a new project
2. Click Project, Add New Module, click Open.
3. Paste the following code into the code window.
4. Delete the first two lines (comment and Main)
5. Click Project, Properties. Under Startup Object, select Sub Main
6. Click Project, References, and select the Keysight PNA Series Type Library.

' Run the Main subroutine
Main
Public Sub Main()
Dim PNA, chan ' VNA COM objects
Const naCorrectionValues = 0 ' enum NASourcePowerCalBuffer
Const port = 2 ' VNA port #2 as source port
Dim stimulus, calvalues
Dim power, calpower, strResult

' Instantiate our VNA COM objects
Set PNA = CreateObject("AgilentPNA835x.Application")
Set chan = PNA.Channels(1)

' Set the number of sweep points to 2 on Channel 1.
chan.NumberOfPoints = 2

' Ensure there's currently no source power cal on for this channel and port.
chan.SourcePowerCorrection(port) = False

' Specify if the cal power level is offset (positive value for a gain, negative
' value for a loss) from the VNA port power setting on the channel when
' no source power cal is active. This is to account for components
' between the VNA test port and cal reference plane.
' In this example, let's set up our calibration
' at the output of an amplifier with 15 dB gain.
chan.SourcePowerCalPowerOffset(port) = 15

' Send our source power correction data to the VNA. For purpose of simplicity
' in this example, we'll set up for no correction (0) at our start stimulus and
' 0.5 dB at our stop stimulus (recall that our sweep currently has just 2 points).
calvalues = Array(0, 0.5)
chan.putSourcePowerCalDataEx naCorrectionValues, port, calvalues

' Set the number of sweep points to 21 on Channel 1.
chan.NumberOfPoints = 21

' Read the fixed power level for this port on Channel 1.
power = chan.TestPortPower(port)

' Turn the source power cal on.
chan.SourcePowerCorrection(port) = True

' Again read the fixed power level for this port on Channel 1
' (with our calibration turned on, this should now include the 15 dB offset
' we indicated our power amplifier provides).
calpower = chan.TestPortPower(port)

' Read the stimulus values from Channel 1.
stimulus = chan.GetXAxisValues

' Read back the source power correction data, now interpolated for 21 points
calvalues = chan.getSourcePowerCalDataEx(naCorrectionValues, port)

' Print the data using a message box (here, Chr returns the ASCII characters
' for Tab (9) and Linefeed (10)).
strResult = "PNA port power = " & power & Chr(10)
strResult = strResult & "Power at reference plane = " & calpower & Chr(10) & hr(10)
strResult = strResult & "Stimulus" & Chr(9) & Chr(9) & "Cal Value" & Chr(10)
For i = 0 To UBound(stimulus)
    strResult = strResult & stimulus(i) & Chr(9) & calvalues(i) & Chr(10)
Next
MsgBox strResult
End Sub
Upload and Download Segment Table

These example programs use the SetAllSegments Method and GetAllSegments Method to do the following:

- Creates a 2-dimensional array (7 x 10) 7 data elements that define each segment x 10 segments
- Uploads the data to the VNA
- Downloads a segment table from the VNA

This program does not make sweep type = segment or show the segment table.

The comments indicate the order in which the segment elements are specified: Index 0 - segment state, Index 4 is IFBW, and so forth.

See Other COM Example Programs

This VBScript (*.vbs) program can be run as a macro in the VNA. To do this, copy the following code into a text editor file such as Notepad and save on the VNA hard drive as *.vbs. Learn how to setup and run the macro.

```vbs
' Create the application instance, and preset the application
Set app = CreateObject("AgilentPNA835x.Application")
app.Preset

Create Multiple Instances of Calibrate All Channels

This example sets up multiple instances of CalibrateAllChannels.

**Note:** You can assign a single client channel to multiple cal all instances. However, care should be taken here. If you create user cal sets, all cal sets will be created but only the last one will be applied. If you are only using a cal register, only the last cal all will be written to the cal register (only supports one calibration). The order that the cal alls are created should be the order in which they are saved (GenerateErrorTerms). This ensures that the client channel imports the proper ETerms.

Create and Cal an SMC Measurement

This example creates and calibrates an SMC measurement. A power sensor must first be connected to the VNA.

By removing the comments (' ') at the start of the **BLUE code**, it can also do the following:

- Load a Mixer setup file from the VNA at: C:\Program Files(x86)\Keysight\Network Analyzer\Documents\Mixer\MyMixer.mxr.
- Cal using an ECal module.
- Perform manual ECAL orientation
- Load a Phase Reference calibration.

This VBScript (*.vbs) program can be run as a macro in the VNA. To do this, copy the following code into a text editor file such as Notepad and save on the VNA hard drive as SMC.vbs. Learn how to setup and run the macro.

Use an Existing Power Cal During an SMC Cal

This example shows how to use an existing Source Power Cal instead of the power cal that is performed during an SMC calibration. To run this program without modification, you need the following:

- A Mixer setup file saved on the VNA: C:\Program Files(x86)\Keysight\Network Analyzer\Documents\Mixer\MyMixer.mxr.
- If the mixer file uses an external LO source, it must be connected and configured.
- An ECal module that covers the frequency range of the measurement.
- An SMC cal set named "SMC_CAL". This is the cal set that source power correction data will be imported from. The input and output frequency ranges of the cal set must cover the corresponding ranges used during calibration, or guided cal initialization will fail.

Error Messages

- If you attempt to import power cal data from an SMC calset that uses different ports than the ones currently in use, the message “The necessary calibration standards were not found." will appear.
- If the imported Cal Set does not cover the frequency range of the current cal, the message “Interpolation target is out of range. Cannot interpolate." will appear.

This VBScript (*.vbs) program can be run as a macro in the VNA. To do this, copy the following code into a text editor file such as Notepad and save on the VNA hard drive as SMC.vbs. Learn how to setup and run the macro.

Create a Balanced Measurement using COM

The following program creates several Balanced measurements in separate windows, generates markers, calculates statistics, and sets limit lines and queries results.

Note: By their nature, balanced measurements are extremely sensitive to phase differences between the two RF paths that make up the balanced port, especially at higher frequencies. A good calibration (not performed in this example) is critical to achieving good balanced measurement results.

This VBScript (*.vbs) program can be run as a macro in the PNA. To do this, copy the following code into a text editor file such as Notepad and save it on the PNA hard drive as BalancedCOM.vbs. Learn how to setup and run the macro.

' PNA application object
Dim app

' Channel 1 object
Dim chan1

' start of marker/limit testing range
Dim minTestStimulus

' end of marker/limit testing range
Dim maxTestStimulus

' Set to true if you want additional balanced measurements.
Dim AdditionalMeasurements
AdditionalMeasurements = 1

' Create / Get the PNA application.
Set app = CreateObject("AgilentPNA835x.Application")
' Preset the instrument
app.Preset
' Get the Channel 1 object
Set chan1 = app.Channels(1)
' Stop data taking for now.
chan1.Hold true
' Set up the start / stop frequency for Channel 1 sweep.
MHZ = 1000000
GHZ = 1000*MHZ
chan1.StartFrequency = 10  *MHZ
chan1.StopFrequency = 1  *GHZ
chan1.NumberOfPoints = 801
' Define our test frequency range
minTestStimulus = 100*MHZ
maxTestStimulus = 900*MHZ
This example uses DUT topology Bal-Bal - a DUT with a balanced input and balanced output.

Port mapping for our DUT:
- logical port 1 = physical ports 1 and 4
- logical port 2 = physical ports 2 and 3

The default is:
- logical port 1 = physical ports 1 and 2
- logical port 2 = physical ports 3 and 4

logical 1 logical 2

1 ------| DUT |------ 2 +
|        |
4 ------|_____  |------ 3 -

chan1.BalancedTopology.SetBBPorts 1, 4, 2, 3

Now we create some Bal-Bal measurements.
By creating Bal-Bal measurements ("BBAL:"..."), the channel is set to Bal-Bal topology, so it is not necessary to do this explicitly with the BalancedTopology.DUTTopology command.
We do it here just for clarity:

chan1.BalancedTopology.DUTTopology = 2
0 == SE-Bal, 1 == SE-SE-Bal, 2 == Bal-Bal

Create four windows, each showing one category of balanced measurement:
Create Forward Transmission Measurements in Bal-Bal topology on Channel 1, window 1

differential mode transmission
app.CreateMeasurement 1, "BBAL:SDD21",1,1
Set sdd21_1 = app.ActiveMeasurement

differential to common mode conversion
app.CreateMeasurement 1, "BBAL:SCD21",1,1
Set scd21_1 = app.ActiveMeasurement

common to differential mode conversion
app.CreateMeasurement 1, "BBAL:SDC21",1,1
Set sdc21_1 = app.ActiveMeasurement

common mode transmission
app.CreateMeasurement 1, "BBAL:SCC21",1,1
Set scc21_1 = app.ActiveMeasurement

Optionally create some additional measurements
If AdditionalMeasurements Then

Create (logical) Port 1 reflection measurements, channel 1, window 2
app.CreateMeasurement 1, "BBAL:SDD11",1,2 ' differential mode reflection
app.CreateMeasurement 1, "BBAL:SDC11",1,2 ' C to D mode conversion reflection
app.CreateMeasurement 1, "BBAL:SCD11",1,2 ' D to C mode conversion reflection
app.CreateMeasurement 1, "BBAL:SCC11",1,2 ' common mode reflection

' Create Reverse Transmission Measurements, channel 1, window 3
app.CreateMeasurement 1, "BBAL:SDD12",1,3 ' differential mode transmission
app.CreateMeasurement 1, "BBAL:SCD12",1,3 ' differential to common mode conversion
app.CreateMeasurement 1, "BBAL:SDC12",1,3 ' common to differential mode conversion
app.CreateMeasurement 1, "BBAL:SCC12",1,3 ' common mode transmission

' Create (logical) Port 2 reflection measurements in window 4
app.CreateMeasurement 1, "BBAL:SDD22",1,4 ' differential mode reflection
app.CreateMeasurement 1, "BBAL:SCD22",1,4 ' C to D mode conversion reflection

Create a Wideband Pulsed Measurement using the PNA-X

This Visual Basic COM example shows you how to configure the PNA-X internal pulse generators and modulators to make wideband pulsed measurements in **pulse profile** mode using the PNA-X.

[Visit the VNA website](#) where you can download a free Wideband Pulsed Application that performs this measurement on the PNA-X.

[See all COM Pulsed examples](#)

```
'Create an VNA Application instance
Dim pnaApp As New AgilentPNA835x.Application

'Create a PathConfiguration instance
Dim pathConf As AgilentPNA835x.PathConfiguration

'Create an PulseGenerator instance
Dim pulseGen As AgilentPNA835x.PulseGenerator

'Create a Channel instance
Dim myChan As AgilentPNA835x.Channel

'Preset PNA-X
pnaApp.Preset

'Assign current active channel to myChan object
Set myChan = pnaApp.ActiveChannel

'Let PNA-X work in CW mode because of doing pulse profile measurement
myChan.SweepType = naCWTimeSweep

'Set CW Freq to 4 GHz
myChan.CWFrequency = 4000000000#

'Set IF Bandwidth to 5 MHz to get the best time resolution
myChan.IFBandwidth = 5000000#

'Assign current active channel path configuration to pathConf object
Set pathConf = myChan.PathConfiguration
```
'Let PNA-X source work in ALC Open Loop mode
myChan.ALCLevelingMode(1) = naALCOpenLoop

'Make the Pulse1 as modulation pulse to generate Pulsed-RF signal
pathConf.Element("PulseModDrive").Value = "Pulse1"

'Enable pulse modulation at Source1Out1 path
pathConf.Element("Src1Out1PulseModEnable").Value = "Enable"

'Assign current active channel pulse generator to pulseGen object
Set pulseGen = myChan.PulseGenerator

'Internal pulse generator has five channels,
'default the channel 0 use as internal ADC trigger signal
'Enable channel 0 of internal pulse generator as trigger signal
pulseGen.State(0) = True

'Enable channel 1 of internal pulse generator as modulation signal
pulseGen.State(1) = True

'Set pulse period to 10 us
pulseGen.Period = 0.00001 '10 us

'Set pulse width of channel 0 to 1 us
pulseGen.Width(0) = 0.000001 '1 us

'Set pulse width of channel 1 to 5 us
pulseGen.Width(1) = 0.000005 '5 us

End Sub
Create an IM Spectrum Measurement

This VBScript example creates IM Spectrum measurement based on passed parameters.

This subprogram is extracted from the macro on the VNA that produces an IM spectrum channel from the Marker function. You can see the entire program at C:\Program Files\Keysight\Network Analyzer\Applications\IMD\IMD.VBS".

This VBScript (*.vbs) program must be used as part of a program that supplies the required parameters. When complete, it can be run as a macro in the VNA. To do this, copy the following code into a text editor file such as Notepad and save it on the VNA hard drive as IMD.vbs.

Learn how to setup and run the macro.

See SweptIMD Object.

```vbs
'' SetupIMSpectrum
'' Setup an IM Spectrum (non-converter) channel based upon supplied parameters
sub SetupIMSpectrum(app, MkrPos, ToneSpacing, TonePower)
    dim objIMXChan, objIMDChan
    dim Fstart, Fstop, NumPoints, ToneFc

    set objIMXChan = objIMSChan.CustomChannelConfiguration
    set objIMDChan = objSIMDChan.CustomChannelConfiguration

    NumPoints = objSIMDChan.NumberOfPoints

    select case objIMDChan.SweepType

    case naIMDToneCWSweep
        ToneFc = objIMDChan.FrequencyCenter

    case naIMDTonePowerSweep
        Fstart = objIMDChan.TonePowerStart(0)
```

Fstop = objIMDChan.TonePowerStop(0)
TonePower = CalcMkrValue(Fstart, Fstop, MkrPos, NumPoints)
ToneFc = objIMDChan.FrequencyCenter

case naIMDToneCenterFreqSweep
  Fstart = objIMDChan.FrequencyCenterStart
  Fstop = objIMDChan.FrequencyCenterStop
  ToneFc = CalcMkrValue(Fstart, Fstop, MkrPos, NumPoints)
end Select

ToneFc = objIMDChan.FrequencyCenter
Fstart = objIMDChan.DeltaFrequencyStart
Fstop = objIMDChan.DeltaFrequencyStop
ToneSpacing = CalcMkrValue(Fstart, Fstop, MkrPos, NumPoints)

case naIMDDeltaFrequencySweep
  ToneFc = MarkerXValue
end Select

objIMXChan.FrequencyCenter = ToneFc
objIMXChan.DeltaFrequency = ToneSpacing
objIMXChan.TonePower(0) = TonePower
objIMXChan.TonePower(1) = TonePower
app.ActiveMeasurement.Trace.ReferenceValue = TonePower + 10
end Sub
Create an iTMSA Measurement

The following VB Script example shows how to create an iTMSA measurement with Power Sweep. Click each link to see a detailed description of each command.

This VBScript (*.vbs) program can be run as a macro in the VNA. To do this, copy the following code into a text editor file such as Notepad and save on the VNA hard drive as Testset.vbs. Learn how to setup and run the macro.

```vbs
'VNA App
dim app

'Measurement
dim meas

dim balancemeas

dim balstimulus

dim chan

set app = createobject("agilentpna835x.application")
set chan = app.activechannel

chan.SweepType = 2 ' Set the sweep type to power sweep

set meas = app.ActiveMeasurement
set balancemeas = meas.BalancedMeasurement

balancemeas.BalancedTopology.DUTTopology = 2 ' Bal-Bal topology

balancemeas.BalancedStimulus.Mode = 1 ' Turn on true mode

'The PNA-X balanced port numbers are always (0)=Bal 1; (-1)=Bal2

chan.StartPowerEx(0) = -5 ' Set the balanced port 1 start power to -5 dbm
chan.StopPowerEx(0) = 5 ' Set the balanced port 1 stop power to 5 dbm

chan.StartPowerEx(-1) = -10 ' Set the balanced port 2 start power to -5 dbm
chan.StopPowerEx(-1) = 0 ' Set the balanced port 2 stop power to 5 dbm
```
Create and Cal a Gain Compression Measurement

This VBScript example creates and calibrates a Gain Compression measurement and performs Compression analysis.

This VBScript (*.vbs) program can be run as a macro in the VNA. To do this, copy the following code into a text editor file such as Notepad and save it on the VNA hard drive as GCA.vbs. Learn how to setup and run the macro.

See Gain Compression Object.

```vbnet

Create and Cal a Noise Figure Measurement

This example program creates a Noise Figure measurement, then calibrates the measurement.

You MUST change the ECal Identification strings (in **Blue** font).

Optional: Uncomment the following lines (in **Blue** font) to change these settings:

- Noise Receiver = Noise Receiver to Std (VNA) Receiver
- Cal Method = "Vector" to "Scalar"
- Receiver Characterization Method = "NoiseSource" to "Power Meter"

This VBScript (*.vbs) program can be run as a macro in the VNA. To do this, copy the following code into a text editor file such as Notepad and save it on the VNA hard drive as Noise.vbs. Learn how to setup and run the macro.

**Bonus: Accessing the NoiseFigure object and NoiseCal object using C#**

Replace `<hostname>` with the full computer name of your VNA

```csharp
Type pna = Type.GetTypeFromProgID("AgilentPNA835x.Application", "<hostname>");

    AgilentPNA835x.Application app =
    (AgilentPNA835x.Application)Activator.CreateInstance(pna);

    app.Reset();

    app.CreateCustomMeasurementEx(1, "NoiseFigure", "NF", 1);

    AgilentPNA835x.ICalManager5 calManager =
    (AgilentPNA835x.ICalManager5)app.GetCalManager();

    AgilentPNA835x.IGuidedCalibration4 guidedCal4 =
    (AgilentPNA835x.IGuidedCalibration4)

    calManager.CreateCustomCalEx(1);

    AgilentPNA835x.INoiseCal noiseCal =
    (AgilentPNA835x.INoiseCal)guidedCal4.CustomCalConfiguration;
```
Create and Cal an NFX Measurement

This program does the following:

- Setup a Noise Figure SC21 Measurement
- Calibrate Noise Figure channel
- Optional - Configure for an Embedded LO

To run this program, make the following edits, highlighted in yellow:

- Set **host** to your VNA computer name
- Set **tunerECal** and **pullECal** to your ECal model and info
- Set **ENR** to correct file name and location
- Set **connector types** for ECal, power sensor, and noise source

This program can be run as a macro in the VNA. To do this, copy the code into a text editor file such as Notepad and save on the VNA hard drive as NFX.vbs. Learn how to setup and run the macro.

  100000000  14.53200
  2e+010  15.73100
Events with C++

The following code, along with the Header file, shows how to use the VNA Events.

Download the Header file 'preventcatcher.h'

```cpp
#include <atlbase.h>
#include <atlcom.h>
#include <iostream>
#include "pnaeventcatcher.h"

inline void HR(HRESULT hr)
{
    if (FAILED(hr))
        throw hr;
}

class MyEventCatcher : public CPNAEventCatcher
{

    public:
        MyEventCatcher()
```
{  
    CoInitialize(NULL);
    CComPtr<IApplication> app;
    HR(app.CoCreateInstance(CLSID_Application));
    CPNAEventCatcher::SubscribeCatcher(app);
    HR(app->AllowAllEvents());
}
~MyEventCatcher()
{
    CPNAEventCatcher::Release();
    CoUninitialize();
}
virtual void OnMeasurementEvent(long eventID, long measurementNumber) {}
virtual void OnChannelEvent(long eventID, long ch)  
{
    if (eventID == 0x68070709L) // MSG_ALL_SWEEPS_COMPLETED_AND_PROCESSED
    {
        static int i = 0;
        ++i;
        std::cout << "Sweep:" << i << std::endl;
    }
}
In a .cpp file, (just like most ATL projects) you must have a declared an instance of CComModule. This will work:

CComModule _Module;

Remember that you are now the "Server" and the VNA is the Client. That makes DCOM a bit complicated.

This code was tested in VS2005 using a wizard generated MFC MDI project.
FOM Examples

All three VBScript examples in this topic create a FOM measurement with the following attributes:

- Sweep the Source (input) from 1 GHz to 2 GHz
- Sweep the Receivers (output) from 2 GHz to 3 GHz
- You provide an LO at 1 GHz

Learn more about Frequency Offset Mode

These programs can be run as a macro in the VNA. To do this, copy the code into a text editor file such as Notepad and save on the VNA hard drive as FOM.vbs. Learn how to setup and run the macro.

The following example will run on any VNA model with FOM (opt S93080A). However, these commands have no provisions for internal second source. It uses commands introduced before 'enhanced FOM' was released for the A.07.10 release.

```vbnet
set app = CreateObject("Agilentpna835x.application")
set chan = app.ActiveChannel
chan.startFrequency = 1e9
chan.StopFrequency = 2e9
' set the receiver frequencies to be 2e9->3e9
chan.FrequencyOffsetFrequency = 1e9
chan.FrequencyOffsetState = 1
```

The following example can be run ONLY on a VNA with revision A.07.10 or later and has FOM (opt S93080A). It uses new FOM commands. See FOMRange object.
The following example can be run ONLY on a VNA with a second internal source, has revision A.07.10 or later, and has FOM (opt S93080A). It uses the internal 2nd source for the fixed LO frequency.

```vba
set app = CreateObject("Agilentpna835x.application")
set chan = app.ActiveChannel
chan.startFrequency = 1e9
chan.StopFrequency = 2e9
' set the receiver frequencies to be 2e9->3e9
chan.fom("Receivers").Offset = 1e9
chan.fom.State = 1
```

```vba
chan.fom("Source2").Coupled = 0
chan.fom("Source2").StartFrequency = 1e9
chan.fom("Source2").StopFrequency = 1e9
' turn off port coupling
chan.coupleports = 0
' set LO to 10 dBm
chan.TestPortPower(3) = 10
'Turn ON port 3, our LO signal on our 2 source PNA
chan.SourcePortMode(3) = 1
chan.fom.State = 1
```
Intro to Examples

Limit Line Testing with COM

This Visual Basic program:

- Turns off existing Limit Lines
- Establishes Limit Lines with the following settings:
  - Frequency range - 4 GHz to 8 GHz
  - Maximum value - (10dB)
  - Minimum value - (-30dB)
- Turns on Lines, Testing, and Sound

If using Global Pass/Fail to report limit results, trigger the VNA after configuring and enabling Limit lines.

```vbnet
Public limts As LimitTest
Set limts = meas.LimitTest
'All Off
For i = 1 To 20
    limts(i).Type = naLimitSegmentType_OFF
Next i

'Set up Limit Lines
limts(1).Type = naLimitSegmentType_Maximum
limts(1).BeginResponse = 10
limts(1).EndResponse = 10
limts(1).BeginStimulus = 4000000000#
limts(1).EndStimulus = 8000000000#
limts(2).Type = naLimitSegmentType_Minimum
limts(2).BeginResponse = -30
limts(2).EndResponse = -30
limts(2).BeginStimulus = 4000000000#
limts(2).EndStimulus = 8000000000#

'Turn on Lines, Testing, and Sound
limts.LineDisplay = 1
limts.State = 1
limts.SoundOnFail = 1
```
Modify Display Colors

This VBScript example modifies display colors, modifies trace1 colors, then saves and recalls the theme.

These programs can be run as a macro in the VNA. To do this, copy the code into a text editor file such as Notepad and save on the VNA hard drive as Colors.vbs. Learn how to setup and run the macro.

```vbs
function RGB(R, G, B)
    RGB = R + G*(2^8) + B*(2^16)
end Function

shell.AppActivate "PNA Series Network Analyzer"
Set app = CreateObject("AgilentPNA835X.Application")
app.preset
Set colors = app.Preferences.DisplayColors
' Uncomment the following line to modify Print colors
'    Set colors = app.Preferences.PrintColors

colors.ResetTheme( )
colors.background = RGB(64,0,64) ' purple
displaycolors.grid = RGB(0,255,128) ' greenish
colors.activeLabels = RGB(0,0,255) ' blue
colors.inactiveLabels = RGB(255,0,0) ' red
colors.failedTraces = RGB(255,128,64) ' orange
dim Trace1
Set Trace1 = colors.Trace(1)
Trace1.DataAndLimits = RGB(1,251,1) ' green
Trace1.Memory = RGB(251,1,1) ' red
Trace1.Markers = RGB(251,251,251) ' white
```
Trace1.MemoryMarkers = RGB(1,251,251)    ' green + blue

colors.StoreTheme("c:\Program Files(86)\Keysight\Network Analyzer\Colors\Theme1.colors")

colors.LoadTheme("c:\Program Files(86)\Keysight\Network Analyzer\Colors\Theme1.colors")
The following VB Script example exercises the COM commands used to control the E5091A testset.

For a description of each command, see E5091Testsets collection.

```vbnet
Sub Main()
    Set pna = CreateObject("AgilentPNA835x.Application")
    Dim testsets As E5091Testsets
    Set testsets = pna.E5091Testsets
    Dim tset1 As E5091Testset
    Set tset1 = testsets(1)
    tset1.OutputPort(1, 3) = naE5091PortR2
    tset1.ControlLines(1) = 5
    tset1.ShowProperties = True
    tset1.Enabled = True
    MsgBox tset1.ID
    MsgBox tset1.Enabled
    MsgBox tset1.ShowProperties
    ' NumberOfPorts property returns 0 when testset not connected
    MsgBox tset1.NumberOfPorts
    MsgBox tset1.OutputPort(1, 3)
    MsgBox tset1.ControlLines(1)

    Dim tset2 As E5091Testset
    Set tset2 = testsets(2)
    tset2.Enabled = True
    tset2.ShowProperties = True
    MsgBox tset2.Enabled
    MsgBox tset2.ShowProperties
End Sub
```
Errors and the SCPIStringParser Object

This C++ program uses the SCPIStringParser.Parse command to detect the failed HRESULT and interrogate the errorInfo object for more details.

// scpierrors.cpp : Defines the entry point for the console application.

#include <iostream>
#include "afx.h"
#include "atlbase.h"
#include "C:\program files(x86)\Keysight\Network Analyzer\Automation\835x.tlb" raw_interfaces_only, no_namespace, named_guids

using namespace std;

HRESULT SendScpiCommand(IScpiStringParser* parser, CComBSTR& cmd, CComBSTR& response)
{
    CComBSTR bstr;
    HRESULT hr = parser->Parse(CComBSTR(cmd), &response);
    if (FAILED(hr))
    {
        // see if this interface supports ErrInfo
        CComPtr<ISupportErrorInfo> spSupportsErrInfo;
        if (SUCCEEDED(parser->QueryInterface(&spSupportsErrInfo)))
        {
            // it does, so let's get the errorinfo object
        }
    }
}
CComPtr<IErrorInfo> spErrorInfo;
if (SUCCEEDED(GetErrorInfo(0, &spErrorInfo)))
{
    CComBSTR errStr;
    spErrorInfo->GetDescription(&errStr);
    std::cout << "ERROR: " << CString(errStr) << std::endl;
}

return hr;

int main()
{
    CoInitialize(NULL);

    CComBSTR response;
    CComPtr<IApplication> spPNA;
    CComPtr<IScpiStringParser> spSCPI;
    if (SUCCEEDED(spPNA.CoCreateInstance(CLSID_Application)))
    {
        spPNA->get_ScpiStringParser(&spSCPI);
        SendScpiCommand(spSCPI, CComBSTR("SYSTEM:PRESET"), response);
        SendScpiCommand(spSCPI, CComBSTR("CALC:PAR:CAT?"), response);
        std::cout << CString(response) << std::endl;
    }
}
SendScpiCommand(spSCPI,
CComBSTR("THIS:IS:A:SYNTAX:ERROR"), response);

CoUninitialize();

return 0;
The following VB Script example exercises the COM commands used to control the Z5623AK64 testset.

For a description of each command, see TestsetControl Object

This VBScript (*.vbs) program can be run as a macro in the VNA. To do this, copy the following code into a text editor file such as Notepad and save on the VNA hard drive as Testset.vbs. Learn how to setup and run the macro.

```vbs
' Demonstrate some COM commands for external testsets.
Dim pna
Set pna = CreateObject("AgilentPNA835x.Application")
Sub DemoTestset(na)
Dim testsets, tset1
Dim portNum
Dim chNum, address
Set testsets = na.ExternalTestsets
chNum = 1

' Load a configuration file.
' NOTE: the K64 testset is only compatible with 4-port analyzers.
address = 0
testsets.Add "Z5623AK64", address

' Get the testset object
' in the testsets collection.
Set tset1 = testsets(1)
```
'Show the selections available for each port.

For portNum = 1 To 4
MsgBox("Port " & CStr(portNum) & " catalog: " & tset1.PortCatalog(portNum))
Next

'Set port mappings on channel 1.
tset1.OutputPorts(chNum) = "5 ext R,2 int R,3 int R,6 int R"

'Set control lines.
tset1.ControlLines(chNum) = 85

'Set label.
tset1.Label(chNum) = "Some label"

'Enable external testset control. This automatically enables status bar display as well.
tset1.Enabled = True
End Sub

'The testset used in this demo is only usable on 4-port analyzers
If (pna.NumberOfPorts <> 4) Then
MsgBox("This program only runs on 4-port analyzers.")
Else
DemoTestset(pna)
End If
RF PathConfiguration Example

Note: These commands are accessible only for PNA-X models.

These Visual Basic and C# examples exercise various commands on the:

- PathConfigurationManager Object
- PathConfiguration Object
- PathElement Object

See Also

IFPathConfiguration Setup example

VB Example

```
' Create / Get the VNA application
Dim app
Set app = CreateObject("AgilentPNA835x.Application")
' Preset the instrument
app.Preset
' Get a channel interface on which to operate
Dim chan
Set chan = app.ActiveChannel
' Modify the Default configuration, and save it as "My Config"
chan.PathConfiguration = "Default"
' Set the "Combiner" element to value "Reversed"
chan.PathConfiguration.Element("Combiner").Value = "Reversed"
' Set the "Src1" element to value "High Power"
chan.PathConfiguration.Element("Src1").Value = "High Power"
' Change the description text
```
Set the instrument's path config back to the default (req. 8)

app.PathConfigurationManager.Load 1, "My Config"

C# Example

```csharp
Type pnaType =
    Type.GetTypeFromProgID("AgilentPNA835x.Application", "PNA-NAME-HERE");

AgilentPNA835x.Application pna =
    (AgilentPNA835x.Application)Activator.CreateInstance(pnaType);

AgilentPNA835x.Channel chan =
    (AgilentPNA835x.Channel)pna.ActiveChannel;

    // Preset the Instrument
    pna.Preset();

    // Modify the Default configuration, and save it as "My Config"
    chan.set_PathConfiguration("Default");

    // Set the "Combiner" element to value "Reversed"
    chan.get_PathConfiguration().get_Element("Combiner").Value = "Reversed";

    // Change the description text
    chan.get_PathConfiguration().DescriptionText = "Connect J8 to J9."

    // Store the modified configuration
    chan.get_PathConfiguration().Store("My Config");

    // Set the instrument's path config back to the default (req. 8)
```
chan.set_PathConfiguration("Default");

// Load a previously saved configuration onto channel 2
pna.PathConfigurationManager.LoadConfiguration(1, "My Config");
Create a Narrowband Pulsed Measurement using the PNA-X or N522x

The following COM example demonstrates how to create a narrowband pulsed measurement using the Pulsed Application DLL on the PNA-X.

See the example program for wideband pulsed measurements on the PNA-X.

It first gets valid configuration settings and then uses those settings to configure the VNA and internal pulsed generators.

To run this program, you need:

- PNA-X or N522x
- Pulsed Application (Option H08)

This VBScript (*.vbs) program can be run as a macro in the VNA. To do this, copy the following code into a text editor file such as Notepad and save it on the VNA hard drive as Pulse.vbs. Learn how to setup and run the macro.

Example #2

```vbscript
Set Application = CreateObject("AgilentPNA835x.Application", "A-N5242A-90065")

Set PowerRange = application.Capabilities.PowerRange
powerRange.Reset
powerRange.PortNumber = 3
powerRange.PathElement("Src2Out1LowBand").Value = "HiPwr"
powerRange.DiscreteFrequencies = Array(1e9,2e9,3e9,4e9)
maxPower = powerRange.DiscreteGetMaxPowerArray
minPower = powerRange.DiscreteGetMinPowerArray

MsgBox( "Frequency: " & ArrayToString(powerRange.DiscreteFrequencies) & " Hz" & _ Chr(10) & "Max power: " & ArrayToString(maxPower) & " dBm" & Chr(10) & _ "Min power: " & ArrayToString(minPower) & " dBm" )

Function ArrayToString(Arr)
ArrayToString = "[
If isArray(Arr) Then
ArrayToString = ArrayToString & CStr(Arr(0))
For i = 1 to ubound(Arr)
ArrayToString = ArrayToString & "," & CStr(Arr(i))
Next
End If
ArrayToString = ArrayToString & "]"
End Function
```
Setup Basic Measurements

This VBScript program sets up four basic s-parameter measurements in four windows, all in a single channel. Handles are created to the measurement, channel, and window objects so that subsequent settings can be made for each.

**Note:** This is only an example. This is not necessarily the most efficient way to make basic S-parameter measurements.

This VBScript (*.vbs) program can be run as a macro in the VNA. To do this, copy the following code into a text editor file such as Notepad and save it on the VNA hard drive as Basic.vbs. Learn how to setup and run the macro.

See VNA Object Model

See CreateSParameterEx

---

```vbs
Set pna = CreateObject("AgilentPNA835x.Application")
pna.Preset

' Get a handle to the preset channel 1, S11 meas, and window(1)
set meas1=pna.ActiveMeasurement
set chan1=pna.ActiveChannel
set win1=pna.ActiveNAWindow

' Creates a new S21 measurement in New window(2)
pna.CreateSParameterEx 1,2,1,2,2
set meas2=pna.ActiveMeasurement
set win2=pna.ActiveNAWindow

' Creates a new S12 measurement in New window(3)
pna.CreateSParameterEx 1,1,2,1,3
set meas3=pna.ActiveMeasurement
set win3=pna.ActiveNAWindow
```
' Creates a new S22 measurement in New window(4)

pna.CreateSParameterEx 1,2,2,2,4

set meas4=pna.ActiveMeasurement

set win4=pna.ActiveNAWindow

'Make settings

' set Stop Frequency for channel
chan1.StopFrequency=1e9

'set Display formats
meas1.format=1 'Lin Mag
meas2.format=2 'Log Mag
meas3.format=3 'Phase
meas4.format=4 'Smith

'Show title in all windows
win1.title="Win #1"

win2.title="Win #2"

win3.title="Win #3"

win4.title="Win #4"
Setup Compression Marker

This example program does the following:

- Creates a compression marker
- Queries the Power Out and Power In values

This VBScript (*.vbs) program can be run as a macro in the VNA. To do this, copy the following code into a text editor file such as Notepad and save it on the VNA hard drive as CompMkr.vbs. Learn how to setup and run the macro.

See the FIFO object.

See Other COM Example Programs

Set app = CreateObject("AgilentPNA835X.Application")
set meas = app.activemasurement
'get the COM marker object
'and create marker1
set mark = meas.marker(1)
' set the compression level
mark.compressionlevel = 1.5
'make it a compression marker
'and find the compression point
mark.searchcompressionpoint
'return power out and power in
'power in
dim answer
answer = mark.compressionpin
wscript.echo("pin: " & answer)
'power out
answer = mark.compressionpout
wscript.echo("pout: " & answer)
This VBScript example creates a Noise Figure Converter measurement for a converter with an Embedded LO.

This VBScript (*.vbs) program can be run as a macro in the VNA. To do this, copy the following code into a text editor file such as Notepad and save it on the VNA hard drive as Noise.vbs. Learn how to setup and run the macro.

```vbs
option explicit

dim app
dim chan
dim host
set app = CreateObject("Agilentpna835x.application")
app.reset

' create NFX traces
app.CreateCustomMeasurementEx 1, "Noise Figure Converters", "NF", 1
app.CreateCustomMeasurementEx 1, "Noise Figure Converters", "SC21", 1

' set channel and application objects
set chan = app.ActiveChannel

dim nfx
set nfx = chan.CustomChannelConfiguration
dim converter
set converter = chan.GetConverter()
dim calMgr
set calMgr = app.GetCalManager
dim nfxCal
set nfxCal = CalMgr.CreateCustomCalEx(1)
dim nfxCalExt
set nfxCalExt = nfxCal.CustomCalConfiguration
```
dim ELO

set ELO = converter.ConverterEmbeddedLO

' Set embedded LO properties
ELO.NormalizePoint = 101
ELO.TuningMode = 0 ' Broadband and precise
ELO.TuningIFBW = 3.0e4
ELO.MaxPreciseTuningIterations = 5
ELO.PreciseTuningTolerance = 1
ELO.TuningSweepInterval = 1
ELO.IsOn = true

' The following single sweep performs the same
' function as "Find Now" on the ELO dialog
chan.Single 1
Setup FastCW and FIFO

This example program does the following:

- Setup an A/R and B/R measurement
- Turn ON point averaging
- Set external edge triggering (commented out)
- Set FIFO and Fast CW
- Write data into FIFO data buffer
- Read FIFO data buffer

This VBScript (*.vbs) program can be run as a macro in the VNA. To do this, copy the following code into a text editor file such as Notepad and save it on the VNA hard drive as FIFO.vbs. Learn how to setup and run the macro.

See the FIFO object.

See Other COM Example Programs

```vbs
Dim app
set app = createObject("Agilentpna835x.application")
' Setup and measure A/R and B/R
app.Reset
app.CreateMeasurement 1,"A/R1",0
app.CreateMeasurement 1,"B/R1",0
' Set IFBW to 600khz (400thousand pts/second)
app.activeChannel.IFBandwidth = 600e3
' Point Averaging Count = 10
app.activeChannel.AverageMode = 0 ' point
app.activeChannel.averagingFactor = 10
app.ActiveChannel.averaging = 1 ' turn on
```
' Edge triggering - positive edge

'app.TriggerSetup.ExternalTriggerConnectionBehavior(1) = 2 ' BNC1 = trigger
positive edge

'app.TriggerSetup.Source = 2 ' external

'app.ActiveChannel.TriggerMode = 0 ' point

'Setup FIFO and Fast CW count

app.ActiveChannel.Hold 1 ' hold - synchronous

app.FIFO.State = 1' turn on FIFO

app.FIFO.Clear

app.activechannel.sweeptype = 3 ' CW sweep

app.activechannel.fastcwpointcount = 1000000' set the point count to 1million

app.activechannel.single 1 ' synchronous single

'the single will wait until the end of sweep.

'You do not have to wait until end of sweep to start emptying FIFO.

points = app.fifo.datacount

msgbox points

'points == 2000000 ' points = 2million. Took 5 seconds to acquire

For I = 0 to 1 ' 2 iterations (2 parameters * 2 sets of 1 million)

Dim data

Data = app.fifo.data(1000000)

Next

msgbox data(0)
Setup Noise Figure Port Mapping

This program demonstrates how to change source and receive ports when measuring noise figure. It assumes that option 029 ("Fully Corrected Noise Figure") is installed.

If only option 028 ("Noise figure measurements using standard receivers") is installed, switching ports is simpler, since only one noise receiver selection is available.

This program can be run as a macro in the VNA. To do this, copy the code into a text editor file such as Notepad and save on the VNA hard drive as NF.vbs. Learn how to setup and run the macro.

Create and Cal a NoiseFigure Measurement

See Other COM Example Programs

```vbs
option explicit

' Noise receiver enumerations
dim naStandardReceiver, naNoiseReceiver

' standard VNA receiver
naStandardReceiver = 0

' dedicated noise receiver (option 029 only)
naNoiseReceiver = 1

dim pna, windowNum, channelNum
set pna = CreateObject("Agilentpna835x.application")

windowNum = 1
channelNum = 1

pna.Reset

' Create Noise Figure measurement
dim noise, noiseChan, noiseConfig
```
set noise = pna.CreateCustomMeasurementEx(channelNum, "Noise Figure Cold Source", "NF", windowNum)

set noiseChan = pna.ActiveChannel

' provides access to noise-specific channel properties
set noiseConfig = noiseChan.CustomChannelConfiguration

' To change from the default input/output port settings of
' source port = VNA1, receive port = VNA2,
' you must first change the noise receiver,
' then select the desired ports.
dim srcPort, rcvPort

' set port mapping to source port = VNA3, receive port = VNA4
srcPort = 3
rcvPort = 4

' use VNA receiver for noise measurements
noiseConfig.NoiseReceiver = naStandardReceiver

noiseConfig.SetPortMap srcPort, rcvPort

' To revert back to using the noise receiver, the source
' and receive ports must be set to their default values
' BEFORE switching to the noise receiver.
' Otherwise, a COM exception will be thrown.
' restore defaults: source=VNA1, receiver=VNA2
noiseConfig.SetPortMap 1,2

' use dedicated noise receiver for noise measurements
noiseConfig.NoiseReceiver = naNoiseReceiver
Setup Phase Control

The following VB Script example exercises the COM commands used to setup and display Phase Sweep measurements.

About Phase Control

PhaseControl Object

See Other COM Example Programs

This VBScript (*.vbs) program can be run as a macro in the VNA. To do this, copy the following code into a text editor file such as Notepad and save on the VNA hard drive as RxLevel.vbs. Learn how to setup and run the macro.

```vbs
'Assume port 1 is connected to port 3
Set pna = CreateObject("AgilentPNA835x.Application")
pna.Preset
Set chan = pna.ActiveChannel
chanNum = chan.ChannelNumber

'Create 3 traces: S33, R3/C(amp),R3/C(phase)
pna.CreateMeasurement 1,"S33",3
Set meas1 = pna.ActiveMeasurement
meas1.Format = 4   'Smithchart format
pna.CreateMeasurement 1,"R3/C",3 'Log format
Set meas2 = pna.ActiveMeasurement
meas2.Format = 1   'Phase format
Set meas = pna.ActiveMeasurement
meas.Format = 2   'Phase format

'turn on 3 and 1
```
chan.SourcePortMode(1) = 1
chan.SourcePortMode(3) = 1
chan.SweepType = 5 'Phase sweep
Set phase = chan.PhaseControl
'set port3's control parameter to R3/C
phase.PhaseParameter(3) = "R3/C"
'notice the reference port should not included in the parameter
phase.PhaseReferencePort(3) = 1
'Set port3 to PAR mode
phase.PhaseControlMode(3) = 1 'PhaseControlParameter mode
phase.FixedRatioedPower(3) = 3
phase.StartPhase(3) = 0
phase.StopPhase(3) = 180
Setup PNOP and PSAT Marker Search

This example program does the following:

- Sets up measurement for either PNOP or PSAT marker search
- Sets parameters for search
- Reads a parameter for each

This VBScript (*.vbs) program can be run as a macro in the VNA. To do this, copy the following code into a text editor file such as Notepad and save it on the VNA hard drive as SearchMkr.vbs. Learn how to setup and run the macro.

```
Set app = CreateObject("AgilentPNA835X.Application")
app.Preset
set meas = app.activemeasurement
'veView Power Out vs Power In
meas.ChangeParameter "B",1
'veperform power sweep
set chan = app.ActiveChannel
chan.SweepType = 2
chan.StartPower = -5
chan.StopPower = 0
'-------------------
'Choose marker search
resp=Msgbox ("PNOP (yes) or PSAT (no)" , 4, "PNA Marker Search Demo")
if resp=6 then
    PNOP1()
Else
```

See Other COM Example Programs
Sub PSAT1()
    set psat = meas.PSaturation
    psat.PMaxBackOff = .3
    psat.SearchPowerSaturation
    'Read PSAT Parameter
    dim answer
    answer = psat.GainSaturation
    wscript.echo("Gain Sat: ", answer)
End Sub

Sub PNOP1()
    set pnop = meas.PNOP
    pnop.BackOff = 2
    pnop.PinOffset = 1
    pnop.SearchPowerNormalOperatingPoint
    'Read PNOP Parameter
    dim answer
    answer = pnop.Gain
    wscript.echo("PNOP Gain: ", answer)
End Sub
Setup Receiver Leveling

The following VB Script example exercises the COM commands used to setup Receiver Leveling.

See Also

About Receiver Leveling

RxLevelingConfiguration Object

See Other COM Example Programs

This VBScript (*.vbs) program can be run as a macro in the VNA. To do this, copy the following code into a text editor file such as Notepad and save on the VNA hard drive as RxLevel.vbs. Learn how to setup and run the macro.

```vbs
' Demonstrate some COM commands for Receiver Leveling.
Dim pna
Set pna = CreateObject("AgilentPNA835x.Application")
Dim chan
Set chan = pna.ActiveChannel
Dim RxLevel
Set RxLevel = chan.GetRxLevelingConfiguration
Dim srcPort
srcPort = 1
pna.Preset
RxLevel.ReferenceReceiver(srcPort) = "R1"
RxLevel.Tolerance(srcPort) = 0.02
RxLevel.IterationNumber(srcPort) = 10
RxLevel.FastMode(srcPort) = True
RxLevel.LevelingIFBW(srcPort) = 100
RxLevel.PowerOffset(srcPort) = 0
RxLevel.PowerMax(srcPort) = 20
```
RxLevel.PowerMin(srcPort)= -50
RxLevel.SafeMode(srcPort)= True
RxLevel.State(srcPort)= True
This VBScript program shows how to send commands that allow you to view specific 'custom' windows, and sweep specific channels, during a UI (Cal Wizard) or remote calibration.

This VBScript (*.vbs) program can be run as a macro in the VNA. To do this, copy the following code into a text editor file such as Notepad and save it on the VNA hard drive as CalWindow.vbs. Learn how to setup and run the macro.

These commands are used to show and sweep specific windows and channels:

- AllowChannelToSweepDuringCalAcquisition Method
- DisplayNAWindowDuringCalAcquisition Method
- DisplayOnlyCalWindowDuringCalAcquisition Method
- SweepOnlyCalChannelDuringCalAcquisition Method

The following command sweeps the Cal Windows before remote acquisition:

- SetupMeasurementsForStep Method

See Other COM Example Programs

```vbs
Set pna = CreateObject("AgilentPNA835x.Application")
pna.Preset

' get a handle to the preset channel 1 so that we can later cal it
set meas=pna.ActiveMeasurement

' Creates a new S21 measurement in channel 2 and New window(2)
' this will be the channel and window to show during cal
pna.CreateSParameterEx 2,2,1,2,2

    vSeg.intVal = num_points; // Number of Points
    SafeArrayPutElement(pSA, i, &vSeg);
    i[0] += 1;
    vSeg.vt = VT_R8; // Remaining parameters are of type double
    vSeg.dblVal = Fstart+j*SegWidth; // Start Frequency
    SafeArrayPutElement(pSA, i, &vSeg);
    i[0] += 1;
    vSeg.dblVal=vSeg.dblVal+SegWidth; // Stop Frequency
SafeArrayPutElement(pSA, i, &vSeg);
  i[0] += 1;
vSeg.dblVal = 1.0e3; //IF Bandwidth
SafeArrayPutElement(pSA, i, &vSeg);
  i[0] += 1;
vSeg.dblVal = 0.0; //Dwell time
SafeArrayPutElement(pSA, i, &vSeg);
  i[0] += 1;
vSeg.dblVal = -5.0; //Power
SafeArrayPutElement(pSA, i, &vSeg);
}

//vSeg no longer needed, clean up
VariantClear(&vSeg);

//Declare Variant to use with Segment data
VariantInit(&v);
v.vt = VT_ARRAY|VT_VARIANT;
v.parray = pSA; //write safearray to variant

// Initialize the COM subsystem

0, // capabilities
NULL); // reserved

// Create an instance of the network analyzer
// Request the NA's IUnknown interface
hr = CoCreateInstance(CLSID_Application, 0, CLSCTX_ALL, IID_IUnknown, (void**) &pUnk);
if (!FAILED(hr))
{
    // QueryInterface for the INetworkAnalyzer interface of the NetworkAnalyzer object
    hr = pUnk->QueryInterface(IID_IApplication, (void**) &pNA);

    if (!FAILED(hr))
    {
        // Reset the analyzer to instrument preset
        pNA->Reset();

        // Create S11 measurement
        pNA->CreateSParameter(1, 1, 1, 1);

        // Set pChan variable to point to the active channel
        pNA->get_ActiveChannel(&pChan);

        // Show Segment table
pNA->NAWindows->Item(1)->ShowTable((NATableType)2);

//Get handle to ISegments Interface
pChan->get_Segments(&pSeg);

//Get handle to ISegments2 Interface
hr = pSeg->QueryInterface(IID_ISegments2, (void**)&pSeg2);

//Set Segment Sweep Options
pSeg2->IFBandwidthOption = VARIANT_TRUE;
pSeg2->SourcePowerOption = VARIANT_TRUE;

//Push segments to VNA
pSeg2->SetAllSegments(v);

//Set Sweep Type to Segment Sweep
pChan->SweepType = naSegmentSweep;

if (pChan)
{
    // Set pMeas variable to point to the active measurement
    pNA->get_ActiveMeasurement(&pMeas);

    if(pMeas)
    {
        // Setup the channel for a single trigger
        pChan->Hold(true);
    }
}
pNA->TriggerSignal = naTriggerManual;
pChan->TriggerMode = naTriggerModeMeasurement;

// Make the VNA application visible
pNA->put_Visible(true);

// Send a manual trigger to initiate a single sweep
pChan->Single(true);

// QueryInterface for the IArrayTransfer interface of the
NetworkAnalyzer object
hr = pMeas->QueryInterface(IID_IArrayTransfer, (void**)&pTrans);

// Get handle for IMeasurement5 interface
hr = pMeas->QueryInterface(IID_IMeasurement5, (void**)&pMeas5);

if (!FAILED(hr))
{
    int val = num_points*NUM_SEGS;

    // Store the data in the "result" variable
    pScalarData = new float[val];
    xVals = new double[val*2];

    // Get X axis values
    vXVals = pMeas5->GetXAxisValues();
// Convert _variant_t array to a SAFEARRAY

sArray = vXVals.parray;

// Convert data from SAFEARRAY to double array. Each SAFEARRAY value
// is 16 bytes so it takes up 2 floats so the xVals size is double
// the number of points. This also means that every other data point
// in the resulting array can be discarded.

hr = SafeArrayAccessData(sArray, (void HUGEP**)&xVals);

// Get Measurement Values

pTrans->getScalar(naRawData, naDataFormat_LogMag, (long *)&val, pScalarData);

// Display the result

printf("S11(dB) - Visual C++ COM Example for PNA operating in segment sweep mode/n/n");

for (int j = 0; j < val; j++)
{
    // Write value...the xVals array is offset by 1 in each data point since
    // the return data is 16 bytes and each double is 8.

    printf("%.3lf GHz, %.4f/n", xVals[2*j+1]/1e9,

    pScalarData[j]);
}

}
}
else
{
    printf("Programmed failed to connect to the PNA.");
}
}
CoUninitialize();

system("PAUSE");
return 0;
Using C#

The following are common C# examples:

**Connecting to a specific VNA via DCOM:**

```csharp
public AgilentPNA835x.Application Connect(string hostname)
{
    AgilentPNA835x.Application pna = null;
    try
    {
        Type t = Type.GetTypeFromProgID("AgilentPNA835x.Application", hostname, true);
        pna = (AgilentPNA835x.Application) Activator.CreateInstance(t);
    }
    catch (Exception e)
    {
        HandleExceptions(e);
    }
    return pna;
}
```

**Using the GetData Interface**
AgilentPNA835x.IMeasurement meas = app.ActiveMeasurement;

    object[] dataArrayAsObj;

    dataArrayAsObj = (object[])(AgilentPNA835x.NADataStore.naMeasResult, AgilentPNA835x.NADataFormat.naDataFormat_LogMag);

    float[] dataArray = new float[dataArrayAsObj.Length];
    for (int j = 0; j < dataArrayAsObj.Length; j++)
    {
        dataArray[j] = (float)dataArrayAsObj[j];
    }

2-dimensional GetData

AgilentPNA835x.IMeasurement meas = app.ActiveMeasurement;

    app.ActiveChannel.Single(true);

    object[,] dataArrayAsObj;

    dataArrayAsObj = (object[,])(AgilentPNA835x.NADataStore.naRawData, AgilentPNA835x.NADataFormat.naDataFormat_Smith);

    float[,] dataArray = new float[dataArrayAsObj.Length, 2];
    for (int j = 0; j < dataArrayAsObj.Length; j++)
    {
        dataArray[j,0] = (float)dataArrayAsObj[j,0];
        dataArray[j,1] = (float)dataArrayAsObj[j,1];
    }

Other C# / .NET Topics

Perform a Guided Cal with CSharp

Getting a handle to the Noise Figure Cal object.

Using .NET
Before developing or running a COM program, you should first establish communication between your PC and the analyzer. This process is referred to as gaining **Access** to the analyzer. You should then register the VNA type library on your PC.

**DCOM** (Distributed Component Object Model) refers to accessing the VNA from a remote PC.

**COM** refers to accessing the VNA application from the analyzer PC.

- **Access Concepts**
- **Access Procedures**
- **Register the VNA Type Library on Your PC**
- **Problems?**

**Note:** After performing a **Firmware Upgrade** you must copy the new type library to your development PC to get access to new COM commands. See **Register the analyzer on your PC**.

### Other Topics about COM Concepts

For detailed information on this subject, see [http://na.support.keysight.com/pna/DCOMSecurity.html](http://na.support.keysight.com/pna/DCOMSecurity.html)

**Note:** 64-bit compiler option is supported.

#### Access Concepts

VNAs are shipped from the factory such that **Everyone** has permission to launch and access the VNA application via COM/DCOM. The term **Everyone** refers to a different range of users depending on whether the VNA is a member of a **Domain** or **Workgroup** (it must be one or the other; not both). By default, the VNA is configured as members of a workgroup. Therefore, **Everyone** includes only those users who have been given logon accounts on the VNA.

**Workgroup**

A workgroup is established by the **VNA administrator** declaring the workgroup name and declaring the VNA as a member of the workgroup. A workgroup does not require a network administrator to create it or control membership.
**Everyone** includes only those users who have been given logon accounts on the VNA.

By default, the VNA is configured as members of a workgroup named WORKGROUP.

**Note:** To setup a logon account for a new user, see [Additional Users](#).
The easiest method of gaining DCOM access, is to make the user's account name and password on the VNA to EXACTLY match their PC logon account name and password.

---

**Domain**

A domain is typically a large organizational group of computers. Network administrators maintain the domain and control which machines have membership in it.

**Everyone** includes those people who have membership in the domain. In addition, those with logon accounts can also access the analyzer.

---

**Summary**

- A **Workgroup** requires no maintenance, but allows DCOM access to only those users with a log-on account for the VNA.

- A **Domain** requires an administrator, but all members of the domain and those with logons to the analyzer are allowed DCOM access to the VNA.

The following section "Access Procedures" provides a tighter level of security allowing only selected (not **Everyone**) domain and workgroup users DCOM **Access** and **Launch** capability of the VNA.

---

**Access Procedures**

Perform this procedure for the following reasons:

- To allow only selected users (not everyone) remote Access and remote Launch capability to the VNA. Launch capability is starting the VNA application if it is not already open.

- To verify that you have DCOM access to the analyzer.

**Note:** Before doing this procedure, you must first have a logon account on the VNA. See [VNA User Accounts](#).

The following procedure grants specific users DCOM access and launch capability of the VNA application:
To perform this procedure, you must first **minimize the VNA application**.

**How do I know which Operating System I have?**

<table>
<thead>
<tr>
<th><strong>Windows 7</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>On the VNA, click the Windows <strong>Start</strong> button</strong></td>
</tr>
<tr>
<td><strong>In the <em>Search programs and files</em> text field, type <strong>cmd</strong> then press <strong>Enter</strong></strong></td>

| Click **OK** |
On the VNA, click the **Type here to search** icon

In the **Type here to search** text field, type `cmd` then press **Enter**

In the **cmd**: window, type `dcomcnfg`

Open the following folder sequence:

- Component Services
- Computers
- My Computer
- DCOM Config

Right click **Keysight PNA Series**

Click **Properties**

Click the **Security** tab

Under **Access Permissions**, click **Customize**, then click **Edit**

Select **Everyone**, then click **Remove**

Click **Add**

Type a group name or user account name

Click **OK**

Under **Launch and Activation Permissions**, click **Customize**, then click **Edit**

Select **Everyone**, then click **Remove**

Click **Add**

Type a group name or user account name

Click **OK**

---

**Register the VNA Type Library on Your PC**

The type library contains the VNA object model. On your PC, there is a Registry file that keeps track of
where object models are located. Therefore, you must register the type library on the PC that will be used to develop code and run the program. It is much more efficient to have the type library registered at design time (BEFORE running your COM program).

Do the following two items before proceeding:

1. Connect your PC and the VNA to LAN.
2. Either map a drive to the analyzer or copy the type library files on a floppy disk or other media. See Drive Mapping.

**Note:** To register the type library on your PC, you must be logged on as an administrator of your PC. Learn about User Accounts.

This procedure will do the following:

- Register the Network Analyzer application on your PC.
- Copy and register the proxystub (835xps.DLL) onto the PC.
- Copy and register the VNA type library (835x.tlb) onto the PC.
- Copy and register the FCA type library (fca.tlb) onto the PC.

1. Using Windows Explorer on your PC, find the Analyzer's C: drive. The drive will not be named "C:" on your PC, but a letter you assigned when mapping the drive.
2. Navigate to Program Files / Keysight / Network Analyzer / Automation
3. Double-click pnaproxy.exe and follow the prompts to Install PNA Proxy. If the installation offers a choice of Modify, Repair, or Remove, then select Remove. Then double-click on pnaproxy.exe again.
4. When prompted, type the Computer name of the VNA (Learn how to find this).
5. After the install program runs, the VNA and FCA type library should be registered on your PC.
6. Your programming environment may require you to set a reference to the VNA type library now located on your PC. In Visual Basic, click Project, References. Then browse to C:/Program Files/Common Files/Keysight/PNA Select 835x.tlb

**Problems?**

- These procedures will fail if there are any programs using the VNA type library (for example: Visual basic, VEE, Visual Studio, or any other application program that may communicate with the VNA).
Perform the following procedure if the previous procedure did not return an error, but you cannot connect to the VNA.

If you received an error, check that both the account name and password used on both the VNA and PC match EXACTLY.

If you still get errors, see http://na.support.keysight.com/pna/DCOMSecurity.html.

1. Map a drive from your remote PC to the VNA. Note the drive letter your PC assigns to the VNA. Substitute this drive letter for VNA in the following procedure.

2. On your PC, go to a DOS prompt c:>

3. Type PNA: (for example o:)

4. Type cd program files/Keysight/network analyzer/automation

5. Type copy 835xps.dll c:/program files/common files/Keysight/pna

6. Type copy 835x.tlb c:/program files/common files/Keysight/pna

If you will NOT be using FCA commands, skip steps 7, 8, and 9.

7. Type cd..

8. Type cd extensions/fca

9. Type copy fca.tlb c:/program files/common files/Keysight/pna

10. If it is not already there, copy regtlib.exe from PNA:/WINNT to your C:/<windows>/system32 directory (<windows> is OS-dependent- it is either windows or WINNT)

11. Type regtlib C:/program files/common files/Keysight/pna/835x.tlb

12. Type regsvr32 C:/program files/common files/Keysight/pna/835xps.dll

13. Type regtlib C:/program files/common files/Keysight/pna/fca.tlb

Perform the Access Procedure after doing these steps.
COM Fundamentals

The following terms are discussed in this topic:

- Objects
- Interfaces
- Collections
- Methods
- Properties
- Events
- Visual Basic Syntax

**Note:** The information contained in this topic is intended to help an experienced SCPI programmer transition to COM programming. This is NOT a comprehensive tutorial on COM programming.

**Other Topics about COM Concepts**

**Visual Basic Syntax**

The examples in VNA Help use Visual Basic as the programming environment for COM, which uses 'dot' notation.

To set a property, follow the object reference with:

- a period (.)
- property or method
- an equal sign (=)
- the new value

For example:

```vbnet
object.property = value 'This Green text following an apostrophe (') is a comment.
```
To read a property, a variable to contain the returned value is followed with:

- an equal sign (=)
- an object, or reference to an object
- a period (.)
- property

For example:

```
variable = object.property
```

To execute a method, an object, or reference to an object is followed with:

- a period (.)
- the method
- a blank space
- any required parameters

For example:

```
object.method parameters
```

Some methods return values, such as methods that return data. To return data from a method, a variable to contain the returned data is followed with:

- an equal sign (=)
- an object, or reference to an object
- a period (.)
- the method
- any required parameters enclosed in parenthesis

```
variable = object.method (parameters)
```
**Objects**

The objects of the Network Analyzer (Application) are arranged in a hierarchical order. The **VNA object model** lists the objects and their relationship to one another.

In SCPI programming, you must first select a measurement before making settings. With COM, you first get a handle to the object (or collection) and refer to that object in order to change or read settings (properties).

For more information on working with objects, see *Getting a Handle to an Object*.

**Interfaces**

A COM Interface is the connection to an object. When you get a handle to an object, you are actually using an interface to an object. This is important if you are developing VNA code that will run on multiple code versions. For more information, see *VNA Interfaces*.

**Collections**

A collection is an object that contains several other objects of the same type. For example, the **Channels** collection contains all of the channel objects.

*Note:* In the following examples, the collections are referred to as a variable. Before using a collection object, you must first get an instance of that object. For more information, see *Getting a Handle to an Object*.

Generally, items in a collection can be identified by **number** or by **name**. The order for objects in a collection cannot be assumed. They are always unordered and begin with 1. For example, in the following procedure, chans(1) is used to set averaging on the first channel in the Channels collection (not necessarily channel 1).

```
Sub SetAveraging()
    chans(1).AveragingFactor = 10
End Sub
```

The following procedure uses the measurement string name to set the display format for a measurement in the measurements collection.

```
meass("CH1_S11_1").Format = 1
```

You can also manipulate an entire collection of objects if the objects share common methods. For example, the following procedure sets the dwell time on all of the segments in the collection.

```
Sub setDwell()
    For Each seg In segs
        segs.DwellTime = 0.03
    Next
```

The objects of the Network Analyzer (Application) are arranged in a hierarchical order. The **VNA object model** lists the objects and their relationship to one another.

In SCPI programming, you must first select a measurement before making settings. With COM, you first get a handle to the object (or collection) and refer to that object in order to change or read settings (properties).

For more information on working with objects, see *Getting a Handle to an Object*.

A COM Interface is the connection to an object. When you get a handle to an object, you are actually using an interface to an object. This is important if you are developing VNA code that will run on multiple code versions. For more information, see *VNA Interfaces*.

A collection is an object that contains several other objects of the same type. For example, the **Channels** collection contains all of the channel objects.

*Note:* In the following examples, the collections are referred to as a variable. Before using a collection object, you must first get an instance of that object. For more information, see *Getting a Handle to an Object*.

Generally, items in a collection can be identified by **number** or by **name**. The order for objects in a collection cannot be assumed. They are always unordered and begin with 1. For example, in the following procedure, chans(1) is used to set averaging on the first channel in the Channels collection (not necessarily channel 1).

```
Sub SetAveraging()
    chans(1).AveragingFactor = 10
End Sub
```

The following procedure uses the measurement string name to set the display format for a measurement in the measurements collection.

```
meass("CH1_S11_1").Format = 1
```

You can also manipulate an entire collection of objects if the objects share common methods. For example, the following procedure sets the dwell time on all of the segments in the collection.

```
Sub setDwell()
    For Each seg In segs
        segs.DwellTime = 0.03
    Next
```
Methods

A method is an action that is performed on an object. For example, `CreateSParameter` is a method on the `Application` object. The following procedure uses that method to create a new S21 measurement in channel 1 in a new window.

```vba
Sub CreatMeas
    app.CreateSParameter 1, 2, 1, 1
End Sub
```

Properties

A property is an attribute of an object that defines one of the object's characteristics, such as size, color, or screen location. A property can also change an aspect of the object's behavior, such as whether the object is visible. In either case, to change the characteristics of an object, you change the values of its properties.

For example, the following statement sets the IF Bandwidth of a channel to 1 KHz.

```vba
Chan.IFBandwidth = 1e3
```

You can also read the current value of a property. The following statement reads the current IF Bandwidth of a channel into the variable `Ifbw`.

```vba
Ifbw = Chan.IFBandwidth
```

Some properties cannot be set and some cannot be read. The Help topic for each property indicates if you can:

- Set and read the property (Write/Read)
- Only read the property (Read-only)
- Only set the property (Write-only)

Events

A COM event is an action recognized by an object, such as clicking the mouse or pressing a key. Using events, your program can respond to a user action, program code, or triggered by the analyzer.

The SCPI equivalent of an event is a Service Request (SRQ).

For example:

```vba
OnChannelEvent
```
For more information, see *Working with the Analyzer's Events*.
Getting a Handle to an Object

The following are discussed in this topic:

- What Is a Handle
- Declaring an Object Variable
- Assigning an Object Variable
- Navigating the Object Hierarchy
- Getting a Handle to a Collection

Other Topics about COM Concepts

What Is a Handle

In SCPI programming, you must first select a measurement before changing or reading settings. With COM, you first get a handle to the object (or collection) and refer to that object to change or read its settings. The following analogy illustrates this:

A CAR could be called an object. More precisely, CAR is a class of objects. For example, one of the properties of the CAR class is "Color". You can read (by looking) or set (by painting) the color property of a car object. In other words, you can only read or set properties of a specific car object; not the entire car class. Therefore, to read or set a property, you need to get "a handle", or an instance of the object.

This process is also called "accessing an object", "getting an instance of an object", "returning an object", or "referring to an object". You can have handles to many instances of an object at the same time.

Accessing VNA Objects

The VNA Application object is the highest object in the VNA object model hierarchy. Because of that, it is the only object that must be 'created' before it, or any other objects, can be accessed and used. During the creation process, the application object is assigned to a variable name, or handle. Throughout your program, that object is used by referring to that variable. All VNA objects can be assigned to a variable, and subsequently referred to, in this same manner.

The following example shows how to create the VNA Application object, as well as illustrate the general steps of get a handle to an object.

There are two steps in the process of getting a handle to analyzer objects:
1. Declaring a Variable

**Note:** The examples in these topics use the Visual Basic Programming Language. See the short section regarding Visual Basic syntax.

Use the Dim statement or one of the other declaration statements (Public, Private, or Static) to declare a variable. The type of variable that refers to an object must be a Variant, an Object, or a specific type of object. Some programming languages, such as VBScript and Keysight VEE, do not allow you to specify variable types.

The following examples ALL declare the variable **VNA**. Each subsequent statement is more specific than the previous:

- `Dim pna 'Variant data type.``
- `Dim pna As Object 'Object data type.``
- `Dim pna As AgilentPNA835x.Application ' Specific Application type``
- `Dim pna As AgilentPNA835x.IApplication ' Interface type``

1. If you use a variable without declaring it first, the data type of the variable is Variant. If you don't care about using automatic type checking, and willing to run code less efficiently, this method is very safe and is useable on all programming environments.

2. If you know the specific object type, and your programming environment allows it, you can declare the variable as an object.

3. Declaring a specific object type provides automatic type checking (Intellisense), faster code, and improved readability.

4. Declaring the interface is the most specific way and is beneficial when developing code for multiple firmware revisions. Learn more about Interfaces.

2. Assigning an Object to a Variable

To assign an object instance to a variable, use the **Set** keyword before the object variable that was declared previously. In the following line of code, we SET the current AgilentPNA835x Application to "pna".

```
Set pna = AgilentPNA835x.Application
```

As mentioned earlier, the AgilentPNA835x object is unique because it is the highest level of object in
the VNA object model hierarchy. Therefore, we must use the `CreateObject` keyword with the `(classname,server name)` parameters.

- The `classname` for the analyzer object is always "AgilentPNA835x.Application".
- To find your analyzer's `server name`, see View or change full computer name

The following statements create an instance of the Analyzer object.

```vba
Dim pna As AgilentPNA835x.Application
Set pna = CreateObject("AgilentPNA835x.Application", "Analyzer46")
```

**Note:** These statements will start the VNA application if it is not already running on your instrument.

### Navigating the Object Hierarchy

Once an instance of the VNA Application is "created", you access all of the VNA objects by navigating the object hierarchy. Navigating the object model hierarchy can be tricky. In addition, you also need to know how to refer to a specific instance of that object. For example, if you have three measurements present on the VNA, how do you refer to the channel 1 measurement? Each object on the VNA Object Model image is linked to an object page. At the top of each object page is a Description section and another called "Accessing the ... Object". These sections together explain how to navigate the VNA hierarchy to access a specific instance of that object.

From the previous discussion, you may think that you must always declare and assign variables to an object before setting or reading its properties. While this method is best for objects that you will continue to reuse, such as a measurement, it is not always necessary. You can also refer to an object directly.

The `TriggerSetup` object, which is a child of the Application object. Because we will only need to refer to this object once to set a couple of properties, and it is easy to access, we will refer to it directly. From the previous example, we already have a handle to the Application object in the variable `VNA`. The following example uses Visual basic 'dot' notation to refer to the TriggerSetup object, and then the Scope property.

```vba
pna.TriggerSetup.Scope = naChannelTrigger
```

By referring to the TriggerSetup object directly, we must type the same path whenever we refer to properties on the TriggerSetup object. The following method assigns the `VNA.TriggerSetup` object to a variable that can be reused.

```vba
Dim trig As Object
Set trig = pna.TriggerSetup
```

Once created, you can treat an object variable exactly the same as the object to which it refers. For
example:

```vbnet
trig.Scope = naChannelTrigger
trig.Source = naTriggerSourceInternal
```

**Getting a Handle to a Collection**

The analyzer has several collections of objects which provide a convenient way of setting or reading all of the objects in the collection with a single procedure. Also, there are objects (limit lines for example) that can only be accessed through the collection.

To get a handle to an item in a collection, you can refer to the object by item number or sometimes by name. However, you first have to get a handle to the collection. To assign the collection to a variable, use the same two step process (1. declare the variable, 2. assign the variable using 'Set').

```vbnet
Dim meass As Measurements
Dim meas As Measurement
```

You can then iterate through the entire collection of measurements to read or set properties

```vbnet
Sub setFormat()
    For Each meas In meass
        meas.Format = naDataFormat_LinMag
    Next
End Sub
```

Or you can read or set a property on an individual object in the collection:

```vbnet
meass(1).Format = naLinMag
```

**Note:** Each object and collection has its own unique way of dealing with item names, and numbers. Refer to the [Analyzer Object Model](#) for details.
Collections in the Analyzer

Collections are a gathering of similar objects. They are a convenience item used primarily to iterate through the like objects in order to change their settings. Collections generally provide the following generic methods and properties:

<table>
<thead>
<tr>
<th>Item(n)</th>
<th>Count</th>
<th>Add(n)</th>
<th>Remove(n)</th>
</tr>
</thead>
</table>

where \((n)\) represents the number of the item in the collection. Some collections may have unique capabilities pertinent to the objects they collect.

Other Topics about COM Concepts

Collections are Dynamic

A collection does not exist until you ask for it. When you request a Channels object (see Getting a Handle to an Object / Collection), handles to each of the channel objects are gathered and placed in an array.

For example, if channels 2 and 4 are the only channels that exist, then the array will contain only 2 items. The command 'channels.Count' will return the number 2, and:

- Channels(1) will contain the channel 2 object.
- Channels(2) will contain the channel 4 object.

The ordering of objects within the collection should not be assumed. If you add a channel to the previous example, as in:

\[\text{Pna.Channels.Add(3)}\]

'channels.Count' will now return 3 and:

- Channels(1) will contain the channel 2 object.
- Channels(2) will contain the channel 3 object.
- Channels(3) will contain the channel 4 object.

Primarily, collections are useful for making this type of iteration possible:
Dim ch as Channel
For each ch in pna.Channels
  Print ch.Number
  Print ch.StartFrequency
  Print ch.StopFrequency
Next ch

As soon as this for-each block has been executed, the Channels object goes out of scope.
The VNA uses several data types to communicate with the host computer. Before using a variable, it is best to declare the variable as the type of data it will store. It saves memory and is usually faster to access. The following are the most common data types:

- **Long Integer**
- **Single Precision (Real)**
- **Double Precision (Real)**
- **Boolean**
- **String**
- **Object**
- **Enumeration**
- **Variant**

### Other Topics about COM Concepts

**Long** (long integer) variables are stored as signed 32-bit (4-byte) numbers ranging in value from -2,147,483,648 to 2,147,483,647.

**Double** (double-precision floating-point) variables are stored as IEEE 64-bit (8-byte) floating-point numbers ranging in value from -1.79769313486232E308 to -4.94065645841247E-324 for negative values and from 4.94065645841247E-324 to 1.79769313486232E308 for positive values.

**Single** (single-precision floating-point) variables are stored as IEEE 32-bit (4-byte) floating-point numbers, ranging in value from -3.402823E38 to -1.401298E-45 for negative values and from 1.401298E-45 to 3.402823E38 for positive values.

**Boolean** variables are stored as 16-bit (2-byte) numbers, but they can only be True or False. Use the keywords True and False to assign one of the two states to Boolean variables.

When other numeric types are converted to Boolean values, 0 becomes False and all other values become True. When Boolean values are converted to other data types, False becomes 0 and True becomes -1.
The following properties return True rather than 1 to conform with this definition. This may affect the functionality of your COM program:

- Bandwidth Tracking Property
- ErrorCorrection Property
- Interpolate Correction Property
- LimitTestFailed Property

**String** variables hold character information. A String variable can contain approximately 65,535 bytes (64K), is either fixed-length or variable-length, and contains one character per byte. Fixed-length strings are declared to be a specific length. Variable-length strings can be any length up to 64K, less a small amount of storage overhead.

**Object** variables are stored as 32-bit (4-byte) addresses that refer to objects within the analyzer or within some other application. A variable declared as Object is one that can subsequently be assigned (using the Set statement) to refer to any actual analyzer object.

**Enumerations (Enum)** are a set of named constant values. They allow the programmer to refer to a constant value by name instead of by number. For example:

```vbnet
Enum DaysOfWeek
  Sunday = 0
  Monday = 1
  Tuesday = 2
  Wednesday = 3
  Thursday = 4
  Friday = 5
  Saturday = 6
End Enum
```

Given this set of enumerations, the programmer can then pass a constant value as follows:

```vbnet
SetTheDay(Monday)
```

rather than

```vbnet
SetTheDay(1)
```
where the reader of the code has no idea what the value 1 refers to.

However, the analyzer RETURNS a long integer, not the text.

```vbnet
Day = DaysofWeek(today) 'Day = 1
```
**Variant** - If you don't declare a data type ("typed" data) the variable is given the Variant data type. The Variant data type is like a chameleon - it can represent many different data types in different situations.

The VNA provides and receives Variant data because there are programming languages that cannot send or receive "typed" data. Variant data transfers at a slower rate than "typed" data.
A COM interface is the connection to an object. When you get a handle to an object, you are actually using an interface to an object. This subtle distinction is relevant to the COM programmer for the following two reasons:

- Interface Inheritance (Coding for Multiple VNA Versions)
- Custom Interfaces.

**Interface Inheritance (Coding for Multiple VNA Versions)**

The VNA continues to evolve and release new firmware / software versions that provide more functionality and features. New commands are added to existing objects, and with them new interfaces are added to support those commands. For example, new commands were added to the Measurement object in VNA release 3.0. These commands are accessible from the new IMeasurement2 interface. This can be important if you develop code using the type library in release 3.0, and run the code on a VNA with an older release, such as 2.0

When you use a command that was new with release 3.0, and you run that code on a VNA with release 2.0 firmware, errors will occur because that VNA does not recognize the new commands. However, even if you do NOT utilize new commands, errors can still occur. The following example shows how this occurs and how to avoid it.

The following Visual Basic statement dimensions the `meas` variable as an object.

```dim meas As Measurement```

When the program compiles, Visual Basic figures out what interface to use to access that object. When dimensioning as an object, VB will use the default interface. As new interfaces are added to an object, they become the default interface. If this program was developed and compiled using the VNA 3.0 type library, the default Interface of the Measurement Object was IMeasurement2. However, if this program is run on an instrument with VNA 2.0 firmware, there was no IMeasurement2 Interface, and an E_NOINTERFACE error will occur.

Therefore, the more robust approach would be to specify the interface instead of the object when declaring a variable.

```dim meas As IMeasurement```
This code will ONLY use the IMeasurement interface; not the default interface.

However, regardless of how you declare a variable, errors will always occur if you use new commands, and run the code on an older instrument.

**Custom Interfaces**

The VNA object model contains three "custom" interfaces use "typed" variables, which is more efficient than using variant type variables. However, these interfaces are only usable from VB6, C, & C++. All other programming languages must use the other standard interfaces.

The custom interfaces are:

- **IArrayTransfer** - Measurement object
- **ICalData** - Calibrator object
- **ISourcePowerCalData** - Channel object
What are Events?

Windows applications work from user-initiated events such as mouse moves and mouse clicks. A mouse-click produces an event that the programmer can either ignore or "handle" by providing an appropriate subroutine like this:

```vba
Sub DoThis_onClick
    Perform something
End Sub
```

If this subroutine were in your program and the mouse-click event occurs on your PC, it would generate a "Callback" to the client and interrupt whatever it was doing and handle the event.

A more practical example of an event in the analyzer is Limit test. If limit test is on and the measurement fails, the analyzer produces a "Limit-failed" event. If the measurement passed, the analyzer produces a "Limit-succeeded" event.

The Analyzer has a very sophisticated Event structure. Your program **CAN** be notified when one or more events occur. However, it may not be necessary.

For example, the analyzer has an event that will notify your program when a sweep is complete. A
A simpler alternative is to use a synchronous command which waits for the sweep to complete.

```plaintext
sync = True
app.ManualTrigger sync
chan.StartFrequency = 4.5E6
```

This would NOT work if you want the controller to do other things while waiting, like setup a power meter or sort some data. In this case you would like a "callback" from the analyzer to let your program know that the sweep has completed. For an example of this see Events Example.

Another reason to use events is when you want to be notified of several conditions when they occur, such as errors or source unlock conditions. It would not be practical to routinely poll these conditions while executing your program.

### Using Events

If you decide to use the COM events to get a callback, your program must do two things:

1. **Subscribe to events:**

   All events in the analyzer are a child of the Application object through the INetworkAnalyzerEvents Interface. You must tell the Application object that you are interested in receiving event callbacks. This process is called subscription.

   In Visual Basic, this is done by including " WithEvents " in the declaration statement. The declaration below dimensions an Application object (myPNA) and subscribes to the events produced by the Application.

   ```vb
   Dim WithEvents myPNA as AgilentPNA835x.Application
   ```

   In C++, this is a bit more involved. You must queryInterface for the IconnectionPointContainer interface, locate the InetworkAnalyzerEvents interface via a call to FindConnectionPoint and call Advise().

2. **Implement the Event Handler**

   When an event occurs, the Application object will "callback" to the client through the INetworkAnalyzerEvents interface.

   In VB, click on the object window (upper left pane). Find the Application object and click it. The event interfaces will appear in the upper right pane. As you click on them, VB supplies the first line of code. You fill in the rest of the handler routine to service the event. The following is an example of a event handler subroutine.

   ```vb
   Note: In C++, you must type the callback.
   ```
Private Sub OnChannelEvent( eventID as Variant, channelNumber as Variant)
Select Case (eventID)
    Case naEventID_CHANNEL_TRIGGER_COMPLETE:
        GetData( channelNumber )
    Case naEventID_CHANNEL_TRIGGER_ABORTED:
        MsgBox( "Hey don't touch the front panel!"")
End Select
End Sub

When the trigger is complete, the application object "fires" the event by making a callback to the event handler Sub OnChannelEvent().

### Filtering Events

There are over 140 different events that you subscribe to when you "Dim WithEvents..." (or the equivalent in your programming language). Monitoring all of these conditions slows the speed of the analyzer significantly. The following methods allow you to filter the events so that you only monitor specific conditions.

- **AllowEventMessage** - monitor a specific event
- **AllowAllEvents** - monitor ALL events
- **DisallowAllEvents** - monitor NO events
- **AllowEventCategory** - monitor specific event categories (discussed later)
- **AllowEventSeverity** - monitor events having one or more of the following severity levels associated with them.

### Severity Enumeration

<table>
<thead>
<tr>
<th>Code</th>
<th>Severity Enumeration</th>
</tr>
</thead>
<tbody>
<tr>
<td>00</td>
<td>naEventSeveritySUCCESS - the operation completed successfully</td>

<td>OnSystemEvent</td>
</tr>
</tbody>
</table>

**Note:** Use the MessageText Method to get a text message describing the event.

Out of Range Errors

When you attempt to set a value on an active function that is beyond the range (min or max) of the allowable values, the analyzer limits that value to an appropriate value (min or max) and sets the function to the limited value. From the front panel controls this is visually evident by the limited value in the edit box or by the annotation on the display. An example would be attempting to set the start frequency below 300kHz. The edit control doesn't allow the number to fall below 300kHz.

When the automation user programs a setting (such as start frequency below the allowable limits) the same behavior takes place. The analyzer accepts the limited value. However, in order to learn what setting took place, you have to read the HRESULT.

All automation calls return HRESULTs. By default the HRESULT returned when an overlimit occurs is S_NA_LIMIT_OUTOFRANGE. This value is a success code, meaning that bit 31 in this 32 value is 0. Programmers should check the return code from all automation calls to determine success or failure.

Some C++ macros (like SUCCEEDED(hr) or FAILED(hr)) only check bit 31. So if you are interested in trapping this outOfRange error you will have to check for S_NA_LIMIT_OUTOFRANGE explicitly.

Alternatively, you can configure the analyzer to report outOfRange conditions with an error code. Use the method: App.SetFailOnOverRange (true). With this method set TRUE, any overrange error will return E_NA_LIMIT_OUTOFRANGE_ERROR.

This method is provided for the benefit of VB clients. VB users can't detect specific success codes...
because the VB runtime strips off the HRESULT and only raises a run time error if bit 31 is set, indicating a fail code.

**Troubleshooting Problems with Callbacks**

When you do callbacks, the client PC becomes the server and the analyzer (server) becomes the client. Callbacks can only take place when both server and client are in the same workgroup or in the same domain. See [Configure for COM](#).
Read and Write Calibration Data using COM

Calibration data in the VNA is stored in Cal Sets. Learn more about Cal Sets

You can read or write two types of Calibration data:

- **Error Terms** - calculated data using standard measurement data and the algorithms for the specified cal type.

- **Standard Measurement data** - raw data resulting from the measurement of a calibration standard.

Each of these data are available in the VNA in either variant data or typed data. Learn more about variant and typed data

Other Topics about COM Concepts

**Calibration / Cal Set Interfaces**

There are several interfaces associated with Calibration.

*ICalibrator*

This interface is the original interface provided with the first version of the VNA. It provides remote access to the "Unguided" Calibration wizard. This interface can perform 1 and 2 port calibrations as well as response cals.

This interface can also read and write error terms from/to a Cal Set. However, ICalibrator is NOT recommended for this purpose. The ICalSet2 Interface is better suited for reading and writing error terms.

See a vbscript example of how to perform a 2-port Cal and read the cal data.

*IGuidedCalibration*

This interface provides the methods and properties used by the Guided Calibration wizard. With this interface you can perform multi-port calibrations (1 to 4 port cals), but no response cals.

*ICalSet2 and ICalData3*

These interfaces provide access to the Cal Set contents. You can read and write error terms with both of these interfaces.
• ICalSet2 uses Variant data, which means it is usable from vbscript.

• ICalData3 uses "typed" data, which means it can be used from any automation engine that can read the type library (VEE, VB, C++, etc.). Typed arguments (such as float or single) are more efficient than variants, so use the ICalData3 interface where better performance is needed.

See a vbscript example of how to read Cal Set data.

ICalSet3

This interface provides access to the stimulus attributes of the Cal data: frequency, power, number of points. These are the stimulus conditions under which the Cal Set was created.
Programming the VNA with C++

The programming information contained in this Help system is aimed at the Visual Basic programmer. VB does a lot of work for the programmer when it comes to managing and accessing components. Using a lower level language like C++ requires a more thorough understanding of the underlying tenets of COM. It is not the intent of this section to teach COM programming. The following is intended to acquaint you with some of the basic concepts you need to know in order to program against COM.

- Initializing COM
- Importing the Type Library
- Creating the Application Object
- Errors
- Events
- Additional Reading
- Example

**Note:** The information in this section assumes development on a Windows OS using Microsoft tools.

### Other Topics about COM Concepts

#### Initializing COM

The first thing you must do before performing any COM transactions is to initialize the COM library. You can do this in a number of ways. The most basic of these is a call to `CoInitialize()` or `CoInitializeEx()`. Alternatively you can use the MFC (Microsoft Foundation Classes) `AfxOleInit()`. Conversely, before your program exits you must uninitialize COM. You can accomplish this with `CoUninitialize()` or the MFC routine `AfxOleTerm()`.

#### Importing the Type Library

To make a component available to the client, the server exports what is called the type library. For the VNA, this file is 835x.tlb. It is located on the VNA's hard drive at `C:\Program Files(x86)\Keysight\Network Analyzer\Automation`. See Configure for COM-DCOM Programming.

The type library can be read and deciphered using another COM interface called ITypeLib. VB uses this interface to present, for example, its object browser. Visual C++ can also read type libraries. This
is done by importing the type library into your project with a compiler directive:

```csharp
#import "C:\Program Files\Common Files\Keysight\Pna\835x.tlb", named_guids
```

When you compile your program with this statement in it, the compiler creates two other files: `835x.tlh` and `835x.tli`. The first is a header file that contains the type definitions for the VNA's COM interfaces and their methods. The second file contains inline functions that wrap the VNA's interface methods. The wrappers are beneficial in that they contain error reporting for each of the method calls.

The `.tlh` file defines a smart pointer which you can use to access the VNA's objects. The smart pointer definition looks like this:

```csharp
_com_smartptr_typedef(Iapplication, _uuidof(Iapplication))
```

A smart pointer is a term used for a C++ object that encapsulates a pointer used to refer to a COM object. All COM objects derive from the interface `IUnknown`. This interface has three methods: `QueryInterface()`, `AddRef()`, and `Release()`. The function of the `AddRef` and `Release` methods is to maintain a reference count on the object and thus control the object's lifetime. Anytime you copy or create a reference to a COM object, you are responsible for incrementing its reference count. And likewise, when you are finished using that reference, it is your responsibility to Release it. Smart pointers do this work for you, as shown in the example program. In addition, smart pointers will also perform the `QueryInterface` call when required. `QueryInterface` is a method that requests a specific interface from an object. In the example program we gain access to the `IArrayTransfer` interface of the `Measurement` object. In the `ReadMethod` routine, we see this:

```csharp
PTransferData = pMeas;
```

The assignment operator is overloaded for the smart pointer and in reality, this simple statement does this:

```csharp
HRESULT hr = pMeas->QueryInterface( IID_IArrayTransfer,(void**)&pTransferData);
```

Using the existing interface pointer (`pMeas`) to the object, this call asks the object if it supports the `IArrayTransfer` interface, and if so to return a pointer to it in `pTransferData`. Smart pointer makes life easier for the C++ programmer. Read more about smart pointers in Microsoft Developer's Network Library (MSDN).

---

Creating the Application Object

The only createable object exported by the VNA is the Application object. Typically this would be done with a call to `CoCreateInstance`:

```csharp
STDAPI CoCreateInstance( 
    CLSID__IApplication, //Class identifier (CLSID) of the object 
    NULL, //Pointer to controlling IUnknown 
    CLS_CTX_SERVER, //Context for running executable code 
```
With the smart pointer, this is taken care of with the following call:

```c++
IApplicationPtr pNA; // declare the smart pointer
pNA = IApplicationPtr("AgilentPNA835x.Application.1");
```

### Errors

All COM method calls are required to return an HRESULT. This is 32 bit long with a specific format.

- The most significant bit indicates success(0) or failure(1).
- The lower 16 bits indicate the specific failure.

Visual Basic strips off the returned HRESULT and raises an error object for non-successful returns. The C++ programmer must himself be diligent about handling errors. You must check the return value of each COM call to ensure its success.

### Events

The Application object sources the INetworkAnalyzerEvents interface. This object is the source for all events. To use events in C++, you must do two things:

1. Implement the INetworkAnalyzerEvents interface - derive an object from INetworkAnalyzerEvents and implement the methods described there.
2. Subscribe to the IconnectionPoint interface of the Application object. - obtain a pointer to the IConnectionPointContainer interface of the Application object and making the following request:

   ```c++
   FindConnectionPoint( IID_InetworkAnalyzerEvents, &pConnection );
   ```

A successful call to this interface will return a valid pointer in pConnection. Use this pointer to subscribe to the Application object:

```c++
pConnect->Advise( IUnknown* punk, DWORD dwCookie);
```

This call provides the server object with a callback address. The IUnknown pointer in this call is the IUnknown pointer of the object that implements the INetworkAnalyzerEvents interface. This is the event sink. The application object needs a pointer to this object in order to call your interface when an event occurs. The `dwCookie` is your subscription key. Use it to unsubscribe (see Unadvise( ) ).

### Additional Reading
Example

The example uses the smart pointer created by Microsoft Visual Studio. The calls to CoInitialize and CoUninitialize open and close the COM libraries. In the example, notice that the pointers local to the main routine are explicitly released. When smart pointers go out of scope, they will perform this duty implicitly. However, we are calling CoUninitialize before they have the chance to be destroyed, so we are obliged to release them.

See the example program.
Using COM from .NET

To communicate with the VNA from Microsoft .NET enabled languages such as C# and Visual Basic.NET perform the following steps:

1. Configure your PC and VNA for COM-DCOM Programming.

2. Reference the type library within the development environment (see the following exception for managed C++ projects.) In the process of referencing the type library, a .NET assembly is created that wraps the VNA type library with a .NET friendly interface. This .NET assembly is called an Interop Assembly.

**Note:** ONLY 32-bit compiler option is supported (64-bit is NOT supported).

**Exception for managed C++ projects:** To generate the Interop Assembly for managed C++ projects, you must use the tlbimp.exe utility. This utility is described in the MSDN documentation. On your PC, click Start then Run then type: tlbimp.exe 835x.tlb and click OK. After doing this you can use the #using directive to include the Interop Assembly on managed C++ projects.

**Example: Creating a .NET object from C#**

The following is an example that shows how to create a .NET object that connects to the VNA over DCOM. In this example, `machineName` is either the DNS name or the IP address of the VNA to connect with.

```csharp
Type pna = Type.GetTypeFromProgID("AgilentPNA835x.Application", machineName);
AgilentPNA835x.IApplication app = (AgilentPNA835x.IApplication)Activator.CreateInstance(pna);
```

**See C# Example Programs:**

Perform a Guided Cal with C#

Using C#

**Registering the VNA Primary Interop Assembly (PIA) (OPTIONAL)**

The PIA is NOT necessary to communicate with the VNA. The following procedure is useful only when there are two .NET programs that want to share the same VNA interface definitions. Without the PIA, each .NET application would use its own Interop Assembly.

To register the PIA on a machine, you need to have the common language runtime (CLR) installed. This is included with Visual Studio.NET. Then perform the following steps:

**Note:** In the following steps, replace `<local directory>` with the full path name of the specified file on
1. Run the PNAPProxy.exe program as described in Configure for COM-DCOM Programming.

2. On the VNA, copy C:/Program Files/Keysight/Network Analyzer/Automation/AgilentPNA835x.dll to a local directory on your PC. Make a note of this directory.

3. On your PC, click Start, then Run, then type: regasm <local directory>/AgilentPNA835x.dll and click OK to register the dll.

4. Again, click Start, then Run, then type: gacutil /i <local directory>/AgilentPNA835x.dll and click OK to add the assembly to the Global Assembly Cache (GAC).

To Uninstall the PIA, perform the following:

1. On your PC, click Start, then Run, then type: gacutil /u <local directory>/AgilentPNA835x.exe and click OK to remove the assembly from the GAC.

2. On your PC, click Start, then Run, then type: regasm/unregsiter <local directory>/agilentpna835x.dll and click OK to unregister the assembly.

3. To uninstall PNA Proxy.exe use the Add/Remove Programs utility in the control panel.

---

**CLS - Clear Status**

Clears the instrument status byte by emptying the error queue and clearing all event registers. Also cancels any preceding *OPC command or query. See [Status Commands](#) and [Reading the Analyzer's Status Registers](#).

---

**ESE - Event Status Enable**

Sets bits in the standard event status enable register. See [Status Commands](#) and [Reading the Analyzer's Status Registers](#).

---

**ESE? - Event Status Enable Query**

Returns the results of the standard event enable register. The register is cleared after reading it. See [Status Commands](#) and [Reading the Analyzer's Status Registers](#).
*ESR - Event Status Enable Register
Reads and clears event status enable register. See Status Commands and Reading the Analyzer’s Status Registers.

*IDN? - Identify
Returns a string that uniquely identifies the analyzer. The string is of the form "Keysight Technologies",<model number>,<serial "number>,<software revision>".

Note: Beginning with Rev 6.01, this command now returns the software revision with 6 digits instead of 4. For example, A.06.01.02.

For 4 state CALPod support the following is required.

- CCT (configurable command table) version 1.4
- Controller FPGA version 8.4

*OPC - Operation complete command
Generates the OPC message in the standard event status register when all pending overlapped operations have been completed (for example, a sweep, or a Default). See Understanding Command Synchronization.

*OPC? - Operation complete query
Returns an ASCII "+1" when all pending overlapped operations have been completed. See Understanding Command Synchronization

*OPT? - Identify Options Query
Returns a comma-separated string identifying the analyzer option configuration.

See a list of VNA options. Refer also to the option number differences between the common option numbers and those returned using this command.

See also SYST:CAP:LIC:CAT? for the installed product license.

*RST - Reset
Executes a device reset and cancels any pending *OPC command or query, exactly the same as a SYSTem:PRESet with one exception: Syst:Preset does NOT reset Calc:FORMAT to ASCII. The contents of the analyzer’s non-volatile memory are not affected by this command.
**SRE - Service Request Enable**

Before reading a status register, bits must be enabled. This command enables bits in the service request register. The current setting is saved in non-volatile memory. See Status Commands and Reading the Analyzer’s Status Registers.

**SRE? - Service Request Enable Query**

Reads the current state of the service request enable register. The register is cleared after reading it. The return value can be decoded using the table in Status Commands. See also Reading the Analyzer’s Status Registers.

**STB? - Status Byte Query**

Reads the value of the instrument status byte. The register is cleared only when the registers feeding it are cleared. See Status Commands and Reading the Analyzer’s Status Registers.

**TST? - Result of Self-test Query**

Returns the result of a query of the analyzer hardware status. An 0 indicates no failures found. Any other value indicates one or more of the following conditions exist. The value returned is the Weight (or sum of the Weights) of the existing conditions. For example:

- If 4 is returned from *TST?, an Overpower condition exists.
- If 6 is returned, both Unleveled and Overpower conditions exist.

<table>
<thead>
<tr>
<th>Bit</th>
<th>Weight</th>
<th>Description</th>
<th>Bit is set to 1 when the following conditions exist:</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>1</td>
<td>Phase Unlock</td>
<td>The source has lost phaselock. This could be caused by a reference channel open or a hardware failure.</td>
</tr>
<tr>
<td>1</td>
<td>2</td>
<td>Unleveled</td>
<td>The source power is unleveled. This could be a source is set for more power than it can deliver at the tuned frequency. Or it could be caused by a hardware failure.</td>
</tr>
<tr>
<td>2</td>
<td>4</td>
<td>Not used</td>
<td></td>
</tr>
<tr>
<td>3</td>
<td>8</td>
<td>EE Write Failed</td>
<td>An attempted write to the EEPROM has failed. This is possibly caused by a hardware failure.</td>
</tr>
<tr>
<td>4</td>
<td>16</td>
<td>YIG Cal Failed</td>
<td>The analyzer was unable to calibrate the YIG. Either the phaselock has been lost or there has been a hardware failure.</td>
</tr>
<tr>
<td>5</td>
<td>32</td>
<td>Ramp Cal Failed</td>
<td>The analyzer was unable to calibrate the analog ramp generator due to a possible hardware failure.</td>
</tr>
<tr>
<td>6</td>
<td>64</td>
<td>Not used</td>
<td></td>
</tr>
</tbody>
</table>
*WAI - Wait
Prohibits the instrument from executing any new commands until all pending overlapped commands have been completed. See Understanding Command Synchronization
About Triggering

Abort Command

ABORt

Applicable Models: All

(Write-only) Stops all sweeps - then resume per current trigger settings. This command is the same as INITiate:IMMediate (restart) except if a channel is performing a single sweep, ABORt will stop the sweep, but not initiate another sweep.

Examples

<table>
<thead>
<tr>
<th>Examples</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>ABOR</td>
</tr>
<tr>
<td></td>
<td>abort</td>
</tr>
</tbody>
</table>

Query Syntax

Not applicable

Default

Not applicable
These commands are used to control the Automatic Fixture Removal (AFR) capabilities in the VNA.

AFR:ADVanced:MCONversion[:STATe] <bool>

**Applicable Models:** All with Automatic Fixture Removal Option (S9x007A/B, 007)

*(Read-Write)* This command turns ON or OFF AFR mode conversion.

**Parameters**

<bool> Choose from:

- **ON (or 1)** - Turns mode conversion on.
- **OFF (or 0)** - Turns mode conversion off.

**Examples**

AFR:ADVanced:MCONversion ON

**Query Syntax**

AFR:ADVanced:MCONversion[:STATe]?

**Return Type**

Boolean

**Default**

OFF

---

**See Also**

</table>

**Query Syntax** Not Applicable

**Default** Not Applicable

AFR:ADVanced:TIME:STARt <num>

**Applicable Models:** All with Automatic Fixture Removal Option (S9x007A/B, 007)

*(Read-Write)* This command gets or sets the manual start time in the AFR configuration.

**Parameters**

- `<num>` Start time in ns.

**Examples**

<table>
<thead>
<tr>
<th>Command</th>
</tr>
</thead>
<tbody>
<tr>
<td>AFR:ADVanced:TIME:STARt -0.2</td>
</tr>
</tbody>

**Query Syntax**

:AFR:ADVanced:TIME:STOP?

**Return Type** Numeric

**Default** Not Applicable

AFR:ADVanced:WINDow:COEFFicient <char>
**Applicable Models:** All with Automatic Fixture Removal Option (S9x007A/B, 007)

*(Read-Write)* This command gets or sets the manual window type in AFR configuration.

**Parameters**

<char> Window coefficient. Choose from:

- **MAXWin**
- **WIDWin**
- **NORMWin**
- **MINWin**

**Examples**

AFR:ADVanced:WINDow:COEFFicient WIDWin

**Query Syntax**
AFR:ADVanced:WINDow:COEFFicient?

**Return Type** String

**Default** NORMWin

---

**AFR:ADVanced:WINDow:MANual[:STATe] <bool>**

**Applicable Models:** All with Automatic Fixture Removal Option (S9x007A/B, 007)

*(Read-Write)* This command turns ON or OFF the manual window coefficient of the AFR.

**Parameters**

<bool> Choose from:

- **ON (or 1)** - Turns manual window coefficient on.
- **OFF (or 0)** - Turns manual window coefficient off.

**Examples**

AFR:ADVanced:MANual:STATe ON

**Query Syntax**
AFR:ADVanced:WINDow:MANual[:STATe]?

**Return Type** Boolean

**Default** OFF

---

**AFR:FIXTure:BLIMited[:STATe] <bool>**
Applicable Models: All with Automatic Fixture Removal Option (S9x007A/B, 007)

(Read-Write) This command selects whether the fixture is band limited or not.

Parameters

<bool> Band limited or not. Choose from:

ON (or 1) - Band limited.

OFF (or 0) - Not band limited.

Examples AFR:FIXTure:BLIMited ON

Query Syntax AFR:FIXTure:BLIMited?

Return Type Boolean

Default OFF

AFR:FIXTure:CDUT[:STATe] <bool>

Applicable Models: All with Automatic Fixture Removal Option (S9x007A/B, 007)

(Read-Write) This command selects whether to use DUT correction or not when the characterization fixture is not equal to the DUT measurement fixture.

Parameters

<bool> DUT correction state. Choose from:

ON (or 1) - Use DUT correction.

OFF (or 0) - Do not use DUT correction.

Examples AFR:FIXTure:CDUT ON

Query Syntax AFR:FIXTure:CDUT?

Return Type Boolean

Default OFF

AFR:FIXTure:CLENgth[:STATe] <bool>
**Applicable Models:** All with Automatic Fixture Removal Option (S9x007A/B, 007)

*(Read-Write)* This command selects Fixture Length A not equal to B correction.

**Parameters**

<bool> Correction match state. Choose from:

- **ON (or 1)** - Correct.
- **OFF (or 0)** - Do not correct.

**Examples**

<table>
<thead>
<tr>
<th>AFR:FIXTure:CLENgth</th>
<th>ON</th>
</tr>
</thead>
</table>

**Query Syntax**

AFR:FIXTure:CLENgth?

**Return Type**

Boolean

**Default**

ON

---

**AFR:FIXTure:CMATch[:STAte] <bool>**

**Applicable Models:** All with Automatic Fixture Removal Option (S9x007A/B, 007)

*(Read-Write)* This command selects Fixture Match A not equal to B correction.

**Parameters**

<bool> Correction match state. Choose from:

- **ON (or 1)** - Correct.
- **OFF (or 0)** - Do not correct.

**Examples**

<table>
<thead>
<tr>
<th>AFR:FIXTure:CMATch</th>
<th>ON</th>
</tr>
</thead>
</table>

**Query Syntax**

AFR:FIXTure:CMATch?

**Return Type**

Boolean

**Default**

ON

---

**AFR:FIXTure:INPuts <char>**

3324
Applicable Models: All with Automatic Fixture Removal Option (S9x007A/B, 007)

(Read-Write) This command describes the fixture inputs (single ended or differential).

Parameters

<char> Choose from:

SENDed - Single ended fixture inputs.

DIFFerential - Differential fixture inputs.

Examples

AFR:FIXTure:INPuts SENDed

Query Syntax

AFR:FIXTure:INPuts?

Return Type

String

Default

SEND

AFR:FIXTure:MEASurement <num>

Applicable Models: All with Automatic Fixture Removal Option (S9x007A/B, 007)

(Read-Write) This command selects the number of fixtures to be characterized.

Parameters

<num> Choose from 1, 2, or 4.

Examples

AFR:FIXTure:MEASurement 2

Query Syntax

AFR:FIXTure:MEASurement?

Return Type

Numeric

Default

2

AFR:FIXTure:PREView
Applicable Models: All with Automatic Fixture Removal Option (S9x007A/B, 007)

(Write-only) This command refreshes preview data. It is required that this command be sent before a query gate, fixture length, and impedance data.

Parameters
None

Examples
AFR:STANDARD:EDIT:GATE AFIX, 0.485
AFR:FIXTURE:PREVIEW
AFR:STANDARD:EDIT:GATE? AFIX

Query Syntax
Not Applicable

Default
Not Applicable

AFR:FIXTURE:PREVIEW:DATA[:IMPedance]? <char_param>

Applicable Models: All with Automatic Fixture Removal Option (S9x007A/B, 007)

(Read-only) This command reads the impedance profile of the calculated fixture model.

Parameters

<char_param> Selected impedance term. Choose from:

ASENded - Single-EndedZA
BSENded - Single-Ended ZB
ADIFf - Differential ZA
BDIFf - Differential ZB
ACOMm - Common mode ZA
BCOMm - Common mode ZB

Examples
AFR:FIXTURE:PREVIEW:DATA:IMPedance? ADIF

Return Type
Block Data

Default
Not Applicable

AFR:FIXTURE:PREVIEW:DATA[:IMPedance]:MARKer:Y? <char_param>,<num_x>
**Applicable Models:** All with Automatic Fixture Removal Option (S9x007A/B, 007)

*(Read-only)* This command reads the impedance profile of the calculated fixture model at a specified position.

**Parameters**

<char_param> Selected impedance term. Choose from:

- **ASENded** - Single-Ended ZA
- **BSENded** - Single-Ended ZB
- **ADIFF** - Differential ZA
- **BDIFF** - Differential ZB
- **ACOMm** - Common mode ZA
- **BCOMm** - Common mode ZB

<num_x> The X-axis position (ns), where the Y-axis value will be returned.

**Examples**

```
AFR:FIXTure:PREView:DATA:IMPedance:MARKer:Y? ADIF,0.5
```

**Return Type** Numeric

**Default** Not Applicable

---

**AFR:FIXTure:REFZ <char>[,<num>]**

**Applicable Models:** All with Automatic Fixture Removal Option (S9x007A/B, 007)

*(Read-Write)* This command chooses the calibration reference Z0 after fixture removal.

**Parameters**

<char> Choose from:

- **SYSZ** - System Z0.
- **MEAZ** - Measured fixture Z0.
- **CUSTom** - User input.

<num> Optional argument. If <char> is set to CUST, this is the user input value for Z0.

**Examples**

```
AFR:FIXTure:REFZ SYSZ
AFR:FIXTure:REFZ CUST,52.0
```
AFR:FIXTure:SET:SYSZ[:STATe] <bool>

Applicable Models: All with Automatic Fixture Removal Option (S9x007A/B, 007)

(Read-Write) This command sets "System Z0" to Calibration Reference Z0.

Parameters

<bool> Choose from:

ON (or 1) - Sets "System Z0" to Calibration Reference Z0.

OFF (or 0) - Do not set "System Z0" to Calibration Reference Z0.

Examples

<table>
<thead>
<tr>
<th>Query Syntax</th>
<th>Return Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>AFR:FIXTure:SET:SYSZ ON</td>
<td>Boolean</td>
</tr>
</tbody>
</table>

AFR:FIXTure:USE:THRUs[:STATe] <bool>

Applicable Models: All with Automatic Fixture Removal Option (S9x007A/B, 007)

(Read-Write) This command specifies whether thrus are used in case of multi-port fixtures.

Parameters

<bool> Choose from:

ON (or 1) - Use thrus.

OFF (or 0) - Do not use thrus.

Examples

<table>
<thead>
<tr>
<th>Query Syntax</th>
<th>Return Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>AFR:FIXTure:USE:THRUs ON</td>
<td>Boolean</td>
</tr>
</tbody>
</table>
AFR:INITialize

**Applicable Models:** All with Automatic Fixture Removal Option (S9x007A/B, 007)

*(Write-only)* Restores the default AFR settings.

**Parameters** None

**Examples** `AFR:INIT`

**Query Syntax** Not Applicable

**Default** Not Applicable

---

AFR:SAVE:FILename <string>[,<string>]

**Applicable Models:** All with Automatic Fixture Removal Option (S9x007A/B, 007)

*(Read-Write)* This command specifies the file paths of saved fixture data.

**Parameters**

- `<string>` Fixture A path.
- `<string>` Fixture B path.

**Examples** `AFR:SAVE:FILename 'C:\fixA.s2p','C:\fixB.s2p'`

**Query Syntax** AFR:SAVE:FILename?

**Return Type** String

**Default** "C:\fixA.s2p,C:\fixB.s2p"

---

AFR:SAVE:IMPedance:NORMalize[:STATe]
**Applicable Models:** All with Automatic Fixture Removal Option (S9x007A/B, 007)

*(Write-only)* This command specifies whether the port impedances are normalized in saving the AFR fixture files.

**Parameters**

<bool> Choose from:

**ON (or 1)** - Normalize the port impedances when they are not equal.

**OFF (or 0)** - Do not normalize the port impedances.

**Examples**

AFR:SAVE:IMPedance:NORMalize 1

**Return Type** Not Applicable

**Default** OFF

---

**AFR:SAVE:PORTs <char>**

**Applicable Models:** All with Automatic Fixture Removal Option (S9x007A/B, 007)

*(Read-Write)* This command assigns the ports for saved fixture data in several formats.

**Parameters**

<char> Port assignment. Choose from:

**PLTS** - PLTS format.

**VNA** - VNA format.

**ADS** - ADS format.

**Examples**

AFR:SAVE:PORTs VNA

**Query Syntax**

AFR:SAVE:PORTs?

**Return Type** String

**Default** VNA

---

**AFR:SAVE:TYPE <char>**
Applicable Models: All with Automatic Fixture Removal Option (S9x007A/B, 007)

(Read-Write) This command sets the file type to save fixture data.

Parameters

<char> Impedance method. Choose from:

TSOnE - Touchstone file type.
TSTwo - Touchstone 2 file type.
CITifile - Citifile file type.

Examples

AFR:SAVE:TYPE \texttt{TSOnE}

Query Syntax

AFR:SAVE:TYPE?

Return Type

String

Default

TSOnE

AFR:STANdard:ALLOpen[:STATe] \texttt{<bool>}

Applicable Models: All with Automatic Fixture Removal Option (S9x007A/B, 007)

(Read-Write) This command selects all OPEN standards.

Parameters

<bool> Select all OPEN standards or not. Choose from:

\textbf{ON (or 1)} - Use all OPEN standards.

\textbf{OFF (or 0)} - Do not use all OPEN standards.

Examples

AFR:STANdard:ALLOpen \texttt{ON}

Query Syntax

AFR:STANdard:ALLOpen?

Return Type

Boolean

Default

OFF

AFR:STANdard:ALLShort[:STATe] \texttt{<bool>}

3331
**Applicable Models:** All with Automatic Fixture Removal Option (S9x007A/B, 007)

(Read-Write) This command selects all SHORT standards.

**Parameters**

<bool> Select all SHORT standards or not. Choose from:

**ON (or 1)** - Use all SHORT standards.

**OFF (or 0)** - Do not use all SHORT standards.

**Examples**

```
AFR:STANdard:ALLShort ON
```

**Query Syntax**

AFR:STANdard:ALLShort?

**Return Type**

Boolean

**Default**

OFF

---

**AFR:STANdard:DATA[:IMPedance]? <char_std>,<char_param>**

**Applicable Models:** All with Automatic Fixture Removal Option (S9x007A/B, 007)

(Read-only) This command reads the impedance profile of the measured standard.

**Parameters**

<char_std> Selected standard. Choose from:

**THRU** - 2X Thru

**STHRu** - Second 2X Thru

**FDUT** - Fixtured DUT

**AOPen** - Fixture A Open

**BOPen** - Fixture B Open

**ASHort** - Fixture A Short

**BSHort** - Fixture B Short

<char_param> Selected impedance term. Choose from:

**ASENded** - Single-Ended ZA

**BSENded** - Single-Ended ZB

**ADIFf** - Differential ZA
**Examples**

AFR:STANdard:DATA:IMPedance? AOP,ADIF

**Return Type**

Block Data

**Default**

Not Applicable

A FR:STANdard:DATA[:IMPedance]:MARKer:Y? <char_std>,<char_param>,<num_x>

**Applicable Models:** All with Automatic Fixture Removal Option (S9x007A/B, 007)

*(Read-only)* This command reads the impedance of the measured standard at a specified position.

**Parameters**

- **<char_std>** Selected standard. Choose from:
  - THRU - 2X Thru
  - STHRu - Second 2X Thru
  - FDUT - Fixture DUT
  - AOPen - Fixture A Open
  - BOPen - Fixture B Open
  - ASHort - Fixture A Short
  - BSHort - Fixture B Short

- **<char_param>** Selected impedance term. Choose from:
  - ASENded - Single-Ended ZA
  - BSENDed - Single-Ended ZB
  - ADIFf - Differential ZA
  - BDIFf - Differential ZB
  - ACOMm - Common mode ZA
  - BCOMm - Common mode ZB
The X-axis position (ns), where the Y-axis value will be returned.

**Examples**

```
AFR:STANdard:DATA:IMPedance:MARKer:Y? AOP,ADIF, 0.5
```

**Return Type** Numeric

**Default** Not Applicable

---

**AFR:STANdard:EDIT:FLENgth <char>,<num>**

**Applicable Models:** All with Automatic Fixture Removal Option (S9x007A/B, 007)

*(Read-Write)* For the selected fixture, this command reads the fixture length for both 1X or 2X AFR, or sets the fixture length for 1X AFR.

**Note:** After setting fixture length to a new value, the preview command must be sent to apply the value.

**Parameters**

- `<char>` Selected fixture. Choose from:
  - `AFIXture` - Fixture A.
  - `BFIXture` - Fixture B.
- `<num>` Fixture length value. Unit is ns.

**Examples**

```
AFR:STANdard:EDIT:FLENgth AFIx,0.3273
AFR:FIXTure:PREView
```

**Query Syntax**

```
AFR:STANdard:EDIT:FLENgth? AFIx
```

**Return Type** Numeric

**Default** Not Applicable

---

**AFR:STANdard:EDIT:GATE <char>,<num>**
Applicable Models: All with Automatic Fixture Removal Option (S9x007A/B, 007)

(Read-Write) This command sets or reads the gate position for the selected fixture.

**Note:** After setting a new gate position, the preview command must be sent to apply the new position.

**Parameters**

- `<char>` Selected fixture. Choose from:
  - **AFIXture** - Fixture A.
  - **BFIXture** - Fixture B.

- `<num>` Gate position value. Unit is ns.

**Examples**

```
AFR:STANDARD:EDIT:GATE AFIX,0.485
AFR:FIXTURE:PREVIEW
```

**Query Syntax**

```
AFR:STANDARD:EDIT:GATE? AFIX
```

**Return Type** Numeric

**Default** Not Applicable

---

**AFR:STANDARD:EDIT:IMPedance <char>,<num>**

Applicable Models: All with Automatic Fixture Removal Option (S9x007A/B, 007)

(Write-only) This command sets the impedance for the selected term.

**Parameters**

- `<char>` Impedance term. Choose from:
  - **ASENded** - Single-Ended ZA.
  - **BSENded** - Single-Ended ZB.
  - **ADIFF** - Differential ZA.
  - **BDIFF** - Differential ZB.
  - **ACOMm** - Common mode ZA.
  - **BCOMm** - Common mode ZB.

- `<num>` Impedance value. Unit is Ohms.

**Examples**

```
AFR:STANDARD:EDIT:IMPedance ASEN,52.5
```

---

3335
AFR:STANdard:EDIT:IMPedance:METHod <char>

Applicable Models: All with Automatic Fixture Removal Option (S9x007A/B, 007)

(Read-Write) This command sets the impedance method.

Parameters

<char> Impedance method. Choose from:

DEFault
AUTO
USER

Examples AFR:STANdard:EDIT:IMPedance:METHod AUTO

Query Syntax AFR:STANdard:EDIT:IMPedance:METHod?

Return Type Character

Default DEFault

AFR:STANdard:LOAD <char>,<string>

Applicable Models: All with Automatic Fixture Removal Option (S9x007A/B, 007)

(Read-Write) This command loads the calibration standards data from a file.

Parameters

<char> Standards type. Choose from:

THRU- 2X Thru.
STHRu - Second 2X Thru.
FDUT - Fixtured DUT.
AOPen - Fixture A Open.
BOPen - Fixture B Open.
ASHort - Fixture A Short.
BSHort - Fixture B Short.
<string> File path of existing measurement data (touchstone 1.0, touchstone 2.0, or citifile).

Examples

AFR:STANdard:LOAD AOPen,'C:\open.s1p'

Query Syntax

AFR:STANdard:LOAD? AOPen

Return Type

String

Default

Not Applicable

AFR:STANdard:MEASure <char>[,<p1>][,<p2>][,<p3>][,<p4>]

Applicable Models: All with Automatic Fixture Removal Option (S9x007A/B, 007)

(Write-only) This command measures the calibration standards.

Parameters

<char> Standards type. Choose from:

THRU - 2X Thru.
STHRu - Second 2X Thru.
FDUT - Fixture DUT.
AOPen - Fixture A Open.
BOPen - Fixture B Open.
ASHort - Fixture A Short.
BSHort - Fixture B Short.

<p1> - Mapped PNA Port 1. Optional parameter.
<p2> - Mapped PNA Port 2. Optional parameter.
<p3> - Mapped PNA Port 3. Optional parameter.
<p4> - Mapped PNA Port 4. Optional parameter.

Examples

AFR:STANdard:MEASure AOPen

Default

Not Applicable

AFR:STANdard:THRU <char>[,<num>]
Applicable Models: All with Automatic Fixture Removal Option (S9x007A/B, 007)

(Read-Write) This command specifies fixture thru settings.

Parameters

<char> Thru type. Choose from:

**KNOWn** - Known thru, flush thru, or user input length.

**UNKNown** - Unknown thru length computed using reflects.

<num> User input thru length. Default is 0.

Examples

```
AFR:STANdard:THRU KNOW,0
```

Query Syntax  AFR:STANdard:THRU?

Return Type  String

Default  "KNOW,0"

AFR:STANdard:USE <char>[,<bool>]

Applicable Models: All with Automatic Fixture Removal Option (S9x007A/B, 007)

(Read-Write) This command chooses the calibration standards.

Parameters

<char> Choose from:

**THRU** - 2X Thru.

**STHRu** - Second 2X Thru.

**FDUT** - Fixtured DUT.

**AOPEN** - Fixture A Open.

**BOPEN** - Fixture B Open.

**ASHort** - Fixture A Short.

**BSHort** - Fixture B Short.
Use calibration standards or not. Choose from:

**ON (or 1)** - Use calibration standards.

**OFF (or 0)** - Do not use calibration standards.

**Examples**

```
AFR:STANdard:USE AOPen,ON
```

**Query Syntax**

AFR:STANdard:USE?

**Return Type**

String of used standards, separated by commas.

For example, use AOPen and BOPen returns:

"AOPen,BOPen"

**Default**

All standards - OFF
Calculate:Correction Commands

Controls error correction functions.

These commands are **Superseded** by the `CALCulate:MEASure:CORRection` commands.

```
CALCulate:CORRection

  EDELay
    | DISTance
    | TIME
    | MEDium
    | UNIT
    | WGCutoff

  ERRor
    | [:STATe]
    | TYPE

  [STATe]
    | INDicator?

  TYPE

  OFFSet
    | [MAGNitude]
    | PHASE
```

Click on a keyword to view the command details.

**Blue** keywords are superseded.

Critical Note: CALCulate commands act on the selected measurement. You can select one measurement for each channel using Calc:Par:MNUM or Calc:Par:Select. Learn more.

CALCulate<cnum>:CORRection:EDELay:DISTance <num>

Applicable Models: N522xB, N523xB, N524xB, M937xA, P937xA

(Read-Write) Sets the electrical delay in physical length (distance) for the selected measurement.

See Critical Note

Parameters

- <cnum> Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, <cnum> is set to 1.
- <num> Electrical delay in distance.

First Specify units using CALC:CORR:EDEL:UNIT

Use SENS:CORR:RVEL:COAX <num> to set Velocity factor.

This parameter supports MIN and MAX as arguments. Learn more.

Examples

- CALC1:CORR:EDEL:DIST 5
- calculate2:correction:distance .003

Query Syntax

CALCulate:CORRection:EDELay:DISTance?

Return Type

Numeric

Default

0

CALCulate<cnum>:CORRection:EDELay:MEDium <char>
Applicable Models: N522xB, N523xB, N524xB, M937xA, P937xA

(Read-Write) Sets the media used when calculating the electrical delay.

Parameters

- `<cnum>` Any existing channel number. If unspecified, value is set to 1.
- `<num>` Choose from: COAX for coaxial medium, WAVEguide for waveguide medium.

Examples

- `CALC:CORR:EDEL:MED COAX`
- `calc3:corr:edelay:medium waveguide`

Query Syntax

CALCulate<cnum>:CORRection:EDELay:MEDium?

Return Type

Character

Default

COAX

CALCulate<cnum>:CORRection:EDELay:UNIT <char>

Applicable Models: N522xB, N523xB, N524xB, M937xA, P937xA

(Read-Write) Sets and returns the units for specifying electrical delay in physical length (distance).

Parameters

- `<cnum>` Any existing channel number. If unspecified, value is set to 1.
- `<char>` Units for delay in distance. Choose from:
  
  - METer
  - FEET
  - INCH

Examples

- `CALC:CORR:EDEL:UNIT MET`
- `calc3:corr:edelay:unit inch`

Query Syntax

CALCulate<cnum>:CORRection:EDELay:UNIT?

Return Type

Character

Default

METer

CALCulate<cnum>:CORRection:EDELay[:TIME] <num>
**Applicable Models:** N522xB, N523xB, N524xB, M937xA, P937xA

*(Read-Write)* Sets the electrical delay for the selected measurement.

See Critical Note

**Parameters**

- **<cnum>** Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, `<cnum>` is set to 1.
- **<num>** Electrical delay in seconds. Choose any number between **-10.00** and **10.00**
  
  Use `SENS:CORR:RVEL:COAX <num>` to set Velocity factor.

This parameter supports MIN and MAX as arguments. Learn more.

**Examples**

```
CALC1:CORR:EDEL:TIME 1NS
```

```
calculate2:correction:time 0.5e-12
```

**Query Syntax**

```
CALCulate:CORRection:EDELay[:TIME]?
```

**Return Type**

Numeric

**Default**

0 seconds

**CALCulate<cnum>:CORRection:EDELay:WGCutoff <num>**

**Applicable Models:** N522xB, N523xB, N524xB, M937xA, P937xA

*(Read-Write)* Sets the waveguide cutoff frequency used when the electrical delay media is set to WAVEguide. (See `CALCulate:CORRection:EDELay:MEDium <char>`.)

**Parameters**

- **<cnum>** Any existing channel number. If unspecified, value is set to 1.
- **<num>** Waveguide cutoff frequency used with the electrical delay calculation.

This parameter supports MIN and MAX as arguments. Learn more.

**Examples**

```
CALC:CORR:EDEL:WGC 18.067 GHz
```

```
calculate3:correction:edelay:wgcutoff 14.047 ghz
```

**Query Syntax**

```
CALCulate<cnum>:CORRection:EDELay:WGCutoff?
```

**Return Type**

Numeric

**Default**

45 MHz
CALCulate<cnum>:CORRection:ERRor[:STATe] <bool>

**Applicable Models:** N522xB, N523xB, N524xB, M937xA, P937xA

*(Read-Write)* Turns error correction ON or OFF on the specified channel.

To turn error correction ON or OFF for a channel, use `SENS:CORR:STATe`.

See Critical Note

**Parameters**

- `<cnum>` Any existing channel number. If unspecified, value is set to 1
- `<bool>` Correction state. Choose from:
  - 0 - Correction OFF
  - 1 - Correction ON

**Examples**

- `CALC:CORR:ERR ON`
- `calculate:correction:error:state off`

**Query Syntax**

CALCulate<cnum>:CORRection:ERRor:STATe?

**Return Type**

Boolean

**Default** Not Applicable

---

CALCulate<cnum>:CORRection:ERRor:TYPE <string>

**Applicable Models:** N522xB, N523xB, N524xB, M937xA, P937xA

*(Read-Write)* Sets the Cal Type on the specified channel. This is used when a Cal Set is applied. Learn more about applying Cal Types.

- Use `SENS:CORR:TYPE:CAT?` to list the Cal Types in the VNA.
- Use `SENS:CORR:CSET:TYPE:CAT?` to list the Cal Types contained in the active Cal Set for the channel.
- Use `SENS:CORR:COLL:METH` to set the Cal type to perform a new Unguided calibration,

See Critical Note

**Parameters**

- `<cnum>` Any existing channel number. If unspecified, value is set to 1
- `<string>` *(String)* Cal type. Case sensitive. Use one of the following:

  **For Full Calibrations (NO Power Cal included):**
This command does not distinguish between TRL and SOLT. The same number of error terms is applied for both Cal Types.

"Full <n> Port(x,y,z...)"

where

<n> = the number of ports to calibrate
x,y,z = the port numbers to calibrate

For example:

"Full 4 Port(1,2,3,4)"

**For Full Calibrations (including Power Cal):**

After the Full <n> port, include the string, "with power"

For example:

"Full 4 Port with power(1,2,3,4)"

**For Response Calibrations:**

"Response(param)" OR

"ResponseAndIsolation(param)"

Where param =

- S-parameter. For example"
  - "Response(S21)"
  - "ResponseAndIsolation(A/R)"

- Single or ratioed receivers using either logical receiver notation or physical receiver notation. For example:
  - "Response(A)"
  - "ResponseAndIsolation(a3/b4)"

**For Enhanced Response Calibrations:**

"EnhancedResp(sourcePort, recPort)"

Where:
- sourcePort = stimulus port number
- recPort = receiver port number

For FCA Calibrations:

Learn more about this setting.

- "SMC_2P" (Response + Input + Output) All four sweeps required. Most accurate.
- "SMCRsp+IN" No Output match. All four sweeps required.
- "SMCRsp+OUT" No Input match. All four sweeps required.
- "SMCRsp" No Input or Output match. Saves two sweeps.

For VMC, multiple Cal types are not available.

For Gain Compression Cal

where r = receive port; s = source port

- "GCA 2P (r,s)" - full 2-port cal
- "GCA Enh Resp (r,s)" - Enhanced Response Cal

For Noise Figure Cal

- VNC_2P - full 2-port Vector Noise Figure correction (requires vector noise figure calset).
- SNC_2P - full 2-port Scalar Noise Figure correction (requires either scalar or vector noise figure calset).

### Examples

CALC:CORR:ERR:TYPE "Scalar Mixer Cal"

### Query Syntax

CALCulate<cnun>:CORRection:ERRor:TYPE?

### Return Type

String

**Default** Not Applicable

CALCulate<cnun>:CORRection[:STATe] <bool>
**Applicable Models:** N522xB, N523xB, N524xB, M937xA, P937xA

*(Read-Write)* Turns error correction ON or OFF for the selected measurement on the specified channel.

To turn error correction ON or OFF for a channel, use `SENS:CORR:STATe`.

**See Critical Note**

**Parameters**

- `<cnum>` Any existing channel number. If unspecified, value is set to 1
- `<bool>` Correction state. Choose from:
  - 0 - Correction OFF
  - 1 - Correction ON

**Examples**

```
CALC:CORR ON
```

```calculate:correction:state off```

**Query Syntax**

CALCulate<cnum>:CORRection:STATe?

**Return Type**

Boolean

**Default**

Not Applicable

---

**CALCulate<cnum>:CORRection[:STATE]:INDicator?**

**Applicable Models:** N522xB, N523xB, N524xB, M937xA, P937xA

*(Read-only)* Returns the error correction state for the selected measurement on the specified channel.

To turn error correction ON or OFF for a channel, use `SENS:CORR:STATe`.

**See Critical Note**

**Parameters**

- `<cnum>` Any existing channel number. If unspecified, value is set to 1

**Examples**

```
CALC:CORR:IND?
```

```calculate:correction:state:indicator?
```

**Return Type**

Character

- **NONE** - No error correction
- **MAST** (Master) - Original error correction terms
INT - Error terms are interpolated. Learn more.

DELT - Delta Match calibration terms. Learn more.

INV - Error terms are not valid

**Default** - NONE

**CALCulate<cnum>:CORRection:TYPE <string>**

**Applicable Models:** N522xB, N523xB, N524xB, M937xA, P937xA

(Read-Write) Sets the Cal Type for the selected measurement on the specified channel. This is used when a Cal Set is applied. Learn more about applying Cal Types.

- Use SENS:CORR:TYPE:CAT? to list the Cal Types in the VNA.
- Use SENS:CORR:CSET:TYPE:CAT? to list the Cal Types contained in the active Cal Set for the channel.
- Use SENS:CORR:COLL:METH to set the Cal type to perform a new Unguided calibration,

**See Critical Note**

**Parameters**

- `<cnum>`  Any existing channel number. If unspecified, value is set to 1
- `<string>`  *String* Cal type. Case sensitive. Use one of the following:

**For Full Calibrations (NO Power Cal included):**

This command does not distinguish between TRL and SOLT. The same number of error terms is applied for both Cal Types.

"Full <n> Port(x,y,z..."

where

<n> = the number of ports to calibrate

x,y,z = the port numbers to calibrate

For example:

"Full 4 Port(1,2,3,4)"

**For Full Calibrations (including Power Cal):**

After the Full <n> port, include the string, "with power"
For example:

"Full 4 Port with power(1,2,3,4)"

For Response Calibrations:

"Response(param)" OR

"ResponseAndIsolation(param)"

Where param =

- S-parameter. For example"
  - "Response(S21)"
  - "ResponseAndIsolation(A/R)"
- Single or ratioed receivers using either logical receiver notation or physical receiver notation. For example:
  - "Response(A)"
  - "ResponseAndIsolation(a3/b4)"

For Enhanced Response Calibrations:

"EnhancedResp(recPort, sourcePort)"

Where:

- recPort = receiver port number
- sourcePort = stimulus port number

For FCA Calibrations:

Learn more about this setting.

- "SMC_2P" (Response + Input + Output) All four sweeps required. Most accurate.

Note: The “SMC_2P” is the only correction type that automatically forces the reverse measurements (SC12, RevOPwr, RevIPwr). If you require any of the reverse measurements while using a lesser correction type, either include those parameters in your channel or use the SENSE:MIXer:REVerse command. Keep in mind that adding the reverse measurements or forcing the reverse sweep
using the SENSE:MIXer:REVerse command will increase the number of sweeps required in the channel.

- "SMCRsp+IN" No Output match. Saves two sweeps.
- "SMCRsp+OUT" No Output match. Saves one sweep.
- "SMCRsp" No Input or Output match. Saves two sweeps.

For VMC, multiple Cal types are not available.

For Gain Compression Cal

where $r = \text{receive port}; s = \text{source port}$

- "GCA 2P (r,s)" - full 2-port cal
- "GCA Enh Resp (r,s)" - Enhanced Response Cal

Examples

```
CALCULATE:CORR:TYPE "Scalar Mixer Cal"
```

Query Syntax

CALCulate<cnum>:CORRection:TYPE?

Return Type

String

Default

Not Applicable

CALCulate<cnum>:CORRection:OFFSet[:MAGNitude] <num> Superseded

Applicable Models: N522xB, N523xB, N524xB, M937xA, P937xA

Note: This command is replaced with SENS:CORR:RPOWer:OFFSet[:AMPLitude].

To set data trace magnitude offset, use CALC:OFFS:MAGN

This command does NOT function for FCA measurements.

See an example of a Receiver Power Calibration.

(Read-Write)

For Receiver Power Calibration, specifies the power level to which the selected (unratioed) measurement data is to be adjusted. This command applies only when the selected measurement is of unratioed power.

Parameters

- `<cnum>` Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, `<cnum>` is set to 1.
<num> Cal power level in dBm. No limits are enforced on this value, but the VNA receivers themselves have maximum and minimum power specifications (that may differ between VNA models) which this value must comply with for a valid receiver power cal.

Examples

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CALC:CORR:OFFS 10DBM</td>
<td>Calculate correction offset magnitude maximum</td>
</tr>
</tbody>
</table>

Query Syntax

CALCulate<cnum>:CORRection:OFFSet[:MAGNitude]?

Return Type

Numeric

Default

0dBm

CALCulate<cnum>:CORRection:OFFSet:PHASe <num>[<char>] Superseded

Applicable Models: N522xB, N523xB, N524xB, M937xA, P937xA

Note: This command is replaced with CALC:OFFS:PHASE

(Read-Write) Sets the phase offset for the selected measurement.

Parameters

<cnum> Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, <cnum> is set to 1.

<num> Offset phase value. Choose any number between:

-360 and 360

<char> Units for phase. OPTIONAL. Choose either:

DEG - Degrees (default)
RAD - Radians

Examples

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CALC:CORR:OFFS:PHAS 10</td>
<td>Calculate correction offset phase 20rad</td>
</tr>
</tbody>
</table>

Query Syntax

CALCulate:CORRection:OFFSet:PHASE?

Return Type

Numeric, returned value always in degrees

Default

0 degrees
Calculate:Custom Commands

Creates and modifies application measurements.

These commands are **Superseded** by the CALCulate:MEASure:DEFine and CALCulate:MEASure:PARameter commands.

**Note:** For setting up a TDR measurement class, use SYSTem:TDR:INITialize.

### CALCulate:CUSTom:

- DEFine
- MODify

**See Also**

- Example Programs
- Synchronizing the Analyzer and Controller
- SCPI Command Tree

### CALCulate<cnum>:CUSTom:DEFine <Mname>, <type> [,param]

**Applicable Models:** All

*(Write-only)* Creates a custom measurement depending on the configurations and options. The custom measurement is not automatically displayed. You must also do the following:

- Use DISP:WIND:STATe to create a window if it doesn't already exist.
- Use DISP:WIND:TRAC:FEED to display the measurement
- Select the measurement (CALC:PAR:SEL) before making additional settings.

**Parameters**

- `<cnum>` Any existing channel number. If unspecified, value is set to 1.
- `<Mname>` Name of the measurement. Any non-empty, unique string, enclosed in quotes.
- `<type>` *(string)* - Choose from the following (click or scroll down to view valid `<params>` for each type)
- "Standard"
- "Active Hot Parameters"
- "Vector Mixer/Converter"
- "Scalar Mixer/Converter"
- "Gain Compression"
- "Gain Compression Converters"
- Modulation Distortion
- "Noise Figure Cold Source"
- "Noise Figure Converters"
- "Swept IMD"
- "IM Spectrum"
- "Swept IMD Converters"
- Modulation Distortion
- Phase Noise
- "IM Spectrum Converters"
- "Differential I/Q"
- "Spectrum Analyzer"

Measurement names to create:

### Vector Mixer/Converter

**For output port Y (input port must be 1):**

- "S11"
- "VCY1"
- "SYY"

**Learn about VMC parameters**

**Note:** Input and output ports are set up using the Mixer Setup dialog. If the ports are not set up using the Mixer Setup dialog, then ports 1 and 2 are the default input and output ports and the only ports that can be used.

### Scalar Mixer

**For input port X and output port Y:**

- "SCXY"
- "SCYX"
- "SXX"

**Learn about SMC parameters**

**Note:** Input and output ports are set up using the Mixer Setup dialog. If the ports are not set up using the Mixer Setup dialog, then ports 1 and 2 are the default input and output ports and the only ports that can be used.
### Gain Compression

- "Gain Compression" Learn more
- "Gain Compression Converters" Learn more

### GCA and GCX:

<table>

There are over 150 possible Swept IMD parameters, too many to list here.

Build the parameters with the Swept IMD Parameter dialog, then copy the parameter name to the remote command.

The following are a few example parameters:
| **"Swept IMD"** | **"PwrMainLo"** | Absolute power of the Low tone at the DUT output. |
| "Swept IMD Converters" | **"IM3"** | Power of the third product relative to the average power of the f1 and f2 tones measured at the DUT output. |
| Learn more | **"OIP3"** | Theoretical power level at which the third product will be the same power level as the average of the main tones at the output of the DUT. |
| **"IM Spectrum"** | **"Output"** | View signals OUT of the DUT and into VNA port 2 (B receiver). |
| Learn more | **"Input"** | View signals IN to the DUT (R1 receiver). |
| **"Reflection"** | **"Output"** | View signals reflected off the DUT input and back into VNA port 1 (A receiver). |
| **"IMx Spectrum Converters"** | **"Output"** | View signals OUT of the DUT and into VNA port 2 (B receiver). |
| Learn more | | |
| **"Differential I/Q"** | Create custom parameters using Sens:DIQ:Par:Def, then specify your custom parameter name here. |
| Learn more | The following are default parameters: |
| **"Input Power over F1 range"** | **"IPwrF1"** | Input Power over F1 range |
| **"Output Power over F1 range"** | **"OPwrF1"** | Output Power over F1 range |
| **"Gain over F1 range"** | **"GainF1"** | Gain over F1 range |

Not applicable

CALCulate<cnum>:CUSTom:MODify <param>

Applicable Models: All

(Write-only) Changes the selected custom measurement to a different parameter. This is dependent upon the configurations and options.

See an example using this command for a VMC and SMC measurement

Parameters

<cnum> Channel of the custom measurement to be changed. First, select the measurement using CALC:PAR:SEL.

@param Parameter to change the custom measurement to. Select a parameter that is valid for the type of measurement. Choose from the same arguments as Calc:Cust:Def.

Examples

SYST:PRES

CALC2:CUST:DEF 'My VC21', 'Vector Mixer/Converter'

Click on a red keyword to view the command details.

Red is a superseded command.

**See Also**

- Example Programs
- Data Access Map
- Synchronizing the Analyzer and Controller
- To read receiver data, use `CALC:RDATA?`
- To read error terms, use `SENS:CORR:CSET:DATA`
- To read SnP measurement data, use `CALC:DATA:SNP?`
- SCPI Command Tree

**Critical Note:** CALCulate commands act on the selected measurement. You can select one measurement for each channel using `Calc:Par:MNUM` or `Calc:Par:Select`. Learn more.

(Write) `CALCulate<cnum>:DATA <char>,<data>`

(Read) `CALCulate<cnum>:DATA? <char>`
Applicable Models: N522xB, N523xB, N524xB, M937xA, P937xA

Reads or writes Measurement data, Memory data, or Normalization Divisor data from the Data Access Map location.

- For Measurement data, use FDATA, RDATA, or SDATA
- For Memory data, use FMEM or SMEM. When querying memory, you must first store a trace into memory using CALC:MATH:MEMorize.
- For Normalization Divisor (Receiver Power Cal error term) data, use SDIV
- Use FORMat:DATA to change the data type (<REAL,32>, <REAL,64> or <ASCii,0>).
- Use FORMat:BORDer to change the byte order. Use “NORMal” when transferring a binary block from LabView or Vee. For other programming languages, you may need to “SWAP” the byte order.

Equation Editor Notes:

- When equation editor is active on a trace in a standard S-parameter channel, Calc:Data returns the data from the parameter on the trace that was measured last. For example, for the equation "S22 + S33 + S11", then S33 is the last measured parameter because it uses source port 3.
- In applications, if equation editor is active and the original parameter for the trace is not requested anywhere in the channel, then zeros are returned. If the original parameter is being measured within the channel, then data for the original parameter is returned.
- In general, if an equation contains no measurement parameters, then data for the original parameter is returned.

Note: The Calc:Data SCORR command to read / write error terms is Superseded with SENS:CORR:CSET:DATA. SCORR commands do NOT accommodate greater than 12 error terms.

See Critical Note

Parameters

- `<cnum>` Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, `<cnum>` is set to 1.
- `<char>` FDATA Formatted measurement data to or from Data Access Map location Display (access point 2).

Note: When querying FDATA, data is received in degrees. When setting phase using FDATA, the command expects the data in radians.

- Corrected data is returned when correction is ON.
- Uncorrected data is returned when correction is OFF.
- Returns TWO numbers per data point for Polar and Smith Chart format.
- Returns one number per data point for all other formats.
- Format of the read data is same as the displayed format.

**RDATA**  Complex measurement data.

**Writes** data to Data Access Map location **Raw Measurement** (access point 0), same as SDATA.

**Note:** Write access is forbidden on the standard channel if factory calibration is on (applies to ENA/PXI/Streamline, not to PNA); to disable factory calibration use `SYST:FCOR:CHAN:COUP:STAT OFF` command.

**Reads** data from Data Access Map location **Raw Measurement** (access point 0).

- Returns TWO numbers per data point.
- Returned numbers are uncorrected (regardless of correction state)

**SDATA**  Complex measurement data.

**Writes** data to Data Access Map location **Raw Measurement** (access point 0).

**Note:** Write access is forbidden on the standard channel if factory calibration is on (applies to ENA/PXI/Streamline, not to PNA); to disable factory calibration use `SYST:FCOR:CHAN:COUP:STAT OFF` command.

**Reads** data from **Apply Error Terms** (access point 1).

**Note:** Writing data to this access point, and then reading the data from this access point, will result in different values if correction or factory cal is ON.

- Returns TWO numbers per data point.
- Corrected data is returned when correction is ON.
- Uncorrected data is returned when correction is OFF.

**FMEM**  Formatted memory data to or from Data Access Map location **Memory result** (access point 4).

- Returns TWO numbers per data point for Polar and Smith Chart format.
- Returns one number per data point for all other formats.
- Format of the read data is same as the displayed format.
- Returned data reflects the correction level (On|OFF) when the data was stored into memory.

**SMEM**  Complex measurement data to or from Data Access Map location Memory (access point 3).

- Returns TWO numbers per data point.
- Returned data reflects the correction level (On|OFF) when the data was stored into memory.
- Returned data reflects the correction level (On|OFF) when the data was stored into memory.

**SDIV**  Complex data from Data Access Map location Normalization (5).

- Returns TWO numbers per data point.
- If normalization interpolation is ON and the number of points changes after the initial normalization, the divisor data will then be interpolated.
- When querying the normalization divisor, you must first store a divisor trace using CALC:NORMalize[:IMMediate].

The following Calc:Data SCORR command to read / write error terms is Superseded with SENS:CORR:CSET:DATA. These SCORR commands do NOT accommodate greater than 12 error terms.

EXAMPLE

CALC:DATA FDATA, Data(x)
calculate2: data sdata, data(r, i)

See another example using this command.

Return Type: Block data

Default - Not Applicable

CALCulate<cnum>:DATA:CUSTom <name>, <data> Superseded

Applicable Models: N522xB, N523xB, N524xB, M937xA, P937xA

Note: This command has been replaced by CALC:DATA: which can now be used with all VNA applications.

(Read-Write) Reads or writes data from a custom-named measurement buffer.

See Critical Note

Parameters

- <cnum> Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, <cnum> is set to 1.
- <name> Name of the buffer to be read or written
- <data> Data to be read or written to the custom buffer. Format as one number per data point.

Examples

CALC:DATA:CUST 'VectorResult0', 0, 1, 2, 3, 4, 5 'Write
CALC:DATA:CUST? 'VectorResult0' 'Read

Query Syntax

CALCulate:DATA:CUSTom? <name>

Return Type

Depends on Form: Data

Default Not Applicable

CALCulate<cnum>:DATA:CUSTom:CATalog? Superseded
Applicable Models: N522xB, N523xB, N524xB, M937xA, P937xA

Note: This command has been replaced by `CALC:DATA:CAT` which can now be used with all VNA applications.

(Read-only) Reads the list of buffer names (comma separated list of string values) available from the selected parameter. Specify the measurement using `CALCulate:PARameter:SELection`.

See Critical Note

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;cnum&gt;</td>
<td>Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, &lt;cnum&gt; is set to 1.</td>
</tr>
</tbody>
</table>

**Examples**

```
CALC:DATA:CUST:CAT?
calculate: data: custom: catalog?
```

**Return Type** String

**Default** Not Applicable

**CALCulate<cnum>:DATA:MFD? <measList>**

Applicable Models: N522xB, N523xB, N524xB, E5080A, M948xA, P937xA

(Read-only) Gets the formatted data array of multiple traces (traces-n, m, .... to l) of the selected channel.

This command gets multiple trace data with one command, while `CALC:MEAS:DATA:FDAT` returns only one trace with one command.

Note: If valid data is not calculated because of the invalid measurement, “1.#QNB” is read out.

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;cnum&gt;</td>
<td>Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, &lt;cnum&gt; is set to 1.</td>
</tr>
<tr>
<td>&lt;measList&gt;</td>
<td>Trace number. &quot;n, m, l, ...&quot; where n, m, l are 1 to the maximum trace number.</td>
</tr>
</tbody>
</table>

Note: Use comma for separator of trace number.

**Examples**

```
CALC:DATA:MFD? "1,2"
```

**Return Type** Data Block

**Default** Not Applicable
CALCulate<cnum>:DATA<data>:MSData? <measList>

**Applicable Models:** N522xB, N523xB, N524xB, E5080A, M948xA, P937xA

*(Read-only)* Gets the corrected data array of multiple traces (traces-n, m, ..., to l) of the selected channel.

This command is allows to get several corrected data with one command, while CALC:MEAS:DATA:SDAT returns only one corrected data with one command.

**Note:** If valid data is not calculated because of the invalid measurement, “1.#QNB” is read out.

**Parameters**

- `<cnum>`: Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, `<cnum>` is set to 1.
- `<measList>`: Trace number. "n, m, l,..." where n, m, l are 1 to the maximum trace number.

**Examples**

```
CALC:DATA:MSD? "1,2"
```

**Return Type**

- **Data Block**
- **Default**
  - Not Applicable

---

CALCulate<cnum>:DATA:SNP? <n> **Superseded**

**Applicable Models:** N522xB, N523xB, N524xB, M937xA, P937xA

**Note:** This command has been replaced by CALC:DATA:SNP:PORTs?

*(Read-only)* Reads SnP data from the selected measurement. Learn more about SnP data.

This command is valid ONLY with standard S-parameter measurements.

**Notes**

- This command returns SNP data without header information, and in columns, not in rows as .SnP files. This means that the data returned from this command sends all frequency data, then all Sx1 magnitude or real data, then all Sx1 phase or imaginary data, and so forth.

- To avoid frequency rounding errors, specify FORM:DATA <Real,64> or <ASCii, 0>

**See Critical Note**

**Parameters**
<cnum>  Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, <cnum> is set to 1.

<n>   Amount of data to return. If unspecified, <n> is set to 2. The number you specify must be less than or equal to the number of available ports on the VNA.

Choose from:

1 (S1P) returns 1-Port data for the active measurement if the active measurement is a reflection parameter such as S11 or S22. The behavior is UNDEFINED if the active measurement is a transmission parameter such as an S21.

2 (S2P) returns data for the four 2 port parameters associated with the current measurement. Default. Data that is not available is zero-filled.

3 (S3P) returns data for the nine 3 port parameters associated with the current measurement. Data that is not available is zero-filled.

4 (S4P) returns data for the sixteen 4 port parameters associated with the current measurement. Data that is not available is zero-filled.

SnP data can be output using several data formatting options. See MMEM:STOR<file>.<snp>

See also MMEM:STOR <file>.<snp>

Examples

CALC:PAR:DEF MyMeasurement, S11
CALC:PAR:SEL MyMeasurement
CALC:DATA:SNP? 1

Return Type

Default: Not Applicable

CALCulate<cnum>:DATA:SNP:PORTs? <"x,y,z">[, FAST]

Applicable Models: N522xB, N523xB, N524xB, M937xA, P937xA

Note: This command replaces CALC:DATA:SNP?. This command is more explicit regarding the data to be returned, and works for VNAs with multiport test sets.

(Read-only) Reads SNP data from the selected measurement for the specified ports. Learn more about SNP data.
This command is valid **ONLY** with standard S-parameter measurements.

**Notes**

- This command returns SNP data without header information, and in columns, not in rows as .SnP files. This means that the data returned from this command sends all frequency data, then all Sx1 magnitude or real data, then all Sx1 phase or imaginary data, and so forth.
- To avoid frequency rounding errors, specify FORM:DATA <Real,64> or <ASCii, 0>
- Data that is not available is zero-filled.
- For sweeps with a large number of data points, always follow this command with *OPC?. Learn more.

See Critical Note

**Parameters**

- `<cnum>` Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, `<cnum>` is set to 1.
- `<"x,y,z">` Comma or space delimited port numbers for which data is requested, enclosed in quotes.

SNP data can be output using several data formatting options. See MMEM:STOR:e:TRACe:FORMat:SNP.

[, FAST] Reduce the saving time

:SENS:CORR:CACH:MODE should be set at ON.

The correction must cover all the ports of the SNP port list.

The active measurement must be a corrected S Parameter defined by the port list for the SNP requests. EG: "S33" is not a proper selected measurement with CALC:DATA:SNP:PORTS? <1,2>

**Examples**

<table>
<thead>
<tr>
<th>Return Type</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>Depends on FORMat:DATA</td>
<td></td>
</tr>
</tbody>
</table>

**CALCulate<cnum>:DATA:SNP:PORTs:SAVE <"x,y,z">,<"filename">[, FAST]**

**Applicable Models:** N522xB, N523xB, N524xB, M937xA, P937xA

**Note:** This command replaces MMEM:STOR sNp for standard channels (only). This command is more explicit regarding the data to be saved, and works for VNAs with multiport test sets.
(Write-only) Saves SNP data from the selected measurement for the specified ports. Learn more about SNP data.

- The Normal vs Mixed Mode selection is NOT used as it is in the Choose Ports dialog. Instead, data is returned as it is displayed on the trace. If the selected measurement is Mixed Mode (balanced), then balanced data is returned. If the selected measurement is an S-parameter, then S-parameter data is returned.

- This command is valid ONLY with the Standard measurement class (NOT applications).

- Data that is not available is zero-filled.

- For sweeps with a large number of data points, always follow this command with *OPC? Learn more.

See Critical Note

**Parameters**

- `<cnum>` Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, `<cnum>` is set to 1.

- `<"x,y,z">` *String* Comma or space delimited port numbers for which data is requested, enclosed in quotes.

- `<filename>` *String* Path, filename, and suffix of location to store the SNP data, enclosed in quotes. The suffix is not checked for accuracy. If saving 2 ports, specify "filename.s2p"; If saving 4 ports, specify "filename.s4p.", and so forth.

SNP data can be output using several data formatting options. See MMEM:STORe:TRACe:FORMat:SNP.

[, FAST] Reduce the saving time

:SENS:CORR:CACH:MODE should be set at ON.

The correction must cover all the ports of the SNP port list.

The active measurement must be a corrected S Parameter defined by the port list for the SNP requests. EG: "S33" is not a proper selected measurement with CALC:DATA:SNP:PORTS? <1,2>

### Examples

CALC:DATA:SNP:PORTs:Save '1,2,4','D:\MyData.s3p';*OPC?

### Return Type

- **Default** Not Applicable

### CALCulate<cnum>:MEASURE<nunum>:RDATa? <char>
(Read-only) Returns receiver data for the selected measurement. To query measurement data, see CALC:DATA?

**Critical Note:** CALCulate commands act on the selected measurement. You can select one measurement for each channel using Calc:Par:MNUM or Calc:Par:Select. Learn more.

**Parameters**

- `<cnum>` Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, `<cnum>` is set to 1.
- `<mnum>` Measurement number for each measurement. There must be a selected measurement on the trace. If unspecified, `<mnum>` is set to 1.
- `<char>` Choose from any physical receiver in the VNA.

For example: "A"

Also, **REF** - returns data for either R1 or R2 data depending on the source port of the selected measurement.

See the **block diagram** showing the receivers in VNA.

**Note:** Logical receiver notation is NOT allowed with this command. Learn more.

**Example**

```
INITiate:CONTinuous OFF
INITiate:IMMediate;*wai
CALC:MEAS:RDATA? A
CALCulate:RDATA? REF
```

**Return Type**

- **Default** Not Applicable

**Notes:**

Generally when you query the analyzer for data, you expect that the number of data values returned will be consistent with the number of points in the sweep.

However, if you query receiver data while the instrument is sweeping, the returned values may contain zeros. For example, if your request for receiver data is handled on the 45th point of a 201 point sweep, the first 45 values will be valid data, and the remainder will contain complex zero.

This can be avoided by synchronizing this request with the end of a sweep or putting the channel in hold mode.

Learn about Unratioed Measurements
**CALCulate<cnum>:DTOPoIogy <device>,<topology>**

**Applicable Models:** Multi-port systems with > 4 ports

*(Read-Write)* Maps the physical VNA ports to a device of balanced and single-ended logical ports for multi-port systems with greater than 4 ports. The device type is selected using `CALCulate:FSIMulator:BAlun:DEViCe`.

**See Also:**

`CALC:FSIM:BAL:PAR:CAT?` - returns the list of measurement parameters available for the currently selected topology.

`CALC:FSIM:BAL:PAR:CUST:DEFine` and `CALC:MEAS:PAR` - defines measurement parameter corresponding to a custom topology for systems where the port count is expandable beyond 4 ports.

**Parameters**

- `<cnum>` Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, `<cnum>` is set to 1.
- `<device>` (String) Device type for the balanced measurement. ‘B’ means the Balanced port; ‘S’ means the Single-ended port. Choose from:
  - B – 1 port balanced device (2 ports)
  - BB – Balanced - Balanced device (4 ports)
  - BS – Balanced - Single-ended device (3 ports)
  - BSS – Balanced - Single-ended - Single-ended device (3 ports)
  - SB – Single-ended - Balanced device (3 ports)
  - SSB – Single-ended - Single-ended - Balanced device (4 ports)
- `<topology>` (Int array) Physical port numbers mapped to the logical ports, separated by ‘,’.
  - ‘B’ (Balanced) requires 2 physical port numbers: `<nPos>`, `<nNeg>`.
  - ‘S’ (Single-ended) requires 1 physical port number.

**Examples**

'The following example sets up 6 physical ports into 5 logical ports:

'Logical port 1 is a single ended port mapped to physical port 1
'Logical port 2 is a single ended port mapped to physical port 2
'Logical port 3 is a balanced port mapped to physical ports 4 and 5
'Logical port 4 is a single ended port mapped to physical port 3
Logical port 5 is a single ended port mapped to physical port 6

Example 1
CALC:FSIM:BAL:DEV CUST
CALC:DTOP "SSBSS",1,2,4,5,3,6
CALC:MEAS:PAR "SDD33"

Example 2
CALC:PAR:COUN 1
CALC:FSIM:BAL:DEV CUST
CALC:FSIM:BAL:PAR:STATE ON
CALC:DTOPology "SSBSS",1,2,4,5,3,6
CALC:FSIM:BAL:PAR:CUST:DEF "SDD33"

Query Syntax  CALCulate<enum>:DTOPology <device>,<topology>?
Return Type  Int array
Default  Not Applicable
Calculate:Equation Commands

Controls Equation Editor capabilities.

```
CALCulate:EQUation:
  LIBRary
    | FUNCTions
    | IMPort?
    | REMove
  STATe
  TEXT
  VALid?
```

Click on a keyword to view the command details.

**see Also**

- Example Programs
- Learn about Equation Editor
- Synchronizing the Analyzer and Controller
- SCPI Command Tree

**Critical Note:** CALCulate commands act on the selected measurement. You can select one measurement for each channel using Calc:Par:MNUM or Calc:Par:Select. Learn more.

```
CALCulate:EQUation:LIBRary:FUNCTIONs <string>
```
Applicable Models: All

(Read-only) Returns the functions in the specified DLL.

Parameters

<string> Full path and filename of the *.dll to be read.

Examples

```
functions = CALC:EQU:LIBR:FUNC "C:\Program Files(x86)\Keysight\Network Analyzer\UserFunctions\Expansion.dll"
```

Query Syntax

CALCulate:EQUation:LIBRary:FUNCtions?

Return Type

Comma delimited string of function names.

Default

Not Applicable

---

CALCulate:EQUation:LIBRary:IMPort <string>

Applicable Models: All

(Read-Write) Imports the functions in the specified DLL and returns whether the functions have been imported into the VNA.

Parameters

<string> Full path and filename of the *.dll.

Examples

```
'Command - Imports functions

CALC:EQU:LIBR:IMPort "C:\Program Files(x86)\Keysight\Network Analyzer\UserFunctions\Expansion.dll"

'Query if Imported successfully

success = CALC:EQU:LIBR:IMPort? "C:\Program Files(x86)\Keysight\Network Analyzer\UserFunctions\Expansion.dll"

1   'Returns 1 if successfully imported
```

Query Syntax

CALCulate:EQUation:LIBRary:IMPort?

Returns the following:

1 - Imported

0 - NOT imported

Return Type

Boolean
**CALCulate:EQUation:LIBRary:REMove <string>**

**Applicable Models:** All

*(Write-only)* Removes an imported an Equation Editor DLL from the VNA.

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;string&gt;</td>
<td>Full path and filename of the *.dll.</td>
</tr>
</tbody>
</table>

**Examples**

```
CALC:EQU:LIBR:REM "C:\Program Files(x86)\Keysight\Network Analyzer\UserFunctions\Expansion.dll"
```

**Query Syntax**

Not Applicable

**Default**

Not Applicable

---

**CALCulate<cnum>:EQUation[:STATe] <bool>**

**Applicable Models:** All

*(Read-Write)* Turns ON and OFF the equation on selected measurement for the specified channel. If the equation is not valid, then processing is not performed. Use `CALC:EQUation:VAlid?` to ensure that the equation is valid.

**See Critical Note**

**Parameters**

<table>

<tr>
<td>&lt;bool&gt;</td>
<td>ON (or 1) - turns equation ON. OFF (or 0) - turns equation OFF.</td>
</tr>
</tbody>
</table>

**Examples**

```
CALC:EQU 1
```

```
calculate2:equation:state 0
```

**Query Syntax**

`CALCulate<cnum>:EQUation[:STATe]?`

**Return Type**

Boolean

**Default**

OFF (0)
CALCulate<cnum>:EQUation:TEXT <string>

Applicable Models: All

(Read-Write) Specifies an equation or expression to be used on the selected measurement for the specified channel.

See Critical Note

Parameters

<cnum> Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, <cnum> is set to 1.

<string> Any valid equation or expression. See Equation Editor.

Examples

'Equation (includes '=')

CALC:EQU:TEXT "foo=S11/S21"

'Expression

calculate2:equation:text "S11/S21"

Query Syntax
CALCulate<cnum>:EQUation:TEXT?

Return Type
String

Default
Not Applicable

CALCulate<cnum>:EQUation:VALid?

Applicable Models: All

(Read-Only) Returns a boolean value to indicate if the current equation on the selected measurement for the specified channel is valid. For equation processing to occur, the equation must be valid and ON (CALC:EQU:STAT 1).

See Critical Note

Parameters

<cnum> Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, <cnum> is set to 1.

Examples

calculate2:equation:valid?
<table>
<thead>
<tr>
<th><strong>Return Type</strong></th>
<th>Boolean</th>
</tr>
</thead>
<tbody>
<tr>
<td>1 - equation is valid</td>
<td></td>
</tr>
<tr>
<td>0 - equation is NOT valid</td>

<td>Not Applicable</td>
</tr>
</tbody>
</table>
Calculate:Filter Commands

Controls the gating function used in time domain measurements. The gated range is specified with either (start / stop) or (center / span) commands.

These commands are **Superseded** by the `CALCulate:MEASure:FILTTer` commands.

![CALCulate:Filter Command Diagram](image)

Click on a keyword to view the command details.

**see Also**

- Example Programs
- Learn about Gating
- Synchronizing the Analyzer and Controller
- SCPI Command Tree

**Critical Note:** `CALCulate` commands act on the selected measurement. You can select one measurement for each channel using `Calc:Par:MNUM` or `Calc:Par:Select`. Learn more.

`CALCulate<cnum>:FILTer[:GATE]:COUPle:PARameters <num>`
Applicable Models: N522xB, N523xB, N524xB, M937xA, P937xA

(Read-Write) Specifies the time domain gating parameters to be coupled. The settings for those parameters will be copied from the selected measurement to all other measurements on the channel.

- To enable Trace Coupling, use SENS:COUP:PAR
- To specify Transform parameters to couple, use CALC:TRAN:COUP:PAR

Learn more about Time Domain Trace Coupling

See Critical Note

Parameters

<cnum> Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, <cnum> is set to 1.

<num> (Numeric) Parameters to couple. To specify more than one parameter, add the numbers.

1 - Gating Stimulus (Start, Stop, Center, and Span TIME settings.)

2 - Gating State (ON / OFF)

4 - Gating Shape (Minimum, Normal, Wide, and Maximum)

8 - Gating Type (Bandpass and Notch)

Examples

'To couple all parameters:
CALC:FILT:COUP:PAR 15

'To couple Stimulus and Type:
calculate2:filter:gate:couple:parameters 9

Query Syntax

CALCulate<cnum>:FILTer[:GATE]:TIME:CENTer <num>
Applicable Models: N522xB, N523xB, N524xB, M937xA, P937xA

(Read-Write) Sets the gate filter center time.

See Critical Note

Parameters

- `<cnum>` Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, `<cnum>` is set to 1.
- `<num>` Center time in seconds; Choose any number between:
  \[ \pm \frac{(\text{number of points}-1)}{\text{frequency span}} \]

Note: This command will accept MIN or MAX instead of a numeric parameter. See SCPI Syntax for more information.

Examples

- `CALC:FILT:GATE:TIME:CENT -5 ns`
- `calculate2:filter:time:center maximum`

Query Syntax

- `CALCulate<cnum>:FILTer[:GATE]:TIME:CENTer?`

Return Type

- Numeric
  - Default: 0

---

CALCulate<cnum>:FIltEr[:GATE]:TIME:SHAPE <char>

Applicable Models: N522xB, N523xB, N524xB, M937xA, P937xA

(Read-Write) Sets the gating filter shape when in time domain.

See Critical Note

Parameters

- `<cnum>` Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, `<cnum>` is set to 1.
- `<char>` Choose from
  - `MAXimum` - the widest gate filter available
  - `WIDE` -
  - `NORMal` -
  - `MINimum` - the narrowest gate filter available

Examples

- `CALC:FILT:GATE:TIME:SHAPE MAX`
- `calculate2:filter:time:shape normal`

Query Syntax

- `CALCulate<cnum>:FIltEr[:GATE]:TIME:SHAPE?`

Return Type

- Character
CALCulate<nun>:FIILTer[:GATE]:TIME:SPAN <num>

**Applicable Models:** N522xB, N523xB, N524xB, M937xA, P937xA

*(Read-Write)* Sets the gate filter span time.

**See Critical Note**

**Parameters**

- `<cnum>` Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, `<cnum>` is set to 1.
- `<num>` Time span in seconds; Choose any number between: 0 and 2* [(number of points-1) / frequency span]

**Note:** This command will accept MIN or MAX instead of a numeric parameter. See SCPI Syntax for more information.

**Examples**

```
calc:fil:time:span 5 ns
```

```
calculate2:filter:time:span maximum
```

**Query Syntax**

CALCulate<nun>:FIILTer[:GATE]:TIME:SPAN?

**Return Type** Numeric

**Default** 20 ns

CALCulate<nun>:FIILTer[:GATE]:TIME:STATe <boolean>

**Applicable Models:** N522xB, N523xB, N524xB, M937xA, P937xA

*(Read-Write)* Turns gating state ON or OFF.

**See Critical Note**

**Note:** Sweep type must be set to Linear Frequency in order to use Transform Gating.

**Parameters**

- `<cnum>` Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, `<cnum>` is set to 1.
- `<boolean>` ON (or 1) - turns gating ON.
  OFF (or 0) - turns gating OFF.

**Examples**

```
calc:filt:time:stat on
```

```
calculate2:filter:gate:time:state off
```

**Default** NORMal
CALCulate<cnum>:FILTER[:GATE]:TIME:START <num>

**Applicable Models:** N522xB, N523xB, N524xB, M937xA, P937xA

*(Read-Write)* Sets the gate filter start time.

**See Critical Note**

**Parameters**

- `<cnum>` Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, `<cnum>` is set to 1.
- `<num>` Start time in seconds; any number between:
  
  ± (number of points-1) / frequency span

  **Note:** This command will accept MIN or MAX instead of a numeric parameter. See SCPI Syntax for more information.

**Examples**

<table>
<thead>
<tr>
<th>Query Syntax</th>
<th>Return Type</th>

</tr>
</tbody>
</table>

CALCulate<cnum>:FILTER[:GATE]:TIME:STOP <num>
Applicable Models: N522xB, N523xB, N524xB, M937xA, P937xA

(Read-Write) Sets the gate filter stop time.

See Critical Note

Parameters

- `<cnum>` Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, `<cnum>` is set to 1.
- `<num>` Stop time in seconds; any number between: ± (number of points-1) / frequency span

**Note:** This command will accept MIN or MAX instead of a numeric parameter. See SCPI Syntax for more information.

Examples

```
CALC:FILT:TIME:STOP -1 ns
calculate2:filter:gate:time:stop maximum
```

Query Syntax

```
CALCulate<cnum>:FILTer[:GATE]:TIME:STOP?
```

Return Type

Numeric

Default

10 ns

CALCulate<cnum>:FILTer[:GATE]:TIME[:TYPE] <char>

Applicable Models: N522xB, N523xB, N524xB, M937xA, P937xA

(Read-Write) Sets the type of gate filter used.

See Critical Note

Parameters

- `<cnum>` Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, `<cnum>` is set to 1.
- `<char>` Choose from:
  - **BPAS** - Includes (passes) the range between the start and stop times.
  - **NOC** - Excludes (attenuates) the range between the start and stop times.

Examples

```
CALC:FILT:TIME BPAS
calculate2:filter:gate:time:type notch
```

Query Syntax

```
CALCulate<cnum>:FILTer[:GATE]:TIME[:TYPE]?
```

Return Type

Character

Default

BPAS
Calculate:Format Commands

These commands are **Superseded** by the CALCulate:MEASure:FORMat commands.

CALCulate:
| FORMat
| UNIT

**Critical Note:** CALCulate commands act on the selected measurement. You can select one measurement for each channel using `Calc:Par:MNUM` or `Calc:Par:Select`. Learn more.

**See Also**

- Example using this command.
- Learn About Data Format
- Synchronizing the Analyzer and Controller

CALCulate<cnum>:FORMat <char>

**Applicable Models:** N522xB, N523xB, N524xB, M937xA, P937xA

(Read-Write) Sets the display format for the measurement.

**See Critical Note**

**Parameters**

- `<cnum>` Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, `<cnum>` is set to 1.
- `<char>` Choose from:
  
  - MLINear
  - MLOGarithmic
  - PHASE
  - UPHase 'Unwrapped phase
- IMAGinary
- REAL
- POLar
- SMITH
- SADMittance 'Smith Admittance
- SWR
- GDELay 'Group Delay
- KELVin
- FAHRenheit
- CELSius
- PPHase 'Positive Phase
- IMPedance
- VOLT
- COMPlex

<table>

</tr>
</tbody>
</table>

CALCulate<cnum>:FORMat:UNIT <dataFormat>, <units>
Applicable Models: N522xB, N523xB, N524xB, M937xA, P937xA

(Read-Write) Sets and returns the units for the specified data format. Measurements with display formats other than those specified are not affected.

See Critical Note

Parameters

<cnum> Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, <cnum> is set to 1.

<dataFormat> Choose from:

- **MLOG** - Log magnitude
- **MLIN** - Linear magnitude

<units> For unratioed MLOG measurements, choose from:

- **DB** Units are displayed in decibels.
- **DBM** Units are displayed in dBm. 0 dBm = 0.001 watt
- **DBMV** Units are displayed in dBmV. 0 dBmV = 0.001 volt
  
  DBmV value depends on the reference impedance: dBmV = dBm + 30 + 10*\log_{10}(Z_0)

- **DBMA** Units are displayed in dBmA. 0 dBmA = 0.001 Ampere
- **DBUV** Units are displayed in dBuV. 0 dBuV = 1 uV
  
  DBuV value depends on the reference impedance: dBuV = dBm + 90 + 10*\log_{10}(Z_0)

For unratioed MLIN measurements, choose from:

- **U** - No units. Linear magnitude without conversion
- **W** - Units are displayed in Watts
- **V** - Units are displayed in Volts
- **A** - Units are displayed in Amperes

Examples

```
CALC:FORM:UNIT MLOG, DBM
```

```
calculate2:format:unit mlog,dbmv
```

Query Syntax
CALCulate<cnum>:FORMat:UNIT? <dataFormat>

Return Type Character

**Default** MLOG, DBM
Calculate:F Simulator Commands

Specifies settings and fixturing for Balanced Measurements.

- Example Programs
- SCPI Command Tree

CALCulate<cnum>:FSIMulator:LEGacy?
Applicable Models: All

(Read only) Returns TRUE if user is only using legacy SCPI fixture commands. If the user has used the GUI or new SCPI commands to create a fixture, it will return FALSE.

Parameters

- `<cnum>` Any existing channel number. If unspecified, value is set to 1

Examples

- `CALC:FSIM:LEG?`
- `calculate2:fsimulator:legacy?`

Query Syntax

CALCulate<cnum>:FSIMulator:LEGacy?

Return Type

Boolean

Default

TRUE

CALCulate<cnum>:FSIMulator:SNP:EXTRapolate <bool> Superseded

Applicable Models: All

Note: This command is changed to CALCulate:FSIMulator:CIRCuIt:FILE:EXTrapolate Learn about Using Fixture Simulator.

(Read-Write) Turns ON and OFF SNP file extrapolation for both 2-port and 4-port embedding/de-embedding. Learn more.

Note: This command affects ALL measurements on the specified channel.

Parameters

- `<cnum>` Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, `<cnum>` is set to 1.
- `<bool>` Choose from:

  - **ON or 1** - Turns Extrapolation ON
  - **OFF or 0** - Turns Extrapolation OFF

Examples

- `CALC:FSIM:SNP:EXTR 1`
- `calculate2:fsimulator:snp:extrapolate 0`

Query Syntax

CALCulate<cnum>:FSIMulator:SNP:EXTRapolate?

Return Type

Boolean

Default

OFF
CALCulate<cem>:FSIMulator:STATe <bool>

**Applicable Models:** All

(Read-Write) Turns all three fixturing functions (de-embedding, port matching, impedance conversion) ON or OFF for all ports on the specified channel. Does not affect port extensions.

**Note:** This command affects ALL measurements on the specified channel.

**Parameters**
- `<cem>` Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, `<cem>` is set to 1.
- `<bool>` Choose from:
  - **ON or 1** - Turns Fixturing ON
  - **OFF or 0** - Turns Fixturing OFF

**Examples**
- `CALC:FSIM:STAT 1`
- `calculate2:fsimulator:state 0`

**Query Syntax**
- `CALCulate<cem>:FSIMulator:STATe?`

**Return Type**
- Boolean

**Default**
- OFF

---

CALCulate<cem>:DTOPology <device>, <topology>

**Applicable Models:** E5080A, M9485A
(Write-only) Defines the device type and the topology for a balanced measurement.

This command will replace the following commands:

CALC:F SIM: BAL: TOP: SBAL[:PPOR]
CALC:F SIM: BAL: TOP: SSB[:PPOR]
CALC:F SIM: BAL: TOP: BBAL[:PPOR]
CALC:F SIM: BAL: TOP: BALS[:PPOR]

Parameters

<cnum> Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, <cnum> is set to 1.
<device> (String) Device type for the balanced measurement. ‘B’ means the Balanced port; ‘S’ means the Single-ended port. Choose from:

B – 1 port balanced device (2 ports)
BB – Balanced - Balanced device (4 ports)
BS – Balanced - Single-ended device (3 ports)
SB – Single-ended - Balanced device (3 ports)
SSB – Single-ended - Single-ended - Balanced device (4 ports)
<topology> (Int array) Physical port numbers mapped to the logical ports, separated by ‘,’.

‘B’ (Balanced) requires 2 physical port numbers: <nPos>, <nNeg>.

‘S’ (Single-ended) requires 1 physical port number.

Examples

CALC: DTOP "SB", 2, 1, 4
calculate:dtopology "SB", 2, 1, 4

Query Syntax

CALCulate<cnum>:MEASure<mnum>:PARameter:BALun[:STATe] <bool>

Return Type Not Applicable
Default Not Applicable
(Read-Write) Sets or gets a balanced measurement state.

Parameters

- `<cnum>`: Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, `<cnum>` is set to 1.
- `<mnum>`: Measurement number for each measurement. There must be a selected measurement on the trace. If unspecified, `<mnum>` is set to 1.
- `<bool>`: ON or 1 - Balanced Transform ON. OFF or 0 - Balanced Transform OFF.

Examples

- `CALC2:MEAS3:PAR:BAL ON`
- `calculate2:measure:parameter:balun:state off`

Query Syntax

`CALCulate<cnum>:MEASure<mnum>:PARameter:BALun[:STATe]?

Return Type

See Also

- Learn about Using Fixture Simulator

- Example Programs

**Critical Note:** CALCulate commands act on the selected measurement. You can select one measurement for each channel using Calc:Par:MNUM or Calc:Par:Select. Learn more.

- CALC:PAR:CAT? alone can NOT be used to return a balanced measurement parameter. If a balanced measurement transform is being performed, then additional querying of the CALC:FSIM system is required to determine the balanced parameter type. See an example.

- **BPORt versus LPORt commands** - For each command in this subsystem that includes a BPORt keyword, there is an LPORt equivalent. The commands are identical except for the way in which the balanced / logical port numbers are specified:
  
  - The BPORt commands refer to the Balanced port number. There can only be up to two balanced ports. This method is compatible with the ENA network analyzer.
  
  - The LPORt commands refer to the Logical port number. A balanced port can appear as either logical port 1, 2, or 3. These are the references as they appear in the front-panel user interface.
CALCulate<cnum>:FSIMulator:DRAFt:APPLy

**Applicable Models:** All

*(Write only)* Copies the draft fixture to active fixture. Exact same functionality as CALC:FSIM:APPL

**Parameters**

Not applicable

**Example**

```
calculate:fsimulator:draft:apply
```

**Return Type**

Not applicable

**Default**

Not applicable

---

CALCulate<cnum>:FSIMulator:DRAFt:CIRCuit<circN>:ADD <block type>, <fixt port count>

**Applicable Models:** All

*(Write only)* Create a block of the specified block type with the specified fixture port count. By default, this block will be created on the VNA Port 1 with "de-embed". It can be moved and changed to "embed" with commands below.

**Parameters**

<p>| &lt;cnum&gt; | Any existing channel number. If unspecified, value is set to 1 |
| &lt;circN&gt; | Circuit Number |
| &lt;block type&gt; | File  | SNP File Block (valid parameters: FILE, FILE:EXTRapolate) |
| | RLGLoop | Ground Loop (Shunt L circuit model) (valid parameters: R, L, C, G) |
| | RCGLoop | Ground Loop (Shunt C circuit model) (valid parameters: R, L, C, G) |
| | CGGLoop | Ground Loop (Shunt C circuit model, but for convenience, user can specifier G instead of R) (valid parameters: R, L, C, G) |
| | FGLoop | Ground Loop (valid parameters: FILE, FILE:EXTRapolate, file must be S1P file) |
| | SLPC | Port Matching Circuit: Series L - Shunt C (valid parameters: R, R2, L, C,G, G2) |</p>

**Return Type**

Not Applicable

**Default**

Not Applicable
Applicable Models: All

(Read only) Returns a comma-separated list of circuit numbers created in the draft circuit.

Parameters
- `<cnum>` Any existing channel number. If unspecified, value is set to 1

Examples
- `CALC:FSIM:DRAF:CIRC:CAT?`
- `calculate2:fsimulator:draft:circuit:catalog?`

Query Syntax
- `CALCulate<cnum>:FSIMulator:DRAFt:CIRCuit:CATalog?`

Return Type
- comma-separated string

Default
- Not Applicable

Applicable Models: All

(Write only) Deletes the specified circuit.

Parameters
- `<cnum>` Any existing channel number. If unspecified, value is set to 1
- `<circN>` Circuit Number

Examples
- `CALC:FSIM:DRAF:CIRC:DEL`
- `calculate2:fsimulator:draft:circuit:delete`

Query Syntax
- Not Applicable

Return Type
- Not Applicable

Default
- Not Applicable
Applicable Models: All

(Read-Write) Sets the Device ports for the specified circuit. The number of ports must be even and correspond to the number of ports of the fixture. This command can be used to reverse or change the order of ports in an SNP file.

**Parameters**

- `<cnum>` Any existing channel number. If unspecified, value is set to 1
- `<circN>` Circuit Number

**Examples**

```
CALC:FSIM:DRAF:CIRC:DEV:PORT 2,1
```

```
calculate2:fsimulator:draft:circuit:device:ports 2,1
```

**Query Syntax**

CALCulate<cnum>:FSIMulator:DRAFt:CIRCuit<circN>:DEVice:PORTs?

**Return Type** Numeric

**Default** Not Applicable

---

CALCulate<cnum>:FSIMulator:DRAFt:CIRCuit<circN>:EMBED:TYPE <embed | deembed>

Applicable Models: All

(Read-Write) Sets whether the circuit should be embedded or de-embedded. Valid for all block Types

The block is create using CALCulate<cnum>:FSIMulator:DRAFt:CIRCuit[n]:ADD <block type>, <fixt port count> . Setting a value not used by the selected circuit will have no affect. Learn more.

**Parameters**

- `<cnum>` Any existing channel number. If unspecified, value is set to 1
- `<char>` Choose from:
  - **EMBED** - Add Network circuit.
  - **DEEMBED** - Remove Network circuit
- `<circN>` Circuit Number

**Examples**

```
CALC:FSIM:DRAF:CIRC:EMBED:TYPE EMBED
```

```
calculate2:fsimulator:draft:circuit:embed:type deembed
```

**Query Syntax**

CALCulate<cnum>:FSIMulator:DRAFt:CIRCuit<circN>:EMBED:TYPE?

**Return Type** character
CALCulate\(<cnum>\):FSIMulator:DRAFt:CIRCuit\(<\text{circN}>\):FILE <filename>

**Applicable Models:** All

(Read-Write) Sets the filename. Valid blocks: FILE, D4PFile, FGLoop

The block is created using CALCulate\(<cnum>\):FSIMulator:DRAFt:CIRCuit\([n]\):ADD <block type>, <fixt port count>. Setting a value not used by the selected circuit will have no affect. Learn more.

**Parameters**

\(<\text{cnum}>\) Any existing channel number. If unspecified, value is set to 1

\(<\text{filename}>\) File name and extension (.s2P) of the de-embedding circuit.

Files are stored in the default folder "D:\".

To recall from a different folder, specify the full path name.

\(<\text{circN}>\) Circuit Number

**Examples**

```
CALC:FSIM:DRAF:CIRC:FILE 'myFile.s2P'
calculate2:fsimulator:draft:circuit:file "D:\myFile.s2P"
```

**Query Syntax** CALCulate\(<cnum>\):FSIMulator:DRAFt:CIRCuit\(<\text{circN}>\):FILE?

**Return Type** string

**Default** Not Applicable

CALCulate\(<cnum>\):FSIMulator:DRAFt:CIRCuit\(<\text{circN}>\):FILE:EXTRapolate <bool>
Applicable Models: All

(Read-Write) Sets whether or not extrapolation is allowed (TRUE/FALSE). Valid blocks: FILe, D4PFile, FGLoop.

The block is create using CALCulate<cnum>:FSIMulator:DRAFt:CIRCuit<n>:ADD <block type>, <fuxt port count> . Setting a value not used by the selected circuit will have no affect. Learn more.

**Parameters**

- `<cnum>` Any existing channel number. If unspecified, value is set to 1
- `<bool>` Choose from:
  - **TRUE or 1** - Turns Extrapolation ON
  - **FALSE or 0** - Turns Extrapolation OFF
- `<circN>` Circuit Number

**Examples**

```
CALC:FSIM:DRAF:CIRC:FILE:EXTR TRUE

calculate2:fsimulator:draft:circuit:file:extrapolate false
```

**Query Syntax**

CALCulate<cnum>:FSIMulator:DRAFt:CIRCuit<circN>:FILE:EXTRapolate?

**Return Type**

Boolean

**Default**

Not Applicable

---

CALCulate<cnum>:FSIMulator:DRAFt:CIRCuit<circN>:FILE:MODify <enum>

Applicable Models: All

(Read-Write) Sets all reflection and crosstalk parameters on the DUT side to zero. Learn more.

The block is create using CALCulate<cnum>:FSIMulator:DRAFt:CIRCuit<n>:ADD <block type>, <fuxt port count> . Setting a value not used by the selected circuit will have no affect. Learn more.

**Parameters**

- `<cnum>` Any existing channel number. If unspecified, value is set to 1
- `<enum>` Choose from:
  - **NONE** - Does not modify the block.
  - **NREFlect** - Sets all reflection parameters on the DUT-side to zero.
NXTalk - Sets all reflection and crosstalk parameters on the DUT-side to zero.

```plaintext
Examples
CALC:FSIM:DRAF:CIRC:FILE:MOD NONE
calculate2:fsimulator:draft:circuit:file:modify nreflect
```

**Query Syntax**

CALCulate<cnum>:FSIMulator:DRAFt:CIRCuit<circN>:FILE:MODify?

**Return Type**

Enumeration

**Default**

NONE

CALCulate<cnum>:FSIMulator:DRAFt:CIRCuit<circN>:NEXT?

**Applicable Models:** All

*(Read only)* Returns the next free circuit number than be used to create a new circuit block

**Parameters**

- `<cnum>` Any existing channel number. If unspecified, value is set to 1
- `<circN>` Circuit Number

```plaintext
Examples
CALC:FSIM:DRAF:CIRC:NEXT?
calculate2:fsimulator:draft:circuit:next?
```

**Query Syntax**

CALCulate<cnum>:FSIMulator:DRAFt:CIRCuit<circN>:NEXT?

**Return Type**

Numeric

**Default**

Not Applicable

CALCulate<cnum>:FSIMulator:DRAFt:CIRCuit<circN>:PARameter:C <value>
Applicable Models: All

(Read-Write) Sets the capacitance (C) circuit element for the specified circuit. Valid blocks: RLGLoop, RCGLoop, CGGLoop, SLPC, PCSL, PLSC, SCPL, PLPC, SCPC, PCSC, SLPL, PLSL.

The block is create using CALCulate<cnm>:FSIMulator:DRAFt:CIRCuit[n]:ADD <block type>, <fixt port count>. Setting a value not used by the selected circuit will have no affect. Learn more.

**Parameters**
- `<cnm>` Any existing channel number. If unspecified, value is set to 1
- `<value>` Capacitance value in farads. Choose a value between -1E18 to 1E18
- `<circN>` Circuit Number

**Examples**
- `CALC:FSIM:DRAF:CIRC:PAR:C 0.00002`
- `calculate2:fsimulator:draft:circuit:parameter:C 0.00002`

**Query Syntax**
- `CALCulate<cnm>:FSIMulator:DRAFt:CIRCuit<circN>:PARameter:C?`

**Return Type**
- Numeric

**Default**
- 0

---

CALCulate<cnm>:FSIMulator:DRAFt:CIRCuit<circN>:PARameter:C2 <value>

Applicable Models: All

(Read-Write) Sets the capacitance (C2) circuit element for the specified circuit. Valid blocks: SLPC, PCSL, PLSC, SCPL, PLPC, SCPC, PCSC, SLPL, PLSL.

The block is create using CALCulate<cnm>:FSIMulator:DRAFt:CIRCuit[n]:ADD <block type>, <fixt port count>. Setting a value not used by the selected circuit will have no affect. Learn more.

**Parameters**
- `<cnm>` Any existing channel number. If unspecified, value is set to 1
- `<value>` Capacitance value in farads. Choose a value between -1E18 to 1E18
- `<circN>` Circuit Number

**Examples**
- `CALC:FSIM:DRAF:CIRC:PAR:C2 0.00002`
- `calculate2:fsimulator:draft:circuit:parameter:C2 0.00002`

**Query Syntax**
- `CALCulate<cnm>:FSIMulator:DRAFt:CIRCuit<circN>:PARameter:C2?`

**Return Type**
- Numeric
**CALCulate<nump>:FSIMulator:DRAFt:CIRCuit<circN>:PARameter:DELay <num>**

**Applicable Models:** All

*(Read-Write)* Sets port extension delay in time. Valid blocks: ILIN.

The block is created using CALCulate<nump>:FSIMulator:DRAFt:CIRCuit[n]:ADD <block type>, <fixt port count>. Setting a value not used by the selected circuit will have no affect. Learn more.

**Parameters**

- `<nump>` Any existing channel number. If unspecified, value is set to 1
- `<num>` The port extension in seconds; may include suffix. Choose a number between: -1E18 and 1E18
- `<circN>` Circuit Number

**Examples**

```
CALC:FSIM:DRAF:CIRC:PAR:DEL 2MS
```
```
calculate2:fsimulator:draft:circuit:parameter:delay .00025
```

**Query Syntax**

CALCulate<nump>:FSIMulator:DRAFt:CIRCuit<circN>:PARameter:DEL?

**Return Type**

Numeric

**Default**

0

---

**CALCulate<nump>:FSIMulator:DRAFt:CIRCuit<circN>:PARameter:G <value>**

**Applicable Models:** All

*(Read-Write)* Sets the conductance (G) circuit element for the specified circuit. Valid blocks: RLGLoop, RCGLoop, CGGLoop, SLPC, PCSL, SCPL, PLPC, SCPC, PCSC, SLPL, PLSL.

The block is created using CALCulate<nump>:FSIMulator:DRAFt:CIRCuit[n]:ADD <block type>, <fixt port count>. Setting a value not used by the selected circuit will have no affect. Learn more.

**Parameters**

- `<nump>` Any existing channel number. If unspecified, value is set to 1
- `<value>` Conductance value in siemens. Choose a value between -1E18 to 1E18
- `<circN>` Circuit Number

---

3408
CALCulate<cnum>:FSIMulator:DRAFt:CIRCuit<circN>:PARameter:G <value>

**Applicable Models:** All

(Read-Write) Sets the conductance (G2) circuit element for the specified circuit. Valid blocks: SLPC, PCSL, PLSC, SCPL, PLPC, SCPC, PCSC, SLPL, PLSL

The block is create using CALCulate<cnum>:FSIMulator:DRAFt:CIRCuit[n]:ADD <block type>, <fixt port count> . Setting a value not used by the selected circuit will have no affect. Learn more.

**Parameters**

- `<cnum>` Any existing channel number. If unspecified, value is set to 1
- `<value>` Conductance value in siemens. Choose a value between -1E18 to 1E18
- `<circN>` Circuit Number

**Examples**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CALC:FSIM:DRAF:CIRC:PAR:G 0.00002</td>
<td></td>
</tr>
<tr>

<td></td>
</tr>
</tbody>
</table>

**Query Syntax**

CALCulate<cnum>:FSIMulator:DRAFt:CIRCuit<circN>:PARameter:G2?

**Return Type**

Numeric

**Default**

0

---

CALCulate<cnum>:FSIMulator:DRAFt:CIRCuit<circN>:PARameter:L <value>

---

3409
Applicable Models: All

(Read-Write) Sets the inductance (L) circuit element for the specified circuit. Valid blocks: RLGLoop, RCGLoop, CGGLoop, SLPC, PCSL, PLSC, SCPL, PLPC, SCPC, PCSC, SLPL, PLSL.

The block is create using CALCulate<cnum>:FSIMulator:DRAFt:CIRCuit[n]:ADD <block type>, <fixt port count>. Setting a value not used by the selected circuit will have no affect. Learn more.

**Parameters**

- `<cnum>` Any existing channel number. If unspecified, value is set to 1
- `<value>` Inductance value in henries. Choose a value between -1E18 to 1E18
- `<circN>` Circuit Number

**Examples**

```
CALC:FSIM:DRAF:CIRC:PAR:L 0.00002
```
```
calculate2:fsimulator:draft:circuit:parameter:l 0.00002
```

**Query Syntax**

CALCulate<cnum>:FSIMulator:DRAFt:CIRCuit<circN>:PARameter:L?

**Return Type** Numeric

**Default** 0

Applicable Models: All

(Read-Write) Sets the inductance (L2) circuit element for the specified circuit. Valid blocks: SLPC, PCSL, PLSC, SCPL, PLPC, SCPC, PCSC, SLPL, PLSL.

The block is create using CALCulate<cnum>:FSIMulator:DRAFt:CIRCuit[n]:ADD <block type>, <fixt port count>. Setting a value not used by the selected circuit will have no affect. Learn more.

**Parameters**

- `<cnum>` Any existing channel number. If unspecified, value is set to 1
- `<value>` Inductance value in henries. Choose a value between -1E18 to 1E18
- `<circN>` Circuit Number

**Examples**

```
CALC:FSIM:DRAF:CIRC:PAR:L2 0.00002
```
```
calculate2:fsimulator:draft:circuit:parameter:l2 0.00002
```

**Query Syntax**

CALCulate<cnum>:FSIMulator:DRAFt:CIRCuit<circN>:PARameter:L2?

**Return Type** Numeric

**Default** 0
CALCulate<cnum>:FSIMulator:DRAFt:CIRCuit<circN>:PARameter:LOSS:VALue <num>

**Applicable Models:** All

*(Read-Write)* Sets the loss at DC. Valid blocks: ILIN.

The block is created using `CALCulate<cnum>:FSIMulator:DRAFt:CIRCuit[n]:ADD <block type>, <fixt port count>`. Setting a value not used by the selected circuit will have no affect. Learn more.

**Parameters**

- `<cnum>` Any existing channel number. If unspecified, value is set to 1
- `<num>` Loss in dB. Choose a value between -90 and 90.
- `<circN>` Circuit Number

**Examples**

```
```

```
calculate2:fsimulator:draft:circuit:parameter:loss:value .1
```

**Query Syntax**

```
CALCulate<cnum>:FSIMulator:DRAFt:CIRCuit<circN>:PARameter:LOSS:VALue?
```

**Return Type** Numeric

**Default** 0

---

CALCulate<cnum>:FSIMulator:DRAFt:CIRCuit<circN>:PARameter:R <value>

**Applicable Models:** All

*(Read-Write)* Sets the resistance (R) circuit element for the specified circuit. Valid blocks: RLGLoop, RCGLoop, CGGLoop, SLPC, PCSL, PLSC, SCPL, PLPC, SCPC, PCSC, SLPL, PLSL.

The block is created using `CALCulate<cnum>:FSIMulator:DRAFt:CIRCuit[n]:ADD <block type>, <fixt port count>`. Setting a value not used by the selected circuit will have no affect. Learn more.

**Parameters**

- `<cnum>` Any existing channel number. If unspecified, value is set to 1
- `<value>` Resistance value in ohms. Choose a value between -1E18 to 1E18
- `<circN>` Circuit Number
### CALCulate<cnum>:FSIMulator:DRAFt:CIRCuit<circN>:PARameter:R2 <value>

**Applicable Models:** All

*(Read-Write)* Sets the resistance (R2) circuit element for the specified circuit. Valid blocks: SLPC, PCSL, PLSC, SCPL, PLPC, SCPC, PCSC, SLPL, PLSL

The block is create using CALCulate<cnum>:FSIMulator:DRAFt:CIRCuit[<n>]:ADD <block type>, <fixt port count>. Setting a value not used by the selected circuit will have no affect. Learn more.

**Parameters**
- `<cnum>` Any existing channel number. If unspecified, value is set to 1
- `<value>` Resistance value in ohms. Choose a value between -1E18 to 1E18
- `<circN>` Circuit Number

### Examples
- CALC:FSIM:DRAF:CIRC:PAR:R 0.00002
- calculate2:fsimulator:draft:circuit:parameter:r 0.00002

**Query Syntax**
- CALCulate<cnum>:FSIMulator:DRAFt:CIRCuit<circN>:PARameter:R2?

**Return Type**
- Numeric

**Default**
- 0

---

### CALCulate<cnum>:FSIMulator:DRAFt:CIRCuit<circN>:PARameter:RIN <value>

**Query Syntax**
- CALCulate<cnum>:FSIMulator:DRAFt:CIRCuit<circN>:PARameter:R2?

**Return Type**
- Numeric

**Default**
- 0
**Applicable Models:** All

**Parameters**

- `<cnum>` Any existing channel number. If unspecified, value is set to 1
- `<value>` Resistance value in ohms. Choose a value between -1E18 to 1E18
- `<circN>` Circuit Number

**Examples**

```
CALC:FSIM:DRAF:CIRC:PAR:RIN 0.00002
```

```
calculate2:fsimulator:draft:circuit2:parameter:rin 0.00002
```

**Query Syntax**

```
CALCulate<cnum>:FSIMulator:DRAFt:CIRCuit<circN>:PARameter:RIN?
```

**Return Type**

Numeric

**Default**

0

---

**Applicable Models:** All

**Parameters**

- `<cnum>` Any existing channel number. If unspecified, value is set to 1
- `<value>` Resistance value in ohms. Choose a value between -1E18 to 1E18
- `<circN>` Circuit Number

**Examples**

```
CALC:FSIM:DRAF:CIRC:PAR:ROUT 0.00002
```

```
calculate2:fsimulator:draft:circuit2:parameter:rout 0.00002
```

**Query Syntax**

```
CALCulate<cnum>:FSIMulator:DRAFt:CIRCuit<circN>:PARameter:ROUT?
```

**Return Type**

Numeric

**Default**

0
CALCulate<cnum>:FSIMulator:DRAFt:CIRCuit<circN>:PARameter:Z0 <value>

**Applicable Models:** All

(Read-Write) Sets the impedance (Z0) for the ideal block (scalar value). Valid blocks: ILIN.

The block is create using CALCulate<cnum>:FSIMulator:DRAFt:CIRCuit[n]:ADD <block type>, <fixt port count>. Setting a value not used by the selected circuit will have no affect. Learn more.

**Parameters**
- `<cnum>`: Any existing channel number. If unspecified, value is set to 1
- `<value>`: Impedance value in ohms. Choose a value between -1E18 to 1E18
- `<circN>`: Circuit Number

**Examples**
- CALC:FSIM:DRAF:CIRC:PAR:Z0 0.00002
- calculate2:fsimulator:draft:circuit:parameter:z0 0.00002

**Query Syntax**
CALCulate<cnum>:FSIMulator:DRAFt:CIRCuit<circN>:PARameter:Z0?

**Return Type**
Numeric

**Default**
0

CALCulate<cnum>:FSIMulator:DRAFt:CIRCuit:RESet

**Applicable Models:** All

(Write only) Resets the circuit section to preset values

**Note:** This command impacts the circuits and the port extensions. It does not change any impedance conversion values.

**Parameters**
- `<cnum>`: Any existing channel number. If unspecified, value is set to 1

**Examples**
- CALC:FSIM:DRAF:CIRC:RES
- calculate2:fsimulator:draft:circuit:reset

**Query Syntax**
Not Applicable

**Return Type**
Not Applicable

**Default**
Not Applicable
CALCulate<cnum>:FSIMulator:DRAFt:CIRCuit<circN>:STATe <bool>

**Applicable Models:** All

*(Read-Write)* Turns the circuit ON and OFF. Valid for all block types

The block is create using CALCulate<cnum>:FSIMulator:DRAFt:CIRCuit[n]:ADD <block type>, <fixt port count>. Setting a value not used by the selected circuit will have no affect. Learn more.

**Parameters**

- `<cnum>` Any existing channel number. If unspecified, value is set to 1
- `<bool>` Choose from:
  - **ON or 1** - Turns the circuit ON
  - **OFF or 0** - Turns the circuit OFF
- `<circN>` Circuit Number

**Examples**

CALC:FSIM:DRAF:CIRC:STAT ON

calculate2:fsimulator:draft:circuit1:state off

**Query Syntax**

CALCulate<cnum>:FSIMulator:DRAFt:CIRCuit[n]:STATe?

**Return Type**

Boolean

**Default**

OFF

CALCulate<cnum>:FSIMulator:DRAFt:CIRCuit<circN>:VNA:PORTs <port list>

**Applicable Models:** All

*(Read-Write)* Sets the VNA ports for the specified circuit.

**Parameters**

- `<cnum>` Any existing channel number. If unspecified, value is set to 1
- `<circN>` Circuit Number

**Examples**

**Query Syntax**

CALCulate<cnum>:FSIMulator:DRAFt:CIRCuit[n]:VNA:PORTs?

**Return Type**

Numeric
CALCulate<cnum>:FSIMulator:DRAFt:DISCard

**Applicable Models:** All

*(Write only)* Copies the active fixture into scratch/draft fixture (discards changes on scratch/draft fixture)

**Parameters**
- Not applicable

**Example**
- **CALC:FSIM:DRAF:DIS**
  - calculate:fsimulator:draft:discard

**Return Type**
- Not applicable

**Default**
- Not applicable

CALCulate<cnum>:FSIMulator:DRAFt:EXTension:PORT<pnum>:DELay <value>

**Applicable Models:** All

*(Read-Write)* Sets and returns the delay value in time at the specified port.

**Note:** This command affects ALL measurements on the specified channel.

**Parameters**
- `<cnum>` Any existing channel number. If unspecified, value is set to 1.
- `<pnum>` Port Number that will receive the delay setting. If unspecified, value is set to 1.
- `<value>` The port extension in seconds; may include suffix. Choose a number between: -1E18 and 1E18 e.

**Examples**
- **CALC:FSIM:DRAF:EXT:PORT1:DEL 0.02**
  - calculate:fsimulator:draft:extension:port2:delay .003

**Query Syntax**
- CALCulate<cnum>:FSIMulator:DRAFt:EXTension:PORT<pnum>:DECLay?

**Return Type**
- Numeric

**Default**
- 0
Applicable Models: All

(Read-Write) Sets and returns the units for specifying port extension delay in physical length (distance).

Parameters

- `<cnum>` Any existing channel number. If unspecified, value is set to 1.
- `<pnum>` Port Number. This number is ignored and all ports have the same setting.
- `<char>` Units for delay in distance. Choose from:
  - METer
  - FEET
  - INCH

Examples

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
</table>

Query Syntax

`CALCulate<cnum>:FSIMulator:DRAFt:EXTension:PORT<pnum>:DISTance:UNIT?`

Return Type

Character

Default

METer

---

Applicable Models: All

(Read-Write) Sets and returns the port extension delay in physical length (distance).

Parameters

- `<cnum>` Any existing channel number. If unspecified, value is set to 1.
- `<pnum>` Port Number that will receive the delay setting. If unspecified, value is set to 1.

Examples

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
</table>

Query Syntax

`CALCulate<cnum>:FSIMulator:DRAFt:EXTension:PORT<pnum>:DISTance:VALue?`

Return Type

Numeric

Default

0
CALCulate<cnum>:FSIMulator:DRAFt:EXTension:PORT<pnum>:END

Applicable Models: All

(Write Only) Moves the port extension block to the right-most side of the circuit sections. This command allows the port extensions to be moved around in the circuit.

Parameters

<cnun> Any existing channel number. If unspecified, value is set to 1.
<pnum> Port Number that will receive the delay setting. If unspecified, value is set to 1.

Examples

CALC:FSIM:DRAF:EXT:PORT1:END
calculate:fsimulator:draft:extension:port2:end

Query Syntax Not applicable

Return Type Not applicable

Default Not applicable

CALCulate<cnum>:FSIMulator:DRAFt:EXTension:PORT<pnum>:LOSS<n>:FREQuency <value>

Applicable Models: All

(Read-Write) Sets and returns the frequency for the Freq and Loss pair number and for the specified port number.

Learn about Loss Compensation values.

Parameters

<cnun> Any existing channel number. If unspecified, value is set to 1
<pnum> Port Number that will receive the freq/loss settings. If unspecified, value is set to 1.

<n> Freq and Loss pair number. Choose from 1 or 2. If unspecified, value is set to 1.

<value> Frequency value. Choose a frequency within the frequency span of the VNA.

Examples

calculate:fsimulator:draft:extension:port2:loss1:frequency 2E10

Query Syntax CALCulate<cnum>:FSIMulator:DRAFt:EXTension:PORT<pnum>:LOSS<n>:FREQuency?

Return Type Numeric
**CALCulate<cnum>:FSIMulator:DRAFt:EXTension:PORT<pnum>:LOSS<n>:VALue <value>**

**Applicable Models:** All

*(Read-Write)* Sets and returns the Loss value for the specified port number.

Learn about Loss Compensation values.

**Note:** This command affects ALL measurements on the specified channel.

**Parameters**

- `<cnum>` Any existing channel number. If unspecified, value is set to 1
- `<pnum>` Port Number that will receive the Freq/Loss settings. If unspecified, value is set to 1.
- `<n>` Loss "Use" number. Choose from 1 or 2. If unspecified, value is set to 1.
- `<value>` Loss in dB. Choose a value between -90 and 90

**Examples**

- `CALC:FSIM:DRAF:EXT:PORT:LOSS1:VAL 1`
- `calculate:fsimulator:draft:extension:port2:loss2:value .1`

**Query Syntax**

`CALCulate<cnum>:FSIMulator:DRAFt:EXTension:PORT<pnum>:LOSS<n>:VALue?`

**Return Type** Numeric

**Default** 0

**CALCulate<cnum>:FSIMulator:DRAFt:EXTension:PORT<pnum>:LOSS<n>[:STATe] <bool>**
Applicable Models: All

(Read-Write) Sets and returns the ON/OFF state for the Freq and Loss pair number and for the specified port number.

Learn about Loss Compensation values.

Note: This command affects ALL measurements on the specified channel.

Parameters

- `<cnum>`: Any existing channel number. If unspecified, value is set to 1
- `<pnum>`: Port Number that will receive the Freq/Loss settings. If unspecified, value is set to 1.
- `<n>`: Freq and Loss pair. Choose from 1 or 2. If unspecified, value is set to 1.
- `<value>`: State of Freq and Loss values for port extension.

0 or OFF Specified Freq and Loss values are OFF

1 or ON Specified Freq and Loss values are ON

Examples

```
CALC:FSIM:DRAF:EXT:PORT:LOSS:STAT 0
```

calculate:fsimulator:draft:extension:port2:loss2:state on

Query Syntax

CALCulate<cnum>:FSIMulator:DRAFt:EXTension:PORT<pnum>:LOSS<n>[:STATe]?

Return Type

Boolean

Default

OFF

CALCulate<cnum>:FSIMulator:DRAFt:EXTension:PORT<pnum>:DCLoss:VALue <value>
### Applicable Models: All

**(Read-Write)** Sets and returns the Port Loss at DC value for the specified port number.

Learn about Loss Compensation values.

**Note:** This command affects ALL measurements on the specified channel.

#### Parameters

- `<cnum>`: Any existing channel number. If unspecified, value is set to 1.
- `<pnum>`: Port number to receive Loss value. If unspecified, value is set to 1.
- `<value>`: Loss in dB. Choose a value between -90 and 90.

#### Examples

```
```
```
calculate:fsimulator:draft:extension:port2:dcloss:value .1
```

#### Query Syntax

```
CALCulate<cnum>:FSIMulator:DRAFt:EXTension:PORT<pnum>:DCLoss:VALue?
```

#### Return Type

Numeric

**Default** 0

---

**CALCulate<cnum>:FSIMulator:DRAFt:EXTension:PORT<pnum>:MEDium <char>**

**Applicable Models: All**

**(Read-Write)** Sets and returns the media type of the added fixture or transmission line.

See also SENS:CORR:EXT:PORT:SYSMedia

**Note:** This command affects ALL measurements on the specified channel.

#### Parameters

- `<cnum>`: Any existing channel number. If unspecified, value is set to 1.
- `<pnum>`: Port Number. This number is ignored and all ports have the same setting.
- `<char>`: Medium type. Choose from:
  - COAX
  - WAVEguide
**Examples**

```
CALC:FSIM:DRAF:EXT:PORT:MED COAX
```

```
calculate:fsimulator:draft:extension:port2:medium waveguide
```

**Query Syntax**

CALCulate<cnum>:FSIMulator:DRAFt: EXTension:PORT<pnum>:MEDium?

**Return Type**

Character

**Default**

COAX

---

**CALCulate<cnum>:FSIMulator:DRAFt:EXTension:PORT<pnum>:WAVEguide:FCUToff <value>**

**Applicable Models:** All

*(Read-Write)* Sets and returns the cutoff (minimum) frequency of the added waveguide fixture or transmission line.

**Parameters**

- `<cnum>` Any existing channel number. If unspecified, value is set to 1
- `<pnum>` Port Number for which media type is being set. If unspecified, value is set to 1.
- `<value>` Cutoff frequency in Hz.

This value is ignored when CALC:FSIM:DRAF:EXT:PORT:MED is set to COAX for the same port.

**Examples**

```
CALC:FSIM:DRAF:EXT:PORT:WAVE:FCUT 1e8
```

```
calculate:fsimulator:draft:extension:port2:waveguide:cutoff 100Mhz
```

**Query Syntax**

CALCulate<cnum>:FSIMulator:DRAFt: EXTension:PORT<pnum>:WAVEguide:FCUToff?

**Return Type**

Numeric

**Default**

System Media Cutoff Frequency

---

**CALCulate<cnum>:FSIMulator:DRAFt:EXTension:PORT<pnum>:WAVEguide:COUPle <bool>**
Applicable Models: All

(Read-Write) Sets and returns the state of coupling with the system Velocity Factor value. Learn more.

**Note:** This command potentially affects ALL measurements on the VNA.

**Parameters**
- `<cnum>` Any existing channel number. If unspecified, value is set to 1
- `<pnum>` Port Number. This number is ignored and all ports have the same setting.
- `<bool>` Coupling state. Choose from:
  - **ON** (or 1) - Velocity Factor is coupled with the system setting.
  - **OFF** (or 0) - Velocity Factor is NOT coupled with the system setting.

**Examples**
- `calculate:fsimulator:draft:extension:port2:waveguide:couple off`

**Query Syntax**
- `CALCulate<cnum>:FSIMulator:DRAFt:EXTension:PORT<pnum>:WAVEguide:COUPle?`

**Return Type** Boolean

**Default** 1 or ON (Coupled)

---

Applicable Models: All

(Read-Write) Sets and returns the velocity factor of the fixture or added transmission line.

**Parameters**
- `<cnum>` Any existing channel number. If unspecified, value is set to 1
- `<pnum>` Port Number for which velocity factor is being set. If unspecified, value is set to 1.
- `<value>` Velocity Factor.

Set SENS:CORR:EXT:PORT:SYSV to use the system velocity factor.

**Examples**
- `CALC:FSIM:DRAF:EXT:PORT:VEL:FAC .6`
- `calculate:fsimulator:draft:extension:port2:velocity:factor 1`
CALCulate<cnum>:FSIMulator:DRAFt:EXTension:PORT<pnum>:VELOCITY:FACTOR?

Return Type: Numeric
Default: System Velocity Factor

CALCulate<cnum>:FSIMulator:DRAFt:EXTension:PORT<pnum>:VELOCITY:COUPLE <bool>

Applicable Models: All
(Read-Write) Sets and returns the state of coupling with the system Velocity Factor value. Learn more.

Note: This command potentially affects ALL measurements on the VNA.

Parameters
- <cnum> Any existing channel number. If unspecified, value is set to 1
- <pnum> Port Number. This number is ignored and all ports have the same setting.
- <bool> Coupling state. Choose from:
  - ON (or 1) - Velocity Factor is coupled with the system setting.
  - OFF (or 0) - Velocity Factor is NOT coupled with the system setting.

Examples
- \texttt{CALC:FSIM:DRAF:EXT:PORT:VEL:COUP 1}
- \texttt{calculate:fsimulator:draft:extension:port2:velocity:couple off}

CALCulate<cnum>:FSIMulator:DRAFt:EXTension:PORT<pnum>[:STATE] <bool>

Return Type: Boolean
Default: 1 or ON (Coupled)
Applicable Models: All

(Read-Write) Sets and returns the state of port extension for the specified port.

Note: This command potentially affects ALL measurements on the VNA.

Parameters

- `<cnum>` Any existing channel number. If unspecified, value is set to 1
- `<pnum>` Port Number for which port extension is being set. If unspecified, value is set to 1.
- `<bool>` Port extension state. Choose from:
  - **ON** (or 1) - Port extension is on
  - **OFF** (or 0) - Port extension is off.

Examples

```
CALC:FSIM:DRAF:EXT:PORT:STAT 1
```

```
calculate:fsimulator:draft:extension:port2:state off
```

Query Syntax

```
CALCulate<cnum>:FSIMulator:DRAFt:EXTension:PORT<pnum>[:STATe]?
```

Return Type

Boolean

Default

0

---

CALCulate<cnum>:FSIMulator:DRAFt:SAVE <snpName>

Applicable Models: All

(Write only) Saves SNP file corresponding to the entire scratch/draft fixture.

Parameters

- `<snpName>` String - snp file name. Appends ".sNp" depending on num ports

Example

```
CALC:FSIM:DRAF:SAVE "myFixture"
```

```
calculate:fsimulator:draft:save "D:\myfixture"
```

Return Type

Not applicable

Default

Not applicable

---

CALCulate<cnum>:FSIMulator:DRAFt:SECTION:CIRcuit:ENABle <ON | OFF>
Applicable Models: All

(Read-Write) Turns all circuits ON or OFF for all ports.

Parameters

<cnun> Any existing channel number. If unspecified, value is set to 1

<ON | OFF> ON (or 1) - turns all circuits ON.

OFF (or 0) - turns all circuits OFF.

Examples

CALC:FSIM:DRAF:SECT:CIRC:ENAB ON

calculate2:fsimulator:draft:section:circuit:enable off

Query Syntax

CALCulate<cnun>:FSIMulator:DRAFt:SECTionCIRCuit:ENABle?

Return Type

Boolean (1 = ON, 0 = OFF)

Default

OFF

CALCulate<cnun>:FSIMulator:DRAFt:SECTion:EXTension:ENABle <ON | OFF>

Applicable Models: All

(Read-Write) Turns port extensions ON or OFF for all ports.

Parameters

<cnun> Any existing channel number. If unspecified, value is set to 1

<ON | OFF> ON (or 1) - turns port extensions ON.

OFF (or 0) - turns port extensions OFF.

Examples

CALC:FSIM:DRAF:SECT:EXT:ENAB ON

calculate2:fsimulator:draft:section:extension:enable off

Query Syntax

CALCulate<cnun>:FSIMulator:DRAFt:SECTion:EXTension:ENABle?

Return Type

Boolean (1 = ON, 0 = OFF)

Default

OFF

CALCulate<cnun>:FSIMulator:DRAFt:SECTion:ZCONversion:ENABle <ON | OFF>
**Applicable Models:** All

*(Read-Write)* Turns all ZConversions ON or OFF (both SE and BAL).

**Note:** This command affects ALL measurements on the specified channel.

### Parameters
- `<cnum>`: Any existing channel number. If unspecified, value is set to 1
- `<ON | OFF>`: ON (or 1) - turns all ZConversions ON. OFF (or 0) - turns all ZConversions OFF.

### Examples
- `CALC:FSIM:DRAF:SECT:ZCON:ENAB ON`
- `calculate2:fsimulator:draft:section:zconversion:enable off`

### Query Syntax
- `CALCulate<cnum>:FSIMulator:DRAFt:SECTion:ZCONversion:ENABle?`

### Return Type
- Boolean (1 = ON, 0 = OFF)

### Default
- OFF

---

**Applicable Models:** All

*(Read-Write)* Sets the differential port impedance conversion function ON/OFF. Must also set the fixture simulator function to ON using CALC:FSIM:STAT.

**See Critical Note**

### Parameters
- `<cnum>`: Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, `<cnum>` is set to 1.
- `<bool>`: State of the differential port impedance conversion function. Choose from
  - **OFF (or 0)**: Differential port impedance conversion OFF
  - **ON (or 1)**: Differential port impedance conversion ON

### Examples
- `CALC:FSIM:DRAF:ZCON:DIFF:STAT 1`
- `calculate2:fsimulator:draft:zconversion:DIFferential:state off`

### Query Syntax
- `CALCulate<cnum>:FSIMulator:DRAFt:ZCONversion:DIFFerential:STATe?`

### Return Type
- Boolean
**Applicable Models:** All

(Read-Write) Sets the complex impedance value for the differential port impedance conversion function.

**See Critical Note**

**Parameters**

- `<cnum>` Channel number of the measurement. There must be a selected measurement on that channel, unspecified, `<cnum>` is set to 1.
- `<pnum>` Balanced port number. Choose from 1 to 999.

**Note:** See Balanced port versus Logical port.

- `<real>` Real part of the Impedance value in Units. Choose a number between 0 and 1E18
- `<img>` Imaginary part of the Impedance value in Units. Choose a number between 0 and 1E18.

**Examples**

```plaintext
CALC:FSIM:DRAF:ZCON:DIFF:BPOR2:COMPL 200,10
```

**Query Syntax**

CALCulate<cnum>:FSIMulator:DRAFt:ZCONversion:DIFFerential:BPORt<pnum>:COMPLex

**Return Type** Numeric

**Default** 0,0

**CALCulate<cnum>:FSIMulator:DRAFt:ZCONversion:DIFFerential:BPORt<pnum>:SCALar<value>**
Applicable Models: All

(Read-Write) Sets the real part of impedance value for the differential port impedance conversion function.

See Critical Note

Parameters

- `<cnum>`: Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, `<cnum>` is set to 1.
- `<pnum>`: Balanced port number. Choose from 1 to 999.

Note: See Balanced port versus Logical port.

- `<value>`: Real part of the Impedance value in Units. Choose a number between 0 and 1E18.

Examples

```
CALC:FSIM:DRAF:ZCON:DIFF:BPOR2:SCAL 200,10
```
```
```

Query Syntax

```
CALCulate<cnum>:FSIMulator:DRAFt:ZCONversion:DIFFerential:BPORt<pnum>:SCALer?
```

Return Type

Numeric

Default

0

---

Applicable Models: All

(Read-Write) Sets the complex impedance value for the differential mode port impedance conversion function.

See Critical Note

Parameters

- `<cnum>`: Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, `<cnum>` is set to 1.
- `<pnum>`: Logical port number. Choose from 1 to 999.

Note: See Balanced port versus Logical port.

- `<real>`: Real part of the Impedance value in Units. Choose a number between 0 and 1E18.

**Return Type**

Boolean

**Default**

Off

---

CALCulate<cnum>:FSIMulator:DRAFt:ZCONversion:COMMonmode:BPORt<pnum>:COMPlex

REAL, IMAG

Applicable Models: All

(Read-Write) Sets the complex impedance value for the common mode port impedance conversion function.

See Critical Note

**Parameters**

- `<cnum>` Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, `<cnum>` is set to 1.
- `<pnum>` Balanced port number. Choose from 1 to 999.
- `<real>` Real part of the Impedance value in Units. Choose a number between 0 and 1E18
- `<img>` Imaginary part of the Impedance value in Units. Choose a number between 0 and 1E18.

**Note:** See Balanced port versus Logical port.
CALCulate\(<cnum>\):FSIMulator:DRAFT:ZCONversion:COMMONmode:BPOR\(<pnum>\):COMPLex \(<real>,<img>\)

**Examples**

CALC:FSIM:DRAF:ZCON:COMM:BPOR2:COMPL 200,10
calculate2:fsimulator:draft:zconversion:commonmode:bport2:complex 20,3

**Query Syntax**

CALCulate\(<cnum>\):FSIMulator:DRAFT:ZCONversion:COMMONmode:BPOR\(<pnum>\):COMPlex?

**Return Type**

Numeric

**Default**

0,0

Applicable Models: All

(Read-Write) Sets the real part of impedance value for the common mode port impedance conversion function.

See Critical Note

**Parameters**

\(<cnum>\) Channel number of the measurement. There must be a selected measurement on that channel, unspecified, \(<cnum>\) is set to 1.

\(<pnum>\) Balanced port number. Choose from 1 to 999.

\(<value>\) Real part of the Impedance value in Units. Choose a number between 0 and 1E18

**Examples**

**Query Syntax**

CALCulate\(<cnum>\):FSIMulator:DRAFT:ZCONversion:COMMONmode:BPOR\(<pnum>\):SCALar \(<value>\)

**Return Type**

Numeric

**Default**

0,0
Applicable Models: All

(Read-Write) Sets the complex impedance value for the common mode port impedance conversion function.

See Critical Note

Parameters

- `<cnum>`: Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, `<cnum>` is set to 1.
- `<pnum>`: Logical port number. Choose from 1 to 999.

Note: See Balanced port versus Logical port.

- `<real>`: Real part of the Impedance value in Units. Choose a number between 0 and 1E18.
- `<img>`: Imaginary part of the Impedance value in Units. Choose a number between 0 and 1E18.

Examples

```
CALC:FSIM:DRAF:ZCON:COMM:LPOR2:COMPL 200,10
```

```
calculate2:fsimulator:draft:zconversion:commonmode:lport2:complex 20,3
```

Query Syntax

```
CALCulate<cnum>:FSIMulator:DRAFt:ZCONversion:COMMONmode:LPORt<pnum>:COMPL?
```

Return Type: Numeric

```
CALCulate<cnum>:FSIMulator:DRAFt:ZCONversion:COMMONmode:LPORt<pnum>:SCALar <value>
```

Applicable Models: All

(Read-Write) Sets the real part of impedance value for the common mode port impedance conversion function.

See Critical Note

Parameters

- `<cnum>`: Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, `<cnum>` is set to 1.
- `<pnum>`: Logical port number. Choose from 1 to 999.

Note: See Balanced port versus Logical port.

CALCulate<cnum>:FSIMulator:CIRCuit<circN>:DEVice:PORTs? <port list - in, out>

Applicable Models: All

(Read only) Returns the Device ports for the specified circuit.

Parameters

- <cnum> Any existing channel number. If unspecified, value is set to 1
- <circN> Circuit Number

Examples

- CALC:FSIM:CIRC:DEV:PORT?
- calculate2:fsimulator:circuit:device:ports?

Query Syntax

CALCulate<cnum>:FSIMulator:DRAFt:CIRCuit<circN>:DEVice:PORTs?

Return Type Numeric

Default Not Applicable

CALCulate<cnum>:FSIMulator:CIRCuit<circN>:EMBED:TYPE?

Applicable Models: All

(Read only) Returns whether the circuit is embedded or de-embedded. Valid for all block Types

The block is create using CALCulate<cnum>:FSIMulator:DRAFt:CIRCuit[n]:ADD <block type>, <fixt port count> . Setting a value not used by the selected circuit will have no affect. Learn more.

Parameters

- <cnum> Any existing channel number. If unspecified, value is set to 1
- <circN> Circuit Number

Examples

- CALC:FSIM:CIRC:EMBED:TYPE?
- calculate2:fsimulator:circuit:embed:type?

Query Syntax

CALCulate<cnum>:FSIMulator:CIRCuit<circN>:EMBED:TYPE?

Return Type character

Default Not Applicable

CALCulate<cnum>:FSIMulator:CIRCuit<circN>:FILE?
Applicable Models: All

(Read only) Returns the filename. Valid blocks: FILE, D4PFile, FGLoop

The block is create using CALCulate<cnm>:FSIMulator:DRAFt:CIRCuit[n]:ADD <block type>, <fixt port count>. Setting a value not used by the selected circuit will have no affect. Learn more.

Parameters

- `<cnm>` Any existing channel number. If unspecified, value is set to 1
- `<circN>` Circuit Number

Examples

- CALC:FSIM:CIRC:FILE?
- calculate2:fsimulator:circuit:file?

Query Syntax

CALCulate<cnm>:FSIMulator:CIRCuit<circN>:FILE?

Return Type

string

Default

Not Applicable

---

CALCulate<cnm>:FSIMulator:CIRCuit<circN>:FILE:EXTRapolate?

Applicable Models: All

(Read only) Returns whether or not extrapolation is allowed (TRUE/FALSE). Valid blocks: FILE, D4PFile, FGLoop.

The block is create using CALCulate<cnm>:FSIMulator:DRAFt:CIRCuit[n]:ADD <block type>, <fixt port count>. Setting a value not used by the selected circuit will have no affect. Learn more.

Parameters

- `<cnm>` Any existing channel number. If unspecified, value is set to 1
- `<circN>` Circuit Number

Examples

- CALC:FSIM:CIRC:FILE:EXTR?
- calculate2:fsimulator:circuit:file:extrapolate?

Query Syntax

CALCulate<cnm>:FSIMulator:CIRCuit<circN>:FILE:EXTRapolate?

Return Type

Boolean

Default

Not Applicable
CALCulate<cnum>:FSIMulator:CIRCuit<circN>:FILE:MODify?

**Applicable Models:** All

*(Read-only)* Returns the current state of the Modify setting (NONE, NREFlect, or NXTalk). Set the Modify state using the CALCulate:FSIMulator:DRAFt:CIRCuit:FILE:MODify command. Learn more.

The block is created using CALCulate<cnum>:FSIMulator:DRAFt:CIRCuit<n>:ADD <block type>, <fixt port count>. Setting a value not used by the selected circuit will have no affect. Learn more.

**Parameters**
- `<cnum>` Any existing channel number. If unspecified, value is set to 1
- `<circN>` Circuit Number

**Examples**
- `CALC:FSIM:CIRC:PAR:C?`
- `calculate2:fsimulator:circuit:file:modify?`

**Query Syntax**
- `CALCulate<cnum>:FSIMulator:CIRCuit<circN>:FILE:MODify?`

**Return Type**
- Enumeration
  - Default: NONE

CALCulate<cnum>:FSIMulator:CIRCuit<circN>:PARameter:C?

**Applicable Models:** All

*(Read only)* Returns the capacitance (C) circuit element for the specified circuit. Valid blocks: RLGLoop, RCGLoop, CGGLoop, SLPC, PCBS, SCPL, PCP, PCPC, PCSC, SLPL, PLPL.

The block is created using CALCulate<cnum>:FSIMulator:DRAFt:CIRCuit<n>:ADD <block type>, <fixt port count>. Setting a value not used by the selected circuit will have no affect. Learn more.

**Parameters**
- `<cnum>` Any existing channel number. If unspecified, value is set to 1
- `<circN>` Circuit Number

**Examples**
- `CALC:FSIM:CIRC:PAR:C?`
- `calculate2:fsimulator:circuit:parameter:C?`

**Query Syntax**
- `CALCulate<cnum>:FSIMulator:CIRCuit<circN>:PARameter:C?`

**Return Type**
- Numeric
## Applicable Models: All

(Read only) Returns the capacitance (C2) circuit element for the specified circuit. Valid blocks: SLPC, PCSL, PLSC, SCPL, PLPC, SCPC, PCSC, SLPL, PLSL

The block is create using CALCulate<cnum>:FSIMulator:DRAFt:CIRCuit[n]:ADD <block type>, <fixt port count> . Setting a value not used by the selected circuit will have no affect. Learn more.

### Parameters
- **<cnum>** Any existing channel number. If unspecified, value is set to 1
- **<circN>** Circuit Number

### Examples
- `CALC:FSIM:CIRC:PAR:C2?`
- `calculate2:fsimulator:circuit:parameter:C2?`

### Query Syntax
- `CALCulate<cnum>:FSIMulator:CIRCuit<circN>:PARameter:C2?`

### Return Type
- Numeric

### Default
- 0

---

## Applicable Models: All

(Read only) Returns port extension delay in time. Valid blocks: ILIN.

The block is create using CALCulate<cnum>:FSIMulator:DRAFt:CIRCuit[n]:ADD <block type>, <fixt port count> . Setting a value not used by the selected circuit will have no affect. Learn more.

### Parameters
- **<cnum>** Any existing channel number. If unspecified, value is set to 1
- **<circN>** Circuit Number

### Examples
- `CALC:FSIM:CIRC:PAR:DEL?`
- `calculate2:fsimulator:circuit:parameter:delay?`

### Query Syntax
- `CALCulate<cnum>:FSIMulator:CIRCuit<circN>:PARameter:DEL?`
**CALCulate<cnum>:FSIMulator:CIRCuit<circN>:PARameter:G?**

**Applicable Models:** All

*(Read only)* Returns the conductance (G) circuit element for the specified circuit. Valid blocks: RLGLoop, RCGLoop, CGGLoop, SLPC, PCSL, PLSC, SCPL, PLPC, SCPC, PCSC, SLPL, PLSL.

The block is create using CALCulate<cnum>:FSIMulator:DRAFt:CIRCuit[n]:ADD <block type>, <fixt port count> . Setting a value not used by the selected circuit will have no affect. Learn more.

**Parameters**

- `<cnum>` Any existing channel number. If unspecified, value is set to 1
- `<circN>` Circuit Number

**Examples**

- `CALC:FSIM:CIRC:PAR:G?`
- `calculate2:fsimulator:circuit:parameter:g?`

**Query Syntax**

CALCulate<cnum>:FSIMulator:CIRCuit<circN>:PARameter:G?

**Return Type** Numeric

**Default** 0

---

**CALCulate<cnum>:FSIMulator:CIRCuit<circN>:PARameter:G2?**

**Applicable Models:** All

*(Read only)* Returns the conductance (G2) circuit element for the specified circuit. Valid blocks: SLPC, PCSL, PLSC, SCPL, PLPC, SCPC, PCSC, SLPL, PLSL.

The block is create using CALCulate<cnum>:FSIMulator:DRAFt:CIRCuit[n]:ADD <block type>, <fixt port count> . Setting a value not used by the selected circuit will have no affect. Learn more.

**Parameters**

- `<cnum>` Any existing channel number. If unspecified, value is set to 1
- `<circN>` Circuit Number
### CALCulate<cnum>:FSIMulator:CIRCuit<circN>:PARameter:G2?

**Examples**

CALC:FSIM:CIRC:PAR:G2?

calculate2:fsimulator:circuit:parameter:g2?

**Query Syntax**

CALCulate<cnum>:FSIMulator:CIRCuit<circN>:PARameter:G2?

**Return Type**

Numeric

**Default**

0

---

### CALCulate<cnum>:FSIMulator:CIRCuit<circN>:PARameter:L?

#### Applicable Models:

All

*(Read only)* Returns the inductance (L) circuit element for the specified circuit. Valid blocks: RLGLoop, RCGLoop, CGGLoop, SLPC, PCSL, SCPL, PLSC, SCPC, PCSC, SLPL, PLSL.

The block is created using CALCulate<cnum>:FSIMulator:DRAFt:CIRCuit[n]:ADD <block type>, <fixt port count>. Setting a value not used by the selected circuit will have no effect. Learn more.

**Parameters**

- `<cnum>` Any existing channel number. If unspecified, value is set to 1
- `<circN>` Circuit Number

**Examples**

CALC:FSIM:CIRC:PAR:L?

calculate2:fsimulator:circuit:parameter:l?

**Query Syntax**

CALCulate<cnum>:FSIMulator:CIRCuit<circN>:PARameter:L?

**Return Type**

Numeric

**Default**

0

---

### CALCulate<cnum>:FSIMulator:CIRCuit<circN>:PARameter:L2?

**Examples**

CALC:FSIM:CIRC:PAR:L2?

**Default**

0

---

3446
Applicable Models: All

(Read only) Returns the inductance (L2) circuit element for the specified circuit. Valid blocks: SLPC, PCSL, PLSC, SCPL, PLPC, SCPC, PCSC, SLPL, PLSL.

The block is created using CALCulate<cn>:FSIMulator:DRAFt:CIRCuit<n>:ADD <block type>, <fixt port count> . Setting a value not used by the selected circuit will have no affect. Learn more.

**Parameters**

- `<cn>` Any existing channel number. If unspecified, value is set to 1
- `<circN>` Circuit Number

**Examples**

```
CALC:FSIM:CIRC:PAR:L2?
CALCulate2:fsimulator:circuit:parameter:l2?
```

**Query Syntax**

```
CALCulate<cn>:FSIMulator:CIRCuit<circN>:PARameter:L2?
```

**Return Type**

Numeric

**Default**

0

CALCulate<cn>:FSIMulator:CIRCuit<circN>:PARameter:LOSS:VALue?

Applicable Models: All

(Read only) Returns the loss at DC. Valid blocks: ILIN.

The block is created using CALCulate<cn>:FSIMulator:DRAFt:CIRCuit<n>:ADD <block type>, <fixt port count> . Setting a value not used by the selected circuit will have no affect. Learn more.

**Parameters**

- `<cn>` Any existing channel number. If unspecified, value is set to 1
- `<circN>` Circuit Number

**Examples**

```
CALC:FSIM:CIRC:PAR:LOSS:VAL?
CALCulate2:fsimulator:circuit:parameter:loss:value?
```

**Query Syntax**

```
CALCulate<cn>:FSIMulator:CIRCuit<circN>:PARameter:LOSS:VALue?
```

**Return Type**

Numeric

**Default**

0
CALCulate\(<\text{cnum}>\):FSIMulator:CIRCuit\(<\text{circN}>\):PARameter:R?

**Applicable Models:** All

*(Read only)* Returns the resistance (R) circuit element for the specified circuit. Valid blocks: RLGLoop, RCGLoop, CGGLoop, SLPC, PCSL, PLSC, PLPC, SCPC, PCSC, SLPL, PLSL.

The block is create using CALCulate\(<\text{cnum}>\):FSIMulator:DRAFt:CIRCuit\([n]\):ADD <block type>, <fixt port count> . Setting a value not used by the selected circuit will have no affect. Learn more.

**Parameters**

- \(<\text{cnum}>\): Any existing channel number. If unspecified, value is set to 1
- \(<\text{circN}>\): Circuit Number

**Examples**

CALC:FSIM:CIRC:PAR:R?
calculate2:fsimulator:circuit:parameter:r?

**Query Syntax**

CALCulate\(<\text{cnum}>\):FSIMulator:CIRCuit\(<\text{circN}>\):PARameter:R?

**Return Type**

Numeric

**Default**

0

---

CALCulate\(<\text{cnum}>\):FSIMulator:CIRCuit\(<\text{circN}>\):PARameter:R2?

**Applicable Models:** All

*(Read only)* Returns the resistance (R2) circuit element for the specified circuit. Valid blocks: SLPC, PCSL, PLSC, SCPL, PLPC, SCPC, PCSC, SLPL, PLSL

The block is create using CALCulate\(<\text{cnum}>\):FSIMulator:DRAFt:CIRCuit\([n]\):ADD <block type>, <fixt port count> . Setting a value not used by the selected circuit will have no affect. Learn more.

**Parameters**

- \(<\text{cnum}>\): Any existing channel number. If unspecified, value is set to 1
- \(<\text{circN}>\): Circuit Number

**Examples**

CALC:FSIM:CIRC:PAR:R?
calculate2:fsimulator:circuit:parameter:r2?

**Query Syntax**

CALCulate\(<\text{cnum}>\):FSIMulator:CIRCuit\(<\text{circN}>\):PARameter:R2?

**Return Type**

Numeric

**Default**

0
CALCulate<cn>:FSIMulator:CIRCuit<cn>:PARameter:RIN?

**Applicable Models:** All

*(Read only)* Returns the resistance (R) value at input of transformer (real only). Valid blocks: TRANs

The block is created using CALCulate<cn>:FSIMulator:DRAFt:CIRCuit[n]:ADD <block type>,<fixt port count>. Setting a value not used by the selected circuit will have no affect. Learn more.

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>

</tr>
</tbody>
</table>

**Query Syntax**

CALCulate<cn>:FSIMulator:CIRCuit<cn>:PARameter:RIN?

**Return Type**

Numeric

**Default**

0

---

CALCulate<cn>:FSIMulator:CIRCuit<cn>:PARameter:ROUT?

**Applicable Models:** All

*(Read only)* Returns the resistance (R) value at output of transformer (real only). Valid blocks: TRANs

The block is created using CALCulate<cn>:FSIMulator:DRAFt:CIRCuit[n]:ADD <block type>,<fixt port count>. Setting a value not used by the selected circuit will have no affect. Learn more.

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;cn&gt;</td>
<td>Any existing channel number. If unspecified, value is set to 1</td>

**Query Syntax**

CALCulate<cn>:FSIMulator:CIRCuit<cn>:PARameter:ROUT?

**Return Type**

Numeric

**Default**

0
### CALCulate<nun>:FSIMulator:CIRCuit<circN>:PARameter:Z0?

**Applicable Models:** All

*(Read only)* Returns the Impedance (Z0) for the ideal block (scalar value). Valid blocks: ILIN.

The block is create using CALCulate<nun>:FSIMulator:DRAFt:CIRCuit[n]:ADD <block type>, <fixt port count> . Setting a value not used by the selected circuit will have no affect. Learn more.

<table>
<thead>
<tr>
<th>Parameters</th>
<th></th>

</thead>
<tbody>
<tr>
<td><code>CALC:FSIM:CIRC:PAR:Z0?</code></td>
<td></td>
</tr>
<tr>
<td><code>calculate2:fsimulator:circuit:parameter:z0?</code></td>
<td></td>
</tr>
</tbody>
</table>

**Default**

0

### CALCulate<nun>:FSIMulator:CIRCuit<circN>:STATe?

**Applicable Models:** All

*(Read only)* Returns the circuit ON/OFF. Valid for all block types

The block is create using CALCulate<nun>:FSIMulator:DRAFt:CIRCuit[n]:ADD <block type>, <fixt port count> . Setting a value not used by the selected circuit will have no affect. Learn more.

<table>
<thead>
<tr>
<th>Parameters</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;nun&gt;</td>
<td>Any existing channel number. If unspecified, value is set to 1</td>

<tbody>
<tr>
<td><code>CALC:FSIM:CIRC:STAT?</code></td>
<td></td>
</tr>
<tr>
<td><code>calculate2:fsimulator:circuit:state?</code></td>
<td></td>
</tr>
</tbody>
</table>

**Default**

OFF
CALCulate<cnum>:FSIMulator:CIRCuit<circN>:VNA:PORTs? <port list>

**Applicable Models:** All

*(Read only)* Returns the VNA ports for the specified circuit.

**Parameters**
- `<cnum>` Any existing channel number. If unspecified, value is set to 1
- `<circN>` Circuit Number

**Examples**
- CALC:FSIM:CIRC:VNA:PORT?
- calculate2:fsimulator:circuit:vna:ports?

**Query Syntax**
- CALCulate<cnum>:FSIMulator:CIRCuit<circN>:VNA:PORTs?

**Return Type** Numeric

**Default** Not Applicable

CALCulate<cnum>:FSIMulator:EXTension:PORT<pnum>:DELay

**Applicable Models:** All

*(Read-Write)* Returns the delay value in time at the specified port.

**Note:** This command affects ALL measurements on the specified channel.

**Parameters**
- `<cnum>` Any existing channel number. If unspecified, value is set to 1.
- `<pnum>` Port Number that will receive the delay setting. If unspecified, value is set to 1.
- `<value>` The port extension in seconds; may include suffix. Choose a number between: -1E18 and 1E18 e.

**Examples**
- CALC:FSIM:EXT:PORT1:DEL?
- calculate2:fsimulator:extension:port2:delay?

**Query Syntax**
- CALCulate<cnum>:FSIMulator:EXTension:PORT<pnum>:DELay?

**Return Type** Numeric

**Default** 0

CALCulate<cnum>:FSIMulator:EXTension:PORT<pnum>:DISTance:UNIT
Applicable Models: All

(Read-only) Returns the units for specifying port extension delay in physical length (distance).

**Parameters**

- `<cnum>` Any existing channel number. If unspecified, value is set to 1.
- `<pnum>` Port Number. This number is ignored and all ports have the same setting.
- `<char>` Units for delay in distance. Choose from:
  - METer
  - FEET
  - INCH

**Examples**

```
calculate:fsimulator:extension:port2:distance:unit?
calculate:fsimulator:extension:port3:distance:unit?
```

**Query Syntax**

```
CALCulate<cnum>:FSIMulator:EXTension:PORT:DISTance:UNIT?
```

**Return Type** Character

**Default** METer

---

**CALCulate<cnum>:FSIMulator:EXTension:PORT<pnum>:DISTance:VALue**

Applicable Models: All

(Read-only) Returns the port extension delay in physical length (distance).

**Parameters**

- `<cnum>` Any existing channel number. If unspecified, value is set to 1.
- `<pnum>` Port Number that will receive the delay setting. If unspecified, value is set to 1.
- `<value>` Physical length of fixture of added transmission line.

**Examples**

```
CALC:FSIM:EXT:PORT1:DIST:VAL?
calculate:fsimulator:extension:port2:distance:value?
```

**Query Syntax**

```
CALCulate<cnum>:FSIMulator:EXTension:PORT<pnum>:DISTance:VALue?
```

**Return Type** Numeric

**Default** 0
CALCulate<cnum>:FSIMulator:EXTension:PORT<pnum>:LOSS<n>:FREQuency

Applicable Models: All

(Read-only) Returns the frequency for the Freq and Loss pair number and for the specified port number.

Learn about Loss Compensation values.

Parameters

- `<cnum>`: Any existing channel number. If unspecified, value is set to 1.
- `<pnum>`: Port Number that will receive the freq/loss settings. If unspecified, value is set to 1.
- `<n>`: Freq and Loss pair number. Choose from 1 or 2. If unspecified, value is set to 1.
- `<value>`: Frequency value. Choose a frequency within the frequency span of the VNA.

Examples

```
CALC:FSIM:EXT:PORT1:LOSS2:FREQ?
calculate:fsimulator:extension:port2:loss1:frequency?
```

Query Syntax

CALCulate<cnum>:FSIMulator:EXTension:PORT<pnum>:LOSS<n>:FREQuency?

Return Type: Numeric

Default: 1 GHz

---

CALCulate<cnum>:FSIMulator:EXTension:PORT<pnum>:LOSS<n>:VALue

Applicable Models: All

(Read-only) Returns the Loss value for the specified port number.

Learn about Loss Compensation values.

Note: This command affects ALL measurements on the specified channel.

Parameters

- `<cnum>`: Any existing channel number. If unspecified, value is set to 1.
- `<pnum>`: Port Number that will receive the Freq/Loss settings. If unspecified, value is set to 1.
- `<n>`: Loss "Use" number. Choose from 1 or 2. If unspecified, value is set to 1.
- `<value>`: Loss in dB. Choose a value between -90 and 90.
CALCulate\(<cnum>\):FSIMulator:EXTension:PORT\(<pnum>\):LOSS\(\langle n\rangle\):VALue?

**Query Syntax**
CALCulate\(<cnum>\):FSIMulator:EXTension:PORT\(<pnum>\):LOSS\(\langle n\rangle\):VALue?

**Return Type**
Numeric

**Default**
0

CALCulate\(<cnum>\):FSIMulator:EXTension:PORT\(<pnum>\):LOSS\(\langle n\rangle\)[:STATe]

**Applicable Models:** All

(Read-only) Returns the ON/OFF state for the Freq and Loss pair number and for the specified port number.

Learn about Loss Compensation values.

**Note:** This command affects ALL measurements on the specified channel.

**Parameters**
- \(<cnum>\) Any existing channel number. If unspecified, value is set to 1
- \(<pnum>\) Port Number that will receive the Freq/Loss settings. If unspecified, value is set to 1.
- \(<n>\) Freq and Loss pair. Choose from 1 or 2. If unspecified, value is set to 1.
- \(<value>\) State of Freq and Loss values for port extension.

**Examples**
- Specified Freq and Loss values are OFF
- Specified Freq and Loss values are ON

CALC:FSIM:EXT:PORT:LOSS1:STAT?
calculate:fsimulator:extension:port2:loss2:state?

**Query Syntax**
CALCulate\(<cnum>\):FSIMulator:EXTension:PORT\(<pnum>\):LOSS\(\langle n\rangle\)[:STATe]?

**Return Type**
Boolean

**Default**
OFF

CALCulate\(<cnum>\):FSIMulator:EXTension:PORT\(<pnum>\):DCLoss:VALue

3454
**Applicable Models:** All

*(Read-only)* Returns the Port Loss at DC value for the specified port number.

Learn about Loss Compensation values.

**Note:** This command affects ALL measurements on the specified channel.

**Parameters**

- `<cnum>` Any existing channel number. If unspecified, value is set to 1
- `<pnum>` Port number to receive Loss value. If unspecified, value is set to 1.
- `<value>` Loss in dB. Choose a value between -90 and 90

**Examples**

```
CALC:FSIM:EXT:PORT:DCL:VAL?
calculate:fsimulator:extension:port2:dcloss:value?
```

**Query Syntax**

`CALCulate<cnum>:FSIMulator:EXTension:PORT<pnum>:DCLoss:VALue?`

**Return Type**

Numeric

**Default**

0

---

**CALCulate<cnum>:FSIMulator:EXTension:PORT<pnum>:MEDium**

**Applicable Models:** All

*(Read-only)* Returns the media type of the added fixture or transmission line.

See also SENS:CORR:EXT:PORT:SYSMedia

**Note:** This command affects ALL measurements on the specified channel.

**Parameters**

- `<cnum>` Any existing channel number. If unspecified, value is set to 1
- `<pnum>` Port Number. This number is ignored and all ports have the same setting.
- `<char>` Medium type. Choose from:

  - COAX
  - WAVEguide
**Examples**

`CALC:FSIM:EXT:PORT:MED?`

`calculate:fsimulator:extension:port2:medium?`

**Query Syntax**

`CALCulate<cnum>:FSIMulator:EXTension:PORT<pnum>:MEDium?`

**Return Type**

Character

**Default**

`COAX`

---

`CALCulate<cnum>:FSIMulator:EXTension:PORT<pnum>:WAVEguide:FCUToff`

**Applicable Models:** All

*(Read-only)* Returns the cutoff (minimum) frequency of the added waveguide fixture or transmission line.

**Parameters**

- `<cnum>` Any existing channel number. If unspecified, value is set to 1
- `<pnum>` Port Number for which media type is being set. If unspecified, value is set to 1.
- `<value>` Cutoff frequency in Hz.

This value is ignored when `CALC:FSIM:EXT:PORT:MED` is set to **COAX** for the same port.

**Examples**

`CALC:FSIM:EXT:PORT:WAVE:FCUT?`

`calculate:fsimulator:extension:port2:waveguide:cutoff?`

**Query Syntax**

`CALCulate<cnum>:FSIMulator:EXTension:PORT<pnum>:WAVEguide:FCUToff?`

**Return Type**

Numeric

**Default**

System Media Cutoff Frequency

---

`CALCulate<cnum>:FSIMulator:EXTension:PORT<pnum>:WAVEguide:COUPlE`
**Applicable Models:** All

*(Read-only)* Returns the state of coupling with the system Velocity Factor value. Learn more.

**Note:** This command potentially affects ALL measurements on the VNA.

**Parameters**

- `<cnum>` Any existing channel number. If unspecified, value is set to 1
- `<pnum>` Port Number. This number is ignored and all ports have the same setting.
- `<bool>` Coupling state. Choose from:
  - **ON** (or 1) - Velocity Factor is coupled with the system setting.
  - **OFF** (or 0) - Velocity Factor is NOT coupled with the system setting.

**Examples**

```
CALC:FSIM:EXT:PORT:WAVE:COUP?
calculate:fsimulator:extension:port2:waveguide:couple?
```

**Query Syntax**

`CALCulate<cnum>:FSIMulator:EXTension:PORT<pnum>:WAVEguide:COUPle?`

**Return Type** Boolean

**Default** 1 or ON (Coupled)

---

**CALCulate<cnum>:FSIMulator:EXTension:PORT<pnum>:VELocity:FACtor**

**Applicable Models:** All

*(Read-only)* Returns the velocity factor of the fixture or added transmission line.

**Parameters**

- `<cnum>` Any existing channel number. If unspecified, value is set to 1
- `<pnum>` Port Number for which velocity factor is being set. If unspecified, value is set to 1.
- `<value>` Velocity Factor.

Set `SENS:CORR:EXT:PORT:SYSV` to use the system velocity factor.

**Examples**

```
CALC:FSIM:EXT:PORT:VEL:FAC?
calculate:fsimulator:extension:port2:velocity:factor?
```

**Query Syntax**

`CALCulate<cnum>:FSIMulator:EXTension:PORT<pnum>:VELocity:FACtor?`
**Return Type**  Numeric  
**Default**  System Velocity Factor

CALCulate\<cnum\>:FSIMulator:EXTension:PORT\<pnum\>:VELocity:COUPle

**Applicable Models:** All

*(Read-only)* Returns the state of coupling with the system Velocity Factor value. Learn more.

**Note:** This command potentially affects ALL measurements on the VNA.

**Parameters**

- `<cnum>`  Any existing channel number. If unspecified, value is set to 1
- `<pnum>`  Port Number. This number is ignored and all ports have the same setting.
- `<bool>`  Coupling state. Choose from:

  - **ON** (or 1) - Velocity Factor is coupled with the system setting.
  - **OFF** (or 0) - Velocity Factor is NOT coupled with the system setting.

**Examples**

```
CALC:FSIM:EXT:PORT:VEL:COUP?
calculate:fsimulator:extension:port2:velocity:couple?
```

**Query Syntax**  
CALCulate\<cnum\>:FSIMulator:EXTension:PORT\<pnum\>:VE locality:COUPle?

**Return Type**  Boolean

**Default**  1 or ON (Coupled)
Applicable Models: All

(Read-only) Returns the state of port extension for the specified port.

Note: This command potentially affects ALL measurements on the VNA.

Parameters

- `<cnum>` Any existing channel number. If unspecified, value is set to 1
- `<pnum>` Port Number for which port extension is being set. If unspecified, value is set to 1.
- `<bool>` Port extension state. Choose from:
  - **ON** (or 1) - Port extension is on
  - **OFF** (or 0) - Port extension is off.

Examples

```
CALC:FISM:EXT:PORT:STAT?
calculate:fimulator:extension:port2:state?
```

Query Syntax

CALCulate `<cnum>`:FSimulator:EXTension:PORT `<pnum>`[:STATe]?

Return Type

Boolean

Default

0

---

CALCulate `<cnum>`:FSIMulator:POWer:COMPensate:MODE `<char>`

Applicable Models: All

(Read-Write) Adjust the source power compensation for gain/loss through “ALL” fixture components or through “DEEMbed” components only.

Parameters

- `<cnum>` Any existing channel number. If unspecified, value is set to 1
- `<char>` Mode selection. Choose from:
  - **ALL**
  - **DEEMbed**

Examples

```
CALC:FISM:POW:COMP:MODE ALL
calculate:fimulator:power:compensate:mode deembed
```
**Query Syntax** | CALCulate<cnum>:FSIMulator:POWer:COMPensate:MODE?
---|---
**Return Type** | Character
**Default** | ALL

**CALCulate<cnum>:FSIMulator:POWer:PORT<pnum>:COMPensate[:STATe] <bool>**

**Applicable Models:** All

*(Read-Wrrite)* Sets and returns on power compensation for the active fixture

**Parameters**

- `<cnum>` Any existing channel number. If unspecified, value is set to 1
- `<pnum>` Port Number for which port extension is being set. If unspecified, value is set to 1.
- `<bool>` power compensation state. Choose from:
  - **ON** (or 1) - Power compensation is on
  - **OFF** (or 0) - Power compensation is off.

**Examples**

```
CALC:FSIM:EXT:POW:PORT ON
calculate:fsimulator:power:port:compensate 0
```

**Query Syntax** | CALCulate<cnum>:FSIMulator:POWer:PORT[p]:COMPensate[:STATe]?
---|---
**Return Type** | Boolean
**Default** | 0

**CALCulate<cnum>:FSIMulator:SAVE <snpName>**
Applicable Models: All

(Write only) Saves SNP file corresponding to the entire active fixture.

**Parameters**

<snpName> String - snp file name. Appends ".sNp" depending on num ports

**Example**

```
CALC:FSIM:SAVE "myFixture"
```

```
calculate:fsimulator:save "D:\myfixture"
```

**Return Type** Not applicable

**Default** Not applicable

---

CALCulate<cnum>:FSIMulator:SECTion:CIRCuit:ENABle?

Applicable Models: All

(Read only) Returns all circuits ON/OFF for all ports.

**Parameters**

<cnum> Any existing channel number. If unspecified, value is set to 1

**Examples**

```
CALC:FSIM:SECT:CIRC:ENAB?
```

```
calculate2:fsimulator:section:circuit:enable?
```

**Query Syntax**

CALCulate<cnum>:FSIMulator:SECTion:CIRCuit:ENABle?

**Return Type** Boolean (1 = ON, 0 = OFF)

**Default** OFF

---

CALCulate<cnum>:FSIMulator:SECTion:EXTension:ENABle?
Applicable Models: All

(Read only) Returns the port extensions ON/OFF for all ports.

Parameters
<cnm> Any existing channel number. If unspecified, value is set to 1

Examples
CALC:FSIM:DRAF:SECT:EXT:ENAB?
calculate2:fsimulator:draft:section:extension:enable?

Query Syntax
CALCulate<cnm>:FSIMulator:DRAFt:SECTion:EXTension:ENABle?

Return Type
Boolean (1 = ON, 0 = OFF)

Default
OFF

Applicable Models: All

(Read only) Returns all ZConversions ON/OFF (both SE and BAL).

Parameters
<cnm> Any existing channel number. If unspecified, value is set to 1

Examples
CALC:FSIM:DRAF:SECT:ZCON:ENAB?
calculate2:fsimulator:draft:section:zconversion:enable?

Query Syntax
CALCulate<cnm>:FSIMulator:DRAFt:SECTion:ZCONversion:ENABle?

Return Type
Boolean (1 = ON, 0 = OFF)

Default
OFF

CALCulate<cnm>:FSIMulator:TOPology:LOAD <fileName>
(Write only) Loads an active fixture from a file.

**Parameters**
- `<fileName>`: Fixture topology file name.

**Example**
```
CALC:FSIM:TOP:LOAD "example.topo"
calculate:fsimulator:topology:load "example.topo"
```

**Return Type**: Not applicable

**Default**: Not applicable

---

CALCulate<cnum>:FSIMulator:TOPology:SAVE <fileName>

(Write only) Saves the current active fixture topology to a file.

**Parameters**
- Not applicable

**Example**
```
CALC:FSIM:TOP:SAVE "example.topo"
calculate:fsimulator:topology:save "example.topo"
```

**Return Type**: Not applicable

**Default**: Not applicable

---

CALCulate<cnum>:FSIMulator:ZCONversion:DIFFerential:STATe
Applicable Models: All

(Read Only) Returns the differential port impedance conversion function ON/OFF.

Parameters

<cnum> Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, <cnum> is set to 1.

Examples

CALC:FSIM:ZCON:DIFF:STAT?
calculate2:fsimulator:zconversion:DIFFerential:state?

Query Syntax

CALCulate<cnum>:FSIMulator:ZCONversion:DIFFerential:STATe?

Return Type

Boolean

0 Differential port impedance conversion OFF

1 Differential port impedance conversion ON

Default 0

CALCulate<cnum>:FSIMulator:ZCONversion:DIFFerential:BPORt<pnum>:COMPLex

Applicable Models: All

(Read-Only) Returns the complex impedance value for the differential port impedance conversion function.

Parameters

<cnum> Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, <cnum> is set to 1.

<pnum> Balanced port number. Choose from 1 to 999.

Note: See Balanced port versus Logical port.

Examples

CALC:FSIM:ZCON:DIFF:BPOR2:COMPL?

Query Syntax

CALCulate<cnum>:FSIMulator:ZCONversion:DIFFerential:BPORt<pnum>:COMPLex?

Return Type

Numeric <real>,<img>

Real part of the Impedance value in Units, Imaginary part of the Impedance value in Units.
CALCulate<cnum>:FSIMulator:ZCONversion:DIFFerential:BPORt<pnum>:SCALar

**Applicable Models:** All

(Read Only) Returns the real part of impedance value for the differential port impedance conversion function.

**Parameters**

- `<cnum>`: Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, `<cnum>` is set to 1.
- `<pnum>`: Balanced port number. Choose from 1 to 999.

**Note:** See Balanced port versus Logical port.

**Examples**

```
CALC:FSIM:ZCON:DIFF:BPOR2:SCAL 200,10
```

**Query Syntax**

CALCulate<cnum>:FSIMulator:ZCONversion:DIFFerential:BPORt<pnum>:SCALer?

**Return Type**

- Numeric
- Real part of the Impedance value in Units

**Default**

0

---

CALCulate<cnum>:FSIMulator:ZCONversion:DIFFerential:LPORt<pnum>:COMPLex
Applicable Models: All

(Read Only) Returns the complex impedance value for the common mode port impedance conversion function.

Parameters

<cnum> Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, <cnum> is set to 1.
<pnum> Logical port number. Choose from 1 to 999.

Note: See Balanced port versus Logical port.

Examples

</tbody>
</table>

CALCulate<cnum>:FSIMulator:ZCONversion:DIFFerential:LPORt<pnum>:SCALar

Applicable Models: All

(Read Write) Returns the real part of impedance value for the differential mode port impedance conversion function.

See Critical Note

Parameters

<cnum> Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, <cnum> is set to 1.
<pnum> logical port number. Choose from 1 to 999.

Note: See Balanced port versus Logical port.

**Query Syntax**

CAlCulate<cnum>:FSIMulator:ZCONversion:DIfferential:LPORt<pnum>:SCALer?

**Return Type**

Numeric

Real part of the Impedance value in Units

**Default**

0

**CALCulate<cnum>:FSIMulator:ZCONversion:COMMonmode:STATe**

**Applicable Models:** All

(Read Only) Returns the common mode port impedance conversion function ON/OFF.

**Parameters**

<cnum> Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, <cnum> is set to 1.

**Examples**

CALC:FSIM:ZCON:COMM:STAT?
calculate2:fsimulator:zconversion:commonmode:state?

**Query Syntax**

CAlCulate<cnum>:FSIMulator:COMMonmode:DIfferential:STATe?

**Return Type**

Boolean

0 Common mode port impedance conversion OFF

1 Common mode port impedance conversion ON

**Default**

0

**CALCulate<cnum>:FSIMulator:ZCONversion:COMMonmode:BPORt<pnum>:COMPLex**

Applicable Models: All

(Read-Write) Returns the complex impedance value for the common mode port impedance conversion function.

Parameters

- `<cnum>` Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, `<cnum>` is set to 1.
- `<pnum>` Balanced port number. Choose from 1 to 999.

Note: See Balanced port versus Logical port.

Examples

- `CALC:FSIM:ZCON:COMM:BPOR2:COMPL?`

Query Syntax

`CALCulate<cnum>:FSIMulator:ZCONversion:COMMonmode:BPORt<pnum>:COMPlex?`

Return Type

Numeric `<real>,<img>`

Real part of the Impedance value in Units, Imaginary part of the Impedance value in Units

Default

0,0

CALCulate<cnum>:FSIMulator:ZCONversion:COMMonmode:BPORt<pnum>:SCALar

Applicable Models: All

(Read Only) Returns the real part of impedance value for the common mode port impedance conversion function.

Parameters

- `<cnum>` Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, `<cnum>` is set to 1.
- `<pnum>` Balanced port number. Choose from 1 to 999.

Note: See Balanced port versus Logical port.

Examples

Query Syntax

`CALCulate<cnum>:FSIMulator:ZCONversion:COMMonmode:BPORt<pnum>:SCALar?`
**CALCulate<cnum>:FSIMulator:ZCONversion:COMMONmode:LPORt<pnum>:COMPLex**

**Applicable Models:** All

*(Read Only)* Returns the complex impedance value for the common mode port impedance conversion function.

**Parameters**

- `<cnum>` Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, `<cnum>` is set to 1.
- `<pnum>` Logical port number. Choose from 1 to 999.

**Note:** See Balanced port versus Logical port.

**Examples**

```
CALC:FSIM:ZCON:COMM:LPOR2:COMPL?
calculate2:fsimulator:zconversion:commonmode:lport2:complex?
```

**Query Syntax**

```
CALCulate<cnum>:FSIMulator:ZCONversion:COMMONmode:LPORt<pnum>:COMPLex
```

**Return Type**

Numeric `<real>,<img>`

Real part of the Impedance value in Units, Imaginary part of the Impedance value in Units.

**Default**

0,0
**Applicable Models:** All

*(Read Only)* Returns the real part of impedance value for the common mode port impedance conversion function.

**Parameters**

- `<cnum>` Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, `<cnum>` is set to 1.
- `<pnum>` logical port number. Choose from 1 to 999.

**Note:** See Balanced port versus Logical port.

**Examples**

```
CALC:FSIM:ZCON:COMM:LPOR2:SCAL?
calculate2:fsimulator:zconversion:commonmode:lport2:scalar?
```

**Query Syntax**

CALCulate`<cnum>`:FSIMulator:ZCONversion:COMMonmode:LPORt`<pnum>`:SCALer?

**Return Type** Numeric, Real part of the Impedance value in Units.

**Default** 0

---

**CALCulate`<cnum>`:FSIMulator:ZCONversion:SENDed:PORt`<pnum>`:STATe**

**Applicable Models:** All

*(Read Only)* Returns the single-ended impedance conversion function ON/OFF. Must also set the fixture simulator function to ON using CALC:FSIM:STAT.

**Parameters**

- `<cnum>` Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, `<cnum>` is set to 1.
- `<pnum>` Port number. Choose from 1 to 999.

**Examples**

```
CALC:FSIM:ZCON:SEND:PORT3:STAT?
calculate2:fsimulator:zconversion:sended:port2:state?
```

**Query Syntax**

CALCulate`<cnum>`:FSIMulator:ZCONversion:SENDed:PORt`<pnum>`:STATe?

**Return Type** Boolean

0 single-ended port impedance conversion OFF

1 single-ended port impedance conversion ON
CALCulate<cnum>:FSIMulator:ZCONversion:SENDed:PORt<pnum>:COMPLex

Applicable Models: All

(Read Only) Returns the complex impedance value for the single-ended port impedance conversion function.

Parameters

- `<cnum>`: Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, `<cnum>` is set to 1.
- `<pnum>`: Pport number. Choose from 1 to 999.

Examples

```
CALC:FSIM:ZCON:SEND:POR2:COMPL?
calculate2:fsimulator:zconversion:sended:port2:complex?
```

Query Syntax

```
CALCulate<cnum>:FSIMulator:ZCONversion:SENDed:PORt<pnum>:COMPLex?
```

Return Type

Numeric `<real>`, `<img>`

Real part of the Impedance value in Units, Imaginary part of the Impedance value in Units.

Default 0,0

CALCulate<cnum>:FSIMulator:ZCONversion:SENDed:PORT<pnum>:SCALer

Applicable Models: All

(Read Only) Returns the real part of impedance value for the single-ended port impedance conversion function.

See Critical Note

Parameters

- `<cnum>`: Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, `<cnum>` is set to 1.
- `<pnum>`: Pport number. Choose from 1 to 999.

Examples

```
CALC:FSIM:ZCON:SEND:PORT:SCAL?
calculate2:fsimulator:zconversion:sended:port2:scalar?
```

Query Syntax

```
CALCulate<cnum>:FSIMulator:ZCONversion:SENDed:PORT<pnum>:SCALer?
```

**Calculate:Function Commands**

These commands are **Superseded** by the `CALCulate:MEASure:FUNCtion` commands.

---

Click on a keyword to view the command details.

**see Also**

- [Example Programs](#)
- [Learn about Trace Statistics](#)
- [Synchronizing the Analyzer and Controller](#)
- [SCPI Command Tree](#)

**Critical Note:** `CALCulate` commands act on the selected measurement. You can select one measurement for each channel using `Calc:Par:MNUM` or `Calc:Par:Select`. Learn more.

```
CALCulate<cnum>:FUNCtion:DATA?
```

3473
**Applicable Models:** N522xB, N523xB, N524xB, M937xA, P937xA

*(Read-only)* Returns the trace statistic data for the selected statistic type for the specified channel. Select the type of statistic with `CALC:FUNC:TYPE`.

See Critical Note

**Parameters**

- `<cnum>` Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, `<cnum>` is set to 1.

**Return Type** Depends on `FORM:DATA`

**Example**

```
CALCulate2:FUNCtion:DATA?
```

**Default** Not applicable

---

**CALCulate<cnum>:FUNCtion:DOMain:USER[:RANGE] <range>**

**Applicable Models:** N522xB, N523xB, N524xB, M937xA, P937xA

*(Read-Write)* Sets the range used to calculate trace statistics. Each channel has 16 user ranges. The x-axis range is specified with the `CALC:FUNC:DOM:USER:START` and `STOP` commands.

See Critical Note

**Parameters**

- `<cnum>` Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, `<cnum>` is set to 1.
- `<range>` Range number. Choose from: 0 to 16
  - 0 is Full Span of the current x-axis range
  - 1 to 16 are user-specified ranges

**Examples**

- `CALC:FUNC:DOM:USER 4`
- `calculate2:function:domain:user:range 0`

**Query Syntax** `CALCulate<cnum>:FUNCtion:DOMain:USER[:RANGe]?`

**Return Type** Numeric

**Default** 0 - Full Span

---

**CALCulate<cnum>:FUNCtion:DOMain:USER:STARt <range>, <start>**
Applicable Models: N522xB, N523xB, N524xB, M937xA, P937xA

(Read-Write) Sets the start of the specified user-domain range.

To apply this range, use **CALC:FUNC:DOM:USER**

To set the stop of the range, use **CALC:FUNC:DOM:USER:STOP**.

See Critical Note

**Note:** This command does the same as **CALC:MARK:FUNC:DOM:USER:STAR**

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>

<tbody>
<tr>
<td><code>&lt;cnum&gt;</code></td>
<td>Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, <code>&lt;cnum&gt;</code> is set to 1.</td>
</tr>
<tr>
<td><code>&lt;range&gt;</code></td>
<td>Range number that will receive the start value. Choose an integer between 1 and 16</td>
</tr>
<tr>
<td><code>&lt;start&gt;</code></td>
<td>Start value of the specified range. Choose a real number between: the analyzer's <strong>Minimum</strong> and <strong>Maximum</strong> x-axis value.</td>
</tr>
</tbody>
</table>

**Examples**

```
CALC:FUNC:DOM:USER:STAR 1,1e9
calculate2:function:domain:user:start 2,2e9
```

**Query Syntax**

```
CALCulate<cnum>:FUNCtion:DOMain:USER:STARt? <range>
```

**Return Type**

Numeric

**Default**

The analyzer's **Minimum** x-axis value

---

**CALCulate<cnum>:FUNCtion:DOMain:USER:STOP** `<range>`, `<stop>`

Applicable Models: N522xB, N523xB, N524xB, M937xA, P937xA

(Read-Write) Sets the stop value of the specified user-domain range.

To apply this range, use **CALC:FUNC:DOM:USER**.

To set the start of the range, use **CALC:FUNC:DOM:USER:START**

See Critical Note

**Note:** This command does the same as **CALC:MARK:FUNC:DOM:USER:STOP**

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>&lt;cnum&gt;</code></td>
<td>Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, <code>&lt;cnum&gt;</code> is set to 1.</td>
</tr>
</tbody>
</table>
Range number that will receive the stop value. Choose an integer between 1 and 16.

Stop value of the specified range. Choose a real number between: the analyzer's Minimum and Maximum x-axis value.

**Examples**

```
CALC:FUNC:DOM:USER:STOP 4,5e9
```

```
calculate2: function: domain: user: stop 3,8e9
```

**Query Syntax**

```
CALCulate<cnum>:FUNCtion:DOMain:USER:STOP? <range>
```

**Return Type**

Numeric

**Default**

The analyzer's Maximum x-axis value

---

**CALCulate<cnum>:FUNCtion:EXECute**

**Applicable Models:** N522xB, N523xB, N524xB, M937xA, P937xA

*(Write-only)* For the active trace of specified channel, executes the statistical analysis specified by the **CALC:FUNC:TYPE** command.

**See Critical Note**

**Parameters**

**<cnum>**

Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, <cnum> is set to 1.

**Examples**

```
CALC:FUNC:EXEC
```

```
calculate2: function: execute
```

**Query Syntax**

Not Applicable

**Default**

Not Applicable

---

**CALCulate<cnum>:FUNCtion:STATistics[:STATe] <ON|OFF>**
**Applicable Models:** N522xB, N523xB, N524xB, M937xA, P937xA

(Read-Write) Displays and hides the trace statistics (peak-to-peak, mean, standard deviation) on the screen.

The analyzer will display either measurement statistics or Filter Bandwidth statistics; not both.

**See Critical Note**

**Parameters**

- `<cnum>`  Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, `<cnum>` is set to 1.
- `<ON|OFF>` ON - Displays trace statistics
  OFF - Hides trace statistics

**Examples**

```
CALC:FUNC:STAT ON
calculate2:function:statistics:state off
```

**Query Syntax**

CALCulate<cnum>:FUNCtion:STATistics[:STATe]?

**Return Type**

Boolean (1 = ON, 0 = OFF)

**Default**

OFF (0)

---

**CALCulate<cnum>:FUNCtion:TYPE <char>**

**Applicable Models:** N522xB, N523xB, N524xB, M937xA, P937xA

(Read-Write) Sets statistic TYPE that you can then query using CALC:FUNCtion:DATA?.

**Note:** This command affects only the selected measurement on the specified channel.

**See Critical Note**

**Parameters**

- `<cnum>`  Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, `<cnum>` is set to 1.
- `<char>`  Choose from:
  - **PTPeak** - the difference between the max and min data points on the trace.
  - **STDEV** - standard deviation of all data points on the trace
  - **MEAN** - mean (average) of all data points on the trace
  - **MIN** - lowest data point on the trace
MAX - highest data point on the trace

**Examples**

<table>
<thead>
<tr>
<th>Command</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>CALC:FUNC:TYPE PTP</code></td>
</tr>
<tr>
<td><code>calculate2:function:type stdev</code></td>
</tr>
</tbody>
</table>

**Query Syntax**

CALCulate<enum>:FUNCtion:TYPE?

**Return Type**

Character

**Default**

PTPeak
Reads Gain Compression data from the current Gain Compression acquisition.

These commands are **Superseded** by the `CALCulate:MEASure:GCData` commands.

### CALCulate:GCData:

- `DATA?`
- `IMAG?`
- `ITERations?`
- `REAL?`

Click on a keyword to view the command details.

**Other Gain Compression commands**

The calibration commands listed in this topic are supplemental to the Guided Cal commands.

- `CALC:CUSTom:DEFine` - creates a gain compression measurement.
- `SENS:GCSetup` - Most Gain Compression settings.
- `CALC:GCMeas:ANAL` - Gain Compression Analysis settings
- Gain compression data can also be saved to a *.csv file. [Learn how.](#)

**See Also**

- Example Programs
- Learn about Gain Compression Application
- Synchronizing the Analyzer and Controller
- SCPI Command Tree

---

**CALCulate<ch>:GCData:DATA? <param>**

**Applicable Models:** N522xB, N524xB, M9485A, E5080A

**(Read-Only)** Returns measurement data at all frequency and power data points for GCA SMART sweeps and 2D sweeps.
- When using SMART sweep, ALL data is returned including ALL background iteration sweeps. Use CALC:GCD:ITER to determine the number of iteration sweeps. The number of data points that are returned is always going to be number of frequency points times the number of iteration sweeps.

- When using 2D sweeps, ALL data is returned. The number of data points returned / freq may vary. Learn more.

Use Calc:Data? to return just the displayed data results (not the background sweeps).

A compression parameter must be present. Learn more.

The format of the data is the same as the format of the measurement that you select using Calc:Par:Select. If the measurement is scalar, than one number is returned per sweep per data point. If complex (such as Smith Chart format) than both real and imaginary numbers are returned.

If correction is on, corrected data are returned. Otherwise, raw data are returned.

**Parameters**

- `<ch>` Any existing channel number. If unspecified, value is set to 1
- `<param>` (String) Parameter to read. NOT Case-sensitive. The specified parameter need NOT be displayed or selected. However, a compression parameter must be present. Learn more.

Choose from:

- "pin" - (CompIn21) Input power at the compression point.
- "pout" - (CompOut21) Output power at the compression point.
- "gain" - (CompGain21) Device gain (S21) at the compression point.
- "inputmatch" - (CompS11) Input match at the compression point.
- "DeltaGain" - (DeltaGain21) Measured Gain (watts) / Ref Gain (watts). Learn more.
- "AI1" and "AI2" - ADC measurements at the specified compression level. Learn more.

Learn more about GCA parameters.

**Examples**

```plaintext
data = CALC:GCD:DATA? "pin"
data = calculate:gcdata:data? "pout"
```

**Return Type**

- Array of data

**Default**

- Not Applicable
CALCulate<ch>:GCData:IMAG? <char>, <dpoint>, <param>

Applicable Models: N522xB, N524xB, M9485A, E5080A

(Read-Only) For a specified data point, returns the imaginary part of the specified Gain Compression data. If correction is on, corrected data are returned. Otherwise, raw data are returned. Can be used with Smart and 2D sweeps.

- For SMART sweep, the number of data points that are returned is always going to be the number of iteration sweeps. Use **CALC:GCD:ITER** to determine the number of iteration sweeps.
- For 2D sweeps, the number of data points returned / freq may vary. Learn more.

**Parameters**

- `<ch>` Any existing channel number. If unspecified, value is set to 1
- `<char>` Choose from:
  - **FREQuency** - for the specified frequency data point, returns all of the measured data for each power stimulus.
  - **POWer** - for the specified power data point, returns all of the measured data for each frequency stimulus.
- `<dPoint>` Data point (FREQ or POWer) for which data is returned.
- `<param>` (String) Parameter to read. NOT Case-sensitive. The specified parameter need NOT be displayed. However, a compression parameter must be present. Learn more.
  - "pin" - (ComplIn21) Input power at the compression point.
  - "pout" - (CompOut21) Output power at the compression point.
  - "gain" - (CompGain21) Device gain (S21) at the compression point.
  - "inputmatch" - (CompS11) Input match at the compression point.
  - "DeltaGain" - (DeltaGain21) Measured Gain (watts) / Ref Gain (watts). Learn more.
  - "AI1" and "AI2" - ADC measurements at the specified compression level. Learn more.

**Examples**

For the fifth frequency data point, returns 'Power Output' imaginary (phase) data from all power stimulus values.

For SmartSweep, if there are 30 power sweep points, 30 values are returned.

For 2D sweeps, 30 or 31 power sweep points may be returned. Learn more.
CALCulate<cnum>:GCData:ITERations?

**Applicable Models:** N522xB, N524xB, M9485A, E5080A

*(Read-only)* In a SMART sweep, returns the max number of iterations that it took for ALL frequencies to converge. Use this number to determine the size of the block data that is returned from Gain Compression SMART sweep data queries.

For a 2D sweep, returns the number of power points.

**Parameters**

- `<cnum>` Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, `<cnum>` is set to 1.

**Examples**

```
data = CALC:GCD:ITER?
```

**Return Type** Numeric

**Default** Not Applicable

---

CALCulate<ch>:GCData:REAL? <char>, <dpoint>, <param>

**Applicable Models:** N522xB, N524xB, M9485A, E5080A

*(Read-Only)* For a specified data point, returns the real part of the Gain Compression data. If correction is on, corrected data are returned. Otherwise, raw data are returned. Can be used with Smart and 2D sweeps.

- For SMART sweep, the number of data points that are returned is always going to be the number of iteration sweeps. Use **CALC:GCD:ITER** to determine the number of iteration sweeps.

- For 2D sweeps, the number of data points returned / freq may vary. Learn more.

**Parameters**

- `<ch>` Any existing channel number. If unspecified, value is set to 1
- `<char>` Choose from:
  - **FREQuency** - for the specified frequency data point, returns all of the measured
data for each power stimulus.

- **POWER** - for the specified power data point, returns all of the measured data for each frequency stimulus.

<dPoint> Data point (FREQ or POWer) for which data is returned.

<param> (String) Parameter to read. NOT Case-sensitive. The specified parameter need NOT be displayed. However, a compression parameter must be present. Learn more.

- "pin" - (Compln21) Input power at the compression point.
- "pout" - (CompOut21) Output power at the compression point.
- "gain" - (CompGain21) Device gain (S21) at the compression point.
- "inputmatch" - (CompS11) Input match at the compression point.
- "DeltaGain" - (DeltaGain21) Measured Gain (watts) / Ref Gain (watts). Learn more.
- "AI1" and "AI2" - ADC measurements at the specified compression level. Learn more.

Examples

For the fifth frequency data point, returns 'Power Output' real data from all power stimulus values.

For SmartSweep, if there are 30 power sweep points, 30 values are returned.

For 2D sweeps, 30 or 31 power sweep points may be returned. Learn more.

data = CALC:GCD:REAL? FREQ,5,"pout"

Return Type Array of data

Default Not Applicable
Gain Compression Analysis Commands

Sets and reads Gain Compression Analysis controls.

These commands are **Superseded** by the \texttt{CALCulate:MEASure:GCMeas} commands.

\begin{verbatim}
CALCulate:GCMeas:ANALysis
  CWFRequency
  ENABle
  ISDisfreq
  XAXis
\end{verbatim}

Click on a keyword to view the command details.

**Other Gain Compression commands**

The calibration commands listed in this topic are supplemental to the Guided Cal commands.

- \texttt{CALC:CUSTom:DEFine} - creates a gain compression measurement.
- \texttt{SENS:GCSetup} - Most Gain Compression settings.
- \texttt{GC:DATA} - Gain Compression data commands
- Gain compression data can also be saved to a *.csv file. Learn how.

**See Also**

- Example Programs
- Learn about Compression Analysis
- Synchronizing the Analyzer and Controller
- SCPI Command Tree

\begin{verbatim}
CALCulate<cn>:GCMeas:ANALysis:ENABle <bool>
\end{verbatim}
**Applicable Models:** N522xB, N524xB, M9485A, E5080A

*(Read-Write)* Enables and disables a compression analysis trace.

**Parameters**

- `<cnum>`: Channel number of the GCA measurement. There must be a selected measurement on that channel using `Calc:Par:Sel`. If unspecified, `<cnum>` is set to 1.
- `<bool>`: `ON` (or 1) - Enable compression analysis. `OFF` (or 0) - Disable compression analysis.

**Examples**

- `CALC:GCM:ANAL:ENAB ON`
- `calculate2:gcmeas:analysis:enable off`

**Query Syntax**

`CALCulate<cnum>:GCMeas:ANALysis:ENABle?`

**Return Type**

Boolean (1 = ON, 0 = OFF)

**Default**

OFF

---

**CALCulate<cnum>:GCMeas:ANALysis:CWFRequency <num>**

*(Read-Write)* Set and return the CW frequency for a compression analysis trace.

**Parameters**

- `<cnum>`: Channel number of the GCA measurement. There must be a selected measurement on that channel using `Calc:Par:Sel`. If unspecified, `<cnum>` is set to 1.
- `<num>`: CW frequency in Hz. Choose a frequency within the range of the gain compression channel.

**Examples**

- `CALC:GCM:ANAL:CWFR 1e9`
- `calculate2:gcmeas:analysis:cwfrequency 1e10`

**Query Syntax**

`CALCulate<cnum>:GCMeas:ANALysis:CWFRequency?`

**Return Type**

Numeric

**Default**

Not Applicable

---

**CALCulate<cnum>:GCMeas:ANALysis:DISCrete | ISD[:STATe] <bool>**
Applicable Models: N522xB, N524xB, M9485A, E5080A

(Read-Write) Sets and returns whether the CW frequency for the compression analysis trace can be set to only the discrete frequencies or provides interpolation.

Parameters

- `<cnum>` Channel number of the GCA measurement. There must be a selected measurement on that channel using `Calc:Par:Sel`. If unspecified, `<cnum>` is set to 1.
- `<bool>` ON (or 1) - Discrete data points only.
  OFF (or 0) - Interpolated data points.

Examples

```
CALC:GCM:ANAL:ISD ON
calculate2:gcmeas:analysis:isdisfrequency off
```

Query Syntax

`CALCulate<cnum>:GCMeas:ANALysis:ISDisfrequency?`

Return Type

Boolean (1 = ON, 0 = OFF)

Default

OFF

---

CALCulate<cnum>:GCMes:ANALysis:XAXis <char>

Applicable Models: N522xB, N524xB, M9485A, E5080A

(Read-Write) Sets and returns the type of data to display on the x-axis of a compression analysis trace.

Parameters

- `<cnum>` Channel number of the GCA measurement. There must be a selected measurement on that channel using `Calc:Par:Sel`. If unspecified, `<cnum>` is set to 1.
- `<bool>` Data to display on X-axis. Choose from:
  
  - PIN - Input power to the DUT.
  - PSOure - power from the source.

Examples

```
CALC:GCM:ANAL:XAX PIN
calculate2:gcmeas:analysis:xaxis psource
```

Query Syntax

`CALCulate<cnum>:GCMeas:ANALysis:XAXis?`

Return Type

Character

Default

PIN
Group Delay Aperture Commands

Controls the Aperture setting used to make Group Delay measurements.

These commands are **Superseded** by the `CALCulate:MEASure:GDElay` commands.

**Critical Note:** `CALCulate` commands act on the selected measurement. You can select one measurement for each channel using `Calc:Par:MNUM` or `Calc:Par:Select`. Learn more.

`CALCulate<cnum>:GDElay:FREQuency <value>`

**Applicable Models:** N522xB, N523xB, N524xB, M937xA, P937xA

**(Read-Write)** Sets group delay aperture using a fixed frequency range.

**See Critical Note**

**Parameters**

- `<cnum>` Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, `<cnum>` is set to 1.
- `<value>` Frequency range (in Hz) to use for the aperture setting. Choose between the equivalent of two data points and the channel frequency span.

**Examples**

`CALC : GDEL : FREQ 1E6`

**Query Syntax**

`CALCulate<cnum>:GDElay:FREQuency?`
CALCulate<cnum>:GDELay:PERCent <value>

**Applicable Models:** N522xB, N523xB, N524xB, M937xA, P937xA

*(Read-Write)* Sets group delay aperture using a percent of the channel frequency span.

**See Critical Note**

**Parameters**

- `<cnum>` Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, `<cnum>` is set to 1.
- `<value>` Percent of frequency span to use for the aperture setting. Choose between the equivalent of two data points and 100 percent of the channel frequency span.

**Examples**

- *set to 25 percent of the channel frequency span*

  ```
  CALC:GDEL:PERC 25
  ```

**Query Syntax**
CALCulate<cnum>:GDELay:PERCent?

**Return Type** Numeric

**Default** Percent of frequency span that equates to 11 points. This can be changed to two points with a preference setting.

CALCulate<cnum>:GDELay:POINts <value>
**Applicable Models:** N522xB, N523xB, N524xB, M937xA, P937xA

**(Read-Write)** Sets group delay aperture using a fixed number of data points.

See Critical Note

**Parameters**

- `<cnum>` Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, `<cnum>` is set to 1.

- `<value>` Number of data points to use for the aperture setting. Choose between two points and the number of points in the channel.

**Examples**

'\textit{set to 25 data points}'

\begin{verbatim}
CALC:GDEL:POIN 25
\end{verbatim}

**Query Syntax**

\texttt{CALCulate\langle\textit{cnum}\rangle:GDELay:POINts?}

**Return Type**

Numeric

**Default**

11 points. This can be changed to two points with a preference setting.
Calc:Limit Commands

Controls the limit segments used for pass / fail testing.

These commands are **Superseded** by the CALCulate:MEASure:LIMit commands.

```
CALCulate:LIMit:
  DATA
    | DELete
  DISPlay
    | [STATe]
  FAIL?
  REPort
    | ALL?
    | DATA?
    | POINts?
  SEGMENT
    | AMPLitude
    | START
    | STOP
    | COUNT?
    | STIMulus
    | START
    | STOP
    | TYPE
  SOUNd
    | [STATe]
  [STATe]
```

Click on a keyword to view the command details.
CALCulate<cnum>:LIMit:DATA <block>

**Applicable Models:** N522xB, N523xB, N524xB, M937xA, P937xA

*(Read-Write)* Sets data for limit segments.

**See Critical Note**

**Parameters**

- `<cnum>` Channel number of the measurement for which limit lines are to be set. There must be a selected measurement on that channel. If unspecified, `<cnum>` is set to 1.

- `<block>` Data for all limit segments. The following is the data format for 1 segment:
  
  **Type, BegStim, EndStim, BegResp, EndResp**

  - **Type** Type of limit segment. Choose from
    - 0 - Off
    - 1 - Max
    - 2 - Min

  - **BegStim** Start of X-axis value (freq, power, time)

  - **EndStim** End of X-axis value

  - **BegResp** Y-axis value that corresponds with Start of X-axis value

  - **EndResp** Y-axis value that corresponds with End of X-axis value

**Examples**

The following writes three max limit segments for a bandpass filter.

```
CALC:LIM:DATA 1,3e5,4e9,-60,0,1,4e9,7.5e9,0,0,1,7.5e9,9e9,0,-30
```

**Query Syntax**

CALCulate<cnum>:LIMit:DATA?

**Return Type**

Depends on FORM:DATA
CALCulate<cnum>:LIMit:DATA:DELete

**Applicable Models:** N522xB, N523xB, N524xB, M937xA, P937xA

*(Write-only)* Deletes all limit line data for the selected measurement on the specified channel.

*See Critical Note*

**Parameters**

- `<cnum>`: Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, `<cnum>` is set to 1.

**Examples**

```
CALC2:LIM:DATA:DEL
```

**Query Syntax**

Not Applicable

**Default**

Not Applicable

---

CALCulate<cnum>:LIMit:DISPlay[:STATe] <ON | OFF>

**Applicable Models:** N522xB, N523xB, N524xB, M937xA, P937xA

*(Read-Write)* Turns the display of limit segments ON or OFF (if the data trace is turned ON).

*See Critical Note*

**Parameters**

- `<cnum>`: Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, `<cnum>` is set to 1.

- `<ON | OFF>`: 
  - ON (or 1) - turns the display of limit segments ON.
  - OFF (or 0) - turns the display of limit segments OFF.

**Examples**

```
CALC:LIM:DISP:STAT ON
calculate2:limit:display:state off
```

**Query Syntax**

CALCulate<cnum>:LIMit:DISPlay[:STATe]?

**Return Type**

Boolean (1 = ON, 0 = OFF)

**Default**

ON

---

CALCulate<cnum>:LIMit:FAIL?
Applicable Models: N522xB, N523xB, N524xB, M937xA, P937xA

(Read-only) Returns the Pass / Fail status of the limit line test. Returns 1 (Fail) if any data point fails for any limit segment.

Limit display (CALC:LIM:DISP) does NOT have to be ON.

See Critical Note

Parameters

\(<\text{cnum}>\) Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, \(<\text{cnum}>\) is set to 1.

Examples

CALC:LIM:FAIL?

Return Type

Boolean

- 0 is returned when Pass
- 1 is returned when Fail

Default

Not Applicable

CALCulate<\text{cnum}>:LIMit:REPort:ALL? <\text{block}>

Applicable Models: N522xB, N523xB, N524xB

(Read-only) Returns the test results (stimulus value, limit test result, upper limit value and lower limit value of all measurement points), for the selected trace. This command returns a point by point description of the limit table and pass/fail test result.

See Critical Note

Parameters

\(<\text{cnum}>\) Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, \(<\text{cnum}>\) is set to 1.

\(<\text{block}>\) Depends on FORM:DATA

If the number of the measurement points is N,

\(<\text{Block}> = \langle\text{first stimulus}\rangle, \langle\text{test result}\rangle, \langle\text{upper limit}\rangle, \langle\text{lower limit}\rangle, \ldots, \langle\text{Nth stimulus}\rangle, \langle\text{test result}\rangle, \langle\text{upper limit}\rangle, \langle\text{lower limit}\rangle\)

Where \(<\text{test result}>\) = -1: No limit, 0: Fail, 1: Pass

The following example returns three points:

CALC:LIM:REP:ALL?
CALCulate<cnum>:LIMit:REPort[:DATA]?<block>

**Applicable Models:** N522xB, N523xB, N524xB

(Read-only) Returns the stimulus values (frequency, power level or time) at all the measurement points that failed the limit test, for the selected trace. If there are no failures, a large number is returned (+9.91000000000E+037).

**See Critical Note**

**Parameters**

- `<cnum>` Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, `<cnum>` is set to 1.
- `<block>` Depends on FORM:DATA

If the number of the measurement points that failed the limit test is N, `<block>`=<First failed stimulus>, ..., <Nth failed stimulus>.
The following example assumes that there are no failures:

```
CALC:LIM:REP:DATA?
+9.91000000000E+037
```

<table>
<thead>
<tr>
<th>Return Type</th>
<th>Numeric</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default</td>
<td>9.91E37 (no failures)</td>
</tr>
</tbody>
</table>

**CALCulate<cnum>:LImit:REPort:POINts?**

**Applicable Models:** N522xB, N523xB, N524xB

(Read-only) Reads the number of the measurement points that failed the limit test, for the active trace of selected channel.

**See Critical Note**

**Parameters**

- `<cnum>`: Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, `<cnum>` is set to 1.

**Examples**

```
CALC:LIM:REP:POIN?
```

<table>
<thead>
<tr>
<th>Query Syntax</th>
<th>Numeric</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default</td>
<td>0</td>
</tr>
</tbody>
</table>

**CALCulate<cnum>:LImit:SEGment<snum>:AMPLitude:STARt <num>**

**Applicable Models:** N522xB, N523xB, N524xB, M937xA, P937xA

(Read-Write) Sets the start (beginning) of the Y-axis amplitude (response) value.

**See Critical Note**

**Parameters**

- `<cnum>`: Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, `<cnum>` is set to 1.
- `<snum>`: Segment number; if unspecified, value is set to 1.
- `<num>`: Choose any number between: -500 and 500

Display value is limited to the Maximum and Minimum displayed Y-axis values.

**Examples**

```
CALC:LIM:SEG1:AMPL:STAR 10
calculate2:limit:segment2:amplitude:start 10
```
### Query Syntax
```
CALCulate<cnum>:LIMit:SEGMent<snum>AMPLitude:STARt?
```

### Return Type
- **Numeric**
- **Default** 0

### Applicable Models:
- N522xB, N523xB, N524xB, M937xA, P937xA

### Parameters
- `<cnum>`: Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, `<cnum>` is set to 1.
- `<snum>`: Segment number; if unspecified, value is set to 1.
- `<num>`: Choose any number between: `-500` and `500`

Display value is limited to the Maximum and Minimum displayed Y-axis values.

### Examples
```
CALC:LIM:SEGM1:AMPL:STOP 10
calculate2:limit:segment2:amplitude:stop 10
```

### Query Syntax
```
CALCulate<cnum>:LIMit:SEGMent<snum>AMPLitude:STOP <num>
```

### Return Type
- **Numeric**
- **Default** 0

### Applicable Models:
- N522xB, N523xB, N524xB, M937xA, P937xA

(Read-Write) Sets the stop (end) of the Y-axis amplitude (response) value.

### See Critical Note

```
CALCulate<cnum>:LIMit:SEGMent:COUNt?
```

### Query Syntax
```
CALCulate<cnum>:LIMit:SEGMent:COUNt
```

### Return Type
- **Numeric**
- **Default** 3497

### Display value is limited to the Maximum and Minimum displayed Y-axis values.
**Applicable Models:** N522xB, N523xB, N524xB, M937xA, P937xA

(Read-only) Returns the number of segments used in a limit test. All segments are counted, whether they are on or not.

**Parameters**
- Not Applicable
- **<cnum>** Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, <cnum> is set to 1.

**Examples**

CALC:LIM:SEGM:COUN?

**Return Type**
- Numeric
- **Default** Not Applicable

**CALCulate<cnum>:LIMit:SEGMent<snum>:STIMulus:STARt <num>**

**Applicable Models:** N522xB, N523xB, N524xB, M937xA, P937xA

(Read-Write) Sets the start (beginning) of the X-axis stimulus value.

**See Critical Note**

**Parameters**
- **<cnum>** Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, <cnum> is set to 1.
- **<snum>** Segment number; if unspecified, value is set to 1.
- **<num>** Choose any number within the X-axis span of the analyzer.

**Examples**

CALC:LIM:SEGM1:STIM:STAR 10

**Query Syntax**

CALCulate<cnum>:LIMit:SEGMent<snum>:STIMulus:STARt?

**Return Type**
- Numeric
- **Default** 0

**CALCulate<cnum>:LIMit:SEGMent<snum>:STIMulus:STOP <num>**
**Applicable Models:** N522xB, N523xB, N524xB, M937xA, P937xA

(Read-Write) Sets the stop (end) of the X-axis stimulus value.

**See Critical Note**

**Parameters**

- `<cnum>` Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, `<cnum>` is set to 1.
- `<snum>` Segment number; if unspecified, value is set to 1.
- `<num>` Choose any number within the X-axis span of the analyzer.

**Examples**

```
calc:lim:seg1:ampl:stop 10
```
```
calculate2:limit:segment2:stimulus:stop 10
```

**Query Syntax**

CALCulate<cnum>:LIMit:SEGMent<snum>:STIMulus:STOP?

**Return Type**

Numeric

Default

0

---

**CALCulate<cnum>:LIMit:SEGMent<snum>:TYPE <char>**

**Applicable Models:** N522xB, N523xB, N524xB, M937xA, P937xA

(Read-Write) Sets the type of limit segment.

**See Critical Note**

**Parameters**

- `<cnum>` Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, `<cnum>` is set to 1.
- `<snum>` Segment number. Choose any number between 1 and 100. If unspecified, value is set to 1.
- `<char>` Choose from:
  - `LMAX` - a MAX limit segment. Any response data exceeding the MAX value will fail.
  - `LMIN` - a MIN limit segment. Any response data below the MIN value will fail.
  - `OFF` - the limit segment (display and testing) is turned OFF.
Examples

<table>
<thead>
<tr>
<th>Query Syntax</th>
<th>Return Type</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>CALC:LIM:SEG:M:T LMIN</code></td>
<td>Character</td>
<td>OFF</td>
</tr>
<tr>
<td><code>calculate2:limit:segment3:TYPE lmax</code></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**CALCulate<cnum>:LIMit:SEGMent<snum>:TYPE?**

**Query Syntax**

CALCulate<cnum>:LIMit:SEGMent<snum>:TYPE?

**Return Type**

Character

**Default**

OFF

**CALCulate<cnum>:LIMit:SOUNd[:STATe] <ON | OFF>**

**Applicable Models:**

N522xB, N523xB, N524xB, M937xA, P937xA

*(Read-Write)* Turns limit testing fail sound ON or OFF.

See Critical Note

**Parameters**

- `<cnum>` Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, `<cnum>` is set to 1.
- `<ON | OFF>`
  - ON (or 1) - turns sound ON.
  - OFF (or 0) - turns sound OFF.

**Examples**

<table>
<thead>
<tr>
<th>Query Syntax</th>
<th>Return Type</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>CALC:LIM:SOUN ON</code></td>
<td>Boolean</td>
<td>1 (ON)</td>
</tr>
<tr>
<td><code>calculate2:limit:sound:state off</code></td>
<td></td>
<td>0 (OFF)</td>
</tr>
</tbody>
</table>

**CALCulate<cnum>:LIMit[:STATe] <ON | OFF>**
**Applicable Models:** N522xB, N523xB, N524xB, M937xA, P937xA

*(Read-Write)* Turns limit segment testing ON or OFF.

- Use `CALC:LIM:DISP` to turn ON and OFF the display of limit segments.
- If using Global Pass/Fail status, trigger the VNA AFTER turning Limit testing ON.

See Critical Note

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;cnum&gt;</td>
<td>Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, &lt;cnum&gt; is set to 1.</td>
</tr>
</tbody>
</table>
| <ON | OFF>         | **ON** (or 1) - turns limit testing ON.  
|              | **OFF** (or 0) - turns limit testing OFF.                                     |

**Examples**

- `CALC:LIM:STAT ON`
- `calculate2:limit:state off`

**Query Syntax**

CALCulate<cnum>:LIMit:STATe?

**Return Type**

Boolean (1 = ON, 0 = OFF)

**Default**

OFF
**Calculate:Marker Commands**

Controls the marker settings used to remotely output specific data to the computer.

These commands are **Superseded** by the `CALCulate:MEASure:MARKer` commands.

<table>

Critical Note: CALCulate commands act on the selected measurement. You can select one measurement for each channel using Calc:Par:MNUM or Calc:Par:Select. Learn more.
Important: Learn about programming the reference marker.

CALCulate<cnump>:MARKer:AOFF

Applicable Models: N522xB, N523xB, N524xB, M937xA, P937xA

CALCulate:MARKer commands are Superseded by the CALCulate:MEASure:MARKer commands.

(Write-only) Turns all markers off for selected measurement.

See Critical Note

Parameters

<cnump>  Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, <cnump> is set to 1.

Examples  

CALC:MARK:AOFF

calculate2:marker:aoff

Query Syntax  Not applicable

Default  Not applicable

CALCulate<cnump>:MARKern:<num>:BUCKet <nump>

Applicable Models: N522xB, N523xB, N524xB, M937xA, P937xA

CALCulate:MARKer commands are Superseded by the CALCulate:MEASure:MARKer commands.

(Read-Write) Sets and reads the data point (bucket) number of the trace on which the marker resides. When the markers are interpolated (non-discrete), the returned value is the nearest marker bucket position.

See Critical Note

Parameters

<cnump>  Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, <cnump> is set to 1.

<n>  Marker number to move or query. The marker must already exist. If unspecified, <n> is set to 1.

<num>  Data point (bucket) number. Choose any data point between: 0 and the number of data points minus 1.

Examples  

CALC:MARK:BUCK 5

calculate2:marker2:bucket 200
CALCulate<cnum>:MARKer<marker>:BUCKet?

Return Type: Integer

Default: The first marker is set to the middle of the span. Subsequent markers are set to the bucket number of the previously active marker.

CALCulate<cnum>:MARKer<marker>:BWIDth <num>

Applicable Models: N522xB, N523xB, N524xB, M937xA, P937xA

CALCulate:MARKer commands are Superseded by the CALCulate:MEASure:MARKer commands.

(Read-Write) Turns on and sets markers 1 through 4 to calculate filter bandwidth. The <num> parameter sets the value below the maximum bandwidth peak that establishes the bandwidth of a filter. For example, if you want to determine the filter bandwidth 3 db below the bandpass peak value, set <num> to -3.

To turn off the Bandwidth markers, either turn them off individually or turn them All Off.

The analyzer screen will show either Bandwidth statistics OR Trace statistics; not both.

To search a User Range with the bandwidth search, first activate marker 1 and set the desired User Range. Then send the CALC:MARK:BWID command. The user range used with bandwidth search only applies to marker 1 searching for the max value. The other markers may fall outside the user range.

See Critical Note

Parameters

- <cnum>: Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, <cnum> is set to 1.
- <num>: Target value below filter peak. Choose any number between -500 and 500

Examples

- CALC:MARK:BWID -3
- calculate2:marker:bwidth -2.513

Query Syntax

CALCulate<cnum>:MARKer<marker>:BWIDth?

Returns the results of bandwidth search:

Return Type: Numeric - Four Character values separated by commas: bandwidth, center Frequency, Q, loss.

Default: -3

CALCulate<cnum>:MARKer<mkr>:COMPression:LEVel <num>
Applicable Models: N522xB, N523xB, N524xB, M937xA, P937xA

CALCulate:MARKer commands are Superseded by the CALCulate:MEASure:MARKer commands.

(Read-Write) Set and read the marker compression level. A compression marker must already exist. Use CALC:MARK ON and CALC:MARK:FUNC COMP to create compression markers.

See Critical Note

Parameters

- `<cnum>` Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, `<cnum>` is set to 1.
- `<mkr>` Any existing marker number from 1 to 15; if unspecified, value is set to 1.
- `<num>` Compression level. Choose any number between: -500 dB to 500 dB

Standard gain compression values are positive.

Examples

- **CALC:MARK:COMP:LEV 1**
- **calculate2:marker:compression:level 1.5**

Query Syntax

- `CALCulate<cnum>:MARKer:mkr:COMPression:LEVel?`

Return Type

- Numeric
- **Default**: +1

---

CALCulate<cnum>:MARKer<mkr>:COMPression:PIN?

Applicable Models: N522xB, N523xB, N524xB, M937xA, P937xA

CALCulate:MARKer commands are Superseded by the CALCulate:MEASure:MARKer commands.

(Read-only) Reads the input power at the marker compression level. First send CALC:MARK:FUNC:EXEC COMP or CALC:MARK:FUNC:TRAC ON

See Critical Note

Parameters

- `<cnum>` Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, `<cnum>` is set to 1.
- `<mkr>` Any existing marker number from 1 to 15; if unspecified, value is set to 1.

Examples

- **CALC:MARK:COMP:PIN?**
- **calculate2:marker:compression:pin?**

Return Type

- Numeric
- **Return Type**: Numeric
- **Default**: 3506
CALCulate<cnum>:MARKer<mkr>:COMPression:POUT?

Applicable Models: N522xB, N523xB, N524xB, M937xA, P937xA

CALCulate:MARKer commands are **Superseded** by the CALCulate:MEASure:MARKer commands.

(Read-only) Reads the output power at the marker compression level. First send CALC:MARK:FUNC:EXEC COMP or CALC:MARK:FUNC:TRAC ON

See Critical Note

**Parameters**

- **<cnum>** Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, <cnum> is set to 1.
- **<mkr>** Any existing marker number from 1 to 15; if unspecified, value is set to 1.

**Examples**

```
CALC:MARK:COMP:POUT?
calculate2:marker2:compression:pout?
```

**Return Type** Numeric

**Default** Not applicable

---

CALCulate<cnum>:MARKer<mkr>:COUPling:METHod <char>

Applicable Models: N522xB, N523xB, N524xB, M937xA, P937xA

CALCulate:MARKer commands are **Superseded** by the CALCulate:MEASure:MARKer commands.

(Read-Write) Sets and reads the scope of Coupled Markers. This is a global setting that affects all markers. Learn more.

**Note:** This command will not take effect until Coupled Markers is turned on using CALC:MARK:COUP:STATe ON.

**Note:** The preset behavior of Coupled Markers depends on the setting of SYStem:PREFerences:ITEM:MCControl, SYStem:PREFerences:ITEM:MCMethod, and SYStem:PREFerences:ITEM:MCPRest.

**Parameters**

- **<cnum>** Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, <cnum> is set to 1.
<mkr> Any existing marker number from 1 to 15; if unspecified, value is set to 1.

<char> CHANnel - Coupling is limited to traces in the same channel.

ALL - Coupling occurs across all channels.

Examples

<table>
<thead>
<tr>
<th>Command</th>
</tr>
</thead>
<tbody>
<tr>
<td>CALC:MARK:COUP:METH CHAN</td>
</tr>
<tr>
<td>calculatel:marker1:coupling all</td>
</tr>
</tbody>
</table>

Query Syntax
CALCulate:MARKer:COUPling:METHod?

Return Type
Character

Default
ALL

CALCulate<cnum>:MARKer<mkr>:COUPling:[STATe]<ON|OFF>

Applicable Models: N522xB, N523xB, N524xB, M937xA, P937xA

CALCulate:MARKer commands are Superseded by the CALCulate:MEASure:MARKer commands.

(Read-Write) Sets and reads the state of Coupled Markers (ON and OFF). The scope of coupled markers can be changed with CALC:MARK:COUP:METH.

See Critical Note

Parameters

<cnun> Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, <cnum> is set to 1.

<mkr> Any existing marker number from 1 to 15; if unspecified, value is set to 1.

<ON|OFF> OFF (0) - Turns Coupled Markers OFF

ON (1) - Turns Coupled Markers ON

Examples

<table>
<thead>
<tr>
<th>Command</th>
</tr>
</thead>
<tbody>
<tr>
<td>CALC:MARK:COUP ON</td>
</tr>
<tr>
<td>calculatel:marker1:coupling off</td>
</tr>
</tbody>
</table>

Query Syntax
CALCulate:MARKer:COUPling:[STATe]?

Return Type
Boolean (1 = ON, 0 = OFF)

Default
OFF

CALCulate<cnum>:MARKer<mkr>:DELTa <ON|OFF>
Applicable Models: N522xB, N523xB, N524xB, M937xA, P937xA

CALCulate:MARKer commands are Superseded by the CALCulate:MEASure:MARKer commands.

(Read-Write) Specifies whether marker is relative to the Reference marker or absolute.

Note: The reference marker must already be turned ON with CALC:MARK:REF:STATE.

See Critical Note

**Parameters**

- `<cnum>` Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, `<cnum>` is set to 1.
- `<mkr>` Any existing marker number from 1 to 15; if unspecified, value is set to 1.
- `<ON|OFF>` ON (or 1) - Specified marker is a Delta marker
  OFF (or 0) - Specified marker is an ABSOLUTE marker

**Examples**

```
CALC:MARK:DELT ON
calculate2:marker8:delta off
```

**Query Syntax**

CALCulate<cnum>:MARKer<mkr>:DELTa?

**Return Type**

Boolean (1 = ON, 0 = OFF)

**Default**

OFF

CALCulate<cnum>:MARKer<mkr>:DISCrete <ON|OFF>

Applicable Models: N522xB, N523xB, N524xB, M937xA, P937xA

CALCulate:MARKer commands are Superseded by the CALCulate:MEASure:MARKer commands.

(Read-Write) Makes the specified marker display either a calculated value between data points (interpolated data) or the actual data points (discrete data).

See Critical Note

**Parameters**

- `<cnum>` Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, `<cnum>` is set to 1.
- `<mkr>` Any existing marker number from 1 to 15; if unspecified, value is set to 1.

3509
<ON|OFF>  
ON (or 1) - Specified marker displays the actual data points  
OFF (or 0) - Specified marker displays calculated data between the actual data points.

Examples

CALC:MARK:DISC ON
calculate2:marker8:discrete off

Query Syntax  
CALCulate<cnum>:MARKer<mkr>:DISCrete?

Return Type
Boolean (1 = ON, 0 = OFF)

Default
OFF

CALCulate<cnum>:MARKer<mkr>:DISTance <num>

Applicable Models: N522xB, N523xB, N524xB, M937xA, P937xA

(Read-Write) Set or query marker distance on a time domain trace.

CALCulate:MARKer commands are Superseded by the CALCulate:MEASure:MARKer commands.

The Write command moves the marker to the specified distance value. Once moved, you can read the Y axis value or read the X-axis time value. (Distance is calculated from the X-axis time value.)

The Read command reads the distance of the marker.

If the marker is set as delta, the WRITE and READ data is relative to the reference marker.

See Critical Note

Parameters
<cnun>  Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, <cnun> is set to 1.
<mkr>  Any existing marker number from 1 to 15; if unspecified, value is set to 1.
<num>  Marker distance in the unit of measure specified with CALC:TRAN:TIME:MARK:UNIT

Examples

CALC:MARK:DIST .1
calculate2:marker8:distance 5

Query Syntax
CALCulate<cnum>:MARKer<mkr>:DISTance?

Return Type
Numeric

Default
Not Applicable

CALCulate<cnum>:MARKer<mkr>:FORMat <char>
**Applicable Models:** N522xB, N523xB, N524xB, M937xA, P937xA

CALCulate:MARKer commands are **Superseded** by the CALCulate:MEASure:MARKer commands.

(Read-Write) Sets the format of the data that will be returned in a marker data query CALC:MARK:Y? and the displayed value of the marker readout. The selection does not have to be the same as the measurement's display format.

**See Critical Note**

**Parameters**

- `<cnum>` Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, `<cnum>` is set to 1.
- `<mkr>` Any marker number from 1 to 15; if unspecified, value is set to 1
- `<char>` Choose from:
  - **DEFault** - The format of the selected measurement
  - **MLINear** - Linear magnitude
  - **MLOGarithmic** - Logarithmic magnitude
  - **IMPedance** - (R+jX)
  - **ADMittance** - (G+jB)
  - **PHASE** - Phase
  - **IMAGinary** - Imaginary part (Im)
  - **REAL** - Real part (Re)
  - **POLar** - (Re, Im)
  - **GDELay** - Group Delay
  - **LINPhase** - Linear Magnitude and Phase
  - **LOGPhase** - Log Magnitude and Phase
  - **KELVin** - temperature
  - **FAHRENheit** - temperature
  - **CELSius** - temperature
  - **NOISe** - Noise (available ONLY in IM Spectrum and SA measurement classes).

### Default

DEFault

---

CALCulate<cnum>:MARKer<mkr>:FUNCTION:APEak:EXCursion <num><unit>

#### Applicable Models:
N522xB, N523xB, N524xB, M937xA, P937xA

CALCulate:MARKer commands are **Superseded** by the CALCulate:MEASure:MARKer commands.

(Read-Write) Sets amplitude peak excursion for the specified marker. The Excursion value determines what is considered a "peak". This command applies to marker peak searches (Next peak, Peak Right, Peak Left).

See Critical Note

#### Parameters

- **<cnum>**
  
  Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, <cnum> is set to 1.

- **<mkr>**
  
  Any existing marker number from 1 to 15; if unspecified, value is set to 1.

- **<num>**
  
  Excursion value. Choose any number between **-500** and **500**.

  **Note:** This command will accept MIN or MAX instead of a numeric parameter. See SCPI Syntax for more information.

- **<unit>**
  
  Varies depending on the data format.

  - Log magnitude (MLOG): dB (decibel)
  - Phase (PHAS), Expanded phase (UPH) or Positive phase (PPH): deg (degree)
  - Group delay (GDEL): s (second)
  - Others: No unit

#### Examples

### Default

3

---

3512
CALCulate<cnum>:MARKer<mkr>:FUNCtion:APEak:THReshold <num><unit>

**Applicable Models:** N522xB, N523xB, N524xB, M937xA, P937xA

CALCulate:MARKer commands are **Superseded** by the CALCulate:MEASure:MARKer commands.

(Read-Write) Sets peak threshold for the specified marker. If a peak (using the criteria set with :EXCursion) is below this reference value, it will not be considered when searching for peaks. This command applies to marker peak searches (Next peak, Peak Right, Peak Left).

See Critical Note

**Parameters**

- `<cnum>` Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, `<cnum>` is set to 1.
- `<mkr>` Any marker number from 1 to 15; if unspecified, value is set to 1
- `<num>` Threshold value. Choose any number between -500 and 500.
- `<unit>` Varies depending on the data format.
  - Log magnitude (MLOG): dB (decibel)
  - Phase (PHAS), Expanded phase (UPH) or Positive phase (PPH): deg (degree)
  - Group delay (GDEL): s (second)
  - Others: No unit

**Note:** This command will accept MIN or MAX instead of a numeric parameter. See SCPI Syntax for more information.

**Examples**

```
CALC:MARK:FUNC:APE:THR -40
calculate2:marker8:function:apeak:threshold -55
```

**Query Syntax**

CALCulate<cnum>:MARKer<mkr>:FUNCtion:APEak:THReshold?

**Return Type** Numeric

**Default** -100

CALCulate<cnum>:MARKer<mkr>:FUNCtion:DOMain:USER[:RANGE] <range>
**Applicable Models:** N522xB, N523xB, N524xB, M937xA, P937xA

CALCulate:MARKer commands are **Superseded** by the CALCulate:MEASure:MARKer commands.

*(Read-Write)* Assigns the specified marker to a range number. The x-axis travel of the marker is constrained to the range's span. The span is specified with the CALC:MARK:FUNC:DOM:USER:START and STOP commands, unless range 0 is specified which is the full span of the analyzer.

Each channel has **16** user ranges. (Trace statistics use the same ranges.) More than one marker can use a domain range.

*See Critical Note*

**Parameters**

- `<cnum>` Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, `<cnum>` is set to 1.
- `<mkr>` Any marker number from 1 to 15; if unspecified, value is set to 1
- `<span>` User span. Choose any Integer from **0 to 16**
  
  - **0** is Full Span of the analyzer
  
  - **1 to 16** are available for user-defined x-axis span

**Examples**

```
CALC:MARK:FUNC:DOM:USER 1
calculate2:marker8:function:domain:user:range 1
```

**Query Syntax**

CALCulate:<cnum>:MARKer:<mkr>:FUNCTION:DOMain:USER[:RANGe]?

Returns the user span number that the specified marker is assigned to.

**Return Type**

Numeric

**Default**

0 - Full Span

CALCulate:<cnum>:MARKer:<mkr>:FUNCTION:DOMain:USER:STARt <start>
Applicable Models: N522xB, N523xB, N524xB, M937xA, P937xA

CALCulate:MARKer commands are Superseded by the CALCulate:MEASure:MARKer commands.

(Read-Write) Sets the start of the span that the specified marker's x-axis span will be constrained to.

Use CALC:MARK:FUNC:DOM:USER<range> to set range number

Note: If the marker is assigned to range 0 (full span), the USER:STARt and STOP commands generate an error. You cannot set the STARt and STOP values for "Full Span".

Note: This command does the same as CALC:FUNC:DOM:USER:STAR

See Critical Note

**Parameters**

- `<cnum>` Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, `<cnum>` is set to 1.
- `<mkr>` Any marker number from 1 to 15; if unspecified, value is set to 1
- `<start>` The analyzer's Minimum x-axis value

**Examples**

```
calculate2:marker8:function:domain:user:start 1e12
```

**Query Syntax**

**Return Type**

Numeric

**Default**

The analyzer's Minimum x-axis value

CALCulate<cnum>:MARKer<mkr>:FUNCtion:DOMain:USER:STOP <stop>
Applicable Models: N522xB, N523xB, N524xB, M937xA, P937xA

CALCulate:MARKer commands are **Superseded** by the CALCulate:MEASure:MARKer commands.

*(Read-Write)* Sets the stop of the span that the marker's x-axis travel will be constrained to.

Use `CALC:MARK:FUNC:DOM:USER<range>` to set range number

Use `CALC:MARK:FUNC:DOM:USER:STARt` to set the stop value.

**Note:** If the marker is assigned to range 0 (full span), the USER:STARt and STOP commands generate an error. You cannot set the STARt and STOP values for "Full Span".

**Note:** This command does the same as `CALC:FUNC:DOM:USER:STOP`

See Critical Note

**Parameters**

- `<cnum>` Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, `<cnum>` is set to 1.
- `<mkr>` Any marker number from 1 to 15; if unspecified, value is set to 1.
- `<stop>` Stop value of x-axis span; Choose any number between the analyzer's MINimum and MAXimum x-axis value.

**Examples**

```
calculate2:marker8:function:domain1:user:stop 1e12
```

**Query Syntax**

`CALCulate<cnum>:MARKer<mkr>:FUNCtion:DOMain:USER:STOP?`

**Return Type** Numeric

**Default** The analyzer's MAXimum x-axis value.

```
CALCulate<cnum>:MARKer<mkr>:FUNCtion:EXECute <func>
```
Applicable Models: N522xB, N523xB, N524xB, M937xA, P937xA

CALCulate:MARKer commands are Superseded by the CALCulate:MEASure:MARKer commands.

(Write-only) Immediately executes (performs) the specified search function.

Learn more about Marker Search

See Critical Note

Parameters

- `<cnum>`  Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, `<cnum>` is set to 1.
- `<mkr>`  Any marker number from 1 to 15; if unspecified, value is set to 1.
- `<func>`  The function to be performed. Choose from:
  - MAXimum - finds the highest value
  - MINimum - finds the lowest value
  - RPEak - finds the next valid peak to the right
  - LPEak - finds the next valid peak to the left
  - NPEak - finds the next highest value among the valid peaks
  - TARGET - finds the target value to the right, wraps around to the left
  - LTARGET - finds the next target value to the left of the marker
  - RTARGET - finds the next target value to the right of the marker
  - COMPression - finds the compression level on a Power Swept S21 trace.

Examples

```
CALC:MARK:FUNC:EXEC MAX
```

Query Syntax

- Not applicable

Default

Not applicable

CALCulate<cnum>:MARKer<mkr>:FUNCTION[:SELect] <char>
Applicable Models: N522xB, N523xB, N524xB, M937xA, P937xA

CALCulate:MARKer commands are **Superseded** by the CALCulate:MEASure:MARKer commands.

(Read-Write) Sets the search function that the specified marker will perform when executed. Use CALC:MARK:FUNC:TRAC ON to automatically execute the search every sweep.

Learn more about Marker Search

See Critical Note

**Parameters**

- **<cnum>** Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, <cnum> is set to 1.
- **<mkr>** Any marker number from 1 to 15; if unspecified, value is set to 1.
- **<char>** Marker function. Choose from:
  - **MAXimum** - finds the highest value
  - **MINimum** - finds the lowest value
  - **RPEak** - finds the next valid peak to the right
  - **LPEak** - finds the next valid peak to the left
  - **NPEak** - finds the next highest value among the valid peaks
  - **TARGET** - finds the target value to the right, wraps around to the left
  - **LTARGET** - finds the next target value to the left of the marker
  - **RTARGET** - finds the next target value to the right of the marker
  - **COMPression** - finds the compression level on a power-swept S21 trace.

**Examples**

```
CALC:MARK:FUNC MAX
CALCulate2:marker8:function:select ltarget
```

**Query Syntax**

CALCulate<cnum>:MARKer<mkr>:FUNCTION[:SE lect]?

**Return Type**

Character

**Default**

MAX

CALCulate<cnum>:MARKer<mkr>:TARGET[:VALUE] <num><unit>
**Applicable Models:** N522xB, N523xB, N524xB, M937xA, P937xA

CALCulate:MARKer commands are **Superseded** by the CALCulate:MEASure:MARKer commands.

*(Read-Write)* Sets the target value for the specified marker when doing Target Searches with CALC:MARK:FUNC:SEL <TARGet | RTARGet | LTARGet>

See Critical Note

**Parameters**

- `<cnum>` Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, `<cnum>` is set to 1.
- `<mkr>` Any marker number from 1 to 15; if unspecified, value is set to 1.
- `<num>` Target value to search for; Units are NOT allowed.
- `<unit>` Varies depending on the data format.
  
  - Log magnitude (MLOG): dB (decibel)
  - Phase (PHAS), Expanded phase (UPH) or Positive phase (PPH): deg (degree)
  - Group delay (GDEL): s (second)
  - Others: No unit

**Examples**

- `CALC:MARK:TARG 2.5`
- `calculate2:marker8:target:value -10.3`

**Query Syntax**

`CALCulate<cnum>:MARKer<mkr>:TARGet[:VALue]`?

**Return Type**

Numeric

**Default**

0

`CALCulate<cnum>:MARKer<mkr>:FUNCtion:TRACking <ON | OFF>`
CALCulate:MARKer commands are Superseded by the CALCulate:MEASure:MARKer commands.

(Read-Write) Sets the tracking capability for the specified marker. The tracking function finds the selected search function every sweep. In effect, turning Tracking ON is the same as doing a CALC:MARK:FUNC:EXECute command every sweep.

See Critical Note

Parameters

- `<cnum>` Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, `<cnum>` is set to 1.
- `<mkr>` Any marker number from 1 to 15; if unspecified, value is set to 1.
- `<ON | OFF>`

  - **ON** (or 1) - The specified marker will "Track" (find) the selected function every sweep.
  - **OFF** (or 0) - The specified marker will find the selected function only when the CALC:MARK:FUNC:EXECute command is sent.

Examples

<table>
<thead>
<tr>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>CALC:MARK:FUNC:TRAC ON</td>
</tr>
<tr>
<td>calculate2:marker8:function:tracking off</td>
</tr>
</tbody>
</table>

Query Syntax

CALCulate<cnum>:MARKer<mkr>:FUNCtion:TRACking?

Return Type

Boolean (1 = ON, 0 = OFF)

Default

OFF

CALCulate<cnum>:MARKer:REFerence[:STATe] <ON | OFF>
Applicable Models: N522xB, N523xB, N524xB, M937xA, P937xA

CALCulate:MARKer commands are **Superseded** by the CALCulate:MEASure:MARKer commands.

**(Read-Write)** Turns the reference marker ON or OFF. When turned OFF, existing Delta markers revert to general-purpose markers.

**Important:** Learn about programming the reference marker.

See Critical Note

**Parameters**

- `<cnum>`: Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, `<cnum>` is set to 1.
- `<ON | OFF>`:
  - **ON** (or 1) - turns reference marker ON
  - **OFF** (or 0) - turns reference marker ON

**Examples**

```
CALC:MARK:REF ON
```

```
calculate2:marker:reference:state OFF
```

**Query Syntax**

CALCulate<cnum>:MARKer:REFerence[:STATe]?

**Return Type**

Boolean (1 = ON, 0 = OFF)

**Default**

OFF

---

CALCulate<cnum>:MARKer:REference:X <num>

Applicable Models: N522xB, N523xB, N524xB, M937xA, P937xA

CALCulate:MARKer commands are **Superseded** by the CALCulate:MEASure:MARKer commands.

**(Read-Write)** Sets and returns the absolute x-axis value of the reference marker.

**Important:** Learn about programming the reference marker.

See Critical Note

- `<cnum>`: Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, `<cnum>` is set to 1.
- `<num>`: X-axis value. Choose any number within the operating domain of the reference marker.

**Examples**

```
CALC:MARK:REF:X 1e9
```

```
calculate2:marker:reference:x 1e6
```
CALCulate<cnum>:MARKer:REFerence:X?

Return Type: Numeric

Default: If the first Marker, turns ON in the middle of the X-axis span. If not, turns ON at the position of the active marker.

CALCulate<cnum>:MARKer:REFerence:Y?

Applicable Models: N522xB, N523xB, N524xB, M937xA, P937xA

CALCulate:MARKer commands are Superseded by the CALCulate:MEASure:MARKer commands.

(Read-only) Returns the absolute Y-axis value of the reference marker.

Important: Learn about programming the reference marker.

See Critical Note

Parameters

<cnum> Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, <cnum> is set to 1.

Examples

CALC:MARK:REF:Y?
calculate2:marker:reference:y?

Return Type: Character

Default: Not applicable

CALCulate<cnum>:MARKer<mkr>:SET <char>
Applicable Models: N522xB, N523xB, N524xB, M937xA, P937xA

CALCulate:MARKer commands are **Superseded** by the CALCulate:MEASure:MARKer commands.

*(Write-only)* Sets the selected instrument setting to assume the value of the specified marker.

Marker Functions CENT, SPAN, STARt, and STOP do not work with channels that are in **CW** or **Segment Sweep** mode.

See Critical Note

### Parameters

- `<cnum>` Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, `<cnum>` is set to 1.
- `<mkr>` Any marker number from 1 to 15; if unspecified, value is set to 1
- `<char>` Choose from:
  - **CENTer** - changes center frequency to the value of the marker
  - **SA** - creates an SA channel with a marker at the same CW frequency. [Learn more.](#)
  - **SPAN** - changes the sweep span to the span that is defined by the delta marker and the marker that it references. Unavailable if there is no delta marker.
  - **STARt** - changes the start frequency to the value of the marker
  - **STOP** - changes the stop frequency to the value of the marker
  - **RLEVel** - changes the reference level to the value of the marker
  - **DElay** - changes the line length at the receiver input to the phase slope at the active marker stimulus position.
  - **CWFReq** - Sets the CW frequency to the frequency of the active marker. Does NOT change sweep type. NOT available in CW or Power Sweep. Use this argument to first set the CW Frequency to a value that is known to be within the current calibrated range, THEN set Sweep:Type to POWer or CW.

### Examples

```
CALC:MARK:SET CENT
calculate2:marker8:set span
```

### Query Syntax

- Not Applicable
- **Default** Not Applicable

CALCulate<cnum>:MARKer<mkr>[:STATe] <ON|OFF>
**Applicable Models:** N522xB, N523xB, N524xB, M937xA, P937xA

CALCulate:MARKer commands are **Superseded** by the CALCulate:MEASure:MARKer commands.

**(Read-Write)** Turns the specified marker ON or OFF. To turn all markers off, use CALC:MARK:AOFF.

See Critical Note

**Parameters**

<**cnum**> Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, <cnum> is set to 1.

<**mkr**> Any marker number from 1 to 15; if unspecified, value is set to 1.

<**ON|OFF**> ON (or 1) - turns marker ON.

OFF (or 0) - turns marker OFF.

**Examples**

```
CALC:MARK ON
```

```
calculate2:marker8 on
```

**Query Syntax**

CALCulate<cnum>:MARKer<mkr>:STATE?

**Return Type**

Boolean (1 = ON, 0 = OFF)

**Default** Off

---

CALCulate<cnum>:MARKer<mkr>:TYPE <**char**>

**Applicable Models:** N522xB, N523xB, N524xB, M937xA, P937xA

CALCulate:MARKer commands are **Superseded** by the CALCulate:MEASure:MARKer commands.

**(Read-Write)** Sets the type of the specified marker.

See Critical Note

**Parameters**

<**cnum**> Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, <cnum> is set to 1.

<**mkr**> Any marker number from 1 to 15; if unspecified, value is set to 1

<**char**> Choose from:

- **NORMAL** - a marker that stays on the assigned X-axis position unless moved or searching.
- **FIXed** - a marker that will not leave the assigned X or current Y-axis position.

### Examples

```
CALC:MARK:TYPE NORM
calculate2:marker2:type fixed
```

### Query Syntax

```
CALCulate<cnum>:MARKer<mkr>:TYPE?
```

### Return Type

Character

**Default**

NORMal

---

**CALCulate<cnum>:MARKer<mkr>:X <num>**

**Applicable Models:** N522xB, N523xB, N524xB, M937xA, P937xA

CALCulate:MARKer commands are **Superseded** by the `CALCulate:MEASure:MARKer` commands.

(Read-Write) Sets the marker's X-axis value (frequency, power, or time). If the marker is set as delta, the SET and QUERY data is relative to the reference marker.

**See Critical Note**

**Parameters**

- `<cnum>`: Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, `<cnum>` is set to 1.
- `<mkr>`: Any marker number from 1 to 15; if unspecified, value is set to 1.
- `<num>`: Any X-axis position within the measurement span of the marker.

**Note:** This command will accept `MIN` or `MAX` instead of a numeric parameter. See [SCPI Syntax](#) for more information.

```
CALC:MARK:X 100Mhz
calculate2:marker8:x maximum
```

**Query Syntax**

```
CALCulate<cnum>:MARKer<mkr>:X?
```

**Return Type**

Numeric

**Default**

First Marker turns ON in the middle of the X-axis span. Subsequent markers turn ON at the position of the active marker.

---

**CALCulate<cnum>:MARKer<mkr>:Y?**
**Applicable Models:** N522xB, N523xB, N524xB, M937xA, P937xA

CALCulate:MARKer commands are **Superseded** by the CALCulate:MEASure:MARKer commands.

*(Read-only)* Reads the marker's Y-axis value. The format of the value depends on the current CALC:MARKER:FORMAT setting. If the marker is set as delta, the data is relative to the reference marker. The query always returns two numbers:

- Smith and Polar formats - (Real, Imaginary)
- LINPhase and LOGPhase - (Real, Imaginary)
- All other formats - (Value,0)

**Note:** To accurately read the marker Y-axis value with trace smoothing applied, the requested format must match the displayed format. Otherwise, the returned value is un-smoothed data. For example, to read the smoothed marker value when measuring group delay, both the display format and the marker format must be set to (Group) Delay.

See Critical Note

**Parameters**

- `<cnum>` Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, `<cnum>` is set to 1.
- `<mkr>` Any marker number from 1 to 15; if unspecified, value is set to 1.

**Examples**

- `CALC:MARK:Y?`
- `calculate2:marker3:y?`

**Query Syntax**

CALCulate<cnum>:MARKer<mkr>:Y?

**Return Type**

- Numeric

**Default**

- Not applicable
Calculate: Math Commands

Controls math operations on the currently selected measurement and memory.

These commands are **Superseded** by the CALCulate:MEASure:MATH commands.

**Critical Note:** CALCulate commands act on the selected measurement. You can select one measurement for each channel using Calc:Par:MNUM or Calc:Par:Select. Learn more.

CALCulate<cnum>:MATH:FUNCTION <char>

**Applicable Models:** N522xB, N523xB, N524xB, M937xA, P937xA

*(Read-Write)* Sets math operations on the currently selected measurement and the trace stored in memory. (There MUST be a trace stored in Memory. See CALC:MATH MEM)

See Critical Note

**Parameters**

- `<cnum>` Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, `<cnum>` is set to 1.
- `<char>` The math operation to be applied. Choose from the following:
CALCulate<cnum>:MATH:FUNCtion?

Query Syntax: CALCulate<cnum>:MATH:FUNCtion?

Return Type: Character

Default: NORMal

CALCulate<cnum>:MATH:INTerpolate <bool>

Applicable Models: N522xB, N523xB, N524xB

(Read-Write) Sets and reads the state of the memory data interpolation. Learn more.

See Critical Note

Parameters

<ch> Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, <ch> is set to 1.

<bool> Choose from:

0 - OFF - Turn memory data interpolation OFF.

1 - ON - Turn memory data interpolation ON.

Examples: CALC2:MATH:INT 1

Query Syntax: CALCulate<ch>:MATH:INTerpolate?

Return Type: Boolean

Default: 0

CALCulate<cnum>:MATH:MEMorize
**Applicable Models:** N522xB, N523xB, N524xB, M937xA, P937xA

*(Write-only)* Puts the currently selected measurement trace into memory. *(Data-> Memory)*.

See Critical Note

**Parameters**

- `<cnum>` Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, `<cnum>` is set to 1.

CALCulate<cnum>:MEASure<mnum>:CONVersion:FUNCtion <char>

**Applicable Models:** All

(Read-Write) Sets or gets the parameter after conversion using the parameter conversion function, for the active trace of selected channel.

**Parameters**
- `<cnum>` Channel number of the measurement (optional).
- `<mnum>` Measurement number for each measurement.
- `<char>` Select from the following parameters after conversion:
  - "OFF"
  - "ZREFlection" - Specifies the equivalent impedance in reflection measurement.
  - "ZTRANSMIT" - Specifies the equivalent impedance (series) in transmission measurement.
  - "ZTSHUNT" - Specifies the equivalent impedance (shunt) in transmission measurement.
  - "YREFlection" - Specifies the equivalent admittance in reflection measurement.
  - "YTRANSMIT" - Specifies the equivalent admittance (series) in transmission measurement.
  - "YTSHUNT" - Specifies the equivalent admittance (shunt) in transmission measurement.
  - "INVERSION" - Specifies the inverse S-parameter (1/S).
"CONJugation" - Specifies the conjugate.

Examples

SCPI sequence to retrieve resistance from a polar chart:

```
CALC:MEAS:CONV:FUNC ZREFlection
CALC:MEAS:FORM:REAL
CALC:MEAS:DATA:FDATA?
```

SCPI sequence to retrieve reactance from a polar chart:

```
CALC:MEAS:CONV:FUNC ZREFlection
CALC:MEAS:FORM:IMAG
CALC:MEAS:DATA:FDATA?
```

Query Syntax

```
CALCulate<cnum>:MEASure<mnum>:CONVersion:FUNCtion?
```

Return Type

Character

Default

"OFF"

CALCulate<cnum>:MEASure<mnum>:COMPutation:DEViation <char>

Applicable Models: All

(Read-Write) Calculates the deviation from a least-squares best fit line.

Parameters

- `<cnum>` Channel number of the measurement (optional).
- `<mnum>` Measurement number for each measurement.
- `<char>` Select from the following parameters:

  - "OFF"
  - "LINear" - Fit to 1st order curve minimizing RSS deviation.
  - "PARabolic" - Fit to 2nd order curve minimizing RSS deviation.
  - "CUBic" - Fit to 3rd order curve minimizing RSS deviation.

Examples

```
CALC:MEAS1:COMP:DEV LIN
```

Query Syntax

```
CALCulate<cnum>:MEASure<mnum>:COMPutation:DEViation?
```

Return Type

Character

Default

"OFF"
CALCulate<cnum>:MEASure<mnum>:DEFine <string>

Applicable Models: All

(Write-only) Creates a measurement but does NOT display it, on an existing or new channel. When a new channel is created, any licensed measurement class can be used. Up to 580 (2000 for M980xA/P50xxA and E5080B) measurements can be created.

Note: For setting up a TDR measurement class, use SYSTem:TDR:INITialize.

Note that each display window can only display a limited number of traces. See Traces, Channels, and Windows on the VNA.

- Use DISP:WIND:STATe to create a window if it doesn't already exist.
- Use DISP:MEAS<mnum>:FEED<wnum> to display the measurement in window <wnum>.

This command replaces the following commands:

CALCulate:PARameter[DEFine]
CALCulate:PARameter[DEFine]:EXTended
CALCulate:CUSTom:DEFine

Parameters

<cnum> Channel number of the new measurement. If unspecified, value is set to 1.

If the specified channel does not exist, then a channel of the specified type will be created. If no type of channel is specified, then a standard channel will be created.

If the specified channel exists, then the parameter will be added to the channel provided the existing channel supports the parameter (otherwise, an error will be generated).

<mnum> Measurement number for the new measurement.

If the specified measurement number is already in use, an error will be generated.

<string> (String) Measurement Parameter and optional measurement class name separated by a ":" (colon). For example, "S21:Gain Compression" creates an S21 measurement and selects the Gain Compression measurement class for the channel.

Note: If a measurement class of a channel does not support the defined
measurement parameter, an error is generated.

Case sensitive.

**For S-parameters:**

Any S-parameter available in the VNA

Single-digit port numbers CAN be separated by "_" (underscore). For example: "S21" or "S2_1"

Double-digit port numbers MUST be separated by underscore. For example: "S10_1"

**For ratioed measurements:**

Any two VNA physical receivers separated by forward slash '/' followed by comma and source port.

For example: "A/R1, 3"

[Learn more about ratioed measurements](#)

See a [block diagram](#) showing the receivers in YOUR VNA.

**For non-ratioed measurements:**

Any VNA physical receiver followed by comma and source port.

For example: "A, 4"

[Learn more about unratioed measurements](#)

See the [block diagram](#) showing the receivers in YOUR VNA.

**Ratioed and Unratioed** measurements can also use [logical receiver notation](#) to refer to receivers. This notation makes it easy to refer to receivers with an [external test set](#) connected to the VNA. You do not need to know which physical receiver is used for each test port. [Learn more](#).

**For ADC measurements:**

Any ADC receiver in the VNA followed by a comma, then the source port.

For example: "AI1,2" indicates the Analog Input1 with source port of 2.

[Learn more about ADC receiver measurements](#)
The following are the existing valid measurement parameters for each measurement class (click a link or scroll down to view). The Measurement Class must be installed and registered on the VNA.

- "Standard"
- "Active Hot Parameters"

```
CALC1:MEAS2:DEF "S11" 'Defines an S11 measurement for channel 1, measurement number 2.
```

```
CALC4:MEAS3:DEF "S21:Gain Compression" 'Defines an S21 measurement for channel 4, measurement number 3, and creates a
```
CALC2:MEAS:DEF "R1,1:Standard" 'Defines an R1,1 measurement for channel 2, measurement number 1 (default), and creates a Standard channel.

SYST:FPrest
CALC1:MEAS1:DEF "NF:Noise Figure Cold Source" 'Defines a Noise Figure measurement for channel 2, measurement number 2, and creates a Noise Figure channel.
DISP:WIND1 ON
DISP:MEAS1:FEED 1
CALC2:MEAS2:DEF "CompIn21:Gain Compression" 'Defines an input power at Compression point but doesn't display on channel 2.
DISP:WIND2 ON
DISP:MEAS2:FEED 2 'CompIn21 measurement in window number 2.
CALC2:MEAS3:DEF "CompOut21:Gain Compression" 'Defines an output power at Compression point but doesn't display on channel 2
DISP:MEAS3:FEED 2 'CompOut21 measurement in window number 2

### Query Syntax

| Default | Not Applicable |

CALCulate<cnum>:MEASure<mnum>:DELete

**Applicable Models:** All

*(Write-only)* Deletes the specified measurement.

**Parameters**

- `<cnum>` Channel number of the measurement (optional).
- `<mnum>` Measurement number.

**Examples**

- `CALC:MEAS2:DEL`
- `calculate2:measure2:delete`

**Query Syntax**

| Default | Not Applicable |

CALCulate:MEASure:DELete:ALL
Applicable Models: All

(Write-only) Deletes all measurements on the VNA.

### Parameters

### Examples

```
CALC:MEAS:DEL:ALL
```

### Query Syntax

Not Applicable

### Default

Not Applicable

---

CALCulate<cnum>:MEASure<mnum>:EQUation:FAST <bool>

Applicable Models: All

(Read-Write) Set and return equation editor trace update delay. This command delays updating the equation editor trace until all trace references have finished updating to ensure that all data is present.

**Note:** This command does not work in application channels. In addition, this command does not work with the standard channel when the channel is in HOLD and then SINGLE sweeps are sent.

### Parameters

- `<cnum>` Channel number of the measurement (optional).
- `<mnum>` Measurement number for each measurement.
- `<bool>` Choose from:
  - **OFF (0)** Do not delay equation editor trace update.
  - **ON (1)** Delay equation editor trace update.

### Examples

```
CALC:MEAS:EQU:FAST 1
calculate2:measure1:equation:fast OFF
```

### Query Syntax

CALCulate<cnum>:MEASure<mnum>:EQUation:FAST?

### Return Type

Boolean

### Default

**OFF** or **0**

---

CALCulate<cnum>:MEASure<mnum>:EQUation[:STATe] <bool>
Applicable Models: All

(Read-Write) Turns ON and OFF the equation on selected measurement for the specified channel. If the equation is not valid, then processing is not performed. Use CALC:EQUation:VALid? to ensure that the equation is valid.

Parameters

- `<cnum>` Channel number of the measurement (optional).
- `<mnum>` Measurement number for each measurement.
- `<bool>` ON (or 1) - turns equation ON.
  OFF (or 0) - turns equation OFF.

Examples

```
CALC:MEAS:EQU 1
```
```
calculate2:measure1:equation:state 0
```

Query Syntax

CALCulate<cnum>:MEASure<mnum>:EQUation[:STATe]?

Return Type

Boolean

Default

OFF (0)

---

CALCulate<cnum>:MEASure<mnum>:EQUation:TEXT <string>

Applicable Models: All

(Read-Write) Specifies an equation or expression to be used on the selected measurement for the specified channel.

Parameters

- `<cnum>` Channel number of the measurement (optional).
- `<mnum>` Measurement number for each measurement.
- `<string>` Any valid equation or expression. See Equation Editor.

Examples

```
'Equation (includes '=')

CALC:MEAS:EQU:TEXT "foo=S11/S21"

'Expression

calculate2:measure1:equation:text "S11/S21"
```

Query Syntax

CALCulate<cnum>:MEASure<mnum>:EQUation:TEXT?

Return Type

String
CALCulate<cnum>:MEASure<mnum>:EQUation:VALid?

**Applicable Models:** All

**(Read-Only)** Returns a boolean value to indicate if the current equation on the selected measurement for the specified channel is valid. For equation processing to occur, the equation must be valid and ON (CALC:EQU:STAT 1).

**Parameters**
- `<cnum>` Channel number of the measurement (optional).
- `<mnum>` Measurement number for each measurement.

**Examples**
```
CALC:MEAS:EQU:VAL?
calculate2:measure1:equation:valid?
```

**Return Type** Boolean
- 1 - equation is valid
- 0 - equation is NOT valid

**Default** Not Applicable

---

CALCulate<cnum>:MEASure<mnum>:FORMat <char>

**Applicable Models:** All

**(Read-Write)** Sets the display format for the measurement.

**Parameters**
- `<cnum>` Channel number of the measurement (optional).
- `<mnum>` Measurement number for each measurement.
- `<char>` Choose from:
  - MLINear
  - MLOGarithmic
  - PHASE
- UPHase 'Unwrapped phase
- IMAGinary
- REAL
- POLar
- SMITh
- SADMittance 'Smith Admittance
- SWR
- GDELay 'Group Delay
- KELVin
- FAHRenheit
- CELSius
- PPHase 'Positive Phase
- COMPlex

Examples

```
CALC:MEAS:FORM MLIN
calculate2:measure1:format polar
```

Query Syntax

```
CALCulate<cnum>:MEASure<mnum>:FORMat?
```

Return Type

Character

Default

MLOG

```
CALCulate<cnum>:MEASure<mnum>:FORMat:UNIT <dataFormat>, <units>
```
Applicable Models: All

(Read-Write) Sets and returns the units for the specified data format. Measurements with display formats other than those specified are not affected.

**Parameters**

- `<cnum>` Channel number of the measurement (optional).
- `<mnum>` Measurement number for each measurement.
- `<dataFormat>` Choose from:
  - **MLOG** - Log magnitude
  - **MLIN** - Linear magnitude
- `<units>` For unratioed MLOG measurements, choose from:
  - **dB** Units are displayed in decibels.
  - **DBM** Units are displayed in dBm. 0 dBm = 0.001 watt
  - **DBMV** Units are displayed in dBmV. 0 dBmV = 0.001 volt
    DBmV value depends on the reference impedance: dBmV = dBm + 30 + 10*log10(Z0)
  - **DBMA** Units are displayed in dBmA. 0 dBmA = 0.001 Ampere
  - **DBUV** Units are displayed in dBuV. 0 dBuV = 1 uV
    DBuV value depends on the reference impedance: dBuV = dBm + 90 + 10*log10(Z0)

For unratioed MLIN measurements, choose from:

- **UNIT** - No units. Linear magnitude without conversion
- **W** - Units are displayed in Watts
- **V** - Units are displayed in Volts
- **A** - Units are displayed in Amperes

**Examples**

```
CALC:MEAS:FORM:UNIT MLOG, DBM
CALCulate2:measure1:format:unit mlog,dbmv
```

**Query Syntax**

CALCulate<cnum>:MEASure<mnum>:FORMat:UNIT? <dataFormat>

**Return Type**

Character

**Default**

MLOG, DBM

CALCulate<ch>:MEASure<mnum>:HOLD:CLEAR
Applicable Models: All

(Write-only) Resets the currently-stored data points to the live data trace and restarts the currently-selected Trace Hold type.

Parameters

- `<ch>` Channel number of the measurement (optional).
- `<mnum>` Measurement number for each measurement.

Examples

```
CALC:MEAS:HOLD:CLE
calculate2:measure1:hold:clear
```

Query Syntax

Not Applicable

Default

Not Applicable

CALCulate<ch>:MEASure<mnum>:HOLD:TYPE <value>

Applicable Models: All

(Read-Write) Sets the type of trace hold to perform.

Parameters

- `<ch>` Channel number of the measurement (optional).
- `<mnum>` Measurement number for each measurement.
- `<value>` Trace Hold type. Choose from:

  - `OFF` - Disables the Trace Hold feature.
  - `MINimum` - Sets Trace Hold to store the lowest measured data points.
  - `MAXimum` - Sets Trace Hold to store the highest measured data points.

Examples

```
CALC:MEAS:HOLD:TYPE MAX
calculate2:measure1:hold:type minimum
```

Query Syntax

CALCulate<ch>:MEASure<mnum>:HOLD:TYPE?

Return Type

Character

Default

OFF

CALCulate<cnum>:MEASure<mnum>:MATH:FUNCtion <char>
Applicable Models: All

(Read-Write) Sets math operations on the currently selected measurement and the trace stored in memory. (There MUST be a trace stored in Memory. See `CALC:MEAS:MATH MEM`)

Parameters

- `<cnum>` Channel number of the measurement (optional).
- `<mnum>` Measurement number for each measurement.
- `<char>` The math operation to be applied. Choose from the following:
  - NORMal: Trace data only
  - ADD: Data + Memory
  - SUBTract: Data - Memory
  - MULTiply: Data * Memory
  - DIVide: Data / Memory

Examples

- `CALC:MEAS:FUNC NORM`
- `calculate2:measure1:math:function subtract`

Query Syntax

`CALC<ch>:MEAS<mnum>:MATH:FUNCtion?`

Return Type

Character

Default

NORMal

CALCulate<ch>:MEASure<mnum>:MATH:INTerpolate[:STATE]?

Applicable Models: N522xB, N523xB, N524xB

(Read-Write) Sets and reads the state of the memory data interpolation. Learn more.

Parameters

- `<cnum>` Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, `<ch>` is set to 1.
- `<mnum>` Measurement number for each measurement.
- `<bool>` Choose from:
  - 0 - OFF - Turn memory data interpolation OFF.
  - 1 - ON - Turn memory data interpolation ON.

Examples

- `CALC2:MEAS:INT 1`

Query Syntax

`CALC<ch>:MEAS<mnum>:MATH:INTerpolate?`

Return Type

Boolean

Default

0
CALCulate<cnum>:MEASure<mnum>:MATH:MEMorize

Applicable Models: All

(Write-only) Puts the currently selected measurement trace into memory. (Data-> Memory).

Parameters

- `<cnum>` Channel number of the measurement (optional).
- `<mnum>` Measurement number for each measurement.

Examples

- CALC:MEAS:MATH:MEM
- calculate2:measure1:math:memorize

Query Syntax

- Not applicable
- Default Not applicable

CALCulate<ch>:MEASure<mnum>:MIXer:XAXis <char>

Applicable Models: All

(Read-Write) Sets or returns the swept parameter to display on the X-axis for the selected FCA and GCX measurement.

Parameters

- `<ch>` Any existing channel number. If unspecified, value is set to 1.
- `<mnum>` Measurement number for each measurement.
- `<char>` Parameter to display on the X-axis. Choose from:
  - INPUT - Input frequency span
  - OUTPUT - Output frequency span
  - LO_1 - First LO frequency span
  - LO_2 - Second LO frequency span

Examples

- CALC:MEAS:MIX:XAX INPUT
- calculate2:measure1:mixer:xaxis output

See an example that creates, selects, and calibrates an SMC and VMC measurement using SCPI.

Query Syntax

CALCulate<ch>:MEASure<mnum>:MIXer:XAXis?
CALCulate<cnum>:MEASure<mnum>:RDATA? <char>

Applicable Models: All

(Read-only) Returns receiver data for the selected measurement.

Parameters

- <cnum> Channel number of the measurement (optional).
- <mnum> Measurement number for each measurement.
- <char> Choose from any physical receiver in the VNA.

For example: "A"

Also, REF - returns data for either R1 or R2 data depending on the source port of the selected measurement.

See the block diagram showing the receivers in YOUR VNA.

Note: Logical receiver notation is NOT allowed with this command. Learn more.

Example

GPIB.Write "INITiate:CONTinuous OFF"
GPIB.Write "INITiate:IMMediate:*wai"
GPIB.Write "CALCulate:MEASure2:RDATA? A"

GPIB.Write "CALCulate:MEASure2:RDATA? REF"

Return Type Depends on FORM:DATA - Two numbers per data point

Default Not Applicable
CALCulate:MEASure:DIStortion Commands

Calculate and display amplitude modulation or phase modulation per trace. This feature is supported on all standard channels and on all memory traces in a standard channel.

```
| CALCulate:MEASure:DISTortion |
|                             |
| BACKoff:                  |
|   | COMPression            |
|   | [:STATe]               |
| MODE                      |
| SLOPe:                    |
|   | APERTure               |
|   | [:STATe]               |
```

Click a keyword to view the command details.

See Also

- Calibrating with SCPI
- Synchronizing the Analyzer and Controller
- SCPI Command Tree

```
| CALCulate<cnum>:MEASure<mnum>:DISTortion:BACKoff:COMPression <num> |
```

3554
(Read-Write) Sets the compression level used in determining the back off calculation.

**Parameters**
- `<cnum>` Channel number of the measurement (optional).
- `<mnum>` Measurement number for each measurement.
- `<num>` Compression level.

**Examples**
- `CALC1:MEAS2:DIST:BACK:COMP 1 dB`
- `calculate2:measure2:distortion:backoff:compression 1 dB`

**Query Syntax**
`CALCulate<cnum>:MEASure<mnum>:DISTortion:BACKoff:COMPression?`

**Return Type** Numeric

**Default** 1 dB

(Read-Write) Enables/disables compression level back off function specified using the `CALCulate:MEASure:DISTortion:BACKoff:COMPression` command. When enabled, the x-axis changes to display the back off from the compression point.

**Parameters**
- `<cnum>` Channel number of the measurement (optional).
- `<mnum>` Measurement number for each measurement.
- `<bool>` Compression level back off state. Choose from:
  - 0 - Compression level back off state OFF
  - 1 - Compression level back off state ON

**Examples**
- `CALC:MEAS2:CORR ON`
- `calculate:measure2:correction:state off`

**Query Syntax**
`CALCulate<cnum>:MEASure<mnum>:DISTortion:BACKoff[:STATe] <bool>`

**Return Type** Boolean

**Default** OFF
CALCulate\(<cnum>\):MEASure\(<mnum>\):DISTortion:MODE \(<char>\)

**Applicable Models:** All

*(Read-Write)* Displays phase or amplitude distortion.

**Parameters**
- \(<cnum>\) Channel number of the measurement (optional).
- \(<mnum>\) Measurement number for each measurement.
- \(<char>\) Choose from:
  - OFF
  - AMPM - Displays phase distortion (in degrees).
  - AMAM - Displays amplitude distortion (in dB).

**Examples**
- `CALC:MEAS:DIST:MODE AMAM`
- `calculate2:measure1:distortion:mode amam`

**Query Syntax**
- `CALCulate\(<cnum>\):MEASure\(<mnum>\):DISTortion:MODE?`

**Return Type**
- Character

**Default**
- OFF

---

CALCulate\(<cnum>\):MEASure\(<mnum>\):DISTortion:SLOPe:APERture \(<num>\)

**Applicable Models:** All

*(Read-Write)* Sets the aperture value over which the phase or gain slope will be calculated.

**Parameters**
- \(<cnum>\) Channel number of the measurement (optional).
- \(<mnum>\) Measurement number for each measurement.
- \(<num>\) Aperture value.

**Examples**
- `CALC1:MEAS2:DIST:SLOP:APER 1 dB`
- `calculate2:measure2:distortion:slope:aperture 1 dB`

**Query Syntax**
- `CALCulate\(<cnum>\):MEASure\(<mnum>\):DISTortion:SLOPe:APERture?`

**Return Type**
- Numeric

**Default**
- 1 dB
CALCulate<cnum>:MEASure<mnum>:DISTortion:SLOPe[:STATe] <bool>

Applicable Models: All

(Read-Write) Enables/disables phase slope (AMPM) or gain slope (AMAM) over the slope aperture to be displayed.

Parameters

- <cnum> Channel number of the measurement (optional).
- <mnum> Measurement number for each measurement.
- <bool> Compression level back off state. Choose from:
  0 - Phase or gain slope over aperture state OFF
  1 - Phase or gain slope over aperture state ON

Examples

- CALC:MEAS2:DIST:SLOP ON
- calculate:measure2:distortion:slope:state off

Query Syntax

CALCulate<cnum>:MEASure<mnum>:DISTortion:SLOPe[:STATe]?

Return Type

Boolean

Default

OFF
CALCulate:MEASure:BLIMit Commands

These commands are for setting up bandwidth tests.

```
CALCulate:MEASure:BLIMit
  BWIDth
    | THReshold
  DISPlay
    | MARKer
    | STATe
  FAIL?
  MAXimum
  MI Nimum
  REPort
    | [:DATA]?
    [:STATe]
```

Click a keyword to view the command details.

See Also

- Synchronizing the Analyzer and Controller
- SCPI Command Tree

CALCulate<cnum>:MEASure<mnum>:BLIMit:BWIDth:THReshold <value>
**Applicable Models:** All

**(Read-Write)** Sets bandwidth threshold value (attenuation from the peak) of the bandwidth test.

**Parameters**
- `<cnum>` Channel number of the measurement (optional).
- `<mnum>` Measurement number for each measurement.
- `<value>` Bandwidth N dB points

**Examples**
- `CALC:MEAS:BLIM:BWID:THR 5`

**Query Syntax**
- `CALCulate<cnum>:MEASure<mnum>:BLIMit:BWIDth:THReshold?`

**Return Type**
- Numeric
- Default: 3

---

**CALCulate<cnum>:MEASure<mnum>:BLIMit:DISPlay:MARKer:STATe <bool>**

**Applicable Models:** All

**(Read-Write)** Turns ON/OFF the bandwidth value display of the bandwidth test, for the active trace of selected channel.

**Parameters**
- `<cnum>` Channel number of the measurement (optional).
- `<mnum>` Measurement number for each measurement.
- `<bool>` ON or 1 - Turns limit testing ON.
  OFF or 0 - Turns limit testing OFF.

**Examples**
- `CALC:MEAS:BLIM:DISP:MARK:STAT ON`
- `calculate2:measure2:blimit:display:marker:state off`

**Query Syntax**
- `CALCulate<cnum>:MEASure<mnum>:BLIMit:DISPLay:BWIDth:STATe?`

**Return Type**
- Boolean
- Default: OFF

---

**CALCulate<cnum>:MEASure<mnum>:BLIMit:FAIL?**
Applicable Models: All

(Read-only) Get the bandwidth limit test results, for the active trace of selected channel.

**Parameters**

- `<cnum>` Channel number of the measurement (optional).
- `<mnum>` Measurement number for each measurement.
- `<bool>` Boolean

- 0 is returned when Pass
- 1 is returned when Fail

**Examples**

CALC:MEAS:BLIM:FAIL?
calculate2:measure2:blimit:fail?

**Query Syntax**

CALCulate<cnum>:MEASure<mnum>:BLIMit:FAIL?

**Return Type**

Boolean

Default Not Applicable

CALCulate<cnum>:MEASure<mnum>:BLIM:MAXimum `<max>`

Applicable Models: All

(Read-Write) Sets/gets the upper limit value of the bandwidth test, for the selected channel.

**Parameters**

- `<cnum>` Channel number of the measurement (optional).
- `<mnum>` Measurement number for each measurement.
- `<max>` Maximum bandwidth

**Examples**

CALC:MEAS:BLIM:MAX 1E6
calculate2:measure2:blimit:maximum 1E6

**Query Syntax**

CALCulate<cnum>:MEASure<mnum>:BLIMit:MAXimum?

**Return Type**

Numeric

Default

CALCulate<cnum>:MEASure<mnum>:BLIM:MINimum `<min>`
**Applicable Models:** All

**(Read-Write)** Sets or returns the lower limit value of the bandwidth test, for the selected channel.

**Parameters**
- `<cnum>` Channel number of the measurement (optional).
- `<mnum>` Measurement number for each measurement.
- `<min>` Minimum bandwidth

**Examples**
- `CALC:MEAS:BLIM:MIN 1E6`
- `calculate2:measure2:blimit:minimum 1E6`

**Query Syntax**
- `CALCulate<cnum>:MEASure<mnum>:BLIMit:MINimum?`

**Return Type** Numeric

---

**Applicable Models:** All

**(Read-only)** Read the bandwidth value of the bandwidth test, for the active trace of selected channel.

**Parameters**
- `<cnum>` Channel number of the measurement (optional).
- `<mnum>` Measurement number for each measurement.

**Examples**
- `CALC:MEAS:BLIM:REP:DATA?`
- `calculate2:measure2:blimit:report:DATA?`

**Query Syntax**
- `CALCulate<cnum>:MEASure<mnum>:BLIMit:REPort:DATA?`

**Return Type** Variant

Default OFF

---

**CALCulate<cnum>:MEASure<mnum>:BLIMit[:STATe]**
Applicable Models: All

(Read-Write) Turns ON/OFF the bandwidth test function, for the active trace of selected channel.

Parameters

- `<cnum>` Channel number of the measurement (optional).
- `<mnum>` Measurement number for each measurement.
- `<bool>` ON or 1 - Turns limit testing ON.
  OFF or 0 - Turns limit testing OFF.

Examples

CALC:MEAS:LIM:STAT ON  
calculate2:measure2:limit:state off

Query Syntax

CALCulate<cnum>:MEASure<mnum>:BLIMit:DIPLay:MARKer:STATe?

Return Type

Boolean

Default

OFF
CALCulate:MEASure:Correction Commands

Controls error correction functions.

CALCulate<cnum>:MEASure<mnum>:CORRection:EDELay:DISTance <num>
Applicable Models: All

(Read-Write) Sets the electrical delay in physical length (distance) for the selected measurement.

**Parameters**
- `<cnum>`: Channel number of the measurement (optional).
- `<mnum>`: Measurement number for each measurement.
- `<num>`: Electrical delay in distance.

Use `SENS:CORR:RVEL:COAX <num>` to set Velocity factor.

This parameter supports MIN and MAX as arguments. Learn more.

**Examples**
```
CALC1:MEAS2:CORR:EDEL:DIST 5
```
```
calculate2:measure2:correction:edelay:distance .003
```

**Query Syntax**
`CALCulate<cnum>:MEASure<mnum>:CORRection:EDELay:DISTance?`

**Return Type**
Numeric
- **Default**: 0

---

CALCulate<cnum>:MEASure<mnum>:CORRection:EDELay:MEDium <char>

**Applicable Models**: All

(Read-Write) Sets the media used when calculating the electrical delay.

**Parameters**
- `<cnum>`: Channel number of the measurement (optional).
- `<mnum>`: Measurement number for each measurement.
- `<num>`: Choose from: **COAX** for coaxial medium, **WAVE**guide for waveguide medium.

**Examples**
```
CALC:MEAS2:CORR:EDEL:MED COAX
```
```
calc3:measure2:correction:edelay:medium waveguide
```

**Query Syntax**
`CALCulate<cnum>:MEASure<mnum>:CORRection:EDELay:MEDium?`

**Return Type**
Character
- **Default**: COAX
CALCulate\textsubscript{\textless\textit{cnum}\textgreater}:MEASure\textsubscript{\textless\textit{mnum}\textgreater}:CORRection:EDELay[\textsubscript{\textless\textit{TIME}\textgreater}] \textless\textit{num}\textgreater

**Applicable Models:** All

**(Read-Write)** Sets the electrical delay for the selected measurement.

**Parameters**

- \textless\textit{cnum}\textgreater: Channel number of the measurement (optional).
- \textless\textit{mnum}\textgreater: Measurement number for each measurement.
- \textless\textit{num}\textgreater: Electrical delay in seconds. Choose any number between \textbf{-10.00} and \textbf{10.00}
  
  Use \texttt{SENS:CORR:RVEL:COAX <\textit{num}>} to set Velocity factor.
  
  This parameter supports MIN and MAX as arguments. [Learn more.]

**Examples**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>\texttt{CALC1:MEAS2:CORR:EDEL:TIME 1NS}</td>
<td>\texttt{calculate2:measure2:correction:time 0.5e-12}</td>
</tr>
</tbody>
</table>

**Query Syntax**

\texttt{CALCulate<\textless\textit{cnum}\textgreater>:MEASure<\textless\textit{mnum}\textgreater>:CORRection:EDELay[:\textless\textit{TIME}\textgreater]?}

**Return Type**

- **Numeric**
- **Default** 0 seconds

---

CALCulate\textsubscript{\textless\textit{cnum}\textgreater}:MEASure\textsubscript{\textless\textit{mnum}\textgreater}:CORRection:EDELay:UNIT \textless\textit{char}\textgreater

**Applicable Models:** All

**(Read-Write)** Sets and returns the units for specifying electrical delay in physical length (distance).

**Parameters**

- \textless\textit{cnum}\textgreater: Channel number of the measurement (optional).
- \textless\textit{mnum}\textgreater: Measurement number for each measurement.
- \textless\textit{char}\textgreater: Units for delay in distance. Choose from:
  
  - METer
  - FEET
  - INCH

**Examples**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>\texttt{CALC:MEAS2:CORR:EDEL:UNIT MET}</td>
<td>\texttt{calc3:meas2:corr:edelay:unit inch}</td>

</tbody>
</table>

**Query Syntax**

\texttt{CALCulate<\textless\textit{cnum}\textgreater>:MEASure<\textless\textit{mnum}\textgreater>:CORRection:EDELay:UNIT?}
CALCulate<cnum>:MEASure<mnum>:CORRection:EDELay:WGCutoff <num>

**Applicable Models:** All

(Read-Write) Sets the waveguide cutoff frequency used when the electrical delay media is set to WAVEguide. (See CALCulate:MEAS:CORRection:EDELay:MEDium <char>.)

**Parameters**
- <cnum> Channel number of the measurement (optional).
- <mnum> Measurement number for each measurement.
- <num> Waveguide cutoff frequency used with the electrical delay calculation.

This parameter supports MIN and MAX as arguments. Learn more.

**Examples**
```
CALC:MEAS2:CORR:EDEL:WGC 18.067 GHz
```
```
```

**Query Syntax**
CALCulate<cnum>:MEASure<mnum>:CORRection:EDELay:WGCutoff?

**Return Type** Numeric

**Default** 45 MHz

CALCulate<cnum>:MEASure<mnum>:CORRection[:STATe] <bool>

**Applicable Models:** All

(Read-Write) Turns error correction ON or OFF for the selected measurement on the specified channel.

To turn error correction ON or OFF for a channel, use SENS:CORR:STATe.

**Parameters**
- <cnum> Channel number of the measurement (optional).
- <mnum> Measurement number for each measurement.
Correction state. Choose from:

0 - Correction OFF

1 - Correction ON

**Examples**

```
CALC:MEAS2:CORR ON
```

```
calculate:measure2:correction:state off
```

**Query Syntax**

CALCulate<cnum>:MEASure<mnum>:CORRection:STATe?

**Return Type**

Boolean

**Default**

Not Applicable

---

CALCulate<cnum>:MEASure<mnum>:CORRection[:STATe]:INDicator?

**Applicable Models:** All

(Read-only) Returns the error correction state for the selected measurement on the specified channel.

To turn error correction ON or OFF for a channel, use SENS:CORR:STATe.

**Parameters**

- `<cnum>` Channel number of the measurement (optional).
- `<mnum>` Measurement number for each measurement.

**Examples**

```
CALC:MEAS2:CORR:IND?
```

```
calculate2:measure2:correction:state:indicator?
```

**Return Type**

Character

**NONE** - No error correction

**MAST** (Master) - Original error correction terms

**INT** - Error terms are interpolated. Learn more.

**DELT** - Delta Match calibration terms. Learn more.

**INV** - Error terms are not valid

**Default**

NONE

---

CALCulate<cnum>:MEASure<mnum>:CORRection:TYPE <string>
Applicable Models: All

(Read-Write) Sets the Cal Type for the selected measurement on the specified channel. This is used when a Cal Set is applied. Learn more about applying Cal Types.

- Use SENS:CORR:TYPE:CAT? to list the Cal Types in the VNA.
- Use SENS:CORR:CSET:TYPE:CAT? to list the Cal Types contained in the active Cal Set for the channel.
- Use SENS:CORR:COLL:METH to set the Cal type to perform a new Unguided calibration,

Parameters

- `<cnum>` Channel number of the measurement (optional).
- `<mnum>` Measurement number for each measurement.
- `<string>` (String) Cal type. Case sensitive. Use one of the following:

For Full Calibrations (NO Power Cal included):

This command does not distinguish between TRL and SOLT. The same number of error terms is applied for both Cal Types.

"Full <n> Port(x,y,z...)"

where

<n> = the number of ports to calibrate
x,y,z = the port numbers to calibrate

For example:

"Full 4 Port(1,2,3,4)"

For Full Calibrations (including Power Cal):

After the Full <n> port, include the string, "with power"

For example:

"Full 4 Port with power(1,2,3,4)"

For Response Calibrations:

"Response(param)" OR

"ResponseAndIsolation(param)"
Where param =

- S-parameter. For example
  - "Response(S21)"
  - "ResponseAndIsolation(A/R)"
- Single or ratioed receivers using either logical receiver notation or physical receiver notation. For example:
  - "Response(A)"
  - "ResponseAndIsolation(a3/b4)"

For Enhanced Response Calibrations:

"EnhancedResp(sourcePort, recPort)

Where:

- sourcePort = stimulus port number
- recPort = receiver port number

For FCA Calibrations:

Learn more about this setting.

- "SMC_2P" (Response + Input + Output) All four sweeps required. Most accurate.

  **Note:** The “SMC_2P” is the only correction type that automatically forces the reverse measurements (SC12, RevOPwr, RevIPwr). If you require any of the reverse measurements while using a lesser correction type, either include those parameters in your channel or use the SENSE:MIXer:REVerse command. Keep in mind that adding the reverse measurements or forcing the reverse sweep using the SENSE:MIXer:REVerse command will increase the number of sweeps required in the channel.

- "SMCRsp+IN" No Output match. Saves two sweeps.
- "SMCRsp+OUT" No Output match. Saves one sweep.
- "SMCRsp" No Input or Output match. Saves two sweeps.

For VMC, multiple Cal types are not available.
For Gain Compression Cal

where r = receive port; s = source port

- "GCA 2P (r,s)" - full 2-port cal
- "GCA Enh Resp (r,s)" - Enhanced Response Cal

Examples

CALC:MEAS2:CORR:TYPE "Scalar Mixer Cal"

Query Syntax

CALCulate<cnum>:MEASure<mnum>:CORRection:TYPE?

Return Type

String

Default

Not Applicable
CALCulate:MEASure:DATA Commands

(Write) CALCulate<cnum>:MEASure<mnum>:DATA:<char> <data>

(Read) CALCulate<cnum>:MEASure<mnum>:DATA:<char>?

Applicable Models: All

Reads or writes Measurement data, Memory data, or Normalization Divisor data from the Data Access Map location.

- For Measurement data, use FDATA or SDATA
- For Memory data, use FMEM or SMEM. When querying memory, you must first store a trace into memory using CALC:MEAS:MATH:MEMorize.
- For Normalization Divisor (Receiver Power Cal error term) data, use SDIV.
- Use FORMAT:DATA to change the data type (<REAL,32>, <REAL,64> or <ASCii,0>).
- Use FORMAT:BORDer to change the byte order. Use “NORMal” when transferring a binary block from LabView or VEE. For other programming languages, you may need to "SWAP" the byte order.

Equation Editor Notes:

- When equation editor is active on a trace in a standard S-parameter channel, Calc:Data returns the data from the parameter on the trace that was measured last. For example, for the equation “S22 + S33 + S11”, then S33 is the last measured parameter because it uses source port 3.
- In applications, if equation editor is active and the original parameter for the trace is not requested anywhere in the channel, then zeros are returned. If the original parameter is being measured within the channel, then data for the original parameter is returned.
- In general, if an equation contains no measurement parameters, then data for the original parameter is returned.

Note: The Calc:Data SCORR command to read/write error terms is Superseded with
SCORR commands do NOT accommodate greater than 12 error terms.

**FDATA**

Formatted measurement data to or from Data Access Map location. Display (access point 2).

**Note:** When querying FDATA, data is received in degrees. When setting phase using FDATA, the command expects the data in radians.

- Corrected data is returned when correction is ON.
- Uncorrected data is returned when correction is OFF.
- Returns TWO numbers per data point for Polar and Smith Chart format. For both formats, the data is the real and imaginary data. To retrieve the resistance and reactance of a trace of data, use the Z-Reflection conversion feature.
- Returns one number per data point for all other formats.
- Format of the read data is same as the displayed format.

**SDATA**

Complex measurement data.

Writes data to Data Access Map location. Raw Measurement (access point 0).

**Note:** Write access is forbidden on the standard channel if factory calibration is on (applies to ENA/PXI/Streamline, not to PNA); to disable factory calibration use SYST:FCOR:CHAN:COUP:STAT
<table>

CALCulate<cnum>:MEASure<mnum>:DATA:BUFFer:X? <bufferName>

Applicable Models: All

(Read-only) Retrieves frequency tone data from the modulation distortion measurement.

Parameters

- <cnum> Channel number of the measurement (optional).
- <mnum> Measurement number for each measurement.
- <bufferName> (string) – Name of the buffer to be read.

Note: The following names assume a 2-port VNA. Also, by default, the parameter names assume that VNA Port 1 is connected to the DUT input and VNA Port 2 is connected to the DUT output. If the RF Path settings are changed from the default, the names will change accordingly. For example, if the VNA has 4 ports and Port 4 is connected to the DUT output, the names will change to "PIn1", "POut4", "S11", "S41", etc.

Choose from:

- "POut2" - Power Out
- "PIn1" - Power In
- "MSig2" - Modulation Signal Out
- "MDist2" - Modulation Distortion Out
- "MGain21" - Modulation Gain
- "MComp21" - Modulation Compression
- "PGain21" - Power Gain
- "S11" - Linear Input Match

The data was stored into memory.

Examples

CALC:MEAS:DATA:FDATA Data(x)
calculate2:measure2:DATA:sdata data(r,i)

See another example using this command.

Return Type: Block data

Default: Not Applicable
"S21" - Linear Gain

"LPin1" - Linear Power In

"LPOut1" - Linear Reflected Power In

"LPOut2" - Linear Power Out

Examples

CALC:MEAS1:DATA:BUFF:X? "POut2"

Return Type String

Default Not Applicable

CALCulate<cnm>:MEAS<mnms>:DATA:BUFF:Y? <bufferName>

Applicable Models: All

(Read-only) Retrieves trace data (Y data) from the modulation distortion measurement.

Parameters

<cnm> Channel number of the measurement (optional).

<mnms> Measurement number for each measurement.

<bufferName> (string) – Name of the buffer to be read.

Note: The following names assume a 2-port VNA. Also, by default, the parameter names assume that VNA Port 1 is connected to the DUT input and VNA Port 2 is connected to the DUT output. If the RF Path settings are changed from the default, the names will change accordingly. For example, if the VNA has 4 ports and Port 4 is connected to the DUT output, the names will change to "Pin1", "POut4", "S11", "S41", etc.

Choose from:

"POut2" - Power Out

"Pin1" - Power In

"MSig2" - Modulation Signal Out

"MDist2" - Modulation Distortion Out

"MGain21" - Modulation Gain

"MComp21" - Modulation Compression
"PGain21" - Power Gain

"S11" - Linear Input Match

"S21" - Linear Gain

"LPin1" - Linear Power In

"LPOut1" - Linear Reflected Power In

"LPOut2" - Linear Power Out

Examples

```
CALC:MEAS1:DATA:BUFF:Y? "POut2"
```

**Return Type** String

**Default** Not Applicable

CALCulate<cnum>:MEASure<mnum>:DATA:RAW <string>,<dataBlock>

**Applicable Models:** All

(Write-Read) Sets the raw data for the specified raw parameter buffer. For unratioed parameters, the source port separator can be either ',' or '_'. This command applies to a Standard channel only. Application channels will return an error.

**Parameters**

- `<cnum>` Channel number of the measurement (optional).
- `<mnum>` Measurement number for each measurement.
- `<string>` String - (Not case-sensitive) Raw parameter buffer. For example, "S11".
- `<dataBlock>` String - (Not case-sensitive) Raw measurement data.

**Examples**

```
```

```
```

**Query Syntax** CALCulate<ch>:MEASure<mnum>:DATA:RAW? "<string>"

**Return Type** Block data

**Default** Not Applicable

CALCulate<cnum>:MEASure<mnum>:DATA:RAW:CATalog?
Applicable Models: All

(Read-only) Returns the list of raw parameters associated with the measurement <mnum>. These are the raw parameters that are actually used by the error correction; the <mnum> measurement may not strictly depend on all of those. For example, 2 port S-parameters. If the DUT has transmission, then changing raw S11 will modify the corrected S22. If transmission is negligible, S22 is unaffected. The list is returned as strings comma separated. For unratioed parameters, the source port separator is ‘_’ instead of ‘,’ to avoid confusion in tokenization. This command applies to a Standard channel only. Application channels will return an error.

**Parameters**
- `<cnum>` Channel number of the measurement (optional).
- `<mnum>` Measurement number for each measurement.

**Example**
```
CALC:MEAS1:DATA:RAW:CAT?
```

**Return Type** String

**Default** Not Applicable

---

CALCulate<cnum>:MEASure<mnum>:DATA:SNP? <n>

Applicable Models: All

(Read-only) Reads SnP data from the selected measurement. Learn more about SnP data.

This command is valid ONLY with standard S-parameter measurements.

**Notes**
- This command returns SnP data without header information, and in columns, not in rows as .SnP files. This means that the data returned from this command sends all frequency data, then all Sx1 magnitude or real data, then all Sx1 phase or imaginary data, and so forth.
- To avoid frequency rounding errors, specify FORMat:DATA <Real,64> or <ASCii, 0>

**Parameters**
- `<cnum>` Channel number of the measurement (optional).
- `<mnum>` Measurement number for each measurement.
- `<n>` Amount of data to return. If unspecified, `<n>` is set to 2. The number you specify must be less than or equal to the number of available ports on the VNA.

Choose from:
1 (S1P) returns 1-Port data for the active measurement if the active measurement is a reflection parameter such as S11 or S22. The behavior is UNDEFINED if the active measurement is a transmission parameter such as an S21.

2 (S2P) returns data for the four 2 port parameters associated with the current measurement. Default. Data that is not available is zero-filled.

3 (S3P) returns data for the nine 3 port parameters associated with the current measurement. Data that is not available is zero-filled.

4 (S4P) returns data for the sixteen 4 port parameters associated with the current measurement. Data that is not available is zero-filled.

SnP data can be output using several data formatting options. See MMEM:STOR<e>:TRACe:FORMat:SNP.

See also MMEM:STOR<e>:<snp>

Examples CALC:MEAS<e>:DATA:SNP? 1

Return Type Depends on FORM:DATA.

Default Not Applicable

CALCulate<e>:MEAS<e>:DATA:SNP:PORTs? <"x,y,z"> 

Applicable Models: All

(Read-only) Reads SNP data from the selected measurement for the specified ports. Learn more about SNP data.

This command is valid ONLY with standard S-parameter measurements.

Notes

- This command returns SNP data without header information, and in columns, not in rows as .SnP files. This means that the data returned from this command sends all frequency data, then all Sx1 magnitude or real data, then all Sx1 phase or imaginary data, and so forth.

- To avoid frequency rounding errors, specify FORM:DATA <Real,64> or <ASCii, 0>

- Data that is not available is zero-filled.

- For sweeps with a large number of data points, always follow this command with *OPC? Learn more.
Parameters

- `<cnum>` Channel number of the measurement (optional).
- `<mnum>` Measurement number for each measurement.
- `<"x,y,z">` Comma or space delimited port numbers for which data is requested, enclosed in quotes.

SNP data can be output using several data formatting options. See `MMEM:STORe:TRACe:FORMat:SNP`.

Examples

```
CALC:MEAS2:DATA:SNP:PORTs? "1,2,4,5,7" 'read data for these ports
```

Return Type

Depends on `FORMat:DATA`

Default Not Applicable

```
CALCulate<cnum>:MEASure<mnum>:DATA:SNP:PORTs:SAVE <"x,y,z">,<filename>[, FAST]
```

Applicable Models: All

(Write-only) Saves SNP data from the selected measurement for the specified ports. Learn more about SNP data.

- The Normal vs Mixed Mode selection is NOT used as it is in the Choose Ports dialog. Instead, data is returned as it is displayed on the trace. If the selected measurement is Mixed Mode (balanced), then balanced data is returned. If the selected measurement is an S-parameter, then S-parameter data is returned.
- This command is valid ONLY with the Standard measurement class (NOT applications).
- Data that is not available is zero-filled.
- For sweeps with a large number of data points, always follow this command with *OPC? Learn more.

Parameters

- `<cnum>` Channel number of the measurement (optional).
- `<mnum>` Measurement number for each measurement.
- `<"x,y,z">` String Comma or space delimited port numbers for which data is requested, enclosed in quotes.
- `<filename>` String Path, filename, and suffix of location to store the SNP data, enclosed in quotes. The suffix is not checked for accuracy. If saving 2 ports, specify "filename.s2p"; If saving 4 ports, specify "filename.s4p.", and so forth.

SNP data can be output using several data formatting options. See
MMEM:STORe:TRACe:FORMat:SNP.

[, FAST] Reduce the saving time

:SENS:CORR:CACH:MODE should be set at ON.

The correction must cover all the ports of the SNP port list.

The active measurement must be a corrected S Parameter defined by the port list for the SNP requests. EG: "S33" is not a proper selected measurement with CALC:DATA:SNP:PORTS? <1,2>

Examples

CALC:MEAS2:DATA:SNP:PORTs:Save '1,2,4','D:\MyData.s3p';*OPC?

Return Type

Depends on FORMat:DATA

Default

Not Applicable

CALCulate<cnum>:MEASure<mnum>:DATA:X:AXiS <string>

Applicable Models: N522xB, N523xB, N524xB, M937xA, P937xA

(Write-Read) Sets the X-axis of the selected measurement to a DC Source. This command does not change the default setting for new traces.

Parameters

<cnum> Channel number of the measurement (optional).
<mnum> Measurement number for each measurement.
<string> String - (Not case-sensitive) For all channels EXCEPT DIQ, choose from the following:

"Default" - The default X-axis setting for the selected measurement. For Application measurements, the X-Axis domain is set with specific commands.

"AO1" - Internal DC source #1

"AO2" - Internal DC source #2

Note: For DIQ channels, see CALC:MEAS:X:AXIS:DOMain

For Modulation Distortion Channels (MOD), choose from:

"SA Frequency" - SA display showing the SA frequency settings.
"Power In" - Displays input power sweep.

"Power Out" - Displays output power sweep.

"Measured Carrin" - Measured input band power.

"Measured CarrOut" - Measured output band power.

For Modulation Distortion Converters Channels (MODX), choose from:

"SA Freq In" - SA display showing mixer input range.

"SA Freq Out" - SA display showing mixer output range.

"Power In" - Displays input power sweep.

"Power Out" - Displays output power sweep.

"Measured Carrin" - Measured input band power.

"Measured CarrOut" - Measured output band power.

Examples

CALC:MEAS:DATA:X:AXIS 'Default'
calculate:measure:data:x:axis "AO1"

Query Syntax

CALCulate<ch>:MEASure<mnum>:DATA:X:AXIS?

Return Type

String

Default

"Default"

CALCulate<cnum>:MEASure<mnum>:DATA:X:AXIS:DOMain <string>
**Applicable Models:** N522xB, N523xB, N524xB

*(Write-Read)* Sets and returns the X-Axis domain of the selected DIQ measurement.

**Parameters**

- `<cnum>`: Channel number of the measurement (optional).
- `<mnum>`: Measurement number for each measurement.

<table>
<thead>
<tr>
<th>Choose one of these:</th>
<th>Then set X-Axis Source (<em>CALC:MEAS:DATA:X:AXIS</em>) using one of these as the argument.</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Frequency&quot;</td>
<td>&quot;F1&quot;, &quot;F2&quot;, etc.</td>

</tbody>
</table>

**Example**

2. *CALC:MEAS:DATA:X:AXIS "Port 1"*

**Query Syntax**

*CALCulate<ch>:MEASure<mnum>:DATA:X:AXIS:DOMain?*

**Return Type**

String

**Default**

*CALC:MEAS:DATA:X:AXIS:DOMain: "Frequency"
CALC:MEAS:DATA:X:AXIS: "F1"*

*CALCulate<ch>:MEASure<mnum>:DATA:X:AXIS:FIXed:PARameter <string>*
Applicable Models: N524xB models with Option S93070xB

(Write-Read) Sets the X-axis fixed parameter for a power sweep measurement in a Modulation Distortion channel.

Parameters

- `<ch>` Channel number of the measurement (optional).
- `<mnum>` Measurement number for each measurement.
- `<string>` String - (Not case-sensitive) For Modulation Distortion Channels (MOD), choose from:
  - "SA Frequency" - SA display showing the SA frequency settings.
  - For Modulation Distortion Converters Channels (MODX), choose from:
    - "SA Freq In" - SA display showing mixer input range.
    - "SA Freq Out" - SA display showing mixer output range.

Examples

```
calculate:measure2:data:x:axis:fixed:parameter "SA Freq In"
```

Query Syntax

Return Type

String

Default

"SA Frequency"

Applicable Models: N524xB models with Option S93070xB

(Write-Read) Sets the X-axis fixed parameter spectrum analyzer frequency value for a power sweep measurement in a Modulation Distortion channel.

Parameters

- `<ch>` Channel number of the measurement (optional).
- `<mnum>` Measurement number for each measurement.
- `<num>` Fixed parameter value.

Examples

```
CALC:MEAS2:DATA:X:AXIS:FIX:PAR:VAL 1.5e9
```
```
calculate:measure2:data:x:axis:fixed:parameter:value 1.5e9
```

Query Syntax

```
```

Return Type

Numeric

Default

Not Applicable

---

CALCulate<cnum>:MEASure<mnum>:DATA:X[:Values]?

Applicable Models: N522xB, N523xB, N524xB, M937xA, P937xA

(Read-only) Returns the stimulus values for the selected measurement in the current units. You can select one measurement for each channel using Calc:Par:MNUM or Calc:Par:Select. Learn more.

This command can be used for all Measurement Classes.

Note: To avoid frequency rounding errors, specify FORM:DATA <Real,64> or <ASCii, 0>

Parameters

- `<cnum>` Channel number of the measurement (optional).
- `<mnum>` Measurement number for each measurement.

Examples

```
1. Calc:Par:Sel "MyGCATrace"
2. CALC:MEAS:DATA:X?
```

Return Type

Depends on FORM:DATA command

Default

Not applicable
CALCulate:MEASure:FILter Commands

Controls the gating function used in time domain measurements. The gated range is specified with either (start / stop) or (center / span) commands.

```
CALCulate:MEASure:FILter
 [:GATE]
  | COUPle
  | PARameters
  | TIME
   | CENTER
   | SHAPE
   | SPAN
   | START
   | STATE
  | STOP
 [:TYPE]
```

Click a keyword to view the command details.

**see Also**

- Learn about Gating
- Synchronizing the Analyzer and Controller
- SCPI Command Tree

CALCulate<cnm>:MEAS<mnm>:FILTer[:GATE]:COUPle:PARameters <num>
(Read-Write) Specifies the time domain gating parameters to be coupled. The settings for those parameters will be copied from the selected measurement to all other measurements on the channel.

- To enable Trace Coupling, use SENS:COUP:PAR
- To specify Transform parameters to couple, use CALC:MEAS:TRAN:COUP:PAR

Learn more about Time Domain Trace Coupling

**Parameters**

- `<cnum>` Channel number of the measurement (optional).
- `<mnum>` Measurement number for each measurement.
- `<num>` (Numeric) Parameters to couple. To specify more than one parameter, add the numbers.
  
  1 - Gating Stimulus (Start, Stop, Center, and Span TIME settings.)
  
  2 - Gating State (ON / OFF)
  
  4 - Gating Shape (Minimum, Normal, Wide, and Maximum)
  
  8 - Gating Type (Bandpass and Notch)

**Examples**

- To couple all parameters:
  
  `CALC:MEAS2:FILT:COUP:PAR 15`
  
- To couple Stimulus and Type:
  

**Query Syntax**

CALCulate<cnum>:MEASure<mnum>:FILTer[:GATE]:TIME:CENTer <num>

**Return Type**

Numeric

**Default**

13 (All parameters except 2 - Gating State)
Applicable Models: All

(Read-Write) Sets the gate filter center time.

Parameters

- `<cnum>` Channel number of the measurement (optional).
- `<mnum>` Measurement number for each measurement.
- `<num>` Center time in seconds; Choose any number between: ± (number of points-1) / frequency span

Note: This command will accept MIN or MAX instead of a numeric parameter. See SCPI Syntax for more information.

Examples

```
CALC:MEAS2:FILT:GATE:TIME:CENT -5 ns
```

Query Syntax

CALCulate<cnum>:MEASure<mnum>:FILTer[:GATE]:TIME:CENTer?

Return Type

Numeric

Default

0

CALCulate<cnum>:MEASure<mnum>:FILTer[:GATE]:TIME:SHAPe <char>

Applicable Models: All

(Read-Write) Sets the gating filter shape when in time domain.

Parameters

- `<cnum>` Channel number of the measurement (optional).
- `<mnum>` Measurement number for each measurement.
- `<char>` Choose from
  - MAXimum - the widest gate filter available
  - WIDE -
  - NORMal -
  - MINimum - the narrowest gate filter available

Examples

```
calculate2:measure2:filter:time:shape normal
```

Query Syntax

CALCulate<cnum>:MEASure<mnum>:FILTer[:GATE]:TIME:SHAPe?

Return Type

Character

Default

NORMal
CALCulate<cnum>:MEASure<mnum>:FILTer[:GATE]:TIME:SPAN <num>

Applicable Models: All

(Read-Write) Sets the gate filter span time.

Parameters

- <cnum> Channel number of the measurement (optional).
- <mnum> Measurement number for each measurement.
- <num> Time span in seconds; Choose any number between:
  0 and $2 \times \frac{(number\ of\ points-1)\ /\ frequency\ span}$

Note: This command will accept MIN or MAX instead of a numeric parameter. See SCPI Syntax for more information.

Examples

- CALC:MEAS2:FILT:TIME:SPAN 5 ns
- calculate2:measure2:filter:time:span maximum

Query Syntax

CALCulate<cnum>:MEASure<mnum>:FILTer[:GATE]:TIME:SPAN?

Return Type Numeric

Default 20 ns

CALCulate<cnum>:MEASure<mnum>:FILTer[:GATE]:TIME:STARt <num>

Applicable Models: All

(Read-Write) Sets the gate filter start time.

Parameters

- <cnum> Channel number of the measurement (optional).
- <mnum> Measurement number for each measurement.
- <num> Start time in seconds; any number between:
  $\pm \frac{(number\ of\ points-1)\ /\ frequency\ span}$

Note: This command will accept MIN or MAX instead of a numeric parameter. See SCPI Syntax for more information.

Examples

- CALC:MEAS2:FILT:TIME:STAR 1e-8
- calculate2:measure2:filter:gate:time:start minimum

Query Syntax

CALCulate<cnum>:MEASure<mnum>:FILTer[:GATE]:TIME:STARt?

Return Type Numeric
### CALCulate<cnum>:MEASure<mnum>:FILTer[:GATE]:TIME:STATe <boolean>

**Applicable Models:** All

*(Read-Write)* Turns gating state ON or OFF.

**Note:** Sweep type must be set to Linear Frequency in order to use Transform Gating.

**Parameters**
- `<cnum>` Channel number of the measurement (optional).
- `<mnum>` Measurement number for each measurement.
- `<boolean>` ON (or 1) - turns gating ON. OFF (or 0) - turns gating OFF.

**Examples**
- `CALC:MEAS2:FILT:TIME:STAT ON`
- `calculate2:measure2:filter:gate:time:state off`

**Query Syntax** `CALCulate<cnum>:MEASure<mnum>:FILTer[:GATE]:TIME:STATe?`

**Return Type** Boolean (1 = ON, 0 = OFF)

**Default** OFF

---

### CALCulate<cnum>:MEASure<mnum>:FILTer[:GATE]:TIME:STOP <num>

**Applicable Models:** All

*(Read-Write)* Sets the gate filter stop time.

**Parameters**
- `<cnum>` Channel number of the measurement (optional).
- `<mnum>` Measurement number for each measurement.
- `<num>` Stop time in seconds; any number between:
  \[\pm \frac{(\text{number of points}-1)}{\text{frequency span}}\]

**Note:** This command will accept MIN or MAX instead of a numeric parameter. See SCPI Syntax for more information.

**Examples**
- `CALC:MEAS2:FILT:TIME:STOP -1 ns`
- `calculate2:measure2:filter:gate:time:stop maximum`

**Query Syntax** `CALCulate<cnum>:MEASure<mnum>:FILTer[:GATE]:TIME:STOP?`
CALCulate\(<cnum>\):MEASure\(<mnum>\):FILTer\([\cdot]:GATE\)[\cdot]:TIME\([\cdot]:TYPE\) \(<char>\)

**Applicable Models:** All

(Read-Write) Sets the type of gate filter used.

**Parameters**

- \(<cnum>\) Channel number of the measurement (optional).
- \(<mnum>\) Measurement number for each measurement.
- \(<char>\) Choose from:

  - **BPASs** - Includes (passes) the range between the start and stop times.
  - **NOTCh** - Excludes (attenuates) the range between the start and stop times.

**Examples**

```
CALC:MEAS2:FILT:TIME BPAS
calculate2:measure2:filter:gate:time:type notch
```

**Query Syntax**

```
CALCulate\(<cnum>\):MEASure\(<mnum>\):FILTer\([\cdot]:GATE\)[\cdot]:TIME\([\cdot]:TYPE\)?
```

**Return Type** Character

**Default** BPAS
CALCulate:MEASure:FUNCtion Commands

- DATA?
- DOMain
  - USER
  - [:RANGe]
  - STARt
  - STOP
- EXECute
- STATistics
  - [:STATe]

Click a keyword to view the command details.

**see Also**

- Learn about Trace Statistics
- Synchronizing the Analyzer and Controller
- SCPI Command Tree

CALCulate<cn num>:MEASure<mn num>:FUNCtion:DATA?
Applicable Models: All

(Read-only) Returns the trace statistic data for the selected statistic type for the specified channel. Select the type of statistic with CALC:MEAS:FUNC:TYPE.

Parameters
- `<cnum>` Channel number of the measurement (optional).
- `<mnum>` Measurement number for each measurement.

Return Type Depends on FORM:DATA

Example
- CALCulate2:MEASure2:FUNCtion:DATA?

Default Not applicable

CALCulate<cnum>:MEASure<mnum>:FUNCtion:DOMain:USER[:RANGe] <range>

Applicable Models: All

(Read-Write) Sets the range used to calculate trace statistics. Each channel has 16 user ranges. The x-axis range is specified with the CALC:MEAS:FUNC:DOM:USER:START and STOP commands.

Parameters
- `<cnum>` Channel number of the measurement (optional).
- `<mnum>` Measurement number for each measurement.
- `<range>` Range number. Choose from: 0 to 16
  - 0 is Full Span of the current x-axis range
  - 1 to 16 are user-specified ranges

Examples
- CALC:MEAS2:FUNC:DOM:USER 4
- calculate2:measure2:function:domain:user:range 0

Query Syntax
- CALCulate<cnum>:MEASure<mnum>:FUNCtion:DOMain:USER[:RANGe]?

Return Type Numeric

Default 0 - Full Span

CALCulate<cnum>:MEASure<mnum>:FUNCtion:DOMain:USER:STARt <range>, <start>
Applicable Models: All

(Read-Write) Sets the start of the specified user-domain range.

To apply this range, use `CALC:MEAS:FUNC:DOM:USER`

To set the stop of the range, use `CALC:MEAS:FUNC:DOM:USER:STOP`.

**Note:** This command does the same as `CALC:MEAS:MARK:FUNC:DOM:USER:STAR`

### Parameters

- `<cnum>` Channel number of the measurement (optional).
- `<mnum>` Measurement number for each measurement.
- `<range>` Range number that will receive the start value. Choose an integer between 1 and 16.
- `<start>` Start value of the specified range. Choose a real number between: the analyzer's Minimum and Maximum x-axis value.

### Examples

- `CALC:MEAS2:FUNC:DOM:USER:STAR 1,1e9`
- `calculate2:measure2:function:domain:user:start 2,2e9`

### Query Syntax

`CALCulate<cnum>:MEASure<mnum>:FUNCtion:DOMain:USER:STARt? <range>`

### Return Type

Numeric

**Default**

The analyzer's Minimum x-axis value

---

CALCulate<cnum>:MEASure<mnum>:FUNCtion:DOMain:USER:STOP <range>, <stop>

Applicable Models: All

(Read-Write) Sets the stop value of the specified user-domain range.

To apply this range, use `CALC:MEAS:FUNC:DOM:USER`.

To set the start of the range, use `CALC:MEAS:MARK:FUNC:DOM:USER:STAR`

**Note:** This command does the same as `CALC:MEAS:MARK:FUNC:DOM:USER:STOP`

### Parameters

- `<cnum>` Channel number of the measurement (optional).
- `<mnum>` Measurement number for each measurement.
<range> Range number that will receive the stop value. Choose an integer between 1 and 16

<stop> Stop value of the specified range. Choose a real number between: the analyzer's Minimum and Maximum x-axis value.

Examples

```
CALC:MEAS2:FUNC:DOM:USER:STOP 4,5e9
calculate2:measure2:function:domain:user:stop 3,8e9
```

Query Syntax

CALCulate<cnum>:MEASure<mnum>:FUNCtion:DOMain:USER:STOP?

Return Type Numeric

Default The analyzer's Maximum x-axis value

---

CALCulate<cnum>:MEASure<mnum>:FUNCtion:EXECute

Applicable Models: All

(Write-only) For the active trace of specified channel, executes the statistical analysis specified by the CALC:MEAS:FUNC:TYPE command.

Parameters

- <cnum> Channel number of the measurement (optional).
- <mnum> Measurement number for each measurement.

Examples

```
CALC:MEAS2:FUNC:EXEC
calculate2:measure2:function:execute
```

Query Syntax Not Applicable

Default Not Applicable

---

CALCulate<cnum>:MEASure<mnum>:FUNCtion:STATistics[:STATE] <ON|OFF>
Applicable Models: All

(Read-Write) Displays and hides the trace statistics (peak-to-peak, mean, standard deviation) on the screen.

The analyzer will display either measurement statistics or Filter Bandwidth statistics; not both.

**Parameters**

- `<cnum>` Channel number of the measurement (optional).
- `<mnum>` Measurement number for each measurement.
- `<ON|OFF>`
  - ON - Displays trace statistics
  - OFF - Hides trace statistics

**Examples**

```
CALC:MEAS2:FUNC:STAT ON
calculate2:measure2:function:statistics:state off
```

**Query Syntax**

`CALCulate<cnum>:MEASure<mnum>:FUNCtion:STATistics[:STATe]?`

**Return Type**

Boolean (1 = ON, 0 = OFF)

**Default**

OFF (0)

---

**CALCulate<cnum>:MEASure<mnum>:FUNCtion:TYPE <char>**

Applicable Models: All

(Read-Write) Sets statistic TYPE that you can then query using `CALC:MEAS:FUNCtion:DATA?`.

**Note:** This command affects only the selected measurement on the specified channel.

**Parameters**

- `<cnum>` Channel number of the measurement (optional).
- `<mnum>` Measurement number for each measurement.
- `<char>` Choose from:
  - `PTPeak` - the difference between the max and min data points on the trace.
  - `STDEV` - standard deviation of all data points on the trace
  - `MEAN` - mean (average) of all data points on the trace
  - `MIN` - lowest data point on the trace
  - `MAX` - highest data point on the trace

- SCPI Command Tree

CALCulate<ch>:MEASure<mnum>:GCData:DATA? <param>

**Applicable Models:** N522xB, N524xB, M9485A

*(Read-Only)* Returns measurement data at all frequency and power data points for GCA SMART sweeps and 2D sweeps.

- When using SMART sweep, ALL data is returned including ALL background iteration sweeps. Use **CALC:MEAS:GCD:ITER** to determine the number of iteration sweeps. The number of data points that are returned is always going to be number of frequency points times the number of iteration sweeps.
- When using 2D sweeps, ALL data is returned. The number of data points returned / freq may vary. Learn
more.

Use CALC:MEAS:DATA? to return just the displayed data results (not the background sweeps).

A compression parameter must be present. Learn more.

The format of the data is the same as the format of the measurement that you select using CALC:MEAS:PAR. If the measurement is scalar, than one number is returned per sweep per data point. If complex (such as Smith Chart format) than both real and imaginary numbers are returned.

If correction is on, corrected data are returned. Otherwise, raw data are returned.

Parameters

- `<ch>` Channel number of the measurement (optional).
- `<mnum>` Measurement number for each measurement.
- `<param>` (String) Parameter to read. NOT Case-sensitive. The specified parameter need NOT be displayed or selected. However, a compression parameter must be present. Learn more.

Choose from:

- "pin" - (CompIn21) Input power at the compression point.
- "pout" - (CompOut21) Output power at the compression point.
- "gain" - (CompGain21) Device gain (S21) at the compression point.
- "inputmatch" - (CompS11) Input match at the compression point.
- "DeltaGain" - (DeltaGain21) Measured Gain (watts) / Ref Gain (watts). Learn more.
- "AI1" and "AI2" - ADC measurements at the specified compression level. Learn more.

Learn more about GCA parameters.

Examples

```plaintext
data = CALC:MEAS2:GCD:DATA? "pin"
data = calculate:measure2:gcdata:data? "pout"
```

Return Type

Array of data

Default Not Applicable

CALCulate<ch>:MEASure<mnum>:GCData:IMAG? <char>, <dpoint>, <param>

Applicable Models: N522xB, N524xB, M9485A
(Read-Only) For a specified data point, returns the imaginary part of the specified Gain Compression data. If correction is on, corrected data are returned. Otherwise, raw data are returned. Can be used with Smart and 2D sweeps.

- For SMART sweep, the number of data points that are returned is always going to be the number of iteration sweeps. Use `CALC:MEAS:GCD:ITER` to determine the number of iteration sweeps.
- For 2D sweeps, the number of data points returned / freq may vary. Learn more.

**Parameters**

- `<ch>` Channel number of the measurement (optional).
- `<mnum>` Measurement number for each measurement.
- `<char>` Choose from:
  - **FREQuency** - for the specified frequency data point, returns all of the measured data for each power stimulus.
  - **POWer** - for the specified power data point, returns all of the measured data for each frequency stimulus.
- `<dPoint>` Data point (FREQ or POWer) for which data is returned.
- `<param>` (String) Parameter to read. NOT Case-sensitive. The specified parameter need NOT be displayed. However, a compression parameter must be present. Learn more.
  - "pin" - (CompIn21) Input power at the compression point.
  - "pout" - (CompOut21) Output power at the compression point.
  - "gain" - (CompGain21) Device gain (S21) at the compression point.
  - "inputmatch" - (CompS11) Input match at the compression point.
  - "DeltaGain" - (DeltaGain21) Measured Gain (watts) / Ref Gain (watts). Learn more.
  - "AI1" and "AI2" - ADC measurements at the specified compression level. Learn more.

**Examples**

For the fifth frequency data point, returns 'Power Output' imaginary (phase) data from all power stimulus values.

For SmartSweep, if there are 30 power sweep points, 30 values are returned.

For 2D sweeps, 30 or 31 power sweep points may be returned. Learn more.
CALCulate<cnum>:MEASure<mnum>:GCData:ITERations?

Applicable Models: N522xB, N524xB, M9485A

(Read-only) In a SMART sweep, returns the max number of iterations that it took for ALL frequencies to converge. Use this number to determine the size of the block data that is returned from Gain Compression SMART sweep data queries.

For a 2D sweep, returns the number of power points.

Parameters

- `<cnum>`: Channel number of the measurement (optional).
- `<mnum>`: Measurement number for each measurement.

Examples

```plaintext
data = CALC:MEAS2:GCD:IMAG? FREQ,5,"pout"
```

Return Type

- Array of data
- Default: Not Applicable

CALCulate<ch>:MEASure<mnum>:GCData:REAL? <char>, <dpoint>, <param>

Applicable Models: N522xB, N524xB, M9485A

(Read-Only) For a specified data point, returns the real part of the Gain Compression data. If correction is on, corrected data are returned. Otherwise, raw data are returned. Can be used with Smart and 2D sweeps.

- For SMART sweep, the number of data points that are returned is always going to be the number of iteration sweeps. Use `CALC:MEAS:GCD:ITER` to determine the number of iteration sweeps.

- For 2D sweeps, the number of data points returned / freq may vary. Learn more.

Parameters

- `<ch>`: Channel number of the measurement (optional).
- `<mnum>`: Measurement number for each measurement.
- `<char>`: Choose from:
- **FREQuency** - for the specified frequency data point, returns all of the measured data for each power stimulus.
- **POWer** - for the specified power data point, returns all of the measured data for each frequency stimulus.

<dPoint> Data point (FREQ or POWer) for which data is returned.

<param> (String) Parameter to read. NOT Case-sensitive. The specified parameter need NOT be displayed. However, a compression parameter must be present. Learn more.

- "pin" - (CompIn21) Input power at the compression point.
- "pout" - (CompOut21) Output power at the compression point.
- "gain" - (CompGain21) Device gain (S21) at the compression point.
- "inputmatch" - (CompS11) Input match at the compression point.
- "DeltaGain" - (DeltaGain21) Measured Gain (watts) / Ref Gain (watts). Learn more.
- "AI1" and "AI2" - ADC measurements at the specified compression level. Learn more.

**Examples**
For the fifth frequency data point, returns 'Power Output' real data from all power stimulus values.
For SmartSweep, if there are 30 power sweep points, 30 values are returned.
For 2D sweeps, 30 or 31 power sweep points may be returned. Learn more.

```
data = CALC:MEAS2:GCD:REAL? FREQ,5,"pout"
```

**Return Type** Array of data

**Default** Not Applicable

CALCulate<cnum>:MEASure<mnum>:GCMeas:ANALysis:CWFRequency <num>
Applicable Models: N522xB, N524xB, M9485A

(Read-Write) Set and return the CW frequency for a compression analysis trace.

Parameters

- `<cnum>` Channel number of the measurement (optional).
- `<mnum>` Measurement number for each measurement.
- `<num>` CW frequency in Hz. Choose a frequency within the range of the gain compression channel.

Examples

```
CALC:MEAS2:GCM:ANAL:CWFR 1e9
```
```
calculate2:measure2:gcmeas:analysis:cwfrequency 1e10
```

Query Syntax

CALCulate<cnum>:MEASure<mnum>:GCMeas:ANALysis:CWFRequency?

Return Type Numeric

Default Not Applicable

CALCulate<cnum>:MEASure<mnum>:GCMeas:ANALysis:DISCRete[:STATe] <bool>

Applicable Models: N522xB, N524xB, M9485A

(Read-Write) Sets and returns whether the CW frequency for the compression analysis trace can be set to only the discrete frequencies or provides interpolation.

Parameters

- `<cnum>` Channel number of the measurement (optional).
- `<mnum>` Measurement number for each measurement.
- `<bool>` ON (or 1) - Discrete data points only.
- OFF (or 0) - Interpolated data points.

Examples

```
CALC:MEAS2:GCM:ANAL:ISD ON
```
```
calculate2:measure2:gcmeas:analysis:isdisfrequency off
```

Query Syntax

CALCulate<cnum>:MEASure<mnum>:GCMeas:ANALysis:ISDisfrequency?

Return Type Boolean (1 = ON, 0 = OFF)

Default OFF

CALCulate<cnum>:MEASure<mnum>:GCMeas:ANALysis:ENABle <bool>
**Applicable Models:** N522xB, N524xB, M9485A

**Parameters**

- `<cnum>` Channel number of the measurement (optional).
- `<mnum>` Measurement number for each measurement.
- `<bool>`
  - **ON** (or 1) - Enable compression analysis.
  - **OFF** (or 0) - Disable compression analysis.

**Examples**

```
calc:meas2:gcmeas:analysis:enable on
calculate2:measure2:gcmeas:analysis:enable off
```

**Query Syntax**

```
calc:meas<mnum>:gcmeas:analysis:enable?
```

**Return Type**

Boolean (1 = ON, 0 = OFF)

**Default**

OFF

---

**CALCulate<cnum>:MEASure<mnum>:GCMeas:ANALysis:XAXis <char>**

**Applicable Models:** N522xB, N524xB, M9485A

**Parameters**

- `<cnum>` Channel number of the measurement (optional).
- `<mnum>` Measurement number for each measurement.
- `<bool>`
  - PIN - Input power to the DUT.
  - PSOsource - power from the source.

**Examples**

```
calc:meas2:gcmeas:analysis:xaxis pin
calculate2:measure2:gcmeas:analysis:xaxis psource
```

**Query Syntax**

```
calc:meas<mnum>:gcmeas:analysis:xaxis?
```

**Return Type**

Character

**Default**

PIN
CALCulate:MEASure:GDELay Commands

Controls the Aperture setting used to make Group Delay measurements.

<table>
<thead>
<tr>
<th>CALCulate:MEASure:GDELay</th>
</tr>

- Synchronizing the Analyzer and Controller
- SCPI Command Tree

CALCulate:<cnum>:MEASure<mnum>:GDELay:FREQuency <value>

Applicable Models: All

(Read-Write) Sets group delay aperture using a fixed frequency range.

Parameters

- <cnum> Channel number of the measurement (optional).
- <mnum> Measurement number for each measurement.
- <value> Frequency range (in Hz) to use for the aperture setting. Choose between the equivalent of two data points and the channel frequency span.

Examples

CALC:MEAS2:GDEL:FREQ 1E6

Query Syntax

CALCulate<cnum>:MEASure<mnum>:GDELay:FREQuency?

Return Type

Numeric

Default

Frequency range that equates to 11 points. This can be changed to two points with a preference setting.

CALCulate:<cnum>:MEASure<mnum>:GDELay:PERCent <value>
Applicable Models: All

(Read-Write) Sets group delay aperture using a percent of the channel frequency span.

**Parameters**

- `<cnum>` Channel number of the measurement (optional).
- `<mnum>` Measurement number for each measurement.
- `<value>` Percent of frequency span to use for the aperture setting. Choose between the equivalent of two data points and 100 percent of the channel frequency span.

**Examples**

- 'set to 25 percent of the channel frequency span
  
  `CALC:MEAS2:GDEL:PERC 25`

**Query Syntax**

`CALCulate<cnum>:MEASure<mnum>:GDELay:PERCent?`

**Return Type**

Numeric

**Default**

Percent of frequency span that equates to 11 points. This can be changed to two points with a preference setting.

---

CALCulate<cnum>:MEASure<mnum>:GDELay:POINts <value>

Applicable Models: All

(Read-Write) Sets group delay aperture using a fixed number of data points.

**Parameters**

- `<cnum>` Channel number of the measurement (optional).
- `<mnum>` Measurement number for each measurement.
- `<value>` Number of data points to use for the aperture setting. Choose between two points and the number of points in the channel.

**Examples**

- 'set to 25 data points
  
  `CALC:MEAS2:GDEL:POIN 25`

**Query Syntax**

`CALCulate<cnum>:MEASure<mnum>:GDELay:POINts?`

**Return Type**

Numeric

**Default**

11 points. This can be changed to two points with a preference setting.

see Also
CALCulate\(<\text{cnum}\>\):MEASure\(<\text{mnum}\>\):LIMit:DATA \(<\text{block}\>

**Applicable Models:** All

(Read-Write) Sets data for limit segments.

**Parameters**

\(<\text{cnum}\>\) Channel number of the measurement (optional).

\(<\text{mnum}\>\) Measurement number for each measurement.

\(<\text{block}\>\) Data for all limit segments. The following is the data format for 1 segment:

\(\text{Type, BegStim, EndStim, BegResp, EndResp}\)

- **Type** Type of limit segment. Choose from
  - 0 - Off
  - 1 - Max
  - 2 - Min

- **BegStim** Start of X-axis value (freq, power, time)

- **EndStim** End of X-axis value

- **BegResp** Y-axis value that corresponds with Start of X-axis value

- **EndResp** Y-axis value that corresponds with End of X-axis value

**Examples**

The following writes three max limit segments for a bandpass filter.

```
CALC:MEAS2:LIM:DATA 1,3e5,4e9,60,0,1,4e9,7.5e9,0,0,1,7.5e9,9e9,0,-30
```

**Query Syntax**

CALCulate\(<\text{cnum}\>\):MEASure\(<\text{mnum}\>\>:LIMit:DATA?

**Return Type**

Depends on FORM:DATA

**Default**

Maximum limit = 100

CALCulate\(<\text{cnum}\>\):MEASure\(<\text{mnum}\>\>:LIMit:DATA:DELeTe
Applicable Models: All

(Write-only) Deletes all limit line data for the selected measurement on the specified channel.

**Parameters**

- `<cnum>` Channel number of the measurement (optional).
- `<mnum>` Measurement number for each measurement.

**Examples**

```
CALC2:MEAS2:LIM:DATA:DEL
```

**Query Syntax** Not Applicable

**Default** Not Applicable

---

CALCulate<cnum>:MEASure<mnum>:LIMit:DISPlay[:STATe] <ON | OFF>

Applicable Models: All

(Read-Write) Turns the display of limit segments ON or OFF (if the data trace is turned ON).

**Parameters**

- `<cnum>` Channel number of the measurement (optional).
- `<mnum>` Measurement number for each measurement.
- `<ON | OFF>`
  - ON (or 1) - turns the display of limit segments ON.
  - OFF (or 0) - turns the display of limit segments OFF.

**Examples**

```
CALC:MEAS2:LIM:DISP:STAT ON
calculate2:limit:display:state off
```

**Query Syntax** CALCulate<cnum>:MEASure<mnum>:LIMit:DISPlay[:STATe]?

**Return Type** Boolean (1 = ON, 0 = OFF)

**Default** ON

---

CALCulate<cnum>:MEASure<mnum>:LIMit:FAIL?
Applicable Models: All

(Read-only) Returns the Pass / Fail status of the limit line test. Returns 1 (Fail) if any data point fails for any limit segment.

Limit display (CALC:LIM:DISP) does NOT have to be ON.

Parameters

- `<cnum>` Channel number of the measurement (optional).
- `<mnum>` Measurement number for each measurement.

Examples

CALC:MEAS2:LIM:FAIL?

Return Type: Boolean

- 0 is returned when Pass
- 1 is returned when Fail

Default: Not Applicable

CALCulate<cnum>:MEASure<mnum>:LIMit:REPort:ALL? <block>

Applicable Models: All

(Read-only) Returns the test results (stimulus value, limit test result, upper limit value and lower limit value of all measurement points), for the selected trace. This command returns a point by point description of the limit table and pass/fail test result.

Parameters

- `<cnum>` Channel number of the measurement (optional).
- `<mnum>` Measurement number for each measurement.
- `<block>` Depends on FORM:DATA

If the number of the measurement points is N,

- `<Block> = <first stimulus>,<test result>,<upper limit>,<lower limit>, ..., <Nth stimulus>,<test result>,<upper limit>,<lower limit>

Where `<test result>` = -1: No limit, 0:Fail, 1:Pass

The following example returns three points:

CALC:MEAS2:LIM:REP:ALL?

+1.00000000000E+009, 'bucket 1 XAxis value
+1.00000000000E+000, 'result (1 == Pass)
Examples

-4.90000009537E+000, 'upper limit
-5.05000019073E+000, 'lower limit
+3.00000000000E+09, 'bucket 2 XAxis value
+1.00000000000E+000,
-4.8499999463E+000,
-5.1999980927E+000,
+5.00000000000E+09, 'bucket 3 Xaxis value
-1.00000000000E+000,
+0.00000000000E+000,
+0.00000000000E+000

Return Type

Variant

Default Depend on the preset status

CALCulate<cnum>:MEASure<mnum>:LIMit:REPort[:DATA]? <block>

Applicable Models: All

(Read-only) Returns the stimulus values (frequency, power level or time) at all the measurement points that failed the limit test, for the selected trace. If there are no failures, a large number is returned (+9.91000000000E+037).

Parameters

- `<cnum>` Channel number of the measurement (optional).
- `<mnum>` Measurement number for each measurement.
- `<block>` Depends on FORM:DATA

If the number of the measurement points that failed the limit test is N, `<block>=<First failed stimulus>, ..., <Nth failed stimulus>.

The following example assumes that there are no failures:

Examples

CALC:MEAS2:LIM:REP:DATA?

+9.91000000000E+037

Return Type

Numeric

Default 9.91E37 (no failures)
CALCulate\(<cnum>\):MEASure\(<mnum>\):LIMit:REPort:POINts?

Applicable Models: All

(Read-only) Reads the number of the measurement points that failed the limit test, for the active trace of selected channel.

CALCulate\(<cnum>\):MEASure\(<mnum>\):LIMit:SEGment\(<snum>\):AMPLitude:STOP \(<num>\)
Applicable Models: All

(Read-Write) Sets the stop (end) of the Y-axis amplitude (response) value.

Parameters

- `<cnum>` Channel number of the measurement (optional).
- `<mnum>` Measurement number for each measurement.
- `<snum>` Segment number; if unspecified, value is set to 1.
- `<num>` Choose any number between: -500 and 500

Display value is limited to the Maximum and Minimum displayed Y-axis values.

Examples

- `calculate2:measure2:limit:segment2:amplitude:stop 10`

Query Syntax

- `CALCulate<cnum>:MEASure<mnum>:LIMit:SEGMent<snum>AMPLitude:STOP?`

Return Type

- Numeric
- Default: 0

CALCulate:MEASure<mnum>:LIMit:SEGMent:COUNt?

Applicable Models: All

(Read-only) Returns the number of segments used in a limit test. All segments are counted, whether they are on or not.

Parameters

- `<mnum>` Measurement number for each measurement.

Examples

- `CALC:MEAS2:LIM:SEGM:COUN?`

Return Type

- Numeric
- Default: Not Applicable
Applicable Models: All

(Read-Write) Sets the start (beginning) of the X-axis stimulus value.

**Parameters**

- `<cnum>` Channel number of the measurement (optional).
- `<mnum>` Measurement number for each measurement.
- `<snum>` Segment number; if unspecified, value is set to 1.
- `<num>` Choose any number within the X-axis span of the analyzer.

**Examples**

```
CALC:MEAS:LIM:SEG1:STIM:STAR 10
```

```
calculate2:measure:limit:segment2:stimulus:start 10
```

**Query Syntax**

CALCulate<cnum>:MEASure<mnum>:LIMit:SEGment<snum>:STIMulus:STARt?

**Return Type**

Numeric

**Default**

0

CALCulate<cnum>:MEASure<mnum>:LIMit:SEGment<snum>:STIMulus:STOP <num>

Applicable Models: All

(Read-Write) Sets the stop (end) of the X-axis stimulus value.

**Parameters**

- `<cnum>` Channel number of the measurement (optional).
- `<mnum>` Measurement number for each measurement.
- `<snum>` Segment number; if unspecified, value is set to 1.
- `<num>` Choose any number within the X-axis span of the analyzer.

**Examples**

```
CALC:MEAS2:LIM:SEG2:AMPL:STOP 10
```

```
calculate2:measure:limit:segment2:stimulus:stop 10
```

**Query Syntax**

CALCulate<cnum>:MEASure<mnum>:LIMit:SEGment<snum>:STIMulus:STOP?

**Return Type**

Numeric

**Default**

0

CALCulate<cnum>:MEASure<mnum>:LIMit:SEGment<snum>:TYPE <char>
Applicable Models: All

(Read-Write) Sets the type of limit segment.

**Parameters**

- `<cnum>` Channel number of the measurement (optional).
- `<mnum>` Measurement number for each measurement.
- `<snum>` Segment number. Choose any number between: 1 and 100
  If unspecified, value is set to 1.
- `<char>` Choose from:
  - **LMAX** - a MAX limit segment. Any response data exceeding the MAX value will fail.
  - **LMIN** - a MIN limit segment. Any response data below the MIN value will fail.
  - **OFF** - the limit segment (display and testing) is turned OFF.

**Examples**

```plaintext
CALC:MEAS2:LIM:SEGM:TYPE LMIN
calculate2:measure2:limit:segment3:type lmax
```

**Query Syntax**

CALCulate<cnum>:MEASure<mnum>:LIMit:SEGMent<snum>:TYPE?

**Return Type** Character

**Default** OFF

---

CALCulate<cnum>:MEASure<mnum>:LIMit:SOUNd[:STATe] <ON | OFF>

Applicable Models: All

(Read-Write) Turns limit testing fail sound ON or OFF.

**Parameters**

- `<cnum>` Channel number of the measurement (optional).
- `<mnum>` Measurement number for each measurement.
- `<ON | OFF>`
  - **ON** (or 1) - turns sound ON.
  - **OFF** (or 0) - turns sound OFF.

**Examples**

```plaintext
CALC:MEAS2:LIM:SOUN ON
calculate2:measure2:limit:sound:state off
```

**Query Syntax**

CALCulate<cnum>:MEASure<mnum>:LIMit:SOUNd[:STATe]?
CALCulate<cnum>:MEASure<mnum>:LIMit[:STATe] <ON | OFF>

**Applicable Models:** All

(Read-Write) Turns limit segment **testing** ON or OFF.

- Use `CALCulate:MEASure:LIMit:DISPLAY` to turn ON and OFF the **display** of limit segments.
- If using **Global Pass/Fail** status, trigger the VNA AFTER turning Limit testing ON.

**Parameters**
- `<cnum>` Channel number of the measurement (optional).
- `<mnum>` Measurement number for each measurement.
- `<ON | OFF>` **ON** (or 1) - turns limit testing ON.
  **OFF** (or 0) - turns limit testing OFF.

**Examples**
- `CALC:MEAS:LIM:STAT ON`
- `calculate2:measure:limit:state off`

**Query Syntax**
- `CALCulate<cnum>:MEASure<mnum>:LIMit:STATe?`

**Return Type** Boolean (1 = ON, 0 = OFF)

**Default** OFF
**CALCulate:MEASure:MARKer Commands**

Controls the marker settings used to remotely output specific data to the computer.

<table>
<thead>
<tr>
<th>CALCulate:MEASure:MARKer:</th>

**CALCulate<cnum>:MEASure<mnum>:MARKer:AOFF**

**Applicable Models:** All

**(Write-only)** Turns all markers off for selected measurement.

**Parameters**

- `<cnum>` Channel number of the measurement (optional).
- `<mnum>` Measurement number for each measurement.

**Examples**

```
CALC:MEAS2:MARK:AOFF
calculate2:measure2:marker:aoff
```

**Query Syntax** Not applicable

**Default** Not applicable

**CALCulate<cnum>:MEASure<mnum>:MARKer<n>:BUCKet <num>**
Applicable Models: All

*(Read-Write)* Sets and reads the data point (bucket) number of the trace on which the marker resides. When the markers are interpolated (non-discrete), the returned value is the nearest marker bucket position.

**Parameters**

- `<cnum>` Channel number of the measurement (optional).
- `<mnum>` Measurement number for each measurement.
- `<n>` Marker number to move or query. The marker must already exist. If unspecified, `<n>` is set to 1.
- `<num>` Data point (bucket) number. Choose any data point between: 0 and the number of data points minus 1.

**Examples**

```
CALC:MEAS:MARK:BUCK 5
```

```
calculate2:measure2:marker2:bucket 200
```

**Query Syntax**

```
CALCulate<cnum>:MEASure<mnum>:MARKer<n>:BUCKet?
```

**Return Type** Integer

**Default** The first marker is set to the middle of the span. Subsequent markers are set to the bucket number of the previously active marker.

---

**CALCulate<cnum>:MEASure<mnum>:MARKer<mkr>:BWIDth:DATA?**

Applicable Models: All

*(Read-only)* Read the bandwidth search result of marker 1 to 15 and reference marker (Mkr :16), for the active trace of selected channel.

If the bandwidth search is impossible, an error occurs when executed and the object is ignored.

**Parameters**

- `<cnum>` Channel number of the measurement (optional).
- `<mnum>` Measurement number for each measurement.
- `<mkr>` Any marker number from 1 to 15; If unspecified, value is set to 1.
  
  Four Character values separated by commas => `{numeric 1}, {numeric 2}, {numeric 3}, {numeric 4}`

  - `{numeric 1}` : Bandwidth
  - `{numeric 2}` : Center point frequency of the 2 cutoff frequency points

CALCulate<cnum>:MEASure<mnum>:MARKer<mkr>:BWIDth:REF <string>

Applicable Models: All

(Read-Write) Set the bandwidth marker function reference to either MARKer or PEAK.

If the reference is set to MARKer, the active marker is not moved; the bandwidth search is computed at the marker's current location.

If the reference is PEAK, the active marker is moved to the maximum or minimum peak on the trace and then bandwidth search is computed.

- If the bandwidth level is negative, the active marker is moved to the maximum peak.
- If the bandwidth level is positive, the active marker is moved to the minimum peak.

Parameters

- <cnum> Channel number of the measurement (optional).
- <mnum> Measurement number for each measurement.
- <mkr> Any marker number from 1 to 15; if unspecified, value is set to 1.
- <string> PEAK

</table>

CALCulate<cnum>:MEASure<mnum>:MARKer<mkr>:BWIDth[:STATe] <bool>
Applicable Models: All

(Read-Write) Turns ON or OFF the bandwidth search result display, for the active trace of selected channel.

**Parameters**
- `<cnum>` Channel number of the measurement (optional).
- `<mnum>` Measurement number for each measurement.
- `<mkr>` Any marker number from 1 to 15; if unspecified, value is set to 1.
- `<bool>` Bandwidth search result display:
  - **ON or 1** - Turns ON the bandwidth search result display.
  - **OFF or 0** - Turns OFF the bandwidth search result display.

**Examples**
- CALC:MEAS:MARK:BWID ON
- calculate2:measure1:marker:bwidth:state off

**Query Syntax**
CALCulate<cnum>:MEASure<mnum>:MARKer<mkr>:BWIDth[:STATe]?

**Return Type**
Boolean

Default
OFF or 0

**CALCulate<cnum>:MEASure<mnum>:MARKer<mkr>:BWIDth:THReshold <value><unit>**

Applicable Models: All

(Read-Write) Sets or returns the bandwidth definition value (the value to define the pass-band of the filter) of marker 1 to 15 and reference marker (Mk :16), for the active trace of selected channel.

**Parameters**
- `<cnum>` Channel number of the measurement (optional).
- `<mnum>` Measurement number for each measurement.
- `<mkr>` Any marker number from 1 to 15; if unspecified, value is set to 1.
- `<value>` Bandwidth definition value (the value to define the pass band of the filter) is between -5E8 to 5E8.
- `<unit>` Varies depending on the data format.
  - Log magnitude (MLOG): dB (decibel)
  - Phase (PHAS), Expanded phase (UPH) or Positive phase (PPH): deg (degree)
  - Group delay (GDEL): s (second)
  - Others: No unit

**Examples**
- CALC:MEAS:MARK:BWID:THR -3
- calculate2:measure1:marker:bwidth:threshold -3
**Query Syntax**

CALCulate<cnum>:MEASure<mnum>:MARKer<mkr>:BWIDth:THReshold?

**Return Type**

Numeric

Default -3

---

**CALCulate<cnum>:MEASure<mnum>:MARKer<mkr>:COUPling:METHod <char>**

**Applicable Models:** All

(Read-Write) Sets and reads the scope of Coupled Markers. This is a global setting that affects all markers. Learn more.

**Note:** This command will not take effect until Coupled Markers is turned on using
CALC:MEAS:MARK:COUP:STATe ON.

**Note:** The preset behavior of Coupled Markers depends on the setting of
SYSTem:PREFerences:ITEM:MCControl, SYSTem:PREFerences:ITEM:MCMethod, and
SYSTem:PREFerences:ITEM:MCPRest.

**Note:** If any or all <cnum>, <mnum>, or <mkr> arguments are omitted, they are assumed to have the value 1.

**Parameters**

- **<cnum>** Must be a valid channel number (unless a measurement number is provided), but marker coupling is not set per channel.
- **<mnum>** Must be a valid measurement number and must be displayed on the screen. Marker coupling is not set per measurement.
- **<mkr>** Not used. The marker number must still be in the range of 1-16, but marker coupling is not set per marker.
- **<char>** CHANnel - Coupling is limited to traces in the same channel.
  - ALL - Coupling occurs across all channels.

**Examples**

CALC:MEAS:MARK:COUP:METH CHAN

calculate:measure:marker:coupling all

**Query Syntax**

CALCulate<cnum>:MEASure<mnum>:MARKer:COUPling:METHod?

**Return Type**

Character

Default ALL
CALCulate:MEASure<mnum>:MARKer<mkr>:COUPling[:STATe]<ON|OFF>

**Applicable Models:** All

*(Read-Write)* Sets and reads the state of Coupled Markers (ON and OFF). The scope of coupled markers can be changed with CALC:MEAS:MARK:COUP:METH.

**Note:** If the `<mnum>` or `<mkr>` argument is omitted, they are assumed to have the value 1.

**Parameters**

- `<mnum>`: Must be a valid measurement number and must be displayed on the screen.
- `<mkr>`: Not used. The marker number must still be in the range of 1-16.
- `<ON|OFF>`
  - OFF (0): Turns Coupled Markers OFF
  - ON (1): Turns Coupled Markers ON

**Examples**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CALC:MEAS:MARK:COUP ON</td>
<td>Turns Coupled Markers ON</td>
</tr>
<tr>
<td>calculate:measure1:marker:coupling off</td>
<td>Turns Coupled Markers OFF</td>
</tr>
</tbody>
</table>

**Query Syntax**

CALCulate<cnum>:MEASure<mnum>:MARKer<mkr>:COUPling[:STATe]?

**Return Type**

Boolean (1 = ON, 0 = OFF)

**Default**

OFF

---

CALCulate<cnum>:MEASure<mnum>:MARKer<mkr>:DELTa <ON|OFF>

**Applicable Models:** All

*(Read-Write)* Specifies whether marker is relative to the Reference marker or absolute.

**Note:** The reference marker must already be turned ON with CALC:MARK:REF:STATE.

**Parameters**

- `<cnum>`: Channel number of the measurement (optional).
- `<mnum>`: Measurement number for each measurement.
- `<mkr>`: Any existing marker number from 1 to 15; if unspecified, value is set to 1.
- `<ON|OFF>`
  - ON (1): Specified marker is a Delta marker
  - OFF (0): Specified marker is an ABSOLUTE marker

**Examples**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CALC:MEAS:MARK:DELT ON</td>
<td>Specified marker is a Delta marker</td>
</tr>
<tr>
<td>calculate2:measure1:marker8:delta off</td>
<td>Specified marker is an ABSOLUTE marker</td>
</tr>
</tbody>
</table>

**Query Syntax**

CALCulate<cnum>:MEASure<mnum>:MARKer<mkr>:DELTa?

**Return Type**

Boolean (1 = ON, 0 = OFF)
**CALCulate<cnum>:MEASure<mnum>:MARKer<mkr>:DISCrete <ON|OFF>**

**Applicable Models:** All

*(Read-Write)* Makes the specified marker display either a calculated value between data points (interpolated data) or the actual data points (discrete data).

**Parameters**

- `<cnum>` Channel number of the measurement (optional).
- `<mnum>` Measurement number for each measurement.
- `<mkr>` Any existing marker number from 1 to 15; if unspecified, value is set to 1.
- `<ON|OFF>`
  - **ON** (or 1) - Specified marker displays the actual data points
  - **OFF** (or 0) - Specified marker displays calculated data between the actual data points.

**Examples**

```
CALC:MEAS:MARK:DISC ON
calculate2:measure2:marker8:discrete off
```

**Query Syntax**

CALCulate<cnum>:MEASure<mnum>:MARKer<mkr>:DISCrete?

**Return Type**

Boolean (1 = ON, 0 = OFF)

**Default**

OFF

---

**CALCulate<cnum>:MEASure<mnum>:MARKer<mkr>:DISTance <num>**

**Applicable Models:** All

*(Read-Write)* Set or query marker distance on a time domain trace.

The Write command moves the marker to the specified distance value. Once moved, you can read the Y axis value or read the X-axis time value. (Distance is calculated from the X-axis time value.)

The Read command reads the distance of the marker.

If the marker is set as delta, the WRITE and READ data is relative to the reference marker.

**Parameters**

- `<cnum>` Channel number of the measurement (optional).
- `<mnum>` Measurement number for each measurement.
- `<mkr>` Any existing marker number from 1 to 15; if unspecified, value is set to 1.
Marker distance in the unit of measure specified with CALC:TRAN:TIME:MARK:UNIT

**Examples**

```
CALC:MEAS:MARK:DIST .1
calculate2:measure1:marker8:distance 5
```

**Query Syntax**

CALCulate\(<cnum>\):MEASure\(<mnum>\):MARKer\(<mkr>\):DISTance?

**Return Type**

Numeric

**Default**

Not Applicable

---

**CALCulate\(<cnum>\):MEASure\(<mnum>\):MARKer\(<mkr>\):FORMat \(<char>\)**

**Applicable Models:** All

(Read-Write) Sets the format of the data that will be returned in a marker data query CALC:MARK:Y? and the displayed value of the marker readout. The selection does not have to be the same as the measurement's display format.

**Parameters**

\(<cnum>\)  Channel number of the measurement (optional).

\(<mnum>\)  Measurement number for each measurement.

\(<mkr>\)  Any marker number from 1 to 15; if unspecified, value is set to 1

\(<char>\)  Choose from:

- **DEFAULT** - The format of the selected measurement
- **MLINear** - Linear magnitude
- **MLOGarithmic** - Logarithmic magnitude
- **IMPedance** - (R+jX)
- **ADMittance** - (G+jB)
- **PHASe** - Phase
- **IMAGinary** - Imaginary part (Im)
- **REAL** - Real part (Re)
- **POLar** - (Re, Im)
- **GDElay** - Group Delay
- **LINPhase** - Linear Magnitude and Phase
**LOGPhase** - Log Magnitude and Phase

**KELVIn** - temperature

**FAHRENheit** - temperature

**CELSius** - temperature

**NOISE** - Noise (available ONLY in IM Spectrum and SA measurement classes).

**Examples**

```
CALC:MEAS:MARK:FORMat MLIN
calculate2:measure:marker8:format Character
```

**Query Syntax**

CALCulate<cnum>:MEASure<mnum>:MARKer<mkr>:FUNCtion:APEak:POLarity?

**Return Type**

Character

**Default**

DEFault

---

CALCulate<cnum>:MEASure<mnum>:MARKer<mkr>:FUNCtion:APEak:POLarity <char>

**Applicable Models:** All

(Read-Write) Sets or returns polarity of the peak search with marker 1 to 15 and reference marker (Mk:16), for the active trace of selected channel.

Learn more about Marker Search

**Parameters**

- `<cnum>` Channel number of the measurement (optional).
- `<mnum>` Measurement number for each measurement.
- `<mkr>` Any marker number from 1 to 15; if unspecified, value is set to 1.
- `<char>` Polarity for peak search function to be performed. Choose from:
  
  - "NEGative": Specifies the negative peak.
  - "POSitive": Specifies the positive peak.
  - "BOTH": Specifies both the positive peak and the negative peak.

**Examples**

```
CALC:MEAS:MARK:FUNC:APE:POL NEG
calculate2:measure1:marker6:function:apeak:polarity both
```

**Query Syntax**

CALCulate<cnum>:MEASure<mnum>:MARKer<mkr>:FUNCtion:APEak:POLarity?
CALCulate\textsubscript{<cnum>}:MEASure\textsubscript{<mnum>}:MARKer\textsubscript{<mkr>}:FUNCtion:COMPres\textsubscript{ion}:LEVel \textsubscript{<num>}

**Applicable Models:** All

*(Read-Write)* Sets and read the marker compression level. A compression marker must already exist. Use CALC:MARK ON and CALC:MEAS:MARK:FUNC COMP to create compression markers.

**Parameters**
- \textsubscript{<cnum>} Channel number of the measurement (optional).
- \textsubscript{<mnum>} Measurement number for each measurement.
- \textsubscript{<mkr>} Any existing marker number from 1 to 15; if unspecified, value is set to 1.
- \textsubscript{<num>} Compression level. Choose any number between: -500 dB to 500 dB

Standard gain compression values are positive.

**Examples**
- `CALC:MEAS:MARK:FUNC:COMP:LEV 1`
- `calculate2:measure1:marker:function:compression:level 1.5`

**Query Syntax**
- `CALCulate\textsubscript{<cnum>}:MEASure\textsubscript{<mnum>}:MARKer\textsubscript{<mkr>}:FUNCtion:COMPres\textsubscript{ion}:LEVel?`

**Return Type**
- Numeric
- Default: +1 dB

---

CALCulate\textsubscript{<cnum>}:MEASure\textsubscript{<mnum>}:MARKer\textsubscript{<mkr>}:FUNCtion:COMPres\textsubscript{ion}:PIN?

**Applicable Models:** All

*(Read-only)* Read the input power at the marker compression level. First send CALC:MEAS:MARK:FUNC:EXEC COMP or CALC:MEAS:MARK:FUNC:TRAC ON.

**Parameters**
- \textsubscript{<cnum>} Channel number of the measurement (optional).
- \textsubscript{<mnum>} Measurement number for each measurement.
- \textsubscript{<mkr>} Any existing marker number from 1 to 15; if unspecified, value is set to 1.

**Examples**
- `CALC:MEAS:MARK:FUNC:COMP:PIN?`
- `calculate2:measure1:marker:function:compression:pin?`

**Return Type**
- Numeric
- Default: Not Applicable
CALCulate<cnum>:MEASure<mnum>:MARKer<mkr>:FUNCtion:COMPression:POUT?

Applicable Models: All

(Read-only) Read the output power at the marker compression level. First send CALC:MEAS:MARK:FUNC:EXEC COMP or CALC:MEAS:MARK:FUNC:TRAC ON

Parameters
- <cnum> Channel number of the measurement (optional).
- <mnum> Measurement number for each measurement.
- <mkr> Any existing marker number from 1 to 15; if unspecified, value is set to 1.

Examples
- CALC:MEAS:MARK:FUNC:COMP:POUT?
- calculate2:measure1:marker:function:compression:pout?

Return Type Numeric
Default Not Applicable

CALCulate<cnum>:MEASure<mnum>:MARKer<mkr>:FUNCtion:COMPression[:STATe] <bool>

Applicable Models: All

(Read-Write) Turns ON or OFF the compression state.

Parameters
- <cnum> Channel number of the measurement (optional).
- <mnum> Measurement number for each measurement.
- <mkr> Any marker number from 1 to 15; if unspecified, value is set to 1.
- <bool> Bandwidth search result display:

  **ON or 1** - Turns ON the compression.

  **OFF or 0** - Turns OFF the compression.

Examples
- CALC:MEAS:MARK:FUNC:COMP:STAT ON
- calculate2:measure1:marker:function:compression:state off

Query Syntax
CALCulate<cnum>:MEASure<mnum>:MARKer:FUNCtion:COMPression[:STATe]?

Return Type Boolean
Default OFF or 0

Applicable Models: All

(Read-Write) Assigns the specified marker to a range number. The x-axis travel of the marker is constrained to the range's span. The span is specified with the CALC:MEAS:MARK:FUNC:DOM:USER:START and STOP commands, unless range 0 is specified which is the full span of the analyzer.

Each channel has 16 user ranges. (Trace statistics use the same ranges.) More than one marker can use a domain range.

Parameters
  <cnum>  Channel number of the measurement (optional).
  <mnum>  Measurement number for each measurement.
  <mkr>   Any marker number from 1 to 15; if unspecified, value is set to 1.
  <range> User span. Choose any Integer from 0 to 16.

  0 is Full Span of the analyzer.

  1 to 16 are available for user-defined x-axis span.

Examples
 calculate2:measure1:marker8:function:domain:user:range 1

Query Syntax

Return Type
  Numeric

Default
  0 - Full Span

CALCulate<cnum>:MEASure<mnum>:MARKer<mkr>:FUNCtion:DOMain:USER:STARt <start>
Applicable Models: All

(Read-Write) Sets the start of the span that the specified marker's x-axis span will be constrained to.

Note: If the marker is assigned to range 0 (full span), the USER:STARt and STOP commands generate an error. You cannot set the STARt and STOP values for "Full Span".

Note: This command does the same as CALC:FUNC:DOM:USER:STAR

Parameters
- `<cnum>` Channel number of the measurement (optional).
- `<mnum>` Measurement number for each measurement.
- `<mkr>` Any marker number from 1 to 15; if unspecified, value is set to 1.
- `<start>` The analyzer's Minimum x-axis value

Examples
- `calculate2:measure1:marker8:function:domain:user:start 1e12`

Query Syntax
- `CALCulate<cnum>:MEASure<mnum>:MARKer<mkr>:FUNCtion:DOMain:USER:STARt?`

Return
- Type: Numeric
- Default: The analyzer's Minimum x-axis value

Applicable Models: All

(Read-Write) Sets the stop of the span that the marker's x-axis travel will be constrained to.

Note: If the marker is assigned to range 0 (full span), the USER:STARt and STOP commands generate an error. You cannot set the STARt and STOP values for "Full Span".

Note: This command does the same as CALC:FUNC:DOM:USER:STOP

Parameters
- `<cnum>` Channel number of the measurement (optional).
- `<mnum>` Measurement number for each measurement.
- `<mkr>` Any marker number from 1 to 15; if unspecified, value is set to 1.
Stop value of x-axis span; Choose any number between the analyzer's MINimum and MAXimum x-axis value.

**Examples**

```
```

```
calculate2:measure1:marker8:function:domain1:user:stop 1e12
```

**Query Syntax**

```
CALCulate<cnum>:MEASure<mnum>:MARKer<mkr>:FUNCtion:DOMain:USER:STOP?
```

**Return Type**

Numeric

**Default**

The analyzer's MAXimum x-axis value.

---

**CALCulate<cnum>:MEASure<mnum>:MARKer<mkr>:FUNCtion:EXECute <func>**

**Applicable Models:** All

*(Write-only)* Immediately executes (performs) the specified search function.

Learn more about Marker Search

**Parameters**

- `<cnum>` Channel number of the measurement (optional).
- `<mnum>` Measurement number for each measurement.
- `<mkr>` Any marker number from 1 to 15; if unspecified, value is set to 1.
- `<func>` The function to be performed. Choose from:

  - MAXimum - finds the highest value.
  - MINimum - finds the lowest value.
  - RPEak - finds the next valid peak to the right.
  - LPEak - finds the next valid peak to the left.
  - NPEak - finds the next highest value among the valid peaks.
  - TARGet - finds the target value to the right, wraps around to the left.
  - LTARget - finds the next target value to the left of the marker.
  - RTARget - finds the next target value to the right of the marker.
  - PEAK - finds the peak value.
  - COMPression - finds the compression level on a Power Swept S21 trace.
  - SPURious - finds spurious signals based on spurious settings.
  - LSPurious - finds the next spurious signal to the left.
• RSPurious - finds the next spurious signal to the right.

Examples

CALC:MEAS:MARK:FUNC:EXEC MAX
calculate2:measure1:marker2:function:execute maximum

Query Syntax
Not Applicable

Default
Not Applicable

CALCulate<cnum>:MEASure<mnum>:MARKer<mkr>:FUNCtion:MULTi:EXECute <func>

Applicable Models: All

(Write-only) Immediately executes (performs) the specified multi search function.

Parameters

<cnun>  Channel number of the measurement (optional).
<mnum>  Measurement number for each measurement.
<mkr>   Any marker number from 1 to 15; if unspecified, value is set to 1.
<func>  The function to be performed. Choose from:

  • **OFF** - function is disabled.
  • **PEAK** - finds the peak value of a multi-peak search.
  • **TARGET** - finds the target value to the right, wraps around to the left.
  • **SPURIOUS** - finds spurious signals based on spurious settings.

Examples

CALC:MEAS:MARK:FUNC:MULT:EXEC PEAK
calculate2:measure1:marker2:function:multi:execute target

Query Syntax
Not Applicable

Default
OFF

CALCulate<cnum>:MEASure<mnum>:MARKer<mkr>:FUNCtion:MULTi:PEAK:EXCursion <num><unit>
Applicable Models: All

(Read-Write) Sets or returns the lower limit of peak excursion value of multi peak search, for the selected channel and selected trace.

Learn more about Marker Search

Parameters

- `<cnum>` Channel number of the measurement (optional).
- `<mnum>` Measurement number for each measurement.
- `<mkr>` Any marker number from 1 to 15; if unspecified, value is set to 1.
- `<num>` Excursion value. Choose any number between -500 and 500.

Notes: If the specified variable is out of the allowable setup range, the minimum value (if the lower limit of the range is not reached) or the maximum value (if the upper limit of the range is exceeded) is set.

This command will accept MIN or MAX instead of a numeric parameter. See SCPI Syntax for more information.

- `<unit>` Varies depending on the data format.
  - Log magnitude (MLOG): dB (decibel)
  - Phase (PHAS), Expanded phase (UPH) or Positive phase (PPH): deg (degree)
  - Group delay (GDEL): s (second)
  - Others: No unit

Examples

- `calculate2:measure2:marker8:function:multi:peak:excursion maximum`

Query Syntax

- `CALCulate<cnum>:MEASure<mnum>:MARKer<mkr>:FUNCtion:MULTi:PEAK:EXCu`

Return Type

- Numeric

Default

- 3

CALCulate<cnum>:MEASure<mnum>:MARKer<mkr>:FUNCtion:MULTi:PEAK:POLarity <func>
Applicable Models: All

(Read-Write) Sets or returns the peak polarity of the multi peak search, for the selected channel and selected trace.

Learn more about Marker Search

Parameters

- `<cnum>` Channel number of the measurement (optional).
- `<mnum>` Measurement number for each measurement.
- `<mkr>` Any marker number from 1 to 15; if unspecified, value is set to 1.
- `<func>` Polarity for multi peak search function to be performed. Choose from:
  - "NEGative" : Specifies the negative peak.
  - "POSitive" : Specifies the positive peak.
  - "BOTH" : Specifies both the positive peak and the negative peak.

Examples

```
```

Query Syntax

```
CALCulate<cnum>:MEASure<mnum>:MARKer<mkr>:FUNCtion:MULTi:PEAK:POLarity?
```

Return Type

Character

Default

"POSitive"

---

CALCulate<cnum>:MEASure<mnum>:MARKer<mkr>:FUNCtion:MULTi:PEAK:THReshold <num><unit>

Applicable Models: All

(Read-Write) Sets peak threshold for the specified marker. If a peak (using the criteria set with :EXCursor below this reference value, it will not be considered when searching for peaks. This command applies to marker peak searches (Next peak, Peak Right, Peak Left).

Parameters

- `<cnum>` Channel number of the measurement (optional).
- `<mnum>` Measurement number for each measurement.
- `<mkr>` Any marker number from 1 to 15; if unspecified, value is set to 1.
- `<num>` Excursion value. Choose any number between -500 and 500.

Note: This command will accept MIN or MAX instead of a numeric parameter. See SCPI Syntax for more information.

- `<unit>` Varies depending on the data format.

CALCulate<cnum>:MEASure<mnum>:MARKer<mkr>:FUNCtion:MULTi:SELect<char>

Applicable Models: All

(Read-Write) Sets or returns the search type of the multi search, for the selected channel and selected trace.

Learn more about Marker Search

Parameters
- <cnum> Channel number of the measurement (optional).
- <mnum> Measurement number for each measurement.
- <mkr> Any marker number from 1 to 15; if unspecified, value is set to 1.
- <char> Select from the following:
  - "OFF ": Turn OFF the multi search function.
  - "PEAK ": Sets the search type to the multi peak search.
  - "TARGet ": Sets the search type to the multi target search.

CALCulate<cnum>:MEASure<mnum>:MARKer<mkr>:FUNCtion:MULTi:TARGet:TRANSition
Applicable Models: All

(Read-Write) Sets the transition type of the multi target search.

Parameters
- `<cnum>` Channel number of the measurement (optional).
- `<mnum>` Measurement number for each measurement.
- `<mkr>` Any marker number from 1 to 15; if unspecified, value is set to 1.
- `<char>` Transition type of multi target search function to be performed. Choose from:
  - "NEGative": Specifies the negative transition.
  - "POSitive": Specifies the positive transition.
  - "BOTH": Specifies both the positive transition and the negative transition.

Examples
- `calculate2:measure1:marker6:function:multi:target:transition both`

Query Syntax
- `CALCulate<cnum>:MEASure<mnum>:MARKer<mkr>:FUNCtion:MULTi:TARGet[:VALue] <num><unit>`

Applicable Models: All

(Read-Write) Sets or returns the target value for the specified marker when doing Multi Target Search, for selected channel and selected trace.

Parameters
- `<cnum>` Channel number of the measurement (optional).
- `<mnum>` Measurement number for each measurement.
- `<mkr>` Any marker number from 1 to 15; if unspecified, value is set to 1.
- `<num>` Target value for multi target search to search for.

The range of target value is -5E8 to 5E8.

Notes: If the specified variable is out of the allowable setup range, the minimum value (if t
lower limit of the range is not reached) or the maximum value (if the upper limit of the range exceeded) is set.

<unit> Varies depending on the data format.

- Log magnitude (MLOG): dB (decibel)
- Phase (PHAS), Expanded phase (UPH) or Positive phase (PPH): deg (degree)
- Group delay (GDEL): s (second)
- Others: No unit

Examples
CALC:MEAS:MARK:FUNC:MULT:TARG 2.5

Query Syntax
CALCulate<cnum>:MEASure<mnum>:MARKer<mkr>:FUNCtion:MULTi:TARGet[:VAI

Return Type Numeric

Default 0

CALCulate<cnum>:MEASure<mnum>:MARKer<mkr>:FUNCtion:MULTi:TRACking <bool>

Applicable Models: All

(Read-Write) Turns ON or OFF the search tracking capability (function to repeat search for each sweep) of the multi search, for the selected channel and selected trace.

Learn more about Marker Search

Parameters
- <cnum> Channel number of the measurement (optional).
- <mnum> Measurement number for each measurement.
- <mkr> Any marker number from 1 to 15; if unspecified, value is set to 1.
- <bool> **ON or 1** - Turns ON the marker search tracking. The specified multi marker will "Track" (find) the selected function every sweep.

**OFF or 0** - Turns OFF the marker search tracking. The specified multi marker will find the selected function **only** when the CALC:MEAS:MARK:FUNC:EXECute command is sent.

Examples
CALC:MEAS:MARK:FUNC:MULT:TRAC ON
calculate2:measure2:marker8:function:multi:tracking off

Query Syntax
CALCulate<cnum>:MEASure<mnum>:MARKer<mkr>:FUNCtion:MULTi:TRACking?

Return Type Boolean
CALCulate<cnum>:MEASure<mnum>:MARKer<mkr>:FUNCtion:PEAK:EXCursion <num><unit>

**Applicable Models:** All

*(Read-Write)* Sets amplitude peak excursion for the specified marker. The Excursion value determines what is considered a "peak". This command applies to marker peak searches (Next peak, Peak Right, Peak Left).

**Parameters**

- `<cnum>` Channel number of the measurement (optional).
- `<mnum>` Measurement number for each measurement.
- `<mkr>` Any existing marker number from 1 to 15; if unspecified, value is set to 1.
- `<num>` Excursion value. Choose any number between -500 and 500.

**Note:** This command will accept MIN or MAX instead of a numeric parameter. See SCPI Syntax for more information.

- `<unit>` Varies depending on the data format.
  - Log magnitude (MLOG): dB (decibel)
  - Phase (PHAS), Expanded phase (UPH) or Positive phase (PPH): deg (degree)
  - Group delay (GDEL): s (second)
  - Others: No unit

**Examples**

- `CALC:MEAS:MARK:FUNC:PEAK:EXC 10`
- `calculate2:measure2:marker8:function:peak:excursion maximum`

**Query Syntax**

`CALCulate<cnum>:MARKer<mkr>:FUNCtion:PEAK:EXCursion?`

**Return Type**

Numeric

**Default**

3

CALCulate<cnum>:MEASure<mnum>:MARKer<mkr>:FUNCtion:PEAK:POLarity <char>
Applicable Models: All

*(Read-Write)* Sets or returns polarity of the peak search with marker 1 to 15 and reference marker (Mk :16), for the active trace of selected channel.

Learn more about Marker Search

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;cnum&gt;</td>
<td>Channel number of the measurement (optional).</td>
</tr>
<tr>
<td>&lt;mnum&gt;</td>
<td>Measurement number for each measurement.</td>
</tr>
<tr>
<td>&lt;mkr&gt;</td>
<td>Any marker number from 1 to 15; if unspecified, value is set to 1.</td>
</tr>
<tr>
<td>&lt;char&gt;</td>
<td>Polarity for peak search function to be performed. Choose from:</td>
</tr>
<tr>
<td></td>
<td>&quot;NEGative&quot; : Specifies the negative peak.</td>
</tr>
<tr>
<td></td>
<td>&quot;POSitive&quot; : Specifies the positive peak.</td>
</tr>
<tr>
<td></td>
<td>&quot;BOTH&quot; : Specifies both the positive peak and the negative peak.</td>
</tr>
</tbody>
</table>

**Examples**

```
CALC:MEAS:MARK:FUNC:APE:POL NE
```

calculate2:measure1:marker6:function:apeak:polarity both

**Query Syntax**

```
CALCulate<cnum>:MEASure<mnum>:MARKer<mkr>:FUNCtion:APEak:POLarity?
```

**Return Type**

Character

**Default**

"POSitive"

---

CALCulate<cnum>:MEASure<mnum>:MARKer<mkr>:FUNCtion:PEAK:THReshold <num><unit>

Applicable Models: All

*(Read-Write)* Sets peak threshold for the specified marker. If a peak (using the criteria set with :EXCursion) is below this reference value, it will not be considered when searching for peaks. This command applies to marker peak searches (Next peak, Peak Right, Peak Left).

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;cnum&gt;</td>
<td>Channel number of the measurement (optional).</td>
</tr>
<tr>
<td>&lt;mnum&gt;</td>
<td>Measurement number for each measurement.</td>
</tr>
<tr>
<td>&lt;mkr&gt;</td>
<td>Any marker number from 1 to 15; if unspecified, value is set to 1</td>
</tr>
<tr>
<td>&lt;num&gt;</td>
<td>Excursion value. Choose any number between -500 and 500.</td>
</tr>
</tbody>
</table>

**Note**: This command will accept MIN or MAX instead of a numeric parameter. See SCPI Syntax for more information.
<unit>  
Varies depending on the data format.

- Log magnitude (MLOG): dB (decibel)
- Phase (PHAS), Expanded phase (UPH) or Positive phase (PPH): deg (degree)
- Group delay (GDEL): s (second)
- Others: No unit

Examples

Query Syntax
CALCulate<cnum>:MARKer<mkr>:FUNCtion:APEak:THReshold?

Return Type
Numeric

Default
-100

CALCulate<cnum>:MEASure<mnum>:MARKer<mkr>:FUNCtion[:SELect] <char>

Applicable Models: All

(Read-Write) Sets the search function that the specified marker will perform when executed. Use CALC:MEAS:MARK:FUNC:TRAC ON to automatically execute the search every sweep.

Learn more about Marker Search

Parameters
- <cnum> Channel number of the measurement (optional).
- <mnum> Measurement number for each measurement.
- <mkr> Any marker number from 1 to 15; if unspecified, value is set to 1.
- <char> Marker function. Choose from:
  
  - MAXimum - finds the highest value
  - MINimum - finds the lowest value
  - RPEak - finds the next valid peak to the right
  - LPEak - finds the next valid peak to the left
  - NPEak - finds the next highest value among the valid peaks
  - TARGet - finds the target value to the right, wraps around to the left
  - LTARget - finds the next target value to the left of the marker
  - RTARget - finds the next target value to the right of the marker
COMPression - finds the compression level on a power-swept S21 trace.

Examples

```
CALC:MEAS:MARK:FUNC MAX
calculate2:measure1:marker8:function:select 1target
```

Query Syntax
CALCulate<cnum>:MEASure<mnum>:MARKer<mkr>:FUNCtion[:SELect]?

Return Type
Character

Default
MAXimum

CALCulate<cnum>:MEASure<mnum>:MARKer<mkr>:FUNCtion:TARGet[:VALue]:TRANSition <char>

Applicable Models: All

(Read-Write) Selects the transition type of the target search for specified marker (marker 1 to 15 and reference marker (Mk :16)) of the active trace of selected channel.

Parameters

- `<cnum>` Channel number of the measurement (optional).
- `<mnum>` Measurement number for each measurement.
- `<mkr>` Any marker number from 1 to 15; if unspecified, value is set to 1.
- `<char>` Transition type for search function to be performed. Choose from:
  - "NEGative ": Specifies the negative transition.
  - "POSitive ": Specifies the positive transition.
  - "BOTH ": Specifies both the positive transition and the negative transition.

Examples

```
CALC:MEAS:MARK:FUNC:TARG:TRAN POS
calculate2:measure1:marker8:function:target:value:transition both
```

Query Syntax
CALCulate<cnum>:MEASure<mnum>:MARKer<mkr>:FUNCtion:TARGet[:VALue]:TRANsition

Return Type
Character

Default
"BOTH"

CALCulate<cnum>:MEASure<mnum>:MARKer<mkr>:FUNCtion:TARGet[:VALue]<num><unit>
Applicable Models: All

(Read-Write) Sets the target value for the specified marker when doing Target Searches with 
CALC:MEAS:MARK:FUNC:SEL <TARGET | RTARGET | LTARGET>

**Parameters**

- `<cnum>` Channel number of the measurement (optional).
- `<mnum>` Measurement number for each measurement.
- `<mkr>` Any marker number from 1 to 15; if unspecified, value is set to 1.
- `<num>` Target value to search for.

The range of value is between -5E8 to 5E8.

**Notes:** If the specified variable is out of the allowable setup range, the minimum value 
(if the lower limit of the range is not reached) or the maximum value (if the upper limit 
of the range is exceeded) is set.

- `<unit>` Varies depending on the data format.

  - Log magnitude (MLOG): dB (decibels)
  - Phase (PHAS), Expanded phase (UPH) or Positive phase (PPH): deg (degree)
  - Group delay (GDEL): s (second)
  - Others: No unit

**Examples**

- `CALC:MEAS:MARK:FUNC:TARG 2.5`
- `calculate2:measure1:marker8:function:target:value -10.3`

**Query Syntax**

CALCulate<cnum>:MEASure<mnum>:MARKer<mkr>:TARGET[:VALue]?

**Return Type**

- Numeric

**Default**

- 0

CALCulate<cnum>:MEASure<mnum>:MARKer<mkr>:FUNCTION:TRACING <bool>
Applicable Models: All

(Read-Write) Turns ON or OFF the tracking search capability for the specified marker. The tracking function finds the selected search function every sweep. In effect, turning Tracking ON is the same as doing a CALC:MEAS:MARK:FUNC:EXECute command every sweep.

Learn more about Marker Search

Parameters

- `<cnum>` Channel number of the measurement (optional).
- `<mnum>` Measurement number for each measurement.
- `<mkr>` Any marker number from 1 to 15; if unspecified, value is set to 1.
- `<bool>` ON or 1 - Turns ON the search tracking. The specified marker will "Track" (find) the selected function every sweep.

OFF or 0 - Turns OFF the search tracking. The specified marker will find the selected function only when the CALC:MEAS:MARK:FUNC:EXECute command is sent.

Examples

```
CALC:MEAS:MARK:FUNC:TRAC ON
calculate2:measure1:marker8:function:tracking off
```

Query Syntax

CALCulate<cnum>:MEASure<mnum>:MARKer<mkr>:FUNCtion:TRACking?

Return Type

Boolean

Default

OFF or 0

CALCulate<cnum>:MEASure<mnum>:MARKer<mkr>:NOTCh:DATA?

Applicable Models: All

(Read-only) Reads the notch search result of marker 1 to 15 and reference marker (Mk :16), for the active trace of selected channel.

If the notch search is impossible, an error occurs and the command is ignored. In this case, no query response is obtained.

Parameters

- `<cnum>` Channel number of the measurement (optional).
- `<mnum>` Measurement number for each measurement.
- `<mkr>` Any marker number from 1 to 15; if unspecified, value is set to 1.

Indicates 4-element array data (notch bandwidth search result). Four Character values separated by commas => {Data 1}, {Data 2}, {Data 3}, {Data 4}

- Data(0) : The bandwidth.
- Data(1): Center point frequency of the 2 cutoff frequency points.
- Data(2): The Q value.
- Data(3): Insertion loss

The index of the array starts from 0.

**Examples**

<table>
<thead>
<tr>
<th>Query Syntax</th>
</tr>
</thead>
<tbody>
<tr>
<td>CALC:MEAS:MARK:NOTCh:DATA?</td>
</tr>
<tr>
<td>calculate2:measure1:marker:notch:data?</td>
</tr>
</tbody>
</table>

**Return Type**

- Variant
- Not Applicable

---

CALCulate<chnum>:MEASure<mnum>:MARKer<mkr>:NOTCh:REF <string>

**Applicable Models:** All

*(Read-Write)* Set the notch marker reference to either MARKer or PEAK.

If the reference is set to MARKer, the active marker is not moved; the notch search is computed at the marker's current location.

If the reference is set to PEAK, the active marker is moved to the maximum or minimum peak on the trace and then notch search is computed.

- If the notch level is negative, the active marker is moved to the maximum peak.
- If the notch level is positive, the active marker is moved to minimum peak.

**Parameters**

- `<chnum>`: Channel number of the measurement (optional).
- `<mnum>`: Measurement number for each measurement.
- `<mkr>`: Any marker number from 1 to 15; if unspecified, value is set to 1.
- `<string>`: PEAK

**Examples**

<table>
<thead>
<tr>
<th>Query Syntax</th>
</tr>
</thead>
<tbody>
<tr>
<td>CALC:MEAS:MARK:NOTCh:REF</td>
</tr>
<tr>
<td>calculate2:measure1:marker:notch:ref</td>
</tr>
</tbody>
</table>

**Return Type**

- String
- MARKer

**Default**

MARKer
CALCulate\(<cnum>:MEASure\(<mnum>:MARKer\(<mkr>:NOTCh[:STATe] <bool>

Applicable Models: All

(Read-Write) Turns ON or OFF the notch search result display, for the active trace of selected channel.

Parameters

\(<cnum>\) Channel number of the measurement (optional).
\(<mnum>\) Measurement number for each measurement.
\(<mkr>\) Any marker number from 1 to 15; if unspecified, value is set to 1.
\(<bool>\) Notch search result display. Choose from:

ON or 1 - Turns ON the notch search result display.
OFF or 0 - Turns OFF the notch search result display.

Examples

CALC:MEAS:MARK:NOTC ON
calculate2:measure1:marker:notch:state off

Query Syntax

CALCulate\(<cnum>:MEASure\(<mnum>:MARKer\(<mkr>:NOTCh[:STATe]\)?

Return Type

Boolean

Default

OFF or 0

CALCulate\(<cnum>:MEASure\(<mnum>:MARKer\(<mkr>:NOTCh:THReshold <num><unit>

Applicable Models: All

(Read-Write) Sets or returns the notch definition value of marker 1 to 15 and reference marker (Mk :16), for the active trace of selected channel.

Parameters

\(<cnum>\) Channel number of the measurement (optional).
\(<mnum>\) Measurement number for each measurement.
\(<mkr>\) Any marker number from 1 to 15; if unspecified, value is set to 1.
\(<num>\) The notch definition value range is between -5E8 to 5E8.
\(<unit>\) Varies depending on the data format as follows:

- Amplitude (MLOG): dB (decibel)
- Phase (PHAS), Expanded phase (UPH), Positive phase (PPH): deg (degree)
- Group delay (GDEL): s (second)

Notes: If the specified parameter is out of the allowable setup range, the minimum value (if the lower limit of the range is not reached) or the maximum value (if the upper limit of the range is exceeded) is set.
**Examples**

```
CALC:MEAS:MARK:NOTC:THR -3
```

```
calculate2:measure1:marker:notch:threshold -3
```

**Query Syntax**

```
CALCulate<cnum>:MEASure<mnum>:MARKer<mkr>:NOTCh:THReshold?
```

**Return Type**

Numeric

**Default**

-3

---

**CALCulate<cnum>:MEASure<mnum>:MARKer:PNOP:BACKoff <num>**

**Applicable Models:** All

(Read-Write) Turns on and sets markers 1, 2, 3, and 4 to calculate various PNOP parameters.

Either this command, or the POFFset command, will initiate the PNOP search markers.

To turn off the PNOP markers, either turn them off individually or turn them All Off.

To search a User Range with the PNOP search, first activate marker 1 and set the desired User Range. Then send CALC:MARK:PNOP:BACK. The user range used with the PNOP search only applies to marker 1 searching for the linear gain value. The other markers may fall outside the user range.

**Parameters**

- `<cnum>` Channel number of the measurement (optional).
- `<mnum>` Measurement number for each measurement.
- `<num>` Backoff value. Choose any number between -500 and 500

**Examples**

```
CALC:MEAS:MARK:PNOP:BACK?
```

```
calculate2:measure1:marker:pnop:backoff 10
```

**Query Syntax**

```
CALCulate<cnum>:MEASure<mnum>:MARKer:PNOP:BACKoff?
```

**Return Type**

Numeric

**Default**

0

---

**CALCulate<cnum>:MEASure<mnum>:MARKer:PNOP:BACKoff:GAIN?**
**Applicable Models:** All

*(Read-only)* Reads the power backoff gain value from a PNOP marker search.

\[ \text{PBO Gain} = \text{PBO Out} - \text{PBO In} \]

**Parameters**

- `<cnum>` Channel number of the measurement (optional).
- `<mnum>` Measurement number for each measurement.

**Examples**

```
CALC:MEAS1:MARK:PNOP:BACK:GAIN?
```

**Default** Not applicable

---

**CALCulate<cnum>:MEASure<mnum>:MARKer:PNOP:BACKoff:PIN?**

**Applicable Models:** All

*(Read-only)* Reads the power backoff input value from a PNOP marker search.

\[ \text{PBO In} = \text{Marker 2 X-axis} \]

**Parameters**

- `<cnum>` Channel number of the measurement (optional).
- `<mnum>` Measurement number for each measurement.

**Examples**

```
CALC:MEAS1:MARK:PNOP:BACK:PIN?
```

**Default** Not applicable

---

**CALCulate<cnum>:MEASure<mnum>:MARKer:PNOP:BACKoff:POUT?**
**Applicable Models:** All

*(Read-only)* Reads the power backoff output value from a PNOP marker search.

PBO Out = Marker 2 Y-axis

**Parameters**

- `<cnum>` Channel number of the measurement (optional).
- `<mnum>` Measurement number for each measurement.

**Examples**

```
CALC:MEAS1:MARK:PNOP:BACK:POUT?
```

**Default** Not applicable

---

**CALCulate<cnum>:MEASure<mnum>:MARKer:PNOP:COMPression?**

**Applicable Models:** All

*(Read-only)* Reads the PNOP compression value from a PNOP marker search.

Pnop Comp = Pnop Gain - Linear Gain (not shown on marker readout).

**Parameters**

- `<cnum>` Channel number of the measurement (optional).
- `<mnum>` Measurement number for each measurement.

**Examples**

```
CALC:MEAS1:MARK:PNOP:COMP?
```

**Default** Not applicable

---

**CALCulate<cnum>:MEASure<mnum>:MARKer:PNOP:COMPression:MAXimum?**
**Applicable Models:** All

*(Read-only)* Reads the max compression value from a PNOP marker search.

Comp Max = Gain Max - Linear Gain (not shown on marker readout).

**Parameters**

- `<cnum>` Channel number of the measurement (optional).
- `<mnum>` Measurement number for each measurement.

**Examples**

```
CALC:MEAS1:MARK:PNOP:COMP:MAX?
```

**Default** Not applicable

---

**CALCulate<cnum>:MEASure<mnum>:MARKer:PNOP:GAIN?**

**Applicable Models:** All

*(Read-only)* Reads the PNOP gain value from a PNOP marker search.

Pnop Gain = Pnop Out - Pnop In.

**Parameters**

- `<cnum>` Channel number of the measurement (optional).
- `<mnum>` Measurement number for each measurement.

**Examples**

```
CALC:MEAS:MARK:PNOP:GAIN?
```

**Default** Not applicable

---

**CALCulate<cnum>:MEASure<mnum>:MARKer:PNOP:GAIN:MAXimum?**
Applicable Models: All

(Read-only) Reads the max gain from a PNOP marker search.

Gain Max = PMax Out - PMax In

**Parameters**

- `<cnum>` Channel number of the measurement (optional).
- `<mnum>` Measurement number for each measurement.

**Examples**

```
CALC:MEAS:MARK:PNOP:GAIN:MAX?
```

**Default** Not applicable

---

CALCulate<cnum>:MEASure<mnum>:MARKer:PNOP:PIN?

Applicable Models: All

(Read-only) Reads the PNOP input value from a PNOP marker search.

Pnop In = Marker 4 X-axis value

**Parameters**

- `<cnum>` Channel number of the measurement (optional).
- `<mnum>` Measurement number for each measurement.

**Examples**

```
CALC:MEAS:MARK:PNOP:PIN?
```

**Default** Not applicable

---

CALCulate<cnum>:MEASure<mnum>:MARKer:PNOP:PIN:MAXimum?
**Applicable Models:** All

*(Read-only)* Reads the max input power from a PNOP marker search.

\[ \text{PMax In} = \text{Marker 3 X-axis value} \]

**Parameters**
- `<cnum>` Channel number of the measurement (optional).
- `<mnum>` Measurement number for each measurement.

**Examples**
- `CALC:MEAS:MARK:PNOP:PIN:MAX?`
- `CALC:MEAS1:MARK:PNOP:POFF 3`
- `CALC:MEAS2:MARK:PNOP:POFF 10`

**Default** Not applicable

---

CALCulate\(<cnum>\):MEASure\(<mnum>\):MARKer:PNOP:POFFset \(<num>\)

**Applicable Models:** All

*(Read-Write)* Turns on and sets markers 1, 2, 3, and 4 to calculate various PNOP parameters.

Either this command, or the Backoff command, will initiate the PNOP search markers.

To turn off the PNOP markers, either turn them off individually or turn them All Off.

To search a User Range with the PNOP search, first activate marker 1 and set the desired User Range. Then send the `CALC:MARK:PNOP:POFF` command. The user range used with the PNOP search only applies to marker 1 searching for the linear gain value. The other markers may fall outside the user range.

**Parameters**
- `<cnum>` Channel number of the measurement (optional).
- `<mnum>` Measurement number for each measurement.
- `<num>` Power Offset value in dB. Choose any number between \(-500\) and \(500\).

**Examples**
- `CALC:MEAS1:MARK:PNOP:POFF 3`
- `CALC:MEAS2:MARK:PNOP:POFF 10`

**Query Syntax** `CALCulate\(<cnum>\):MEASure\(<mnum>\):MARKer:PNOP:POFFset?`

**Return Type** Numeric

**Default** 0
CALCulate<cnum>:MEASure<mnum>:MARKer:PNOP:POUT?

**Applicable Models:** All

*(Read-only)* Reads the output power value of the offset marker from a PNOP marker search.

\[ \text{Pnop Out} = \text{Marker 4 Y-axis value} \]

**Parameters**

- `<cnum>` Channel number of the measurement (optional).
- `<mnum>` Measurement number for each measurement.

**Examples**

```
CALC : MEAS2 : MARK : PNOP : POUT?
```

**Default** Not applicable

CALCulate<cnum>:MEASure<mnum>:MARKer:PNOP:POUT:MAXimum?

**Applicable Models:** All

*(Read-only)* Reads the max output power from a PNOP marker search.

\[ \text{PMax Out} = \text{Marker 3 Y-axis value} \]

**Parameters**

- `<cnum>` Channel number of the measurement (optional).
- `<mnum>` Measurement number for each measurement.

**Examples**

```
CALC : MEAS2 : MARK : PNOP : POUT : MAX?
```

**Default** Not applicable

CALCulate<cnum>:MEASure<mnum>:MARKer<mkr>:PNOP[:STATE] <ON|OFF>
Applicable Models: All

(Read-Write) Turns the PNOP marker search ON and OFF.

**Parameters**

- `<cnum>` Channel number of the measurement (optional).
- `<mnum>` Measurement number for each measurement.
- `<mkr>` Any marker number from 1 to 15; if unspecified, value is set to 1.
- `<ON|OFF>`
  - `ON` (or 1) - turns marker ON.
  - `OFF` (or 0) - turns marker OFF.

**Examples**

```
CALC:MEAS1:MARK:PNOP ON
CALC:MEAS2:MARK:PNOP ON
```

**Query Syntax**

CALCulate<cnum>:MEASure<mnum>:MARKer<mkr>:PNOP:STATe?

**Return Type**

Boolean (1 = ON, 0 = OFF)

**Default**

Off

---

CALCulate<cnum>:MEASure<mnum>:MARKer:PSATuration:BACKoff <num>

Applicable Models: All

(Read-Write) Turns on and sets markers 1, 2, and 3 to calculate various Power Saturation parameters. The `<num>` parameter sets and reads the back-off value for a Power Saturation marker search.

To turn off the Power Saturation markers, either turn them off individually or turn them All Off.

To search a User Range with the PSAT search, first activate marker 1 and set the desired User Range. Then send the CALC:MARK:PSAT:BACK command. The user range used with the PSAT search only applies to marker 1 searching for the linear gain value. The other markers may fall outside the user range.

**Parameters**

- `<cnum>` Channel number of the measurement (optional).
- `<mnum>` Measurement number for each measurement.
- `<num>` Backoff value. Choose any number between -500 and 500

**Examples**

```
CALC:MEAS2:MARK:PSAT:BACK 3
CALC:MEAS2:MARK:PSAT:BACKoff 10
```

**Query Syntax**

CALCulate<cnum>:MEASure<mnum>:MARKer:PSATuration:BACKoff?
CALCulate<cnum>:MEASure<mnum>:MARKer:PSATuration:COMPression:MAXimum?

**Applicable Models:** All

*(Read-only)* Reads the compression maximum value from a PSAT marker search.

Comp Max = Gain Max - Gain Linear

Use CALC:MARK:PSAT:BACK to initiate a PSAT search.

**Parameters**

- `<cnum>` Channel number of the measurement (optional).
- `<mnum>` Measurement number for each measurement.

**Examples**

```
CALC:MEAS2:MARK:PSAT:COMP:MAX?
```

**Default** Not applicable

---

CALCulate<cnum>:MEASure<mnum>:MARKer:PSATuration:COMPression:SATuration?

**Applicable Models:** All

*(Read-only)* Reads the compression saturation value from a PSAT marker search.

Comp Sat = Gain Sat - Gain Linear

Use CALC:MARK:PSAT:BACK to initiate a PSAT search.

**Parameters**

- `<cnum>` Channel number of the measurement (optional).
- `<mnum>` Measurement number for each measurement.

**Examples**

```
CALC:MEAS2:MARK:PSAT:COMP:SAT?
```

**Default** Not applicable

---

CALCulate<cnum>:MEASure<mnum>:MARKer:PSATuration:GAIN?
**Applicable Models:** All

*(Read-only)* Reads the saturation gain value from a PSAT marker search.

Gain Sat = Psat Out - Psat In

Use CALC:MARK:PSAT:BACK to initiate a PSAT search.

**Parameters**

- `<cnum>` Channel number of the measurement (optional).
- `<mnum>` Measurement number for each measurement.

**Examples**

<table>
<thead>
<tr>
<th>CALCULATE</th>
<th>MEASURE</th>
<th>MARKER</th>
<th>PSATURATION</th>
<th>GAIN</th>
<th>LINEAR</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;cnum&gt;</td>
<td>&lt;mnum&gt;</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Default** Not applicable

---

**CALCulate<cnum>:MEASure<mnum>:MARKer:PSATuration:GAIN:MAXimum?**

**Applicable Models:** All

*(Read-only)* Reads the linear gain value from a PSAT marker search.

Gain Linear = Marker 1 - Y-axis value MINUS X-axis value.

Use CALC:MARK:PSAT:BACK to initiate a PSAT search.

**Parameters**

- `<cnum>` Channel number of the measurement (optional).
- `<mnum>` Measurement number for each measurement.

**Examples**

<table>
<thead>
<tr>
<th>CALCULATE</th>
<th>MEASURE</th>
<th>MARKER</th>
<th>PSATURATION</th>
<th>GAIN</th>
<th>LINEAR</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;cnum&gt;</td>
<td>&lt;mnum&gt;</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Default** Not applicable
**Applicable Models:** All

*(Read-only)* Reads the maximum gain value from a PSAT marker search.

Gain Max = PMax Out - PMax In

Use CALC:MARK:PSAT:BACK to initiate a PSAT search.

**Parameters**

- `<cnum>` Channel number of the measurement (optional).
- `<mnum>` Measurement number for each measurement.

**Examples**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>CALC:MEAS2:MARK:PSAT:GAIN:MAX?</strong></td>
<td>Gain Max</td>
</tr>
<tr>
<td><strong>CALC:MEAS2:MARK:PSAT:PIN?</strong></td>
<td>Psat In</td>
</tr>
<tr>
<td><strong>CALC:MEAS2:MARK:PSAT:PIN:MAXimum?</strong></td>
<td>Psat Max</td>
</tr>
</tbody>
</table>

**Default** Not applicable

---

**CALCulate<cnum>:MEASure<mnum>:MARKer:PSATuration:PIN?**

**Applicable Models:** All

*(Read-only)* Reads the power saturation input value from a PSAT marker search.

Psat In = Marker 2 X-axis value

Use CALC:MARK:PSAT:BACK to initiate a PSAT search.

**Parameters**

- `<cnum>` Channel number of the measurement (optional).
- `<mnum>` Measurement number for each measurement.

**Examples**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>CALC:MEAS2:MARK:PSAT:PIN?</strong></td>
<td>Psat In</td>
</tr>
<tr>
<td><strong>CALC:MEAS2:MARK:PSAT:PIN:MAXimum?</strong></td>
<td>Psat Max</td>
</tr>
</tbody>
</table>

**Default** Not applicable

---

**CALCulate<cnum>:MEASure<mnum>:MARKer:PSATuration:PIN:MAXimum?**
Applicable Models: All

(Read-only) Reads the maximum input power from a PSAT marker search.

PMAX In = Marker 3 X-axis value

Use CALC:MARK:PSAT:BACK to initiate a PSAT search.

**Parameters**

- `<cnum>` Channel number of the measurement (optional).
- `<mnum>` Measurement number for each measurement.

**Examples**

```
CALC:MEAS2:MARK:PSAT:PIN:MAX?
```

**Default** Not applicable

---

CALCulate<cnum>:MEASure<mnum>:MARKer:PSATuration:POUT?

Applicable Models: All

(Read-only) Reads the back-off output power from a PSAT marker search.

PSat Out = Marker 2 Y-axis value

Use CALC:MARK:PSAT:BACK to initiate a PSAT search.

**Parameters**

- `<cnum>` Channel number of the measurement (optional).
- `<mnum>` Measurement number for each measurement.

**Examples**

```
CALC:MEAS2:MARK:PSAT:POUT?
```

**Default** Not applicable

---

CALCulate<cnum>:MEASure<mnum>:MARKer:PSATuration:POUT:MAXimum?
Applicable Models: All

(Read-only) Reads the back-off output power from a PSAT marker search.

PMaxOut = Marker 3 Y-axis value

Use CALC:MARK:PSAT:BACK to initiate a PSAT search.

Parameters

- `<cnum>` Channel number of the measurement (optional).
- `<mnum>` Measurement number for each measurement.

Examples

<table>
<thead>
<tr>
<th>Command</th>
</tr>
</thead>
<tbody>
<tr>
<td>CALC:MEAS2:MARK:PSAT:POUT:MAX?</td>
</tr>
</tbody>
</table>

Default Not applicable

CALCulate<cnum>:MEASure<mnum>:MARKer<mkr>:PSATuration[:STATe] <ON|OFF>

Applicable Models: All

(Read-Write) Turns the PSAT marker search ON and OFF.

Parameters

- `<cnum>` Channel number of the measurement (optional).
- `<mnum>` Measurement number for each measurement.
- `<mkr>` Any marker number from 1 to 15; if unspecified, value is set to 1.
- `<ON|OFF>` ON (or 1) - turns marker ON.
  
  OFF (or 0) - turns marker OFF.

Examples

<table>
<thead>
<tr>
<th>Command</th>
</tr>
</thead>
<tbody>
<tr>
<td>CALC:MEAS1:MARK:PSAT ON</td>
</tr>
<tr>
<td>calculate2:measure2:marker8:psaturation on</td>
</tr>
</tbody>
</table>

Query Syntax

CALCulate<cnum>:MEASure<mnum>:MARKer<mkr>:PSATuration:STATe?

Return Type

Boolean (1 = ON, 0 = OFF)

Default Off

CALCulate<cnum>:MEASure<mnum>:MARKer<mkr>:REFerence[:STATe] <bool>
Applicable Models: All

(Read-Write) Turns ON or OFF the reference marker mode, for the active trace of selected channel. When turned OFF, existing Delta markers revert to absolute markers.

Parameters
- \(<cnum>\): Channel number of the measurement (optional).
- \(<mnum>\): Measurement number for each measurement.
- \(<mkr>\): Any marker number from 1 to 15; if unspecified, value is set to 1.
- \(<bool>\): ON or 1 - Turns reference marker mode ON. OFF or 0 - Turns reference marker mode OFF.

Examples
- `CALC:MEAS:MARK:REF ON`
- `calculate2:measure1:marker:reference:state OFF`

Query Syntax
- `CALCulate<cnum>:MEASure<mnum>:MARKer<mkr>:REFerence[:STATe]?`

Return Type
- Boolean

Default
- OFF or 0

CALCulate\(<cnum>:MEASure\(<mnum>:MARKer\(<mkr>:REFerence:X <num>

Applicable Models: All

(Read-Write) Sets and returns the absolute x-axis value of the reference marker.

Parameters
- \(<cnum>\): Channel number of the measurement (optional).
- \(<mnum>\): Measurement number for each measurement.
- \(<mkr>\): Any marker number from 1 to 15; if unspecified, value is set to 1.
- \(<num>\): X-axis value. Choose any number within the operating domain of the reference marker.

Examples
- `CALC:MEAS:MARK:REF:X 1e9`
- `calculate2:measure1:marker:reference:x 1e6`

Query Syntax
- `CALCulate<cnum>:MEASure<mnum>:MARKer<mkr>:REFerence:X?`

Return Type
- Numeric

Default
- If the first Marker, turns ON in the middle of the X-axis span. If not, turns ON at the position of the active marker.

CALCulate\(<cnum>:MEASure\(<mnum>:MARKer\(<mkr>:REFerence:Y <num>
Applicable Models: All

(Read-Write) Sets and returns the absolute Y-axis value of the reference marker (Set the reference marker Y position only when the marker is a fixed marker type).

**Parameters**

- `<cnum>` Channel number of the measurement (optional).
- `<mnum>` Measurement number for each measurement.
- `<mkr>` Any marker number from 1 to 15; if unspecified, value is set to 1.
- `<num>` Y-axis value. Choose any number within the operating domain of the reference marker.

**Examples**

```
CALC:MEAS:MARK:REF:Y 1e6
calculate2:measure1:marker:reference:y 1e9
```

**Return Type**

Numeric

**Default**

Not Applicable

---

**CALCulate<cnum>:MEASure<mnum>:MARKer<mkr>:SET <char>**

Applicable Models: All

(Write-only) Sets the selected instrument setting to assume the value of the specified marker.

Marker Functions CENT, SPAN, STARt, and STOP do not work with channels that are in CW or Segment Sweep mode.

**Parameters**

- `<cnum>` Channel number of the measurement (optional).
- `<mnum>` Measurement number for each measurement.
- `<mkr>` Any marker number from 1 to 15; if unspecified, value is set to 1
- `<char>` Choose from:

  - **CENTer** - changes center frequency to the value of the marker.
  - **SPAN** - changes the sweep span to the span that is defined by the delta marker and the marker that it references. Unavailable if there is no delta marker.
  - **STARt** - changes the start frequency to the value of the marker.
  - **STOP** - changes the stop frequency to the value of the marker.
  - **RLEVel** - changes the reference level to the value of the marker.
  - **DELay** - changes the line length at the receiver input to the phase slope at the active marker stimulus position.
  - **CWFReq** - Sets the CW frequency to the frequency of the active marker. Does NOT
change sweep type. NOT available in CW or Power Sweep. Use this argument to first set
the CW Frequency to a value that is known to be within the current calibrated range, THEN
set Sweep:Type to POWer or CW.

- **SA** - creates an SA channel with a marker at the same CW frequency. Learn more.

**Examples**

<table>

</table>

**CALCulate<cnum>:MEASure<mnum>:MARKer<mkr>:STATe <bool>**

**Applicable Models:** All  

*(Read-Write)* Turns ON or OFF the specified marker. Marker 16 is the Reference Marker. To turn all markers OFF, use **CALC:MEAS:MARK:AOFF**.

**Parameters**

- `<cnum>` Channel number of the measurement (optional).
- `<mnum>` Measurement number for each measurement.
- `<mkr>` Any marker number from 1 to 15; if unspecified, value is set to 1.
- `<bool>` ON or 1 - Turns marker ON.  
  OFF or 0 - Turns marker OFF.

**Examples**

<table>
<thead>
<tr>
<th>Query Syntax</th>
<th>Return Type</th>

**CALCulate<cnum>:MEASure<mnum>:MARKer<mkr>:TYPE <char>**
Applicable Models: All

(Read-Write) Sets the type of the specified marker.

Parameters

- `<cnum>` Channel number of the measurement (optional).
- `<mnum>` Measurement number for each measurement.
- `<mkr>` Any marker number from 1 to 15; if unspecified, value is set to 1
- `<char>` Choose from:
  - NORMal - a marker that stays on the assigned X-axis position unless moved or searching.
  - FIXed - a marker that will not leave the assigned X or current Y-axis position.

Examples

```
CALC:MEAS:MARK:TYPE NORM
```

```
calculate2:measure1:marker2:type fixed
```

Query Syntax

```
CALCulate<cnum>:MEASure<mnum>:MARKer<mkr>:TYPE?
```

Return Type

Character

Default

NORMal

CALCulate<cnum>:MEASure<mnum>:MARKer<mkr>:X <num>

Applicable Models: All

(Read-Write) Sets the marker's X-axis value (frequency, power, or time). If the marker is set as delta, the SET and QUERY data is relative to the reference marker.

Parameters

- `<cnum>` Channel number of the measurement (optional).
- `<mnum>` Measurement number for each measurement.
- `<mkr>` Any marker number from 1 to 15; if unspecified, value is set to 1.
- `<num>` Any X-axis position within the measurement span of the marker.

(When the span value of the sweep range is 0, the range is from 0 to sweep time value.)

Notes: If the specified variable is out of the allowable setup range, the minimum value (if the lower limit of the range is not reached) or the maximum value (if the upper limit of the range is exceeded) is set.

This command will accept MIN or MAX instead of a numeric parameter. See SCPI Syntax for more information.

- `<unit>` Hz (hertz), dBm or s (second)

Examples

```
CALC:MEAS:MARK:X 100Mhz
```

```
calculate2:measure1:marker8:x maximum
```
CALCulate<cnum>:MEASure<mnum>:MARKer<mkr>:X?

Return Type
Numeric

Default
First Marker turns ON in the middle of the X-axis span. Subsequent markers turn ON at the position of the active marker.

(When the span value of the sweep range is 0, the preset value is 0.)

CALCulate<cnum>:MEASure<mnum>:MARKer<mkr>:Y?

Applicable Models: All

(Read-only) Reads the marker's Y-axis value. The format of the value depends on the current CALC:MEAS:MARK:FORMAT setting. If the marker is set as delta, the data is relative to the reference marker. The query always returns two numbers:

- Smith and Polar formats - (Real, Imaginary)
- LINPhase and LOGPhase - (Real, Imaginary)
- All other formats - (Value,0)

Note: To accurately read the marker Y-axis value with trace smoothing applied, the requested format must match the displayed format. Otherwise, the returned value is un-smoothed data. For example, to read the smoothed marker value when measuring group delay, both the display format and the marker format must be set to (Group) Delay.

Parameters
- <cnum> Channel number of the measurement (optional).
- <mnum> Measurement number for each measurement.
- <mkr> Any marker number from 1 to 15; if unspecified, value is set to 1.

Examples
- CALC:MEAS:MARK:Y?
- calculate2:measure1:marker3:y?

Query Syntax
CALCulate<cnum>:MEASure<mnum>:MARKer<mkr>:Y?

Return Type
Numeric

Default
Not Applicable
CALCulate:MEASure:OFFSet Commands

Allows the data trace magnitude and phase to be offset.

<table>
<thead>
<tr>
<th>CALCulate:MEASure:OFFSet</th>
</tr>
</thead>
<tbody>
<tr>
<td>MAGNitude</td>
</tr>
<tr>
<td></td>
</tr>

CALCulate<cnum>:MEASure<mnum>:OFFSet:MAGNitude <num>

Applicable Models: All

(Read-Write) Offsets the data trace magnitude by the specified value.

To offset the data trace magnitude to a slope value that changes with frequency, use

CALC:MEAS:OFFS:MAGN:SLOP

Parameters

- <cnum> Channel number of the measurement (optional).
- <mnum> Measurement number for each measurement.
- <num> Offset value in dB.

Examples

- CALC:MEAS:OFFS:MAGN:4
calculate1:measure2:offset:magnitude -2

Query Syntax

CALCulate<cnum>:MEASure<mnum>:OFFSet:MAGNitude?

Return Type

- Numeric
  - Default: 0

CALCulate<cnum>:MEASure<mnum>:OFFSet:MAGNitude:SLOPe <num>
Applicable Models: All

(Read-Write) Offsets the data trace magnitude to a value that changes linearly with frequency. The offset slope begins at 0 Hz.

Parameters
- `<cnum>` Channel number of the measurement (optional).
- `<mnum>` Measurement number for each measurement.
- `<num>` Offset slope value in dB/1GHz.

Examples
- `CALC:MEAS:OFFS:MAGN:SLOP 1 'Offset slope set to 1dB/GHz`
- `calculate1:measure2:offset:magnitude:slope -2 'Offset slope set to -2dB/GHz`

Query Syntax
- `CALC:MEASure<mnum>:OFFSet:MAGNitude:SLOPe?`

Return Type
- Numeric
- Default: 0

CALCulate<cnum>:MEASure<mnum>:OFFSet:PHASe <num>[<char>]

Applicable Models: All

(Read-Write) Sets the phase offset for the selected measurement.

Parameters
- `<cnum>` Channel number of the measurement (optional).
- `<mnum>` Measurement number for each measurement.
- `<num>` Offset phase value. Choose any number between: -360 and 360
- `<char>` Units for phase. OPTIONAL. Choose either: DEG - Degrees (default)
- RAD - Radians

Examples
- `CALC:MEAS:OFFS:PHAS 10`
- `calculate3:measure2:offset:phase 20rad`

Query Syntax
- `CALC:MEASure<mnum>:OFFSet:PHASe?`

Return Type
- Numeric, returned value always in degrees
- Default: 0 degrees
CALCulate:MEASure:PARameter Commands

Selects a measurement parameter.

```
CALCulate:MEASure
    PARameter
```

Click a keyword to view the command details.

See Also

- Learn about Measurement Parameters
- Synchronizing the Analyzer and Controller
- SCPI Command Tree

```
CALCulate<cnum>:MEASure<mnum>:PARameter <string>
```

**Applicable Models:** All

*(Read-Write)* Set/get a measurement parameter for the specified (cnum/mnum) measurement.

This command replaces the following commands:

- `CALC:CUST:MOD`
- `CALC:PAR:MOD:EXT`
- `CALC:FSIM:BAL:PAR:SBAL[:DEF]`
- `CALC:FSIM:BAL:PAR:SSB[:DEF]`
- `CALC:FSIM:BAL:PAR:BBAL[:DEF]`
- `CALC:FSIM:BAL:PAR:BALS[:DEF]`
- `CALC:FSIM:BAL:PAR:BAL[:DEF]`

**Note:** For Application Measurements see `CALCulate:MEASure:DEFine`

<table>

<td>Measurement number for each measurement.</td>
</tr>
</tbody>
</table>
For S-parameters:

Any S-parameter available in the VNA

Single-digit port numbers CAN be separated by "_" (underscore). For example: "S21" or "S2_1"

Double-digit port numbers MUST be separated by underscore. For example: "S10_1"

For ratioed measurements:

Any two VNA physical receivers separated by forward slash '/' followed by comma and source port.

For example: "A/R1, 3"

Learn more about ratioed measurements

See a block diagram showing the receivers in YOUR VNA.

For non-ratioed measurements:

Any VNA physical receiver followed by comma and source port.

For example: "A, 4"

Learn more about unratioed measurements.

See the block diagram showing the receivers in YOUR VNA.

Ratioed and Unratioed measurements can also use logical receiver notation to refer to receivers. This notation makes it easy to refer to receivers with an external test set connected to the VNA. You do not need to know which physical receiver is used for each test port. Learn more.

For ADC measurements:

Any ADC receiver in the VNA followed by a comma, then the source port.

For example: "AI1,2" indicates the Analog Input1 with source port of 2.

Learn more about ADC receiver measurements.

For Balanced Measurements:

For 1 port balanced measurement, choose from:
For Balanced - Single-ended measurement, choose from:

Sdd11, Scd11, Sdc11, Scc11, Ssd21, Ssc21, Sds22, Scs22, Imb, CMMR1, CMMR2

- Imb = - S_{1pos_2}/S_{1neg_2}
- CMMR1 = Ssd21/Ssc21
- CMMR2 = Sds21/Scs21

For Balanced - Single-ended - Single-ended measurement, choose from:

Sdd11, Scd11, Sdc11, Scc11, Ssd21, Ssc21, Ssd31, Ssc31, Sds12, Scs12, Sds13, Ssc13, Sss22, Sss32, Sss23, Sss33, Imbal1, Imbal2, Sds12/Scs12, Sds13/Scs13

For Single-ended - Balanced measurement, choose from:

Sss11, Sds21, Ssc21, Ssd12, Ssc12, Sdd22, Scd22, Sdc22, CMMR1, CMMR2

- Imb = - S_{2pos_1}/S_{2neg_1}
- CMMR1 = Sds21/Ssc21
- CMMR2 = Ssd21/Ssc21

For Balanced - Balanced measurement, choose from:

Sdd11, Sdd21, Sdd12, Sdd22, Scd11, Scd21, Sdc12, Sdc22, Scc11, Scc21, Scc12, Scc22, Imb1, Imb2, CMMR

- Imb1 = -(S_{1pos_2pos} - S_{1pos_2neg})/(S_{1neg_2pos} - S_{1neg_2neg})
- Imb2 = -(S_{2pos_1pos} - S_{2pos_1neg})/(S_{2neg_1pos} - S_{2neg_1neg})
- CMMR = - Sdd21/Scc21

For Single-ended - Single-ended - Balanced measurement, choose from:

Sss11, Sss21, Sss12, Sss22, Ssd31, Ssc31, Sds32, Ssc32, Ssd13, Ssc13, Ssd23, Ssc23, Sdd33, Ssc33, Sdc33, CMMR1, CMMR2

- Imb1 = -(S_{1pos_2pos} - S_{1pos_2neg})/(S_{1neg_2pos} - S_{1neg_2neg})
- Imb2 = \(-\frac{S_{2pos_1pos} - S_{2pos_1neg}}{S_{2neg_1pos} - S_{2neg_1neg}}\)
- Imb3 = \(-\frac{S_{3pos_1}}{S_{3neg_1}}\)
- Imb4 = \(-\frac{S_{3pos_2}}{S_{3neg_2}}\)
- CMMR1 = \(\frac{S_{ds31}}{Scs31}\)
- CMMR2 = \(\frac{S_{ds32}}{Scs32}\)

**Note:** The right definition for SSB imbalance is added as Imb3, 4. The definition for SSB Imb1, 2 seem a mistake, but keep it remained for backward compatibility.

**Examples**

```
CALC:MEAS:PAR "Sdd11"
calculate2:measure2:parameter "Sdd11"
CALC:MEAS2:DEF 'PN:Phase Noise' 'Defines a Phase Noise measurement but doesn't display.'
DISP:MEAS2:FEED 1 'Displays Phase Noise measurement in window number 1.'
CALC:MEAS2:PAR 'AM' 'Changes the Phase Noise parameter to AM in window number 1.'
```

**Query Syntax**

CALCulate<cnum>:MEASure<mnum>:PARameter?

**Return Type**

String

**Default**

"S11"
CALCulate:MEASure:RLIMit Commands

These commands are for setting up ripple tests.

```plaintext
CALCulate:MEASure:RLIMit
   DATA
   DISPlay
      | LINE
      | STATe
      | SELECT
      | TYPE
   FAIL
   REPORT
      | DATA
   STATe
```

Click a keyword to view the command details.

**see Also**

- Synchronizing the Analyzer and Controller
- SCPI Command Tree

CALCulate<cnum>:MEASure<mnum>:RLIMit:DATA <data>
Applicable Models: All

(Read-Write) Sets or returns the ripple limit table for the active trace of selected channel.

**Parameters**
- `<cnum>` Channel number of the measurement (optional).
- `<mnum>` Measurement number for each measurement.
- `<data>` Indicates the array data (for ripple line) of \(1 + \text{Num (number of limit lines)} \times 4\). Where \(n\) is an integer between 1 and Num.
  
  - Data(0) : The number of limit lines you want to set. Specify an integer ranging 0 to 12. When the number of limit lines is set to 0 (clears the limit table), the variable Data is only required with Data(0).
  
  - Data(nx4-3) : The type of the n-th line.

  Specify an integer 0 to 1 as follows.
  
  0: OFF
  
  1: ON

  - Data(nx4-2) : The value on the horizontal axis (frequency/power/time) of the start point of the n-th line.

  - Data(nx4-1) : The value on the horizontal axis (frequency/power/time) of the end point of the n-th line.

  - Data(nx4) : The ripple line value (dB) of the n-th line.

  The index of the array starts from 0.

**Examples**

```
CALC: MEAS: RLIM: DATA
calculate2:measure2:rlimit: data
```

**Query Syntax**
CALCulate<cnun>:MEASure<mnum>:RLIMit:DATA?

**Return Type**
Variant type Array

**Default**
OFF
Applicable Models: All

(Read-Write) Turns ON/OFF the ripple limit line display, for the active trace of selected channel.

Parameters
- `<cnum>` Channel number of the measurement (optional).
- `<mnum>` Measurement number for each measurement.
- `<bool>` ON or 1 - Turns limit testing ON.
  OFF or 0 - Turns limit testing OFF.

Examples
```
CALC:MEAS:RLIM:DISP:LINE:STAT ON
```
```
calculate2:measure2:rlimit:display:line:state off
```

Query Syntax
```
CALCulate<cnum>:MEASure<mnum>:RLIMit:DISPly:LINE:STATe?
```

Return Type
Boolean

Default
OFF

CALCulate<cnum>:MEASure<mnum>:RLIMit:DISPly:SELect <band>

Applicable Models: All

(Read-Write) Sets or gets the ripple limit band for ripple value display for selected channel.

Parameters
- `<cnum>` Channel number of the measurement (optional).
- `<mnum>` Measurement number for each measurement.
- `<band>` 1 to 12

Examples
```
CALC:MEAS:RLIM:DISP:RIPP:SEL
```
```
calculate2:measure2:rlimit:display:ripple:select
```

Query Syntax
```
CALCulate<cnum>:MEASure<mnum>:RLIMit:DISPlay:SELect?
```

Return Type
Numeric

Default
1

CALCulate<cnum>:MEASure<mnum>:RLIMit:DISPlay:TYPE <typ>
Applicable Models: All

(Read-Write) Sets/gets the display type of ripple value for the active trace of selected channel.

Parameters
- `<cnum>` Channel number of the measurement (optional).
- `<mnum>` Measurement number for each measurement.
- `<typ>` Select from the following:
  - "OFF": Specifies the display OFF.
  - "ABSolute": Specifies the absolute value for display type.
  - "MARgin": Specifies the margin for display type.

Examples
```
CALC:MEAS:RLIM:DISP:TYPE
```
```
calculate2:measure2:rlimit:display:type
```

Query Syntax
```
CALCulate<cnum>:MEASure<mnum>:RLIMit:DISPLay:TYPE?
```
Return Type
Boolean
Default
OFF

CALCulate<cnum>:MEASure<mnum>:RLIMit:FAIL

Applicable Models: All

(Read-only) Read the ripple test result for the active trace.

Parameters
- `<cnum>` Channel number of the measurement (optional).
- `<mnum>` Measurement number for each measurement.
- `<bool>` Boolean
  - 0 is returned when Pass
  - 1 is returned when Fail

Examples
```
CALC:MEAS:RLIM:FAIL?
```
```
calculate2:measure2:rlimit:FAIL?
```

Query Syntax
```
CALCulate<cnum>:MEASure<mnum>:RLIMit:FAIL?
```
Return Type
Boolean
Default
Not Applicable

CALCulate<cnum>:MEASure<mnum>:RLIMit:REPort:DATA
Applicable Models: All

(Read-only) Reads the ripple value of the ripple test for the active trace.

**Parameters**
- `<cnum>` Channel number of the measurement (optional).
- `<mnum>` Measurement number for each measurement.
- `<data>` `{numeric 1} ... {numeric NOP×3+1}<newline><^END>`

NOP is the number of measurement points.

- `{numeric 1}`: Number of ripple limit line
- `{numeric n×3-1}`: Number of ripple limit bands.
- `{numeric n×3}`: Ripple value.
- `{numeric n×3+1}`: Ripple test result (1: Fail, 0: Pass)

**Examples**
```
CALC:MEAS:RLIM:REP:DATA?
calculate2:measure2:rlimit:report:data?
```

**Query Syntax**
```
CALCulate<cnum>:MEASure<mnum>:RLIMit:STATe?
```

**Return Type** Variant

**Default** OFF

CALCulate<cnum>:MEASure<mnum>:RLIMit:STATe <bool>

Applicable Models: All

(Read-Write) Turns ON/OFF the ripple test function for the active trace of selected channel.

**Parameters**
- `<cnum>` Channel number of the measurement (optional).
- `<mnum>` Measurement number for each measurement.
- `<bool>` ON (or 1) - turns limit testing ON.
  OFF (or 0) - turns limit testing OFF.

**Examples**
```
CALC:MEAS:RLIM:STAT ON
calculate2:measure2:rlimit:state off
```

**Query Syntax**
```
CALCulate<cnum>:MEASure<mnum>:RLIMit:STATe?
```

**Return Type** Boolean

**Default** OFF
CALCulate:MEASure:SA Commands

Controls the marker settings used in the SA application.

**Important:** Learn about programming the reference marker.

CALCulate<ch>:MEASure<mnum>:SA:MARKer<n>:BAND:FUNCTION <enum>
**Applicable Models:** All with Spectrum Analysis Options (S9x09xA/B, S9x090A/B) or N524xB models with Option S93070xB

*(Read-Write)* Set and read the SA marker function type.

**Parameters**

- `<cnum>` Channel number of the measurement (optional).
- `<mnum>` Measurement number for each measurement.
- `<n>` Marker number. If unspecified, `<n>` is set to 1.
- `<enum>` Choose from:
  - MNOI - Marker noise.
  - BPOW - Band power.
  - BDEN - Band density.
  - OFF

<table>
<thead>

</thead>
</table>

CALCulate<ch>:MEASure<mnum>:SA:MARKer<n>:BAND:IBW <num>
Applicable Models: All with Spectrum Analysis Options (S9x09xxA/B, S9x090A/B) or N524xB models with Option S93070xB

(Read-Write) Sets and reads the integration bandwidth marker. The IBW is used to determine total signal power within a specified frequency span. For example, to calculate the total power of a signal composed of 100 tones spaced 1 MHz apart over a 100 MHz span, the signal power would be integrated over an IBW of 100 MHz.

Parameters
- `<ch>` Channel number of the measurement (optional).
- `<mnum>` Measurement number for each measurement.
- `<n>` Marker number. If unspecified, `<n>` is set to 1.
- `<num>` Choose an integration bandwidth.

Examples

```
CALC:MEAS2:SA:MARK:BAND:IBW 100e6
```

Query Syntax
```
CALCulate<ch>:MEASure<mnum>:SA:MARKer<n>:BAND:IBW?
```

Return Type: Numeric

Default: Not Applicable

Applicable Models: All with Spectrum Analysis Options (S9x09xxA/B, S9x090A/B) or N524xB models with Option S93070xB

(Read-Write) Sets and reads the ACPR density marker.

Parameters
- `<ch>` Channel number of the measurement (optional).
- `<mnum>` Measurement number for each measurement.
- `<n>` Marker number. If unspecified, `<n>` is set to 1.
- `<bool>` Choose from:
  - 0 - OFF - Turn band density marker OFF.
  - 1 - ON - Turn band density marker ON.

Examples
```
'Select the measurement
CALC2:PAR:SEL "M2SA_CH2_A"

'Create marker3 on that measurement
```
CALC2:MARK3 ON
'Make it a band density noise marker

**Query Syntax**  CALCulate<ch>:MEASure<mnum>:SA:MARKer<n>:BDENsity:ACPR[:STATe]?

**Return Type**  Boolean

**Default**  0

**CALCulate<ch>:MEASure<mnum>:SA:MARKer<n>:BDENsity:BW <num>**

**Applicable Models:** All with Spectrum Analysis Options (59x09xxA/B, 59x090A/B)

(Read-Write) Sets and reads the bandwidth of the band density marker.

**Parameters**

- `<ch>`  Channel number of the measurement (optional).
- `<mnum>`  Measurement number for each measurement.
- `<n>`  Marker number. If unspecified, `<n>` is set to 1.
- `<num>`  Choose a bandwidth.

**Examples**  CALC:MEAS2:SA:MARK:BDEN:BW 1e6

**Query Syntax**  CALCulate<ch>:MEASure<mnum>:SA:MARKer<n>:BDENsity:BW?

**Return Type**  Numeric

**Default**  1 MHz

**CALCulate<ch>:MEASure<mnum>:SA:MARKer<n>:BDENsity:DATA?**
Applicable Models: All with Spectrum Analysis Options (S9x09xxA/B, S9x090A/B)

(Read-only) Returns the band density level in dBm/Hz from the band density marker.

Parameters

- `<ch>` Channel number of the measurement (optional).
- `<mnum>` Measurement number for each measurement.
- `<n>` Band density marker number. If unspecified, `<n>` is set to 1.

Examples

```
CALC:MEAS2:SA:MARK:BDEN:DATA?
calculate2:measure2:sa:marker2:bdensity:data?
```

Return Type Numeric

Default Not applicable

---

CALCulate<ch>:MEASure<mnum>:SA:MARKer<n>:BDENsity:EQSPan <num>

Applicable Models: All with Spectrum Analysis Options (S9x09xxA/B, S9x090A/B)

(Read-Write) Sets and reads the frequency span used by Power Density to normalize the power.

Parameters

- `<ch>` Channel number of the measurement (optional).
- `<mnum>` Measurement number for each measurement.
- `<n>` Marker number. If unspecified, `<n>` is set to 1.
- `<num>` Choose a span.

Examples

```
CALC:MEAS:SA:MARK:BDEN:EQSPan 1e6
```

Query Syntax CALCulate<ch>:MEASure<mnum>:SA:MARKer<n>:BDENsity:EQSPan?

Return Type Numeric

Default 1 MHz

---

CALCulate<ch>:MEASure<mnum>:SA:MARKer<n>:BDENsity:NOISe[:STATe] <bool>
**Applicable Models:** All with Spectrum Analysis Options (S9x09xxA/B, S9x090A/B)

*(Read-Write)* Sets and reads the state of the band density noise marker.

**Parameters**

- `<ch>` Channel number of the measurement (optional).
- `<mnum>` Measurement number for each measurement.
- `<n>` Marker number. If unspecified, `<n>` is set to 1.
- `<bool>` Choose from:
  - **0 - OFF** - Turn band density noise marker OFF.
  - **1 - ON** - Turn band density noise marker ON.

**Examples**

'Select the measurement

```
CALC2:PAR:SEL "M2SA_CH2_A"
```

'Create marker3 on that measurement

```
CALC2:MARK3 ON
```

'Make it a band density noise marker

```
CALC:MEAS:SA:MARK:BDEN:NOIS:STAT 1
```

**Query Syntax**

```
CALCulate<ch>:MEASure<mnum>:SA:MARKer<n>:BDENsity:NOISe?
```

**Return Type**

Boolean

**Default**

0

```
```
Applicable Models: All with Spectrum Analysis Options (S9x09xxA/B, S9x090A/B) or N524xB models with Option S93070xB

(Read-Write) Sets and reads the NPR density marker.

Parameters

- `<ch>` Channel number of the measurement (optional).
- `<mnum>` Measurement number for each measurement.
- `<n>` Marker number. If unspecified, `<n>` is set to 1.
- `<bool>` Choose from:
  - 0 - OFF - Turn band density marker OFF.
  - 1 - ON - Turn band density marker ON.

Examples

- 'Select the measurement
  CALC2:PAR:SEL "M2SA_CH2_A"

- 'Create marker3 on that measurement
  CALC2:MARK3 ON

- 'Make it a band density noise marker
  CALC2:MEAS:SA:MARKer<n>:BDENsity:NPR:STAT 1

Query Syntax

CALCulate<ch>:MEASure<mnum>:SA:MARKer<n>:BDENsity:NPR[:STATe]?

Return Type

Boolean

Default

0

CALCulate<ch>:MEASure<mnum>:SA:MARKer<n>:BDENsity:POWer[:STATe] <bool>
**Applicable Models:** All with Spectrum Analysis Options (S9x09xxA/B, S9x090A/B)

*(Read-Write)* Sets and reads the state of the band power density marker.

**Parameters**

- `<ch>` Channel number of the measurement (optional).
- `<mnum>` Measurement number for each measurement.
- `<n>` Marker number. If unspecified, `<n>` is set to 1.
- `<bool>` Choose from:
  - 0 - **OFF** - Turn band power density marker OFF.
  - 1 - **ON** - Turn band power density marker ON.

**Examples**

'Select the measurement

CALC2:PAR:SEL "M2SA_CH2_A"

'Create marker3 on that measurement

CALC2:MARK3 ON

'Make it a band density noise marker

CALC:MEAS:SA:MARK:BDEN:POW:STAT 1

**Query Syntax**

CALCulate<ch>:MEASure<mnum>:SA:MARKer<n>:BDENsity:POWer?

**Return Type**

Boolean

**Default**

0

CALCulate<ch>:MEASure<mnum>:SA:MARKer<n>:BDENsity:POWer:BW <num>
Applicable Models: All with Spectrum Analysis Options (S9x09xxA/B, S9x090A/B)

(Read-Write) Sets and reads the bandwidth of the band power density marker.

**Parameters**
- `<ch>` Channel number of the measurement (optional).
- `<mnum>` Measurement number for each measurement.
- `<n>` Marker number. If unspecified, `<n>` is set to 1.
- `<num>` Choose a bandwidth.

**Examples**
```
```

**Query Syntax**
```
CALCulate<ch>:MEASure<mnum>:SA:MARKer<n>:BDENsity:POWer:BW?
```

**Return Type** Numeric

**Default** 1 MHz

---

CALCulate<ch>:MEASure<mnum>:SA:MARKer<n>:BDENsity:TONE:BW <num>

Applicable Models: All with Spectrum Analysis Options (S9x09xxA/B, S9x090A/B)

(Read-Write) Sets and reads the bandwidth of the band tone density marker.

**Parameters**
- `<ch>` Channel number of the measurement (optional).
- `<mnum>` Measurement number for each measurement.
- `<n>` Marker number. If unspecified, `<n>` is set to 1.
- `<num>` Choose a bandwidth.

**Examples**
```
```

**Query Syntax**
```
CALCulate<ch>:MEASure<mnum>:SA:MARKer<n>:BDENsity:TONE:BW?
```

**Return Type** Numeric

**Default** 1 MHz

---

CALCulate<ch>:MEASure<mnum>:SA:MARKer<n>:BDENsity:TONE[:STATe] <bool>
Applicable Models: All with Spectrum Analysis Options (S9x09xxA/B, S9x090A/B)

(Read-Write) Sets and reads the state of the band tone density marker.

Parameters

- `<ch>` Channel number of the measurement (optional).
- `<mnum>` Measurement number for each measurement.
- `<n>` Marker number. If unspecified, `<n>` is set to 1.
- `<bool>` Choose from:
  - **0 - OFF** - Turn band tone density marker OFF.
  - **1 - ON** - Turn band tone density marker ON.

Examples

```
'Select the measurement
CALC2:PAR:SEL "M2SA_CH2_A"

'Create marker3 on that measurement
CALC2:MARK3 ON

'Make it a band density noise marker
CALC:MEAS:SA:MARK:BDEN:TONE:STAT 1
```

Query Syntax

CALCulate<ch>:MEASure<mnum>:SA:MARKer<n>:BDENsity:TONE?

Return Type

Boolean

Default

0

CALCulate<ch>:MEASure<mnum>:SA:MARKer<n>:BDENsity:TONE:TSPacing <num>
Applicable Models: All with Spectrum Analysis Options (S9x09xxA/B, S9x090A/B)

(Read-Write) Sets and reads the spacing of the band tone density marker.

Parameters

- `<ch>` Channel number of the measurement (optional).
- `<mnum>` Measurement number for each measurement.
- `<n>` Marker number. If unspecified, `<n>` is set to 1.
- `<num>` Choose a spacing value.

Examples

```
```

Query Syntax

```
CALCulate<ch>:MEASure<mnum>:SA:MARKer<n>:BDENsity:TONE:TSPacing?
```

Return Type Numeric

Default 100 MHz

---

CALCulate<ch>:MEASure<mnum>:SA:MARKer<n>:BPOWer:DATA?

Applicable Models: All with Spectrum Analysis Options (S9x09xxA/B, S9x090A/B)

(Read-only) Returns the band power level from the band power marker.

Parameters

- `<ch>` Channel number of the measurement (optional).
- `<mnum>` Measurement number for each measurement.
- `<n>` Band power marker number.

Examples

```
CALC:MEAS2:SA:MARK:BPOWER:DATA?
calculate2:measure2:sa:marker2:bpower:data?
```

Default Not applicable

---

CALCulate<ch>:MEASure<mnum>:SA:MARKer<n>:BPOWer:SPAN <num>
**Applicable Models:** All with Spectrum Analysis Options (S9x09xA/B, S9x090A/B)

*(Read-Write)* Sets and reads the frequency span of the band power marker. This area is marked by two vertical dotted lines on the screen and the marker's y-axis value is set to the measured power value. Noise and power on the same marker share the same span.

**Parameters**
- `<ch>` Channel number of the measurement (optional).
- `<mnum>` Measurement number for each measurement.
- `<n>` Marker number.
- `<num>` Choose a frequency span within the frequency range of the analyzer.

**Examples**
```
CALC:MEAS2:SA:MARK:BPOW:SPAN 1e6
```

**Query Syntax**
```
CALCulate<ch>:MEASure<mnum>:SA:MARKer<n>:BPOWer:SPAN?
```

**Return Type** Numeric

**Default** 1 MHz

---

**CALCulate<ch>:MEASure<mnum>:SA:MARKer<n>:BPOWer[:STATe] <bool>**

**Applicable Models:** All with Spectrum Analysis Options (S9x09xA/B, S9x090A/B)

*(Read-Write)* Sets and reads the state of the band power marker. This command makes a band power marker from a generic marker. The generic marker must first be created using:

```
CALC:MEAS:MARK:STATe
```

**Parameters**
- `<ch>` Channel number of the measurement (optional).
- `<mnum>` Measurement number for each measurement.
- `<n>` Marker number.
- `<bool>` Choose from:
  - 0 - OFF - Turn band power marker OFF.
  - 1 - ON - Turn band power marker ON.

**Examples**
```
'Create marker3 on the specified measurement
CALC2:MEAS2:MARK3 ON

'Make it a band power marker
CALC:MEAS2:SA:MARK:BPOW:STAT 1
```
CALCulate<ch>:MEASure<mnum>:SA:MARKer<n>:BPOWer?

Return Type: Boolean
Default: 0

CALCulate<ch>:MEASure<mnum>:SA:MARKer<n>:OCCBand:CENTer?

Applicable Models: All with Spectrum Analysis Options (S9x09xxA/B, S9x090A/B)

(Read-only) Returns the occupied bandwidth center frequency.

Parameters
- `<ch>`: Channel number of the measurement (optional).
- `<mnum>`: Measurement number for each measurement.
- `<n>`: Marker number.

Examples
- `CALC:MEAS:SA:MARK:OCCB:CENT?`

Default: Not applicable

CALCulate<ch>:MEASure<mnum>:SA:MARKer<n>:OCCBand:PERCent <num>

Applicable Models: All with Spectrum Analysis Options (S9x09xxA/B, S9x090A/B)

(Read-Write) Sets and returns the percentage of the band power to search for.

Parameters
- `<ch>`: Channel number of the measurement (optional).
- `<mnum>`: Measurement number for each measurement.
- `<n>`: Marker number.
- `<num>`: Percentage value.

Examples

Query Syntax: CALCulate<ch>:SA:MARKer<n>:OCCBand:PERCent?
Return Type: Numeric
Default: 99.0
CALCulate<ch>:MEASure<mnum>:SA:MARKer<n>:OCCBand:POWer?

**Applicable Models:** All with Spectrum Analysis Options (S9x09xxA/B, S9x090A/B)

*(Read-only)* Returns the occupied bandwidth power.

**Parameters**
- `<ch>` Channel number of the measurement (optional).
- `<mnum>` Measurement number for each measurement.
- `<n>` Marker number.

**Examples**
- `CALC:MEAS:SA:MARK:OCCB:POW?`
- `calculate2:measure:sa:marker2:occband:power?`

**Default** Not applicable

CALCulate<ch>:MEASure<mnum>:SA:MARKer<n>:OCCBand:SPAN?

**Applicable Models:** All with Spectrum Analysis Options (S9x09xxA/B, S9x090A/B)

*(Read-only)* Returns the occupied bandwidth span.

**Parameters**
- `<ch>` Channel number of the measurement (optional).
- `<mnum>` Measurement number for each measurement.
- `<n>` Marker number.

**Examples**
- `CALC:MEAS:SA:MARK:OCCB:SPAN?`

**Default** Not applicable

CALCulate<ch>:MEASure<mnum>:SA:MARKer<n>:OCCBand[:STATe] <bool>
Applicable Models: All with Spectrum Analysis Options (S9x09xxA/B, S9x090A/B)

(Read-Write) Sets and returns the occupied bandwidth on/off state.

Parameters

- `<ch>` Channel number of the measurement (optional).
- `<mnum>` Measurement number for each measurement.
- `<n>` Marker number.
- `<bool>` Choose from:
  - **0 - OFF** - Turns occupied bandwidth OFF.
  - **1 - ON** - Turns occupied bandwidth ON.

Examples

```
CALC:MEAS:SA:MARK:OCCB:STAT 1
```

Query Syntax

CALCulate<ch>:MEASure<mnum>:SA:MARKer<n>:SEARch:ACPR

Default

- **0**

Note: If occupied band state is turned ON, then Band Power or Band Noise is turned OFF.

---

CALCulate<ch>:MEASure<mnum>:SA:MARKer<n>:SEARch:ACPR

Applicable Models: All with Spectrum Analysis Options (S9x09xxA/B, S9x090A/B)

(Write-only) Executes the search ACPR density marker.

Parameters

- `<ch>` Channel number of the measurement (optional).
- `<mnum>` Measurement number for each measurement.
- `<n>` Marker number. If unspecified, `<n>` is set to 1.

Examples

```
```

Query Syntax

Not Applicable

Default

- Not Applicable
CALCulate<ch>:MEASure<mnum>:SA:MARKer<n>:SEARch:NPR

Applicable Models: All with Spectrum Analysis Options (S9x09xA/B, S9x090A/B)

(Write-only) Executes the search NPR density marker.

Parameters

<ch> Channel number of the measurement (optional).

<mnum> Measurement number for each measurement.

<n> Marker number. If unspecified, <n> is set to 1.

Examples

CALC:MEAS:SA:MARK:SEAR:NPR

Query Syntax Not Applicable

Default Not Applicable
CALCulate:MEASure:SMOothing Commands

Controls point-to-point smoothing. Smoothing is a noise reduction technique that averages adjacent data points in a measurement trace. Choose the amount of smoothing by specifying either the number of points or the aperture. Smoothing is not the same as CALC:AVERage which averages each data point over a number of sweeps.

```
CALCulate:MEASure:SMOothing
  APERture
  POINts
  [:STATe]
```

Click a keyword to view the command details.

CALCulate<cnum>:MEASure<mnum>:SMOothing:APERture <num>

**Applicable Models:** All

*(Read-Write)* Sets the amount of smoothing as a percentage of the number of data points in the channel.

**Parameters**
- `<cnum>` Channel number of the measurement (optional).
- `<mnum>` Measurement number for each measurement.
- `<num>` Percentage value. Choose any number between: 1 and 25

**Examples**
- `CALC:MEAS:SMO:APER 2`
- `calculate2:measure2:smoothing:aperture 20.7`

**Query Syntax**
- `CALCulate<cnum>:MEASure<mnum>:SMOothing:APERture?`

**Return Type**
- Numeric
- Default: 1.5

CALCulate<cnum>:MEASure<mnum>:SMOothing:POINts <num>
Applicable Models: All

([Read-Write]) Sets the number of adjacent data points to average.

**Parameters**

- `<cnum>` Channel number of the measurement (optional).
- `<mnum>` Measurement number for each measurement.
- `<num>` Number of points from 1 point to maximum of 25% of data points in the channel. For example: if number of points in a data trace = 401, the maximum value for points = 100. The points value is always rounded to the closest odd number.

**Examples**

CALCulate<cnum>:MEASure<mnum>:SMOothing:POINts?

**Return Type**

Numeric

**Default**

3

CALCulate<cnum>:MEASure<mnum>:SMOothing[:STATe] <bool>

Applicable Models: All

([Read-Write]) Turns data smoothing ON or OFF.

**Parameters**

- `<cnum>` Channel number of the measurement (optional).
- `<mnum>` Measurement number for each measurement.
- `<bool>` ON or 1 - Turns smoothing ON. OFF or 0 - Turns smoothing OFF.

**Examples**

<table>
<thead>
<tr>
<th>Command</th>

- Synchronizing the Analyzer and Controller
CALCulate<cnum>:MEASure<mnum>:TRANsform:COUPle:PARameters <num>

Applicable Models: All

(Read-Write) Specifies the time domain transform parameters to be coupled. The settings for those parameters will be copied from the selected measurement to all other measurements on the channel.

- To turn coupling ON and OFF, use SENS:COUP:PAR
- To specify Gating parameters to couple, use CALC:MEAS:FILT:COUP:PAR

Learn more about Time Domain Trace Coupling

Parameters
- <cnum> Channel number of the measurement (optional).
- <mnum> Measurement number for each measurement.
- <num> (Numeric) Parameters to couple. To specify more than one parameter, add the numbers.
  1 - Transform Stimulus (Start, Stop, Center, and Span TIME settings.)
  2 - Transform State (ON / OFF)
  4 - Transform Window (Kaiser Beta / Impulse Width)
  8 - Transform Mode (Low Pass Impulse, Low Pass Step, Band Pass)
  16 - Transform Distance Marker Units

Examples
- To couple all parameters:
  
  ```
  CALC:MEAS:TRAN:COUP:PAR 31
  ```
  
- To couple Stimulus and Mode:
  
  ```
  calculate2:measure2:transform:couple:parameters 9
  ```

Query Syntax
CALCulate<cnum>:MEASure<mnum>:TRANsform:TIME:ALIgnment <enum>

Return Type
Numeric

Default
29 (All parameters except 2 - Transform State)
Applicable Models: All

(Read-Write) Sets the way the PNA computes the DC value of the frequency-domain measurement. The correct DC value is required for inverse-FFT accuracy, and if not estimated properly, can cause distortions in the time-domain measurement in the form of an undesired slope in the waveform.

Parameters

\(<\text{cnum}>\) Channel number of the measurement (optional).
\(<\text{mnum}>\) Measurement number for each measurement.
\(<\text{enum}>\) Choose from:

**LEGacy** - The DC value is extrapolated using three data points. The transform offset is calculated using the delay of the first frequency point. This is the same algorithm used in the HP 8510 network analyzer.

**NORMalize** - The DC value is extrapolated using three data points. The transform offset is set to zero at \(t=0\) minus six rise-times. This mode requires that a good S-parameter calibration has been performed, which can be verified by observing a flat time-domain response at \(t=0\) when measuring a load located at the physical point corresponding to \(t=0\). Normalize mode is principally used to help stabilize the time-domain trace at time \(t=0\) to 50 ohms, to remove bouncing of the response at \(t=0\). This method is similar to that used with PLTS, and is very useful in determining the time-domain-transform response of transmission lines and printed-circuit-board characteristics.

Examples

```
CALC:MEAS:TRAN:TIME:ALIG NORM
calculate2:measure2:transform:time:alignment?
```

Return Type

Enumeration

Default

NORMalize

CALCulate\(<\text{cnum}>\):MEASure\(<\text{mnum}>\):TRANsform:TIME:CENTer \(<\text{num}>\)
Applicable Models: All

(Read-Write) Sets the center time for time domain measurements.

Parameters
- `<cnum>` Channel number of the measurement (optional).
- `<mnum>` Measurement number for each measurement.
- `<num>` Center time in seconds; any number between: ± (number of points-1) / frequency span

Note: This command will accept MIN or MAX instead of a numeric parameter. See SCPI Syntax for more information.

Examples
```
CALC:MEAS:TRAN:TIME:CENT 1e-8
calculate2:measure2:transform:time:center 15 ps
```

Query Syntax
```
CALCulate<cnum>:MEASure<mnum>:TRANsform:TIME:CENTer?
```

Return Type
Numeric

Default
0

\textbf{CALCulate}<cnum>:MEASure<mnum>:TRANsform:TIME:CLIP <bool> \textbf{Applicable Models: All}

(Read-Write) Turns the start/stop time limits ON or OFF. When ON, limits the start/stop times to avoid aliasing.

Parameters
- `<cnum>` Channel number of the measurement (optional).
- `<mnum>` Measurement number for each measurement.
- `<bool>` ON (or 1) - turns start/stop time limits ON.
  OFF (or 0) - turns start/stop time limits OFF.

Examples
```
CALC:MEAS:TRAN:TIME:CLIP ON
calculate2:measure2:transform:time:clip off
```

Query Syntax
```
CALCulate<cnum>:MEASure<mnum>:TRANsform:TIME:CLIP?
```

Return Type
Boolean (1 = ON, 0 = OFF)

Default
ON

\textbf{CALCulate}<cnum>:MEASure<mnum>:TRANsform:TIME:IMPulse:WIDTh <num>
Applicable Models: All

(Read-Write) Sets the impulse width for the transform window.

Parameters
- `<cnum>` Channel number of the measurement (optional).
- `<mnum>` Measurement number for each measurement.
- `<num>` Impulse width in seconds; Choose any number between: .6 / frequency span and 1.39 / frequency span

Examples
- CALC:MEAS:TRAN:TIME:IMP:WIDTh 10

Query Syntax
- CALCulate<cnum>:MEASure<mnum>:TRANsform:TIME:IMPulse:WIDTh?

Return Type
- Numeric
- Default: .98 / Default Span

CALCulate<cnum>:MEASure<mnum>:TRANsform:TIME:KBESsel <num>

Applicable Models: All

(Read-Write) Sets the parametric window for the Kaiser Bessel window.

Parameters
- `<cnum>` Channel number of the measurement (optional).
- `<mnum>` Measurement number for each measurement.
- `<num>` Window width for Kaiser Bessel in seconds; Choose any number between: 0.0 and 13.0

Examples
- CALC:MEAS:TRAN:TIME:KBES 10
- calculate2:measure2:transform:time:kbessel 13

Query Syntax
- CALCulate<cnum>:MEASure<mnum>:TRANsform:TIME:KBESsel?

Return Type
- Numeric
- Default: 6

CALCulate<cnum>:MEASure<mnum>:TRANsform:TIME:LPFREQuency
(Write-only) Sets the start frequencies in LowPass Mode.

Parameters
- `<cnum>` Channel number of the measurement (optional).
- `<mnum>` Measurement number for each measurement.

Examples
```
CALC:MEAS:TRAN:TIME:LPFR
```
```
calculate2:measure2:transform:time:lpfrequency
```

Query Syntax Not Applicable
Default Not Applicable

---

**CALCulate<cnum>:MEASure<mnum>:TRANsform:TIME:MARKer:MODE <char>**

Applicable Models: All

(Read-Write) Specifies the measurement type in order to determine the correct marker distance.

- Select Auto for S-Parameter measurements.
- Select Reflection or Transmission for arbitrary ratio or unratioed measurements.

This setting affects the display of ALL markers for only the ACTIVE measurement.

Learn more about Distance Markers.

Parameters
- `<cnum>` Channel number of the measurement (optional).
- `<mnum>` Measurement number for each measurement.
- `<char>` Choose from:
  - AUTO - If the active measurement is an S-Parameter, automatically chooses reflection or transmission. If non S-Parameter measurements, reflection is chosen.
  - REFLection - Displays the distance from the source to the receiver divided by two (to compensate for the return trip.)
  - TRANsmission - Displays the distance from the source to the receiver.

Examples
```
CALC:MEAS:TRAN:TIME:MARK:MODE REFL
```
```
calculate2:measure2:transform:time:marker:mode auto
```

Query Syntax
```
CALCulate<cnum>:MEASure<mnum>:TRANsform:TIME:MARKer:MODE?
```

Return Type Character
Default AUTO
CALCulate<cnum>:MEASure<mnum>:TRANsform:TIME:MARKer:UNIT <char>

**Applicable Models:** All

*(Read-Write)* Specifies the unit of measure for the display of marker distance values. This setting affects the display of ALL markers for only the ACTIVE measurement (unless Distance Maker Units are coupled using CALC:MEAS:TRAN:COUP:PAR).

Learn more about [Distance Markers](#).

**Parameters**
- `<cnum>` Channel number of the measurement (optional).
- `<mnum>` Measurement number for each measurement.
- `<char>` Choose from:
  - METRs
  - FEET
  - INCHes

**Examples**
- `calculate2:measure2:transform:time:marker:unit feet`

**Query Syntax**
- `CALCulate<cnum>:MEASure<mnum>:TRANsform:TIME:MARKer:UNIT?`

**Return Type**
- Character

**Default**
- METRs

---

CALCulate<cnum>:MEASure<mnum>:TRANsform:TIME:SPAN <num>

**Applicable Models:** All

*(Read-Write)* Sets the span time for time domain measurements.

**Parameters**
- `<cnum>` Channel number of the measurement (optional).
- `<mnum>` Measurement number for each measurement.
- `<num>` Span time in seconds; any number between: 0 and 2 * [(number of points-1) / frequency span]

**Note:** This command will accept MIN or MAX instead of a numeric parameter. See [SCPI Syntax](#) for more information.

**Examples**
- `CALC:MEAS:TRAN:TIME:SPAN 1e-8`
- `calculate2:measure2:transform:time:span maximum`

**Query Syntax**
- `CALCulate<cnum>:MEASure<mnum>:TRANsform:TIME:SPAN?`
CALCulate\(<cnum>\):MEASure\(<mnum>\):TRANsform:TIME:STARt \(<num>\)

**Applicable Models:** All

*(Read-Write)* Sets the start time for time domain measurements.

**Parameters**

- \(<cnum>\) Channel number of the measurement (optional).
- \(<mnum>\) Measurement number for each measurement.
- \(<num>\) Start time in seconds; any number between:
  \[\pm \frac{(\text{number of points}-1)}{\text{frequency span}}\]

**Examples**

<table>
<thead>
<tr>
<th>Query Syntax</th>
</tr>
</thead>
<tbody>
<tr>
<td>CALCulate(&lt;cnum&gt;):MEASure(&lt;mnum&gt;):TRANsform:TIME:STARt?</td>
</tr>
</tbody>
</table>

**Return Type** Numeric

**Default** 20 ns

---

CALCulate\(<cnum>\):MEASure\(<mnum>\):TRANsform:TIME:STATe \(<bool>\)

**Applicable Models:** All

*(Read-Write)* Turns the time domain transform capability ON or OFF.

**Note:** *Sweep type* must be set to Linear Frequency in order to use Time Domain Transform.

**Parameters**

- \(<cnum>\) Channel number of the measurement (optional).
- \(<mnum>\) Measurement number for each measurement.
- \(<bool>\) ON (or 1) - turns time domain ON.
  OFF (or 0) - turns time domain OFF.

**Examples**

<table>
<thead>
<tr>
<th>Query Syntax</th>
</tr>
</thead>
<tbody>
<tr>
<td>CALC:MEAS:TRAN:TIME:STAT ON</td>
</tr>
<tr>
<td>calculate2:measure2:transform:time:stat off</td>
</tr>
</tbody>
</table>

**Return Type** Boolean (1 = ON, 0 = OFF)
CALCulate<cnum>:MEASure<mnum>:TRANsform:TIME:STEP:RTIMe <num>

Applicable Models: All

(Read-Write) Sets the step rise time for the transform window.

Parameters
- <cnum>: Channel number of the measurement (optional).
- <mnum>: Measurement number for each measurement.
- <num>: Rise time in seconds; Choose any number between:
  - 0.45 / frequency span and 1.48 / frequency span

Examples
- calculate2:measure2:transform:time:step:rtime 15 ps

Query Syntax
- CALCulate<cnum>:MEASure<mnum>:TRANsform:TIME:STEP:RTIMe?

Return Type
- Numeric
- Default: 0.99 / Default Span

CALCulate<cnum>:MEASure<mnum>:TRANsform:TIME:STOP <num>

Applicable Models: All

(Read-Write) Sets the stop time for time domain measurements.

Parameters
- <cnum>: Channel number of the measurement (optional).
- <mnum>: Measurement number for each measurement.
- <num>: Stop time in seconds; any number between:
  - ± (number of points-1) / frequency span

Note: This command will accept MIN or MAX instead of a numeric parameter. See SCPI Syntax for more information.

Examples
- CALC:MEAS:TRAN:TIME:STOP 1e-8
- calculate2:measure2:transform:time:stop maximum

Query Syntax
- CALCulate<cnum>:MEASure<mnum>:TRANsform:TIME:STOP?

Return Type
- Numeric
- Default: 10 ns

CALCulate<cnum>:MEASure<mnum>:TRANsform:TIME[:TYPE] <char>
**Applicable Models:** All

(Read-Write) Sets the type of time domain measurement.

**Parameters**

- `<cnum>` Channel number of the measurement (optional).
- `<mnum>` Measurement number for each measurement.
- `<char>` Type of measurement. Choose from:
  - **BPASs** - Set transform mode to band pass.
  - **LPSTep** - Set transform mode to low pass step.
  - **LPIMpulse** - Set transform mode to low pass impulse.

**Examples**

Learn about these settings.

```
CALC:MEAS:TRAN:TIME BPAS
```

```
calculate2:measure2:transform:time:type bpas
```

**Query Syntax**

```
CALCulate<cnum>:MEASure<mnum>:TRANsform:TIME[:TYPE]?
```

**Return Type**

Character

**Default**

BPAS
CALCulate:MEASure:X Commands

Controls the display of X-axis for various measurements.

```
CALCulate:MEASure:X
  AXIS
    | DOMain
    | FIXed
    | PARameter
    | VALue
    | UNIT?
[:,VALues]
```

Click a keyword to view the command details.

See Also

- SCPI Command Tree

CALCulate<ch>:MEASure<mnum>:X:AXIS <string>

**Applicable Models:** All

(Write-Read) Sets the X-axis of the selected measurement. This command does not change the default setting for new traces.

**Parameters**

- `<ch>` Channel number of the measurement (optional).
- `<mnum>` Measurement number for each measurement.
- `<string>` String - (Not case-sensitive) For all channels EXCEPT DIQ, choose from the following:
  
  - "Default" - The default X-axis setting for the selected measurement. For Application measurements, the X-Axis domain is set with specific commands.
  
  - "AO1" - Internal DC source #1
"AO2" - Internal DC source #2

**Note:** For DIQ channels, see `CALC:MEAS:X:AXIS:DOMain`

For Modulation Distortion Channels (MOD), choose from:

"**SA Frequency**" - SA display showing the SA frequency settings.

"**Power In**" - Displays input power sweep.

"**Power Out**" - Displays output power sweep.

"**Measured Carrin**" - Measured input band power.

"**Measured CarrOut**" - Measured output band power.

For Modulation Distortion Converters Channels (MODX), choose from:

"**SA Freq In**" - SA display showing mixer input range.

"**SA Freq Out**" - SA display showing mixer output range.

"**Power In**" - Displays input power sweep.

"**Power Out**" - Displays output power sweep.

"**Measured Carrin**" - Measured input band power.

"**Measured CarrOut**" - Measured output band power.

**Examples**

```plaintext
CALC:MEAS2:X:AXIS 'Default'
calculate:measure2:x:axis "AO1"
```

**Query Syntax**

`CALCulate<ch>:MEASure<mnum>:X:AXIS?`

**Return Type**

String

**Default**

"Default"

`CALCulate<ch>:MEASure<mnum>:X:AXIS:DOM ain <string>`
Applicable Models: All

(Write-Read) Sets and returns the X-Axis domain of the selected DIQ measurement.

Parameters

<ch> Channel number of the measurement (optional).
<mnum> Measurement number for each measurement.

<table>
<thead>
<tr>
<th>Choose one of these:</th>
<th>Then set X-Axis Source (CALC:MEAS:X:AXIS) using one of these as the argument.</th>

2. CALC:MEAS2:X:AXIS "Port 1"

Query Syntax

CALCulate<ch>:MEASure<mnum>:X:AXIS:DOMAIN?

Return Type

String

Default

CALC:MEAS:X:AXIS:DOMAIN: "Frequency"
CALC:MEAS:X:AXIS: "F1"

CALCulate<ch>:MEASure<mnum>:X:AXIS:FIXed:PARameter <string>
Applicable Models: N524xB models with Option S93070xB

(Write-Read) Sets the X-axis fixed parameter for a power sweep measurement in a Modulation Distortion channel.

Parameters

- `<ch>` Channel number of the measurement (optional).
- `<mnum>` Measurement number for each measurement.
- `<string>` String - (Not case-sensitive) For Modulation Distortion Channels (MOD), choose from:
  - "SA Frequency" - SA display showing the SA frequency settings.

For Modulation Distortion Converters Channels (MODX), choose from:
  - "SA Freq In" - SA display showing mixer input range.
  - "SA Freq Out" - SA display showing mixer output range.

Examples

</table>

Applicable Models: N524xB models with Option S93070xB

(Write-Read) Sets the X-axis fixed parameter spectrum analyzer frequency value for a power sweep measurement in a Modulation Distortion channel.

**Parameters**

- `<ch>` Channel number of the measurement (optional).
- `<mnum>` Measurement number for each measurement.
- `<num>` Fixed parameter value.

**Examples**

```
calc:meas2:x:axis:fix:par:val 1.5e9
```

**Query Syntax**

```
```

**Return Type**

- **Numeric**
- **Default** Not Applicable

---

CALCulate<ch>:MEASure<mnum>:X:AXIS:UNIT?

**Applicable Models:** All

(Read-only) Returns the current units of the X-axis (FREQuency | POWer | PHASe | DC | POINts | DEFault).

This command can be used for all Measurement Classes.

**Parameters**

- `<ch>` Channel number of the measurement (optional).
- `<mnum>` Measurement number for each measurement.

**Examples**

```
CALC:MEAS2:X:AXIS:UNIT?
```

**Return Type**

- **Enumeration**
- **Default** FREQuency

---

CALCulate<ch>:MEASure<mnum>:X:[VALues]?
Applicable Models: All

(Read-only) Returns the stimulus values for the selected measurement in the current units.

This command can be used for all Measurement Classes.

Note: To avoid frequency rounding errors, specify FORM:DATA <Real,64> or <ASCii, 0>

Parameters

- `<ch>` Channel number of the measurement (optional).
- `<mnum>` Measurement number for each measurement.

Examples

1. Calc:MEAS2:Par:Sel "MyGCATrace"
2. CALC:MEAS2:X?

Return Type

Depends on FORM:DATA command

Default Not applicable
CALCulate:Measure:UNCertainty Commands

Controls the trace settings for Dynamic Uncertainty for S-Parameters.

CALCulate<cnum>:MEASure<mnum>:UNCertainty:DISPlay:CFACtor <value>

Applicable Models: N522xB, N523xB, N524xB

(Write-Read) Sets and returns the coverage factor (sigma) value to apply to the displayed uncertainty for the selected measurement trace. Coverage Factor corresponds to the level of confidence used in computing the specified measurement uncertainties.

Parameters

- <cnum> Channel number of the measurement (optional).
- <mnum> Measurement number for each measurement.
- <value> Integer. Choose from: 

### Coverage Factor and Approximate Confidence Level

</table>

### Examples

```
CALC1:MEAS:UNC:DISP:CFAC 2
```

### Query Syntax

`CALCulate<cnum>:MEASure<mnum>:UNCertainty:DISPlay:CFACtor?`

### Return Type

Numeric

### Default

2

### Calculation<cnm>:MEASure<mnm>:UNCertainty:DISPlay:TYPE <char>

**Applicable Models:** N522xB, N523xB, N524xB

*(Write-Read)* Sets and returns the display type for uncertainties for the selected measurement trace.

**Parameters**

- `<cnum>`: Channel number of the measurement (optional).
- `<mnum>`: Measurement number for each measurement.
- `<char>`: Display type. Choose from:
  - **NONE** - Display the trace without uncertainties.
  - **MAXimum** – Display the trace as the uncertainty maximum (measured or memory data + upper limit uncertainty values). Not supported with Smith Chart or Polar display format.
  - **MINimum** - Display the trace as the uncertainty minimum (measured or memory data - lower limit uncertainty values). Not supported with Smith Chart or Polar display format.
  - **BAR** – Display the uncertainties as “error bars” around the trace. Not supported with Smith Chart or Polar display format.
  - **SHADe** – Display the uncertainties as a shaded region around the trace. Not supported with Smith Chart or Polar display format.
  - **ELLipse** – Display the uncertainties in ellipse form. Supported only in Smith Chart or Polar display format.
CALCulate<cnum>:MEASure<mnum>:UNCertainty:DISPlay:TYPE?  

Return Type: Character  
Default: NONE

**CALCulate<cnum>:MEASure<mnum>:UNCertainty:MODE:CABLe:REPeat <bool>**

**Applicable Models:** N522xB, N523xB, N524xB

*(Write-Read)* Sets and returns whether the cable/connection repeatability contribution is currently included in the uncertainty values for the selected measurement trace.

**Parameters**
- `<cnum>` Channel number of the measurement (optional).
- `<mnum>` Measurement number for each measurement.
- `<bool>` Choose from:
  - OFF (or 0) - Cable repeatability is NOT included.
  - ON (or 1) - Cable repeatability IS included.

**Examples** CALC1:MEAS:UNC:MODE:CABL:REP ON

**Query Syntax** CALCulate<cnum>:MEASure<mnum>:UNCertainty:MODE:CABLE:REPeat?  
**Return Type** Boolean  
**Default** ON

CALCulate<cnum>:MEASure<mnum>:UNCertainty:MODE:ETERm <bool>
Applicable Models: N522xB, N523xB, N524xB

(Write-Read) Sets and returns whether the uncertainties associated with the correction error terms are being included in the uncertainty values for the selected measurement trace.

**Parameters**

- `<cnum>` Channel number of the measurement (optional).
- `<mnum>` Measurement number for each measurement.
- `<bool>` Choose from:
  - OFF (or 0) - Error term uncertainty contribution is NOT included.
  - ON (or 1) - Error term uncertainty contribution IS included.

**Examples**

<table>
<thead>
<tr>
<th>Query Syntax</th>
<th>Return Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>CALC1:MEAS:UNC:MODE:ETERm?</td>
<td>Boolean</td>
</tr>
</tbody>
</table>

**Default** ON

---

CALCulate<cnum>:MEASure<mnum>:UNCertainty:MODE:NOISe <bool>

Applicable Models: N522xB, N523xB, N524xB

(Write-Read) Sets and returns whether the noise contribution is currently included in the uncertainty values for the selected measurement trace.

**Parameters**

- `<cnum>` Channel number of the measurement (optional).
- `<mnum>` Measurement number for each measurement.
- `<bool>` Choose from:
  - OFF (or 0) - Noise contribution is NOT included.
  - ON (or 1) - Noise contribution IS included.

**Examples**

<table>
<thead>
<tr>
<th>Query Syntax</th>
<th>Return Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>CALC1:MEAS:UNC:MODE:NOISe?</td>
<td>Boolean</td>
</tr>
</tbody>
</table>

**Default** ON
CALCulate<cnum>:MEASure<mnum>:UNCertainty:SAVE <"x,y,z">,<filename>

Applicable Models: N522xB, N523xB, N524xB

(Write-only) Saves all three uncertainty data formats from the active measurement for the specified ports.

- This command is valid ONLY with Dynamic Uncertainty Calibration applied to the active measurement.
- Data that is not available is zero-filled.
- For sweeps with a large number of data points, always follow this command with *OPC? Learn more.

Parameters
- <cnum> Channel number of the measurement (optional).
- <mnum> Measurement number for each measurement.
- <"x,y,z"> String Comma or space delimited port numbers for which data is requested, enclosed in quotes.
- <filename> String Path, filename, and suffix of location to store the uncertainty data, enclosed in quotes. The suffix is not checked for accuracy.

- (*.u*p) S-parameter Uncertainty File - If saving 2 ports, specify "filename.u2p"; If saving 4 ports, specify "filename.u4p.", and so forth.
- (*.dsd) S-parameter Data Standard Definition file - Data for Only one or two ports is allowed.
- (*.sdatcv) METAS S-parameter Covariance File.

Examples
All three examples save the active uncertainty measurement on channel 1
'Saves ports 2 and 3 to .u2p file
CALC1:MEAS:UNC:SAVE "2,3","C:\myData.u2p"
'Saves ports 1 and 2 to .dsd file
CALC1:MEAS:UNC:SAVE "1,2","C:\myData.dsd"
'Saves ports 1 through 4 to .sdatcv file
CALC1:MEAS:UNC:SAVE "1,2,3,4","C:\myData.sdatcv"

Query Syntax Not Applicable
Default  Not Applicable
**Calculate:Mixer Command**

This command is **Superseded** by the `CALCulate:MEASure:MIXer:XAXis` command.

---

CALCulate<ch>:MIXer:XAXis <char>

**Applicable Models:** N522xB, N523xB, N524xB, M937xA, P937xA

*(Read-Write)* Sets or returns the swept parameter to display on the X-axis for the selected FCA and GCX measurement.

**Critical Note:** CALCulate commands act on the selected measurement. You can select one measurement for each channel using `Calc:Par:MNUM` or `Calc:Par:Select`. Learn more.

**Parameters**

- `<ch>`  Any existing channel number. If unspecified, value is set to 1.
- `<char>` Parameter to display on the X-axis. Choose from:
  - **INPUT**  - Input frequency span
  - **OUTPUT**  - Output frequency span
  - **LO_1**  - First LO frequency span
  - **LO_2**  - Second LO frequency span

**Examples**

```
CALC:MIX:XAX INPUT
calc2:mixer:xaxis output
```

See an example that creates, selects, and calibrates an SMC and VMC measurement using SCPI.

**Query Syntax**  CALCulate<ch>:MIXer:XAXis?

**Return Type**  Character

- **Default**  OUTPUT
Calculate:Normalize Commands

Specifies the normalization features used for a receiver power calibration.

These commands are Superseded (Sept 2004).

See the replacement commands in a new Receiver Power Cal example.

CALCulate: NORMalize

[IMMediate]  STATe  INTerpolation  [STATe]

Click on a keyword to view the command details.

See Also

- Example Programs
- Learn about Receiver Cal
- SCPI Command Tree

Save and recall your receiver power calibration (which use .CST file commands):

- SENS:CORR:CSET:SAVE
- SENS:CORR:CSET[:SEL]

Or use these two commands and specify either .STA or .CST file extensions:

- MMEM:LOAD
- MMEM:STOR

Critical Note: CALCulate commands act on the selected measurement. You can select one measurement for each channel using Calc:Par:Select

CALCulate<cnum>:NORMalize[:IMMediate]  Superseded
Applicable Models: N522xB, N523xB, N524xB, M937xA, P937xA

Note: This command is replaced with SENS:CORR:COLL:METH RPOWer and SENS:CORR:COLL[:ACQ] POWer

See an example of a Receiver Power Calibration.

(Write only) Stores the selected measurement’s data to that measurement’s “divisor” buffer for use by the Normalization data processing algorithm. This command is not compatible with ratioed measurements such as S-parameters. It is intended for receiver power calibration when the selected measurement is of an unratioed power type.

See Critical Note

Parameters

CALCulate<cnum>:NORMalize:STATe <ON | OFF>  Superseded

Applicable Models: N522xB, N523xB, N524xB, M937xA, P937xA

Note: This command is replaced with SENS:CORR[:STATe] ON|OFF

(Read-Write) Specifies whether or not normalization is applied to the measurement. Normalization is enabled only for measurements of unratioed power where it serves as a receiver power calibration.

See Critical Note

Parameters

CALCulate<cnm>:NORMalize:INTerpolate[:STATe] <ON | OFF>  **Superseded**

**Applicable Models:** N522xB, N523xB, N524xB, M937xA, P937xA

**Note:** This command is replaced with SENS:CORR:INT[:STATe] ON|OFF

(Read-Write) Turns normalization interpolation ON or OFF. Normalization is enabled only for measurements of unratioed power, where it serves as a receiver power calibration.

See Critical Note

**Parameters**

- `<cnm>` Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, `<cnm>` is set to 1.
- `<ON | OFF>` **ON (or 1)** – turns interpolation ON.
  
  **OFF (or 0)** – turns interpolation OFF.

**Examples**

- `CALC:NORM:INT ON`
- `calculate2:normalize:interpolate:state off`

**Query Syntax**

CALCulate<cnm>:NORMalize:INTerpolate[:STATe]?

**Return Type** Boolean (1 = ON, 0 = OFF)

**Default** OFF
Calculate:Offset Commands

Allows the data trace magnitude and phase to be offset.

These commands are **Superseded** by the CALCulate:MEASure:OFFSet commands.

```
CALCulate:OFFSet
    MAGNitude  PHASE
        SLOPe
```

Click on a keyword to view the command details.

**See Also**

- Example Programs
- Learn about Magnitude Offset
- Learn about Phase Offset
- Synchronizing the Analyzer and Controller
- SCPI Command Tree

**Critical Note:** CALCulate commands act on the selected measurement. You can select one measurement for each channel using Calc:Par:NUM or Calc:Par:Select. Learn more.

```
CALCulate<cnum>:OFFSet:MAGNitude <num>
```
Applicable Models: All

(Read-Write) Offsets the data trace magnitude by the specified value.

To offset the data trace magnitude to a slope value that changes with frequency, use

CALC:OFFS:MAGN:SLOP

See Critical Note

Parameters

- **<cnum>** Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, <cnum> is set to 1.
- **<num>** Offset value in dB.

Examples

- CALC:OFFS:MAGN:4
calculate:offset:magnitude -2

Query Syntax

CALCulate<cnum>:OFFSet:MAGNitude?

Return Type

Numeric

Default

0

CALCulate<cnum>:OFFSet:MAGNitude:SLOPe <num>

Applicable Models: All

(Read-Write) Offsets the data trace magnitude to a value that changes linearly with frequency. The offset slope begins at 0 Hz.

See Critical Note

Parameters

- **<cnum>** Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, <cnum> is set to 1.
- **<num>** Offset slope value in dB/ 1GHz.

Examples

- CALC:OFFS:MAGN:SLOP 1 'Offset slope set to 1dB/1GHz
calculate:offset:magnitude:slope -2 'Offset slope set to -2dB/1GHz

Query Syntax

CALCulate<cnum>:OFFSet:MAGNitude:SLOPe?

Return Type

Numeric

Default

0

CALCulate<cnum>:OFFSet:PHASe <num>[<char>]

3732
Applicable Models: All

(Read-Write) Sets the phase offset for the selected measurement.

See Critical Note

Parameters

<cnum> Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, <cnum> is set to 1.

<num> Offset phase value. Choose any number between: -360 and 360

<char> Units for phase. OPTIONAL. Choose either:
  DEG - Degrees (default)
  RAD - Radians

Examples

```
CALC:OFFS:PHAS 10
calculate:offset:phase 20rad
```

Query Syntax  CALCulate:OFFSet:PHASe?

Return Type  Numeric, returned value always in degrees

Default  0 degrees
Calculate:Parameter Commands

Lists, creates, selects, and deletes measurements.

For application measurements, use Calc:Custom commands.

```
CALCulate:PARameter:
    CATalog
       | EXTended
    COUNT
    DEFINE
       | EXTended
    DELETE
       | ALL
    MNUMBER
       | [SELECT]
    MODify
       | EXTended
    SELECT
    TAG
       | NEXT?
    TNUMBER?
    WNUMBER?
```

Click on a keyword to view the command details.

Blue commands are superseded.

See Also

- Example Programs
- Learn about Measurement Parameters
- Synchronizing the Analyzer and Controller
Critical Note: CALCulate commands act on the selected measurement. You can select one measurement for each channel using Calc:Par:MNUM or Calc:Par:Select. Learn more.

CALCulate<cnum>:PARameter:CATalog? <enum> Superseded

Applicable Models: All

Note: This command is replaced with CALC:PAR:CAT:EXTended? which lists parameters with "_" instead of "," allowing the list to be parsed easily. This command will continue to work.

(Read-only) Returns the names and parameters of existing measurements for the specified channel.

Note: For Balanced Measurements: CALC:PAR:CAT? may have an unexpected behavior. Learn more.

See Critical Note

Parameters

- **<cnum>** Channel number of the measurements to be listed. If unspecified, <cnum> is set to 1.
- **<enum>** Choose from:
  - **NORMal** - This is the default if no parameter is specified. If a trace title is defined in a standard channel, then the "name" returned is the same as the trace title. For non standard channels, the "name" returned is the underlying parameter name, regardless of whether the user has turned on a trace title or not.
  - **DISPlay** - If a trace title is defined, then the "name" returned is the same as the trace title.
  - **DEFine** - The "name" returned is always the same as the underlying parameter name, regardless of whether the trace title is turned on or not.

Examples

```
CALC:PAR:CAT? DISP
calculate2:parameter:catalog?
```

Return Type

String - "<measurement name>,<parameter>,[<measurement name>,<parameter>...]"

Default

"CH1_S11_1,S11"

CALCulate<cnum>:PARameter:CATalog:EXTended? <enum>
Applicable Models: All

(Read-only) Returns the names and parameters of existing measurements for the specified channel. This command lists receiver parameters with "_" such that R1,1 is reported as R1_1. This makes the returned string a true "comma-delimited" list all the time.

The returned string of this command is easily parsed and used to create measurements using the CALC:PAR:EXT command.

**Parameters**

- `<cnum>` Channel number of the measurements to be listed. If unspecified, `<cnum>` is set to 1.
- `<enum>` Choose from:
  - **NORMal** - This is the default if no parameter is specified. If a trace title is defined in a standard channel, then the "name" returned is the same as the trace title. For non standard channels, the "name" returned is the underlying parameter name, regardless of whether the user has turned on a trace title or not.
  - **DISPlay** - If a trace title is defined, then the "name" returned is the same as the trace title.
  - **DEFine** - The "name" returned is always the same as the underlying parameter name, regardless of whether the trace title is turned on or not.

**Examples**

```
CALC:PAR:CAT:EXT? DEF
```

```
calculate2:parameter:catalog:extended?
```

**Return Type** String - "<measurement name>,<parameter>[,<measurement name>,<parameter>...]"

**Default** "CH1_S11_1,S11"

CALCulate<cnum>:PARarameter:COUNt <numOfTraces>,[<measClass>]
Applicable Models: All

(Read-Write) Sets or gets the number of traces of selected channel.

Requirements:

- Requires that window [n] exist. So to use the command properly you need to create window [n] before this command can succeed.
- If window[n] exists but is already occupied by another channel’s measurement, an error is returned “Duplicate trace number”.
- If window[n] does not exist, an error is returned: “Window number not found”.
- If the command succeeds, it will always delete measurements.
calc[n]:par:count <m> will delete existing measurements in channel [n] and create <m> copies of S11 in window [n].

Parameters

- `<cnum>` Channel number of the measurements to be listed. If unspecified, `<cnum>` is set to 1.
- `<measClass>` Measurement class name.
- `<numOfTraces>` Number of traces on the selected channel. Varies depending on the upper limit setting for the channel/trace number.

Note: This command always deletes existing measurements and replaces them with S11.

Examples

- 'Create a standard S-parameter channel with one trace
  disp:wind4:state on
calc4:par:count 1

- 'Create a Gain Compression channel with one trace
  disp:wind4:state on
calc4:par:count 1,"Gain Compression"

Query Syntax

- Numeric
- Default 1

CALCulate<cnum>:PARameter[:DEFine] <Mname>,<param>[,port] Superseded

Applicable Models: N522xB, N523xB, N524xB, M937xA, P937xA

Note: This command is replaced with CALC:PAR:DEFine:EXTended. This command will continue to work for up to 4-port parameters.
(Write-only) Creates a measurement but does NOT display it.

There is no limit to the number of measurements that can be created. However, there is a limit to the number of measurements that can be displayed. See Traces, Channels, and Windows on the VNA.

- Use \texttt{DISP:WIND:STATe} to create a window if it doesn't already exist.
- Use \texttt{DISP:WIND<wnum>:TRAC<tnum>:FEED <Mname>} to display the measurement.

For Application Measurements see \texttt{CALC:CUST:DEF}

You must select the measurement (\texttt{CALC<cnum>:PAR:SEL <mname>}) before making additional settings.

See Critical Note

\textbf{Parameters}

\begin{itemize}
\item \texttt{<cnum>} Channel number of the new measurement. If unspecified, value is set to 1.
\item \texttt{<Mname>} Name of the measurement. Any non-empty, unique string, enclosed in quotes.
\item \texttt{<param>} Parameter to be measured. Quotes are optional.
\end{itemize}

\textbf{For S-parameters:}

Any S-parameter available in the VNA

\textbf{For ratioed measurements:}

Any two receivers that are available in the VNA. (See the \texttt{block diagram} showing the receivers in YOUR VNA.)

For example: AR1 (this means A/R1)

\textbf{For non-ratioed measurements:}

Any receiver that is available in the VNA. (See the \texttt{block diagram} showing the receivers in YOUR VNA.)

For example: A

\textbf{For Balanced Measurements:}

First create an S-parameter measurement, then change the measurement using \texttt{CALC:FSIM:BAL} commands. See an example.

\textbf{For Applications} see \texttt{CALC:CUST:DEF}.
[port] Optional argument;

For multi-port reflection S-parameter measurements: specifies the VNA port which will provide the load for the calibration. This argument is ignored if a transmission S-parameter is specified.

For all non S-parameter measurements: specifies the source port for the measurement.

Examples

CALC4:PAR 'ch4_S33',S33,2 'Defines an S33 measurement with a load on port2 of the analyzer.'

calculate2:parameter:define 'ch1_a', a, 1 'unratioed meas'

calculate2:parameter:define 'ch1_a', arl,1 'ratioed meas'

Query Syntax

Not Applicable; see Calc:Par:Cat?

Default

Not Applicable

CALCulate<cnum>:PARameter[:DEFine]:EXTended <Mname>,<param>

Applicable Models: N522xB, N523xB, N524xB, M937xA, P937xA

Note: This command replaces CALC:PAR:DEF as it allows the creating of measurements using external multiport testsets.

(Write-only) Creates a measurement but does NOT display it.

There is no limit to the number of measurements that can be created. However, there is a limit to the number of measurements that can be displayed. See Traces, Channels, and Windows on the VNA.

- Use DISP:WIND:STATe to create a window if it doesn't already exist.
- Use DISP:WIND<wnum>:TRAC<tnum>:FEED <Mname> to display the measurement.

Note: For Application Measurements see CALC:CUST:DEF

You must select the measurement using CALC:PAR:SELect before making additional settings.

See Critical Note

Parameters

<cnum> Channel number of the new measurement. If unspecified, value is set to 1.

<Mname> (String) Name of the measurement. Any non-empty, unique string, enclosed in quotes.
<param> (String ) Measurement Parameter to create. Case sensitive.

**For S-parameters:**

Any S-parameter available in the VNA

Single-digit port numbers CAN be separated by "_" (underscore). For example: "S21" or "S2_1"

Double-digit port numbers MUST be separated by underscore. For example: "S10_1"

**For ratioed measurements:**

Any two VNA physical receivers separated by forward slash '/' followed by comma and source port.

For example: "A/R1, 3"

Learn more about ratioed measurements

See a block diagram showing the receivers in YOUR VNA.

**For non-ratioed measurements:**

Any VNA physical receiver followed by comma and source port.

For example: "A, 4"

Learn more about unratioed measurements.

See the block diagram showing the receivers in YOUR VNA.

Ratioed and Unratioed measurements can also use logical receiver notation to refer to receivers. This notation makes it easy to refer to receivers with an external test set connected to the VNA. You do not need to know which physical receiver is used for each test port. Learn more.

**For ADC measurements:**

Any ADC receiver in the VNA followed by a comma, then the source port.

For example: "AI1,2" indicates the Analog Input1 with source port of 2.

Learn more about ADC receiver measurements.

**For Balanced Measurements:**
First create an S-parameter measurement, then change the measurement using `CALC:FSIM:BAL "define" commands. See an example.

**Note:** For Application Measurements see `CALC:CUST:DEF`

**Examples**

```plaintext
CALC4:PAR:EXT 'ch4_S33', 'S33' 'Defines an S33 measurement
```

```plaintext
calculate2:parameter:define:extended 'ch1_a', 'b9, 1' 'logical receiver notation for unratioed meas of test port 9 receiver with source port 1.
```

```plaintext
calculate2:parameter:define:extended 'ch1_a', 'b9/a10,1' 'logical receiver notation for ratioed meas of test port 9 receiver divided by the reference receiver for port 10 using source port 1
```

**Query Syntax**  Not Applicable; see `Calc:Par:Cat`?

**Default**  Not Applicable

**CALCulate<cnum>:PARameter:DELete[:NAME] <Mname>**

**Applicable Models:** All

(Write-only) Deletes the specified measurement.

See Critical Note

**Parameters**

- `<cnum>`  Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, `<cnum>` is set to 1.
- `<Mname>`  String - Name of the measurement

**Examples**

```plaintext
CALC:PAR:DEL 'TEST'
calculate2:parameter:delete 'test'
```

**Query Syntax**  Not Applicable

**Default**  Not Applicable

**CALCulate:PARameter:DELeTe:ALL**
Applicable Models: All

(Write-only) Deletes all measurements on the VNA.

See Critical Note

### Parameters

<table>
<thead>
<tr>
<th>Examples</th>
<th>CALC:PAR:DEL:ALL</th>
</tr>
</thead>
</table>

### Query Syntax

Not Applicable

Default

Not Applicable

CALCulate\(<cnum>\):PARameter:MNUMber[:SELect] \(<n>[,fast]\)

Applicable Models: N522xB, N523xB, N524xB, M937xA, P937xA

(Read-Write) Sets and returns the selected measurement for the channel using the Tr#. Most CALC:
commands require that this, or CALC:PAR:SEL, be sent before a setting change is made to that measurement. Each channel can have one selected measurement.

#### Parameters

| \(<cnum>\) | Channel number of the measurement to be selected. If unspecified, \(<cnum>\) is set to 1. |
| \(<n>\) | Numeric - Measurement number. These are the same numbers you see in the “Tr1”, “Tr2” annotation next to the parameter name on the VNA screen. |
| [fast] | Optional. The VNA display is NOT updated. Therefore, do not use this argument when an operator is using the VNA display. Otherwise, sending this argument results in much faster sweep speeds. There is NO other reason to NOT send this argument. |

#### Examples

| CALC:PAR:MNUM 2 |
| calculate2:parameter:mnumber:select 3,fast |

#### Query Syntax

CALCulate\(<cnum>\):PARameter:MNUMber[:SELect]? |

There is NO query available to determine if the FAST argument has been set.

#### Return Type

Numeric

Default

1 (Trace number when factory preset is performed)

CALCulate\(<cnum>\):PARameter:MODify <param> Superseded
Applicable Models: N522xB, N523xB, N524xB, M937xA, P937xA

Note: This command is replaced with \texttt{CALC:PAR:MOD:EXT}. This command will continue to work for up to 4 port parameters.

(Write-only) Modifies a standard measurement using the same arguments as \texttt{CALC:PAR:DEF}. To modify an FCA measurement, use \texttt{CALC:CUST:MOD}.

See Critical Note

Parameters
\begin{itemize}
    \item \texttt{<cnum>} Channel number of the measurement. The selected measurement on that channel will be changed. If unspecified, \texttt{<cnum>} is set to 1.
    \item \texttt{<param>} Measurement parameter to change to. Use the same \texttt{<param>} arguments as \texttt{CALC:PAR:DEF}.
\end{itemize}

Examples
\begin{verbatim}
SYST:PRESET
CALC:PAR:DEF "MyMeas", S11
CALC:PAR:SEL "MyMeas"
CALC:PAR:MOD AR1 'changes the selected S11 measurement to an A/R1 measurement'
\end{verbatim}

Query Syntax
- Not Applicable

Default
- Not Applicable

\texttt{CALCulate<cnum>:PARameter:MODify:EXTended <param>}

Applicable Models: N522xB, N523xB, N524xB, M937xA, P937xA

Note: This command replaces \texttt{CALC:PAR:MOD} as it allows modification of measurements using external multiport testsets.

(Write-only) Modifies a standard measurement using the same arguments as \texttt{CALC:PAR:DEF:EXT}.

To modify an Application measurement, use \texttt{CALC:CUST:MOD}.

See Critical Note

Parameters
\begin{itemize}
    \item \texttt{<cnum>} Channel number of the measurement. The selected measurement on that channel will be changed. If unspecified, \texttt{<cnum>} is set to 1.
\end{itemize}
<param>  (String) New measurement parameter. Use the same <param> arguments as CALC:PAR:DEF:EXT.

Examples

SYST:PRESET
CALC:PAR:DEF:EXT "MyMeas", "S10_1"
CALC:PAR:SEL "MyMeas"
CALC:PAR:MOD:EXT "a4b4,1"  'changes the selected S10_1 measurement to an a4/b4 measurement with source port 1

Query Syntax

Not Applicable

Default

Not Applicable

CALCulate<cnum>:PARameter:TAG:NEXT?

Applicable Models:  E5080A, M9485A

(Read-only)

Parameters

<cnum>  Channel number of the measurement. The selected measurement on that channel will be changed. If unspecified, <cnum> is set to 1.

Examples

CALC:PAR:TAG:NEXT

Query Syntax

Not Applicable

Default

Not Applicable

CALCulate<cnum>:PARameter:SELect <Mname>[,.fast]
Applicable Models: N522xB, N523xB, N524xB, M937xA, P937xA

(Read-Write) Sets the selected measurement. Most CALC: commands require that this command be sent before a setting change is made. One measurement on each channel can be selected at the same time.

- Use `CALC:PAR:MNUM` to select a measurement by Tr# number. Learn more.
- To obtain a list of currently named measurements, use `CALC:PAR:CAT?`

### Parameters

- `<cnum>` Channel number of the measurement to be selected. If unspecified, `<cnum>` is set to 1.
- `<Mname>` String - Name of the measurement. CASE-SENSITIVE. Do NOT include the parameter name that is returned with Calc:Par:Cat?
- `[fast]` Optional. The VNA display is NOT updated. Therefore, do not use this argument when an operator is using the VNA display. Otherwise, sending this argument results in much faster sweep speeds. There is NO other reason to NOT send this argument.

### Examples

```
CALC:PAR:SEL 'TEST'
calculate2:parameter:select 'test',fast
```

### Query Syntax

```
CALCulate:PARameter:SELection?
```

There is NO query available to determine if the FAST argument has been set.

### Return Type

String

**Default**

"CH1_S11_1" (Trace name when factory preset is performed)

---

**CALCulate<cnum>:PARameter:TAG:NEXT?**

**Applicable Models:** N522xB, N523xB, N524xB, M937xA, P937xA

(Read-only) Returns a string that is guaranteed to be unique and valid for use with `CALC:PAR:DEF`.

### Parameters

- `<cnum>` Channel number of the trace. If unspecified, `<cnum>` is set to 1.

### Examples

```
CALC:PAR:TAG:NEXT?
calculate2:parameter:tag:next?
```

### Return Type

String

**Default**

Not Applicable
CALCulate<cnum>:PARameter:TNUMber?

**Applicable Models:** N522xB, N523xB, N524xB, M937xA, P937xA

*(Read-only)* Returns the trace number of the selected trace. Select a trace using Calc:Par:Select.

**Parameters**

\(<\text{cnum}>\)    Channel number of the trace. If unspecified, \(<\text{cnum}>\) is set to 1.

**Examples**

```
CALC:PAR:TNUM?
calculate2:parameter:tnumber?
```

**Return Type** Numeric

**Default** Not Applicable

---

CALCulate<cnum>:PARameter:WNUMber?

**Applicable Models:** N522xB, N523xB, N524xB, M937xA, P937xA

*(Read-only)* Returns the window number of the selected trace. Select a trace using Calc:Par:Select.

**Parameters**

\(<\text{cnum}>\)    Channel number of the selected trace. If unspecified, \(<\text{cnum}>\) is set to 1.

**Examples**

```
CALC:PAR:WNUM?
calculate2:parameter:wnumber?
```

**Return Type** Numeric

**Default** Not Applicable
Calculate:RData? Command

This command is **Superseded** by the **CALCulate:MEASure:RDA**Ta command.

---

**Critical Note:** CALCulate commands act on the selected measurement. You can select one measurement for each channel using **Calc:Par:MNUM** or **Calc:Par:Select**. Learn more.

CALCulate<cnum>:RDATA? <char>

Applicable Models: N522xB, N523xB, N524xB, M937xA, P937xA

(Read-only) Returns receiver data for the selected measurement. To query measurement data, see **CALC:DATA?**

**Parameters**

- `<cnum>` Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, `<cnum>` is set to 1.
- `<char>` Choose from any physical receiver in the VNA.

For example: "A"

Also, **REF** - returns data for either R1 or R2 data depending on the source port of the selected measurement.

See the block diagram showing the receivers in YOUR VNA.

**Note:** Logical receiver notation is NOT allowed with this command. Learn more.

**Example**

```
GPIB.Write "INITiate:CONTinuous OFF"
GPIB.Write "INITiate:IMMediate;*wai"
GPIB.Write "CALCulate:RDATA? A"
```

```
GPIB.Write "CALCulate:RDATA? REF"
```

**Return Type** Depends on **FORM:DATA** - Two numbers per data point

**Default** Not Applicable

**Notes:**

Generally when you query the analyzer for data, you expect that the number of data values returned will be consistent with the number of points in the sweep.

However, if you query **receiver** data while the instrument is sweeping, the returned values may contain
zeros. For example, if your request for receiver data is handled on the 45th point of a 201 point sweep, the first 45 values will be valid data, and the remainder will contain complex zero.

This can be avoided by synchronizing this request with the end of a sweep or putting the channel in hold mode.

Learn about Unratioed Measurements
**CALCulate:SA:MARKer commands**

Controls the marker settings used in the SA application.

These commands are **Superseded** by the **CALCulate:MEASure:SA** commands.

**Critical Note:** CALCulate commands act on the selected measurement. You can select one measurement for each channel using Calc:Par:MNUM or Calc:Par:Select. Learn more.

If you use Calc:Par:Cat? to return the list of current measurements, the returned string will be similar to ‘CH1_B_1,B’.

To select this measurement as a parameter for SA, you need to send Calc:Par:Sel ‘CH1_B_1’.

Moreover, most of the following commands will return ‘+202, “Parameter not valid” if they are called with marker number n, and marker number n is not currently turned ON.

**Important:** Learn about programming the reference marker.

**Note:** For all band power marker family (this includes BNOise, BPOWer, OCCBand markers) and
when measuring wideband repetitive modulated signals, there is basically 2 approaches to get good measurements:

- Either run the coherent mode of SA if the modulated test signal repetition period or tone spacing is known and a frequency reference connection is made between the signal source and the PNA (usually the 10 MHz ref signal BNC). See SA Setup Coherence.

- Or make use of a RBW that is equal or smaller than 1/20 of the modulated test signal tone spacing (rule of thumb). The test signal tone spacing is 1/ the test signal duration. For example, if the ARB file that generates the test signal replays each 100 microseconds, it means the tone spacing is 10 kHz. So, we recommend to set the RBW to 500 Hz or below.

CALCulate<ch>:SA:MARKer<n>:BDENsity:ACPR[:STATe] <bool>

**Applicable Models:** All with Spectrum Analysis Options (S9x09xxA/B, S9x090A/B) or N524xB models with Option S93070xB

(Read-Write) Sets and reads the ACPR density marker.

**See Critical Note**

**Parameters**

- `<ch>` Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, `<ch>` is set to 1.
- `<n>` Marker number. If unspecified, `<n>` is set to 1.
- `<bool>` Choose from:
  - 0 - OFF - Turn band density marker OFF.
  - 1 - ON - Turn band density marker ON.

**Examples**

'Select the measurement
CALC2:PAR:SEL "M2SA_CH2_A"

'Create marker3 on that measurement
CALC2:MARK3 ON

'Make it a band density noise marker
CALC2:SA:MARK3:BDEN:ACPR:STAT 1

**Query Syntax** CALCulate<ch>:SA:MARKer<n>:BDENsity:ACPR[:STATe]?

**Return Type** Boolean
CALCulate<ch>:SA:MARKer<n>:BDENsity:BW <num>

**Applicable Models:** All with Spectrum Analysis Options (S9x09xxA/B, S9x090A/B)

*(Read-Write)* Sets and reads the bandwidth of the band density marker.

**See Critical Note**

**Parameters**

- `<ch>` Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, `<ch>` is set to 1.
- `<n>` Marker number. If unspecified, `<n>` is set to 1.
- `<num>` Choose a bandwidth.

**Examples**

```
CALC:SA:MARK:BDEN:BW 1e6
```

**Query Syntax**

```
CALCulate<ch>:SA:MARKer<n>:BDENsity:BW?
```

**Return Type** Numeric

**Default** 1 MHz

---

CALCulate<ch>:SA:MARKer<n>:BDENsity:DATA?

**Applicable Models:** All with Spectrum Analysis Options (S9x09xxA/B, S9x090A/B)

*(Read-only)* Returns the band density level in dBm/Hz from the band density marker.

**See Critical Note**

**Parameters**

- `<ch>` Channel number of the measurement. There must be a selected measurement on that SA channel. If unspecified, `<ch>` is set to 1.
- `<n>` Band density marker number. If unspecified, `<n>` is set to 1.

**Examples**

```
CALC:SA:MARK:BDEN:DATA?
calculate2:sa:marker2:bdensity:data?
```

**Return Type** Numeric

**Default** Not applicable

---

3752
**CALCulate<ch>:SA:MARKer<n>:BDENsity:EQSPan <num>**

**Applicable Models:** All with Spectrum Analysis Options (S9x09xxA/B, S9x090A/B)

(Read-Write) Sets and reads the frequency span used by Power Density to normalize the power.

**See Critical Note**

**Parameters**

- `<ch>` Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, `<ch>` is set to 1.
- `<n>` Marker number. If unspecified, `<n>` is set to 1.
- `<num>` Choose a span.

**Examples**

```
CALC:SA:MARK:BDEN:EQSPan 1e6
```

**Query Syntax**

CALCulate<ch>:SA:MARKer<n>:BDENsity:EQSPan?

**Return Type**

Numeric

**Default**

1 MHz

---

**CALCulate<ch>:SA:MARKer<n>:BDENsity:NOISe[:STATe] <bool>**

**Applicable Models:** All with Spectrum Analysis Options (S9x09xxA/B, S9x090A/B)

(Read-Write) Sets and reads the state of the band density noise marker.

**See Critical Note**

**Parameters**

- `<ch>` Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, `<ch>` is set to 1.
- `<n>` Marker number. If unspecified, `<n>` is set to 1.
- `<bool>` Choose from:
  - 0 - OFF - Turn band density noise marker OFF.
  - 1 - ON - Turn band density noise marker ON.

**Examples**

```
'Select the measurement
CALC2:PAR:SEL "M2SA_CH2_A"

'Create marker3 on that measurement
```
CALC2:MARK3 ON

'Make it a band density noise marker

CALC:SA:MARK:BDEN:NOIS:STAT 1

**Query Syntax**
CALCulate<ch>:SA:MARKer<n>:BDENsity:NOISe?

**Return Type**
Boolean

**Default**
0

---

**CALCulate<ch>:SA:MARKer<n>:BDENsity:NPR[:STATe] <bool>**

**Applicable Models:** All with Spectrum Analysis Options (S9x09xxA/B, S9x090A/B) or N524xB models with Option S93070xB

(Read-Write) Sets and reads the NPR density marker.

**See Critical Note**

**Parameters**

- `<ch>` Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, `<ch>` is set to 1.
- `<n>` Marker number. If unspecified, `<n>` is set to 1.
- `<bool>` Choose from:

  - **0 - OFF** - Turn band density marker OFF.
  - **1 - ON** - Turn band density marker ON.

**Examples**

'Select the measurement
CALC2:PAR:SEL "M2SA_CH2_A"

'Create marker3 on that measurement
CALC2:MARK3 ON

'Make it a band density noise marker
CALC2:SA:MARK3:BDEN:NPR:STAT 1

**Query Syntax**
CALCulate<ch>:SA:MARKer<n>:BDENsity:NPR[:STATe]?

**Return Type**
Boolean

**Default**
0

---

3754
CALCulate<ch>:SA:MARKer<n>:BDENsity:POWer:BW <num>

Applicable Models: All with Spectrum Analysis Options (S9x09xxA/B, S9x090A/B)

(Read-Write) Sets and reads the bandwidth of the band power density marker.

See Critical Note

Parameters

<ch> Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, <ch> is set to 1.

<n> Marker number. If unspecified, <n> is set to 1.

<num> Choose a bandwidth.

Examples

Query Syntax

CALCulate<ch>:SA:MARKer<n>:BDENsity:POWer:BW?

Return Type

Numeric

Default

1 MHz

CALCulate<ch>:SA:MARKer<n>:BDENsity:POWer[:STATe] <bool>

Applicable Models: All with Spectrum Analysis Options (S9x09xxA/B, S9x090A/B)

(Read-Write) Sets and reads the state of the band power density marker.

See Critical Note

Parameters

<ch> Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, <ch> is set to 1.

<n> Marker number. If unspecified, <n> is set to 1.

<bool> Choose from:

0 - OFF - Turn band power density marker OFF.

1 - ON - Turn band power density marker ON.

Examples

'Select the measurement

CALC2:PAR:SEL "M2SA_CH2_A"

'Create marker3 on that measurement
'Make it a band density noise marker

CALC:SA:MARK:BDEN:POW:STAT 1

**Query Syntax**

CALCulate<ch>:SA:MARKer<n>:BDENsity:POWer?

**Return Type**

Boolean

**Default**

0

**CALCulate<ch>:SA:MARKer<n>:BDENsity:TONE:BW <num>**

**Applicable Models:** All with Spectrum Analysis Options (S9x09xxA/B, S9x090A/B)

*(Read-Write)* Sets and reads the bandwidth of the band tone density marker.

**See Critical Note**

**Parameters**

- `<ch>` Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, `<ch>` is set to 1.
- `<n>` Marker number. If unspecified, `<n>` is set to 1.
- `<num>` Choose a bandwidth.

**Examples**

CALC:SA:MARK:BDEN:TONE:BW 1e6

**Query Syntax**

CALCulate<ch>:SA:MARKer<n>:BDENsity:TONE:BW?

**Return Type**

Numeric

**Default**

1 MHz

**CALCulate<ch>:SA:MARKer<n>:BDENsity:TONE[:STATe] <bool>**
Applicable Models: All with Spectrum Analysis Options (S9x09xxA/B, S9x090A/B)

(Read-Write) Sets and reads the state of the band tone density marker.

See Critical Note

Parameters

<ch> Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, <ch> is set to 1.

<n> Marker number. If unspecified, <n> is set to 1.

<bool> Choose from:

0 - OFF - Turn band tone density marker OFF.

1 - ON - Turn band tone density marker ON.

Examples

'Select the measurement
CALC2:PAR:SEL "M2SA_CH2_A"

'Create marker3 on that measurement
CALC2:MARK3 ON

'Make it a band density noise marker
CALC:SA:MARK:BDEN:TONE:STAT 1

Query Syntax
CALCulate<ch>:SA:MARKer<n>:BDENsity:TONE?

Return Type
Boolean

Default
0
**Applicable Models:** All with Spectrum Analysis Options (S9x09xxA/B, S9x090A/B)

**(Read-Write)** Sets and reads the spacing of the band tone density marker.

**See Critical Note**

**Parameters**

- `<ch>` Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, `<ch>` is set to 1.
- `<n>` Marker number. If unspecified, `<n>` is set to 1.
- `<num>` Choose a spacing value.

**Examples**

`CALC:SA:MARK:BDEN:TONE:TSP 100e6`

**Query Syntax**

`CALCulate<ch>:SA:MARKer<n>:BDENsity:TONE:TSPacing?`

**Return Type** Numeric

**Default** 100 MHz

---

**CALCulate<ch>:SA:MARKer<n>:BPOWer:DATA?**

**Applicable Models:** All with Spectrum Analysis Options (S9x09xxA/B, S9x090A/B)

**(Read-only)** Returns the band power level from the band power marker.

**See Critical Note**

**Parameters**

- `<ch>` Channel number of the measurement. There must be a selected measurement on that SA channel. If unspecified, `<ch>` is set to 1.
- `<n>` Band power marker number. If unspecified, `<n>` is set to 1.

**Examples**

`CALC:SA:MARK:BPOW:DATA?`

`calculate2:sa:marker2:bpower:DATA?`

**Default** Not applicable

---

**CALCulate<ch>:SA:MARKer<n>:BPOWer:SPAN <num>**
**CALCulate<ch>:SA:MARKer<n>:BPOWer[:STATe] <bool>**

**Applicable Models:** All with Spectrum Analysis Options (S9x09xxA/B, S9x090A/B)

*(Read-Write)* Sets and reads the state of the band power marker. This command makes a band power marker from a generic marker. The generic marker must first be created using: `CALC:MARK:STATe`

See Critical Note

**Parameters**

- `<ch>` Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, `<ch>` is set to 1.
- `<n>` Marker number. If unspecified, `<n>` is set to 1.
- `<bool>` Choose from:
  - 0 - OFF - Turn band power marker OFF.
  - 1 - ON - Turn band power marker ON.

**Examples**

```
'Select the measurement

CALC2:PAR:SEL "M2SA_CH2_A"
```
Create marker3 on that measurement

CALC2:MARK3 ON

Make it a band power marker

CALC:SA:MARK:BPOW:STAT 1

Query Syntax

CALCulate<ch>:SA:MARKer<n>:BPOWer?

Return Type

Boolean

Default

0

CALCulate<ch>:SA:MARKer<n>:OCCBand:CENTer?

Applicable Models: All with Spectrum Analysis Options (S9x09xxA/B, S9x090A/B)

(Read-only) Returns the occupied bandwidth center frequency.

See Critical Note

Parameters

<ch> Channel number of the measurement. There must be a selected measurement on that SA channel. If unspecified, <ch> is set to 1.

<n> Marker number. If unspecified, <n> is set to 1.

Examples

CALC:SA:MARK:OCCB:CENT?

calculate2:sa:marker2:occband:cent?

Default Not applicable

CALCulate<ch>:SA:MARKer<n>:OCCBand:PERCent <num>
**Applicable Models:** All with Spectrum Analysis Options (S9x09xxA/B, S9x090A/B)

*(Read-Write)* Sets and returns the percentage of the band power to search for.

See Critical Note

**Parameters**

- `<ch>` Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, `<ch>` is set to 1.
- `<n>` Marker number. If unspecified, `<n>` is set to 1.
- `<num>` Percentage value.

**Examples**

```
calculate2:sa:marker2:occband:percent 99
```

**Query Syntax**

```
CALCulate<ch>:SA:MARKer<n>:OCCBand:PERCent?
```

**Return Type**

Numeric

**Default**

99.0

---

**CALCulate<ch>:SA:MARKer<n>:OCCBand:POWer?**

**Applicable Models:** All with Spectrum Analysis Options (S9x09xxA/B, S9x090A/B)

*(Read-only)* Returns the occupied bandwidth power.

See Critical Note

**Parameters**

- `<ch>` Channel number of the measurement. There must be a selected measurement on that SA channel. If unspecified, `<ch>` is set to 1.
- `<n>` Marker number. If unspecified, `<n>` is set to 1.

**Examples**

```
CALC:SA:MARK:OCCB:POW?
calculate2:sa:marker2:occband:power?
```

**Default**

Not applicable

---

**CALCulate<ch>:SA:MARKer<n>:OCCBand:SPAN?**
**Applicable Models:** All with Spectrum Analysis Options (S9x09xxA/B, S9x090A/B)

**(Read-only)** Returns the occupied bandwidth span.

See Critical Note

**Parameters**

- `<ch>` Channel number of the measurement. There must be a selected measurement on that SA channel. If unspecified, `<ch>` is set to 1.
- `<n>` Marker number. If unspecified, `<n>` is set to 1.

**Examples**

```
CALC:SA:MARK:OCCB:SPAN?
calculate2:sa:marker2:occband:span?
```

**Default** Not applicable

---

**CALCulate<ch>:SA:MARKer<n>:OCCBand[:STATe] <bool>**

**Applicable Models:** All with Spectrum Analysis Options (S9x09xxA/B, S9x090A/B)

**(Read-Write)** Sets and returns the occupied bandwidth on/off state.

See Critical Note

**Parameters**

- `<ch>` Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, `<ch>` is set to 1.
- `<n>` Marker number. If unspecified, `<n>` is set to 1.
- `<bool>` Choose from:
  - **0** - OFF - Turns occupied bandwidth OFF.
  - **1** - ON - Turns occupied bandwidth ON.

**Examples**

```
CALC:SA:MARK:OCCB:STAT 1
calculate2:sa:marker2:occband:state 1
```

**Query Syntax** CALCulate<ch>:SA:MARKer<n>:OCCBand[:STATe]?

**Return Type** Boolean
**Note:** If occupied band state is turned ON, then Band Power or Band Noise is turned OFF.
Calculate: Smoothing Commands

Controls point-to-point smoothing. Smoothing is a noise reduction technique that averages adjacent data points in a measurement trace. Choose the amount of smoothing by specifying either the number of points or the aperture. Smoothing is not the same as CALC:AVERage which averages each data point over a number of sweeps.

These commands are Superseded by the CALCulate:MEASure:SMoothing commands.

![CALCulate:SMoothing Diagram]

Click on a keyword to view the command details.

See Also

- Example Programs
- Learn about Smoothing
- Synchronizing the Analyzer and Controller
- SCPI Command Tree

Critical Note: CALCulate commands act on the selected measurement. You can select one measurement for each channel using Calc:Par:MNUM or Calc:Par:Select. Learn more.

CALCulate<cnum>:SMOothing:APERture <num>
**Applicable Models:** N522xB, N523xB, N524xB, M937xA, P937xA

*(Read-Write)* Sets the amount of smoothing as a percentage of the number of data points in the channel.

See Critical Note

**Parameters**

- `<cnum>` Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, `<cnum>` is set to 1.
- `<num>` Percentage value. Choose any number between: 1 and 25

**Examples**

```plaintext
CALC:SMO:APER 2

calculate2:smoothing:aperture 20.7
```

**Query Syntax**

CALCulate<cnum>:SMOothing:APERture?

**Return Type** Numeric

**Default** 1.5

**CALCulate<cnum>:SMOothing:POINts <num>**

**Applicable Models:** N522xB, N523xB, N524xB, M937xA, P937xA

*(Read-Write)* Sets the number of adjacent data points to average.

See Critical Note

**Parameters**

- `<cnum>` Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, `<cnum>` is set to 1.
- `<num>` Number of points from 1 point to maximum of 25% of data points in the channel. For example: if number of points in a data trace = 401, the maximum value for points = 100. The points value is always rounded to the closest odd number.

**Examples**

```plaintext
CALC:SMO:POIN 50

calculate2:smoothing:points 21
```

**Query Syntax**

CALCulate<cnum>:SMOothing:POINts?

**Return Type** Numeric

**Default** 3
CALCulate<cnum>:SMOothing[:STATe] <ON | OFF>

Applicable Models: N522xB, N523xB, N524xB, M937xA, P937xA

(Read-Write) Turns data smoothing ON or OFF.

See Critical Note

Parameters

<cnum> Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, <cnum> is set to 1.

<ON | OFF> ON (or 1) - turns smoothing ON.
           OFF (or 0) - turns smoothing OFF.

Examples

CALC:SMO ON
calculate2:smoothing:state off

Query Syntax CALCulate<cnum>:SMOothing[:STATe]?

Return Type Boolean (1 = ON, 0 = OFF)

Default OFF

**CALCulate<cnum>:TDR:ALLocate <enum>**

**Applicable Models:** All with TDR Options (S9x011A/B)

**(Read-Write)** This command sets the type of parameter and format allocation for each trace.

**Parameters**

- `<cnum>` Channel number of the measurement. If unspecified, `<cnum>` is set to 1.
- `<enum>` Parameters to display. Choose from:
  
  **SPARameters** - Display all S-parameter data.
  
  **TPARameters** - Display all Time domain data.
  
  **MIXed** - Display a mix of commonly measured time-domain and S-parameter data.

**Examples**

```
CALC:TDR:ALL SPAR
```

```
calculate2:tdr:allocate spparameters
```

**Query Syntax**

```
CALCulate<cnum>:TDR:ALLocate?
```

**Return Type**

String

**Default**

MIXed
CALCulate<cnum>:TDR:DEVice <enum>

**Applicable Models:** All with TDR Options (S9x011A/B)

*(Read-Write)* This command sets the DUT topology.

**Parameters**

- `<cnum>` Channel number of the measurement. If unspecified, `<cnum>` is set to 1.
- `<enum>` Topology. Choose from:
  - **SEND1** - Single-ended, 1-port.
  - **SEND2** - Single-ended, 2-port.
  - **DIF1** - Differential, 1-port.
  - **SEND4** - Single-ended, 4-port.
  - **DIF2** - Differential, 2-port.

**Examples**

```
CALC:TDR:DEV SEND2
calculate2:tdr:device:send2
```

**Query Syntax**

CALCulate<cnum>:TDR:DEVice?

**Return Type** String

**Default** SEND1
**Applicable Models:** All with TDR Options (S9x011A/B)

*(Read-Write)* This command sets the filename of the s4p de-embedding user file.

**Parameters**
- `<cnum>`: Channel number of the measurement. If unspecified, `<cnum>` is set to 1.
- `<pnum>`: Port number for balance port. If unspecified, `<pnum>` is set to 1.
- `<file>`: File Name. This file is saved as a 4-port touchstone file with the .s4p extensions.

**Examples**
- `CALC:TDR:DEEM:BPOR1:FIL "test.s4p"`
- `calculate2:tdr:deem:bport2:filename "test.s4p"`

**Query Syntax**
- `CALCulate<cnum>:TDR:DEEM:BPOR<pnum>:FILename?`

**Return Type**
- `String`

**Default**
- " " (Empty String)

---

**Applicable Models:** All with TDR Options (S9x011A/B)

*(Read-Write)* This command sets s4p de-embedding function state ON/OFF.

**Parameters**
- `<cnum>`: Channel number of the measurement. If unspecified, `<cnum>` is set to 1.
- `<pnum>`: Port number for balance port. If unspecified, `<pnum>` is set to 1.
- `<bool>`: ON or 1 - Turns s4p de-embedding function ON.
  - OFF or 0 - Turns s4p de-embedding function OFF.

**Examples**
- `CALC:TDR:DEEM:BPOR1:STAT ON`
- `calculate2:tdr:deem:bport2:state off`

**Query Syntax**
- `CALCulate<cnum>:TDR:DEEM:BPOR<pnum>:STATe?`

**Return Type**
- `Boolean`

**Default**
- OFF

---

```bash
CALCulate<cnum>:TDR:DEEM:PORT<pnum>:FILENAME <file>
```
**Applicable Models:** All with TDR Options (S9x011A/B)

(Read-Write) This command sets the filename of the s2p de-embedding user file.

**Parameters**

- `<cnum>` Channel number of the measurement. If unspecified, `<cnum>` is set to 1.
- `<pnum>` Port number. If unspecified, `<pnum>` is set to 1.
- `<file>` File Name. This file is saved as a 2-port touchstone file with the .s2p extensions.

**Examples**

```
CALC:TDR:DEEM:PORT1:FIL "test.s2p"
calculate2:tdr:deem:port2:filename "test.s2p"
```

**Query Syntax**

CALCulate<cnum>:TDR:DEEM:PORT<pnum>:FILENAME?

**Return Type**

String

**Default**

"" (Empty String)

---

**CALCulate<cnum>:TDR:DEEM:PORT<pnum>:STATe <bool>**

**Applicable Models:** All with TDR Options (S9x011A/B)

(Read-Write) This command sets s2p de-embedding function state ON/OFF.

**Parameters**

- `<cnum>` Channel number of the measurement. If unspecified, `<cnum>` is set to 1.
- `<pnum>` Port number. If unspecified, `<pnum>` is set to 1.
- `<bool>` ON or 1 - Turns s2p de-embedding function ON.
  OFF or 0 - Turns s2p de-embedding function OFF.

**Examples**

```
CALC:TDR:DEEM:PORT1:STAT ON
calculate2:tdr:deem:port2:state off
```

**Query Syntax**

CALCulate<cnum>:TDR:DEEM:PORT<pnum>:STATe?

**Return Type**

Boolean

**Default**

OFF

---

**CALCulate<cnum>:TDR:DEEM:STATe <bool>**
**Applicable Models:** All with TDR Options (S9x011A/B)

(Read-Write) This command sets de-embedding function state ON/OFF.

**Parameters**

- `<cnum>`: Channel number of the measurement. If unspecified, `<cnum>` is set to 1.
- `<bool>`: ON or 1 - Turns de-embedding function ON. OFF or 0 - Turns de-embedding function OFF.

**Examples**

```
CALC:TDR:DEEM:STAT ON
calculate2:tdr:deem:state off
```

**Query Syntax**

```
CALCulate<cnum>:TDR:DEEM::STATe?
```

**Return Type**

Boolean

**Default**

OFF

---

**CALCulate<cnum>:TDR:EMPHasis:CURSor:POST1 <value>**

**Applicable Models:** All with TDR Options (S9x011A/B)

(Read-Write) This command sets the emphasis post1 level.

**Parameters**

- `<cnum>`: Channel number of the measurement. If unspecified, `<cnum>` is set to 1.
- `<value>`: Post1 level value. The range is -20 dB to +20 dB.

**Examples**

```
CALC:TDR:EMPH:CURS:POST1 3
calculate2:tdr:emphasis:cursor:post1 3
```

**Query Syntax**

```
CALCulate<cnum>:TDR:EMPH:CURS:POST1?
```

**Return Type**

Double

**Default**

0

---

**CALCulate<cnum>:TDR:EMPHasis:CURSor:POST2 <value>**
**CALCulate<cnump>:TDR:EMPHasis:CURSor:POST2 3**

**CALCulate<cnump>:TDR:EMPHasis:CURSor:PRE1 2**

**CALCulate<cnump>:TDR:EMPHasis:STATe ON**
CALCulate<cnum>:TDR:EQUalization:CTLE:DC <value>

Applicable Models: All with TDR Options (S9x011A/B)

(Read-Write) This command sets the equalization CTLE (Continuous Time Linear Equalization) DC gain parameter.

Parameters
- <cnum> Channel number of the measurement. If unspecified, <cnum> is set to 1.
- <value> CTLE value. The range is 0 to 10.

Examples
- CALC:TDR:EQU:CTLE:DC 0.077
- calculate2:tdr:equalization:ctle:dc 0.077

Query Syntax
- CALCulate<cnum>:TDR:EQUalization:CTLE:DC?

Return Type
- Double

Default
- 0.667

CALCulate<cnum>:TDR:EQUalization:CTLE:POLE1 <value>

Applicable Models: All with TDR Options (S9x011A/B)

(Read-Write) This command sets the equalization CTLE (Continuous Time Linear Equalization) Pole1 parameter.

Parameters
- <cnum> Channel number of the measurement. If unspecified, <cnum> is set to 1.
- <value> CTLE value. The range is 0 to 76E9 in Hz.

Examples
- CALC:TDR:EQU:CTLE:POLE1 2E9
- calculate2:tdr:equalization:ctle:pole1 2e9

Query Syntax
- CALCulate<cnum>:TDR:EQUalization:CTLE:POLE1?

Return Type
- Double

Default
- 1.95E9

CALCulate<cnum>:TDR:EQUalization:CTLE:POLE2 <value>
Applicable Models: All with TDR Options (S9x011A/B)

(Read-Write) This command sets the equalization CTLE (Continuous Time Linear Equalization) Pole2 parameter.

Parameters
- `<cnum>` Channel number of the measurement. If unspecified, `<cnum>` is set to 1.
- `<value>` CTLE value. The range is 0 to 76E9 in Hz.

Examples
- `CALC:TDR:EQU:CTLE:POLE2 2E9`
- `calculate2:tdr:equalization:ctle:pole2 2e9`

Query Syntax
- `CALCulate<cnum>:TDR:EQUalization:CTLE:POLE2?`

Return Type
- Double

Default
- 5E9

CALCulate<cnum>:TDR:EQUalization:CTLE:ZERO1 <value>

Applicable Models: All with TDR Options (S9x011A/B)

(Read-Write) This command sets the equalization CTLE (Continuous Time Linear Equalization) zero parameter.

Parameters
- `<cnum>` Channel number of the measurement. If unspecified, `<cnum>` is set to 1.
- `<value>` CTLE value. The range is 0 to 76E9 in Hz.

Examples
- `CALC:TDR:EQU:CTLE:ZERO1 650E6`
- `calculate2:tdr:equalization:ctle:zero1 650e6`

Query Syntax
- `CALCulate<cnum>:TDR:EQUalization:CTLE:ZERO1?`

Return Type
- Double

Default
- 650E6

CALCulate<cnum>:TDR:EQUalization:FILENAME <file>
**Applicable Models:** All with TDR Options (S9x011A/B)

*(Read-Write)* This command sets the filename of the equalization equation user file. It is necessary to select the file using CALCulate:TDR:EQUalization:TYPE and turn ON the :CALCulate:TDR:EQUalization:STATe. This file is saved with .csv extension.

Specify the file name with the extension. When you use directory names (folder names) and file name, separate them with "\" (back slash), or "/" (slash).

**Parameters**
- `<cnum>`: Channel number of the measurement. If unspecified, `<cnum>` is set to 1.
- `<file>`: Filename up to 254 characters.

**Examples**
- `CALC:TDR:EQU:FIL "C:\folder\User.csv"`
- `calculate2:tdr:equalization:filename "C:\folder\User.csv"`

**Query Syntax**
- `CALCulate<cnum>:TDR:EQUalization:FILename?`

**Return Type**
- String

**Default**
- " " (Empty String)

**CALCulate<cnum>:TDR:EQUalization:STATe <bool>**

*Applicable Models:* All with TDR Options (S9x011A/B)

*(Read-Write)* Turns the equalization function state ON or OFF.

**Parameters**
- `<cnum>`: Channel number of the measurement. If unspecified, `<cnum>` is set to 1.
- `<bool>`: ON or 1 - Turns equalization ON. OFF or 0 - Turns equalization OFF.

**Examples**
- `CALC:TDR:EQU:STAT ON`
- `calculate2:tdr:equalization:state off`

**Query Syntax**
- `CALCulate<cnum>:TDR:EQUalization:STATe?`

**Return Type**
- Boolean

**Default**
- OFF

**CALCulate<cnum>:TDR:EQUalization:TYPE <enum>**
**Applicable Models:** All with TDR Options (S9x011A/B)

*(Read-Write)* This command sets the equalization type.

**Parameters**

- `<cnum>` Channel number of the measurement. If unspecified, `<cnum>` is set to 1.
- `<enum>` Equalization type. Choose from:
  - **EQUation** - Option to enter values for equation calculation.
  - **USER** - Load user file.

**Examples**

- `CALC:TDR:EQU:TYPE EQU`
- `calculate2:tdr:equalization:type equation`

**Query Syntax**

`CALCulate<cnum>:TDR:EQUalization:TYPE?`

**Return Type** Double

**Default** EQUation

---

**CALCulate<cnum>:TDR:EYE:EXECute**

**Applicable Models:** All with TDR Options (S9x011A/B)

*(Write-only)* This command performs the calculation for the simulated eye diagram for the active trace.

**Parameters**

- `<cnum>` Channel number of the measurement. If unspecified, `<cnum>` is set to 1.

**Example**

- `CALC:TDR:EYE:STAT ON`
- `CALC:PAR:MNUM:SEL 3`
- `CALC:TDR:EYE:EXEC`

---

**CALCulate<cnum>:TDR:EYE:INPut:BPATtern:LENGth <value>**
**Applicable Models:** All with TDR Options (S9x011A/B)

(Read-Write) This command sets the bits’ power of 2 for a PRBS pattern. This value is used only when the selected bit pattern type is PRBS.

**Parameters**
- `<cnum>`: Channel number of the measurement. If unspecified, `<cnum>` is set to 1.
- `<value>`: Bit pattern power of 2. The range is 3 to 15 (resolution is 1).

**Examples**
- `CALC:TDR:EYE:INP:BPAT:TYPE PRBS`
- `CALC:TDR:EYE:INP:BPAT:LENG 7`

**Query Syntax**
- `CALCulate<cnum>:TDR:EYE:INPut:BPATtern:LENGth?`

**Return Type**
- Integer

**Default**
- 7

---

**CALCulate<cnum>:TDR:EYE:INPut:BPATtern:TYPE <enum>**

**Applicable Models:** All with TDR Options (S9x011A/B)

(Read-Write) This command sets the bit pattern type for the simulated eye function.

**Parameters**
- `<cnum>`: Channel number of the measurement. If unspecified, `<cnum>` is set to 1.
- `<enum>`: Eye pattern type. Choose from:
  - **PRBS** - Pseudo-Random Bit Sequence.
  - **K285** - K 28.5.
  - **USER** - Custom user-defined pattern.
  - **STAT** - Statistical calculation.

**Examples**

**Query Syntax**
- `CALCulate<cnum>:TDR:EYE:INPut:BPATtern:TYPE?`

**Return Type**
- String

**Default**
- PRBS

---

**CALCulate<cnum>:TDR:EYE:INPut:DRATe <value>**
Applicable Models: All with TDR Options (S9x011A/B)

(Read-Write) This command sets the bit rate in bits/sec for the simulated eye function.

Parameters
- `<cnum>`: Channel number of the measurement. If unspecified, `<cnum>` is set to 1.
- `<value>`: Bit rate in bits/sec. The range is 1.21M to 60.8G.

Examples
- `CALC:TDR:EYE:INP:DRAT 1.1E9`
- `calculate2:tdr:eye:input:drate 1.1e9`

Query Syntax: `CALCulate<cnum>:TDR:EYE:INPut:DRATe?`

Return Type: Double

Default: 1G

CALCulate<cnum>:TDR:EYE:INPut:JITTer:DLIMit <value>

Applicable Models: All with TDR Options (S9x011A/B)

(Read-Write) This command sets the display limit value.

Parameters
- `<cnum>`: Channel number of the measurement. If unspecified, `<cnum>` is set to 1.
- `<value>`: Display limit value. The range is 0 to 1.

Examples
- `CALC:TDR:EYE:INP:JITT:DLIM 0`
- `calculate2:tdr:eye:input:jitter:dlimit 0`

Query Syntax: `CALCulate<cnum>:TDR:EYE:INPut:JITTer:DLIMit?`

Return Type: Double

Default: 1E-9

CALCulate<cnum>:TDR:EYE:INPut:JITTer:PERiodic:FREQuency <value>

Applicable Models: All with TDR Options (S9x011A/B)

(Read-Write) This command sets the periodic jitter frequency. This value is used only when the periodic jitter function type is selected.

Parameters
- `<cnum>`: Channel number of the measurement. If unspecified, `<cnum>` is set to 1.
- `<value>`: Periodic jitter frequency in Hz. The range is 0 to TDR eye jitter max frequency.

Examples
- `CALC:TDR:EYE:INP:JITT:PER:FREQ 0`
- `calculate2:tdr:eye:input:jitter:periodic:frequency 0`

Return Type: Double

Default: 500E3
CALCulate\(<\text{cnum}>\)::TDR:EYE:INPut:JITTer:PERiodic:MAGNitude \(<\text{value}>\)

**Applicable Models:** All with TDR Options (S9x011A/B)

*(Read-Write)* This command sets the periodic jitter magnitude in rms. This value is used only when periodic jitter function type is selected.

**Parameters**
- \(<\text{cnum}>\): Channel number of the measurement. If unspecified, \(<\text{cnum}>\) is set to 1.
- \(<\text{value}>\): Periodic jitter magnitude. The range is 0 to 1 UI.

**Examples**
- **CALC::TDR::EYE::INP::JITT::TYPE::PER**
- **CALC::TDR::EYE::INP::JITT::PER::MAGN 0.5**

**Query Syntax**

```
CALCulate\(<\text{cnum}>\)::TDR:EYE:INPut:JITTer:PERiodic:MAGNitude? 
```

**Return Type**

Double

**Default**

0

CALCulate\(<\text{cnum}>\)::TDR:EYE:INPut:JITTer:RANDom:MAGNitude \(<\text{value}>\)

**Applicable Models:** All with TDR Options (S9x011A/B)

*(Read-Write)* This command sets the random jitter magnitude in rms. This value is used only when random jitter function type is selected.

**Parameters**
- \(<\text{cnum}>\): Channel number of the measurement. If unspecified, \(<\text{cnum}>\) is set to 1.
- \(<\text{value}>\): Random jitter magnitude. The range is 0 to 0.25 UI.

**Examples**
- **CALC::TDR::EYE::INP::JITT::TYPE::RAND**
- **CALC::TDR::EYE::INP::JITT::RAND::MAGN 0.05**

**Query Syntax**

```
CALCulate\(<\text{cnum}>\)::TDR:EYE:INPut:JITTer:RANDom:MAGNitude? 
```

**Return Type**

Double

**Default**

0

CALCulate\(<\text{cnum}>\)::TDR:EYE:INPut:JITTer:STATe \(<\text{bool}>\)
**Applicable Models:** All with TDR Options (S9x011A/B)

**(Read-Write)** Turns the jitter function state with simulated eye ON or OFF.

**Parameters**
- `<cnum>`: Channel number of the measurement. If unspecified, `<cnum>` is set to 1.
- `<bool>`: ON or 1 - Turns jitter ON.
  OFF or 0 - Turns jitter OFF.

**Examples**
```
CALC:TDR:EYE:INP:JITT:STAT ON  
calculate2:tdr:eye:input:jitter:state off
```

**Query Syntax**
```
CALCulate<cnum>:TDR:EYE:INPut:JITTer:STATe?
```

**Return Type**
Boolean

**Default**
OFF

---

**CALCulate<cnum>:TDR:EYE:INPut:JITTer:TYPE <enum>**

**Applicable Models:** All with TDR Options (S9x011A/B)

**(Read-Write)** This command sets the jitter function type for the simulated eye function.

**Parameters**
- `<cnum>`: Channel number of the measurement. If unspecified, `<cnum>` is set to 1.
- `<enum>`: Jitter type. Choose from:
  - **RANDom** - Random jitter function.
  - **PERiodic** - Periodic jitter function.

**Examples**
```
CALC:TDR:EYE:INP:JITT:TYPE RAND  
calculate2:tdr:eye:input:jitter:type random
```

**Query Syntax**
```
CALCulate<cnum>:TDR:EYE:INPut:JITTer:TYPE?
```

**Return Type**
String

**Default**
PERiodic

---

**CALCulate<cnum>:TDR:EYE:INPut:OLEVel <value>**
**Applicable Models:** All with TDR Options (S9x011A/B)

*(Read-Write)* This command sets the voltage level for bit "1" for the simulated eye function.

**Parameters**
- `<cnum>`: Channel number of the measurement. If unspecified, `<cnum>` is set to 1.
- `<value>`: Level for bit "1". The range is -5 V to +5 V.

**Examples**
- `CALC:TDR:EYE:INP:OLEV 100E-3`
- `calculate2:tdr:eye:input:olevel 100e-3`

**Query Syntax**
- `CALCulate<cnum>:TDR:EYE:INPut:OLEVel?`

**Return Type**
- Double

**Default**
- 0.2

---

**CALCulate<cnum>:TDR:EYE:INPut:RTIMe:DATA <value>**

**Applicable Models:** All with TDR Options (S9x011A/B)

*(Read-Write)* This command sets the rise time value for the simulated eye function.

**Parameters**
- `<cnum>`: Channel number of the measurement. If unspecified, `<cnum>` is set to 1.
- `<value>`: Rise time for simulated eye function in seconds.

**Examples**
- `CALC:TDR:EYE:INP:RTIM:DATA 90E-12`
- `calculate2:tdr:eye:input:rtime:data 90e-12`

**Query Syntax**
- `CALCulate<cnum>:TDR:EYE:INPut:RTIMe:DATA?`

**Return Type**
- Double

**Default**
- 35E-12

---

**CALCulate<cnum>:TDR:EYE:INPut:RTIMe:THReshold <enum>**
**Applicable Models:** All with TDR Options (S9x011A/B)

*(Read-Write)* This command sets the rise time threshold for the simulated eye.

**Parameters**

- `<cnum>` Channel number of the measurement. If unspecified, `<cnum>` is set to 1.
- `<enum>` Threshold levels. Choose from:
  - **T1_9** - 10% to 90%.
  - **T2_8** - 20% to 80%.

**Examples**

```
CALC:TDR:EYE:INP:RTIM:THR T1_9
```
```
calculate2:tdr:eye:input:rtime:threshold t1_9
```

**Query Syntax**

`CALCulate<cnum>:TDR:EYE:INPut:RTIMe:THReshold?`

**Return Type** String

**Default** T1_9

---

**CALCulate<cnum>:TDR:EYE:INPut:ZLEVel <value>**

**Applicable Models:** All with TDR Options (S9x011A/B)

*(Read-Write)* This command sets the voltage level for bit "0" for the simulated eye function.

**Parameters**

- `<cnum>` Channel number of the measurement. If unspecified, `<cnum>` is set to 1.
- `<value>` Voltage level for bit "0". The range is -5 V to +5 V.

**Examples**

```
CALC:TDR:EYE:INP:ZLEV 100E-3
```
```
calculate2:tdr:eye:input:zlevel 100e-3
```

**Query Syntax**

`CALCulate<cnum>:TDR:EYE:INPut:ZLEVEL?`

**Return Type** Double

**Default** 0

---

**CALCulate<cnum>:TDR:EYE:MASK:FAIL?**
**Applicable Models:** All with TDR Options (S9x011A/B)

(Read-only) This command returns the mask test result.

**Parameters**

- `<cnum>`: Channel number of the measurement. If unspecified, `<cnum>` is set to 1.

**Examples**

- `CALC:TDR:EYE:MASK:FAIL?`
- `calculate2:tdr:eye:mask:fail?`

**Return Type**

Boolean

- ON or 1 - Mask test fail.
- OFF or 0 - Mask test pass.

**Default**

Not Applicable

---

**CALCulate<cnum>:TDR:EYE:MASK:STATe <bool>**

**Applicable Models:** All with TDR Options (S9x011A/B)

(Read-Write) Turns the mask test function state with simulated eye ON or OFF.

**Parameters**

- `<cnum>`: Channel number of the measurement. If unspecified, `<cnum>` is set to 1.
- `<bool>`: ON or 1 - Turns mask test ON.  
  OFF or 0 - Turns mask test OFF.

**Examples**

- `CALC:TDR:EYE:MASK:STAT ON`
- `calculate2:tdr:eye:mask:state off`

**Query Syntax**

`CALCulate<cnum>:TDR:EYE:MASK:STATe?`

**Return Type**

Boolean

**Default**

OFF

---

**CALCulate<cnum>:TDR:EYE:RESults:DATA?**

**Applicable Models:** All with TDR Options (S9x011A/B)

(Read-only) This command returns the results of the eye measurement. There are 18 values returned. The minimum and maximum values are returned in addition to the displayed results (16 values) on the TDR application GUI.

**Parameters**

- `<cnum>`: Channel number of the measurement. If unspecified, `<cnum>` is set to 1.

**Examples**

- `CALC:TDR:EYE:RESults:DATA?`
- `calculate2:tdr:eye:results:data?`

**Return Type**

Variant Array

**Default**

Not Applicable
CALCulate<cnum>:TDR:EYE:RESults:DISPlay:STATe <bool>

**Applicable Models:** All with TDR Options (S9x011A/B)

*(Read-Write)* Turns the overlay ON or OFF.

**Parameters**
- `<cnum>`: Channel number of the measurement. If unspecified, `<cnum>` is set to 1.
- `<bool>`: ON or 1 - Turns overlay ON.
  
  OFF or 0 - Turns overlay OFF.

**Examples**
- `CALC:TDR:EYE:RES:DISP:STAT ON`
- `CALCulate2:tdr:eye:results:display:state off`

**Query Syntax**
- `CALCulate<cnum>:TDR:EYE:RESulsts:DISPlay:STATe?`

**Return Type**
- Boolean

**Default**
- ON

CALCulate<cnum>:TDR:EYE:RESults:THReshold <enum>

**Applicable Models:** All with TDR Options (S9x011A/B)

*(Read-Write)* This command sets the rise time threshold level for the results of eye measurement.

**Parameters**
- `<cnum>`: Channel number of the measurement. If unspecified, `<cnum>` is set to 1.
- `<enum>`: Threshold levels. Choose from:
  - **T1_9** - 10% to 90%.
  - **T2_8** - 20% to 80%.

**Examples**
- `CALC:TDR:EYE:RES:THR T1_9`
- `CALCulate2:tdr:eye:results:threshold t1_9`

**Query Syntax**
- `CALCulate<cnum>:TDR:EYE:RESulsts:THReshold?`

**Return Type**
- String

**Default**
- T1_9

CALCulate<cnum>:TDR:EYE:STATe <bool>
**Applicable Models:** All with TDR Options (S9x011A/B)

**(Read-Write)** Turns the Eye/Mask window ON or OFF.

**Parameters**
- `<cnum>`: Channel number of the measurement. If unspecified, `<cnum>` is set to 1.
- `<bool>`: ON or 1 - Turns Eye/Mask window ON.
  OFF or 0 - Turns Eye/Mask window OFF.

**Examples**
- `CALC:TDR:EYE:STAT ON`
- `calculate2:tdr:eye:state off`

**Query Syntax**
- `CALCulate<cnum>:TDR:EYE:STATe?`

**Return Type**
- Boolean
- Default: OFF

**CALCulate<cnum>:TDR:MEASure[1-256]:ACTive:MARKer <value>**

**Applicable Models:** All with TDR Options (S9x011A/B)

**(Read-Write)** This command sets active marker number.

**Parameters**
- `<cnum>`: Channel number of the measurement. If unspecified, `<cnum>` is set to 1.
- `<value>`: Marker number to activate. The range is 0 to 10.

**Examples**
- `CALC:TDR:MEAS1:ACT:MARK 1`
- `calculate2:tdr:measure1:active:marker 1`

**Query Syntax**
- `CALCulate<cnum>:TDR:MEASure[1-256]:ACTive:MARKer?`

**Return Type**
- Integer
- Default: 0

**CALCulate<cnum>:TDR:MEASure[1-256]:DTIMe:DATA?**

**Applicable Models:** All with TDR Options (S9x011A/B)

**(Read-only)** This command returns the delta time result value. You can get the result even if `CALCulate:TDR:MEASure:DTIMe:STATe` is off.

**Parameters**
- `<cnum>`: Channel number of the measurement. If unspecified, `<cnum>` is set to 1.

**Examples**
- `CALC:TDR:MEAS1:DTIM:DATA?`
- `calculate2:tdr:measure1:dtime:data?`

**Return Type**
- Double
- Default: Not Applicable
**CALCulate\(<\text{cnum}\>):TDR:MEASure[1-256]:DTIMe:POSition \(<\text{value}\>)**

**Applicable Models:** All with TDR Options (S9x011A/B)

(Read-Write) This command sets delta time reference position.

**Parameters**

- **\(<\text{cnum}\)>** Channel number of the measurement. If unspecified, \(<\text{cnum}\)> is set to 1.
- **\(<\text{value}\)>** Delta time reference position. The range is 0 to 100.

**Examples**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>CALC:TDR:MEAS1:DTIM:POS 0</code></td>
<td><code>calculate2:tdr:measure1:dtime:position 0</code></td>
</tr>
</tbody>
</table>

**Query Syntax**

`CALCulate\(<\text{cnum}\>):TDR:MEASure[1-256]:DTIMe:POSition?`

**Return Type**

Double

**Default**

50

---

**CALCulate\(<\text{cnum}\>):TDR:MEASure[1-256]:DTIMe:STATe \(<\text{bool}\>)**

**Applicable Models:** All with TDR Options (S9x011A/B)

(Read-Write) Turns the delta time marker in the marker search ON or OFF.

**Parameters**

- **\(<\text{cnum}\)>** Channel number of the measurement. If unspecified, \(<\text{cnum}\)> is set to 1.
- **\(<\text{bool}\)>** ON or 1 - Turns delta time marker ON.
  
  OFF or 0 - Turns delta time marker OFF.

**Examples**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
</table>

**Query Syntax**

`CALCulate\(<\text{cnum}\>):TDR:MEASure[1-256]:DTIMe:STATe?`

**Return Type**

Boolean

**Default**

OFF

---

**CALCulate\(<\text{cnum}\>):TDR:MEASure[1-256]:DTIMe:TARGet \(<\text{value}\>)**
**Applicable Models:** All with TDR Options (S9x011A/B)

**(Read-Write)** This command sets the target trace number for the delta time function. The MEASure[1-256] is the trace number starting point for delta time. The <value> is the trace number stopping point for delta time.

**Parameters**
- `<cnum>` Channel number of the measurement. If unspecified, `<cnum>` is set to 1.
- `<value>` Trace number stopping point for delta time. The range is 1 to 16.

**Examples**
- `CALC:TDR:MEAS1:DTIM:TARG 5`
- `calculate2:tdr:measure1:dtime:target 5`

**Query Syntax**
- `CALCulate<cnum>:TDR:MEASure[1-256]:DTIMe:TARGet?`

**Return Type**
- Integer

**Default**
- 1

---

**CALCulate<cnum>:TDR:MEASure[1-256]:FORMat <enum>**

**Applicable Models:** All with TDR Options (S9x011A/B)

**(Read-Write)** This command sets the trace format.

**Parameters**
- `<cnum>` Channel number of the measurement. If unspecified, `<cnum>` is set to 1.
- `<enum>` Trace format.

For S-Parameter measurements, choose from:
- MLINear
- MLOGarithmic
- PHASe
- UPHase
- IMAGinary
- REAL
- POLar
- SMITh
- SADMittance
For Time Domain measurements, choose from:

- IMPedance
- VOLT
- MLOGarithmic
- MLINear
- REAL

Examples:

```
CALC:TDR:MEAS1:FORM IMP
calculate2:tdr:measure1:format impedance
```

Query Syntax:

```
CALCulate<cnum>:TDR:MEASure[1-256]:FORMat?
```

Return Type:

String

Default:

MLINear

```
CALCulate<cnum>:TDR:MEASure[1-256]:MARKer:REference[:STATe] <ON | OFF>
```
**Applicable Models:** All with TDR Options (S9x011A/B)

*(Read-Write)* Turns the reference marker ON or OFF.

**Parameters**

- `<cnum>` Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, `<cnum>` is set to 1.
- `<ON | OFF>` **ON** (or 1) - turns reference marker ON  
  **OFF** (or 0) - turns reference marker ON

**Examples**

```
CALC:TDR:MEAS1:MARK:REF ON
```

**Query Syntax**

`CALCulate<cnum>:TDR:MEASure[1-256]:MARKer:REFerence[:STATe]?

**Return Type**

Boolean

**Default**

Off

---

**CALCulate<cnum>:TDR:MEASure[1-256]:MARKer<mkr>:STATe <ON|OFF>**

**Applicable Models:** All with TDR Options (S9x011A/B)

*(Read-Write)* Turns the specified marker ON or OFF.

**Parameters**

- `<cnum>` Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, `<cnum>` is set to 1.
- `<mkr>` Any marker number from 1 to 15; if unspecified, value is set to 1.
- `<ON|OFF>` **ON** (or 1) - turns marker ON.  
  **OFF** (or 0) - turns marker OFF.

**Examples**

```
CALC:TDR:MEAS1:MARK ON
calculate2:tdr:measure1:marker8 on
```

**Query Syntax**

`CALCulate<cnum>:TDR:MEASure[1-256]:MARKer<mkr>:STATe?`

**Return Type**

Boolean

**Default**

Off

---

`CALCulate<cnum>:TDR:MEASure[1-256]:PARameter <string>`
Applicable Models: All with TDR Options (S9x011A/B)

**Parameters**

- `<cnum>` Channel number of the measurement. If unspecified, `<cnum>` is set to 1.
- `<sting>` Measurement parameter.

For S-Parameter measurements:

- Sxy
- Sddy
- Sdcxy
- Scdxy
- Sccxy
- X: 1 to 4
- Y: 1 to 4

For Time Domain measurements:

- Txy
- Tddy
- Tdcxy
- Tcdxy
- Tccxy

**Examples**

```
CALC:TDR:MEAS1:PAR T11
calculate2:tdr:measure1:parameter t11
```

**Query Syntax**

CALCulate<cnum>:TDR:MEASure[1-256]:PARameter?

**Return Type**

String

**Default**

S11

CALCulate<cnum>:TDR:MEASure[1-256]:PEELing:STATe <bool>
**Applicable Models:** All with TDR Options (S9x011A/B)

(Read-Write) This command sets state for the peeling function.

**Parameters**
- `<cnum>`: Channel number of the measurement. If unspecified, `<cnum>` is set to 1.
- `<bool>`: ON or 1 - Turns peeling function ON.
  OFF or 0 - Turns peeling function OFF.

**Examples**
- `CALC:TDR:MEAS1:PEEL:STAT ON`
- `calculate2:tdr:measure1:peeling:state off`

**Query Syntax**
`CALCulate<cnum>:TDR:MEASure[1-256]:PEELing:STATe?`

**Return Type**
Boolean

**Default**
OFF

**CALCulate<cnum>:TDR:MEASure[1-256]:SMOothing:STATe <bool>**

**Applicable Models:** All with TDR Options (S9x011A/B)

(Read-Write) This command sets state for the smoothing function.

**Parameters**
- `<cnum>`: Channel number of the measurement. If unspecified, `<cnum>` is set to 1.
- `<bool>`: ON or 1 - Turns smoothing function ON.
  OFF or 0 - Turns smoothing function OFF.

**Examples**
- `CALC:TDR:MEAS1:SMO:STAT ON`
- `calculate2:tdr:measure1:smoothing:state off`

**Query Syntax**
`CALCulate<cnum>:TDR:MEASure[1-256]:SMOothing:STATe?`

**Return Type**
Boolean

**Default**
OFF

**CALCulate<cnum>:TDR:MEASure[1-256]:TIME:IMPulse:WIDTh <value>**

**Applicable Models:** All with TDR Options (S9x011A/B)

(Read-Write) This command sets the impulse width value for the transform function.

**Parameters**
- `<cnum>`: Channel number of the measurement. If unspecified, `<cnum>` is set to 1.
- `<value>`: Transform function impulse width value.

**Examples**
- `CALC:TDR:MEAS1:TIME:IMP:WIDT 17E-12`
- `calculate2:tdr:measure1:time:impulse:width 17e-12`

**Query Syntax**
`CALCulate<cnum>:TDR:MEASure[1-256]:TIME:IMPulse:WIDTh?`

**Return Type**
Double

**Default**
0
CALCulate<cnum>:TDR:MEASure[1-256]:TIME:STEP:COUPle <bool>

**Applicable Models:** All with TDR Options (S9x011A/B)

*(Read-Write)* This command enables/disables rise time coupling.

**Parameters**
- **<cnum>** Channel number of the measurement. If unspecified, <cnum> is set to 1.
- **<bool>**
  - ON or 1 - Turns rise time coupling ON.
  - OFF or 0 - Turns rise time coupling OFF.

**Examples**

```
CALC:TDR:MEAS:TIME:STEP:COUP ON
calculate2:tdr:meas:time:step:couple_off
```

**Query Syntax**
CALCulate<cnum>:TDR:MEAS:TIME:STEP:COUPle?

**Return Type** Boolean

**Default** ON

---

CALCulate<cnum>:TDR:MEASure[1-256]:TIME:STEP:RTIMe <value>

**Applicable Models:** All with TDR Options (S9x011A/B)

*(Read-Write)* This command sets rise time value for the transform function.

**Parameters**
- **<cnum>** Channel number of the measurement. If unspecified, <cnum> is set to 1.
- **<value>** Transform function rise time value in seconds.

**Examples**

```
CALC:TDR:MEAS1:TIME:STEP:RTIM 0
calculate2:tdr:measure1:time:step:rtime 0
```

**Query Syntax**
CALCulate<cnum>:TDR:MEASure[1-256]:TIME:STEP:RTIMe?

**Return Type** Double

**Default** 0

---

CALCulate<cnum>:TDR:MEASure[1-256]:TIME:STEP:RTIMe:THReshold <enum>
**Applicable Models:** All with TDR Options (S9x011A/B)

*(Read-Write)* This command sets the rise time threshold level for the results of eye measurement.

**Parameters**
- `<cnum>` Channel number of the measurement. If unspecified, `<cnum>` is set to 1.
- `<enum>` Transform function rise time threshold levels. Choose from:
  - **T1_9** - 10% to 90%.
  - **T2_8** - 20% to 80%.

**Examples**
```
CALC:TDR:MEAS1:TIME:STEP:RTIM:THR T1_9
```
```
calculate2:tdr:measure1:time:step:rtime:threshold t1_9
```

**Query Syntax**
```
CALCulate<cnum>:TDR:MEASure[1-256]:TIME:STEP:RTIMe:THReshold?
```

**Return Type** String

**Default** T1_9

---

**CALCulate<cnum>:TDR:MEASure[1-256]:TIME:TYPE <enum>**

**Applicable Models:** All with TDR Options (S9x011A/B)

*(Read-Write)* This command sets the stimulus type for the transform function.

**Parameters**
- `<cnum>` Channel number of the measurement. If unspecified, `<cnum>` is set to 1.
- `<enum>` Transform function stimulus type. Choose from:
  - **LPSTep** - Low pass step.
  - **LPIMpulse** - Low pass impulse.

**Examples**
```
CALC:TDR:MEAS1:TIME:TYPE LPST
```
```
calculate2:tdr:measure1:time:type lpstep
```

**Query Syntax**
```
CALCulate<cnum>:TDR:MEASure[1-256]:TIME:TYPE?
```

**Return Type** String

**Default** LPSTep

---

**CALCulate<cnum>:TDR:MEASure[1-256]:TTIMe:DATA?**
**Applicable Models:** All with TDR Options (S9x011A/B)

*(Read-only)* This command returns the rise time result value for marker search. You can get the data even if CALCulate:TDR:MEASure:TTIMe:STATe is off.

**Parameters**
- `<cnum>` Channel number of the measurement. If unspecified, `<cnum>` is set to 1.

**Examples**
- `CALC:TDR:MEAS1:TTIM:DATA?`
- `calculate2:tdr:measure1:ttime:data?`

**Return Type** Double

**Default** Not Applicable

**CALCulate<cnum>:TDR:MEASure[1-256]:TTIMe:STATe <bool>**

**Applicable Models:** All with TDR Options (S9x011A/B)

*(Read-Write)* This command displays the rise time marker.

**Parameters**
- `<cnum>` Channel number of the measurement. If unspecified, `<cnum>` is set to 1.
- `<bool>` ON or 1 - Turns rise time marker ON.
- OFF or 0 - Turns rise time marker OFF.

**Examples**
- `CALC:TDR:MEAS1:TTIM:STAT ON`
- `calculate2:tdr:measure1:ttime:state off`

**Query Syntax** `CALCulate<cnum>:TDR:MEASure[1-256]:TTIMe:STATe?`

**Return Type** Boolean

**Default** OFF

**CALCulate<cnum>:TDR:MEASure[1-256]:TTIMe:THReshold <enum>**
**Applicable Models:** All with TDR Options (S9x011A/B)

(Read-Write) This command sets the rise time threshold for the rise time in the marker search function.

**Parameters**

- `<cnum>`: Channel number of the measurement. If unspecified, `<cnum>` is set to 1.
- `<enum>`: Rise time threshold levels. Choose from:
  - **T1_9**: 10% to 90%.
  - **T2_8**: 20% to 80%.

**Examples**

```
CALC:TDR:MEAS1:TTIM:THR T1_9
```

```
calculate2:tdr:measure1:ttime:threshold t1_9
```

**Query Syntax**

```
CALCulate<cnum>:TDR:MEASure[1-256]:TTIme:THReshold?
```

**Return Type**

String

**Default**

T1_9

---

**CALCulate<cnum>:TDR:TIME:COUPle <bool>**

**Applicable Models:** All with TDR Options (S9x011A/B)

(Read-Write) This command enables/disables time coupling.

**Parameters**

- `<cnum>`: Channel number of the measurement. If unspecified, `<cnum>` is set to 1.
- `<bool>`: ON or 1 - Turns time coupling ON.
  OFF or 0 - Turns time coupling OFF.

**Examples**

```
CALC:TDR:TIME:COUP ON
calculate2:tdr:time:couple off
```

**Query Syntax**

```
CALCulate<cnum>:TDR:TIME:COUPlE?
```

**Return Type**

Boolean

**Default**

ON

---

**CALCulate<cnum>:TDR:TIME:STEP:AMPLitude <value>**
Applicable Models: All with TDR Options (S9x011A/B)

(Read-Write) This command sets or gets the step amplitude value.

Parameters

- `<cnum>` Channel number of the measurement. If unspecified, `<cnum>` is set to 1.
- `<value>` Step amplitude value in Hz, dBm, or seconds. The range is 0.001 to 5.

Examples

```
CALC:TDR:TIME:STEP:AMPL 200ms
calculate2:tdr:time:step:amplitude .05s
```

Query Syntax

CALCulate<cnum>:TDR:TIME:STEP:AMPLitude?

Return Type

Double

Default

0.2
CALC:HOLD Commands

Controls the Trace Hold settings.

These commands are Superseded by the CALCulate:MEASure:HOLD commands.

**CALCulate:HOLD**

<table>
<thead>
<tr>
<th>TYPE</th>
</tr>
</thead>
<tbody>
<tr>
<td>CLEar</td>
</tr>
</tbody>
</table>

Click on a keyword to view the command details.

**see Also**

- Learn about Trace Hold
- Example Programs
- Synchronizing the Analyzer and Controller
- SCPI Command Tree

**Critical Note:** CALCulate commands act on the selected measurement. You can select one measurement for each channel using Calc:Par:MNUM or Calc:Par:Select. Learn more.

**CALCulate<cnum>:HOLD:TYPE <char>**

**Applicable Models:** N522xB, N523xB, N524xB, M937xA, P937xA

**(Read-Write)** Sets the type of trace hold to perform.

See Critical Note

**Parameters**

- `<cnum>` Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, `<cnum>` is set to 1.
- `<char>` Trace Hold type. Choose from:
  - **OFF** - Disables the Trace Hold feature.
  - **MINimum** - Sets Trace Hold to store the lowest measured data points.
**MAXimum** - Sets Trace Hold to store the highest measured data points.

**Examples**

```
CALC:HOLD:TYPE MAX
```

```
calculate2:hold:type minimum
```

**Query Syntax**  
CALCulate<ch>:HOLD:TYPE?

**Return Type**  
Character

**Default**  
OFF

---

CALCulate<ch>:HOLD:CLEar

**Applicable Models:** N522xB, N523xB, N524xB, M937xA, P937xA

*(Write-only)* Resets the currently-stored data points to the live data trace and restarts the currently-selected Trace Hold type.

**See Critical Note**

**Parameters**

<chnum>  
Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, <cnum> is set to 1.

**Examples**

```
CALC:HOLD:CLE
```

```
calculate2:hold:clear
```

**Query Syntax**  
Not Applicable

**Default**  
Not Applicable
**Calculate:Transform Commands**

Specifies the settings for time domain transform.

These commands are **Superseded** by the `CALCulate:MEASure:TRANsform` commands.

</tbody>
</table>
CALCulate<cnum>:TRANsform:COUPle:PARameters <num>

**Applicable Models:** N522xB, N523xB, N524xB, M937xA, P937xA

*(Read-Write)* Specifies the time domain transform parameters to be coupled. The settings for those parameters will be copied from the selected measurement to all other measurements on the channel.

- To turn coupling ON and OFF, use SENS:COUP:PAR
- To specify Gating parameters to couple, use CALC:FILT:COUP:PAR

Learn more about **Time Domain Trace Coupling**

See Critical Note

**Parameters**

- **<cnum>** Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, <cnum> is set to 1.
- **<num>** (Numeric) Parameters to couple. To specify more than one parameter, add the numbers.

  1 - Transform Stimulus (Start, Stop, Center, and Span TIME settings.)
  
  2 - Transform State (ON / OFF)
  
  4 - Transform Window (Kaiser Beta / Impulse Width)
  
  8 - Transform Mode (Low Pass Impulse, Low Pass Step, Band Pass)
  
  16 - Transform Distance Marker Units
Examples

'To couple all parameters:
CALC:TRAN:COUP:PAR 31

'To couple Stimulus and Mode:
calculate2:transform:couple:parameters 9

Query Syntax
CALCulate<cnum>:TRANSform:COUPle:PARameters?

Return Type
Numeric

Default
29 (All parameters except 2 - Transform State)

CALCulate<cnum>:TRANSform:TIME:CENTer <num>

Applicable Models: N522xB, N523xB, N524xB, M937xA, P937xA

(Read-Write) Sets the center time for time domain measurements.

See Critical Note

Parameters

<cnum> Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, <cnum> is set to 1.
<num> Center time in seconds; any number between:
± (number of points-1) / frequency span

Note: This command will accept MIN or MAX instead of a numeric parameter. See SCPI Syntax for more information.

Examples
CALC:TRAN:TIME:CENT 1e-8
calculate2:transform:time:cen 15 ps

Query Syntax
CALCulate<cnum>:TRANSform:TIME:CENTer?

Return Type
Numeric

Default
0

CALCulate<cnum>:TRANSform:TIME:IMPulse:WIDTh <num>
**Applicable Models:** N522xB, N523xB, N524xB, M937xA, P937xA

*(Read-Write)* Sets the impulse width for the transform window.

**See Critical Note**

**Parameters**

- `<cnum>` Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, `<cnum>` is set to 1.
- `<num>` Impulse width in seconds; Choose any number between: 
  0.6 / frequency span and 1.39 / frequency span

**Examples**

```
CALC:TRAN:TIME:IMP:WIDTh 10  
calculate2:transform:time:impulse:width 13
```

**Query Syntax**

CALCulate<cnum>:TRANsform:TIME:IMPulse:WIDTh?

**Return Type** Numeric

**Default** 0.98 / Default Span

---

CALCulate<cnum>:TRANsform:TIME:KBESsel <num>

**Applicable Models:** N522xB, N523xB, N524xB, M937xA, P937xA

*(Read-Write)* Sets the parametric window for the Kaiser Bessel window.

**See Critical Note**

**Parameters**

- `<cnum>` Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, `<cnum>` is set to 1.
- `<num>` Window width for Kaiser Bessel in seconds; Choose any number between: 
  0.0 and 13.0

**Examples**

```
CALC:TRAN:TIME:KBES 10  
calculate2:transform:time:kbessel 13
```

**Query Syntax**

CALCulate<cnum>:TRANsform:TIME:KBESsel?

**Return Type** Numeric

**Default** 6

---

CALCulate<cnum>:TRANsform:TIME:LPFREQuency
Applicable Models: N522xB, N523xB, N524xB, M937xA, P937xA

(Write-only) Sets the start frequencies in LowPass Mode.

See Critical Note

Parameters

<cnun> Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, <cnun> is set to 1.

Examples

CALC:TRAN:TIME:LPFR
calculate2:transform:time:lpfrequency

Query Syntax

Not applicable

Default

Not applicable

CALCulate<cnun>:TRANsform:TIME:MARKer:MODE <char>

Applicable Models: N522xB, N523xB, N524xB, M937xA, P937xA

(Read-Write) Specifies the measurement type in order to determine the correct marker distance.

- Select Auto for S-Parameter measurements.
- Select Reflection or Transmission for arbitrary ratio or unratioed measurements.

This setting affects the display of ALL markers for only the ACTIVE measurement.

Learn more about Distance Markers.

See Critical Note

Parameters

<cnun> Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, <cnun> is set to 1.

<char> Choose from:

AUTO If the active measurement is an S-Parameter, automatically chooses reflection or transmission. If non S-Parameter measurements, reflection is chosen.

REFLection Displays the distance from the source to the receiver divided by two (to compensate for the return trip.)

TRANsmission Displays the distance from the source to the receiver.
CALCulate<cnum>:TRANSform:TIME:MARKer:UNIT <char>

**Applicable Models:** N522xB, N523xB, N524xB, M937xA, P937xA

*(Read-Write)* Specifies the unit of measure for the display of marker distance values. This settings affects the display of ALL markers for only the ACTIVE measurement (unless Distance Maker Units are coupled using `CALC:TRAN:COUP:PAR`.

Learn more about Distance Markers.

**Parameters**

- `<cnum>` Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, `<cnum>` is set to 1.
- `<char>` Choose from:
  - METRs
  - FEET
  - INCHes

**Examples**

- `CALC:TRAN:TIME:MARK:UNIT INCH`
- `calculate2:transform:time:marker:unit feet`

**Query Syntax**

CALCulate<cnum>:TRANSform:TIME:MARKer:UNIT?

**Return Type** Character

**Default** METRs

---

CALCulate<cnum>:TRANSform:TIME:SPAN <num>
**Applicable Models:** N522xB, N523xB, N524xB, M937xA, P937xA

(Read-Write) Sets the span time for time domain measurements.

**See Critical Note**

**Parameters**

- `<cnum>` Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, `<cnum>` is set to 1.

- `<num>` Span time in seconds; any number between: 0 and `2* [(number of points-1) / frequency span]`

**Note:** This command will accept **MIN** or **MAX** instead of a numeric parameter. See **SCPI Syntax** for more information.

**Examples**

```
CALC:TRAN:TIME:SPAN 1e-8
CALC:TRAN:TIME:SPAN maximum
```

**Query Syntax**

CALCulate<cnum>:TRANsform:TIME:SPAN?

**Return Type** Numeric

**Default** 20 ns

---

**CALCulate<cnum>:TRANsform:TIME:STARt <num>**

**Applicable Models:** N522xB, N523xB, N524xB, M937xA, P937xA

(Read-Write) Sets the start time for time domain measurements.

**See Critical Note**

**Parameters**

- `<cnum>` Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, `<cnum>` is set to 1.

- `<num>` Start time in seconds; any number between: 
  `± (number of points-1) / frequency span`

**Note:** This command will accept **MIN** or **MAX** instead of a numeric parameter. See **SCPI Syntax** for more information.

**Examples**

```
CALC:TRAN:TIME:STAR 1e-8
CALC:TRAN:TIME:STAR minimum
```

**Query Syntax**

CALCulate<cnum>:TRANsform:TIME:STARt?

**Return Type** Numeric
CALCulate<cnum>:TRANsform:TIME:STATe <ON | OFF>

Applicable Models: N522xB, N523xB, N524xB, M937xA, P937xA

(Read-Write) Turns the time domain transform capability ON or OFF.

See Critical Note

Note: Sweep type must be set to Linear Frequency in order to use Time Domain Transform.

Parameters

- <cnum> Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, <cnum> is set to 1.
- <ON|OFF> ON (or 1) - turns time domain ON.
  OFF (or 0) - turns time domain OFF.

Examples

- CALC:TRAN:TIME:STAT ON
- calculate2:transform:time:state off

Query Syntax

- CALCulate<cnum>:TRANsform:TIME:STATe?

Return Type

- Boolean (1 = ON, 0 = OFF)
- Default OFF

CALCulate<cnum>:TRANsform:TIME:STOP <num>

Applicable Models: N522xB, N523xB, N524xB, M937xA, P937xA

(Read-Write) Sets the stop time for time domain measurements.

See Critical Note

Parameters

- <cnum> Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, <cnum> is set to 1.
- <num> Stop time in seconds; any number between:

\[ \pm \frac{(number \ of \ points - 1)}{frequency \ span} \]

Note: This command will accept MIN or MAX instead of a numeric parameter. See SCPI Syntax for more information.

Examples

- CALC:TRAN:TIME:STOP 1e-8
- calculate2:transform:time:stop maximum
CALCulate<cnum>:TRANsform:TIME:STEP:RTIMe <num>

**Applicable Models:** N522xB, N523xB, N524xB, M937xA, P937xA

*(Read-Write)* Sets the step rise time for the transform window.

**See Critical Note**

**Parameters**

- `<cnum>` Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, `<cnum>` is set to 1.
- `<num>` Rise time in seconds; Choose any number between: `.45 / frequency span` and `1.48 / frequency span`

**Examples**

```
CALC:TRAN:TIME:STEP:RTIM 1e-8
calculate2:transform:time:step:rtime 15 ps
```

**Query Syntax**

CALCulate<cnum>:TRANsform:TIME:STEP:RTIMe?

**Return Type** Numeric

**Default** `.99 / Default Span`

---

CALCulate<cnum>:TRANsform:TIME:STIMulus <char>

**Applicable Models:** N522xB, N523xB, N524xB, M937xA, P937xA

*(Read-Write)* Sets the type of simulated stimulus that will be incident on the DUT.

**See Critical Note**

**Parameters**

- `<cnum>` Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, `<cnum>` is set to 1.
- `<char>` Choose from:
  - **STEP** - simulates a step DUT stimulus
  - **IMPulse** - simulates a pulse DUT stimulus

**Examples**

```
STEP can ONLY be used when CALC:TRAN:TIME:TYPE is set to LPASs (Lowpass). (STEP cannot be used with TYPE = BPASs.)
```
:STIM STEP will set :TYPE to LPASs

:TYPE BPASs will set :STIM to IMPulse

Examples

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
</table>

Query Syntax

CALCulate<cnum>:TRANsform:TIME:STIMulus?

Return Type

Character

Default

IMPulse

CALCulate<cnum>:TRANsform:TIME:ALIGnment <enum>

Applicable Models: N522xB, N523xB, N524xB, M937xA, P937xA

(Read-Write) Selects the way the PNA computes the DC value of the frequency-domain measurement. The correct DC value is required for inverse-FFT accuracy, and if not estimated properly, can cause distortions in the time-domain measurement in the form of an undesired slope in the waveform.

See Critical Note

Parameters

- **<cnum>**
  - Channel number of the measurements to be listed. If unspecified, <cnum> is set to 1.

- **<enum>**
  - Choose from:

    - **LEGacy** - The DC value is extrapolated using three data points. The transform offset is calculated using the delay of the first frequency point. This is the same algorithm used in the HP 8510 network analyzer.

    - **NORMalize** - The DC value is extrapolated using three data points. The transform offset is set to zero at t=0 minus six rise-times. This mode requires that a good S-parameter calibration has been performed, which can be verified by observing a flat time-domain response at t=0 when measuring a load located at the physical point corresponding to t=0. Setting the time domain trace to zero at a time before t=0 stabilizes the trace for determining impedances after time t=0, resulting in improved behavior compared to Legacy mode. This method is similar to that used with PLTS, and is very useful in determining the time-domain-transform response of transmission lines and printed-circuit-board characteristics.

Examples

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
</table>
CALCulate<cnum>:TRANSform:TIME[:TYPE] <char>

**Applicable Models:** N522xB, N523xB, N524xB, M937xA, P937xA

*(Read-Write)* Sets the type of time domain measurement.

**See Critical Note**

**Parameters**

- `<cnum>` Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, `<cnum>` is set to 1.
- `<char>` Type of measurement. Choose from:
  - **LPASs** - Lowpass; Must also send `CALC:TRAN:TIME:LPFRequency` before calibrating.
  - **BPASs** - Bandpass;

BPASs can only be used when `CALC:TRAN:TIME:STIM` is set to IMPulse. (BPASs cannot be used with :STIM = STEP)

**:STIM STEP** will set :TYPE to **LPASs**

**:TYPE BPASs** will set :STIM to **IMPulse**

**Examples**

```
CALC:TRAN:TIME LPAS
calculate2:transform:time:type bpas
```

**Query Syntax**

CALCulate<cnum>:TRANSform:TIME[:TYPE]?

**Return Type**

- **Enumeration**
- **Default** LEGacy

**Default**

- **Character** BPAS
CALCulate:Uncertainty Commands

Controls the trace settings for Dynamic Uncertainty for S-Parameters.

These commands are Superseded by the CALCulate:MEASure:UNCertainty commands.

### Trace Properties

<table>
<thead>
<tr>
<th>Trace Property</th>
<th>Command</th>
</tr>
</thead>
<tbody>

</tr>
</tbody>
</table>

- **Apply to all traces**: None
- **Add Trace**: None
- **Save Data**: CALC:UNCertainty:SAVE

**See Also**

- See other Dynamic Uncertainty commands
- Learn more about Dynamic Uncertainty

**Critical Note**: CALCulate commands act on the selected measurement. You can select one measurement for each channel using Calc:Par:MNUM or Calc:Par:Select. Learn more.

```
CALCulate<ch>:UNCertainty:DISPlay:TYPE <char>
```
Applicable Models: N522xB, N523xB, N524xB

(Write-Read) Sets and returns the display type for uncertainties for the selected measurement trace.

See Critical Note

Parameters

<ch> Channel number of the measurement to display uncertainties. If unspecified, value is set to 1.

<char> Display type. Choose from:

**NONE** - Display the trace without uncertainties.

**MAXimum** – Display the trace as the uncertainty maximum (measured or memory data + upper limit uncertainty values). Not supported with Smith Chart or Polar display format.

**MINimum** - Display the trace as the uncertainty minimum (measured or memory data - lower limit uncertainty values). Not supported with Smith Chart or Polar display format.

**BAR** – Display the uncertainties as “error bars” around the trace. Not supported with Smith Chart or Polar display format.

**SHADe** – Display the uncertainties as a shaded region around the trace. Not supported with Smith Chart or Polar display format.

**ELLipse** – Display the uncertainties in ellipse form. Supported only in Smith Chart or Polar display format.

Examples

```
CALC1:UNC:DISP:TYPE BAR
```

Query Syntax

CALCulate<ch>:UNCertainty:DISPlay:TYPE?

Return Type

Character

Default

NONE

CALCulate<ch>:UNCertainty:DISPlay:CFACtor <value>
Applicable Models: N522xB, N523xB, N524xB

(Write-Read) Sets and returns the coverage factor (sigma) value to apply to the displayed uncertainty for the selected measurement trace. Coverage Factor corresponds to the level of confidence used in computing the specified measurement uncertainties.

See Critical Note

Parameters

<ch> Channel number of the measurement to display uncertainties. If unspecified, value is set to 1.

)value> Integer. Choose from:

<table>
<thead>
<tr>
<th>Coverage Factor</th>
<th>Approximate confidence level</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>67%</td>
</tr>
<tr>
<td>2</td>
<td>95%</td>
</tr>
<tr>
<td>3</td>
<td>99%</td>
</tr>
<tr>
<td>4</td>
<td>&gt;99%</td>
</tr>
</tbody>
</table>

Examples CALC1:UNC:DISP:CFAC 2

Query Syntax CALCulate<ch>:UNCertainty:DISPlay:CFACtor?

Return Type Numeric

Default 2

CALCulate<ch>:UNCertainty:MODE:CABLe:REPeat <bool>

Applicable Models: N522xB, N523xB, N524xB

(Write-Read) Sets and returns whether the cable/connection repeatability contribution is currently included in the uncertainty values for the selected measurement trace.

See Critical Note

Parameters

<ch> Channel number of the measurement to display uncertainties. If unspecified, value is set to 1.

<bool> Choose from:

OFF (or 0) - Cable repeatability is NOT included.

ON (or 1) - Cable repeatability IS included.
CALCulate<ch>:UNCertainty:MODE:CABLe:REPeat?

Return Type: Boolean
Default: ON

CALCulate<ch>:UNCertainty:MODE:NOISe <bool>

Applicable Models: N522xB, N523xB, N524xB

(Write-Read) Sets and returns whether the noise contribution is currently included in the uncertainty values for the selected measurement trace.

See Critical Note

Parameters:

<ch> Channel number of the measurement to display uncertainties. If unspecified, value is set to 1.

<bool> Choose from:

OFF (or 0) - Noise contribution is NOT included.

ON (or 1) - Noise contribution IS included.

Examples: CALC1:UNC:MODE:NOIS ON

Query Syntax: CALCulate<ch>:UNCertainty:MODE:NOISe?

Return Type: Boolean
Default: ON

CALCulate<ch>:UNCertainty:MODE:ETERm <bool>
Applicable Models: N522xB, N523xB, N524xB

(Write-Read) Sets and returns whether the uncertainties associated with the correction error terms are being included in the uncertainty values for the selected measurement trace.

See Critical Note

Parameters

<ch> Channel number of the measurement to display uncertainties. If unspecified, value is set to 1.

<bool> Choose from:

OFF (or 0) - Error term uncertainty contribution is NOT included.

ON (or 1) - Error term uncertainty contribution IS included.

Examples

CALC1:UNC:MODE:ETER ON

Query Syntax

CALCulate<ch>:UNCertainty:MODE:ETERm?

Return Type

Boolean

Default

ON

CALCulate<ch>:UNCertainty:SAVE '"x,y,z'','<filename>

Applicable Models: N522xB, N523xB, N524xB

(Write-only) Saves all three uncertainty data formats from the active measurement for the specified ports.

- This command is valid ONLY with Dynamic Uncertainty Calibration applied to the active measurement.
- Data that is not available is zero-filled.
- For sweeps with a large number of data points, always follow this command with *OPC? Learn more.

See Critical Note

Parameters

<ch> Channel number of the uncertainty measurement. If unspecified, value is set to 1.

"x,y,z" String Comma or space delimited port numbers for which data is requested, enclosed in quotes.

<filename> String Path, filename, and suffix of location to store the uncertainty data,
enclosed in quotes. The suffix is not checked for accuracy.

- **(".up") S-parameter Uncertainty File** - If saving 2 ports, specify "filename.u2p"; If saving 4 ports, specify "filename.u4p.", and so forth.
- **(".dsd") S-parameter Data Standard Definition file** - Data for Only one or two ports is allowed.
- **(".sdatcv") METAS S-parameter Covariance File.**

**Examples**

All three examples save the active uncertainty measurement on channel 1

'Saves ports 2 and 3 to .u2p file

CALC1:UNC:SAVE "2,3","C:\myData.u2p"

'Saves ports 1 and 2 to .dsd file

CALC1:UNC:SAVE "1,2","C:\myData.dsd"

'Saves ports 1 through 4 to .sdatcv file

CALC1:UNC:SAVE "1,2,3,4","C:\myData.sdatcv"

**Query Syntax**

Not Applicable

**Default**

Not Applicable
CALCulate:X (Axis) Commands

Controls the display of X-axis for various measurements.

These commands are **Superseded** by the CALCulate:MEASure:X commands.

```text
CALCulate:X:
  AXIS
    | :DOMain
    [:VALues]
```

Click on a keyword to view the command details.

**See Also**

- Example Programs
- Synchronizing the Analyzer and Controller
- SCPI Command Tree

**Critical Note:** CALCulate commands act on the selected measurement. You can select one measurement for each channel using `Calc:Par:MNUM` or `Calc:Par:Select`. Learn more.

CALCulate<ch>:X:AXiS <string>

**Applicable Models:** N522xB, N523xB, N524xB, M937xA, P937xA

**(Write-Read)** Sets the X-axis of the selected measurement to a DC Source. This command does not change the default setting for new traces.

**Parameters**

- `<ch>` Channel number of the selected measurement. If unspecified, value is set to 1.
- `<string>` String - (Not case-sensitive) For all channels EXCEPT DIQ, choose from the following:

  - **"Default"** - The default X-axis setting for the selected measurement. For Application measurements, the X-Axis domain is set with specific commands.
  - **"AO1"** - Internal DC source #1
"AO2" - Internal DC source #2

**Note:** For DIQ channels, see `CALC:X:AXIS:DOMain`

**Examples**

- `CALC:X:AXIS 'Default'`
- `calculate:x:axis "AO1"

**Query Syntax**

`CALCulate<ch>:X:AXIS?`

**Return Type**

String

**Default**

"Default"

---

`CALCulate<ch>:X:AXIS:DOMain <string>`

**Applicable Models:** N522xB, N523xB, N524xB

*(Write-Read)* Sets and returns the X-Axis domain of the selected DIQ measurement.

**Parameters**

- `<ch>` The Differential IQ channel number. If unspecified, value is set to 1.

**Choose one of these:**

<table>
<thead>
<tr>
<th>Choose one of these:</th>
<th>Then set X-Axis Source <em>(CALC:X:AXIS)</em> using one of these as the argument.</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Frequency&quot;</td>
<td>&quot;F1&quot;, &quot;F2&quot;, etc.</td>
</tr>
<tr>
<td>&quot;Power&quot;</td>
<td>Source port: &quot;Port 1&quot;, &quot;Port 2&quot;, etc.</td>
</tr>
<tr>
<td>&quot;Phase&quot;</td>
<td>Source port: &quot;Port 1&quot;, &quot;Port 2&quot;, etc.</td>
</tr>
<tr>
<td>&quot;DC&quot;</td>
<td>DC Source: &quot;AO1&quot;, &quot;AO2&quot;</td>
</tr>
<tr>
<td>&quot;Points&quot;</td>
<td>&quot;Points&quot;</td>
</tr>
</tbody>
</table>

**Example**

1. `CALC:X:AXIS:DOM "Power"
2. `CALC:X:AXIS "Port 1"

**Query Syntax**

`CALCulate<ch>:X:AXIS:DOMain?`

**Return Type**

String
**CALCulate\(<\text{nnum}>\):X[:\text{VALues}]\)?**

**Applicable Models:** N522xB, N523xB, N524xB, M937xA, P937xA

*(Read-only)* Returns the stimulus values for the selected measurement in the current units. You can select one measurement for each channel using `Calc:Par:MNUM` or `Calc:Par:Select`. Learn more.

This command can be used for all Measurement Classes.

**Note:** To avoid frequency rounding errors, specify `FORM:DATA <\text{Real},64>` or `\text{<ASCii, 0>}`

### Parameters

- **<\text{nnum}>**
  Any existing channel number; if unspecified, value is set to 1.

### Examples

1. `Calc:Par:Sel "MyGCATrace"
2. `CALC:X?`

### Return Type

- **Default** Not applicable
### CalPod Commands

Click on a blue keyword to view the command details.

In addition to the above Calpod commands, the following IEE 488 Common Commands can also be sent as a string argument:

- **CLS** - Clears all errors and event data from the error/event queue.
- **IDN?** - Returns the instrument identification information.

For 4 state CALPod support the following is required.
- **CCT (configurable command table) version 1.4**
- **Controller FPGA version 8.4**

- **OPC?** - Operation complete query. This query immediately returns a value, independent of whether or not the operation is complete. A return value of 0 indicates the operation is not complete. A value of +1 indicates the operation is complete. Typically this command is used in a loop with a 0.25 second delay when waiting for an operation to complete.

- **TST?** - Performs a communication test on all the currently enabled Calpods. 0 = Test failed on one or more enabled Calpods. 1 = All enabled Calpods working.

- **SYSTem:ERRor?** - Queries the Event/Error queue and returns the most recent error element.

### Important Notes

- ALL commands on this page are sent as a string argument from: `CONTrol:CALPod:COMMa nd <string>`
- Use single quotes ONLY (NOT double quotes) for the CONT:CALP:COMM string arguments.
- Sending queries requires TWO question marks. See following note as example.
- To read errors with the commands on this page, use the Calpod query: 
  ```
  CONT:CALP:COMM? 'SYSTem:ERRor'
  ```

- ALL queries return strings.

```
CALPod:AVERage < num >
```
Applicable Models: All

(Read-Write) Sets the number of OSL averages used during initialization and recorrect.

See important notes.

Parameters

<num> Number of OSL averages to apply. Use an integer between 1 and 100.

Examples

<table>
<thead>
<tr>
<th>Example</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CONT:CALP:COMM 'CALP:AVER 8'</td>
<td>Sets the number of OSL averages to 8.</td>
</tr>
</tbody>
</table>

Query Syntax

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CONT:CALP:COMM? 'CALP:AVER?'</td>
<td>Query the number of OSL averages.</td>
</tr>
</tbody>
</table>

Return Type

Numeric

Default

4

CALPod:DISable <port>

Applicable Models: All

(Write-only) Unassign Calpod serial number from the specified VNA port.

See important notes.

Parameters

<port> VNA port number to un-assign.

Examples

<table>
<thead>
<tr>
<th>Example</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CONT:CALP:COMM 'CALP:DIS 2'</td>
<td>Unassign the Calpod from port 2.</td>
</tr>
</tbody>
</table>

Query Syntax

Not Applicable

Default

Not Applicable

CALPod:ENABle <port>,<sn>
(Write-read) Assign or return the Calpod serial number for the specified VNA port. If a Calpod module is already assigned to the specified VNA port, this assignment will replace the existing assignment.

See important notes.

**Parameters**

- **<port>** VNA port number to be assigned the Calpod serial number.
- **<sn>** Calpod serial number.

**Examples**

```
CONT:CALP:COMM 'CALP:ENAB 2, 0001234' 'WRITE
CONT:CALP:COMM 'CALP:ENAB? 2' 'READ
```

**Query Syntax**

CONTrol:CALPod:COMMand? 'CALPod:ENABle? <port>'

**Return Type** String

**Default** Not Applicable

---

**CALPod:HIDE**

Applicable Models: All

(Write-only) Hides the Calpod setup dialog.

See important notes.

**Parameters** None

**Examples**

```
CONT:CALP:COMM 'CALP:HIDE'
```

**Query Syntax** Not Applicable

**Default** Not Applicable

---

**CALPod:INITialize:ACTive**

3825
**Applicable Models:** All

*Write-only* Performs the initialize process for the active (selected) channel. Select a channel using `CALCulate:MEASure:PARameter`.

See important notes.

<table>
<thead>
<tr>
<th>Parameters</th>
<th>None</th>
</tr>
</thead>
<tbody>
<tr>
<td>Examples</td>
<td><code>CONT:CALP:COMM 'CALP:INIT:ACT'</code></td>

<td>Not Applicable</td>
</tr>
<tr>
<td>Default</td>
<td>Not Applicable</td>
</tr>
</tbody>
</table>

**CALPod:INITialize:ALL**

**Applicable Models:** All

*Write-only* Performs the initialize ALL channels process.

See important notes.

<table>
<thead>
<tr>
<th>Parameters</th>
<th>None</th>
</tr>
</thead>
<tbody>
<tr>
<td>Examples</td>
<td><code>CONT:CALP:COMM 'CALP:INIT:ALL'</code></td>
</tr>
<tr>
<td>Query Syntax</td>
<td>Not Applicable</td>
</tr>
<tr>
<td>Default</td>
<td>Not Applicable</td>
</tr>
</tbody>
</table>

**CALPod:LAUNch**

**Applicable Models:** All

*Write-only* Starts the Calpod software. The Calpod software can be started using this (Launch) command or by activating the Calpod user interface. Once the Calpod software is started it remains active until the VNA application is terminated.

Send this command first in your program, then wait a couple seconds while the software starts before sending the next command.

See important notes.

<table>
<thead>
<tr>
<th>Parameters</th>
<th>None</th>
</tr>
</thead>
</table>
| Examples   | `CONT:CALP:COMM 'CALP:LAUN'`
|            | `wait 3` |
**CALPod:POWer < 0 | 1 >**

**Applicable Models**: All

(Read-Write) Enables or disables the ‘Correct Power’ setting in the Calpod setup dialog.

See important notes.

**Parameters**
- 0 – disable power correction
- 1 – enable power correction

Note that ON and OFF cannot be used as arguments to this command.

**Examples**
- `CONT:CALP:COMM 'CALP:POW 1'`
- `CONT:CALP:COMM? 'CALP:POW?'`

**Query Syntax**
- `CONT:CALP:COMM 'CALP:POW 1'`
- `CONT:CALP:COMM? 'CALP:POW?'`

**Return Type**
- Numeric

**Default**
- 0 (disabled)

---

**CALPod:RECorrect:ACTive**

**Applicable Models**: All

(Write-only) Performs the recorrect process for the active (selected) channel. Select a channel using CALCulate:MEASure:PARameter.

See important notes.

**Parameters**
- None

**Examples**
- `CONT:CALP:COMM 'CALP:REC:ACT'`

**Query Syntax**
- Not Applicable

**Default**
- Not Applicable

---

**CALPod:RECorrect:ALL**
Applicable Models: All

(Write-only) Performs the recorrect process for ALL channels.

See important notes.

**Parameters** None

**Examples** CONT:CALP:COMM 'CALP:REC:ALL'

**Query Syntax** Not Applicable

**Default** Not Applicable

---

**CALPod:SHOW**

Applicable Models: All

(Write-only) Shows the Calpod setup dialog.

See important notes.

**Parameters** None

**Examples** CONT:CALP:COMM 'CALP:SHOW'

**Query Syntax** Not Applicable

**Default** Not Applicable

---

**CALPod:STATe <sn>,<state>**

Applicable Models: All

(Write-only) Sets the specified Calpod module to specified impedance state.

See important notes.

**Parameters**

<sn> Serial number of the Calpod module. When set to 1, all modules are set to the specified state.

<state> Impedance state. Not case sensitive. Choose from:

*Short*, *Open*, *Load*, or *Thru*

**Examples** CONT:CALP:COMM 'CALPod:STATE 0001234,thru'

**Query Syntax** Not Applicable
CALPod:TEMP? <sn>

**Applicable Models:** All

*(Read-only)* Returns the temperature of the specified Calpod module in degrees Celsius.

See important notes.

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;sn&gt;</td>
<td>Serial number of the Calpod module.</td>
</tr>
</tbody>
</table>

**Examples**

```
CONT:CALP:COMM? 'CALPod:TEMP? 0001234'
```

**Query Syntax**

Not Applicable

**Return Type**

String

**Default**

Not Applicable

**CONTrol:CALPod:COMMand <string>**

**Applicable Models:** N522xB, N523xB, N524xB, M937xA, E5080A/B, P937xA

**(Write-Read)** Sends commands that control a Calpod module. Reads query versions Calpod commands.

See ALL Calpod commands.

Learn more about Calpod.

**Parameters**

<string> Calpod command. See ALL Calpod commands that can be used in this string.

**Write Example**

```plaintext
'Enclose all strings in SINGLE quotes (NOT double quotes)
```
CONTroL:CALPod:COMMaNd? <string>

Relevant only for query strings.

Read Example

CONT:CALP:COMM? '*OPC?'

'returns 0 if the calpod software is currently processing an operation
'returns 1 if operations are complete

Return Type
String
Default Not Applicable

CONTroL:CHANnel:INTerface:CONTroL:CONFig:RECall[:STATe] <string>

Applicable Models: N522xB, N523xB, N524xB, E5080A

(Write-only) Recalls an Interface Control configuration file. Learn more about Interface Control.

Parameters
<string> File name and extension (.xml) of the configuration file to recall. Files are typically stored in the default folder "D:\". To recall from a different folder, specify the full path name.

Examples
CONT:CHAN:INT:CONT:CONF:REC 'MyConfigFile.xml'

Query Syntax
Not Applicable
Default Not Applicable

CONTroL:CHANnel:INTerface:CONTroL[:STATe] <bool>
Applicable Models: N522xB, N523xB, N524xB, E5080A/B

(Read-Write) Enables and disables ALL Interface Control settings. To send data, the individual interfaces must also be enabled. Learn more about Interface Control.

Parameters

<bool> Boolean

OFF (0) - Interface Control is disabled; NO control data is sent.

ON (1) - Interface Control is enabled.

Examples

```plaintext
CONT:CHAN:INT:CONT 1
control:channel:interface:control:state 0
```

Query Syntax

CONTrol:CHANnel:INTerface:CONTrol[:STATe]?

Return Type

Boolean

Default

OFF (0)

---

CONTrol:ECAL:MODule<num>:PATH:COUNt? <name>

Applicable Models: All

(Read-only) Returns the number of unique states that exist for the specified path name on the selected ECal module.

This command performs exactly the same function as SENS:CORR:CKIT:ECAL:PATH:COUNt?

Use the CONT:ECAL:MOD:PATH:STAT command to set the module into one of those states.

Use SENS:CORR:CKIT:ECAL:PATH:DATA? to read the data for a state.

Parameters

[num] Optional argument. USB number of the ECal module. If unspecified (only one ECal module is connected to the USB), <num> is set to 1. If two or more modules are connected, use SENS:CORR:CKIT:ECAL:LIST? to determine how many, and SENS:CORR:CKIT:ECAL:INF? to verify their identities.

<name> Name of the path for which to read number of states. Choose from:

Reflection paths

- A
- B
- C (4-port modules)
- D (4-port modules)

Transmission paths

- AB
- AC (4-port modules)
- AD (4-port modules)
- BC (4-port modules)
- BD (4-port modules)
- CD (4-port modules)

Note: For each transmission path, the first of the available states is the through state, the second is the confidence (attenuator) state.

Examples

```
CONT:ECAL:MOD:PATH:COUN? A
control:ecal:module2:path:count? cd
```

See example program

Return Type

- Integer

Default

- Not Applicable

**CONTrol:ECAL:MODule<num>:PATH:STATe <path>, <stateNum>**

Applicable Models: All

(Write-only) Sets the internal state of the selected ECAL module. This command supersedes CONT:ECAL:MOD:STAT .

- Use CONT:ECAL:MOD:PATH:COUN? to read the number of unique states that exist for the specified path name on the module.
- Use SENS:CORR:CKIT:ECAL:PATH:DATA? to read the data for a state (from the module memory) corresponding to the stimulus values of a channel.

Parameters
[num] Optional argument. USB number of the ECal module. If unspecified (only one ECal module is connected to the USB), <num> is set to 1. If two or more modules are connected, use SENS:CORR:CKIT:ECAL:LIST? to determine how many, and SENS:CORR:CKIT:ECAL:INF? to verify their identities.

<path> Path name for which to set a state.

**Note:** The impedance paths are not independent. For example, changing the impedance presented on path A will cause a change to the impedance on path B.

Choose from:

Reflection paths

- A
- B
- C (4-port modules)
- D (4-port modules)

Transmission paths

- AB
- AC (4-port modules)
- AD (4-port modules)
- BC (4-port modules)
- BD (4-port modules)
- CD (4-port modules)

<stateNum> Number of the state to set. Refer to the following table to associate the <stateNum> with a state in your ECal module.

In addition, CONT:ECAL:MOD:PATH:COUNt? returns the number of states in the specified ECal module.
<table>
<thead>
<tr>

Query Syntax Not Applicable

Default Not Applicable

CONTrol:ECAL:MODule<num>:STATe <value> Superseded
Applicable Models: N522xB, N523xB, N524xB, M937xA, P937xA

This command is replaced with CONT:ECAL:MOD:PATH:STATe.

(Write-only) Sets the internal state of the selected ECAL module.

Parameters

[num] Optional argument. USB number of the ECAL module. If unspecified (only one ECAL module is connected to the USB), <num> is set to 1. If two or more modules are connected, use SENS:CORR:COLL:CKIT:INF? to verify their identity.

[value] Integer code for switching the module. The following are codes for Keysight ECAL modules.

```

### Query Syntax

Not Applicable

### Default

Not Applicable
CONTrol:MULTiplexer<id>:OUTPut:<grp>[:DATA] <num>

**Applicable Models:** E5080A/B

*(Read-Write)* Sets or returns the output port data for specified group with id of the E5092A multiport test set.

**Notes:** This command is available only for E5092A multiport test set.

**Parameters**

- `<id>`  Id of the multiport test set either 1 or 2. If unspecified, Id is assumed to be 1.
- `<grp>` A | B | C | D
- `<num>` An integer specifying the decimal value of the control line. Values are obtained by adding weights from the following table that correspond to individual lines.

The output port data range is between 0 to 255 (0=All line are turns OFF and 255 all lines are turn ON).

<table>
<thead>
<tr>
<th>Line</th>
<th>Weight</th>

<td>32</td>
</tr>
<tr>
<td>7</td>
<td>64</td>
</tr>
<tr>
<td>8</td>
<td>128</td>
</tr>
</tbody>
</table>

**Examples**

CONT:MULT1:OUTP:B 8

**Query Syntax**

CONTrol:MULTiplexer<id>:OUTPut:<grp>[:DATa]?

**Return Type**

Numeric

**Default** 0

CONTrol:MULTiplexer<id>:OUTPut:<grp>VOLTage[:DATA] <volt>

**Applicable Models:** E5080A/B
(Read-Write) Sets or returns the output voltage for specified group with id of the E5092A multiport test set.

Notes: This command is available only for E5092A multiport test set.

Parameters

<id>  Id of the multiport test set either 1 or 2. If unspecified, Id is assumed to be 1.
<grp> A | B | C | D
<volt> Output voltage range for <grp> is between 0 to 5.2V and resolution is 10mV.

Examples

CONT:MULT1:OUTP:B:VOLT 4.2

Query Syntax

CONTrol:MULTiplexer<id>:OUTPut:<grp>:VOLtage[:DATa]?

Return Type

Numeric

Default

0 V

CONTROL:NOISe:SOURce[:STATe] <bool>

Applicable Models: N522xB, N523xB, N524xB

(Read-Write) Set and read the noise source (28V) ON and OFF.

Parameters

<bool> Boolean

OFF (0) - Noise Source OFF

ON (1) - Noise Source ON

Examples

CONT:NOIS:SOUR 1
control:noise:source:state 0

Query Syntax

CONTrol:NOISe:SOURce[:STATe]?

Return Type

Boolean

Default

For VNA models with a Noise Figure option (028/029/H29), the 28V line is ON at application start and after a preset. The ON/OFF state is also available from a VNA softkey menu.

For VNA models WITHOUT a Noise Figure option (028/029/H29), the 28V line is OFF at application start and its state is not affected by a preset. The ON/OFF state is NOT available from a VNA softkey menu.
**CONTrol:PHASe:COUNt?**

**Applicable Models:** All

*(Read only)* Reads the number of phase reference modules connected.

**Parameters** None

**Examples**

```
CONT:PHAS:COUN?
control:phase:count?
```

**Return Type** Numeric value

**Default** N/A

---

**CONTrol:PHASe:MODule[x]:DATA:STORe <path>**

**Applicable Models:** All

*(Write-only)* Reads the calibration data from the phase reference of the specified module (x), and writes the data to the Path.

**Parameters**

- `<path>` (String) Directory path to stored data.

**Examples**

```
CONT:PHAS:MOD1:DATA:STOR "D:MyPhaseRefCalData.csv"
control:phase:module1:data:store "D:MyPhaseRefCalData.csv"
```

**Return Type** N/A

**Default** N/A

---

**CONTrol:PHASe:MODule[x]:MODel?**

**Applicable Models:** All

*(Read only)* Reads the model number of the specified module (x).

**Parameters** None

**Examples**

```
CONT:PHAS:MOD1:MOD?
control:phase:module1:model?
```

**Return Type** String

**Default** N/A
CONTrol:PHASe:MODule[x]:SERial?

Applicable Models: All

(Read only) Reads the serial number of the specified module (x).

Parameters

Examples

```
CONT:PHAS:MOD1:SER?
control:phase:module1:serial?
```

Return Type Numeric

Default N/A

CONTrol:PHASe:MODule[x]:SETup <divideNumber>

Applicable Models: All

(Write-only) Turns on the phase reference, and sets the divide number.

Parameters

<divideNumber> Divide number can be 1, 2, 4, 8, 16.

Examples

```
CONT:PHAS:MOD1:SET 2
control:phase:module1:setup 2
```

Return Type Numeric

Default N/A

CONTrol:SIGNal <conn>,<char>

Applicable Models: N522xB, N523xB, N524xB

(Read-Write) Configures external triggering in the VNA.

Note: To configure external triggering in the current VNA models, use the Trigger commands.

- To control BNC1 and BNC2 with this command, then you **MUST** have TRIG:PREF:AIGlobal = **ON**. Learn more
- Trigger:Sequence:Source is automatically set to External when **CONTrol:SIGNal** is sent.
- Edge triggering is only available on some Microwave VNA models.
- For more information, see External Triggering in the VNA.

Parameters
Rear Panel connector to send or receive trigger signals. Choose from:

**BNC1** Trigger IN from rear-panel Trigger IN BNC connector

*Note:* Only one of the input connectors is active at a time. When a command is sent to one, the VNA automatically makes the other INACTIVE.

**BNC2** Trigger OUT to rear-panel Trigger OUT BNC connector.

**MATHtrigger** - Trigger IN from rear-panel Material Handler connector Pin 18

**RDY** - Ready for trigger OUT.

- PNA-X: Meas Trig RDY
- PNA-L: Handler I/O p21 (Some models)

INACTIVE - Disables the specified connector **<conn>**.

Choose from ONLY the following when **<conn>** is set to BNC1 or AUXT or MATHtrigger:

- **TIENEGATIVE** - (Trigger In Edge Negative) - Triggers the VNA when receiving a negative going signal

- **TIEPOSITIVE** - (Trigger In Edge Positive) - Triggers the VNA when receiving a positive going signal

- **TILLOW** - (Trigger In Level Low) - Triggers the VNA when receiving a low level signal

- **TILHIGH** - (Trigger In Level High) - Triggers the VNA when receiving a High-level signal

Choose from ONLY the following when **<conn>** is set to BNC2:

Use CONTrol:SIGNal:TRIGger:OUTP to enable the BNC2 output.

The following selections send a positive or negative pulse before or after each trigger acquisition. This normally occurs each sweep unless a channel is in point trigger mode.

- **TOPPAFTER** - (Trigger Out Pulse Positive After) - Sends a POSITIVE going TTL pulse at the END of each trigger acquisition.

- **TOPPBEFORE** - (Trigger Out Pulse Positive Before) - Sends a POSITIVE going TTL pulse at the START of each trigger acquisition.
- **TOPNAFTER** - (Trigger Out Pulse Negative After) - Sends a NEGATIVE going TTL pulse at the END of each trigger acquisition.

- **TOPNBEFORE** - (Trigger Out Pulse Negative Before) - Sends a NEGATIVE going TTL pulse at the START of each trigger acquisition.

Choose from **ONLY the following** when <conn> is set to **RDY** :

- **LOW**  Outputs a TTL low when the VNA is ready for trigger. (Default setting)
- **HIGH** Outputs a TTL high when the VNA is ready for trigger.

### Examples

**CONT:SIGN BNC1,TIENEGATIVE**

**control:signal bnc2,toppbefore**

**CONT:SIGN RDY,LOW**

### Query Syntax

**CONTrol:SIGNal? <conn>**

In addition to the arguments listed above, the following is also a possible returned value:

**NAVAILABLE** - This feature is not available on this VNA

### Return Type

Character

**Default**

At Preset:

BNC1 = INACTIVE  
BNC2 = INACTIVE  
AUXT = TILHIGH

When Output is enabled :

BNC1 = INACTIVE  
BNC2 = TOPPAFTER  
AUXT = TILHIGH

**CONTrol:SIGNal:TRIGger:ATBA <bool>**
**Applicable Models:** N522xB, N523xB, N524xB, M980xA, P50xxA/B, P93xxB, E5080B

**Accept Trigger Before Armed** Determines what happens to an EDGE trigger signal if it occurs before the VNA is ready to be triggered. (LEVEL trigger signals are always ignored.) For more information, see External triggering.

**Parameters**

- **<bool>**
  - **OFF (0)** - A trigger signal is ignored if it occurs before the VNA is ready to be triggered.
  - **ON (1)** - A trigger signal is remembered and then used when the VNA becomes armed (ready to be triggered). The VNA remembers only one trigger signal.

**Examples**

```
CONT:SIGN:TRIG:ATBA 0
control:signal:trigger:atba ON
```

**Query Syntax**

`CONTrol:SIGNal:TRIGger:ATBA?`

**Return Type**

Boolean

**Default**

OFF

---

**CONTrol:SIGNal:TRIGger:OUTP <bool>**

**Applicable Models:** N522xB, N523xB, N524xB

**Output Enabled** The VNA can be enabled to send trigger signals out the rear-panel TRIGGER OUT BNC connector. Use CONTrol:SIGNal to configure for output triggers.

**Note:** To configure external triggering in the current VNA models, use the Trigger commands.

For more information, see External triggering.

**Parameters**

- **<bool>**
  - **OFF (0)** - VNA does NOT output trigger signals.
  - **ON (1)** - VNA DOES output trigger signals.

**Examples**

```
CONT:SIGN:TRIG:OUTP 1
control:signal:trigger:outp OFF
```

**Query Syntax**

`CONTrol:SIGNal:TRIGger:OUTP?`

**Return Type**

Boolean
CONTrol:SIGNal:AIO:PIN:COUNt?

Applicable Models: E5080B

(Read only) Read the total number of pin on the application I/O. In case for the E5080B, always 15. For more information, see application I/O.

Parameters
- None

Examples
- CONT:SIGN:AIO:PIN:COUN?
- control:signal:aio:pin:count?

Query Syntax
- CONTrol:SIGNal:AIO:PIN:COUNt?

Return Type
- Numeric value

Default
- 15

CONTrol:SIGNal:AIO:PIN<pin>:FUNCtion <func>

Applicable Models: E5080B

(Write-Read) Set and Read the function for the specified port in the application I/O interface. The assigned settings are not saved in a state file, but the setting is stored when changing function and recall them at the next firmware start up.

Parameters
- <pin> Pin Number.
- <func> function name

<table>
<thead>

</tbody>
</table>

*1) For Noise Figure switch control, the signal is asserted no matter which pins are used in index(x) is not specified.

Examples

```
CONT:SIGN:AIO:PIN:FUNC "LOW"
control:signal:aio5:pin:function "NF_SOURCE15"
```

Query Syntax

```
CONTrol:SIGNal:AIO:PIN:FUNC?
```

Return Type

<sting>

Default

See the table in <func>

---

**Applicable Models:** E5080B

*(Read Only)* Read the list of the available function for the specified pin in the application I/O.

Example, "RF_PULSE_MOD_IN" is returned for the pin 8.

**Parameters**

- `<pin>` Pin Number.

**Examples**

```
CONT:SIGN:AIO:PIN3:FUNC:CAT?
control:signal:aio:pin3:function:catalog?
```

**Query Syntax**

```
```

**Return Type**

<sting>, available function list with Comma separated chars

**Default**

See the table in <func> of CONTrol:SIGNal:APPLication:FUNC?

Applicable Models: E5080B

(Read-Write) Set and read the function for the selected pin on the Application I/O connector. It is set on channel basis and reflected only when “CHANNEL_CTRL” is selected in :CONTroll:SIGNal:AIO:PIN<pin>:FUNCtion <func> for the specified pin. The setting is saved in the state file and subject to preset. Function can be selected from Output signals

Parameters

<pin> Pin Number 1-5, 10-13
<ch> Channel number

Examples

:CONT:SIGN:AIO:PIN3:CHAN1:FUNC?
:CONT:SIGN:AIO:PIN3:CHAN1:FUNC "HIGH"

Query Syntax

CONTroll:SIGNal:AIO:PIN:CHAN:FUNC?

Return Type <char>

Default HIGH

Applicable Models: E5080B

(Read Only) Read the catalog of the functions assignable to the pin on the Application I/O connector.

Parameters

<pin> Pin Number 1-5, 10-13

Examples

control:signal:aio:pin5:channel:function:catalog?

Query Syntax

Return Type Comma separated chars

Default NA
Applicable Models: E5080B
