(Read only) Read the level of the specified INPUT pin of the application I/O. This command reads the level immediately after its execution. It is not necessary to assign the pin as INPUT by command. When the specified pin number is 6 to 9 or 14, "Specified Application IO port is not input port." error is returned.

Parameters

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>
<th>Examples</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;pin&gt;</td>
<td>Pin Number. (E5080B: 1 to 5, 10 to 13)</td>
<td>CONT:SIGN:AIO:PIN:INP2:LEV?</td>
</tr>
<tr>
<td></td>
<td></td>
<td>control:signal:aio:pin:input1:level?</td>
</tr>
</tbody>
</table>

Query Syntax

CONTrol:SIGNal:AIO:PIN:INPut:LEVel?

Return Type

Char ("HIGH" or "LOW")

Default

N/A

CONTrol:SIGNal:KDMI:MAIN:COUNt?

Applicable Models: M980xA,P50xxA/B, P93xB

(Read only) Read the number of ports in the main control port of the I/O connector interface. In case for the M980xA/P50xxA, always 6.

For more information, see I/O Connector Interface (M980xA/P50xxA)

Parameters

None

Example

CONT:SIGN:KDMI:MAIN:COUN?

control:signal:kDMI:main:count?

Query Syntax

CONTrol:SIGNal:KDMI:MAIN:COUNt?

Return Type

Numeric value

Default

6.

CONTrol:SIGNal:KDMI:MAIN<port>:CHANnel<ch>:FUNCtion <func>

Applicable Models: M980xA,P50xxA/B, P93xB

(Write-Read) Set and Read the function for the specified port and channel in the main of the I/O adapter interface. To use this, set CONTrol:SIGNal:KDMI:MAIN:FUNCion at CHANNEL_CTRL. The setting is saved in the state file and subject to preset. Function can be selected from Output signal.
Parameters

<port> Port Number. The number of total ports is returned by CONTrol:SIGNal:KDMI:MAIN:COUNt?.

<func> function name

<table>
<thead>
<tr>
<th>Function name</th>
<th>Description</th>
<th>Type</th>
<th>Assignable port number</th>
</tr>
</thead>
<tbody>
<tr>
<td>PULSE_OUT1</td>
<td>1st pulse output</td>
<td>Output</td>
<td>1</td>
</tr>
<tr>
<td>PULSE_OUT2</td>
<td>2nd pulse output</td>
<td>Output</td>
<td>2</td>
</tr>
<tr>
<td>PULSE_OUT3</td>
<td>3rd pulse output</td>
<td>Output</td>
<td>3</td>
</tr>
<tr>
<td>PULSE_OUT4</td>
<td>4th pulse output</td>
<td>Output</td>
<td>4</td>
</tr>
<tr>
<td>LOW</td>
<td>Set the Low (Output Low level) at the assigned port</td>
<td>Output</td>
<td>1, 2, 3 or 4</td>
</tr>
<tr>
<td>HIGH</td>
<td>Set the High (Output High level) at the assigned port</td>
<td>Output</td>
<td>1, 2, 3 or 4</td>
</tr>
<tr>
<td>NF_SOURCEx (x=1,2,…) *1</td>
<td>Noise Figure source switch control for port x</td>
<td>Output</td>
<td>1, 2, 3 or 4</td>
</tr>
<tr>
<td>NF_RECEIVERx (x=1,2,…) *1</td>
<td>Noise Figure receiver switch control for port x</td>
<td>Output</td>
<td>1, 2, 3 or 4</td>
</tr>
<tr>
<td>NF_LOy (y=1,2,…)</td>
<td>Noise Figure LO switch control for module y</td>
<td>Output</td>
<td>1, 2, 3 or 4</td>
</tr>
</tbody>
</table>

*1) For Noise Figure switch control, the signal is asserted no matter which ports are used in the NF channel if the port/module index(x) is not specified.

Examples

```
CONTrol:SIGNal:KDMI:MAIN1:FUNCion "CHANNEL_CTRL"
CONTrol:SIGNal:KDMI:MAIN1:CHAN1:FUNC "LOW"
CONTrol:SIGNal:KDMI:main2:FUNCion "CHANNEL_CTRL"
control:signal:kDMI:main2:channel2:function "NF_LO1"
```

Query Syntax

CONTrol:SIGNal:KDMI:MAIN:CHAN:FUNC?
**Return Type**  <string>

**Default**  HIGH

**CONTrol:SIGNal:KDMI:MAIN<port>:FUNCtion <func>**

**Applicable Models:**  M980xA, P50xxA/B, P93xxB

*(Write-Read)* Set and Read the function for the specified port in the main c of the I/O adapter interface. The assigned settings are preserved for each system configuration even after preset, firmware restart and power on/off. The CONTrol:SIGNal:KDMI:MAIN:CHANnel:FUNCtion allows you to set the function independently for each channel.

For more information, see I/O Connector Interface

**Parameters**

<port>  Port Number. The number of total ports is returned by CONTrol:SIGNal:KDMI:MAIN:CO

<func>  function name

<table>
<thead>
<tr>
<th>Function name</th>

<td>Output 1, 2, 3 or 4</td>
<td>Output 1, 2, 3 or 4</td>
<td>Output 1, 2, 3 or 4</td>
</tr>
</tbody>
</table>

*1) For Noise Figure switch control, the signal is asserted no matter which ports are used in channel if the port/module index(x) is not specified.

Examples

```plaintext
CONT:SIGN:KDMI:MAIN1:FUNC "LOW"
control:signal:kdmimain2:function "NF_LO1"
```

Query Syntax

`CONTrol:SIGNal:KDMI:MAIN:FUNC?`

Return Type

<sting>

Default

See the table in <func>

---

`CONTrol:SIGNal:KDMI:MAIN<port>:FUNCtion:CATalog?`

**Applicable Models:** M980xA, P50xA/B, P93xB

*(Read Only)* Read the list of the available function for the specified port in the main control of the I/O adapter interface. Example, "RF_PULSE_MOD_IN, INPUT1" is returned for the port 5.

For more information, see I/O Connector Interface

**Parameters**

- `<port>` Port Number. The number of total ports is returned by `CONTrol:SIGNal:KDMI:MAIN:COUNt?`.

**Examples**

```plaintext
CONT:SIGN:KDMI:MAIN:FUNC:CAT?
control:signal:kdmimain:func:catalog?
```

**Query Syntax**

**Return Type**

<sting>, available function list with Comma separated chars

**Default**

See the table in <func> of `CONTrol:SIGNal:KDMI:MAIN:FUNC?`

**Applicable Models:** M980xA, P50xxA

*(Read only)* Read the level of the specified INPUT port of the I/O adapter main side. This command reads the level immediately after its execution. It is not necessary to assign the port as INPUT by CONTrol:SIGNal:KDMI:MAIN:FUNCtion command. When the specified `<num>` is not 3 to 6, "Requested input is not assigned to any KDMI ports" error is returned.

For more information, see I/O Connector Interface

**Parameters**

- `<num>` Input Number (M980xA, P50xxA: 3 to 6)

<table>
<thead>
<tr>
<th>Examples</th>
<th>CONT:SIGN:KDMI:MAIN:INP2:LEV?</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>control:signal:kdi:main:input1:level?</td>
</tr>
</tbody>
</table>

**Query Syntax** CONTrol:SIGNal:KDMI:MAIN:INPut:LEVEL?

**Return Type** Char ("HIGH" or "LOW")

**Default** N/A

CONTrol:SIGNal:KDMI:SUB:COUNt?

**Applicable Models:** M980xA,P50xxA/B, P93xxB

*(Read only)* Read the number of ports in the sub control of the I/O adapter interface. In case for the M980xA/P50xxA, always 6.

For more information, see I/O Connector Interface

**Parameters** None

<table>
<thead>
<tr>
<th>Examples</th>
<th>CONT:SIGN:KDMI:SUB:COUN?</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>control:signal:kdi:sub:count?</td>
</tr>
</tbody>
</table>

**Query Syntax** CONTrol:SIGNal:KDMI:SUB:COUNt?

**Return Type** Numeric value

**Default** 6

**Applicable Models:** M980xA,P50xxA/B, P93xxB

*(Write-Read)* Set and Read the function for the specified port and specified channel in the sub control.
port of the I/O adapter interface. To use this, set CONTrol:SIGNal:KDMI:SUB:FUNCion at CHANNEL_CTRL. The setting is saved in the state file and subject to preset. Function can be selected from Output signal.

**Parameters**

*<port>* Port Number. The number of total ports is returned by CONTrol:SIGNal:KDMI:SUB:COUNt?.

*<ch>* Channel Number.

*<func>* function name

<table>
<thead>
<tr>
<th>Function name</th>

<td>LOW</td>
<td>Set the Low at the assigned port</td>
<td>Output</td>
<td>3, 4, 5 or 6</td>
</tr>
<tr>
<td>HIGH</td>
<td>Set the High at the assigned port</td>
<td>Output</td>
<td>3, 4, 5 or 6</td>
</tr>
<tr>
<td>NF_RECEIVERx (x=1,2,...) *1</td>
<td>Noise Figure receiver switch control for port x</td>
<td>Output</td>
<td>3, 4, 5 or 6</td>
</tr>
<tr>
<td>NF_LOy (y=1,2,...)</td>
<td>Noise Figure LO switch control for module y</td>
<td>Output</td>
<td>3, 4, 5 or 6</td>
</tr>
</tbody>
</table>

*1) For Noise Figure switch control, the signal is asserted no matter which ports are used in the NF channel if the port/module index(x) is not specified.

**Examples**

- CONT:SIGN:KDMI:SUB3:FUNC "CHANNEL_CTRL"
- CONTrol:SIGNal:KDMI:SUB2:FUNCion "CHANNEL_CTRL"
**Query** CONTrol:SIGNal:KDMI:SUB:FUNCtion?

**Return Type** <string>

**Default** HIGH

### CONTrol:SIGNal:KDMI:SUB<port>:FUNCtion <func>

**Applicable Models:** M980xA, P50xxA/B, P93xxB

**(Write-Read)** Set and Read the function for the specified port in the sub control port of the I/O adapter interface. The assigned settings are preserved for each system configuration even after preset, firmware restart and on/off. The CONTrol:SIGNal:KDMI:SUB:CHANnel:FUNCtion allows you to set the function independently for each channel.

For more information, see I/O Connector Interface

**Parameters**

- `<port>` Port Number. The number of total ports is returned by CONTrol:SIGNal:KDMI:SUB:COU
- `<func>` function name

<table>
<thead>
<tr>

<td></td>
</tr>
<tr>
<td><strong>NF_LOy</strong> (y=1,2,...)</td>
<td>Noise Figure LO switch control for module y</td>
<td><strong>Output</strong> 3,</td>
<td></td>
</tr>
</tbody>
</table>

*1) For Noise Figure switch control, the signal is asserted no matter which ports are used in channel if the port/module index(x) is not specified.

**Examples**

```
CONT:SIGN:KDMI:SUB3:FUNC "LOW"
control:signal:kmi:sub2:func "INPUT4"
```

**Query Syntax**

```
```

**Return Type**

<sting>, available function list with Comma separated chars

**Controllable Models**: M980xA, P50xxA/B, P93xxB

*(Read Only)* Read the list of the available function for the specified port in the sub control port of the I/O adapter interface. Example, "TRIGGER_IN, INPUT3" is returned for the port 1.

For more information, see I/O Connector Interface

**Parameters**

- `<port>` Port Number. The number of total ports is returned by CONTrol:SIGNal:KDMI:SUB:COUNt?.

**Examples**

```
CONT:SIGN:KDMI:SUB:FUNC:CAT?
control:signal:kdm:sub:function:catalog?
```

**Query Syntax**

```
```

**Return Type**

<sting>, available function list with Comma separated chars
**Default**  See the table in <func> of  CONTrol:SIGNal:KDMI:SUB:FUNC?

CONTrol:SIGNal:KDMI:SUB:INPut<num>:LEVel?

**Applicable Models:** M980xA, P50xxA

*(Read only)* Read the level of the specified INPUT port of the I/O adapter sub side. This command reads the level immediately after its execution. It is not necessary to assign the port as INPUT by CONTrol:SIGNal:KDMI:SUB:FUNCtion command. The When the specified input number is not 1 to 4, "Requested input is not assigned to any KDMI port" error is returned.

For more information, see I/O Connector Interface (M980xA/P50xxA)

**Parameters**

- `<num>`  Input Number (M980xA, P50xxA: 1 to 4)

**Examples**

- `CONT:SIGN:KDMI:SUB:INP4:LEV?`
- `control:signal:kmi:sub:input5:level?`

**Query Syntax**  CONTrol:SIGNal:KDMI:MAIN:INPut:LEVel?

**Return Type**  Char ("HIGH" or "LOW")

**Default**  N/A

CONTrol:SIGNal:PXI:RTRigger[:STATe] <bool>

**Applicable Models:** M980xA

*(Write-Read)* Turns ON / OFF Ready for Trigger output from Backplane Trigger Lines.

**Parameters**

- `<bool>`  Choose from:
  - **ON** (or 1) - VNA DOES output ready for trigger signal from Backplane Trigger line
  - **OFF** (or 0) – VNA does NOT output ready for trigger signal from Backplane Trigger line.

**Examples**

- `CONT:SIGN:PXI:RTR 1`
- `control:signal:pxi:rtrigger:stat off`

**Query Syntax**  CONTrol:SIGNal:PXI:RTRigger[:STATe]?

**Return Type**  Boolean

3858
CONTrol:SIGNal:PXI:RTTrigger:ROUTe <char>

Applicable Models: M980xA

(Write-Read) Specifies the Backplane Trigger Line to use for the trigger OUT ready line.

Parameters

<char> Choose from:

- **TRIG0** – Backplane Trigger Lines (PXI TRIG0)
- **TRIG1** – Backplane Trigger Lines (PXI TRIG1)
- **TRIG2** – Backplane Trigger Lines (PXI TRIG2)
- **TRIG3** – Backplane Trigger Lines (PXI TRIG3)
- **TRIG4** – Backplane Trigger Lines (PXI TRIG4)
- **TRIG5** – Backplane Trigger Lines (PXI TRIG5)
- **TRIG6** – Backplane Trigger Lines (PXI TRIG6)
- **TRIG7** – Backplane Trigger Lines (PXI TRIG7)

Examples

CONT:SIGN:PXI:RTR:ROUT TRIG0
control:signal:pxi:rtrigger:route trig0

Query Syntax

CONTrol:SIGNal:PXI:RTTrigger:ROUTe?

Return Type

Character

Default

TRIG1

**Applicable Models:** M980xA

(*Write-Read*) Turns ON / OFF the trigger output from PXI Backplane line when “CONTrol:SIGNal:TRIGger:OUTP[:STATe]” is “ON”.

**Parameters**

<bool> **ON** (or 1) - VNA DOES output trigger signals from PXI Backplane when “CONTrol:SIGNal:TRIGger:OUTP[:STATe]” is “ON”.

**OFF** (or 0) – VNA does NOT output trigger signals from PXI Backplane.

**Examples**

```
CONT:SIGN:PXI:TRIG:OUTP 1
control:signal:pxi:trigger:output:stat off
```

**Query Syntax**

CONTrol:SIGNal:PXI:TRIGger:OUTPut[:STATe]?

**Return Type** Boolean

**Default** OFF

**CONTrol:SIGNal:PXI:TRIGger:OUTPut:ROUTe <char>**

**Applicable Models:** M980xA

(*Write-Read*) Specifies the Backplane Trigger Line to use for the trigger output line.

**Parameters**

<char> Choose from:

- **TRIG0** – Backplane Trigger Lines (PXI TRIG0)
- **TRIG1** – Backplane Trigger Lines (PXI TRIG1)
- **TRIG2** – Backplane Trigger Lines (PXI TRIG2)
- **TRIG3** – Backplane Trigger Lines (PXI TRIG3)
- **TRIG4** – Backplane Trigger Lines (PXI TRIG4)
- **TRIG5** – Backplane Trigger Lines (PXI TRIG5)
- **TRIG6** – Backplane Trigger Lines (PXI TRIG6)
- **TRIG7** – Backplane Trigger Lines (PXI TRIG7)

**Examples**

```
CONT:SIGN:PXI:TRIG:OUTP:ROUT TRIG0
control:signal:pxi:trigger:output:route trig0
```
**Query Syntax**  

**Return Type**  
Character

**Default**  
TRIG2

CONTrol:SIGNal:STReamline:RTRigger[:STATe] <bool>

**Applicable Models:** P50xxA/B, P93xxB

*(Write-Read)* Turns ON / OFF Ready for Trigger output from Streamline Rear SMB.

**Parameters**

<bool> Choose from:

- **ON** (or 1) - VNA DOES output ready for trigger signal from Streamline Rear SMB
- **OFF** (or 0) – VNA does NOT output ready for trigger signal from Streamline Rear SMB

**Examples**

```
CONT:SIGN:STR:RTR 1
control:signal:streamline:rtrigger:stat off
```

**Query Syntax**  
CONTrol:SIGNal:STReamline:RTRigger[:STATe]?

**Return Type**  
Boolean

**Default**  
0 (Preset will not reset the setting.)

CONTrol:SIGNal:STReamline:RTRigger:ROUTe <char>

**Applicable Models:** P50xxA/B, P93xxB

*(Write-Read)* Specifies the Backplane Trigger Line to use for the trigger OUT ready line.

**Parameters**

<char> Choose from:

- **NONE** – Streamline Rear SMB Not connected (NONE)
- **REAR1** – Streamline Rear SMB (TRIG1)
- **REAR2** – Streamline Rear SMB (TRIG2)

**Examples**

```
CONT:SIGN:STR:RTR:ROUT TRIG1
control:signal:streamline:rtrigger:route trig1
```

**Query Syntax**  
CONTrol:SIGNal:STReamline:RTRigger:ROUTe?
**Return Type**  Character  
**Default**  N/A

**CONTrol:SIGNal:STReamline:TRIGger:OUTPut[:STATe] <bool>**

**Applicable Models:**  P50xxA/B, P93xxB  

*(Write-Read)* Turns ON / OFF the trigger output from Streamline Rear SMB when “CONTrol:SIGNal:TRIGger:OUTP[:STATe]” is “ON”.

**Parameters**

<bool>  ON (or 1) - VNA DOES output trigger signals from Streamline Rear SMB when “CONTrol:SIGNal:TRIGger:OUTP[:STATe]” is “ON”.  

OFF (or 0) – VNA does NOT output trigger signals from Streamline Rear SMB.

**Examples**

```
CONT:SIGN:STR:TRIG:OUTP 1
control:signal:streamline:trigger:output:stat off
```

**Query Syntax**  CONTrol:SIGNal:STReamline:TRIGger:OUTPut[:STATe]?

**Return Type**  Boolean  
**Default**  OFF

**CONTrol:SIGNal:STReamline:TRIGger:OUTPut:ROUTe <char>**

**Applicable Models:**  P50xxA/B, P93xxB  

*(Write-Read)* Specifies the Streamline Rear SMB to use for the trigger output line.

**Parameters**

<char>  Choose from:

**NONE** – Streamline Rear SMB Not connected (NONE)  

**REAR1** – Streamline Rear SMB (REAR TRIG1)  

**REAR2** – Streamline Rear SMB (REAR TRIG2)

**Examples**

```
CONT:SIGN:STR:TRIG:OUTP:ROUT TRIG0
control:signal:streamline:trigger:output:route trig0
```

**Query Syntax**  CONTrol:SIGNal:STReamline:TRIGger:OUTPut:ROUTe?

**Return Type**  Character
Default TRIG2
## Control:Multiplexer Commands

Controls the E5092A Configurable Multiport Test Set.

### CONTroMULTiplexer:

#### OUTPut

| A|B|C|D|DATA |
| A|B|C|D:VOLTage[DATA] |

#### PORT

| [:SELect] |

Click on a keyword to view the command details.

### See Also

- Learn about External Test Set Control
- Synchronizing the Analyzer and Controller
- SCPI Command Tree

### CONTroMULTiplexer<id>:OUTPut:<grp>[:DATA] <num>
Applicable Models: N522xB, N523xB, N524xB, E5080B, M980xA

(Read-Write) Sets or returns the output port data for specified group with id of the E5092A multiport test set.

Notes:
This command performs an **immediate** setting of the specified data on the indicated test set, as opposed to the `SENS<e<cn><num>:MULTiplexer<id>:OUTPut:<grp>[[:DATA]] <num>` command which sets the data only at the beginning of each sweep of the specified channel number ‘cn’. To use this command with the M980xA PXI VNA, the firmware version must be A.15.xx.xx and above, and the S94702A AMX VNA Plugin license is required.

**Parameters**

- `<id>`  
  Id of the external test set either 1 or 2. If unspecified, Id is assumed to be 1.

- `<grp>`  
  A | B | C | D

- `<num>`  
  An integer specifying the decimal value of the control line. Values are obtained by adding weights from the following table that correspond to individual lines.

The output port data range is between 0 to 255 (0=All lines are turned OFF and 255 all lines are turned ON).

<table>
<thead>
<tr>
<th>Line</th>
<th>Weight</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>1</td>
</tr>
<tr>
<td>2</td>
<td>2</td>
</tr>
<tr>
<td>3</td>
<td>4</td>
</tr>
<tr>
<td>4</td>
<td>8</td>
</tr>
<tr>
<td>5</td>
<td>16</td>
</tr>
<tr>
<td>6</td>
<td>32</td>
</tr>
<tr>
<td>7</td>
<td>64</td>
</tr>
<tr>
<td>8</td>
<td>128</td>
</tr>
</tbody>
</table>

**Examples**

```
CONT:MULT1:STAT OFF
CONT:MULT1:OUTP:B 8
' immediately output 8 from control line B.
```

**Query Syntax**

`CONTrol:MULTiplexer<id>:OUTPut:<grp>[[:DATa]]?`

**Return Type**  
Numeric

**Default**  
0

`CONTrol:MULTiplexer<id>:OUTPut:<grp>:VOLTage[:DATA] <volt>`
**Applicable Models:** N522xB, N523xB, N524xB, E5080B, M980xA

(Read-Write) Sets or returns the output voltage for specified group with id of the E5092A multiport test set.

**Notes:**
This command performs an immediate setting of the specified voltage on the indicated test set, as opposed to the `SENSe<cnum>:MULTiplexer<id>:OUTPut:<grp>:VOLTage[:DATA] <volt>` command which sets the voltage only at the beginning of each sweep of the specified channel number `cnum`. To use this command with the M980xA PXI VNA, the firmware version must be A.15.xx.xx and above, and the S94702A AMX VNA Plugin license is required.

**Parameters**
- `<id>`  Id of the external test set either 1 or 2. If unspecified, Id is assumed to be 1.
- `<grp>`  A | B | C | D
- `<volt>`  Output voltage range for `<grp>` is between 0 to 5.2V and resolution is 10mV.

**Examples**

```
CONT:MULT1:STAT OFF
CONT:MULT1:OUTP:B:VOLT 4.2
' immediately set control line B voltage to 4.2 volt.
```

**Query Syntax**  `CONTro:MULTiplexer<id>:OUTPut:<grp>:VOLtage[:DATa]`?

**Return Type**  Numeric  
**Default**  0 V

```
CONTrol:MULTiplexer<id>:PORT<pnum>[[:SELect] <string>

Applicable Models: N522xB, N523xB, N524xB, E5080B, M980xA

(Write-Only) Sets the multiport test set port. If this command creates a conflict with an existing port, the VNA will resolve the conflict.

**Notes:**
This command performs an immediate setting of the specified port on the indicated test set, as opposed to the `SENSe<cnum>:MULTiplexer<id>:PORT<pnum>:SELect <string>` command which sets the port only at the beginning of each sweep of the specified channel number `cnum`. To use this command with the M980xA PXI VNA, the firmware version must be A.15.xx.xx and above, and the S94702A AMX VNA Plugin license is required.

**Parameters**
- `<id>`  Id of the external test set. If unspecified, Id is assumed to be 1. Must be previously set by the `SENSe:MULT:TYPE` command.
<pnum> The VNA connection port number (1 to 4).

If the E5092A’s configuration is E5092_28, this parameter specifies the individual switch number (1 to 4: SP4T switches, 5 to 10: SPDT switches).

<string> The label of the E5092A’s measurement port.

If the E5092A’s configuration is E5092_28, this parameter specifies the connection of the individual switch. Refer to the table of SENS:MULT:PORT:SEL.

**Examples**

<table>

CSET:CATalog?

**Applicable Models:** All

This command replaces SENS:CORR:CSET:CAT?

*(Read-only)* Returns the names of Cal Sets stored on the VNA.

**Parameters** None

**Examples**

CSET:CAT?

**Returns:**

"CalSet_0913,CalSet_1,CalSet_2,CalSet_3,CalSet_4,CH1_CALREG,CH31_CALREG,
CH1_CALREG,CH31_CALREG,MyCalAll_SMC_002,MyCalAll_STD_001"

**Return Type** Comma-separated string of names

**Default** Not Applicable

CSET:COPY <string>,<string>
Applicable Models: All

(Write-only) Creates a new Cal Set and copies the current Cal Set data into it. Use this command to manipulate data on a Cal Set without corrupting the original cal data.

Parameters

<string>,<string> The first string is the name of the current Cal Set. The second string is the name of the new Cal Set copy.

Examples

CSET: COPY 'My2Port','My2PortCopy'

Query Syntax Not Applicable

Default Not Applicable

CSET:DALL

Applicable Models: All

(Write-only) Deletes ALL Cal Sets from the VNA, including phase reference and Global Delta Match Cal Sets.

Parameters None

Examples CSET: DALL

Query Syntax Not Applicable

Default Not Applicable

CSET:DATE? <string>

Applicable Models: All

(Read-only) Returns the (year, month, day) that the specified Cal Set was last saved.

See Also

MMEM:DATE?

MMEM:TIME?

CSET:TIME?

Parameters

<string> Cal Set name.
Examples

CSET:DATE? "CalSet_11"

Returns:

+2013,+5,+1

Return Type: Comma-separated integers.

Default: Not Applicable

---

CSET:DELETE <string>

Applicable Models: All

This command replaces SENS:CORR:CSET:DELETE

(Write-only) Deletes the specified Cal Set from the VNA.

- If the Cal Set is currently being used by a channel, the Cal Set is deleted and correction for the channel is turned off.
- If the Cal Set is not found, no error is returned.

Parameters

<string> Name of the Cal Set to delete. Not case-sensitive.

Examples

CSET:DEL "MyCalSet"

Query Syntax: Not Applicable

Default: Not Applicable

---

CSET:EXISTS? <string>
Applicable Models: All

(Read-only) Returns whether or not the specified Cal Set exists on the VNA.

Parameters

<string> Name or GUID of the Cal Set enclosed in quotes.

The GUID must also be enclosed in curly brackets.

Examples

dim check
check = CSET:EXISts? "MyCalSet"
check = CSET:EXISts? "{7C4EEA5E-40D2-4D70-A048-33BFFE704163}"

Return Type Boolean

ON or 1 - Cal Set exists.
OFF or 0 - Cal Set does NOT exist.

Default Not Applicable

CSET:ETERm:CATalog? <CSET Name>[,<errorTermFilter>]

Applicable Models: All

(Read-only) Returns a list of error term names for the given Cal Set.

Parameters

<CSET Name> (String) Name of Cal Set to query.
<errorTermFilter> (Optional argument) CSET:ETER:CAT? <CSETName>, "<errorTermFilter>" will return only the error term names with the filter string in them. For example, if it is a full 2-port cal, then CSET:ETER:CAT? <CSETName>, “cross” would return all “Crosstalk(n,n)” error terms. (Note that the filter is not case sensitive.)

Entering CSET:ETER:CAT? <CSETName> "" or CSET:ETER:CAT? <CSETName> will return all error terms for the given Cal Set.

Examples

CSET:ETER:CAT? "CalSet_1"
CSET:ETER:CAT? "CalSet_1", "trans"

Return Type Variant

Default Not Applicable
CSET:ETERm[:DATA] <CSET Name>,<ETerm Name>,<data>

**Applicable Models:** All

*(Read-Write)* Sets and returns the error term data (real, imaginary pairs) for the given Cal Set and error term name.

**Parameters**
- `<CSET Name>` *(String)* Name of Cal Set to manipulate.
- `<ETerm Name>` *(String)* Name used to identify an error term in the Cal Set.
- `<data>` *(Block)* Error term data - a real/imaginary data pair for each data point.

**Examples**
```
CSET:ETER "CalSet_1","Directivity(1,1)", 0.237,-1.422, 0.513, 0.895
CSET:ETER? "CalSet_1","Directivity(1,1)"  'read
```

**Query Syntax**
CSET:ETERm:DATA? <CSET Name>,<ETerm Name>

**Return Type**
Block data

**Default**
Not Applicable

---

CSET:ETERm:FORMat? <term name>,<rcv port>,<src port>[,<rcvPort gainstate>][,<srcPort gainstate>]

**Applicable Models:** All

*(Read-only)* Returns switched gain error terms. Switched gain error terms have a suffix on the term name to identify the receiver gain states that apply to the term. For example:

- TransmissionTracking(2,1)
- TransmissionTracking(2,1)[0,1]
- TransmissionTracking(2,1)[1,0]
- TransmissionTracking(2,1)[1,1]

**Parameters**
- `<term name>` *(String)* Name used to identify an error term.
- `<rcv port>` Receiver port number.
- `<src port>` Source port number.
- `<rcvPort gainstate>` Receiver port gain state.
- `<srcPort gainstate>` Source port gain state.
CSET:ETERm:X:VALues <CSET Name>,<ETerm Name>,<freqlist>

Applicable Models: All

(Read-Write) Sets and returns the x-axis frequencies for the given Cal Set and error term name. This command requires that the error term already be in existence either from a calibration session or having been created with CSET:ETER:DATA.

This command requires that the frequency array length match the existing size of the error term. For example, if the error term is 3 buckets long (3 complex numbers), then the frequency list must be 3 values long.

Parameters

- `<CSET Name>` (String) Name of Cal Set to manipulate.
- `<ETerm Name>` (String) Name used to identify an error term in the Cal Set.
- `<freqlist>` (Block) X-axis frequencies associated with the error term.

Examples

'CQuery error term data from calset named "Calset1"
CSET:ETER:DATA? "Calset7","Directivity(1,1)"

'If needed, change or upload the data for the "Directivity" error term (example of a three point eterm)

'Query what the frequency values are for the error term
CSET:ETER:X:VAL? "Calset7","Directivity(1,1)"

'If needed, change the frequency values for the error term
CSET:ETER:X:VAL "Calset7","Directivity(1,1)" 1.00000000000E+007,1.42450000000E+008,2.74900000000E+008

Query Syntax

CSET:ETERm:X:VALues? <CSET Name>,<ETerm Name>

Return Type

Block data
CSET:FIXTure:CASCade <s2p1>,<s2p2>,<s2pResult>,<char>

**Applicable Models:** All

*(Write-only)* Combines the losses and phase shift of two S2P files into a single S2P file. Learn more.

**Parameters**

- `<s2p1>` *(String)* Path and filename of one of the S2P files to be combined.
- `<s2p2>` *(String)* Path and filename of the other S2P file to be combined.
- `<s2pResult>` *(String)* Path and filename of the combined S2P file.
- `<char>` *(Character)* Format. Choose from:
  - REIM - Real, imaginary data pairs
  - LOG - Log magnitude, phase
  - LINear - Linear magnitude, phase

**Examples**

```
CSET:FIXT:CASC "D:\a.s2p","D:\b.s2p","D:\c.s2p",LOG
```

**Query Syntax** Not Applicable

**Default** Not Applicable

---

CSET:FIXTure:CHARacterize <cs1>,<cs2>,<port>,<s2p>,<char>[,<pivot>]

**Applicable Models:** All

*(Write-only)* Characterizes a fixture based on two Cal Sets. The stimulus settings of the two Cal Sets do NOT have to be identical, but they MUST have a common frequency range for interpolation. A new S2P file is created. Learn more about Cal Plane Manager.

**Parameters**

- `<cs1>` *(String)* Name of an existing Cal Set 1 which describes the cal closest to the VNA. The Cal Set must reside on the VNA.
- `<cs2>` *(String)* Name of an existing Cal Set 2 which describes the cal closest to the DUT. The Cal Set must reside on the VNA.
- `<port>` *(Numeric)* Port number described in the Cal Sets.
- `<s2p>` *(String)* Name of the S2P file containing the adapter/fixture characterization.
(Character) Format. Choose from:

- REIM - Real, imaginary data pairs
- LOG - Log magnitude, phase
- LINear - Linear magnitude, phase

Examples

CSET:FIXT:CHAR "CalSet1","CalSet2",1,"Fixture.s2p"

cset:fixture:characterize "CalSet1","CalSet2",2,"Fixture.s2p",90

Query Syntax

Not Applicable

Default

Not Applicable

CSET:FIXTure:DEEMbed <cs1>,<cs2>,<s2p>,<port>, <compPwr>[,extrap]

Applicable Models: All

(Write-only) De-embeds a fixture from an existing Cal Set based on an S2P file. A new Cal Set is created with the effects of the fixture removed.

When the new Cal Set is applied to a channel, the effects of fixturing are removed from the measurement data. Do NOT enable fixturing. The effects of the fixture are removed when the new Cal Set is selected and correction is turned ON.

Parameters

<cs1> (String) Name of an existing Cal Set which resides on the VNA.

<cs2> (String) Name of new Cal Set which contains updated error terms with fixture de-embedded.

<s2p> (String) Name of the S2P file which characterizes the adapter/fixture.

<port> (Numeric) Port number from which fixture will be de-embedded.

<compPwr> (Boolean)

ON (1) - When the Cal Set contains a power correction array for the fixture port, that array will be compensated for the fixture loss.

Warning: enabling power compensation can result in an increase in test port power and consequently, increased power to the DUT. Use with caution.

OFF (0) - Do not compensate for loss in source power through the fixture.

[extrap] (Boolean) Optional argument.
ON (1) - Applies a simple extrapolation when the S2P file has a narrower frequency range than the Cal Set. The values for the first and last data points are extended in either direction to cover the frequency range of the Cal Set.

OFF (0) - Extrapolation is NOT performed (default setting).

Examples

CSET:FIXT:DEEM "MyCalSet","MyNewCalSet","Fixture.s2p",1,1,1

cset:fixture:deembed
"MyCalSet","MyNewCalSet","Fixture.s2p",1,1,1 'extrapolation is performed if the s2p frequency range is narrower than that of the Cal Set.

Query Syntax Not Applicable

Default Not Applicable

CSET:FIXTURE:EMBED <cs1>,<cs2>,<s2p>,<port>,<compPwr>[,extrap]

Applicable Models: All

(Write-only) Embeds a fixture (usually a matching network) into an existing Cal Set based on an S2P file. A new Cal Set is created with the effects of the matching network included in the correction data.

When the new Cal Set is applied to a channel, the effects of the fixture are included in the measurement data. Do NOT enable fixturing. The effects of the matching network are included when the new Cal Set is selected and correction is turned ON.

Parameters

<cs1> (String) Name of an existing Cal Set which resides on the VNA.
<cs2> (String) Name of new Cal Set which contains updated error terms with fixture embedded.
<s2p> (String) Name of the S2P file which characterizes the fixture / matching network.
<port> (Numeric) Port number to which fixture will be added.
<compPwr> (Boolean)

ON (1) - Increase the source power to compensate for the loss through the fixture. The result is that the specified power level will be correct at the DUT input.

Warning: enabling power compensation can result in an increase in test port power and consequently, increased power to the DUT. Use with caution.
OFF (0) - Do not compensate for loss in source power through the matching network.

[extrap] (Boolean) Optional argument.

ON (1) - Applies a simple extrapolation when the S2P file has a narrower frequency range than the Cal Set. The values for the first and last data points are extended in either direction to cover the frequency range of the Cal Set.

OFF (0) - Extrapolation is NOT performed (default setting).

Examples

CSET:FIXT:EMB "MyCalSet","MyNewCalSet","Fixture.s2p",1,1

cset:fixture:embed "MyCalSet","MyNewCalSet","Fixture.s2p",1,1,1

'extrapolation is performed if the s2p frequency range is narrower than that of the Cal Set.'

Query Syntax
Not Applicable

Default
Not Applicable

CSET:FIXTure:ENR:EMBed <inEnr>,<s2p>,<outEnr>

Applicable Models: All

(Write-only) Generate a new ENR file by embedding an adapter to an existing ENR file.

Parameters

<inEnr> (String) Path and filename of original ENR file.

<s2p> (String) Path and filename of the S2P file which characterizes the adapter/fixture network.

<outEnr> (String) Path and filename of new ENR file to output

Examples

CSET:FIXT:EMB "D:\Original.enr","D:\adapter.s2p","D:\new.enr"

Query Syntax
Not Applicable

Default
Not Applicable

CSET:FIXTure:ZERO<original_s4p>,<result_s4p>,<sparameters>,<complexformat>
Applicable Models: All

(Write-only) Creates a new S4P file.

Parameters

- `<original_s4p>` (String) Path and filename of the original S4P file.
- `<result_s4p>` (String) Path and filename of the new S4P file.
- `<sparameters>` (String) Comma-separated terms to zero-out.
- `<complexformat>` (Character) Format. Choose from:
  - REIM - Real, imaginary data pairs
  - LOG - Log magnitude, phase
  - LIN - Linear magnitude, phase

Examples

```
CSET:FIXT:ZERO
"D:\originalFile.s4p","D:\newFile.s4p","S11,S21,S33",LOG
```

Query Syntax

Not Applicable

Default

Not Applicable

---

CSET:ITEM:CATalog? <calset>

Applicable Models: All

(Read-only) The Cal Set mainly contains error term data for measurement correction purposes. But Cal Sets can also contain auxiliary information used to describe how the Cal Set was constructed. This information is stored as name value pairs and can be accessed by the item name. The catalog query returns a list of item names contained in the specific Cal Set being queried.

Parameters

- `<calset>` (String) Name of the Cal Set item.

Examples

```
CSET:ITEM:CAT? "mycalset"
```

Return Type

String

Default

Not Applicable

---

CSET:ITEM:DATA? <calset>,<itemName>
Applicable Models: All

(Read-Write) Returns the VNA Measurement Class or Channel that created the specific Cal Set item.

About Cal Set Items

A Cal Set item is a named value. You can list the named values using CSET:ITEM:CATalog? or SENS:CORR:CSET:ITEM:CATalog?

You can query the value of a specific item by asking for its data: CSET:ITEM:DATA?

For example, one of the items added by the VNA firmware to every Cal Set is named 'Created By'. The value attached to this item is the name of the VNA Measurement Class or Channel that created the Cal Set. When an SMC cal is performed, you can query the Cal Set for the 'Create By' item, and it will return 'Scalar Mixer/Converter'. The same query on an NFx channel returns 'Noise Figure Converters'.

CSET:ITEM:DATA? "mycalset","Created By"

Parameters

- `<cnum>` Any existing channel number. If unspecified, value is set to 1.
- `<calset>` (String) Name of the Cal Set item.
- `<itemName>` (String) VNA Measurement Class or Channel that created the Cal Set.

Examples

```
SENS:CORR:CSET:ITEM? "mycalset","Created By"
```

Return Type

String

Default

Not Applicable

CSET:TIME? <string>

Applicable Models: All

(Read-only) Returns the (hour, minute, second) that the specified Cal Set was last saved. The time is returned in local time as setup in the VNA operating system.

See Also

CSET:DATE?

MMEM:DATE?

MMEM:TIME?

Parameters

- `<string>` Cal Set name.
Examples

CSET:TIME? "CalSet_11"

'Returns:
+13,+6,+1

Return Type
Comma-separated integers.

Default
Not Applicable

CSET:VALIDATE? <calset>,<channel>

Applicable Models: All

(Read-only) This query compares the stimulus of "chanNumber" (<channel>) with the stimulus stored in the specified calset.

Parameters

<calset>  (String) Name of the Cal Set item.
<channel> (Integer) Any existing channel number.

Examples

CSET:VALIDATE? "CalSet_11",2

Return Type
Enumeration:

EQUal - Calset stimulus matches the channel stimulus.

DELTa - Calset can be used, but differs in some property that is not related to the xAxis.

XAXis - Calset can be used but will be "interpolated": interpolated data maybe computed or just decimated based on the alignment.

REStore - Calset could be used but requires restoring the calibration stimulus stored in the calset.

REJect - Calset is rejected (calset not recognized or was created by an incompatible channel).

Default
Not Applicable

**DISPlay:ANNotation:FREQuency[:STATe] <ON | OFF>**
Applicable Models: All

(Read-Write) Turns frequency information on the display title bar ON or OFF for all windows.

**Parameters**

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;ON</td>
<td>OFF&gt;</td>
</tr>
</tbody>
</table>

**Examples**

```
DISP:ANN:FREQ ON
display:annotation:frequency:state off
```

**Query Syntax**

DISPlay:ANNotation:FREQuency[:STATe]?

**Return Type**

Boolean (1 = ON, 0 = OFF)

**Default**

ON (1)

---

**DISPlay:ANNotation:MESSage:STATe <ON | OFF>**

Applicable Models: All

(Read-Write) Enables and disables error pop-up messages on the display.

**Parameters**

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;ON</td>
<td>OFF&gt;</td>
</tr>
</tbody>
</table>

**Examples**

```
DISP:ANN:MESS:STAT ON
display:annotation:message:state off
```

**Query Syntax**

DISPlay:ANNotation:MESSage:STATe?

**Return Type**

Boolean (1 = ON, 0 = OFF)

**Default**

ON (1)

---

**DISPlay:ANNotation[:STATus] <ON | OFF>**
Applicable Models: All

(Read-Write) Turns the status bar at the bottom of the screen ON or OFF. The status bar displays information for the active window.

Parameters

<ON | OFF>
  ON (or 1) - turns status bar ON.
  OFF (or 0) - turns status bar OFF.

Examples

  DISP:ANN ON
  display:annotation:status off

Query Syntax

  DISPlay:ANNotation[:STATus]?

Return Type

  Boolean (1 = ON, 0 = OFF)

Default

  Last state that was set

---

DISPlay:ARRange <char>

Applicable Models: All

(Write-only) Places EXISTING measurements into pre-configured window arrangements. Overlay, Stack(2), Split(3), and Quad(4) creates new windows. To learn more, see Window Layout.

Parameters

<char>
  Window arrangement. Choose from:

  - TILE - tiles existing windows
  - CASCade - overlaps existing windows
  - OVERlay - all traces placed in 1 window
  - STACk - 2 windows
  - SPLit - 3 windows
  - QUAD - 4 windows
  - MEASure - 1 measurement per window
  - CHANnel - 1 channel per window
  - LTOR - Arrange existing windows as a single row of side-by-side windows.

Examples

  DISP:ARR CASC
display:arrange cascade

Query Syntax

  Not Applicable
DISPlay:CATalog?

Applicable Models: All

(Read-only) Returns the existing Window numbers.

**Note:** If there are no traces in the window, this query returns the "EMPTY" string.

To read the window number of the selected trace, use `Calc:Par:WNUM`.

<table>
<thead>
<tr>
<th>Return Type</th>
<th>String of Character values, separated by commas</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example</td>
<td>Two windows with numbers 1 and 2 returns: &quot;1,2&quot;</td>
</tr>
<tr>
<td>Default</td>
<td>Not applicable</td>
</tr>
</tbody>
</table>

DISPlay:ENABle <ON | OFF>

Applicable Models: All

(Read-Write) Specifies whether to disable or enable all analyzer display information in all windows in the analyzer application. Marker data is not updated. More CPU time is spent making measurements instead of updating the display.

**Parameters**

<ON | OFF>  
ON (or 1) - turns the display ON.  
OFF (or 0) - turns the display OFF.

**Examples**

`DISP:ENAB ON`  
`display:enable off`

**Query Syntax**  
`DISP:ENABle?`

**Return Type**  
Boolean (1 = ON, 0 = OFF)

**Default**  
ON

DISPlay:FSIGn <ON | OFF>
Applicable Models: All

(Read-Write) Shows or hides the window which displays global pass/fail results.

Parameters

<ON | OFF>  
ON (or 1) - displays the pass/fail dialog
OFF (or 0) - hides the pass/fail dialog

Examples

DISP:FSIG ON  
display:fsign off

Query Syntax  
DISPlay:FSIGn?

Return Type  
Boolean (1 = ON, 0 = OFF)

Default  
OFF

DISPlay:GUI:POWer:SPIN:RESolution <real>

Applicable Models: All

(Read-Write) Sets and returns the resolution of the front panel knob when it is used to adjust Source Power manually.

Parameters

<real>  
Spin resolution value (Real value). The range of acceptable values is 0.01 to 100.

Examples

DISP:GUI:POW:SPIN:RES 0.01  
'dWrite - Every tick of the front panel knob will change the Power Level by 0.01 dBm.'

display:gui:power:spin:resolution 0.01

Query Syntax  
DISPlay:GUI:POWer:SPIN:RESolution?

Return Type  
Real

Default  
0.1

DISPlay:MEASure<mnum>:DELete
### Applicable Models: All

(Write-only) Deletes the trace associated with the specified measurement number.

**Note:** The measurement is not deleted. This command does the reverse of `DISP:MEAS:FEED`.

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>&lt;mnum&gt;</code></td>
<td>Measurement number for each measurement. There must be a selected measurement on the trace. If unspecified, <code>&lt;mnum&gt;</code> is set to 1.</td>
</tr>
</tbody>
</table>

<table>

### DISPlay:MEASure<mnum>:FEED <wnum>

**Applicable Models:** All

(Write-only) This command creates a new trace in the specified window and connects the trace to measurement which results in the trace displaying the data from measurement.

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>&lt;mnum&gt;</code></td>
<td>Measurement number for the measurement. If unspecified, <code>&lt;mnum&gt;</code> is set to 1.</td>
</tr>
<tr>
<td><code>&lt;wnum&gt;</code></td>
<td>Display the measurement in a specified Window number. The window must be turned on. In addition, a window number must be specified. The range is 1 to 500.</td>
</tr>
</tbody>
</table>

</thead>
</table>

<table>
<thead>
<tr>
<th>Default</th>
<th>Not Applicable</th>
</tr>
</thead>
</table>

### DISPlay:MEASure<mnum>:MEMory[:STATe] <bool>
Applicable Models: All

(Read-Write) Turns the memory trace ON or OFF for the specified measurement.

Note: DISP:MEAS:FEED must first be done to feed the measurement to a trace. This command behaves the same as DISP:WIND:TRAC:MEM[:STAT] except that it only requires the measurement number.

Parameters
<mnum>
Measurement number for each measurement. There must be a selected measurement on the trace. If unspecified, <mnum> is set to 1.

<bool>
ON or 1 - Turns the memory trace ON.
OFF or 0 - Turns the memory trace OFF.

Examples
DISP:MEAS:MEM ON
display:measure:memory:state off

Query
Syntax
DISPlay:MEASure<mnum>:MEMory[:STATe]?

Return Type
Boolean
Default
OFF

DISPlay:MEASure<mnum>:MOVE <toWin>

Applicable Models: All

(Write-only) Moves a trace associated with measurement number to the specified window. If the window is OFF, it will be turn ON.

Parameters
<mnum>
Measurement number for each measurement. There must be a selected measurement on the trace. If unspecified, <mnum> is set to 1.

<toWin>
Number of the window to which the specified measurement is moved. If the window does not exist, it will be created.

Examples
DISP:MEAS:MOVE 2
display:measure:move 1

Query
Syntax
Not Applicable

Default
Not Applicable

DISPlay:MEASure<mnum>:SELect
**Applicable Models:** All

*(Write-only)* Activates the specified measurement to be selected.

**Parameters**

- `<mnum>` Measurement number for each measurement. There must be a selected measurement on the trace. If unspecified, `<mnum>` is set to 1.

**Examples**

<table>
<thead>
<tr>
<th>Command</th>
</tr>
</thead>
<tbody>
<tr>
<td>DISP:MEAS:SEL</td>
</tr>
<tr>
<td>display:measure:select</td>
</tr>
</tbody>
</table>

**Query Syntax** Not Applicable

**Default** Not Applicable

---

**DISPlay:MEASure<mnum>[:STATe] <bool>**

**Applicable Models:** All

*(Read-Write)* Turns ON or OFF the display of a trace associated with the specified measurement. When OFF, the measurement behind the trace is still active.

Note: A trace must first be created (via FEED), then the visibility of the trace can be affected with this command. If the trace has not been created, an error is generated: 107, Requested trace not found.

**Parameters**

- `<mnum>` Measurement number for each measurement. There must be a selected measurement on the trace. If unspecified, `<mnum>` is set to 1.
- `<bool>` ON or 1 - Turns the trace ON.
  OFF or 0 - Turns the trace OFF.

**Examples**

<table>
<thead>
<tr>
<th>Command</th>
</tr>
</thead>
<tbody>
<tr>
<td>DISP:MEAS:STAT ON</td>
</tr>
<tr>
<td>display:measure off</td>
</tr>
</tbody>
</table>

**Query Syntax** `DISPlay:MEASure<mnum>[:STATe]?`

**Return Type** Boolean

**Default** ON or 1

---

**DISPlay:MEASure<mnum>:TITle:DATA <string>**
Applicable Models: All

(Read-Write) Sets or gets the title for the specified measurement. The trace title is embedded in the trace status field. Learn more about Trace Titles.

Newer entries replace (not append) older entries. The title is turned ON and OFF with \texttt{DISP:WIND:TRAC:TITL:STAT}.

**Parameters**

- \texttt{<mnum>} Measurement number for each measurement. There must be a selected measurement on the trace. If unspecified, \texttt{<mnum>} is set to 1.
- \texttt{<string>} Used as the title to be displayed for the measurement. Any characters (not spaces) enclosed with quotes.

**Examples**

\begin{verbatim}
DISP:MEAS:TITL:DATA 'MyNewMeas'
display:measure:title: data 'hello'
\end{verbatim}

**Query Syntax**

\texttt{DISPlay:MEASure<mnum>:TITLe:DATA?}

**Return Type**

String

**Default**

Not Applicable

\begin{verbatim}
DISPlay:MEASure<mnum>:TITLe[:STATe] <bool>
\end{verbatim}

Applicable Models: All

(Read-Write) Turns ON or OFF the measurement title.

Note: The measurement and trace need to exist. When turned OFF, the previous trace title returns. Set a new trace title using \texttt{DISP:WIND:TRAC:TITL:DATA}

Learn more about Trace Titles

**Parameters**

- \texttt{<mnum>} Measurement number for each measurement. There must be a selected measurement on the trace. If unspecified, \texttt{<mnum>} is set to 1.
- \texttt{<bool>} ON or 1 - turns the title ON.

**Examples**

\begin{verbatim}
DISP:MEAS:TITL ON
Display:measure:title:state off
\end{verbatim}

**Query Syntax**

\texttt{DISPlay:MEAS<mnum>:TITLe[:STATe]?
}

**Return Type**

Boolean

**Default**

OFF or 0
DISPlay:MEASure<mnum>:Y[:SCALe]:AUTO

**Applicable Models:** All

*(Write-only)* Performs an Autoscale on the specified trace in the specified measurement, providing the best fit display.

Autoscale is performed only when the command is sent; it does NOT keep the trace autoscaled indefinitely.

Autoscale behaves differently when *scale coupling* is enabled. How it behaves depends on the scale coupling method. [Learn more.]

See Also, **DISPlay:WINDow:Y:AUTO** which performs an Autoscale All.

**Parameters**
- `<mnum>` Measurement number for each measurement. There must be a selected measurement on the trace. If unspecified, `<mnum>` is set to 1.

**Examples**
- `DISP:MEAS:Y:AUTO`
- `display:measure:y:scale:auto`

**Query Syntax**
Not Applicable

**Default**
Not Applicable

---

**DISPlay:MEASure<mnum>:Y[:SCALe]:PDIVision <num>**

**Applicable Models:** All

*(Read-Write)* Sets the Y axis Scale Per Division value of the specified trace associated with the specified measurement.

**Note:** The measurement and trace need to exist.

**Parameters**
- `<mnum>` Measurement number for each measurement. There must be a selected measurement on the trace. If unspecified, `<mnum>` is set to 1.
- `<num>` Units / division value (Real value). The range of acceptable values is dependent on format and domain.

**Note:** This command will accept MIN or MAX instead of a numeric parameter. See [SCPI Syntax](#) for more information.

**Examples**
- `DISP:MEAS:Y:PDIV 1`
- `display:measure:y:scale:pdivision maximum`

**Query Syntax**
- `DISP:MEASure<mnum>:Y[:SCALe]:PDIVision?`
**DISPlay:MEASure<mnum>:Y[:SCALe]:RLEVel <num>**

**Applicable Models:** All

(Read-Write) Sets the Y axis Reference Level of the specified trace associated with the specified measurement.

**Note:** The measurement and trace need to exist.

**Parameters**

- `<mnum>`: Measurement number for each measurement. There must be a selected measurement on the trace. If unspecified, `<mnum>` is set to 1.
- `<num>`: Reference level value (Real value). The range of acceptable values is dependent on format and domain.

**Examples**

```plaintext
DISP:MEAS:Y:RLEV 0
display:measure:y:scale:rlevel minimum
```

**Query Syntax**

DISPlay:MEASure<mnum>:Y[:SCALe]:RLEVel?

**Return Type**

Numeric

**Default**

0

---

**DISPlay:MEASure<mnum>:Y[:SCALe]:RPOSition <num>**
Applicable Models: All

(Read-Write) Sets the Reference Position of the specified trace associated with the specified measurement.

Note: The measurement and trace need to exist.

Parameters

- `<mnum>`: Measurement number for each measurement. There must be a selected measurement on the trace. If unspecified, `<mnum>` is set to 1.
- `<num>`: Reference position on the screen measured in horizontal graticules from the bottom (Real value). The range of acceptable values is dependent on format and domain.

Note: This command will accept MIN or MAX instead of a numeric parameter. See SCPI Syntax for more information.

Examples

- `DISP:MEAS:Y:RPOS 0`
- `display:measure:y:rposition maximum`

Query Syntax

`DISPlay:MEASure<mnum>:Y[:SCALe]:RPOsition?`

Return Type

Numeric

Default

5

Display:SHEet<num>:ARRange <char>

Applicable Models: All

(Write-only) This command arranges existing windows to sheets.

Parameters

- `<num>`: Sheet number
- `<char>`: Sheet arrangement. Choose from:
  - WINDow: one sheet per window
  - CHANnel: one sheet per channel
  - TRACe: one channel per sheet
  - ONE: merge all windows into one sheet

Examples

- `DISP:SHE:ARR CHAN`
- `display:sheet:arrange channel`
**Query Syntax**

**Return Type**

| Default | One sheet per window |

**Applicable Models:** All

**(Read-only)** This command reads and displays comma separated list of window numbers which the sheet contains.

**Parameters**

- `<num>`: Sheet number

**Examples**

- `DISP:SHE:CAT?`
- `display:sheet:catalog?`

**Return Type**: Character

| Default | 1 |

---

**Applicable Models:** All

**(Write-only)** Sets the sheet visible and invisible:

- **ON**: If OFF, sets the sheet visible with a new window.
- **OFF**: If ON, sets the sheet invisible with all the containing window state OFF (DISPlay:WINDow:STATe OFF)

**Parameters**

- `<num>`: Sheet number

**Examples**

- `DISP:SHE:STAT ON`
- `display:sheet:state off`

**Query Syntax**: DISPlay:SHEet:STATe?

**Return Type**: Bool

| Default | OFF except for Sheet 1 |
**Display:Sheet<num>:Title:Data <char>**

**Applicable Models:** All

*(Read-Write)* This command sets or gets the sheet label.

**Parameters**

- `<num>` Sheet number
- `<char>` The label of the sheets. Default and present value is "Sheet 1"

**Examples**

```
DISP:SHE:TITL:DATA "Sheet 1"
display: sheet: title: data "Sheet 1"
```

**Query Syntax**

DISPlay:SHEet:TITLe:DATA?

**Return Type** Character

**Default** "Sheet 1"

---

**Display:Split <num>**

**Applicable Models:** All

*(Write-only)* Destroys all existing traces, channels and windows, then creates N windows. No channels are created.

**Parameters**

- `<num>` N is 1 or greater.

**Examples**

```
DISP:SPL
display:split
```

**Query Syntax**

DISPlay:SPLit?

**Return Type** Numeric

**Default** Not Applicable

---

**Display:Status:Log:Clear**

**Applicable Models:** All

*(Write-only)* Clears the message region in the status bar.

**Parameters**

**Examples**

```
DISP:STAT:LOG:CLE
display:status:log:clear
```

**Query Syntax**

Not Applicable

**Default** Not Applicable
**DISPlay:TMAX <bool>**

**Applicable Models:** All

*(Read-Write)* Maximizes (isolates) or restores the active trace in the active window. When turned ON, the active trace is the ONLY trace on the display. All other traces are hidden. Learn more.

**Parameters**

<bool>  
ON (or 1) - Maximize / isolates the active trace.
OFF (or 0) - Restores other traces to the normal window setting.

**Examples**

```
DISP:TMAX ON
display:tmax 0
```

**Query Syntax**  
DISPlay:TMAX?

**Return Type**  
Boolean (1 = ON, 0 = OFF)

**Default**  
OFF

---

**DISPlay[:TILE] - Superseded**

This command is replaced by **DISP:ARRange**

*(Write-only)* Tiles the windows on the screen.

**Examples**

```
DISP
display:tile
```

**Default**  
Not Applicable

---

**DISPlay:TOOLbar:CSET[:STATe] <bool>**
Applicable Models: All

(Read-Write) Show or hide the calset toolbar.

Parameters

<bool>

ON (or 1) - Toolbar ON.

OFF (or 0) - Toolbar OFF.

Examples

DISP:TOOL:CSET ON
display:toolbar:cset:state off

Query Syntax

DISPlay:TOOLbar:CSET[:STATe]?

Return Type

Boolean (1 = ON, 0 = OFF)

Default

ON

---

DISPlay:TOOLbar:ENTRy[:STATe] <bool>

Applicable Models: All

(Read-Write) Specifies whether to show or hide the active entry toolbar. See this toolbar.

Parameters

<bool>

ON (or 1) - Toolbar ON.

OFF (or 0) - Toolbar OFF.

Examples

DISP:TOOL:ENTR ON
display:toolbar:entry:state off

Query Syntax

DISPlay:TOOLbar:ENTRy[:STATe]?

Return Type

Boolean (1 = ON, 0 = OFF)

Default

ON

---

DISPlay:TOOLbar:EXTensions[:STATe] <bool>
Applicable Models:  All

(Read-Write) Specifies whether to show or hide the port extensions toolbar. See this toolbar.

**Parameters**

- `<bool>`  
  - **ON** (1) - Toolbar ON.
  - **OFF** (0) - Toolbar OFF.

**Examples**

```plaintext
DISP:TOOL:EXT ON
display:toolbar:extensions:state off
```

**Query Syntax**  
DISPlay:TOOLbar:EXTensions[:STATe]?

**Return Type**  
Boolean (1 = ON, 0 = OFF)

**Default**  
ON

**DISPlay:TOOLbar:KEYS[:STATe] <bool>**

Applicable Models: All

(Read-Write) Specifies whether to show or hide the virtual hardkeys on the VNA display. These are primarily used when the VNA is accessed remotely using VNC or Windows Remote Desktop.

**Parameters**

- `<bool>`  
  - **ON** (1) - Keys ON.
  - **OFF** (0) - Keys OFF.

**Examples**

```plaintext
DISP:TOOL:KEYS ON
display:toolbar:keys:state off
```

**Query Syntax**  
DISPlay:TOOLbar:KEYS [:STATe]?

**Return Type**  
Boolean (1 = ON, 0 = OFF)

**Default**  
ON

**DISPlay:TOOLbar:MARKer[:STATe] <bool>**
Applicable Models: All

(Read-Write) Specifies whether to show or hide the marker toolbar. See this toolbar.

**Parameters**

<bool> ON (or 1) - Toolbar ON.

OFF (or 0) - Toolbar OFF.

**Examples**

| Display:TOOL:MARK ON | display:toolbar:marker:state off |

**Query Syntax**

DISPlay:TOOLbar:MARKer[:STATe]?

**Return Type**

Boolean (1 = ON, 0 = OFF)

Default ON

---

**DISPlay:TOOLbar:MEASurement[:STATe] <bool> OBSOLETE**

This toolbar was eliminated with A.10.00

(Read-Write) Specifies whether to show or hide the measurement toolbar.

**Parameters**

<bool> ON (or 1) - Toolbar ON.

OFF (or 0) - Toolbar OFF.

**Examples**

| DISP:TOOL:MEAS ON | display:toolbar:measurement:state off |

**Query Syntax**

DISPlay:TOOLbar:MEASurement[:STATe]?

**Return Type**

Boolean (1 = ON, 0 = OFF)

Default ON

---

**DISPlay:TOOLbar:STIMulus[:STATe] <bool> OBSOLETE**
This toolbar was eliminated with A.10.00

(Read-Write) Specifies whether to show or hide the stimulus toolbar.

Parameters

<bool>  
ON (or 1) - Toolbar ON.
OFF (or 0) - Toolbar OFF.

Examples

DISP:TOOL:STIM ON
display:toolbar:stimulus:state off

Query Syntax

DISPlay:TOOLbar:STIMulus[:STATe]?

Return Type

Boolean (1 = ON, 0 = OFF)

Default

ON

DISPlay:TOOLbar:SWEep[:STATe] <bool> OBSOLETE

This toolbar was eliminated with A.10.00

(Read-Write) Specifies whether to show or hide the sweep control toolbar.

Parameters

<bool>  
ON (or 1) - Toolbar ON.
OFF (or 0) - Toolbar OFF.

Examples

DISP:TOOL:SWE ON
display:toolbar:sweep:state off

Query Syntax

DISPlay:TOOLbar:SWEep[:STATe]?

Return Type

Boolean (1 = ON, 0 = OFF)

Default

ON
Applicable Models: All

(Read-Write) Specifies whether to show or hide the Time Domain toolbar. See this toolbar.

Parameters

<bool>  
ON (or 1) - Toolbar ON.
OFF (or 0) - Toolbar OFF.

Examples  
DISP:TOOL:TRAN ON
display:toolbar:transform:state off

Query Syntax  
DISPlay:TOOLbar:TRANsform[:STATe]?

Return Type  
Boolean (1 = ON, 0 = OFF)

Default  
ON

DISPlay:UPDATE[:STATe] <bool>

Applicable Models: All

(Read-Write) Enables or disables display updates. Disabling display updates improves measurement performance. When disabled, the display windows (traces, markers, etc.) are frozen.

Parameters

<bool>  
ON (or 1) - Toolbar ON.
OFF (or 0) - Toolbar OFF.

Examples  
DISP:UPD ON
display:update:state off

Query Syntax  
DISPlay:UPDate[:STATe]?

Return Type  
Boolean (1 = ON, 0 = OFF)

Default  
ON

DISPlay:UPDATE:IMMediate
Applicable Models: All

(Write-only) Executes the display update once when the display update of the LCD screen is set to OFF (specifying False with the DISPlay:ENABle object).

<table>

DISPlay:VISible <ON | OFF>

Applicable Models: All

(Read-Write) Makes the VNA application visible or not visible. In the Not Visible state, the analyzer cycle time for making measurements, and especially data transfer, can be significantly faster because the display does not process data.

<table>
<thead>
<tr>
<th>Parameters</th>
<th>&lt;ON</th>

DISPlay:WINDow<wnum>:ANNotation:LIMit:XPOSition <num>
Applicable Models: All

(Read-Write) Sets and returns the X-axis position of the Limit Line Pass/Fail indicator on the VNA screen. The lower-left corner of the Pass/Fail indicator is the point of reference for positioning.

Parameters

| <wnum> | Any existing window number. If unspecified, value is set to 1. |
| <num> | X-axis position. Choose a value between 0 (far left) and 10 (far right). |

Examples

```
DISP:WIND:ANN:LIM:XPOS 1.5
```
```
display:window:annotation:limit:xposition 5
```

Query Syntax

DISPlay:WINDow:ANNotation:LIMit:XPOSition?

Return Type

Numeric

Default

7

DISPlay:WINDow<wnum>:ANNotation:LIMit:YPOSition <num>

Applicable Models: All

(Read-Write) Sets and returns the Y-axis position of the Limit Line Pass/Fail indicator on the VNA screen. The lower-left corner of the Pass/Fail indicator is the point of reference for positioning.

Parameters

| <wnum> | Any existing window number. If unspecified, value is set to 1. |
| <num> | Y-axis position. The maximum position is limited to the current Y-axis division value. Choose a value between 2 (bottom) and 30 (top). |

Examples

```
DISP:WIND:ANN:LIM:YPOS 1.5
```
```
display:window:annotation:limit:yposition 5
```

Query Syntax

DISPlay:WINDow:ANNotation:LIMit:YPOSition?

Return Type

Numeric

Default

0

DISPlay:WINDow<wnum>:ANNotation:MARKer:COUPle[:STATe] <bool>

Applicable Models: All
(Read-Write) Sets the marker readouts to coupled (one combination annotation) or not coupled (one annotation per trace). This setting is per Window scope.

See other SCPI Marker commands. Learn more about Marker readout.

Parameters

- `<wnum>` Any existing window number. If unspecified, value is set to 1.
- `<bool>` ON (or 1) - Marker readouts are coupled
  OFF (or 0) - Marker readouts are not coupled

Examples

```markdown
DISP:WIND:ANN:MARK:COUP ON
display:window:annotation:marker:couple on
```

Query Syntax

`DISPlay:WINDow:ANNotation:MARKer:COUPle?`

Return Type

Boolean

Default

ON

`DISPlay:WINDow<wnum>:ANNotation:MARKer:NUMBer <num>`

Applicable Models: All

This command replaces `DISP:WIND:ANN:MARK:SINGle`

(Read-Write) Sets the number of marker readouts to display per trace. Display up to 20 marker readouts per window.

See other SCPI Marker commands. Learn more about Marker readout.

Parameters

- `<wnum>` Any existing window number. If unspecified, value is set to 1.
- `<num>` Number of marker readouts to display. Choose a value between 1 and 16.

Examples

```markdown
DISP:WIND:ANN:MARK:NUMB 7
display:window:annotation:marker:number 2
```

Query Syntax

`DISPlay:WINDow:ANNotation:MARKer:NUMBer?`

Return Type

Numeric

Default

5

`DISPlay:WINDow:ANNotation:MARKer:MEASure<mnum>:XPOSition <num>`

Applicable Models: All
(Read-Write) Sets the X-axis position of marker readouts. Readouts are right-justified at the specified position. This function is used when :DISP:WIND:ANN:MARK:COUP:STAT is off. Use :DISP:WIND:ANN:MARK:XPOS is used when :DISP:WIND:ANN:MARK:COUP:STAT is on.

See other SCPI Marker commands. Learn more about Marker readout.

**Parameters**

- `<mnum>` Measurement. If unspecified, value is set to 1.
- `<num>` X-axis position. Choose a value between 1 (far left) and 10 (far right).

**Examples**

```
display:window:annotation:marker:measure:xposition 5
```

**Query Syntax**

DISPlay:WINDow:ANNotation:MARKer:MEASure<mnum>:YPOSitio<wnum>

**Return Type**

Numeric

**Default**

10

DISPlay:WINDow:ANNotation:MARKer:MEASure<mnum>:YPOSitio<wnum>

Applicable Models: All

(Read-Write) Sets the Y-axis position of marker readouts. Readouts are top-justified at the specified position. This function is used when :DISP:WIND:ANN:MARK:COUP:STAT is off. Use :DISP:WIND:ANN:MARK:YPOS is used when :DISP:WIND:ANN:MARK:COUP:STAT is on.

See other SCPI Marker commands. Learn more about Marker readout.

**Parameters**

- `<mnum>` Measurement. If unspecified, value is set to 1.
- `<num>` Y-axis position. Choose a value between 1 (bottom) and 10 (top).

**Examples**

```
display:window:annotation:marker:measure:yposition 5
```

**Query Syntax**

DISPlay:WINDow:ANNotation:MARKer:MEASure<mnum>:YPOSitio<wnum>

**Return Type**

Numeric

**Default**

10

DISPlay:WINDow<wnum>:ANNotation:MARKer:RESolution:STIMulus <num>
Applicable Models: All

(Read-Write) For the X-axis (stimulus), sets the number digits to display after the decimal point in marker readouts.

See other SCPI Marker commands. Learn more about Marker readout.

Parameters

- `<wnum>` Any existing window number. If unspecified, value is set to 1.
- `<num>` Number of digits to display. Choose a value between 2 and 6.

Examples

```
DISP:WIND:ANN:MARK:RES:STIM 2
display:window:annotation:marker:resolution:stimulus 4
```

Query Syntax

```
DISPlay:WINDow:ANNotation:MARKer:RESolution:STIMulus?
```

Return Type

Numeric

Default

3

---

DISPlay:WINDow<wnum>:ANNotation:MARKer:RESolution:RESPonse <num>

Applicable Models: All

(Read-Write) For the Y-axis (response), sets the number digits to display after the decimal point in marker readouts.

See other SCPI Marker commands. Learn more about Marker readout.

Parameters

- `<wnum>` Any existing window number. If unspecified, value is set to 1.
- `<num>` Number of digits to display. Choose a value between 1 and 4.

Examples

```
DISP:WIND:ANN:MARK:RES:RESP 1
display:window:annotation:marker:resolution:stimulus 2
```

Query Syntax

```
DISPlay:WINDow:ANNotation:MARKer:RESolution:RESPonse?
```

Return Type

Numeric

Default

2

---

DISPlay:WINDow<wnum>:ANNotation:MARKer:SINGle[:STATe] <bool> - Superseded
Applicable Models: All

**Note:** This command is replaced by `DISP:WIND:ANN:MARK:NUMB` (Read-Write) Either shows marker readout of only the active trace or other traces simultaneously.

See other SCPI Marker commands. Learn more about Marker readout.

**Parameters**

- `<wnum>` Any existing window number. If unspecified, value is set to 1.
- `<bool>`
  - **ON** (or 1) - Shows the readout of only the active marker for each trace.
  - **OFF** (or 0) - Shows up to 5 marker readouts per trace, up to 20 total readouts.

**Examples**

```
DISP:WIND:ANN:MARK:SING ON
display:window:annotation:marker:single off
```

**Query Syntax**

`DISPlay:WINDow:ANNotation:MARKer:SINGle?`

**Return Type**

Boolean (1 = ON, 0 = OFF)

**Default**

OFF

---

**DISPlay:WINDow<wnum>:ANNotation:MARKer:SIZE <char>**

Applicable Models: All

(Read-Write) Specifies the size of the marker readout text. See other SCPI Marker commands. Learn more about Marker readout.

**Parameters**

- `<wnum>` Any existing window number. If unspecified, value is set to 1.
- `<char>` Readout text size. Choose from: NORMAL | LARGE

**Examples**

```
DISP:WIND:ANN:MARK:SIZE LARG
display:window:annotation:marker:size normal
```

**Query Syntax**

`DISPlay:WINDow:ANNotation:MARKer:SIZE?`

**Return Type**

Character

**Default**

NORMAL

---

DISPlay:WINDow<wnum>:ANNotation:MARKer[:STATe] <ON | OFF>
**Applicable Models:** All

(Read-Write) Specifies whether to show or hide the Marker readout (when markers are ON) on the selected window. See other SCPI Marker commands. Learn more about Marker readout.

**Parameters**

- `<wnum>` Any existing window number. If unspecified, value is set to 1.
- `<ON | OFF>` **ON** (or 1) - turns marker readout ON.
  **OFF** (or 0) - turns marker readout OFF.

**Examples**

- `DISP:WIND:ANN:MARK ON`  
  `display:window:annotation:marker:state on`
- `DISP:WIND:ANN:MARK:OFF`  
  `display:window:annotation:marker:state off`

**Query Syntax**

`DISP:WIND:ANN:MARK[:STAT]e?`

**Return Type**

Boolean (1 = ON, 0 = OFF)

**Default**

ON

**Applicable Models:** All

(Read-Write) Sets the symbol to display for marker position.

See other SCPI Marker commands.

**Parameters**

- `<wnum>` Any existing window number. If unspecified, value is set to 1.
- `<char>` Marker symbol. Choose from:
  
  - TRIangle
  - FLAG
  - LINE

**Examples**

- `DISP:WIND:ANN:MARK:SYMB TRI`  
  `display:window:annotation:marker:symbol triangle`
- `DISP:WIND:ANN:MARK:SYMB LINE`  
  `display:window:annotation:marker:symbol line`

**Query Syntax**

`DISP:WIND:ANN:MARK:SYMB?`

**Return Type**

Character

**Default**

TRIangle
DISPlay:WINDow<wnum>:ANNotation:MARKer:VISible <char>

**Applicable Models:** All

*(Read-Write)* Shows the marker readouts only for active trace or for all traces. This setting is per Window scope. See this toolbar.

**Parameters**

- **<wnum>** Any existing window number. If unspecified, value is set to 1.
- **<char>** ACTive - readout is turned on for active trace only.
- **ALL** - readout is turned on for all traces.

**Examples**

<table>
<thead>
<tr>
<th>DISPlay:WIND:ANN:MARK:VIS ACT</th>
</tr>
</thead>
<tbody>
<tr>
<td>display:windows:annotation:marker:visible:all</td>
</tr>
</tbody>
</table>

**Query Syntax**

DISPlay:WINDow:ANNotation:MARKer:VISible?

**Return Type** Character

**Default** ALL

---

DISPlay:WINDow<wnum>:ANNotation:MARKer:SYMBol:ABOVe[:STATe] <ON | OFF>

**Applicable Models:** E5080, M9485A

*(Read-Write)* Specifies whether or not to force marker symbols to be displayed above the trace. When ON, all marker symbols will be displayed above the trace and the active marker will be filled solid. See other SCPI Marker commands.

**Parameters**

- **<wnum>** Any existing window number. If unspecified, value is set to 1.
- **<ON | OFF>**
  - **ON (or 1)** - ALL marker symbols are displayed above the trace. Only the active marker is filled solid.
  - **OFF (or 0)** - ONLY the active marker is displayed above the trace. The active marker is not filled solid.

**Examples**

<table>
<thead>
<tr>
<th>DISPlay:WIND:ANN:MARK:SYMB:ABOV ON</th>
</tr>
</thead>
<tbody>
<tr>
<td>display:window:annotation:marker:symbol:above:state off</td>
</tr>
</tbody>
</table>

**Query Syntax**

DISPlay:WINDow:ANNotation:MARKer:SYMBol:ABOVe[:STATe]?

**Return Type** Boolean (1 = ON, 0 = OFF)
**DISPlay:WINDow<wnum>:ANNotation:MARKer:XPOSition <num>**

**Applicable Models:** All

*(Read-Write)* Sets the X-axis position of marker readouts. Readouts are right-justified at the specified position.

See other SCPI Marker commands. Learn more about Marker readout.

**Parameters**

- `<wnum>` Any existing window number. If unspecified, value is set to 1.
- `<num>` X-axis position. Choose a value between 1 (far left) and 10 (far right).

**Examples**

```
DISP:WIND:ANN:MARK:XPOS 1.5
display:window:annotation:marker:xposition 5
```

**Query Syntax** DISPlay:WINDow:ANNotation:MARKer:XPOSition?

**Return Type** Numeric

**Default** 10

---

**DISPlay:WINDow<wnum>:ANNotation:MARKer:YPOSition <num>**

**Applicable Models:** All

*(Read-Write)* Sets the Y-axis position of marker readouts. Readouts are top-justified at the specified position.

See other SCPI Marker commands. Learn more about Marker readout.

**Parameters**

- `<wnum>` Any existing window number. If unspecified, value is set to 1.
- `<num>` Y-axis position. Choose a value between 1 (bottom) and 10 (top).

**Examples**

```
DISP:WIND:ANN:MARK:YPOS 1.5
display:window:annotation:marker:yposition 5
```

**Query Syntax** DISPlay:WINDow:ANNotation:MARKer:YPOSition?

**Return Type** Numeric

**Default** 10
DISPlay:WINDow<wnum>:ANNotation[:TRACe]:SCOPe <enum>

Applicable Models: All

(Read-Write) Set and read the scope for trace annotation. Either display trace annotation for all traces or just the active trace.

Parameters

<wnum> Any existing window number. If unspecified, value is set to 1.
<enum> Choose from:

ALL
ACTive

Examples DISP:WIND:ANN:SCOP ACT

Query Syntax DISPlay:WINDow:ANNotation[:TRACe]:SCOPe?
Return Type Enumeration

Default ALL

DISPlay:WINDow<wnum>:ANNotation[:TRACe][:STATe] <ON | OFF>

Applicable Models: All

(Read-Write) Specifies whether to show or hide the Trace Status buttons on the left of the display.

Parameters

<wnum> Any existing window number. If unspecified, value is set to 1.
<ON | OFF> ON (or 1) - turns the buttons ON.
OFF (or 0) - turns the buttons OFF.

Examples DISP:WIND:ANN ON
display:window:annotation:trace:state off

Query Syntax DISPlay:WINDow:ANNotation[:TRACe][:STATe]?
Return Type Boolean (1 = ON, 0 = OFF)

Default ON

DISPlay:WINDow<wnum>:ANNotation: X[:STATe] <bool>
Applicable Models: All

(Read-Write) Turns ON or OFF the X-axis scale label in display window.

Parameters

<wnum>  Any existing window number. If unspecified, value is set to 1.

<bool>  ON or 1 - Turns ON the X-axis scale.
        OFF or 0 - Turns OFF the X-axis scale.

Examples

DISP:WIND:ANN:X ON
display:window:annotation:x off

Query Syntax

DISPlay:WINDow:ANNotation:X?

Return Type  Boolean

Default  ON or 1

DISPlay:WINDow<wnum>:ANNotation: Y[:STATe] <bool>

Applicable Models: All

(Read-Write) Turns ON or OFF the Y-axis scale label in display window.

Parameters

<wnum>  Any existing window number. If unspecified, value is set to 1.

<bool>  ON or 1 - Turns ON the Y-axis scale.
        OFF or 0 - Turns OFF the Y-axis scale.

Examples

DISP:WIND:ANN:Y ON
display:window:annotation:y off

Query Syntax

DISPlay:WINDow:ANNotation:Y?

Return Type  Boolean

Default  ON or 1

DISPlay:WINDow<wnum>:CATalog?
Applicable Models: All

(Read-only) Returns the trace numbers for the specified window.

**Note:** If there are no traces in the window, this query returns the "EMPTY" string.

**Parameters**

- `<wnum>` Any existing window number. If unspecified, value is set to 1.

**Example**

Window 1 with four traces:

```
DISPlay:WINDow1:CATalog?
Returns:
"1,2,3,4"
```

**Return Type**

- String of Character values separated by commas

**Default**

- Not applicable

**DISPlay:WINDow<wnum>:ENABle <ON | OFF>**

Applicable Models: All

(Read-Write) Specifies whether to disable or enable all analyzer display information in the specified window. Marker data is not updated. More CPU time is spent making measurements instead of updating the display.

**Parameters**

- `<wnum>` Any existing window number. If unspecified, value is set to 1.
- `<ON | OFF>`
  - ON (or 1) - turns the display ON.
  - OFF (or 0) - turns the display OFF.

**Examples**

```
DISP:WIND:ENABLE ON
display:window1:enable off
```

**Query Syntax**

```
DISPlay:WINDow<wnum>:ENABle?
```

**Return Type**

- Boolean (1 = ON, 0 = OFF)

**Default**

- ON

**DISPlay:WINDow<wnum>:FEED <snum>**
(Write-only) This command feeds a specified window to the sheet. If there is a window in the sheet, the sheet is visible. If there is no window in the sheet, the sheet is not visible. If no windows exists in the system, one empty sheet is visible.

**Parameters**

- `<wnum>`: Any existing window number. If unspecified, value is set to 1.
- `<snum>`: Sheet number

**Examples**

- `DISP:WIND:FEED 5`
- `display:window:feed 5`

**Return Type**: Not Applicable

**Default**: Not Applicable

---

**DISPlay:WINDow<wnum>:NEXT[:NUMBer]?**

(Read-only) Returns the lowest window number which has less than the maximum number of traces. Basically, returns the first window which has room for another trace. Note that the window may need to be turned on first (i.e. disp:wind:stat ON may be needed).

**Parameters**

- `<wnum>`: Any existing window number. If unspecified, value is set to 1.

**Examples**

- `DISP:WIND:NEXT`
- `display:window1:NEXT`

**Query Syntax**: DISPlay:WINDow<wnum>:NEXT?

**Return Type**: Not Applicable

**Default**: Not Applicable

---

**DISPlay:WINDow<wnum>:SIZE <char>**
**Applicable Models:** All

*(Read-Write)* Sets or returns the window setting of Maximized or Normal. To arrange all of the windows, use `DISP:ARR`.

**Parameters**

- `<wnum>` Any existing window number. If unspecified, value is set to 1
- `<char>` Window size. Choose from:

<table>
<thead>
<tr>
<th>MAX</th>
<th>NORM</th>
</tr>
</thead>
</table>

**Examples**

```markdown
DISP:WIND:SIZE MAX
display:window:size norm
```

**Query Syntax**

`DISPlay:WINDow:SIZE?`

**Default**

Not Applicable

---

**DISPlay:WINDow<wnum>[::STATe] <ON | OFF>**

**Applicable Models:** All

*(Read-Write)* Write to create or delete a window on the screen or Read whether a window is present.

**Parameters**

- `<wnum>` Window number to create; choose any integer between 1 and the maximum number of windows allowed in the VNA.
- `<ON | OFF>`
  - **ON** (or 1) - The window `<wnum>` is created.
  - **OFF** (or 0) - The window `<wnum>` is deleted.

**Examples**

```markdown
DISP:WIND ON
display:window2:state off
```

**Query Syntax**

`DISPlay:WINDow<wnum>[::STATe]?`

**Return Type**

Boolean (1 = ON, 0 = OFF)

**Default**

Window number "1" ON

---

**DISPlay:WINDow<wnum>:TABLe <char>**
Applicable Models: All

(Read-Write) Write to show the specified table at the bottom of the analyzer screen or Read to determine what table is visible.

Parameters

- `<wnum>` Any existing window number. If unspecified, value is set to 1
- `<char>` Table to show. Choose from:
  - OFF | MARKer | LIMit | SEGment | RLIMit | DISTortion

Examples

- `DISP:WIND:TABLE SEGM`
- `display:window:table off`

Query Syntax

- `DISPlay:WINDow<wnum>:TABLe?`
  - **Default**: OFF

**DISPlay:WIND<wnum>:TABLe:INOise:ENABle <ON | OFF>**

Applicable Models: N522xB, N524xB with Phase Noise Option S93031xB

(Read-Write) Enable or disable displaying the integrated noise table.

Parameters

- `<wnum>` Window number to create; choose any integer between 1 and the maximum number of windows allowed in the VNA.
- `<ON | OFF>` ON (or 1) - Display the integrated noise table.
  - OFF (or 0) - Do not display the integrated noise table.

Examples

- `DISP:WIND:TABLE:INO:ENAB  ON`
- `display:window2:table:inoise:enable off`

Query Syntax

- `DISPlay:WINDow<wnum>:TABLe:INOise:ENABle?`
  - **Return Type**: Boolean (1 = ON, 0 = OFF)
  - **Default**: OFF

**DISPlay:WIND<wnum>:TABLe:SNOise:ENABle <ON | OFF>**
**Applicable Models:** N522xB, N524xB with Phase Noise Option S93031xB

*(Read-Write)* Enable or disable displaying the spot noise table.

**Parameters**

- `<wnum>` Window number to create; choose any integer between 1 and the maximum number of windows allowed in the VNA.
- `<ON | OFF>` ON (or 1) - Display the spot noise table. OFF (or 0) - Do not display the spot noise table.

**Examples**

```
DISP:WIND:TABL:SNO:ENAB ON
display:window2:table:snoise:enable off
```

**Query Syntax** DISPLAY:WIND<wnum>:TABLe:SNOise:ENABle?

**Return Type** Boolean (1 = ON, 0 = OFF)

**Default** OFF

**Applicable Models:** N522xB, N524xB with Phase Noise Option S93031xB

*(Read-Write)* Enable or disable displaying the spurious table.

**Parameters**

- `<wnum>` Window number to create; choose any integer between 1 and the maximum number of windows allowed in the VNA.
- `<ON | OFF>` ON (or 1) - Display the spurious table. OFF (or 0) - Do not display the spurious table.

**Examples**

```
DISP:WIND:TABL:SPUR:ENAB ON
display:window2:table:spurious:enable off
```

**Query Syntax** DISPLAY:WIND<wnum>:TABLe:SPURious:ENABle?

**Return Type** Boolean (1 = ON, 0 = OFF)

**Default** OFF

**DISPlay:WIND<wnum>:TABLe:DATA <string>**
Applicable Models: All

(Read-Write) Sets data in the window title area. The title is turned ON and OFF with DISP:WIND:TITL:STAT OFF.

Parameters

- `<wnum>` Any existing window number. If unspecified, value is set to 1.
- `<string>` Title to be displayed. Any characters, enclosed with quotes. If the title string exceeds 50 characters, an error will be generated and the title not accepted. Newer entries replace (not append) older entries.

Examples

```
DISP:WIND:TITL:DATA 'hello'
display:window2:title:data 'hello'
```

Query Syntax

DISPlay:WINDow<wnum>:TITLe:DATA?

Return Type

String

Default

NA

DISPlay:WINDow<wnum>:TITLe[:STATe] <ON | OFF>

Applicable Models: All

(Read-Write) Turns display of the title string ON or OFF. When OFF, the string remains, ready to be redisplayed when turned back ON.

Parameters

- `<wnum>` Any existing window number. If unspecified, value is set to 1.
- `<ON | OFF>`
  - `ON` (or 1) - turns the title string ON.
  - `OFF` (or 0) - turns the title string OFF.

Examples

```
DISP:WIND:TITL ON
display:window1:title:state off
```

Query Syntax

DISPlay:WINDow<wnum>:TITLe[:STATe]?

Return Type

Boolean (1 = ON, 0 = OFF)

Default

ON
**Applicable Models:** All

(Write-only) Deletes the specified trace from the specified window. The measurement parameter associated with the trace is not deleted.

**Parameters**

- `<wnum>` Any existing window number. If unspecified, value is set to 1.
- `<tnum>` The number of the trace to be deleted; if unspecified, value is set to 1.

**Note:** This is NOT the trace number of the channel which appears as the Tr annotation on the Trace Status display. This `<tnum>` is the trace number within the specified window, and is used ONLY for remote programs.

**Examples**

```
DISP:WIND:TRAC:DEL
display:window2:trace2:delete
```

**Query Syntax**

Not Applicable

**Default**

Not Applicable

---

**DISPlay:WINDow<wnum>:TRACe<tnum>:FEED <name>**

**Applicable Models:** All

(Write-only) Creates a new trace `<tnum>` and associates (feeds) a measurement `<name>` to the specified window `<wnum>`. This command should be executed after creating a new measurement with CALCulate:MEASure:DEFine.

**Note:** Window `<wnum>` must already be turned on before this command can be used. Turn on the window state using DISPPlay:WINDow:STATe.

To feed the same measurement to multiple traces, create another measurement with the same `<parameter>`, but different `<name>`, using the CALC:PAR:DEF command. The analyzer will collect the data only once.

**Parameters**

- `<wnum>` Any existing window number. If unspecified, value is set to 1.
- `<tnum>` Trace number to be created. Choose any Integer between 1 and the VNA maximum number of traces per window allowed.

**Note:** This is NOT the trace number of the channel which appears as the Tr annotation on the Trace Status display. This `<tnum>` is the trace number within the specified window, and is used ONLY for remote programs.
Name of the measurement that was defined with CALC:PAR:DEF <name>,<parameter>

Example

```
CALCulate1:PARameter:DEFine 'CH1_S11',s11,1
CALCulate1:PARameter:SELect 'CH1_S11'
DISPlay:WINDow1:STATe ON
DISPlay:WINDow1:TRACe1:FEED 'CH1_S11'
```

Query Syntax

Not applicable

Default

"CH1_S11"

DISPlay:WINDow<wnum>:TRACe<tnum>:FEED:MNUMber <int>

Applicable Models: All

(Write-only) Creates a new trace <tnum> for an existing measurement (MNUM) and associates (feeds) the measurement number to the specified window <wnum>. A measurement is created using the CALC:MEAS:DEF command.

Measurements created in the system all have unique numbers. Similarly, every window has a unique number and the numbers are displayed in the lower-left corner of each window. Every window has the capacity to hold a finite number of traces from 1 to N, where N is the maximum number of traces per window. Each window uses the same range of trace numbers. For example, window 1 can have a trace 1 and so can window 2.

Parameters

- `<wnum>` Any existing window number. If unspecified, value is set to 1.
- `<tnum>` Trace number to be created. Choose any Integer between 1 and the VNA maximum number of traces per window allowed.

**Note:** After executing the DISPlay:WIND:TRAC:FEED:MNUM command, a new trace is added to the specified window and the trace number of the channel which appears as the Tr annotation on the Trace Status display is the actual measurement number.

- `<int>` Number of an existing measurement. The range is 1 to 2000.

Examples

```
CALC:MEAS2:DEF "S22"
DISP:WIND:TRAC4:FEED:MNUM 2
```

Query Syntax

Not applicable

Default

Not applicable
**DISPlay:WINDow:TRACe:GRATicule:GRID:LTYPE <value>**

**Applicable Models:** All

*(Read-Write)* Sets and returns the grid line type (solid | dotted) for all open windows. Grid is returned to solid when the VNA is Preset. Learn more.

**Parameters**

- `<value>` Line type. Choose from:
  - **SOLid** - solid lines
  - **DOTTed** - dotted lines

**Examples**

```
DISP:WIND:TRAC:GRAT:GRID:LTYPE SOL
```

**Query Syntax**

```
DISPlay:WINDow:TRACe:GRATicule:GRID:LTYPE?
```

**Return Type** Character

**Default** SOLID

---

**DISPlay:WIND<wnum>:TRACe<tnum>:MEMory[:STATe] <ON | OFF>**

**Applicable Models:** All

*(Read-Write)* Turns the memory trace ON or OFF.

**Parameters**

- `<wnum>` Any existing window number. If unspecified, value is set to 1.
- `<tnum>` Any existing trace number; if unspecified, value is set to 1.

**Note:** This is **NOT** the trace number of the channel which appears as the Tr annotation on the Trace Status display. This `<tnum>` is the trace number within the specified window, and is used ONLY for remote programs.

- `<ON | OFF>`
  - **ON** (or 1) - turns the memory trace ON.
  - **OFF** (or 0) - turns the memory trace OFF.

**Examples**

```
DISP:WIND:TRAC:MEM ON
```

**Query Syntax**

```
DISPlay:WIND<wnum>:TRACe<tnum>:MEMory[:STATe]?
```

**Return Type** Boolean (1 = ON, 0 = OFF)

**Default** OFF

---

3925
DISPlay:WINDow<fromWin>:TRACe<tnum>:MOVE <toWin>

Applicable Models: All

(Write-only) Moves a trace from one window to another window.

Parameters

<fromWin> Window number to move the trace from. If unspecified, value is set to 1.

Use Disp:Cat? to read the existing window numbers.

<tnum> Trace number to be moved. If unspecified, value is set to 1.

Use Disp:Wind:Cat? to read the trace numbers in an existing window.

Note: This is NOT the trace number of the channel which appears as the Tr annotation on the Trace Status display. This <tnum> is the trace number within the specified window, and is used ONLY for remote programs.

[toWin] Number of the window to move the trace to. If the window does not exist, it will be created.

Examples

DISP:WIND:TRAC2:MOVE 2
DISPLAY:WINDOW2:TRACE2:MOVE 1

Query Syntax

Not applicable

Default

Not applicable

DISPlay:WINDow<wnum>:TRACe:NEXT[:NUMBer]?

Applicable Models: All

(Read-only) Returns the next unused trace number. For example, if trace #1, #2, and #3 are being used, then this command will return 4.

Parameters

<wnum> Any existing window number. If unspecified, value is set to 1.

Examples

DISP:WIND:TRAC:NEXT?
DISPLAY:WINDOW1:TRACE:NEXT?

Return Type

Integer

Default

Not Applicable

DISPlay:WINDow<wnum>:TRACe<tnum>:SELect
Applicable Models: All

(Write-only) Activates the specified trace in the specified window for front panel use.

Parameters
<wnum> Any existing window number. If unspecified, value is set to 1.
Use Disp:Cat? to read the existing window numbers.
<tnum> Any existing trace number; if unspecified, value is set to 1.

Note: This is NOT the trace number of the channel which appears as the Tr annotation on the Trace Status display. This <tnum> is the trace number within the specified window, and is used ONLY for remote programs.

Examples
DISP:WIND:TRAC:SEL
display:window2:trace2:select

Query Syntax
Default NA

DISPlay:WINDow<wnum>:TRACe<tnum>[:STATe] <ON | OFF>

Applicable Models: All

(Read-Write) Turns the display of the specified trace in the specified window ON or OFF. When OFF, the measurement behind the trace is still active.

Parameters
<wnum> Any existing window number. If unspecified, value is set to 1.
Use Disp:Cat? to read the existing window numbers.
<tnum> Any existing trace number; if unspecified, value is set to 1.
Use Disp:Wind:Cat? to read the trace numbers in an existing window.

Note: This is NOT the trace number of the channel which appears as the Tr annotation on the Trace Status display. This <tnum> is the trace number within the specified window, and is used ONLY for remote programs.

Examples
DISP:WIND:TRAC ON
display:window2:trace2:state off

Query Syntax
DISPlay:WIND<wnum>:TRACe<tnum>[:STATe]?
**Return Type**  
Boolean (1 = ON, 0 = OFF)  
**Default**  
ON

**DISPlay:WINDow<wnum>:TRACe<tnum>:TITLe:DATA <string>**

**Applicable Models:** All

*(Read-Write)* Writes and read data to the trace title area. The trace title is embedded in the trace status field. [Learn more about Trace Titles](#).

Newer entries replace (not append) older entries. The title is turned ON and OFF with **DISP:WIND:TRAC:TITL:STAT**.

**Parameters**

- `<wnum>` Any existing window number. If unspecified, value is set to 1.
  
  Use **Disp:Cat?** to read the existing window numbers.

- `<tnum>` Trace number of the specified window. If unspecified, value is set to 1. Use **Display:Cat?** to read the window numbers. Use **Disp:Window:Cat?** to read the trace numbers of the specified window.

  **Note:** This is **NOT** the trace number of the channel which appears as the Tr annotation on the Trace Status display. This `<tnum>` is the trace number within the specified window, and is used ONLY for remote programs.

- `<string>` Title to be displayed. Any characters (not spaces) enclosed with quotes.

**Examples**

- **DISP:WIND:TRAC:TITL:DATA 'MyNewMeas'**
- **display:window2:trace3:title:data 'hello'**

**Query Syntax**  
**DISPlay:WINDow<wnum>:TRACe<tnum>TITLe:DATA?**

**Return Type**  
String  
**Default**  
Not Applicable

**DISPlay:WINDow<wnum>:TRACe<tnum>:TITLe[:STATe] <bool>**
Applicable Models: All

*(Read-Write)* Turns display of the Trace Title ON or OFF. When turned OFF, the previous trace title returns. Set a new trace title using **DISP:WIND:TRAC:TITL:DATA**

Learn more about Trace Titles

**Parameters**

- **<wnum>** Any existing window number. If unspecified, value is set to 1
  
  Use **Disp:Cat?** to read the existing window numbers.
  
- **<tnum>** Trace number of the specified window. If unspecified, value is set to 1. Use **Display:Cat?** to read the window numbers. Use **Disp:Window:Cat?** to read the trace numbers of the specified window.

  **Note:** This is **NOT** the trace number of the channel which appears as the Tr annotation on the Trace Status display. This **<tnum>** is the trace number within the specified window, and is used ONLY for remote programs.

- **<bool>** ON (or 1) - turns the title ON.

  OFF (or 0) - turns the title OFF.

**Examples**

- **DISP:WIND:TRAC:TITL ON**
- **Display:window2:trace3:title:state off**

**Query Syntax**

**DISPlay:WINDow<wnum>:TRACe<tnum>:TITLe[:STATe]?**

**Return Type**

Boolean (1 = ON, 0 = OFF)

**Default**

ON

**DISPlay:WINDow<wnum>:TRACe<tnum>:X[:SCALe]:RLEVel <num>**
**Applicable Models:** All  

*(Read-Write)* Sets the X axis **Reference Level** of the specified trace in the specified window.

**Parameters**

- `<wnum>` Any existing window number. If unspecified, value is set to 1.  
  Use `Disp:Cat?` to read the existing window numbers.
- `<tnum>` Any existing trace number; if unspecified, value is set to 1.  
  Use `Disp:Wind:Cat?` to read the trace numbers in an existing window.
- `<num>` Reference level value.

**Examples**

```
DISP:WIND:TRAC:X:RLEV 0  
display:window2:trace2:x:scale:rlevel 0
```

**Query Syntax**

`DISPlay:WINDow<wnum>:TRACe<tnum>:X[:SCALe]:RLEVel?`

**Return Type** Numeric

**Default** Not Applicable

---

**Applicable Models:** All  

*(Read-Write)* Sets the **Reference Position** of the specified trace in the specified window.

**Parameters**

- `<wnum>` Any existing window number. If unspecified, value is set to 1.  
  Use `Disp:Cat?` to read the existing window numbers.
- `<tnum>` Any existing trace number; if unspecified, value is set to 1.  
  Use `Disp:Wind:Cat?` to read the trace numbers in an existing window.

**Note:** This is **NOT** the trace number of the channel which appears as the Tr annotation on the Trace Status display. This `<tnum>` is the trace number within the specified window, and is used ONLY for remote programs.

**Examples**

```
DISPlay:WINDow<wnum>:TRACe<tnum>:X[:SCALe]:RPOSition <num>
```

**Query Syntax**

`DISPlay:WINDow<wnum>:TRACe<tnum>:X[:SCALe]:RPOSition <num>`
Reference position on the screen measured in horizontal graticules from the bottom. Choose a value between 0 and 10.

| Examples | DISP:WIND:TRAC:X:RPOS 0  
display:window2:trace2:x:rposition 10 |
|---|---|

Example Syntax

DISPlay:WINDow<wnum>:TRACe<tnum>:X[:SCALe]:RPOSition?

Return Type

Numeric

Default

5

DISPlay:WINDow<wnum>:TRACe<tnum>:Y[:SCALe]:AUTO

Applicable Models: All

(Write-only) Performs an Autoscale on the specified trace in the specified window, providing the best fit display.

Autoscale is performed only when the command is sent; it does NOT keep the trace autoscaled indefinitely.

Autoscale behaves differently when scale coupling is enabled. How it behaves depends on the scale coupling method. Learn more.

See Also, DISP:WINDow:Y:AUTO which performs an Autoscale All.

Parameters

<table>
<thead>
<tr>
<th>&lt;wnum&gt;</th>
<th>Any existing window number. If unspecified, value is set to 1. Use Disp:Cat? to read the existing window numbers.</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;tnum&gt;</td>
<td>Any existing trace number; if unspecified, value is set to 1. Use Disp:Wind:Cat? to read the trace numbers in an existing window.</td>
</tr>
</tbody>
</table>

Note: This is NOT the trace number of the channel which appears as the Tr annotation on the Trace Status display. This <tnum> is the trace number within the specified window, and is used ONLY for remote programs.

Example Syntax

DISP:WIND:TRAC:Y:AUTO
display:window2:trace2:y:scale:auto

Query Syntax

Not applicable

Default

Not applicable
DISPlay:WINDow:TRACe:Y[:SCALe]:COUPle:METHod <char>

Applicable Models: All

(Read-Write) Sets and returns the method of scale coupling. Learn more about Scale coupling.

Parameters

<char>  OFF - NO scale coupling for any windows.

WINDow - Scale settings are coupled for traces in each window.

ALL - Scale settings are coupled for traces in ALL selected windows.

Enable the selected windows using DISP:WIND:TRAC:Y:COUP ON

Examples

DISP:WIND:TRAC:Y:COUP:METH ALL

Display:window2:trace:y:scale:method window

Query Syntax

DISPlay:WINDow:TRACe:Y[:SCALe]:COUPle:METHod?

Return Type

Character

Default

OFF

DISPlay:WINDow<wnum>:TRACe:Y[:SCALe]:COUPle[:STATe] <bool>

Applicable Models: All

(Read-Write) Enables and disables scale coupling for the specified window. Learn more about Scale coupling.

Parameters

<wnum>  Any existing window number. If unspecified, value is set to 1

Use Disp:Cat? to read the existing window numbers.

<bool>  ON (or 1) - Scale coupling enabled for specified window.

OFF (or 0) - Scale coupling disabled for specified window.

Examples

DISP:WIND:TRAC:Y:COUP ON

Display:window2:trace:y:scale:couple:state off

Query Syntax

DISPlay:WINDow<wnum>:TRACe:Y[:SCALe]:COUPle[:STATe]?

Return Type

Boolean (1 = ON, 0 = OFF)

Default

ON
DISPlay:WINDow<wnum>:TRACe<tnum>:Y[:SCALe]:PDIVision <num>

Applicable Models: All

(Read-Write) Sets the Y axis Per Division value of the specified trace in the specified window.

Parameters

<wnum> Any existing window number. If unspecified, value is set to 1.

Use Disp:Cat? to read the existing window numbers.

<tnum> Any existing trace number; if unspecified, value is set to 1.

Use Disp:Wind:Cat? to read the trace numbers in an existing window.

Note: This is NOT the trace number of the channel which appears as the Tr annotation on the Trace Status display. This <tnum> is the trace number within the specified window, and is used ONLY for remote programs.

<num> Units / division value. The range of acceptable values is dependent on format and domain.

Note: This command will accept MIN or MAX instead of a numeric parameter. See SCPI Syntax for more information.

Examples

DISP:WIND:TRAC:Y:PDIV 1
display:window2:trace2:y:scale:pdivision maximum

Query Syntax
DISPlay:WINDow<wnum>:TRACe<tnum>:Y[:SCALe]:PDIVision?

Return Type Numeric

Default 10
Applicable Models: All

(Read-Write) Sets the Y axis Reference Level of the specified trace in the specified window.

Parameters

<wnum> Any existing window number. If unspecified, value is set to 1.

Use Disp:Cat? to read the existing window numbers.

<tnum> Any existing trace number; if unspecified, value is set to 1.

Use Disp:Wind:Cat? to read the trace numbers in an existing window.

Note: This is NOT the trace number of the channel which appears as the Tr annotation on the Trace Status display. This <tnum> is the trace number within the specified window, and is used ONLY for remote programs.

<num> Reference level value. The range of acceptable values is dependent on format and domain.

Note: This command will accept MIN or MAX instead of a numeric parameter. See SCPI Syntax for more information.

Examples

DISP:WIND:TRAC:Y:RLEV 0
display:window2:trace2:y:scale:rlevel minimum

Query Syntax

DISPlay:WINDow<wnum>:TRACe<tnum>:Y[:SCALe]:RLEVel?

Return Type

Numeric

Default

Not Applicable

DISPlay:WINDow<wnum>:TRACe<tnum>:Y[:SCALe]:RPOSition <num>
Applicable Models: All

(Read-Write) Sets the **Reference Position** of the specified trace in the specified window.

**Parameters**

- **<wnum>** Any existing window number. If unspecified, value is set to 1.
  
  Use `Disp:Cat?` to read the existing window numbers.

- **<tnum>** Any existing trace number; if unspecified, value is set to 1.
  
  Use `Disp:Wind:Cat?` to read the trace numbers in an existing window.

**Note:** This is NOT the trace number of the channel which appears as the Tr annotation on the Trace Status display. This <tnum> is the trace number within the specified window, and is used ONLY for remote programs.

- **<num>** Reference position on the screen measured in horizontal graticules from the bottom. Choose a value between 0 and 10.

  **Note:** This command will accept MIN or MAX instead of a numeric parameter. See **SCPI Syntax** for more information.

**Examples**

```plaintext
DISP:WIND:TRAC:Y:RPOS 0
display:window2:trace2:y:rposition maximum
```

**Query Syntax**

```plaintext
DISPlay:WINDow<wnum>:TRACe<tnum>:Y[:SCALe]:RPOSition?
```

**Return Type** Numeric

**Default** 5

---

**DISPlay:WINDow<wnum>:TRACe<tnum>:Y[:SCALe]:BOTTom <num>**
**Applicable Models:** All

**(Read-Write)** Sets the minimum scale value for the Log Y-axis.

**Parameters**

<wnum> Any existing window number. If unspecified, value is set to 1.

Use Disp:Cat? to read the existing window numbers.

<tnum> Any existing trace number; if unspecified, value is set to 1.

Use Disp:Wind:Cat? to read the trace numbers in an existing window.

**Note:** This is NOT the trace number of the channel which appears as the Tr annotation on the Trace Status display. This <tnum> is the trace number within the specified window, and is used ONLY for remote programs.

<num> Minimum scale value. Range from 10f to 500P.

**Examples**

```
DISP:WIND:TRAC:Y:BOTT 0
display:window2:trace2:y:bottom 100
```

**Query Syntax**

```
DISPlay:WINDow<wnum>:TRACe<tnum>:Y[:SCALe]:BOTTom?
```

**Return Type** Numeric

**Default** 1

---

**DISPlay:WINDow<wnum>:TRACe<tnum>:Y[:SCALe]:TOP <num>**

**Applicable Models:** All

**(Read-Write)** Sets the maximum scale value for the Log Y-axis.

**Parameters**

<wnum> Any existing window number. If unspecified, value is set to 1.

Use Disp:Cat? to read the existing window numbers.

<tnum> Any existing trace number; if unspecified, value is set to 1.

Use Disp:Wind:Cat? to read the trace numbers in an existing window.

**Note:** This is NOT the trace number of the channel which appears as the Tr annotation on the Trace Status display. This <tnum> is the trace number within the specified window, and is used ONLY for remote programs.

<num> Maximum scale value. Range from 20f to 1E.
Examples

\texttt{DISP:WIND:TRAC:Y:TOP 0}
\texttt{display:window2:trace2:y:top 100}

Query Syntax
\texttt{DISPlay:WINDow<wnum>:TRACe<tnum>:Y[:SCALe]:TOP?}

Return Type
Numeric

Default
1k

\texttt{DISPlay:WINDow<wnum>:TRACe<tnum>:Y:SPACing<char>}

Applicable Models: All

(Read-Write) Sets or returns format type for Y axis graph, either linear or logarithmic.

Parameters

\begin{itemize}
\item \texttt{<wnum>}: Any existing window number. If unspecified, value is set to 1.
\item \texttt{<tnum>}: Any existing trace number; if unspecified, value is set to 1.
\item \texttt{<char>}: choose either \texttt{LINear} or \texttt{LOGarithmic}
\end{itemize}

Examples

\texttt{DISP:WIND:TRACY:SPAC LOG}
\texttt{Display:window2:trace2:y:spacing logarithmic}

Query Syntax
\texttt{DISPlay:WINDow<wnum>:TRACe<tnum>:Y:SPACing?}

Return Type
char

Default
Lin

\texttt{DISPlay:WINDow<wnum>:Y:AUTO}
**Applicable Models:** All

*(Write-only)* Scales **ALL** of the traces to fit in the same window. This is equivalent to "Autoscale All" from the front panel.

Autoscale behaves differently when *scale coupling* is enabled. How it behaves depends on the scale coupling method. [Learn more.](#)

Autoscale is performed only when the command is sent; it does NOT keep the trace autoscaled indefinitely.

See Also, **DISPlay:WINDow:TRACE:y:AUTo** which Autoscales only the specified trace.

**Parameters**

- **<wnum>**  Any existing window number. If unspecified, value is set to 1.

  Use **Disp:Cat?** to read the existing window numbers.

**Examples**

```
DISP:WIND:y:auto
display:window2:y:auto
```

**Query Syntax**

Not applicable

**Default**

Not applicable

---

**DISPlay:WINDow<wnum>:y[:SCALe]:DIFvisions <num>**

**Applicable Models:** All

*(Read-Write)* Sets or returns the number of divisions in all the graphs, for the selected channel

**Parameters**

- **<wnum>**  Any existing window number. If unspecified, value is set to 1

  Use **Disp:Cat?** to read the existing window numbers.

- **<bool>**  ON or 1 - Scale coupling enabled for specified window.

- **<num>**  Number of divisions is between 4 to 30.

  Units / division value. The range of acceptable values is dependent on format and domain.

  **Note:** This command will accept MIN or MAX instead of a numeric parameter. See **SCPI Syntax** for more information.

Format Commands

Specifies the way that data will be transferred when moving large amounts of data.

```
FORMat

BORDer [DATA]
```

Click on a keyword to view the command details.

See Also

- Example Programs
- Synchronizing the Analyzer and Controller
- SCPI Command Tree

**FORMat:BORDer <char>**

**Applicable Models:** All

(Read-Write) Set the byte order used for GPIB data transfer. Some computers read data from the analyzer in the reverse order. This command is only implemented if FORMAT:DATA is set to :REAL.

If FORMAT:DATA is set to :ASCII, the swapped command is ignored.

**Parameters**

<char> Choose from:

- **NORMal** - Use when your controller is anything other than an IBM compatible computers.
- **SWAPped** - for IBM compatible computers.

**Note:** Use **NORMal** if you are using VEE, LabView, or T&M Tool kit.

**Examples**

```
FORM:BORD SWAP
format:border normal
```
Query Syntax

FORMat:BORDer?

Return Type  Character

Default  Normal

FORMat[:DATA] <char>

Applicable Models: All

(Read-Write) Sets the data format for transferring measurement data and frequency data.

- To transfer measurement data, use CALC:MEAS:DATA.
- To transfer Cal Set data, use SENS:CORR:CSET:DATA
- To transfer Source Power correction data, use:
  - SOURce:POWer:CORRection:COLLect:TABLe:DATA
  - SOURce:POWer:CORRection:COLLect:TABLe:FREQuency
  - SOURce:POWer:CORRection:DATA
- To transfer FIFO buffer data, use SYST:FIFO:DATA?

The following commands transfer frequency data. Use <REAL, 64>

- CALC:MEAS:DATA:SNP?
- CALC:MEAS:X?
- SENS:X?

Use FORMat:BORDer to change the byte order. Use “NORMal” when transferring a binary block from LabView or Vee. For other programming languages, you may need to SWAP the byte order.

Parameters

<char> In the VNA, measurement data is stored as 32 bit and frequencies stored as 64 bit. Therefore, use REAL,32 when getting data and REAL,64 when getting frequencies. That way you are guaranteed to avoid losing any precision as well as getting the maximum speed on the data transfer.

Choose from:
- **REAL,32** - (default value for REAL) Best for transferring large amounts of measurement data. Can cause rounding errors in frequency data.

- **REAL,64** - Slower but has more significant digits than REAL,32. REQUIRED to accurately represent frequency data. See above list for commands which transfer frequency information.

- **ASCii,0** - The easiest to implement, but very slow. Use when you have small amounts of data to transfer.

**Note** The REAL,32 and REAL,64 arguments transfer data in block format as explained in Transferring Measurement Data.

### Examples

```
FORM REAL,64
format:data ascii
```

### Query Syntax

FORMat:DATA?

### Return Type

Character,Character

### Default

ASCii,0

Syst:Preset does NOT reset this command.

However, *RST does reset this command to ASCii,0
Hardcopy Command

Controls printing of the VNA screen and optional data to a printer or a file.

HCOPy:DPRinter <string>

Applicable Models: All

(Read-Write) Sets the default printer and selects as the current printer. Use HCOPy:PRINters? to return a list of locally installed printers.

This setting survives instrument preset and VNA application restart.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;string&gt;</td>
<td>Name of the printer to become the default.</td>
</tr>
</tbody>
</table>

Examples

- HCOP:DPR "MyPrinter"
- hcopy:dprinter "YourPrinter"

Query Syntax

HCOPy:DPRinter?

Return Type
String

Default
Not Applicable

HCOPy:FILE <filename>

Applicable Models: All

(Write-only) Saves the screen image to a file. The image does NOT include the optional print data invoked by many HCOPy commands.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;filename&gt;</td>
<td>Name of the file to save the screen to. The file is saved to the current working directory unless a valid full path name is specified. Use one of the following suffixes: .bmp - not recommended due to large file size .jpg - not recommended due to poor quality .png - recommended</td>
</tr>
</tbody>
</table>

Examples

- HCOPY:FILE "myFile.png"
- hcopy:file "c:/data/myfile.png"

Query Syntax

Not Applicable
HCOP[:IMMediate]

Applicable Models: All

(Write-only) Prints the screen to the default printer.

Examples

```
HCOP
hcopy:immediate
```

Query Syntax

Not applicable

Default

Not Applicable

---

HCOPy:ITEM:AWINdow[:STATe] <bool>

Applicable Models: All

(Read-Write) When ON, prints only the Active window. When OFF, prints all windows.

This setting survives instrument preset and VNA application restart.

Parameters

```
<bool> Active window state. Chose from:

    OFF or (0) - Print ALL windows.

    ON or (1) - Print Active window only.
```

Examples

```
HCOP:ITEM:AWIN 1
hcopy:item:awindow:state off
```

Query Syntax

HCOPy:ITEM:AWINdow[:STATe]?

Return Type

Boolean

Default

OFF (0)

---

HCOPy:ITEM:CTABle[:STATe] <bool>
**Applicable Models:** All

(Read-Write) When ON, prints the channel settings table.

This setting survives instrument preset and VNA application restart.

**Parameters**

- **<bool>** Channel table print state. Chose from:
  - **OFF** or (0) - Does NOT print the channel settings table.
  - **ON** or (1) - Prints channel settings table.

**Examples**

- `HCOPy:ITEM:CTAB 1`
- `hcopy:ITEM:ctable:state off`

**Query Syntax**

- `HCOPy:ITEM:CTABle[:STATe]?`

**Return Type**

- Boolean

**Default**

- OFF (0)

---

**HCOPy:ITEM:GPFail[:STATe] <bool>**

**Applicable Models:** All

(Read-Write) When ON, prints the Global Pass/Fail status in the page header.

This setting survives instrument preset and VNA application restart.

**Parameters**

- **<bool>** Pass / Fail print state. Chose from:
  - **OFF** or (0) - Does NOT print Pass / Fail status.
  - **ON** or (1) - Print Pass / Fail status

**Examples**

- `HCOPy:ITEM:GPF 1`
- `hcopy:ITEM:gpfail:state off`

**Query Syntax**

- `HCOPy:ITEM:GPFail[:STATe]?`

**Return Type**

- Boolean

**Default**

- OFF (0)

---

**HCOPy:ITEM:LOGO[:STATe] <bool>**
Applicable Models: All

(Read-Write) When ON, prints the Keysight Technologies logo in the page header.

This setting survives instrument preset and VNA application restart.

Parameters
<bool> Keysight logo print state. Chose from:

OFF or (0) - Prints the Keysight logo.

ON or (1) - Does NOT print the Keysight logo.

Examples
HCOP:ITEM:LOGO 1
hcopy:item:logo:state off

Query Syntax
HCOPy:ITEM:LOGO[:STATe]?

Return Type
Boolean

Default
OFF (0)

---

HCOPy:ITEM:MKRData[:STATe] <bool>

Applicable Models: All

(Read-Write) When ON, includes marker data as part of the trace attributes table.

To print marker data, HCOP:ITEM:TTABLE must also be set to ON.

This setting does not affect the limited marker readout data that can be displayed in the measurement window.

This setting survives instrument preset and VNA application restart.

Parameters
<bool> Marker data print state. Chose from:

OFF or (0) - Does NOT print Marker data.

ON or (1) - Print Marker data.

Examples
HCOP:ITEM:MKRD 1
hcopr:item:mkrd:state off

Query Syntax
HCOPy:ITEM:MKRData[:STATe]?
HCOPy:ITEM:PNUMber[:STATe] <bool>

**Applicable Models:** All

*(Read-Write)* When ON, prints page numbers (1 of n) in the header at the top of each page.

This setting survives instrument preset and VNA application restart.

**Parameters**
- `<bool>` Page number print state. Chose from:
  - **OFF** or (0) - Does NOT print page numbers.
  - **ON** or (1) - Print page numbers.

**Examples**
```
HCOP:ITEM:PNUM 1
hcopy:item:pnumber:state off
```

**Query Syntax**
HCOPy:ITEM:PNUMber[:STATe]?

**Return Type** Boolean
**Default** OFF (0)

---

HCOPy:ITEM:SEGData[:STATe] <bool> - **Obsolete**

**Note:** This command no longer works beginning with A.09.40

*(Read-Write)* When ON, includes ALL segment data as part of the channel settings table.

To print ALL segment data, HCOP:ITEM:CTAB must also be set to ON.

This setting survives instrument preset and VNA application restart.

**Parameters**
- `<bool>` Expanded segment data print state. Chose from:
  - **OFF** or (0) - Does NOT print expanded segment data, but summary data is printed.
  - **ON** or (1) - Print expanded segment data.
**Examples**

HCOP:ITEM:SEGD 1
hcop:item:segdata:state off

**Query Syntax**

HCOPy:ITEM:SEGData[:STATe]?

**Return Type**

Boolean

**Default**

OFF (0)

---

**HCOPy:ITEM:SWINdow[:STATe] <bool>**

**Applicable Models:** All

*(Read-Write)* When ON, prints a single measurement window per page. When OFF, prints up to four measurement windows per page.

This setting survives instrument preset and VNA application restart.

**Parameters**

<bool> Single window print state. Chose from:

- **OFF** or (0) - Print up to four windows per page.
- **ON** or (1) - Print only one window per page.

**Examples**

HCOP:ITEM:SWIN 1
hcop:item:swindow:state off

**Query Syntax**

HCOPy:ITEM:SWINdow[:STATe]?

**Return Type**

Boolean

**Default**

OFF (0)

---

**HCOPy:ITEM:TIME[:STATe] <bool>**
Applicable Models: All

(Read-Write) When ON, prints the VNA computer date and time in the header.

This setting survives instrument preset and VNA application restart.

Parameters

<bool> Time stamp print state. Chose from:

OFF or (0) - Does NOT print time stamp.

ON or (1) - Print time stamp.

Examples

HCOPy:ITEM:TIME 1
hcopy:item:time:state off

Query Syntax

HCOPy:ITEM:TIME:[STATE]?  

Return Type

Boolean

Default

OFF (0)

HCOPy:ITEM:TTABle[:STATE] <bool>

Applicable Models: All

(Read-Write) When ON, prints the trace attributes table.

This setting survives instrument preset and VNA application restart.

Parameters

<bool> Trace attributes table print state. Chose from:

OFF or (0) - Does NOT print the trace attributes table.

ON or (1) - Print the trace attributes table.

Examples

HCOPy:ITEM:TTABle 1
hcopy:item:tttable:state off

Query Syntax

HCOPy:ITEM:TTABle[:STATE]?  

Return Type

Boolean

Default

OFF (0)

HCOPy:ITEM:WFRaction <value>
Applicable Models: All

**Parameters**

<value> Window size as a fraction of the page. Chose a value from .4 (40%) to 1.0 (100%)

**Examples**

<table>
<thead>
<tr>
<th>Command</th>
</tr>
</thead>
<tbody>
<tr>
<td>HCOP:ITEM:WFR .8</td>
</tr>
<tr>
<td>hcopy:ITEM:wfraction .5</td>
</tr>
</tbody>
</table>

**Query Syntax**

HCOP:ITEM:WFRaction?

**Return Type** Numeric

**Default** .4

---

HCOPy:ITEM:WINDows[:STATe] <bool>

Applicable Models: All

(Read-Write) When ON, prints measurement windows.

Use HCOPy:ITEM:AWINDOW to specify all windows or only the active window.

This setting survives instrument preset and VNA application restart.

**Parameters**

<bool> Windows print state. Chose from:

- **OFF** or (0) - Does not print measurement windows.
- **ON** or (1) - Print measurement windows.

**Examples**

<table>
<thead>
<tr>
<th>Command</th>
</tr>
</thead>
<tbody>
<tr>
<td>HCOP:ITEM:WIND 1</td>
</tr>
<tr>
<td>hcopy:ITEM:windows:state off</td>
</tr>
</tbody>
</table>

**Query Syntax**

HCOPy:ITEM:WINDows[:STATe]?

**Return Type** Boolean

**Default** OFF (0)

---

HCOPy:PAGE:DIMensions:LLEFt <left, lower>
Applicable Models: All

(Read-Write) Sets the left and lower page margins.

This setting survives instrument preset and VNA application restart.

Parameters

\(<\text{left}>\quad \text{Left page margin as a percentage of entire page width. Value must be between 0 and 1.}\n\)<lower> Lower page margin as a percentage of entire page length. Value must be between 0 and 1.

Examples

\[
\text{HCOP:PAGE:DIM:LLERF} \, 0.10, 0.10
\]
\[
hcopy:page:dimensions:llleft \, 0.5, 0.7
\]

Query Syntax

HCOPy:PAGE:Dimensions:LLFlt?

Return Type

Numeric, Numeric

Default

Depends on selected page size

HCOPy:PAGE:Dimensions:URIGHT <right, upper>

Applicable Models: All

(Read-Write) Sets the right and upper page margins.

This setting survives instrument preset and VNA application restart.

Parameters

\(<\text{right}>\quad \text{Right page margin as a percentage of entire page width. Value must be between 0 and 1.}\n\)<upper> Upper page margin as a percentage of entire page length. Value must be between 0 and 1.

Examples

\[
\text{HCOP:PAGE:DIM:URIG} \, 0.10, 0.10
\]
\[
hcopy:page:dimensions:uright \, 0.5, 0.7
\]

Query Syntax

HCOPy:PAGE:Dimensions:URIGht?

Return Type

Numeric, Numeric

Default

Depends on selected page size

HCOPy:PAGE:ORientation <char>
Applicable Models: All

(Read-Write) Sets the page orientation.

This setting survives instrument preset and VNA application restart.

**Parameters**

- **<char>** Choose from:
  - PORTrait
  - LANDscape

**Examples**

```
HCOP:PAGE:ORI PORT
hcopy:page:orientation landscape
```

**Query Syntax**

HCOPy:PAGE:ORIentation?

**Return Type**

Character

**Default**

PORTrait

---

HCOPy:PAGE:SIZE <int>

Applicable Models:

(Read-Write) Sets the paper type, which implies the page size.

This setting survives instrument preset and VNA application restart.

**Parameters**

- **<int>** Choose from: I
<table>
<thead>
<tr>
<th>Integer</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Letter 8 1/2 x 11 in</td>

For more paper type choices, see Microsoft's "wingdi.h" file, which can be downloaded as part of the Platform SDK.

**Examples**

```
HCOP:PAGE:SIZE 2
hcopy:page:size 5
```

**Query Syntax**

HCOPY:PAGE:SIZE?

**Return Type**

Integer

**Default**

1

---

**HCOPY:SDUMP:DATA?**

**Applicable Models:** All

*(Read-only)* Returns the display image in a definite-length arbitrary binary block. The format of the data is PNG by default. Use HCOPY:SDUMP:DATA:FORMat to change the format.

This command is equivalent to saving an image to the VNA (HCOPY:FILE) and then using MMEM:TRAN to transfer the file to the computer.

**Examples**

```
HCOPY:SDUMP?
hcopysdump?
```

**Return Type**

A definite-length arbitrary binary block

**Default**

Not Applicable
HCOPy:SDUMp:DATA:FORMat <char>

**Applicable Models:** All

*(Read-Write)* Sets the graphic format for HCOPy:SDUMp:DATA?

**Parameters**

- **<char>** Choose from: JPG | BMP | PNG

**Examples**

```
HCOP:SDUMp:DATA:FORMat BMP
```

**Query Syntax**

HCOPy:SDUMp:DATA:FORMat?

**Return Type** Character

**Default** PNG

---

HCOPy:PRINters?

**Applicable Models:** All

*(Read-only)* Returns a comma-separated list of printers installed on the VNA. Select a printer using HCOPy:DPRinter.

This setting survives instrument preset and VNA application restart.

**Examples**

```
HCOP:PRIN?
hcopy:printers?
```

**Query Syntax**

HCOPy:PRINters?

**Return Type** String

**Default** Not Applicable
Initiate Commands

Controls triggering signals

```
INITiate
  CONTinuous [IMMediate]
```

Click on a red keyword to view the command details.

See Also

- Example  Triggering the VNA
- Learn about Triggering
- Synchronizing the Analyzer and Controller
- SCPI Command Tree

**INITiate:CONTinuous <boolean>**

**Applicable Models:** All

*(Read-Write)* Specifies whether the VNA trigger source is set to Internal (continuous) or Manual.

- For SIMPLE, single-triggering of a single channel, use *Sens:Sweep:Mode SINGle* which sets the number of trigger signals each channel will ACCEPT (Continuous, Groups, *Single*, or HOLD - none.)
- This command is a subset of *TRIG:SEQ:SOURce*, which can also set the trigger source to External.
- See a map of user interface to SCPI triggering commands.
- For more information on triggering, see the VNA Trigger Model.
- See the Example program: Triggering the VNA using SCPI.

**Parameters**

- `<boolean>`
  - **ON** (or 1) - Internal (continuous) trigger.
  - **OFF** (or 0) - Manual sweep. Use *INIT:IMMediate* to send a trigger signal

**Examples**

| INIT:CONT ON |
| initiate:continuous off |

**Query Syntax**

INITiate:CONTinuous?

**Return Type**

Boolean (1 = ON, 0 = OFF)
INITiate<chnum>[::IMMediate]

**Applicable Models:** All

(Write-only) Stops the current sweeps and immediately sends a trigger. (Same as Trigger! on the VNA front panel).

- This command requires Trigger:Source to be set to Manual. This causes ONE trigger signal to be SENT each time INIT:IMM is issued.
- For SIMPLE, single-triggering of a single channel, use Sens:Sweep:Mode SINGLE which sets the number of trigger signals each channel will ACCEPT (Continuous, Groups, Single, or HOLD - none.)

**See the Example program:** Triggering the VNA using SCPI

**Note:** An SMC Fixed Output measurement cannot be triggered using this command. For more information, see the example program.

To trigger ALL channels in turn:

Set ALL channels to Sens<ch>:Sweep:Mode Continuous. The <ch> argument in INIT<ch>:IMM is ignored.

Then…

- TRIG:SCOP ALL triggers ALL channels (in sequence) each time Init:Imm is sent.
- TRIG:SCOP CURRent triggers ONLY the NEXT channel each time Init:Imm is sent.

To trigger ONLY a specified channel:

1. Set ALL channels to Sens<ch>:Sweep:Mode HOLD
2. Send TRIG:SCOP CURRent
3. Send Init<ch>:Imm where <ch> is the channel to be triggered.

**Advanced** Situations that require some channels to be in CONT and others in HOLD are rare. The following describes the behavior of the Init:Imm command in these situations:

**When Trigger:Scope = Global:**

- If the SPECIFIED <chnum> channel is in hold mode, it is put in single trigger (accepts 1 trigger signal) and
goes to the end of the queue of channels to be triggered. The other 'non-hold' channels are triggered. The next Init:Imm triggers the specified channel first.

For example: ch1 is in Hold, ch2 and ch3 are in CONT and we send INIT1:IMM

- On the first INIT:IMM, ch2 and ch3 is triggered.
- next INIT:IMM, ch1, ch2, ch3 is triggered.
- next INIT:IMM, ch2 and ch3 is triggered.
- next INIT:IMM, ch1, ch2, ch3 is triggered, and so forth.

When Trigger:Scope = Channel

- Only ONE channel is triggered for each issued INIT<ch>:IMM command.
- If the specified channel is in hold, it is put in single trigger (accepts 1 trigger signal) and goes the end of the queue of channels to be triggered as in the 'Global' example.

This is one of the VNA overlapped commands. Learn more.

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;cnum&gt;</td>
<td>Any existing channel number. If unspecified, value is set to 1</td>
</tr>

**Query Syntax**

- Not applicable

**Default**

- Not applicable
LXI Command

SCPI Command Tree

LXI:IDENtify[:STATe] <bool>

Applicable Models: N522xB, N523xB, N524xB, E5080A

(Read-Write) Sets and returns the status of the LXI LAN status indicator on the LAN Status dialog.

Parameters

<bool> Choose from:

- **OFF** or **0** - Changes the LXI Status indicator to ‘NORMAL’ and closes the dialog if it was opened by this command.
- **ON** or **1** - Changes the LXI Status indicator to ‘IDENTIFY’ and opens the dialog if it was not already open.

Examples

```
LXI:IDEN 1
lxi:identify:state off
```

Query Syntax

LXI:IDENtify[:STATe]?

Return Type

Boolean

Default

OFF
Memory Commands

The memory commands control saving and loading instrument states and measurement trace data to the hard drive. To read and write trace data in GPIB format, see `CALC:MEAS:DATA`.

Specifying Path Names

The MMEM commands use the following rules to specify path names:

- The default folder is "D:\". Learn more.
- You can change the active directory using MMEMory:CDIRectory.
- Specify only the file name if using the active directory.
- You can also use an absolute path name to specify the folder and file.
**MMEMory:CATalog[:<char>]? [<folder>]**

**Applicable Models:** All

*(Read-only)* Returns a comma-separated string of file names that are in the specified folder. If there are no files of the specified type, "NO CATALOG" is returned. [Learn about File Types.]

**Note:** If Enable Remote Drive Access is unchecked in the Remote Interface dialog, this command will return an error.

**Parameters**

- **<char>** The type of files to list. Choose from:
  - **STATe** - Instrument states (.sta)
  - **CORRection** - Calibration Data (.cal)
  - **CSARchive** - Instrument state and calibration data (.csa)
  - **CSTate** - Instrument state and link to Calibration data (.cst)
  - **[:File]**

  If unspecified then ALL file types (even unknown types) are listed.

- **<folder>** String - Any existing folder name. See [Specifying Path Names]

**Examples**

- `MMEM:CAT?` 'lists all files from the current folder
- `mmemory:catalog:correction? 'D:' ` 'lists .cal files from the specified folder

**Default** Not applicable

---

**MMEMory:CDIRectory <folder>**
Applicable Models: All

(Read-Write) Changes the folder name.

Note: If Enable Remote Drive Access is unchecked in the Remote Interface dialog, this command will return an error.

Parameters

<folder> Any drive and folder name that already exists.

If the same level as the default path, then no punctuation is required.

**MMEM:CDIR Service**

If the new folder is at a different level than the default, use a slash (/) before the folder name and enclose in quotes.

`mmemory:cdirectory '/automation' 'changes default directory up one level.'`

You can use an absolute path to specify the new folder.

`mmemory:cdirectory 'C:/automation/service'`

Query Syntax

MMEMory:CDIRectory? 'Returns the current folder name

Return Type

String

Default See Specifying Path Names

---

MMEMory:COPY <file1>,<file2>

Applicable Models: All

(Write-only) Copies file1 to file2. Extensions must be specified.

Note: If Enable Remote Drive Access is unchecked in the Remote Interface dialog, this command will return an error.

Parameters

<file1> String - Name of the file to be copied. See Specifying Path Names

<file2> String - Name of the file to be created from file1.

Examples

`MMEM:COPY 'MyFile.cst','YourFile.cst'`

Query Syntax

Not applicable

Default Not applicable
MMEMory:DATE? <fileName>

Applicable Models: All

(Read-only) Returns the (year, month, day) that the specified file was last saved.

To query the last date and time a cal set was modified, use CSET DATE? and CSET:TIME?

See Also

MMEM:TIME?

Parameters

<fileName>  String - File name. See Specifying Path Names

Example

MMEM:DATE? "myFile.txt"

>Returns

+2013,+4,+12

mmemory:date? "D:\Calset_18.pcs"

>Returns

+2013,+4,+12

Return Type  Comma-separated integers

Default  Not applicable

---

MMEMory:DELete <file>

Applicable Models: All

(Write-only) Deletes file. Extensions must be specified.

Note: If Enable Remote Drive Access is unchecked in the Remote Interface dialog, this command will return an error.

Parameters

<file>  String - Name of the file to be deleted. See Specifying Path Names

Examples

MMEM:DEL 'MyFile.cst'

Query Syntax  Not applicable

Default  Not applicable
MMEMory:LOAD[:<char>] <file>

Applicable Models: All

(Write-only) Loads the specified file. Learn about File Types

Parameters

<char>  The type of file to load. Choose from:

- ASCFactor
- BSCFactor
- STATe - Instrument states (.sta)
- CORRection - Calibration Data (.cal)
- CSARchive - Instrument state and calibration data (.csa)
- CSTate - Instrument state and link to Calibration data (.cst)
- ENR - Excess Noise Source data (Noise Figure App only)
- SEGment
- [:File]
- PLOSs

When <char> is ENR, then include CAL, - See example below.

*.sNp files CAN be recalled to the VNA although no <char> is used. See example below.

If <char> is unspecified, the extension must be included in the filename.

If an extension is specified in <file> that does not agree with <char> then no action is taken.

=file>  String - Name of the file to be loaded. See Specifying Path Names

Examples

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MMEM:LOAD 'MyFile.cst'</td>
<td></td>
</tr>
<tr>
<td>mmemory:load:state 'MyInstState'</td>
<td></td>
</tr>
<tr>
<td>MMEM:LOAD:ENR CAL, &quot;D:/data/calset/346C_16500.enr&quot;</td>
<td></td>
</tr>
<tr>
<td>MMEM:LOAD &quot;MyFile.s2p&quot;</td>
<td></td>
</tr>
</tbody>
</table>

Query Syntax  Not applicable

Default  Not applicable
MMEMory:LOAD:LIMIT <file>

Applicable Models: All

(Write-only) Load limit test data of the active trace of the active channel from a CSV file.

Parameters

<file> A file path by string format.

The CSV file shall have header lines and a title row as follows.

"# E5080 Limit Test"

"# Revision: 1.00"

<table>
<thead>
<tr>
<th>TYPE, BEGIN STIMULUS, END STIMULUS, BEGIN RESPONSE, END RESPONSE</th>
</tr>
</thead>
</table>

Examples

MMEM:LOAD:LIM 'MyFile.csv'

Query Syntax

Not Applicable

Default

Not Applicable

---

MMEMory:LOAD:PN:SPURious:OSSPur <file>

Applicable Models: N522xB, N524xB with Phase Noise Option S93031xB

(Write-only) Load user specified spurious frequency list of the active trace of the active channel.

Parameters

<file> String - Name of the user specified spurious frequency list. See Specifying Path Names

Examples

MMEM:LOAD:PN:SPUR:OSSP 'MyFile.csv'

mmemory:load:pn:spurious:osspur 'D:/MyFile.csv'

Query Syntax

Not applicable

Default

Not applicable

---

MMEMory:LOAD:PN:SPURious:THReshold <file>
Applicable Models: N522xB, N524xB with Phase Noise Option S93031xB

(Write-only) Load the threshold table of the active trace of the active channel.

Parameters

- `<file>` String - Name of the threshold table. See Specifying Path Names

Examples

- `MMEM:LOAD:PN:SPUR:THR 'MyFile.csv'`
- `mmemory:load:pn:spurious:threshold 'D:/MyFile.csv'`

Query Syntax

- Not applicable

Default

- Not applicable

---

**MMEMory:LOAD:RLIMit <file>**

Applicable Models: All

(Write-only) Load ripple limit test data of the active trace of the active channel from a CSV file.

Parameters

- `<file>` A file path by string format.

The CSV file shall have header lines and a title row as follows.

- "# E5080 Ripple Limit Test"
- "# Revision: 1.00"

Examples

- `MMEM:LOAD:RLIM 'MyFile.csv'`

Query Syntax

- Not Applicable

Default

- Not Applicable

---

**MMEMory:MDIRectory <folder>**
Applicable Models: All

(Write-only) Makes a folder.

**Note:** If Enable Remote Drive Access is unchecked in the Remote Interface dialog, this command will return an error.

### Parameters

- `<folder>`: String - Name of the folder to make. See Specifying Path Names

### Examples

- `MMEM:MDIR 'MyFolder`
- `mmemory:mdirectory 'D:/NewFolder'

### Query Syntax

Not applicable

### Default

Not applicable

---

**MMEMory:MOVE <file1>,<file2>**

Applicable Models: All

(Write-only) Renames `<file1>` to `<file2>`. File extensions must be specified.

### Parameters

- `<file1>`: String - Name of the file to be renamed. See Specifying Path Names
- `<file2>`: String - Name of the new file.

### Examples

- `MMEM:MOVE 'MyFile.cst','YourFile.cst'

### Query Syntax

Not applicable

### Default

Not applicable

---

**MMEMory:RDIREctory <folder>**
Applicable Models: All

(Write-only) Removes the specified folder.

**Note:** If Enable Remote Drive Access is unchecked in the Remote Interface dialog, this command will return an error.

**Parameters**

- `<folder>` String - Name of the folder to remove. See Specifying Path Names

**Examples**

```
MMEM:RDIR 'MyFolder'
```

**Query Syntax**

Not applicable

**Default**

Not applicable

---

MMEMory:STORe[:<char>] <file>

Applicable Models: All

(Write-only) Stores the specified file (.sta, .cal, .cst, .csa, .snp, s2px).

Learn about saving SNP files on the VNA.

Learn about saving S2Px files on the VNA.

To save other data files, use MMEM:STOR:DATA.

To save ENR files, use MMEMory:STORE:ENR

**Parameters**

- `<char>` Optional argument. The type of file to store. Choose from:
  - ASCFactor
  - BSCFactor
  - CORRection - Calibration Data (.cal)
  - CSARchive - Instrument state and calibration data (.csa)
  - CSTate - Instrument state and link to Calibration data (.cst)
  - CSV:FORMat
  - ENR
  - [:File]
- **PLOSs**
- **SEGment**
- **STATe** - Instrument states (.sta)
- **STATe:TRACe**
- **TRACe**

No `<char>` is specified for s1p, s2p, s2px and so forth.

Include either `<char>` or the file extension. If both `<char>` and the extension are specified, they must agree or an error is returned and no action is taken. See examples below.

Learn about File Types

<file> String - Name of any valid file that does not already exist. See [Specifying Path Names](#).

**Examples**

<table>
<thead>
<tr>
<th>MMEM:STOR:STAT 'myState'</th>
</tr>
</thead>
<tbody>
<tr>
<td>mmemory:store 'c:/bin/myState.sta'</td>
</tr>
<tr>
<td>MMEM:STOR 'MyData.S2P'</td>
</tr>
</tbody>
</table>

**Query Syntax** Not applicable

**Default** Not applicable

---

**MMEMory:STORe:CITifile:DATA <filename>** - Superseded

**Applicable Models:** All

This command is replaced with **MMEMory:STORe:DATA**.

(Write only) Saves UNFORMATTED trace data to .cti file. Learn more.

**Parameters**

- `<filename>` Any path that already exists with filename.

  If the same level as the default, then no path is required.

<table>
<thead>
<tr>
<th>MMEM:STOR:CIT:DATA 'MYFile.cti'</th>
</tr>
</thead>
<tbody>
<tr>
<td>mmemory:store:citifile:adata &quot;D:\myFile.cti&quot;</td>
</tr>
</tbody>
</table>

**Query Syntax** Not Applicable
**Specifying Path Names**

**MMEMory:STORe:CITifile:FORMat <filename> - Superseded**

**Applicable Models:** All

This command is replaced with **MMEMory:STORe:DATA**.

*(Write only)* Saves FORMATTED trace data to .cti file. [Learn more.](#)

**Parameters**

*<filename>* Any path that already exists with filename.

If the same level, then no path is required

```
MMEM:STOR:CIT:FORM 'MYFile.cti'
```

Of you can specify an absolute path and filename:

```
mmemory:store:citifile:format "D:\myFile.cti"
```

**Query Syntax** Not Applicable

**Default** See **Specifying Path Names**

---

**MMEMory:STORe:DATA <filename>,<type>,<scope>,<format>,<selector>**

**Applicable Models:** All

*(Write-only)* Stores trace data to the following file types: *.prn, *.cti, *.csv, *.mdf. Not all choices are valid with other arguments. See [Valid parameter combinations](#) below.

---

**Notes:**

To save snp files for standard channels (only), use **CALC:MEAS:Data:SNP:PORTs:SAVE**

To save state and calibration files, use **MMEM:STORE**

This command replaces the following:

- **MMEMory:STORe:CITifile:DATA**
- **MMEMory:STORe:CITifile:FORMat**
Parameters

<filename>  (String) Name and extension of the file to which data will be saved. If the extension does not agree with the file type, an error is NOT returned but the data may NOT be what you expect.

See rules for specifying a filename.

<type>  (String) File type to save. Choose from:

"PRN Trace Data" - *.prn data. Learn more.

"Citifile Data Data" - unformatted *.cti data. Learn more.

"Citifile Formatted Data" - formatted *.cti data.

"CSV Formatted Data" - formatted *.csv data. Learn more.

"MDIF Data" - *.mdf data. Learn more.

"GCA Sweep Data" - Gain compression data. Learn more.

"IMD Sweep Data" - Swept IMD data. Learn more.

<scope>  (String) How much data to save. Choose from:

"Trace" - only the specified measurement number is saved.

"Displayed" - all displayed measurements are saved.

"Channel" - all measurements that are in the channel in which the selected measurement reside are saved.

"Auto"

For all Standard Meas Class (S-parameter) channels:

- When correction is OFF, the specified trace is saved.
- When correction is ON, all corrected parameters associated with the calibrated ports in the Cal Set are saved.

For all other channels:
When correction is OFF or ON, the specified trace is saved.

<format> The format in which data is saved. Choose from:

"Displayed" - the format is the same as that in which it is displayed on the VNA screen.

"RI" - Real / Imaginary

"MA" - Magnitude / Angle

"DB" - LogMag / Degrees

<selector> (Integer) Choose from:

-1 Use when <scope> = "Displayed" (does NOT require a selected trace).

<measurement number> Use for all other <scope> selections. Use Calc:Par:MNUM? to read the measurement number of the selected trace.

The following are valid parameter combinations for ALL measurement classes:

<table>
<thead>
<tr>
<th>&lt;type&gt; (String)</th>

MMEMory:STORE:TRACe:FORMat:CITifile <char> - Superseded
Applicable Models: All

This command is replaced with **MMEMory:STORe:DATA**.

*(Read-Write)* Specifies the format of subsequent citifile save statements.

**Parameters**

- **<char>** Format in which the citifile will be saved with subsequent **MMEMory:STORe:CIT:FORMat** statements. Choose from:
  - **MA** - Linear Magnitude / degrees
  - **DB** - Log Magnitude / degrees
  - **RI** - Real / Imaginary
  - **AUTO** - Format in which the trace is already displayed. If other than Log Mag, Linear Magnitude, or Real/Imag, then the format will be in Real/Imag.
  - **DISP** - Displayed format.

**Examples**

<table>
<thead>
<tr>
<th>MMEM: STOR: TRAC: FORM: CIT MA</th>
</tr>
</thead>
</table>

**Query Syntax**

**MMEMory:STORe:TRACe:FORMat:CITifile?**

**Return Type**

Character

**Default**

Auto

---

**MMEMory:STORe:TRACe:CONTents:CITifile <char>** - **Superseded**

Applicable Models: All

This command is replaced with **MMEMory:STORe:DATA**.

*(Read-Write)* Specifies the contents of subsequent citifile save statements. *(See Data Define Saves)*

**Parameters**

- **<char>** Choose from:
  - **SING** - Single trace
  - **DISP** - All displayed traces
  - **AUTO** - All displayed traces

**Examples**

<table>
<thead>
<tr>
<th>MMEM: STOR: TRAC: CONT: CIT SING</th>
</tr>
</thead>
</table>

3977
Query Syntax: MMEMory:STORe:TRACe:CONTents?

Return Type: Character

Default: Auto

**MMEMory:STORe:TRACe:FORMat:SNP <char>**

**Applicable Models:** All

(Read-Write) Specifies the format of subsequent .s1p, .s2p, .s3p; s4p save statements. [Learn more.]

To save SNP data, use **CALC:MEAS:DATA:SNP:PORTs:SAVE**

**Parameters**

- `<char>` Choose from:
  - **MA** - Linear Magnitude / degrees
  - **DB** - Log Magnitude / degrees
  - **RI** - Real / Imaginary
  - **AUTO** - data is output in currently selected trace format. If other than LogMag, LinMag, or Real/Imag, then output is in Real/Imag.

**Examples**

- **MMEM:STOR:TRAC:FORM:SNP MA**

**Query Syntax: MMEMory:STORe:TRACe:FORMat:SNP?**

**Return Type:** Character

Default: Auto'

**MMEMory:TIME? <fileName>**
Applicable Models: All

(Read-only) Returns the (hour, minute, second) that the specified file was last saved. The time is returned in local time as setup in the VNA operating system.

To query the last date and time a cal set was modified, use CSET DATE? and CSET:TIME?

See Also

MMEM:DATE?

Parameters
<fileName>  String - File name. See Specifying Path Names

Example

```
MMEM:TIME? "myFile.txt"
'returns
+12,+34,+12

mmemory:time? "D:\Calset_18.pcs"
'returns
+12,+34,+12
```

Return Type  Comma-separated integers

Default  Not applicable

MMEMory:TRANsfer <fileName>,<dataBlock>

Applicable Models: All

(Read-Write) Transfers data between the VNA and an external controller. Other MMEM commands transfer data between the VNA application and the VNA hard drive. If <fileName> already exists, it will be overwritten.

To read trace data from the VNA in block format, use CALC:MEAS:DATA.

Note: If Enable Remote Drive Access is unchecked in the Remote Interface dialog, this command will return an error.

Parameters

<fileName>  String - File name. See Specifying Path Names

<dataBlock>  Block Data - The contents of the file.

The data block is a block of binary data. Use the following syntax:
```markdown
#<num digits><byte count><data bytes><NL><END>

where:

<num digits> specifies how many digits are contained in <byte count>

<byte count> specifies how many data bytes will follow in <data bytes>

Example:

#210ABCDE+WXYZ<nl><end>

Where:

- # - always sent before definite block data
- 2 - specifies that the byte count is two digits (2)
- 10 - specifies the number of data bytes that will follow, not counting <NL><END>

ABCDE+WXYZ - 10 digits of data

<NL><END> - always sent at the end of block data

- SCPI Command Tree

OUTPut:MANual:NOISE[:STATe] <bool> "usbNsSrcID"

**Applicable Models:** N522xB, N523xB, N524xB, M937xA, P937xA

*(Read-Write)* Sets and reads the noise source (28V) ON or OFF.

**Note:** “usbNsSrcID” is an optional parameter. If this optional parameter is specified, it turns the noise source on/off for the specified devices.

**Parameters**

- `<bool>`
  - **ON (1)** - Noise source ON
  - **OFF (0)** - Noise source OFF

**Examples**

- `OUTP:MAN:NOIS 0`
- `output:manual:noise:state 1`

**Query Syntax**

- `OUTPut:MANual:NOIS[e][:STATe]`?

**Return Type**

Boolean (1 = ON, 0 = OFF)

**Default**

For VNA models with a Noise Figure option (028/029/H29), the 28V line is always ON. The ON/OFF state is also available from a VNA softkey menu.

For VNA models WITHOUT a Noise Figure option (028/029/H29), the 28V line is OFF by default and survives a preset. The ON/OFF state is NOT available from a VNA softkey menu.
OUTPut[:STATe] <ON | OFF>

Applicable Models: All

(Read-Write) Turns RF power from the source ON or OFF.

See note about source power state with instrument state save and recall.

Parameters

<ON | OFF>

ON (or 1) - turns RF power ON

OFF (or 0) - turns RF power OFF

Examples

OUTP ON
output:state off

Query Syntax

OUTPut[:STATe]?

Return Type

Boolean (1 = ON, 0 = OFF)

Default

ON
**Route Command**

Learn about Frequency Offset

SCPI Command Tree

**ROUTe<cnum>:PATH:LOOP[:R1] <char>**

**Applicable Models:** N522xB, N524xB

*(Read-Write)* Throws internal switch to reference receiver when the specified channel is measured.

N523xA models do NOT have the R1 reference receiver switch.

**Parameters**

- `<cnum>`: Any existing channel number. If unspecified, value is set to 1
- `<char>`: Position of the switch. Choose from:
  - **INTernal**: bypass R1 Loop. Connects the port 1 source directly to the R1 receiver.
  - **EXTernal**: flow through R1 Loop. Allows direct access to the R1 receiver through the Reference 1 front-panel connectors.

**Examples**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ROUT:PATH:LOOP INT</td>
<td>INTernal setting</td>
</tr>
<tr>
<td>route2:path:loop:r1 external</td>
<td>EXTernal setting</td>
</tr>
</tbody>
</table>

**Query Syntax**

ROUTe<cnum>:PATH:LOOP:R1?

**Return Type**

Character

**Default**

INTernal
Controls the Active Hot Parameters configuration.

SENSe<ch>:ACTive:DISP:INTerpolate[:STATe] <bool>
Applicable Models: N524xB

(Read-Write) Sets whether or not interpolation is on for display. Frequency, power, and phase X axis are supported for display. Interpolation may be applied in the trace.

Parameters

- `<ch>` Any existing active match channel. If unspecified, value is set to 1.
- `<bool>` Choose from:
  - **ON** or (1) Interpolate the results
  - **OFF** or (0) Do NOT interpolate the results.

Examples

```
SENS:ACTive:DISP:INT 1
sense:active:disp:interpolation off
```

Query Syntax

```
SENSe<ch>:ACTive:DISP:INTERpolation[:STATe]?
```

Return Type

Boolean

Default

OFF

Applicable Models: N524xB

(Read-Write) Set and read a fixed trace input power level.

Parameters

- `<ch>` Any existing active match channel. If unspecified, value is set to 1.
- `<tnum>` The number of the trace to set input power. If unspecified, the trace number is set to 1.
- `<num>` Input power level. The range is -10 to 0. The units are Hz, dBm, or s.

Examples

```
SENS:ACTive:DISPlay:TRACe1:IPWer 0 dBm
sense:active:display:trace1:ipwer 0 dBm
```

Query Syntax

```
SENSe<ch>:ACTive:DISPlay:TRACe<tnum>:IPWer <num>
```

Return Type

Numeric

Default

Not Applicable
Applicable Models: N524xB

(Read-Write) Set and read the number of phase points. For the tuning tone at the output, a phase sweep is done for each point.

Parameters

- `<ch>` Any existing active match channel. If unspecified, value is set to 1.
- `<num>` Phase points. Do not exceed the max number of phase points (50).

Examples

- `SENS:ACTive:SWEep:PHAS:POIN 201`
- `sense:active:sweep:phase:point 101`

Query Syntax

- `SENS<ch>:ACTive:SWEep:PHASe:POINt?`

Return Type

- Numeric

Default

- 8

---

SENSe<ch>:ACTive:SWEep:POWeR:STARt <num>

Applicable Models: N524xB

(Read-Write) Set and read the start power level for a 3D sweep.

Parameters

- `<ch>` Any existing active match channel. If unspecified, value is set to 1.
- `<num>` Start power level in dBm. Choose a value from the min power to max power of the hardware.

Examples

- `SENS:ACTive:SWEep:POW:STAR 0`
- `sense:active:sweep:power:start 0`

Query Syntax

- `SENS<ch>:ACTive:SWEep:POWeR:STARt?`

Return Type

- Numeric

Default

- -10 dBm

---

SENSe<ch>:ACTive:SWEep:POWeR:STEP <num>
(Read-Write) Set and read the number of power steps for a 3D sweep.

Parameters

- `<ch>` Any existing active match channel. If unspecified, value is set to 1.
- `<num>` Number of power steps. The range is 2 to 20001.

Examples

```
SENS:ACTive:SWE:POW:STEP 201
sense:active:sweep:power:step 201
```

Query Syntax

SENS<ch>:ACTive:SWEep:POWer:STEP?

Return Type

Numeric

Default

201

SENSe<ch>:ACTive:SWEep:POWer:STOP <num>

(Read-Write) Set and read the stop power level for a 3D sweep.

Parameters

- `<ch>` Any existing active match channel. If unspecified, value is set to 1.
- `<num>` Stop power level in dBm. Choose a value from min power to max power of the hardware.

Examples

```
SENS:ACTive:SWE:POW:STOP 0
sense:active:sweep:power:stop 0
```

Query Syntax

SENS<ch>:ACTive:SWEep:POWer:STOP?

Return Type

Numeric

Default

0 dBm
**Applicable Models:** N524xB

**(Read-Write)** Set and read the sweep type.

**Parameters**

- `<ch>` Any existing active match channel. If unspecified, value is set to 1.
- `<char>` Sweep type. Choose from:
  - **LIN** - frequency linear sweep
  - **LOG** - frequency log sweep
  - **POW** - power sweep
  - **MULT** - Multiple sweep. Sweeps frequency with fixed power and has several sweeps with different power values. This is called a 3D sweep: frequency, power, and phase.

**Examples**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SENS:ACTive:SWE:TYPE LIN</td>
<td>Sense:active:sweep:type lin</td>
</tr>

SENSe<ch>:ACTive:SWEep:TYPE?

**Return Type**

Character

**Default**

LIN

---

**SENSe<ch>:ACTive:TTONe:MODE <char>**

**Applicable Models:** N524xB

**(Read-Write)** Set and read the tuning tone mode. The tuning tone is the source at the output port to extract the X parameters.

**Parameters**

- `<ch>` Any existing active match channel. If unspecified, value is set to 1.
- `<char>` Tuning tone mode. Choose from:
  - **ABSolute** - tone power is an absolute power
  - **RELative** - tone power is a dBc power relative to the input power

**Examples**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SENS:ACTive:TTON:MODE ABS</td>
<td>Sense:active:ttone:mode abs</td>
</tr>

**Query Syntax**

SENSe<ch>:ACTive:TTONe:MODE?

**Return Type**

Character

**Default**

ABSolute
SENSe<ch>:ACTive:TTONe:ABSolute <num>

Applicable Models: N524xB

(Read-Write) Set and read the absolute tone power level.

Parameters

- **<ch>** Any existing active match channel. If unspecified, value is set to 1.
- **<num>** Absolute tone power level.

Examples

```
SENS:ACTive:TTON:ABS -5
sense:active:ttone:absolute -5
```

Query Syntax

SENSe<ch>:ACTive:TTONe:ABSolute?

Return Type

Numeric

Default

-5 dBm

SENSe<ch>:ACTive:TTONe:RELative <num>

Applicable Models: N524xB

(Read-Write) Set and read the tone power relative to the input power (dBc).

Parameters

- **<ch>** Any existing active match channel. If unspecified, value is set to 1.
- **<num>** Relative tone power level.

Examples

```
SENS:ACTive:TTON:REL 10
sense:active:ttone:relative 10
```

Query Syntax

SENSe<ch>:ACTive:TTONe:RELative?

Return Type

Numeric

Default

-15 dBc
Sense Amplifier

When you use the M9485A, you can control the M9379A amplifier through the VNA firmware. The following commands are available when the launcher includes the M9379A.

```
SENSe:AMPLifier:M9379
  | COUNt?
  | MODule
    | :ATTenuation
    | :CHASsis
    | :CONTrol[:STATe]
    | :PATH
    | :POWer[:STATe]
    | :SLOT
    | :SWITch:PATH
```

Click on a keyword to view the command details.

---

**SENSe<cnum>:AMPLifier:M9379:COUNt?**

**Applicable Models:** M9485A

*(Read-only)* Returns the total number of M9379A amplifier modules that are connected to the VNA firmware.

**Parameters**

<table>
<thead>
<tr>
<th>&lt;cnum&gt;</th>
<th>Any existing channel number; if unspecified, value is set to 1. This command is common for all channels and the setting is ignored.</th>
</tr>
</thead>
</table>

**Examples**

```
SENSe:AMPLifier:M9379:COUNt?
sense2:amplifier:m9379:count
```

**Return Type** Numeric

**Default** Not applicable

---

3990
SENSe<cnum>:AMPlifier:M9379:MODule<mod>:ATTenuation <att>

Applicable Models: M9485A

(Read-Write) Sets and reads the attenuation of the M9379A amplifier 1.

Parameters
- <cnum>: Any existing channel number; if unspecified, value is set to 1.
- <mod>: Module number of M9379A. The number starts from 1 for the leftmost module of M9379A.
- <att>: Attenuation in dB from 0 to 28 with 2 step

Examples
SENS:AMPL:M9379:MOD1:ATT 10
sense2:amplifier:m9379:module2:attenuation 5

Query Syntax
SENSe<cnum>:AMPlifier:M9379:MODule<mod>:ATTenuation?

Return Type
Numeric
Default
28

SENSe<cnum>:AMPlifier:M9379:MODule<mod>:CHASsis?

Applicable Models: M9485A

(Read Only) Returns the chassis number where the specified M9379A module is located.

Parameters
- <cnum>: Any existing channel number; if unspecified, value is set to 1. This command is common for all channels and the setting is ignored.
- <mod>: Module number of M9379A. The number starts from 1 for the leftmost module of M9379A.

Examples
SENS:AMPL:M9379:MOD1:CHAS?
sense2:amplifier:m9379:module2:chassis?

Return Type
Numeric
Default
Not applicable

SENSe<cnum>:AMPlifier:M9379:MODule<mod>:CONTrol[:STATe] <bool>
Applicable Models: M9485A

(Read-Write) Sets and reads the status of M9379A control.

Parameters

- `<cnum>`: Any existing channel number; if unspecified, value is set to 1.
- `<mod>`: Module number of M9379A. The number starts from 1 for the leftmost module of M9379A.
- `<bool>`: Module control state. Choose from:
  - 0 or OFF - Skips to control the M9379A at the specified channel.
  - 1 or ON - Enables to control the M9379A at the specified channel.

Examples

```
SENS:AMPL:M9379:MOD1:CONT ON
sense2:amplifier:m9379:module2:control 0
```

Query Syntax

```
SENSe<cnum>:AMPLifier:M9379:MODule<mod>:CONTrol[:STATe]?
```

Return Type: Boolean

Default: 1 or ON

---

Applicable Models: M9485A

(Read-Write) Sets and reads the path for the M9379A amplifier 1.

Parameters

- `<cnum>`: Any existing channel number; if unspecified, value is set to 1.
- `<mod>`: Module number of M9379A. The number starts from 1 for the leftmost module of M9379A.
- `<char>`: Path. Choose from:
  - THRU - Through.
  - AMPLifier - amplifier 1.
  - NFReceiver - NF receiver switch (NF measurement only)

Examples

```
SENS:AMPL:M9379:MOD1:PATH THRU
sense2:amplifier:m9379:module2:path amplifier
```
Query Syntax  
SENSe<cnum>:AMPLifier:M9379:MODule<mod>:PATH?

Return Type  
Char

Default  
THRU

SENSe<cnum>:AMPLifier:M9379:MODule<mod>:POWer[:STATe] <bool>

Applicable Models: M9485A

(Read-Write) Sets and reads the status of M9379A power.

Parameters

<cnum> Any existing channel number; if unspecified, value is set to 1. This command is common for all channels and the setting is ignored.

<mod> Module number of M9379A. The number starts from 1 for the leftmost module of M9379A.

<bool> power control state. Choose from:

0 or OFF - Power off

1 or ON - Power on

Examples

SENSe:AMPL:M9379:MOD1:POW ON
sense2:amplifier:m9379:module2:power 0

SENSe<cnum>:AMPLifier:M9379:MODule<mod>:SLOT?

Query Syntax  
SENSe<cnum>:AMPLifier:M9379:MODule<mod>:POWer[:STATe]?

Return Type  
Boolean

Default  
0 or OFF
Applicable Models: M9485A

(Read Only) Reads the slot number where the M9379A is located.

**Parameters**

- `<cnum>`: Any existing channel number; if unspecified, value is set to 1. This command is common for all channels and the setting is ignored.
- `<mod>`: Module number of M9379A. The number starts from 1 for the leftmost module of M9379A.

**Examples**

```
SENS:AMPL:M9379:MOD1:SLOT?
sense2:amplifier:m9379:module2:slot?
```

**Return Type** Numeric

**Default** Not applicable

---

SENSe<cnum>:AMPlifier:M9379:MODule<mod>:SWITch:PATH <char>

Applicable Models: M9485A

(Read-Write) Sets and reads the path for the M9379A switch

**Parameters**

- `<cnum>`: Any existing channel number; if unspecified, value is set to 1.
- `<mod>`: Module number of M9379A. The number starts from 1 for the leftmost module of M9379A.
- `<char>`: Path. Choose from:
  - **A** - Path A
  - **B** - Path B
  - **NFSource** - NF source switch (NF measurement only)
  - **NFLO** - NF LO switch (Option 720 only)
  - **NFR Receiver** - NF receiver switch (NF measurement only)

**Examples**

```
SENS:AMPL:M9379:MOD1:SWIT:PATH A
sense2:amplifier:m9379:module2:switch:path b
```

- Synchronizing the Analyzer and Controller
- SCPI Command Tree

SENSe<cnum>:AVERage:CLEar

Applicable Models: All

(Write-only) Clears and restarts averaging of the measurement data. Does NOT apply to point averaging.

Parameters

- `<cnum>` Any existing channel number; if unspecified, value is set to 1.

Examples

- SENS:AVER:CLE
- sense2:average:clear

Query Syntax

- Not applicable

Default

- Not applicable

SENSe<cnum>:AVERage:COUNt <num>
Applicable Models: All

(Read-Write) Sets the number of measurements to combine for an average. Must also set SENS:AVER[:STATe] ON

**Parameters**

- `<cnum>` Any existing channel number; if unspecified, value is set to 1.
- `<num>` Number of measurements to average. Choose any number between 1 and \(2^{16}\).

**Examples**

- SENS:AVER:COUN 999
- sense2:average:count 73

**Query Syntax**

SENSe<cnum>:AVERage:COUNt?

**Return Type**

Numeric

**Default**

1

---

SENSe<cnum>:AVERage:MODE <char>

Applicable Models: All

(Read-Write) Sets the type of averaging to perform: Point or Sweep.

**Parameters**

- `<cnum>` Any existing channel number; if unspecified, value is set to 1.
- `<num>` Averaging Type. Choose from:
  
  **POINt** - Averaging measurements are made on each data point before stepping to the next data point.
  
  **SWEEP** - Averaging measurements are made on subsequent sweeps until the required number of averaging sweeps are performed.

**Examples**

- SENS:AVER:MODE POIN
- sense2:average:mode sweep

**Query Syntax**

SENSe<cnum>:AVERage:MODE?

**Return Type**

Character

**Default**

Sweep

---

SENSe<cnum>:AVERage[:STATe] <ON | OFF>
Applicable Models: All

(Read-Write) Turns trace averaging ON or OFF.

Parameters

<cnm> Any existing channel number; if unspecified, value is set to 1.

<ON | OFF> ON (or 1) - turns averaging ON.
OFF (or 0) - turns averaging OFF.

Examples

SENS:AVER ON
sense2:average:state off

Query Syntax SENSE<cnm>:AVERage[:STATe]?

Return Type Boolean (1 = ON, 0 = OFF)

Default Off
SENSe:BANDwidth | BWIDth Commands

SENSe:BANDwidth | BWIDth:

  RESolution <num>
  TRACk:FORCe
  TRACk[:STATE] <bool>

See Also

- Example Programs
- Learn about IF Bandwidth
- Synchronizing the Analyzer and Controller
- SCPI Command Tree

SENSe<cnum>:BANDwidth | BWIDth[:RESolution] <num>

Applicable Models: All

(Read-Write) Sets the bandwidth of the digital IF filter to be used in the measurement. (Use either Sense:Bandwidth or Sense:Bwidth)

Parameters

- `<cnum>`: Any existing channel number. If unspecified, value is set to 1
- `<num>`: IF Bandwidth in Hz. The list of valid IF Bandwidths is different depending on the VNA model. (Click to see the lists.) If an invalid number is specified, the analyzer will round up to the closest valid number.

This parameter supports MIN and MAX as arguments. Learn more.

Examples

- `SENS:BWID 1KHZ`
- `sense2:bandwidth:resolution 1000`

Query Syntax

SENSe<cnum>:BANDwidth | BWIDth[:RESolution]?

Return Type

Numeric

Default

Varies with VNA model.

SENSe<cnum>:BANDwidth | BWIDth:TRACk:FORCe <bool>
Applicable Models: N522xB, N5234B, N5235B, N524xB, E5080

(Read-Write) Enables/disables the Reduce IF BW at Low Frequencies feature in segments with IFBW arbitrary.

(Use either Sense:Bandwidth:Track:Force or Sense:Bwidth:Track:Force).

Parameters

- `<cnum>`: Any existing channel number. If unspecified, value is set to 1
- `<bool>`: Choose from:
  - **ON** or **1** - Enable reduce IF BW at Low Frequencies in segments with IFBW arbitrary.
  - **OFF** or **0** - Disable reduce IF BW at Low Frequencies in segments with IFBW arbitrary.

Examples

- SENS:BWID:TRAC:FORC OFF
-sense2:bandwidth:track:force 1

Query Syntax

SENSe<cnum>:BANDwidth | BWIDth:TRACk[:STATe] <bool>

Return Type

Boolean

Default

OFF

SENSe<cnum>:BANDwidth | BWIDth:TRACk[:STATe] <bool>

Applicable Models: N522xB, N5234B, N5235B, N524xB, E5080

(Read-Write) Sets and returns the state of the Reduce IF BW at Low Frequencies feature.

(Use either Sense:Bandwidth:Track or Sense:Bwidth:Track).

Parameters

- `<cnum>`: Any existing channel number. If unspecified, value is set to 1
- `<bool>`: Choose from:
  - **ON** or **1** - Reduce IF BW at Low Frequencies is set ON
  - **OFF** or **0** - Reduce IF BW at Low Frequencies is set OFF

Examples

- SENS:BWID:TRAC OFF
- sense2:bandwidth:track 1

Query Syntax

SENSe<cnum>:BANDwidth | BWIDth:TRACk[:STATe]?

SENSe<cnum>:CONTrol[:STATe] <bool>

Applicable Models: E5080B

(Read-Write) Sets and read the state of interface control for all channels. Channel number is ignored.

Parameters
- <cnum> Channel number.
- <bool> Module control state. Choose from:
  - O or OFF - Interface control port signals won't be sent.
  - 1 or ON - Interface control port signals will be sent.

Examples

Query Syntax :SENSe<cnum>:CONTrol[:STATe]?
Return Type Boolean
Default OFF or 0
Preset 0
Save or Recall Yes

SENSe<cnum>:CONTrol:DWELl <char>, <num>
Applicable Models: E5080B

(Read-Write) Sets and read the delay time between the time all interface control port signals and all commands sent and the one measurements start. Set independently per channel and for forward and reverse sweep. Not set per IO type.

**Parameters**

- `<cnum>` Channel number.
- `<char>` Character - when to send remote commands. Choose from:
  
  **AFTER** - After the channel sweep ends.
  
  **BEFORE** - Before the channel sweep starts.
- `<num>` Wait time in milliseconds. Any positive integer is allowed.

**Examples**

SENS:CONT:DWEL BEF 10

**Save or Recall** Yes

SENSe<cnum>:CONTrol:HANDler:<grp>[::DATA] <char>, <num>

Applicable Models: E5080B

(Read-Write) Sends values to the respective Handler I/O port (A-D). Although ports C and D are normally bidirectional, ONLY Output mode is allowed using the Interface Control feature. It cannot read from these, or any other ports.

**Parameters**

- `<cnum>` Channel number.
- `<grp>` Port identifier to set bits for. Choose from:
  
  A , B , C and D .
<char> Character - when to send remote commands. Choose from:

**AFTER** - After the channel sweep ends.

**BEFORE** - Before the channel sweep starts.

<num> The number of the data bits to set. The range of the value is determined as follows.

- Port A: 0 - 255
- Port B: 0 - 255
- Port C: 0 - 15
- Port D: 0 - 15

### Examples

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
</table>

### Query Syntax

:SENSecnum>:CONTr:HANDler<grp>[:DATA]? <char>

### Return Type

Numeric

- **Default**: 0
- **Preset**: 0
- **Save or Recall**: Yes

---

**SENSe<cnum>:CONTr:HANDler<STATE> <char>, <bool>**

**Applicable Models**: E5080B

*(Read-Write)* Set and read the control function state for each channel. If ON, Handler I/O port signals will be sent before the beginning of the sweep or after the end of the sweep. If OFF, these signals will not be changed.

### Parameters

- **<cnum>** Channel number.
- **<char>** Character - when to send remote commands. Choose from:
  - **AFTER** - After the channel sweep ends.
  - **BEFORE** - Before the channel sweep starts.
<bool> Choose from:

ON (1) - Handler I/O port signals will be sent.

OFF (0) - Handler I/O port signals won't be sent.

Examples

```
SENS:CONT:HAND AFT, ON
sense2:control:handler? after
```

Query Syntax

```
:SENSe<cnum>:CONTrol:HANDler[:STATe]? <char>
```

Return Type

Boolean

Default 1

Preset 1

Save or Recall Yes

SENS<cnum>:CONTrol:DIO<id>[:STATe] <char>, <bool>

Applicable Models: E5080B

(Read-Write) Set and read the control function state for each channel. If ON, DUT control signals will be sent before the beginning of the sweep or after the end of the sweep. If OFF, then DUT signals will not be changed.

Parameters

<cnm> Channel number.

<id> DIO number, 1 or 2

<char> Character - when to send remote commands. Choose from:

AFTER - After the channel sweep ends.

BEFORE - Before the channel sweep starts.

<bool> Function enable or disable control.

Choose from: ON or OFF

Examples

```
SENS:CONT:DI01 AFT, ON
sense2:control:di01? after
```

Query Syntax

```
:SENSe<cnum>:CONTrol:DIO<id>[:STATe]? <char>
```

Return Type

Boolean (1= ON, 0= OFF)

Default OFF
SENSe<cnum>:CONTrol:DIO<id>:VIO[:STATe] <char>, <bool>

Applicable Models: E5080B

(Read-Write) Set and read the VIO function state for each channel. If ON, then VIO's voltage is set to the value which is determined by SENSe:CONTrol:DIO:LEVel before the beginning of the sweep or after the end of the sweep. If OFF, the VIO's voltage is disabled.

Parameters
<cnun> Channel number.
{id> DIO number, 1 or 2
<char> Character - when to send remote commands. Choose from:

**AFTer** - After the channel sweep ends.

**BEFore** - Before the channel sweep starts.

<bool> Function enable or disable control.

Choose from: **ON** or **OFF**

Examples

```
SENSe:CONT:DIO1:VIO AFT, OFF
sense2:control:dio1:vio? after
```

Query Syntax

:SENSe<cnum>:CONTrol:DIO<id>:VIO[:STATe]? <char>

Return Type

Boolean (1 = ON, 0 = OFF)

Default

ON

SENSe<cnum>:CONT:DI<id>:LEVel <char>, <num>

Applicable Models: E5080B

(Read-Write) Specifies IO level of the DUT Control DIO1 or DIO2's 8-bit IO. The value of AFTer is overwritten by the one of BEFore and vice versa due to set the same value to both AFTer and BEFore.

Parameters

<cnun> Channel number.

{id> DIO number, 1 or 2
<char> Character - when to send remote commands. Choose from:

**AFTer** - After the channel sweep ends.

**BEFore** - Before the channel sweep starts.

4008
IO level in volt. Value range, 0.9 to 3.5, step 0.05.

Examples

SENS:CONT:DIO1:VIO AFT, OFF
sense2:control:dio1:vio? after

Query Syntax

:SENS<cnm>:CONTrol:DIO<id>:LEVel? <char>

Return Type

Numeric

Default

1.2

Note: The default value definition comes from MIPI RFFE standard. Referring to the VIO Supply Pin Requirements, 1.2V is the minimum typical voltage value of the definition.

SENSe<cnm>:CONTrol:DIO<id>:IMMediate <char>

Applicable Models: E5080B

(Write only) Specifies parameter set of DUT Control function for each channel. And, fetch E5080B Hardware status values (PIO input state, RFFE read command results) and stores the values in Firmware variables. If executed, the DUT signals will be sent immediately. It doesn't matter if Enable DUT Control is ON or OFF.

Parameters

<cnm> Channel number.
<br> <id> DIO number, 1 or 2
<br> <char> Character - when to send remote commands. Choose from:
<br> AFTer - After the channel sweep ends.
<br> BEF ore - Before the channel sweep starts.

Examples

SENS:CONT:DIO1:IMM BEF

Query Syntax

Not applicable

Default

Not applicable

SENSe<cnm>:CONTrol:DIO<id>:IOTYpe<iogroup> <char>, <enum>
Applicable Models: E5080B

(Read-Write) Specifies IO function type of the 8-bit IO pin, for each IO group. IO group1 is IO pin 1 and 2, group2 is pin 3 and 4, group3 is pin 5 and 6, group4 is pin 7 and 8.

Parameters

- `<cnum>` Channel number.
- `<id>` DIO number, 1 or 2
- `<iogroup>` IO group number. Value range, 1 to 4.
- `<char>` Character - when to send remote commands. Choose from:
  - `AFTER` - After the channel sweep ends.
  - `BEFORE` - Before the channel sweep starts.
- `<enum>` Set the IO function for the IO group. Choose from: `PARallel` or `RFFE`

Examples

```
SENS:CONT:DIO1:IOTY AFT, RFFE
sense2:control:dio1:ioty1? after
```

Query Syntax

`:SENSe<cnum>:CONTrol:DIO<id>:PIO<iopin>:TYPE <char>, <enum>`

Return Type

Character

Default

`PARallel`

SENS<cnue>:CONT<id>:PIO<iopin>:TYPE <char>, <enum>

Applicable Models: E5080B

(Read-Write) Set or read the signal direction type of Parallel IO, for each IO pin.. This setting is valid when the IO pin function is selected as parallel IO.

Parameters

- `<cnum>` Channel number.
- `<id>` DIO number, 1 or 2
- `<iopin>` IO pin number.
- `<char>` Character - when to send remote commands. Choose from:
  - `AFTER` - After the channel sweep ends.
  - `BEFORE` - Before the channel sweep starts.
- `<enum>` IO direction. Choose from: `IN` or `OUT`
Examples

SENS:CONT:DIO1:PIO:TYPE AFT, IN
sense2:control:dio1:pio2:type? after

Query Syntax

Return Type
Character

Default
OUT

SENSe<cnum>:CONTrol:DIO<id>:PIO<iopin>:LEVel <char>, <enum>

Applicable Models: E5080B

(Read-Write) Set or read the signal level of IO pin, high or low. This setting is valid when the IO pin function is selected as parallel IO. If the IO type is IN, this command shall be a read-only command. Write command will cause error.

Parameters

<cnum> Channel number.
<id> DIO number, 1 or 2
<iopin> IO pin number.
<char> Character - when to send remote commands. Choose from:

AFTER - After the channel sweep ends.

BEFORE - Before the channel sweep starts.

<enum> Signal level. Choose from: HIGH or LOW

Examples

SENS:CONT:DIO1:PIO:LEV AFT, HIGH
sense2:control:dio1:pio7:level? after

Query Syntax
:SENSe<cnum>:CONTrol:DIO<id>:PIO<iopin>:LEVel? <char>

Return Type
Character

Default
LOW

SENSe<cnum>:CONTrol:DIO<id>:RFFE:CLOCk <char>, <num>
**Applicable Models:** E5080B

*(Read-Write)* Set or read the RFFE clock rate.

**Parameters**

- `<cnum>` Channel number.
- `<id>` DIO number, 1 or 2
- `<char>` Character - when to send remote commands. Choose from:
  - **AFTer** - After the channel sweep ends.
  - **BEFore** - Before the channel sweep starts.
- `<num>` Clock rate in Hz. Value range, 25kHz to 25000kHz. Possible values are \((50000/n) \text{ kHz}\), with integer \(n\), 2000 to 2.

**Examples**

```
SENS:CONT:DIO1:RFFE:CLOC AFT, 25000
sense2:control:dio1:rffe:clock? after
```

**Query Syntax**

```
:SENSe<cnum>:CONTrol:DIO<id>:RFFE:CLOCk? <char>
```

**Return Type** Numeric

**Default** 50000

Note: The default value is the minimum integer value of clock rate, which meets the RFFE standard frequency range.

---

**SENSe<cnum>:CONTrol:DIO<id>:RFFE<rftech>:CSEQUence<csnum>:SADDress <char>, <num>**

**Applicable Models:** E5080B

*(Read-Write)* Set or read the secondary address (“SA” in GUI) for the specified command sequence.

**Parameters**

- `<cnum>` Channel number.
- `<id>` DIO number, 1 or 2
- `<rftech>` RFFE channel number. 1 to 4.
- `<csnum>` RFFE command sequence number. 1 to 16.
Character - when to send remote commands. Choose from:

**AFTer** - After the channel sweep ends.

**BEFore** - Before the channel sweep starts.

DUT RFFE secondary address. 0 to 15.

Examples

<table>
<thead>
<tr>
<th>Query</th>
<th>Syntax</th>
</tr>
</thead>
</table>

**Query Syntax**

**Return Type**

Numeric

**Default**

0

SENSe<ncnum>:CONT<cid>:DIO<rid>:RFFE<rffech>:CSEQ<csnum>:TYPE <char>, <enum>

**Applicable Models:** E5080B

*(Read-Write)* Set or read the command sequence type for the specified command sequence.

**Parameters**

- `<ncnum>` Channel number.
- `<id>` DIO number, 1 or 2
- `<rffech>` RFFE channel number. 1 to 4.
- `<csnum>` RFFE command sequence number. 1 to 16.
- `<char>` Character - when to send remote commands. Choose from:
  
  **AFTer** - After the channel sweep ends.

  **BEFore** - Before the channel sweep starts.

- `<enum>` RFFE command sequence type. Choose from:
  
  **R 0WRite** : Register 0 Write
  
  **RREad** : Register Read
  
  **RWRite** : Register Write
  
  **ERRead** : Extended Register Read
  
  **ERWRite** : Extended Register Write
Example:
```
SENS:CONT:DIO1:RFFE:CSEQ:TYPE AFT, R0WR
sense2:control:dio1:rffe1:csequence2:type? after
```

**Query Syntax:**
```
```

**Return Type:** Character

**Default:** RREad

---

SENSe<cnum>:CONTrol:DIO<id>:RFFE<rffech>:CSEQuence<csnum>:BCOunt <char>, <num>

**Applicable Models:** E5080B

(Read-Write) Set and read the byte count for the specified command sequence.

**Parameters**
- `<cnum>` Channel number.
- `<id>` DIO number, 1 or 2
- `<rffech>` RFFE channel number. 1 to 4.
- `<csnum>` RFFE command sequence number. 1 to 16.
- `<char>` Character - when to send remote commands. Choose from:
  - **AFTER** - After the channel sweep ends.
  - **BEFORE** - Before the channel sweep starts.
- `<num>` Byte Count value. Integer value. The value range is coupled with command sequence type setting.

</table>

**Examples**
```
SENS:CONT:DIO1:RFFE:CSEQ:BCO AFT, 4
```

Query Syntax
SENS<ch>:CONTro:DI<id>:RFFE<rfe>:CSEQ<cs>:BCOunt?
<ch>

Return Type Numeric
Default 1

SENS<ch>:CONTro:DI<id>:RFFE<rfe>:CSEQ<cs>:ADDRes<char>, <num>

Applicable Models: E5080B

(Read-Write) Set and read the address value for the specified command sequence.

Parameters
<ch> Channel number.
<id> DIO number, 1 or 2
<rfe> RFFE channel number. 1 to 4.
<cs> RFFE command sequence number. 1 to 16.
<char> Character - when to send remote commands. Choose from:
    AFTER - After the channel sweep ends.
    BEFORE - Before the channel sweep starts.
<num> Address value. Integer value. The value range is coupled with command sequence type setting.

<table>

Examples
SEN:CONT:DI01:RFFE:CSEQ:ADD AFT, 4
sense2:control:diol:rffe1:csequence2:address? after

Query Syntax
SENS<ch>:CONTro:DI<id>:RFFE<rfe>:CSEQ<cs>:ADDRes<char>
SETSe<cnum>:CONTol:DIO<id>:RFFE<rffech>:CSEQ<csnum>:[:WRITe]:DATA <char>, <data>

**Applicable Models:** E5080B

*(Read-Write)* Set and read the data values for the specified command sequence.

This command works if the command sequence type is “Register 0 Write” or “Register Write” or “Extended Register Write”. If the command sequence type is “Register Read” or ”Extended Register Read”, this command will cause error.

**Parameters**

- `<cnum>`: Channel number.
- `<id>`: DIO number, 1 or 2
- `<rffech>`: RFFE channel number. 1 to 4.
- `<csnum>`: RFFE command sequence number. 1 to 16.
- `<char>`: Character - when to send remote commands. Choose from:
  - **AFTer** - After the channel sweep ends.
  - **BEFore** - Before the channel sweep starts.
- `<data>`: Comma separated list of data values. The value length is coupled with byte count setting. If data list length does not match with byte count setting, write command will cause error.

**Examples**

```
SENS:CONT:DI1:RFFE:CSEQ:WRIT:DATA AFT, 10
```

**Query Syntax**

```
```

**Return Type**

- Numeric
- **Default** 0

```
```
Applicable Models: E5080B

**(Read only)** Read the data and parity value pairs from DUT for the specified command sequence.

**Parameters**

- `<cnum>` Channel number.
- `<id>` DIO number, 1 or 2
- `<rffech>` RFFE channel number. 1 to 4.
- `<csnum>` RFFE command sequence number. 1 to 16.
- `<char>` Character - when to send remote commands. Choose from:
  - **AFTER** - After the channel sweep ends.
  - **BEFORE** - Before the channel sweep starts.

**Examples**

```
```

**Query Syntax**

- Comma separated numeric values, list of data and parity pairs.
- Ex. Byte count is 3 case, return values are below:
  - `[data#1],[parity#1],[data#2],[parity#2],[data#3],[parity#3]`

**Default** Not applicable

---

**SENS<cnum>:CONTrol:DIO<id>:RFFE<rffech>:CSEQuence:coun**

**Applicable Models: E5080B**

**(Read-Write)** Set and read the RFFE Command Sequence count. If user set the larger value than previously set, new RFFE Command Sequences will be added with default parameter value.

**Parameters**

- `<cnum>` Channel number.
- `<id>` DIO number
- `<rffech>` RFFE channel number. 1 to 4.
Character - when to send remote commands. Choose from:

**AFTER** - After the channel sweep ends.

**BEFORE** - Before the channel sweep starts.

**Examples**

```
SENS:CONT:DI01:RFFE:CSEQ:COUN AFT
```

**Query Syntax**

```
:SENSe<cnum>:CONTrol:DI0<id>:RFFE<rffe>:CSEQunce:COUNt?<char>
```

**Return Type**

Numeric

**Default**

0

---

**SENSe<cnum>:CONTrol:MACR:o[:STATe] <char>, <bool>**

**Applicable Models:** E5080B, N522xB, N523xB, N524xB

(Read-Write) Enables or disables software interface controls.

**Parameters**

- `<cnum>` Channel number.
- `<char>` Character - when to send remote commands. Choose from:
  - **AFTER** - After the channel sweep ends.
  - **BEFORE** - Before the channel sweep starts.
- `<bool>` **ON** or 1 - Turns software interface control ON.
  - **OFF** or 0 - Turns software interface control OFF.

**Examples**

```
SENS:CONT:MACR AFT, ON
sense2:control:macro? after
```

**Query Syntax**

```
:SENSe<cnum>:CONTrol:MACR:o[:STATe]? <char>
```

**Return Type**

Boolean

**Default**

OFF

---

**SENSe<cnum>:CONTrol:MACR:o:COMMand <char>, <cmdList>**
**Applicable Models:** E5080B, N522xB, N523xB, N524xB

*(Read-Write)* Set and read SCPI commands with target GPIB addresses (numbers) or VISA addresses. The specified SCPI commands are sent to the target instruments before the first trace on the channel begins sweeping. It is the end user’s responsibility to use this command.

**Parameters**

- `<cnum>` Channel number.
- `<char>` Character - when to send remote commands. Choose from:
  - **AFTer** - After the channel sweep ends.
  - **BEFore** - Before the channel sweep starts.
- `<cmdList>` The string of “\n” separates a pair of GPIB/VISA addresses and SCPI commands, and the string of “ ” separates GPIB/VISA address and SCPI in the following format;

  “address1 command1\naddress2 command2\n …”

**Examples**

- `SENS:CONT:MACR:COMM AFT`
- `sense2:control:macro? after`

**Query Syntax**

`:SENSe<cnum>:CONTro:MACRo:COMMand? <char>`

**Return Type**

String of comma-separated GPIB/VISA addresses and SCPI commands

**Default**

" "

**SENSe<cnum>:CONTro:MACRo:FILE:PATH <char>, <path>**

**Applicable Models:** E5080B, N522xB, N523xB, N524xB

*(Read-Write)* Set and read a file path to a macro. The macro is executed before the first trace on the channel begins sweeping. It is the end user’s responsibility to use this command. It’s needed to check the check box of “Enable Drive Access” in the SCPI dialog to execute the actual macro file.

**Parameters**

- `<cnum>` Channel number.
- `<char>` Character - when to send remote commands. Choose from:
  - **AFTer** - After the channel sweep ends.
  - **BEFore** - Before the channel sweep starts.
<path> Command line strings

Examples

SENSe:CONT:MACR:FILE:PATH AFT, "cscript D:\temp\test.vbs"

sense2:control:file:path? after

Query Syntax

:SENSe<cnum>:CONTrol:MACRo:FILE:PATH? <char>

Return Type

String

Default

" "

SENSe<cnum>:CONTrol:MACRo:FILE:ARGuments <char>, <arg>

Applicable Models: E5080B, N522xB, N523xB, N524xB

(Read-Write) Set and read arguments for a macro. The macro is executed before the first trace on the channel begins sweeping. It is the end user’s responsibility to use this command. It’s needed to check the check box of “Enable Drive Access” in the SCPI dialog to execute the actual macro file.

Parameters

<cnun> Channel number.

<char> Character - when to send remote commands. Choose from:

AFTer - After the channel sweep ends.

BEFore - Before the channel sweep starts.

<arg> Arguments for a macro

Examples

SENSe:CONT:MACR:FILE:ARG AFT, "localhost"

sense2:control:file? after

Query Syntax

Return Type

String

Default

" "

4020
Sense:Correction Commands

Performs and applies calibration and other error correction features.

- To perform a Guided Calibration, use ONLY the Sens:Corr Coll:GUIDed commands.
- To perform an Unguided Calibration, do NOT use the Sens:Corr:Coll:Guided commands.
- See the "Unguided" example programs for clarification.

```

      | THRU:ADAPpter:DEEMbed:[STATe]
```
SENSe<cnum>:CORRection:CACHE:MODE <num>
Applicable Models: All

(Read-Write) Set this mode at ON for SNP file fast saving. This must be enabled before the SNP data is acquired by CALC:MEAS:DATA:SNP:PORTS:SAVE or CALC:DATA:SNP:PORTS:SAVE. This value is channel specific. If the channel does not exist, the default value is returned (1).

Parameters

- `<cnum>` Any existing channel number. If unspecified, value is set to 1.
- `<num>`
  - 0: Never correct all results.
  - 1: Always correct all results.
  - 2: Correct all results when correction is a full 2P and greater.
  - 3: Correct all results when correction is a full 4P and greater.
  - N: Correct all results when correction is a full NP and greater.

Examples

```
SENS2:CORR:CACHE:MODE 2  'any value > 0 and < 9 will work for this example
SENS:SWE:MODE SING;*OPC?
CALC:MEAS1:DATA:SNP:PORTS:SAVE

```

Query Syntax

SENSe:CORRection:CACHe:MODE?

Return Type

Numeric

Default

1 (Preset does not affect the setting.)

SENSe<cnum>:CORRection:CCheck[:ACQuire] <mod>[,.char]
Applicable Models: All

(Write-only) Reads the 'confidence data' associated with the specified ECal module and puts it into memory. The measurement is selected using `SENS:CORR:CCH:PAR`. This command is compatible with *OPC.

**Note:** A confidence check can NOT be performed remotely from User Characterizations that are stored on the VNA disk.

**Parameters**

- `<cnum>` Any existing channel number. If unspecified, value is set to 1.
- `<mod>` ECal Module that contains the confidence data. Choose from:
  - **ECAL1**
  - ..through..
  - **ECAL50**

- `[char]` Optional argument. Specifies which characterization within the ECal module that the confidence data will be read from.
  - **CHAR0** Factory characterization (data that was stored in the ECal module by Keysight). Default if not specified.
  - **CHAR1** User characterization #1
  - **CHAR2** User characterization #2
  - ...and so forth up to:
  - **CHAR12** User characterization #12

**Examples**

- `SENS:CORR:CCH:acquire ecal1,char1`

**Query Syntax**

- Not applicable

**Default**

Not applicable

---

`SENSe<cnum>:CORR:CCHeck:DONE`
Applicable Models: All

(Write-only) Concludes the Confidence Check and sets the ECal module back into the idle state.

Parameters

- `<cnum>` Any existing channel number. If unspecified, value is set to 1

Examples

- `SENS:CORR:CCH:DONE`
- `sense2:correction:ccheck:done`

Query Syntax

- Not applicable

Default

- Not applicable

SENSe<cnum>:CORRection:CCHeck:PARameter <Mname>

Applicable Models: All

(Read-Write) Specifies an existing measurement to be used for the Confidence Check.

**Note:** A confidence check can NOT be performed remotely from User Characterizations that are stored on the VNA disk.

Parameters

- `<cnum>` Any existing channel number. If unspecified, value is set to 1
- `<Mname>` Name of the measurement you are selecting for the confidence check. The measurement must already exist.

Examples

- `SENS:CORR:CCH:PAR 'TEST'`
  'selects the measurement "test" on channel 1 for the confidence check'
- `sense2:correction:ccheck:parameter 'test'`
  'selects the measurement "test" on channel 2 for the confidence check'

Query Syntax

- `SENSe<cnum>:CORRection:CCHeck:PARameter?`

  Returns the name of the selected measurement on channel `<cnum>`.

Return Type

- String

Default

- Not applicable

SENSe<cnum>:CORRection:COLLect[:ACQuire] <class>[,subclass][,sync]
Applicable Models: All

(Write-only) For UNGUIDED calibration, measures the specified standards from the selected calibration kit. The calibration kit is selected using the Sense:Correction:Collect:CKIT command.

For using two sets of standards, see SENS:CORR:TST.

Note: Before using this command you must select two items:
1. Select a calibration method using SENS:CORR:COLL:METH
2. Select a measurement using CALCulate:MEASure:DEFine. You can select one measurement for each channel.

Parameters

- `<cnum>` Any existing channel number. If unspecified, value is set to 1
- `<class>` Measures the standards associated with these class labels. Choose from:

<table>
<thead>
<tr>
<th>Label</th>
<th>SOLT (Forward)</th>
<th>SOLT (Reverse)</th>
<th>TRL</th>

ECAL1 through ECAL modules

ECAL50 RESPONSE Same as Normalize selection in Unguided Cal. (subclass is ignored)
POWER Take a receiver power cal sweep and turn correction ON
SLSET Sets 'sliding load type', and increments the "number of slides" count. The total number of slides is critical to the correct calculation of the sliding load algorithm. See a sliding load cal example.
SLDONE Computes the sliding load using a circle fit algorithm.

[subclass] Optional argument. For mechanical calibration kits, choose from the following to specify the standard to be acquired from the SENS:CORR:COLL:CKIT:ORDer list. If not specified, subclass is set to SST1.
If an ECAL module (1 through 8) is specified for `<class>`, choose one of the following for specifying which characterization within the ECAL module will be used for the acquire. If not specified, the default is **CHAR0**.

**CHAR0** Factory characterization (data that was stored in the ECAL module by Keysight)

**CHAR1** User characterization #1

**CHAR2** User characterization #2

...and so forth up to:

**CHAR12** User characterization #12

[asynchronous] Optional argument. Choose from:

**SYNchronous** - blocks SCPI commands during standard measurement (default behavior)

**ASYNchronous** - does NOT block SCPI commands during standard measurement.

Learn more about this argument

**Examples**

```plaintext
SENS:CORR:COLL STAN1

'If SENS:CORR:COLL:CKIT:ORDer2 5,3,7 was specified, the following command measures standard 3 (the second in the order list)
sense1:correction:collect:acquire stan3,sst2

SENS:CORR:COLL ECAL4,ASYN; *OPC?
sense2:correction:collect:acquire ecal2,char1
```

**Query Syntax** Not applicable

**Default** Not applicable
SENSe<cnum>:CORRection:COLLect:APPLy

Applicable Models: All

(Write-only) Applies error terms to the measurement that is selected using CALCulate:MEASure:PARameter.

**Note:** Before using this command you must select a measurement using CALCulate:MEASure:DEFine. You can select one measurement for each channel.

**Note:** This command is only necessary if you need to modify error terms. If you do not need to modify error terms, SENSe<cnum>:CORRection:COLLect:SAVE calculates and then automatically applies error terms after you use SENS:CORR:COLL:ACQuire to measure cal standards.

**Parameters**

- `<cnum>` Any existing channel number. If unspecified, value is set to 1

**Example**

1. CALCulate2:PARameter:SELect S21_2 'select the measurement to apply terms to
2. SENSe2:CORRection:COLLect:METHod SPARSOLT 'set type of cal method.
3. CALCulate2:DATA? SCORR1 'download the error term of interest
4. 'Modify the error term here
5. CALCulate2:DATA SCORR1 'upload the error term of interest
6. SENSe2:CORRection:COLLect:APPLy 'applies the error terms to the measurement

<th>Command</th>
<th>Example</th>
</tr>
</thead>
</table>

See an example using this command.

Query Syntax Not Applicable

Default Not Applicable

SENSe:CORRection:COLLect:DISPlay:WINDow<wNum>[:STATe] <bool>

Applicable Models: All

(Write-only) Set the 'show' state of the window to be displayed during a calibration to view the measurements/channels. Learn more.

When this command is sent, the specified window is 'flagged' to be shown during calibration. The flag is cleared when the window is closed. A Preset or Instrument State Recall also closes the window. If the same window number is reopened, this command must be sent again to show the window during a calibration. The flag is NOT saved with an instrument state.

Send this command for each additional window to show during a calibration.

Parameters

<wNum> Window number to show during a calibration. The calibration window will also be shown with this window.

The window must already be created.

Use DISPlay:CATalog? to read all existing window numbers.

<bool> Window state. Choose from:

ON (or 1) - Show the specified window during calibration.

OFF (or 0) - Do NOT show the specified window during calibration.

SENSe:CORRection:COLLect:IDLE:TRIGger \<bool>\n
**Applicable Models:** All

*(Read-Write)* This command enables/disables asynchronous sweeping during a calibration acquisition.

**Parameters**

\<bool> Choose from:

- **ON** (or 1) - Enable asynchronous sweeping during a calibration acquisition (the default legacy behavior).
- **OFF** (or 0) - Disable asynchronous sweeping during a calibration acquisition.

**Examples**

SENS:CORR:COLL:IDLE:TRIG 1

**Query Syntax**

SENSe:CORRection:COLLect:IDLE:TRIGger?

**Return Type**

Boolean (1 = ON, 0 = OFF)

**Default**

ON

---

SENS:CORRection:COLLect:ISOLation:AVERage:INCRement \<num>\n
**Applicable Models:** All

*(Read-Write)* Specifies amount to increment (increase) the channel averaging factor during isolation measurement of the ECal module during an unguided ECal calibration.

**Note:** if the channel currently has averaging turned OFF and \<num> is greater than 1, averaging will be turned ON only during the isolation measurements and with the averaging factor equal to \<num>.

**Parameters**

\<num> Incremental Averaging factor. The maximum averaging factor is 65536 (2^16).

**Examples**

SENS:CORR:COLL:ISOL:AVER:INCR 16

sense:correction:collect:isolation:average:increment 0

**Query Syntax**

SENSe:CORRection:COLLect:ISOLation:AVERage:INCRement?

**Return Type**

Numeric
SENSe<cnum>:CORRection:COLLect:ISOLation:ECAL[:STATe] <bool>

**Applicable Models:** All

(Read-Write) Specifies whether or not the isolation state of the ECal module will be measured as part of an unguided ECal calibration.

An unguided calibration is performed using the SENS:CORR:COLL:METH and SENS:CORR:COLL:ACQ commands.

**Note:** The inherent isolation of the VNA is better than that attained with this command. ONLY use this command when using an external test set, and ONLY using a 8509x ECal module.

**Parameters**

- `<cnum>` Any existing channel number. If unspecified, value is set to 1
- `<bool>` ON (or 1) - isolation is measured during the unguided ECal calibration.
  - OFF (or 0) isolation is NOT measured during the unguided ECal calibration.

**Examples**

```plaintext
SENS1:CORR:COLL:ISOL:ECAL ON
sense2:correction:collect:isolation:ecal:state 0
```

**Query Syntax**

SENSe:CORRection:COLLect:ISOLation:ECAL:STATe?

**Return Type**

Boolean (1 = ON, 0 = OFF)

**Default**

OFF

---

SENSe<cnum>:CORRRection:COLLect:METHod <char>

**Applicable Models:** All

(Read-Write) For UNGUIDED calibration, sets the calibration method (also known as 'Calibration Type' on calibration dialog box.) To select a Cal Type from a Cal Set, use CALC:MEAS:CORR:TYPE.

**Note:** Before using this command you must select a measurement using CALCulate:PARameter:SELect. You can select one measurement for each channel.

**Parameters**

- `<cnum>` Any existing channel number. If unspecified, value is set to 1
- `<char>` Choose from:
<table>
<thead>

**Applicable Models:** M9485A

*(Read-Write)*: Specify the ports allowed to participate in a multiport calibration.

**Parameters**

- `<cnum>`: Any existing channel number. If unspecified, value is set to 1
- `<port numbers>`: comma separated list of ports
Calset is 16 port VNA with a 16 port calibration.
Full 3Port (1,2,3) error correction on ports 1,2,3
All other port parameters are uncorrected.

Query Syntax
Return Type Character
Default Not Applicable

SENSe<cnum>:CORRection:COLLect:METHod:PORT:SUBS:RESet
Applicable Models: M9485A
(Write Only): Reset the full and response list of the port subset correction.

Parameters
<cnum> Any existing channel number. If unspecified, value is set to 1

Query Syntax Not Applicable
Return Type Not Applicable
Default Not Applicable

Applicable Models: M9485A
(Read-Write): Specify the ports that can be corrected using lesser corrections (enhanced response). This list is not allowed to overlap with the full multiport calibration list specified by :SENS:CORR:COLL:METH:PORT:FULL:VAL.

Parameters
<cnum> Any existing channel number. If unspecified, value is set to 1
<port numbers> comma separated list of ports
Examples

Calset: 16 port VNA with a 16 port calibration

Example 1
SENS:CORR:METH:PORT:SUBS:FULL:VAL 1,2,3,4,5,6
SENS:CORR:METH:PORT:SUBS:RESP:VAL 7,8,
Full 6 Port on ports 1 to 6
Enhanced Response for parameters involving ports 7 and 8
No correction for ports 9 to 16

Example 2
SENS:CORR:METH:PORT:SUBS:FULL:VAL 0
SENS:CORR:METH:PORT:SUBS:RESP:VAL 1,2,3,4,5,6,7,8,9,10,11,12,13,14,15,16
All parameters are enhance response corrected

**Return Type** Boolean

**Default** O - OFF

---

SENSe<cnum>:CORRection:COLLect:SAVE

**Applicable Models:** All

*(Write-only)* For UNGUIDED calibrations ONLY. This command does the following:

- calculates the error terms using the selected :METHod
- applies the error terms to the selected measurement (turns error correction ON.)
- saves the calibration error-terms to the channels Cal Register or a User Cal Set.

The Cal Register or User Cal Set is determined by the setting of the

Do NOT use this command during an ECAL. When performing an ECAL calibration using `SENSe:CORR:COLL:ACQuire`, this SAVE operation is performed automatically before the completion of a successful ACQuire.
Before using this command you must select a measurement using `CALCulate:MEASure:PARameter`. You can select one measurement for each channel.

**Parameters**

- `<cnum>`
  - Any existing channel number. If unspecified, value is set to 1

**Examples**

- `SENS:CORR:COLL:SAVE`
- `sense2:correction:collect:save`

**Query Syntax**

Not applicable

**Default**

Not applicable

---

**SENSe:CORRection:COLLect:SWEep:CHANnel:AOFF**

**Applicable Models:** All

(Write-only) Clears ALL flags for channels to sweep during calibration. To flag a channel, see `SENS:CORR:COLL:SWE:CHAN`.

**Examples**

- `SENS:CORR:COLL:SWE:CHAN:AOFF`
- `sense:correction:collect:sweep:channel:aoff`

**Default**

Not applicable

---

**SENSe<cnum>:CORRection:COLLect:SWEep:CHANnel<enum2>[:STATE] <bool>**

**Applicable Models:** All

(Write-only) Specifies an alternate channel (other than the calibration channel) to be viewed while using the calibration wizard.

When this command is sent, the `<cnum2>` channel is 'flagged' to be swept during calibration.

The flag is cleared when the channel is deleted, if the Measurement Class is changed, or if all measurements are deleted from the channel.

If the same channel number is recreated, this command must be sent again to sweep the channel during a calibration. The flag is NOT saved with an instrument state.

A Preset or Instrument State Recall deletes the channel.

**Note:** This command is intended to be used in conjunction with the interactive calibration wizard.

**Parameters**
The channel to be calibrated. If unspecified, value is set to 1.

The channel to sweep when waiting to measure a standard.

This channel must already exist with at least one measurement in the channel. If this channel is in continuous sweep mode, it must have the same attenuator settings and path configuration (PNA-X only).

Channel sweep state. Choose from:

ON (or 1) - Sweep the channel during calibration.

OFF (or 0) - Do NOT sweep the channel during calibration.

Examples

```
SENSe:CORRection:COLL:SWE:CHAN2 1
sense2:correction:collect:sweep:channel3:state off
```

See an example using this command.

SENSe<ch>:CORRection:INTerpolate[:STATe] <ON | OFF>
Applicable Models: All

(Read-Write) Turns correction interpolation ON or OFF.

Note: Before using this command you must select a measurement using CALC:PAR:SEL. You can select one measurement for each channel.

Parameters

- `<ch>`: Any existing channel number. If unspecified, value is set to 1.
- `<ON | OFF>`: 
  - ON (or 1) - turns interpolation ON.
  - OFF (or 0) - turns interpolation OFF.

Examples

- `SENS:CORR:INT ON`
- `sense2:correction:interpolate:state off`

Query Syntax

- `SENSe<cnum>:CORRection:INTerpolate[:STATe]`?

Return Type

- Boolean (1 = ON, 0 = OFF)

Default

ON

SENSe<ch>:CORRection:ISOLation[:STATe] <ON | OFF> OBSOLETE

This command no longer works beginning in the VNA 5.2 release. The set and query of this command will NOT return an error.

To perform isolation as part of an unguided calibration, you must explicitly measure the isolation standard using `SENS:CORR:COLL:ACQ Stan5`.

To measure isolation as part of an ECal, use `SENS:CORR:COLL:ISOL:ECAL`.

(Read-Write) Turns isolation cal ON or OFF during Full 2-port calibration. If this command is not sent, the default state is to disable Isolation.

Parameters

- `<ch>`: Any existing channel number. If unspecified, value is set to 1.
- `<ON | OFF>`: 
  - ON (or 1) - turns isolation ON.
  - OFF (or 0) - turns isolation OFF.

Examples

- `SENS:CORR:ISOL ON`
- `sense2:correction:isolation:state off`

Query Syntax

- `SENSe<cnum>:CORRection:ISOLation[:STATe]`?

Return Type

- Boolean (1 = ON, 0 = OFF)
**SENSe<ch>:CORRection:METHods:MATCh <bool>**

**Applicable Models:** All

*(Read-Write)* Turns match-correction ON or OFF. Use this command AFTER performing an Guided Power Cal. Learn more.

**Parameters**

- `<ch>` Channel number on which Guided Power Cal was performed. If unspecified, value is set to 1.
- `<bool>`
  - **ON** (or 1) - Turns match-correction ON
  - **OFF** (or 0) - Turns match-correction OFF.

**Examples**

```
SENS:CORR:METH:MATC 0
sense2:correction:methods:match off
```

**Query Syntax**

`SENSe<cnum>:CORRection:METHods:MATCh?`

**Return Type**

Boolean (1 = ON, 0 = OFF)

**Default** ON

---

**SENSe<ch>:CORRection:METHods:PORT:SUBSet:FULL[:VALue] <port numbers>**

**Applicable Models:** All

*(Read-Write)* Sets and returns the selected ports to include in a full NPort correction. If other ports are selected using the `SENSe:CORRection:METHods:PORT:SUBSet:RESPonse[:VALue]` command, they will be corrected with enhanced response calibration. Ports not selected using the `SENSe:CORRection:METHods:PORT:SUBSet:FULL[:VALue]` or `SENSe:CORRection:METHods:PORT:SUBSet:RESPonse[:VALue]` command are uncorrected. Learn more.

The default is all ports are selected for a full NPort correction. To assign a port to be corrected with enhanced response calibration using the `SENSe:CORRection:METHods:PORT:SUBSet:RESPonse[:VALue]` command, they first have to be removed from the full NPort correction list. Ports can be removed from the full NPort correction list by setting a new list that excludes the ports to be corrected with enhanced response calibration.

For information about port sub-setting, refer to Port Sub-Setting Examples.

**Note:** The `SENSe:CORRection:METHods:PORT:SUBSet[:STATe]` must be set to ON to enable the full
command.

**Parameters**

- `<ch>` Channel number.
- `<port numbers>` Comma separated list of ports to include in the full correction. The default is all ports selected.

**Examples**

16-port VNA with an active 16-port calibration

```plaintext
SENS:CORR:METH:PORT:SUBS:STAT 1
SENS:CORR:METH:PORT:SUBS:FULL:VAL 1,2,3
sense2:correction:methods:port:subset:full:value 1,2,3

Result: Full correction on ports 1, 2, and 3
All other port parameters are uncorrected
```

**Query Syntax**

`SENSe<ch>:CORRection:METHods:PORT:SUBSet:FULL[:VALue]?`

**Return Type**

Array_int

**Default**

All ports included

---

**SENSe<ch>:CORRection:METHods:PORT:SUBSet:RESSet**

**Applicable Models:** All

(Write) Resets the full and response list to their default values. Learn more.

For information about port sub-setting, refer to Port Sub-Setting Examples.

**Parameters**

- `<ch>` Channel number.

**Examples**

```plaintext
SENS:CORR:METH:PORT:SUBS:RES
sense2:correction:methods:port:subset:reset
```

**Return Type**

Not applicable

**Default**

Not applicable

---

**SENSe<ch>:CORRection:METHods:PORT:SUBSet:RESPonse[:VALue] <port numbers>**

**Applicable Models:** All

(Read-Write) Sets and returns the selected ports to be corrected with enhanced response calibration. If other ports are selected using the `SENSe:CORRection:METHods:PORT:SUBSet:FULL[:VALue]` command, they will be corrected in a full NPort correction. Ports not selected using the `SENSe:CORRection:METHods:PORT:SUBSet:RESPonse[:VALue]` or

To assign a ports to be corrected with enhanced response calibration ensure that they are not selected for the full NPort correction list. Ports can be removed from the full NPort correction list by setting a new list that excludes the ports to be corrected with enhanced response calibration.

For information about port sub-setting, refer to Port Sub-Setting Examples.

**Note:** The SENSe:CORRection:METHods:PORT:SUBSet[:STATe] must be set to ON to enable the response command.

**Parameters**

- `<ch>` Channel number.
- `<port numbers>` Comma separated list of ports to include for enhanced response correction. The default is no ports selected.

**Examples**

**Example #1:**
16-port VNA with an active 16-port calibration

SENSe:CORR:METH:PORT:SUBS:STAT 1
SENSe:CORR:METH:PORT:SUBS:FULL:VAL 1,2,3,4,5,6
SENSe:CORR:METH:PORT:SUBS:RESP:VAL 7,8

Result: Full correction on ports 1-6
Enhanced response corrected for parameters involving ports 7 and 8
No correction for ports 9-16

**Example #2:**
16-port VNA with an active 16-port calibration

SENSe:CORR:METH:PORT:SUBS:FULL:VAL 0
SENSe:CORR:METH:PORT:SUBS:RESP:VAL 1,2,3,4,5,6,7,8,9,10,11,12,13,14,15,16

Result: Enhanced response correction for parameters involving any ports

**Query Syntax**  SENSe<ch>:CORRection:METHods:PORT:SUBSet:RESPonse[:VALue]?

**Return Type** Array_int

**Default** Empty list

SENSe<ch>:CORRection:METHods:PORT:SUBSet[:STATe] <bool>
Applicable Models: All

(Read-Write) Set and return the ON/OFF subset correction state. Learn more.

For information about port sub-setting, refer to Port Sub-Setting Examples.

Parameters

```

Query Syntax

```
SENSe<cnum>:CORRection:MODel?
```

Return Type

String

Default

TERM10
SENSe:CORRection:PREFerence:CALibration[:FOM]:RANGe <char>

Applicable Models: All

(Read-Write) Specifies the FOM frequency range to use when performing calibration.

Parameters

<char> Choose from:

PRIMary - Used for calibrating at the mmWave frequencies when NOT using a test set. Learn more.

AUTO - All other calibration situations.

Examples

SENSe:CORRection:PREFerence:CALibration[:FOM]:RANGe?

Query Syntax

SENSe:CORRection:PREFerence:CALibration[:FOM]:RANGe AUTO

Default AUTO

SENSe:CORRection:PREFerence:CSET:SAVE <char>

Applicable Models: All

Important Notes:

- This command replaces SENSe:CORRection:PREFerence:CSET:SAVE
- With 6.0 we implemented a change that defaults to saving completed calibrations to Cal Registers instead of User Cal Sets. To revert to the old behavior, send this command with the USER argument.

(Read-Write) Specifies the default manner in which calibrations that are performed using SCPI or COM are to be stored. Cal data is ALWAYS stored to the channel Cal Register regardless of this setting.

This setting survives instrument preset and reboot. It remains until changed by another execution of this command.

Note: Cal Set arguments used with commands such as SENSe:CORRection COLL:GUID:INIT, SENSe:CORRection COLL:GUID:SAVE and SENSe:CORRection COLL:GUID:SAVE:CSET will override any of these default preference settings.

Learn about Cal Registers and User Cal Sets.
### Parameters

**<char> CALRegister** - Each Cal is saved ONLY to the channel Cal Register. If the error terms from a new Cal can co-exist with those in the Cal Register, they are appended.

**USER** - Each Cal is saved to its own new User Cal Set file. The Cal Set name is automatically generated. To change the name, send `SENS:CORR:CSET:NAME` after the cal is complete. This reverts to pre-6.0 behavior.

**REUSE** - The cal is saved to the Cal Set that is currently selected on the specified channel, which could be the channel Cal Register. If the channel does not yet have a selected Cal Set, the cal will be saved to a new User Cal Set with an automatically-generated name. If the error terms from a new Cal can co-exist with those in the Cal Set, they are appended.

### Examples

<table>
<thead>
<tr>
<th>Query Syntax</th>
</tr>
</thead>
<tbody>
<tr>
<td>SENS:CORR:PREF:CSET:SAVE USER</td>
</tr>
<tr>
<td>sense:correction:preference:cset:save reuse</td>
</tr>
</tbody>

### Query Syntax

`SENSe:CORRection:PREFerence:CSET:SAVE?`

### Return Type

Character

### Default

CALRegister

---

**SENSe:CORRection:PREFerence:CSET:SAVUser <bool> Superseded**

**Applicable Models:** N522xB, N523xB, N524xB, M9485A

This command is replaced with `SENS:CORR:PREF:CSET:SAVE`

**NOTE:** With 6.0 we implemented a change that defaults to saving completed calibrations to Cal Registers instead of User Cal Sets. To revert to the old behavior, send this command as ON (1). For UI and COM use, this can be done from the GPIB console.

(Read-Write) Specifies whether cal data is automatically saved to a User Cal Set file after performing a SCPI calibration. Cal data is always saved to a Cal Register regardless of this setting.

This setting survives instrument preset and reboot. It remains until changed by another execution of this command.

Learn about [Cal Registers and User Cal Sets](#).

### Parameters

**<bool> ON or 1** - Cal is automatically saved to a User Cal Set file when performing a SCPI calibration. The Cal Set name is automatically generated. To change the
name, send SENS:CORR:CSET:NAME after the cal is complete. Reverts to pre-6.0 behavior.

**OFF** or **0** - Cal is NOT automatically saved to a User Cal Set. To save a calibration to a User Cal Set, use SENS:CORR:COLL:GUID:INIT.

**Examples**

<table>
<thead>
<tr>
<th>SENS:CORR:PREF:CSET:SAV</th>
<th>1</th>
</tr>
</thead>
<tbody>
<tr>
<td>sense:correction:preference:cset:savuser</td>
<td>0</td>
</tr>
</tbody>
</table>

**Query Syntax**

SENS:CORR:PREF:CSET:SAVUser?

**Return Type**

Boolean (1 = ON, 0 = OFF)

**Default**

OFF (0)

---

**SENS:CORR:PREF:ECAL:ORIentation[:STATe] <ON|OFF>**

**Applicable Models:** All

(Read-Write) Specifies whether or not the VNA should perform orientation of the ECal module during calibration. Orientation is a technique by which the VNA automatically determines which ports of the module are connected to which ports of the VNA. Orientation begins to fail at very low power levels or if there is much attenuation in the path between the VNA and the ECal module. If orientation is turned OFF, the SENS:CORR:PREF:ECAL:PMAP command must be used to specify the port connections before performing a cal.

**Note:** For 3-port or 4-port measurements, when orientation is OFF, you are not allowed to specify how the ECAL module is connected. Instead, the VNA determines the orientation. Use SENS:CORR:COLL:GUID:DESC? to query the orientation. The VNA does not verify that you made the connection properly.

This setting remains until the VNA is restarted or this command is sent again.

**Parameters**

- `<bool>`
  - ECAL orientation state. Choose from:

  **ON** or **1** - VNA performs orientation of the ECal module.

  **OFF** or **0** - VNA does NOT performs orientation of the ECal module.

**Examples**

<table>
<thead>
<tr>
<th>SENS:CORR:PREF:ECAL:ORI</th>
<th>OFF</th>
</tr>
</thead>
<tbody>
<tr>
<td>sense:correction:preference:ecal:orientation:state</td>
<td>on</td>
</tr>
</tbody>
</table>

**Query Syntax**

SENS:CORR:PREF:ECAL:ORIentation[:STATe]?

**Return Type**

Boolean (1 = ON, 0 = OFF)

**Default**

ON (1)
SENSe:CORRection:PREFerence:ECAL:OVERrange[:STATE] <ON|OFF>

Applicable Models: All

(Read-Write) Sets and returns the ECAL over range state.

Parameters

<bool> ECAL over range state. Choose from:

ON or 1 - Enable ECAL over range.

OFF or 0 - Disable ECAL over range.

Examples

SENSe:CORRection:PREFerence:ECAL:OVER range:state on

Query Syntax

SENSe:CORRection:PREFerence:ECAL:OVERrange[:STATE]?

Return Type

Boolean (1 = ON, 0 = OFF)

Default

ON (1)

SENSe:CORRection:PREFerence:ECAL:PMAP <module>,<string>

Applicable Models: All

(Read-Write) When ECal module orientation is turned OFF (SENSe:CORRection:PREFerence:ECAL:ORI), this command specifies the port mapping (which ports of the module are connected to which ports of the VNA) prior to performing ECAl calibrations.

This setting remains until the VNA is restarted or this command is sent again.

Parameters

<module> Specifies which ECAl module this port map is being applied to. Choose from:

ECAL1

...through.

ECAL50

<string> Format this parameter in the following manner:

Aw,Bx,Cy,Dz

where
- A, B, C, and D are literal ports on the ECAL module
- w,x,y, and z are substituted for VNA port numbers to which the ECAL module port is connected.

Ports of the module which are not used are omitted from the string.

For example, on a 4-port ECal module with

- port A connected to VNA port 2
- port B connected to VNA port 3
- port C not connected
- port D connected to VNA port 1

the string would be: A2,B3,D1

If either the receive port or source port (or load port for 2-port cal) of the CALC:PAR:SELelected measurement is not in this string and orientation is OFF, an attempt to perform an ECal calibration will fail.

### Examples

- sense:correction:preference:ecal:pmap ecal3, 'a2,b1,c3'

### Query Syntax

SENSe:CORRection:PREFerence:ECAL:PMAP? <module>

### Return Type

String

### Default

Null string ()
This command is no longer supported. Learn more about old and new behaviors.

(Read-Write) Sets and returns a preference for the Unguided Cal behavior described below. This setting persists until it is changed.

This preference can also be set ON by executing the script on the VNA at C:\Program Files(x86)\Keysight\Network Analyzer\System\wincal32.reg.

Parameters
- `<bool>` Boolean - Choose from:
  - **0 - OFF** - Reverts to new (preferred) behavior. An error is returned if standard data is not acquired before sending `SENS:CORR:COLL:SAVE`.
  - **1 - ON** - (WinCal compatible) Prevents `SENS:CORR:COLL:SAVE` from failing when standard data has not, and will not, be acquired.

Examples
```
SENS:CORR:PREF:SIMC 0
sense:correction:preference:simcal 1
```

Query Syntax
```
SENSe:CORRection:PREFerence:SIMCal?
```

Return Type
- Boolean

Default
- 0

---

SENSe:CORRection:PREFerence:TRIG:FREE `<char>`, `<bool>`

Applicable Models: All

(Read-Write) Sets and returns the preference for the trigger behavior during a calibration. This setting persists until it is changed.

Note: If `TRIGger:SOURce` = Manual, during a calibration the VNA ALWAYS switches to Internal for one trigger, then back to Manual, regardless of this preference command.

Parameters
- `<char>` Character - Calibration type. Choose from:
  - `GUIDed` - preference setting pertains to a Guided calibration.
  - `UNGuided` - preference setting pertains to an Unguided calibration.

- `<bool>` Boolean - Choose from:
  - **0 - OFF** - The trigger behavior during the specified calibration type DOES
respect the setting of the TRIGger:SOURce command. For example, when Trigger source = External, the single trigger method will wait for the External trigger signal and then allow only one sweep.

1 - ON - (Pre-6.0 behavior) The trigger behavior during the specified calibration type does NOT respect the setting of the TRIGger:SOURce command. For example, when Trigger source = External, during calibration the VNA switches to Internal sweep, responds to one trigger signal to measure the standard, then switches back to External.

Examples

<table>
<thead>
<tr>
<th>Query Syntax</th>
<th>Return Type</th>
<th>Default</th>
</tr>
</thead>
</table>

Parameters

- `<cnum>` Any existing channel number. If unspecified, value is set to 1
- `<num>` Offset Value in dB. Specify loss as a negative number; and gain as a positive number. Choose a number between -200 and 200.

Examples

<table>
<thead>
<tr>
<th>Query Syntax</th>
<th>Return Type</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>SENSE:CORR:RPOW:OFFS .5</td>
<td>sense:correction:rpower:offset:amplitude .-5</td>
<td>0</td>
</tr>
</tbody>
</table>

SENSe<cnum>:CORRection:RPOWer:OFFSet[:AMPLitude] <num>

(Read-Write) Adjusts a receiver power cal to account for components or adapters that are added between the source port and receiver while performing this cal. For more information, see Receiver Cal.

Parameters

- `<cnum>` Any existing channel number. If unspecified, value is set to 1
- `<num>` Offset Value in dB. Specify loss as a negative number; and gain as a positive number. Choose a number between -200 and 200.
Applicable Models: All

(Read-Write) Sets the velocity factor to be used with Electrical Delay and Port Extensions.

Parameters

- `<cnum>` Any existing channel number. If unspecified, value is set to 1
- `<num>` Velocity factor. Choose a number between 0 and 10 (.66 polyethylene dielectric; .7 PTFE dielectric)

Examples

- `SENS:CORR:RVEL:COAX .66`
- `sense2:correction:rvelocity:coax .70`

Query Syntax

- `SENSe<cnum>:CORRection:RVELocity:COAX?`

Return Type

- Numeric

Default

- 1

SENSe<cnum>:CORRection:SFORward[:STATe] <boolean>

Applicable Models: All

(Read-Write) Sets the direction a calibration will be performed when only one set of standards is used.

Use `SENSe:CORRection:TSTandards[:STATe] OFF` to specify that only one set of standards will be used.

Parameters

- `<cnum>` Any existing channel number. If unspecified, value is set to 1
- `<boolean>` ON (1) - FORWARD direction of a 2-port calibration will be performed
  - OFF (0) - REVERSE direction of a 2-port calibration will be performed

Examples

- `SENS:CORR:SFOR 1`
- `sense2:correction:sforward:state 0`
- See an example using this command

Query Syntax

- `SENSe<cnum>:CORRection:SFORward[:STATe]?`

Return Type

- Boolean

Default

- ON
Applicable Models: All

(Read-Write) Turns error correction ON and OFF for the specified channel.

**Note:** Before using this command you must select a measurement using \CALCulate:MEASure:PARameter. You can select one measurement for each channel.

**Parameters**

- `<cnum>` Any existing channel number. If unspecified, value is set to 1
- `<ON | OFF>` **ON** (or 1) - correction is applied to the channel.
  - **OFF** (or 0) - correction is NOT applied to the channel.

**Examples**

```
SENS:CORR ON
sense2:correction:state off
```

**Query Syntax**

```
SENSe<cnum>:CORRection[:STATe]?
```

To query the error correction state for a measurement, use \CALC:MEAS:CORR:STATe?

**Return Type**

Boolean (1 = ON, 0 = OFF)

**Default**

OFF

---

**SENSe<cnum>:CORRection:TCOLd:USER:VALue <num>**

Applicable Models: All

(Read-Write) Sets and returns the temperature of the noise source connector. Learn more about Noise Figure Calibration.

**Parameters**

- `<cnum>` Any existing channel number. If unspecified, value is set to 1.
- `<num>` Noise source temperature in Kelvin.

**Examples**

```
sense2:correction:tcold:user:value 298
```

See an example using this command

**Query Syntax**

```
SENSe<cnum>:CORRection:TCOLd:USER:VALue?
```

**Return Type**

Numeric

**Default**

Not Applicable
SENSe<cnum>:CORRection:TSTandards[:STATe] <boolean>

Applicable Models: All

(Read-Write) Specifies the acquisition of calibration data using ONE or TWO sets of standards.

Parameters

- <cnum> Any existing channel number. If unspecified, value is set to 1.
- <boolean>
  - ON (1) - TWO identical sets of standards will be used to simultaneously calibrate two ports (for both Forward and Reverse parameters).
  - OFF (0) - ONE set of standards will be used to perform a full 2-port calibration, one port at a time.

When specifying ON (use two sets), the SENS:CORR:COLL:ACQuire command uses the same standard index for each calibration class. To specify the calibration standard gender for each port, you must first ensure that the order of calibration class accurately reflects the configuration of your DUT. For example, for a DUT with a male connector on port 1 and a female connector on port 2, order the devices within the S11 classes (A, B, and C) such that the MALE standards are first in the list. Then order the S22 classes specifying the FEMALE standards as the first in the list.

Examples

```
SENS:CORR:TST 1
sense2:correction:tstandard:state 0
```

See an example using this command

Query Syntax

SENSe<cnum>:CORRection:TSTandards[:STATe]?

Return Type

Boolean

Default

ON

SENSe:CORRection:TYPE:CATalog? <char>
Applicable Models: All

(Read-Write) Lists the Cal Types in the VNA by either GUID or registered name. Learn more about applying Cal Type using SCPI.

**Note:** Before using this command you must select a measurement using `CALCulate:MEASure:PARameter`. You can select one measurement for each channel.

**Parameters**

<table>

**Examples**

```
SENS1:CORR:WAVE ACT
```

**Query Syntax**

```
SENSe<cnum>:CORR:WAVE[:METHod]? 
```

**Return Type**

String

**Default**

MATC
SENSe<cnum>::CORRrection::WAVE::NORM[:METHod] <param>

Applicable Models: N522xB, N523xB, N524xB

(Write-Read) Sets and returns the wave normalization method.

Parameters

   <cnum>   Any existing channel number. If unspecified, value is set to 1.
   <parm>   Wave normalization method. Choose from:

       POWER - Waves are computed according to Kurokawa's power wave
               definition.

       TRAVeling – Waves are computed according to a traveling wave definition.

Examples

   SENS1::CORR::WAVE::NORM POW

Query Syntax

   SENS<channel>::CORR::WAVE::NORM[:METHod]?

Return Type

   String

Default

   POW
Manages the list of cal kits that are installed in the VNA.

SENSe:CORRection:CKIT:CLEar[:IMMediate] [ckit]

Applicable Models: All

(Write-only) Deletes installed cal kits.

Parameters

[ckit] Optional String. Cal Kit to delete. If not specified, all VNA Cal kits are deleted, including custom kits.

Examples

SENSe:CORRection:CKIT:CLE
sense:correction:ckit:clear:immediate "85052B"

Query Syntax

Not Applicable

Default

Not Applicable

SENSe:CORRection:CKIT:COUNt?

Applicable Models: All

(Read-only) Returns the number of installed cal kits.

Examples

SENSe:CORRection:CKIT:COUNt?

Query Syntax

SENSe:CORRection:CKIT:COUNt?

Return Type

Numeric

Default

Not Applicable

SENSe:CORRection:CKIT:ECAL<mod>:CLIS?
Applicable Models: All

(Read-only) Returns a list of characterizations stored in the specified ECal module.

Parameters

<mod> ECal module from which to read user characterization numbers. Choose from 1 to 50. If unspecified, value is set to 1.

Examples

Module 1 contains User Characterizations 1 and 3.

SENSe:CORRection:CKIT:ECAL:CLIST?

'Returns the following (0 always indicates the factory characterization):

0,1,3

Return Type

Numeric list, separated by commas.

Default

Not Applicable

SENSe:CORRection:CKIT:ECAL:DMEMory:CLEar <kitName>

Applicable Models: All

(Write-only) Deletes user characterizations from VNA disk memory.

Parameters

<kitName> Optional String argument. ECal Model, User Characterization name + " ECal", and serial number of the ECal module, separated by spaces. See examples below.

If unspecified, ALL User Characterizations that are stored in VNA disk memory are deleted.

Examples

'These examples all use "MyUserChar" as the User characterization name.

'The "My User Char" characterization is deleted from disk memory.

'All User characterizations are deleted from disk memory.

Default

Not Applicable
SENSe:CORRection:CKIT:ECAL:DMEMory:IMPort <file>

Applicable Models: All

(Write-only) After the VNA disk memory is Exported to a file, use this command to Import the file into VNA disk memory, which allows the User Characterization to be used with the VNA and ECal module.

**Note:** An ECal confidence check can NOT be performed remotely from User Characterizations that are stored on the VNA disk.

**Parameters**

*<file>* String. Full path and file name of file that was exported.

**Examples**

```
SENS:CORR:CKIT:ECAL:DMEM:IMP "D:\myDiskUserChar.euc"
```

**Query Syntax**

Not Applicable

**Default**

Not Applicable

---

SENSe:CORRection:CKIT:ECAL:EXPort <kit>[,<file>][,<NewName>]]

Applicable Models: All

(Write-only) Saves an existing ECal characterization to a file. Use this command to archive the user characterization or to move the characterization to a different VNA for use with the specified ECal module. After exporting the user characterization, use **SENS:CORR:CKIT:ECAL:DMEM:IMPort** to make the user characterization available for use.

**Parameters**

*<kit>* String. Not case sensitive. ECal Model, User char name + " ECal", and serial number of the ECal module used for the characterization, separated by spaces. See examples below.

If the model and serial number of the module is not found, an error is returned.

*<file>]* Optional String argument. Path and filename of the user characterization. If not specified, the file is saved using characterization name + ".euc". If the path is not specified, it is stored in C:\ProgramData\Keysight\Network Analyzer\ECal User Characterizations\. The extension ".euc" is appended if one is not specified.

*<NewName>*] Optional String argument. This allows you to change the name for the User Characterization. When specified, the new name is saved in the file with the characterization. If unspecified, the existing user characterization name is
saved.

**Note:** If this argument is specified, the second argument (<file>) must also be specified.

### Query Syntax

**Default**

Not Applicable

**SENSe:CORRection:CKIT:ECAL<mod>:INFormation? [<char>]**

**Applicable Models:** All

*(Read-only)* Reads the identification and characterization information from the specified ECaI module.

**Note:** To read user-characterization information that is stored in VNA disk memory, then use SENS:CORR:CKIT:ECAL:KNAM:INF?

**Parameters**

- **<mod>**
  - ECaI module from which to read characterizations. Choose from 1 through 50. If unspecified, value is set to 1.
  - Do NOT assume the <mod> number is the order in which ECaI modules were connected.
  - Use SENS:CORR:CKIT:ECAL:LIST? to read a list of <mod> numbers of currently-attached ECaI modules.

- **<char>**
  - Optional argument. Specifies which characterization to read information from. If not specified, value is set to CHAR0.
Choose from:

- CHAR0  Factory characterization (data that was stored in the ECal module by Keysight)
- CHAR1  User characterization #1
- CHAR2  User characterization #2
- - through -
- CHAR12 User characterization #12

Examples

```

'Example return string:
"ModelNumber: 85092-60007, SerialNumber: 01386, ConnectorType: N5FN5F, PortAConnector: Type N (50) female, PortBConnector: Type N (50) female, MinFreq: 30000, MaxFreq: 9100000000, NumberOfPoints: 250, Calibrated: July 4 2002"
```

Return Type

Character

Default  Not Applicable

SENSe:CORRection:CKIT:ECAL:KNAMe:INFormation? <kitName>

Applicable Models: All

(Read-only) Reads the identification and characterization information from the specified ECal module or VNA disk memory.

Learn more about User Characterization in VNA Disk Memory.

Parameters

- <kitName>  String. ECal model and characterization to read information from, enclosed in quotes, in the following format:

  `<model> <name> ECal <serial number>`

Where:

- <model>: Always required
- <name>:

  - For the factory characterization, do not specify.
For a user-characterization stored in the module, use **User <n>** in the string, where <n> is the user-characterization number. Not case sensitive. Separate User and <n> with a space.

For a user-characterization stored in VNA disk memory, use **<charName>** from `SENS:CORR:CKIT:ECAL:CHAR:DMEM:SAVE <charName>`

**ECal** - not case sensitive

<serial number>: Optional. Include when two or more ECal modules with same model number are attached to the VNA,

Each item is separated with a space.

**Examples**

- 'For a factory characterization in module memory:

- 'For user characterization in module memory with optional serial number:

- 'For user characterization "foo" in disk memory:

- 'Example return string:
  "ModelNumber: N4433A, SerialNumber: 00028, ConnectorType: N5FN5F, PortAConnector: Type N (50) female, PortBConnector: Type N (50) female, MinFreq: 30000, MaxFreq: 9100000000, NumberOfPoints: 250, Calibrated: July 4 2002"

**Return Type**  String

**Default**  Not Applicable

`SENSe:CORRection:CKIT:ECAL:LIST?`
**Applicable Models:** All

*(Read-only)* Returns a list of index numbers for ECal modules that are currently attached to the VNA. Use these numbers (called `<mod>` in VNAHelp) to refer to the ECal module using SCPI commands.

### Examples

```scpi
SENS:CORR:CKIT:ECAL:LIST?

'If 2 modules are attached to the VNA
'then the returned list will be:
+1,+2

'If NO modules are attached to the VNA
'then the returned list will be:
+0
```

See example program using this command.

**Return Type** Numeric list, separated by commas.

**Default** Not Applicable

---

**SENSe<ch>:CORRection:CKIT:ECAL<n>:ORIent? <pnaPort>[,<charN>]**

**Applicable Models:** All

*(Read-only)* Returns the ECal port that is connected to the specified VNA port. A calibration does not have to be in process.

- `<ch>` Channel number that contains the frequency range to be calibrated.
- `<n>` ECal module number. Choose from 1 through 50.

If unspecified (only one ECal module is connected to the USB), `<n>` is set to 1. If two or more modules are connected, use `SENS:CORR:CKIT:ECAL:LIST?` to determine how many, and `SENS:CORR:CKIT:ECAL:INF?` to verify their identities.

- `<pnaPort>` VNA port number.
- `<charN>` Optional argument. If unspecified, factory data (CHAR0) is used. User Characterization number that matches the physical adapters/fixtures that are on the ECal module. This aids in determining the orientation of the ECal module. Choose from:

  - **CHAR0** Factory characterization (data that was stored in the ECal module by Keysight)
  - **CHAR1** User characterization #1
Beginning with A.08.33, up to 12 User Characterizations can be stored in a single ECal module. Previous releases allowed up to 5. Learn more.

Examples

sense2:correction:ckit,ecal1:orient? 2, char2

Return Type
The returned ECal port number is a 1-based number: 1 = Port A, 2 = Port B, 3 = Port C, 4 = Port D.

Zero (0) is returned when the auto-orientation routine is unable to resolve the orientation.

Default
Not Applicable

SENSe:CORRection:CKIT:ECAL<n>:PATH:COUNt? <path>

Applicable Models: All

(Read-only) Returns the number of unique states that exist for the specified path name on the selected ECal module.

This command performs exactly the same function as CONT:ECAL:MOD:PATH:COUNt?

Use the CONT:ECAL:MOD:PATH:STAT command to set the module into one of those states.

Use SENSe:CORR:CKIT:ECAL:PATH:DATA? to read the data for a state.

Parameters

<n> USB number of the ECal module. Choose from 1 to 50.

If unspecified (only one ECal module is connected to the USB), <n> is set to 1. If two or more modules are connected, use SENSe:CORR:CKIT:ECAL:LIST? to determine how many, and SENSe:CORR:CKIT:ECAL:INF? to verify their identities.

<path> Name of the path for which to read number of states. Choose from:

Reflection paths

• A
Transmission paths

- **AB**
- **AC** (4-port modules)
- **AD** (4-port modules)
- **BC** (4-port modules)
- **BD** (4-port modules)
- **CD** (4-port modules)

**Examples**

```
CONT:ECAL:MOD:PATH:COUNT?
control:ecal:module2:path:count?
```

**Return Type** Integer

**Default** Not Applicable

**Applicable Models:** All

(Read-only) Returns the data for a state from the memory of the selected ECal module. The returned data is interpolated if necessary to have the same stimulus values as the specified channel <ch>.

- For a reflection path state, the data is reflection S-parameter data. The number of values equals the number of stimulus points on the channel multiplied by 2 (because they are complex numbers).
- For a transmission path state, the data is all 4 S-parameters of the state. The number of values returned is 4 times that of a reflection state.

The data is returned in the same format as **CALC:MEAS:DATA:SNP?**

**Note:** This command returns SNP data without header information, and in columns, not in rows as .SnP files. This means that the data returned from this command sends all frequency data, then all Sx1 magnitude or real data, then all Sx1 phase or imaginary data, and so forth.

**Parameters**

- `<ch>` Any existing channel number. If unspecified, value is set to 1.
<num> Optional argument. USB number of the ECal module. Choose from 1 through 50.

If unspecified (only one ECal module is connected to the USB), <num> is set to 1. If two or more modules are connected, use SENS:CORR:CKIT:ECAL:LIST? to determine how many, and SENS:CORR:CKIT:ECAL:INF? to verify their identities.

<path> Name of the path for which to read number of states. Choose from:

Reflection paths

- A
- B
- C (4-port modules)
- D (4-port modules)

Transmission paths

- AB
- AC (4-port modules)
- AD (4-port modules)
- BC (4-port modules)
- BD (4-port modules)
- CD (4-port modules)

<stateNum> Number of the state to set. Refer to the following table to associate the <stateNum> with a state in your ECal module.

In addition, CONT:ECAL:MOD:PATH:COUNT? returns the number of states in the specified ECal module.
<table>
<thead>
<tr>
<th>&lt;stateNum&gt;</th>

** The following modules have only FOUR Impedance states (1, 2, 3, 4): N4690B, N4691B, N4692A, N4696B, N7550A - N7556A.

<char> Optional argument. Specifies which characterization within the ECal module to read information from. If not specified, value is set to CHAR0.

Choose from:

- **CHAR0** Factory characterization (data that was stored in the ECal module by Keysight)
- **CHAR1** User characterization #1
- **CHAR2** User characterization #2
- and so forth up to:
- **CHAR12** User characterization #12
### SENSE:CORRection:CKIT:EXPort <kit>[,<file>]

**Applicable Models:** All

(Write-only) Saves an existing cal kit definitions to a file. Use this command to archive or move a user-defined or modified cal kit to a different VNA. After exporting the cal kit, use SENSE:CORR:CKIT:IMPort to make the cal kit available for use on the VNA. This command provides the same behavior as the Installed Kits - Save As button on the Edit VNA Cal Kits dialog.

**Parameters**

- `<kit>`: String. Not case sensitive. Name of the cal kit to export, as seen in the Cal Kits field of the Select DUT Connectors and Cal Kits dialog of a SMART Cal.
- `<file>`: Optional String argument. Path and filename to where the Cal Kit file is to be saved. If not specified, the file is saved using `<kit> + ".ckt". If the path is not specified, it is stored in C:/Program Files/Keysight/Network Analyzer/PNACalKits/User.

**Examples**

- 'File unspecified
  
  SENS:CORR:CKIT:EXP "MyCalKit"
  
- Both parameters are specified
  
  sense:correction:ckit:export "MyCalKit","C:\myBackupCalKit.ckt"

**Query Syntax**

Not Applicable

**Default**

Not Applicable

---

### SENSE:CORRection:CKIT:IMPort <string>

---
Applicable Models: All

(Write-only) Imports the specified cal kit (.ckt file) and appends the imported kit to the end of the list of kits.

Note: Although there is no limit to the number of cal kits that can be imported, during an Unguided cal, you can access ONLY mechanical cal kits #1 through #95.

**Parameters**

| <string> | Path and cal kit name. |

**Examples**

SENSe:CORRection:CKIT:IMPort "c:\users\public\public documents\network analyzer\documents/85033D.ckt"

**Query Syntax**

Not Applicable

**Default**

Not Applicable

SENSe:CORRection:CKIT:INITialize[:IMMediate] [ckit]

Applicable Models: All

(Write-only) Restores default factory installed cal kits. This command also selects kit number 1, as you would using SENS:CORR:COLL:CKIT:SEL 1. Therefore, if you intend to work with a Cal Kit remotely, select the Cal Kit AFTER sending this command.

Note: This command can also delete all existing User-defined Cal Kits. However, if saved using Save As, these kits can be restored in the same manner as after a VNA firmware upgrade. Learn more about saving modified Cal Kits.

**Parameters**

| [ckit] | Optional String. Cal Kit to restore. If not specified, all VNA factory Cal kits are restored. |

**Examples**

SENSe:CORR:CKIT:INITialize

SENSe:CORRection:ckit:initialize:immediate "85052B"

**Query Syntax**

Not Applicable

**Default**

Not Applicable

SENSe:CORRection:CKIT:LOAD <string>
Applicable Models: All

(Write-only) Loads the specified collection of cal kits from a .wks file. You can make your own collection of cal kits from the Advanced Modify Cal Kit menu.

**Parameters**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;string&gt;</td>
<td>Path and file name of the cal kit collection.</td>
</tr>
</tbody>
</table>

**Examples**

```
sense:correction:ckit:load "C:\ProgramData\Keysight\Network Analyzer\PnaCalKits\factory\wMyCalKits.wks"
```

**Query Syntax** Not Applicable

**Default** Not Applicable
Sense:Correction:Collect:Ckit Commands

Use to change the definitions of calibration kit standards.

### SCPI Command Tree

**Note:** You should provide data for every definition field - for every standard in your calibration kit. If a field is not set, the default value may not be what you expect.

For more information, read *Specifying Calibration Standards and Kits for Keysight Vector Network Analyzers (Application Note 1287-11)*

---

**SENSe:CORRection:COLLect:CKIT:CATalog?**

**Applicable Models:** All

*(Read-only)* Returns the names of the first 95 mechanical cal kits in your VNA that can be used for unguided calibrations.

<table>
<thead>
<tr>
<th>Example</th>
<th>SENS:COR:COLL:CKIT:CAT?</th>
</tr>
</thead>
</table>

**Return Type** A comma-separated string

**Default** Not Applicable

---

**SENSe:CORRection:COLLect:CKIT:CLISt <class>, <list_stds>**

**Applicable Models:** All

*(Write-Read)* Assigns the calibration class for the standard

**Parameters**

- `<class>` Specify the calibration classes:
  - **SA** - OPEN Standards (standards in the SA class are not always Opens)
  - **SB** - SHORT Standards
  - **SC** - LOAD Standards
  - **THRU** - Thru
  - **FWDT** - Forward Trans
  - **FWDM** - Forward Match
  - **REVT** - Reverse Trans
  - **REVM** - Reverse Match
**TRLT** - TRL Thru

**TRLR** - TRL Reflection

**TRLLm** - TRL Line

**UTHRu** - Unknown Thru

**ISOL** - Isolation

*<list_stds>* List of standard IDs (Same as **SENS:CORR:COLL:CKIT:OLIS**). A standard ID can be between 1 and 1000.

**Examples**

`SENS:CORR:COLL:CKIT:CLIST SA,1,2,5`

`SENS:CORR:COLL:CKIT:CLIST? SA`

**Return Type** Numeric; returns standard number of the selected class

**Default** Not Applicable

---

**SENSe:CORRection:COLLect:CKIT:CLABel <class>, <label>**

**Applicable Models:** All

*(Write-Read)* Defines the label for the standard classes.

**Parameters**

- **<class>** Specify the calibration classes:
  - **SA** - OPEN Standards (standards in the SA class are not always Opens)
  - **SB** - SHORT Standards
  - **SC** - LOAD Standards
  - **TRAN** - Thru
  - **FWDT** - Forward Trans
  - **FWDM** - Forward Match
  - **REVT** - Reverse Trans
  - **REVM** - Reverse Match
  - **TRLT** - TRL Thru
  - **TRLR** - TRL Reflection
**TRLLm** - TRL Line

**UTHRu** - Unknown Thru

**ISOL** - Isolation

<label> Label of standard

### Examples

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
</table>

**Return Type**  String; returns the label.

**Default**  Not Applicable

---

**SENSe:CORRection:COLLect:CKIT:CONNeector:ADD**

<fami>le>,<start>,<stop>,<z0>,<gender>,<media>,<cutoff>

**Applicable Models:** All

*(Write only)* Creates a new connector. The connector is automatically added to the list of available connectors for the currently selected cal kit. If a connector includes both male and female connectors, each connector must be added separately.

**Parameters**

- `<family>`  (String) Name of connector family. Limited to 50 characters.
- `<start>` Start frequency
- `<stop>` Stop frequency
- `<z0>` Characteristic Impedance of the connector in ohms.
- `<gender>` Connector gender. Choose from:
  - MALE
  - FEMALE
  - NONE
- `<media>` Media of the connector. Choose from:
  - COAX - coaxial
  - WAVE - waveguide
- `<cutoff>` Cutoff frequency of the connector (waveguide only).

**Examples**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SENS:CORR:COLL:CKIT:CONN:ADD &quot;PSC 1.8 mm&quot;,0 HZ,999.9 GHZ,50,FEMALE,COAX,0.0</td>
<td></td>
</tr>
<tr>
<td>SENS:CORR:COLL:CKIT:CONN:ADD &quot;PSC 1.8 mm&quot;,0 HZ,999.9 GHZ,50,MALE,COAX,0.0</td>
<td></td>
</tr>
</tbody>
</table>

**Query Syntax**  Not applicable
SENSe:CORRection:COLLect:CKIT:CONNector:CATalog?

Applicable Models: All

(Read-only) Returns a comma-separated list of all connectors defined within the currently selected cal kit. The returned string includes the connector family name followed by the connector gender, if any. Kits may include a primary connector family name and additional connector family names.

Connector family names are case sensitive. A connector family named "PSC 2.4" is different from a connector family named "psc 2.4".

Learn more about Connector Family Name.

Examples

```
'Returned string
"Type-N (50) male, Type-N (50) female"
```

Default Not Applicable

---

SENSe:CORRction:COLLect:CKIT:CONNector:DELeete

Applicable Models: All

(Write-only) Deletes the primary connector family name from the selected kit. The VNA allows multiple connector families for each kit. If a kit includes multiple connector families, only the first listed (primary) connector family name is deleted.

Once the connector family is deleted, the connector may not be assigned to any new or existing standard within the kit.

The previously defined standards retain their association to the deleted connector name. To reassign standards to a new connector family name, use SENS:CORR:COLL:CKIT:CONN:SNAMe.

Examples

```
SENS:CORR:COLL:CKIT:CONN:DEL
```

Query Syntax Not Applicable

Default Not Applicable

---

SENSe:CORRrection:COLLect:CKIT:CONNector:FNAMe <name>
Applicable Models: All

(Read-Write) Replaces the primary connector family name from the selected kit with a new connector family name. The connector family name is replaced in all standards in the kit that share that name. The VNA allows multiple connector families for each kit. If a kit includes multiple connector families, only the first listed (primary) connector family name is replaced. Use the query form of this command to return the name of the primary connector family.

Parameters

<name>  New connector family name. Limited to 50 characters.

Examples

SENS:CORR:COLL:CKIT:CONN:FNAM 'MYPSC35'

Sense:correction:collect:ckit:connector:name 'My Type N'

Query Syntax

SENSe:CORRection:COLLect:CKIT:CONNector:FNAMe?

Return Type

String

Default

Not Applicable

SENSe:CORRection:COLLect:CKIT:CONNector:SNAMe <family>,<gender>,<port>

Applicable Models: All

(Read-Write) Assigns a family name to the currently selected standard from the currently selected kit. Specify each port of a 2-port standard individually. Use the query form of this command to read the connector family name assigned to the current standard. The name is not assigned unless the connector family name is previously defined within the selected kit.

Parameters

?family>  String. Connector family name.

<gender>  Connector gender. Choose from:

MALE

FEMALE

NONE

<port>  Number of the connector port to be assigned the connector family name. 2-port standards such as a thru line must be assigned separately. It is not relevant which connector is port 1 or port 2.

1  Specifies a 1-port standard or the first port of a 2-port standard.

2  Specifies the second port of a 2-port standard.

Examples

SENS:CORR:COLL:CKIT:CONN:SNAME "Type-N (50)",MALE,1
SENSe:CORRection:COLLect:CKIT:DESCription <string>

Applicable Models: All

(Read-Write) Modifies the cal kit description field of the selected kit. This description appears in the Edit VNA Cal Kit dialog box.

Parameters

<string> Description of the cal kit. Limited to 50 characters.

Examples

```
SENSe:CORRection:COLLect:CKIT:DESC "My New CalKit"
```

Query Syntax

SENSe:CORRection:COLLect:CKIT:DESCription?

Return Type

String

Default

Not Applicable

SENSe:CORRection:COLLect:CKIT:INFormation? <module>[,char]

Applicable Models: All

(Read Only) Reads characterization information from an ECal module.

Parameters

<string> Specifies which ECal module to read from. Choose from:

- **ECAL1**
- through.

- **ECAL50**

[char] Optional argument.

Specifies which characterization within the ECal module to read information from. If this argument is not used, the default is **CHAR0**. **CHAR1** through **CHAR5** are for user characterizations that may have been written to the module by the User Characterization feature on the VNA. Choose from:

- **CHAR0** Factory characterization (data that was stored in the ECal module by
SENSe:CORRection:COLLect:CKIT:NAME <name>

**Applicable Models:** All

*(Read-Write)* Sets a name for the selected calibration kit.

**Parameters**

- **<name>**  
  Calibration Kit name. Any string name, can include numerics, period, and spaces; any length (although the dialog box display is limited to about 30 characters).

**Examples**

```
SENSe:CORRection:COLLect:CKIT:NAME 'MYAPC35'
SENSe:correction:collect:ckit:name 'mytypen'
```

**Query Syntax**

SENSe:CORRection:COLLect:CKIT:NAME?

**Return Type**  
String

**Default**  
Not Applicable

---

SENSe:CORRection:COLLect:CKIT:OLAbel<class> <name> - **Superseded**
This command is replaced by `SENS:COR:CKIT:CLAB`.

**Applicable Models:** All

*(Read-Write)* Sets the label for the calibration class designated by `<class>`. The label is used in the prompts for connecting the calibration standards associated with that `<class>`.

**Parameters**

- `<class>` Number of the calibration class. Choose a number between: 1 and 18. The `<class>` numbers are associated with the following calibration Classes:

<table>
<thead>
<tr>
<th>Class</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Port 1</td>

</tr>
</tbody>
</table>
<name>  Label for the calibration class. Must be enclosed in quotes. Any string between 1 and 12 characters long. Cannot begin with a numeric.

Examples
SENS:CORR:COLL:CKIT:OLAB3 'LOADS'
sense:correction:collect:ckit:olabel4 'Thru'

Return Type  String
Default  Not Applicable

SENSe:CORRection:COLLect:CKIT:OLiSt[class]? - Superseded
This command is replaced by SENS:CORR:CKIT:CLIS.

Applicable Models: All

(Read-only) Returns seven values of standards that are assigned to the specified class.
This command ALWAYS applies to the Cal Kit that is selected (using SENS:CORR:COLL:CKIT:SEL) when this ORDer command is sent.

Parameters

<class>  Number of the calibration class to be queried. The <class> numbers are associated with the following calibration Classes:

<table>
<thead>
<tr>
<th>Class</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Port 1</td>
<td></td>
</tr>
<tr>

**Examples**

```
SENS:CORR:COLL:CKIT:OLIS?
```

Always returns 7 standard numbers. Unassigned standards return 0

**Return Type**

Numeric; returns the `<class>` number of the selected standard.

**Default**

Not Applicable

---

This command is replaced by **SENS:CORR:CKIT:CLIS**.

**Applicable Models:** All

*(Read-Write)* Sets a standard number to a calibration class. This command does **NOT** set or dictate the order for measuring the standards. For more information, see Assigning Standards to a Calibration Class.

This command **ALWAYS** applies to the Cal Kit that is selected (using **SENS:CORR:COLL:CKIT:SEL**) when this **ORDer** command is sent.

**Parameters**

`<class> ` Number of the calibration class that is assigned to `<standard>`. Choose a number between: **1** and **18**. The `<class>` numbers are associated with the following calibration Classes:
<table>
<thead>
<tr>
<th>Port</th>
<th>Class</th>
<th>Description</th>
<th>STAN#</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>

**Query Syntax**

SENSe:CORRection:COLLect:CKIT:ORDer<class>?

**Return Type** Numeric

**Default** Not Applicable

---

**SENSe<cnum>:CORRection:COLLect:CKIT:PORT<n>[:SELe]ct <string>**

**Applicable Models:** All

(Read-Write) Sets and returns the name of the Cal Kit to use for Unguided cal.

This command effectively does the same task as SENS:CORR:COLL:CKIT but specifies the cal kit by name.

**Note:** During an Unguided cal, you can access ONLY mechanical cal kits #1 through #95. However, there is no limit to the number of cal kits that can be imported.

**Parameters**

- `<cnum>`: Currently not used. The unguided cal kit selection is for all ports on all channels.
- `<n>`: Currently not used. The unguided cal kit selection is for all ports on all channels.
- `<string>`: Cal Kit name enclosed in quotes. Use SENS:CORR:COLL:CKIT:CAT? to read a list of all available Cal Kits in the VNA.

**Examples**

<table>
<thead>
<tr>
<th>Examples</th>
</tr>
</thead>
<tbody>
<tr>
<td>SENS:CORR:COLL:CKIT:PORT &quot;85052B&quot;</td>
</tr>
<tr>
<td>sense2:correction:collect:ckit:port:select &quot;85052D&quot;</td>
</tr>
</tbody>
</table>

**Query Syntax**

SENSe<cnum>:CORRection:COLLect:CKIT:PORT<n>[:SELe]ct?

**Return Type** String

**Default** Last kit selected
SENSe:CORRection:COLLect:CKIT:RESet <num> - Superseded

Applicable Models: All

This command is replaced by Sens:Corr:CKit:Init.

(Write-only) Resets the selected calibration kit to factory default definition values.

Parameters

<num> The number of the calibration kit to be reset. Choose any integer between: 1 and 8

Examples

SENS:CORR:COLL:CKIT:RESet 1
sense:correction:collect:ckit:reset 4

Query Syntax

Not Applicable

Default

Not Applicable

SENSe<cnun>:CORREction:COLLect:CKIT[:SElect] <num>

Applicable Models: All

(Read-Write) Selects (makes active) a calibration kit for performing an UNGUIDED calibration or for modifying standards. All subsequent "CKIT" commands that are sent apply to this selected calibration kit. Select a calibration standard using SENS:CORR:COLL:CKIT:STAN <num>. Kits 1 to approximately kit 37 are factory installed Cal Kits.

Note: During an Unguided cal, you can access ONLY mechanical cal kits #1 through #95. However, there is no limit to the number of cal kits that can be imported.

This command effectively does the same task as SENS:CORR:COLL:CKIT:PORT which specifies the cal kit by name instead of this command which specifies by number.

Parameters

<cnun> Any existing channel number; if unspecified, value is set to 1.

<num> The number of the calibration kit. Choose from:

Use SENSe:CORRection:COLLect:CKIT:RESet to restore Cal Kits to default values.

Name

1 Cal Kit 1
2 Cal Kit 2
3 Cal Kit 3
Cal Kit 94
Cal Kit 95
ECal module

Note: Always check the list of available cal kits using SENSE:CORRection:COLLect:CKIT:CATalog? to ensure that the correct cal kit is selected.

Examples
SENS:CORR:COLL:CKIT 2
sense2:correction:collect:ckit:select 7

Query Syntax
SENSe<cnum>:CORRection:COLLect:CKIT?

Return Type
Numeric

Default
Last kit selected

SENSe:CORRection:COLLect:CKIT:STANdard:C0 <num>

Applicable Models: All

(Read-Write) Sets the C0 value (the first capacitance value) for the selected standard. For a detailed discussion of this value, search for App Note 8510-5B at www.Keysight.com.

Parameters

<num> Value for C0 in femtofarads (1E-15)

Examples
The following commands set C0=15 femtofarads:

SENS:CORR:COLL:CKIT:STAN:d:C0 15
sense:correction:collect:ckit:standard:c0 15

Query Syntax
SENSe:CORRection:COLLect:CKIT:STANdard:C0?

Return Type
Numeric

Default
Not Applicable

SENSe:CORRection:COLLect:CKIT:STANdard:C1 <num>
Applicable Models: All

(Read-Write) Sets the C1 value (the second capacitance value) for the selected standard. For a detailed discussion of this value, search for App Note 8510-5B at www.Keysight.com.

Parameters
<num> Value for C1.

Examples
The following two commands set C1=15:

SENSe:CORRection:COLLect:CKIT:STANdard:C1 15
sense:correction:collect:ckit:standard:c1 15

Query Syntax
SENSe:CORRection:COLLect:CKIT:STANdard:C1?

Return Type
Numeric

Default
Not Applicable

SENSe:CORRection:COLLect:CKIT:STANdard:C2 <num>

Applicable Models: All

(Read-Write) Sets the C2 value (the third capacitance value) for the selected standard. For a detailed discussion of this value, search for App Note 8510-5B at www.Keysight.com.

Parameters
<num> Value for C2.

Examples
The following two commands set C2:

SENSe:CORRection:COLLect:CKIT:STANdard:C2 15
sense:correction:collect:ckit:standard:c2 15

Query Syntax
SENSe:CORRection:COLLect:CKIT:STANdard:C2?

Return Type
Numeric

Default
Not Applicable

SENSe:CORRection:COLLect:CKIT:STANdard:C3 <num>
Applicable Models: All

(Read-Write) Sets the C3 value (the fourth capacitance value) for the selected standard. For a detailed discussion of this value, search for App Note 8510-5B at www.Keysight.com.

**Parameters**

| <num> | Value for C3. |

**Examples**
The following two commands set C3

```
SENS:CORR:COLL:CKIT:STAN:C3 15
sense:correction:collect:ckit:standard:c3 15
```

**Query Syntax**
SENSe:CORRection:COLLect:CKIT:STANdard:C3?

**Return Type**
Numeric

**Default**
Not Applicable

---

SENSe:CORRection:COLLect:CKIT:STANdard:CHARacter <char>

Applicable Models: All

(Read-Write) Sets the media type of the selected calibration standard.

**Parameters**

| <char> | Media type of the standard. Choose from: Coax - Coaxial Cable Wave - Waveguide |

**Examples**
SENSe:CORRection:COLLect:CKIT:STANdard:CHARacter COAX
SENSe:CORRection:COLLect:CKIT:STANdard:CHARacter WAVE

**Query Syntax**
SENSe:CORRection:COLLect:CKIT:STANdard:CHARacter?

**Return Type**
Numeric

**Default**
Coax

---

SENSe:CORRection:COLLect:CKIT:STANdard:DATA:LOAD <string>
**Applicable Models:** All

*(Write-only)* Loads response (and optionally accuracy) data from a file for the selected database standard. Accuracy data is loaded if the file being loaded contains accuracy data. [Learn more.](#)

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;string&gt;</td>
<td>Path and filename.</td>
</tr>
</tbody>
</table>

**Examples**

```
SENS:CORR:COLL:CKIT:STAN:DATA:LOAD "c:\users\public\network\ analyzer\database_file.dat"
```

**Default** Not Applicable

---

**SENSe:CORRRection:COLLect:CKIT:STANdard:DELay <num>**

**Applicable Models:** All

*(Read-Write)* Sets the electrical delay value for the selected standard.

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;num&gt;</td>
<td>Electrical delay in picoseconds</td>
</tr>
</tbody>
</table>

**Examples**

```
The following two commands set delay to 50 picoseconds
SENS:CORR:COLL:CKIT:STAN:DEL 50e-12
sense2:correction:collect:ckit:standard:delay 50ps
```

**Query Syntax**

```
SENSe:CORRection:COLLect:CKIT:STANdard:DELay?
```

**Return Type** Numeric

**Default** Not Applicable

---

**SENSe:CORRRection:COLLect:CKIT:STANdard:FMAXimum <num>**

**Applicable Models:** All

*(Read-Write)* Sets the maximum frequency for the selected standard.

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;num&gt;</td>
<td>Maximum frequency in Hertz.</td>
</tr>
</tbody>
</table>

**Examples**

```
SENS:CORR:COLL:CKIT:STAN:FMAX 9e9
sense:correction:collect:ckit:standard:fmaximum 9Ghz
```

**Query Syntax**

```
SENSe:CORRection:COLLect:CKIT:STANdard:FMAXimum?
```

**Return Type** Numeric

**Default** Not Applicable
SENSe:CORRection:COLLect:CKIT:STANdard:FMINimum <num>

Applicable Models: All

(Read-Write) Sets the minimum frequency for the selected standard.

**Parameters**

<num> Minimum frequency in Hertz.

**Examples**

SENSe:CORR:CORR:COLL:CKIT:STAN:FMIN 1e3
sense:correction:collect:ckit:standard:fminimum 1khz

**Query Syntax**

SENSe:CORRection:COLLect:CKIT:STANdard:FMINimum?

**Return Type**

Numeric

**Default**

Not Applicable

---

SENSe:CORRection:COLLect:CKIT:STANdard:IMPedance <num>

Applicable Models: All

(Read-Write) Sets the characteristic impedance for the selected standard.

**Parameters**

<num> Impedance in Ohms

**Examples**

SENSe:CORR:CORR:COLL:CKIT:STAN:IMP 75
sense:correction:collect:ckit:standard:impedance 50.3

**Query Syntax**

SENSe:CORRection:COLLect:CKIT:STANdard:IMPedance?

**Return Type**

Numeric

**Default**

50

---

SENSe:CORRection:COLLect:CKIT:STANdard:L0 <num>
### SENSE:CORRection:COLLect:CKIT:STANdard:L0 <num>

**Applicable Models:** All

*(Read-Write)* Sets the L0 value (the first inductance value) for the selected standard. For a detailed discussion of this value, search for App Note 8510-5B at www.Keysight.com.

**Parameters**

- `<num>` Value for L0 in femtohenries (1E-15)

**Examples**

The following two commands set L0=15 femtohenries:

```plaintext
SENS:CORR:COLL:CKIT:STAN:L0 15
sense:correction:collect:ckit:standard:l0 15
```

**Query Syntax**

```
SENSe:CORRection:COLLect:CKIT:STANdard:L0?
```

**Return Type** Numeric

**Default** Not Applicable

### SENSE:CORRection:COLLect:CKIT:STANdard:L1 <num>

**Applicable Models:** All

*(Read-Write)* Sets the L1 value (the second inductance value) for the selected standard. For a detailed discussion of this value, search for App Note 8510-5B at www.Keysight.com.

**Parameters**

- `<num>` Value for L1.

**Examples**

The following two commands set L1=15:

```plaintext
SENS:CORR:COLL:CKIT:STAN:L1 15
sense:correction:collect:ckit:standard:l1 15
```

**Query Syntax**

```
SENSe:CORRection:COLLect:CKIT:STANdard:L1?
```

**Return Type** Numeric

**Default** Not Applicable

### SENSE:CORRection:COLLect:CKIT:STANdard:L2 <num>

- **4096**
Applicable Models: All

(Read-Write) Sets the L2 value (the third inductance value) for the selected standard. For a detailed discussion of this value, search for App Note 8510-5B at www.Keysight.com.

Parameters

<num> Value for L2.

Examples

The following two commands set L2=15:

```
SENS:CORR:COLL:CKIT:STAN:L2 15
sense:correction:collect:ckit:standard:l2 15
```

Query Syntax

SENSe:CORRection:COLLect:CKIT:STANdard:L2?

Return Type

Numeric

Default

Not Applicable

SENSe:CORRection:COLLect:CKIT:STANdard:L3 <num>

Applicable Models: All

(Read-Write) Sets the L3 value (the fourth inductance value) for the selected standard. For a detailed discussion of this value, search for App Note 8510-5B at www.Keysight.com.

Parameters

<num> Value for L3.

Examples

The following two commands set L3=15:

```
SENS:CORR:COLL:CKIT:STAN:L3 15
sense:correction:collect:ckit:standard:l3 15
```

Query Syntax

SENSe:CORRection:COLLect:CKIT:STANdard:L3?

Return Type

Numeric

Default

Not Applicable

SENSe:CORRection:COLLect:CKIT:STANdard:LABel <name>
Applicable Models: All

(Read-Write) Sets the label for the selected standard. The label is used to prompt the user to connect the specified standard.

Parameters

- `<name>`: Label for the standard; Must be enclosed in quotes. Any string between 1 and 12 characters long. Cannot begin with a numeric.

Examples

```
SENS:CORR:COLL:CKIT:STAN:LAB 'OPEN'
sense:correction:collect:ckit:standard:label 'Short2'
```

Query Syntax

```
SENSe:CORRection:COLLect:CKIT:STANdard:LABel?
```

Return Type: String

Default: Not Applicable

SENSe:CORRection:COLLect:CKIT:STANdard:LOSS <num>

Applicable Models: All

(Read-Write) Sets the insertion loss for the selected standard.

Parameters

- `<num>`: Insertion loss in Gohms / sec. (GigaOhms per second of electrical delay)

Examples

```
SENS:CORR:COLL:CKIT:STAN:LOSS 3.5e9
sense:correction:collect:ckit:standard:loss 3
```

Query Syntax

```
SENSe:CORRection:COLLect:CKIT:STANdard:LOSS?
```

Return Type: Numeric

Default: Not Applicable

SENSe:CORRection:COLLect:CKIT:STANdard:REMove

Applicable Models: All

(Write only) Deletes the selected standard from the selected cal kit.

Examples

```
SENS:CORR:COLL:CKIT:STAN:REMove
```

Default: Not Applicable

SENSe:CORRection:COLLect:CKIT:STANdard:SDEScription <string>
Applicable Models: All

(Read-Write) Modifies the description of the selected standard of the selected kit. This description appears in the edit kit dialog box.

**Parameters**

- `<string>` Description of the standard.

**Examples**

**Query Syntax**

SENS:CORR:COLL:CKIT:STAN:SDESRIPTION?

**Return Type**

String

**Default**

Not Applicable

---

**SENSe:CORRection:COLLect:CKIT:STANdard[:SELECT] <num>**

Applicable Models: All

(Read-Write) Selects the calibration standard. All subsequent "CKIT" commands to modify a standard will apply to the selected standard. Select a calibration kit using SENS:CORR:COLL:CKIT:SEL

**Parameters**

- `<num>` Number of the standard. Choose any number between: 1 and 1000

**Examples**

SENS:CORR:COLL:CKIT:STAN 3
sense:correction:collect:ckit:standard:select 8

**Query Syntax**

SENSe:CORRection:COLLect:CKIT:STANdard[:SELect]?

**Return Type**

Numeric

**Default**

1

---

**SENSe:CORRection:COLLect:CKIT:STANdard:TYPE <char>**
Applicable Models: All

(Read-Write) Sets the type for the selected standard.

Parameters

<char>  Choose from:
OPEN
SHORT
LOAD
SLOAD (sliding load)
THRU (through)
ARBI (arbitrary)
DATabased (data-based)

Examples

SENS:CORR:COLL:CKIT:STAN:TYPE LOAD
sense:correction:collect:ckit:standard:type short

Query Syntax

SENSe:CORRection:COLLect:CKIT:STANdard:TYPE?

Return Type

Character

Default  Not Applicable

SENSe:CORRection:COLLect:CKIT:STANdard:TZReal <num>

Applicable Models: All

(Read-Write) Sets the TZReal component value of the Terminal Impedance for the selected standard.

Note: Only applicable when the Standard Type is set to ARBI

Parameters

<num>  Value for TZReal in Ohms

Examples

The following commands set TZReal=15 Ohms:

SENS:CORR:COLL:CKIT:STAN:TZReal 15
sense:correction:collect:ckit:standard:TZReal 15

Query Syntax

SENSe:CORRection:COLLect:CKIT:STANdard:TZReal?

Return Type

Numeric

Default  Not Applicable
**SENSe:CORRection:COLLect:CKIT:STANdard:TZImag <num>**

**Applicable Models:** All

**(Read-Write)** Sets the TZImag component value of the Terminal Impedance for the selected standard.

**Note:** Only applicable when the Standard Type is set to **ARBI**

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;num&gt;</td>
<td>Value for TZImag in Ohms</td>
</tr>
</tbody>
</table>

**Examples**
The following two commands set TZImag=15 Ohms:

```plaintext
SENS:CORR:COLL:CKIT:STAN:TZImag 15
sense:correction:collect:ckit:standard:TZImag 15
```

**Query Syntax**

```
SENSe:CORRection:COLLect:CKIT:STANdard:TZImag?
```

**Return Type**

Numeric

**Default**

Not Applicable

---

**SENSe:CORRection:COLLect:CKIT:TRLoption:IMPedance <char>**

**Applicable Models:** All

**(Read-Write)** Sets the reference impedance when using this TRL cal kit. Learn more.

Before sending this command, select a cal kit using **SENSe:CORRe:COLLect:CKIT:SELect**.

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;char&gt;</td>
<td>Choose from:</td>
</tr>
</tbody>
</table>

**SYSTem** - The system impedance is used as the reference impedance. During a Guided or Unguided Cal, the Z0 of the Cal standard's connector definition sets the System Z0.

Make this selection when the desired test port impedance differs from the impedance of the LINE standard. Also, make this selection when skin effect impedance correction is desired for coax lines.

**LINE** The impedance of the line standard is used as the reference impedance, or center of the Smith Chart. Any reflection from the line standard is assumed to be part of the directivity error.

**Examples**

```
SENS:CORR:COLL:CKIT:TRL:IMP SYST
sense:correction:collect:ckit:TRLoption:impedance line
```
### SENSe:CORRection:COLLect:CKIT:TRLoption:LRLChar <bool>

**Applicable Models:** All

(Read-Write) This setting ONLY applies if an LRL Cal Kit is being modified AND Testport Reference Plane is set to THRU AND the TRL Thru class standard and the TRL Line/Match class standard both have the same values for Offset Z0 and Loss. Otherwise, this setting is ignored.

Before sending this command, select a cal kit using `SENS:CORR:COLL:CKIT:SELect`.

**Parameters**

<bool> Choose from:

- **1** or **ON** - Automatically correct for line loss and dispersion characteristics.
- **0** or **OFF** - Select when anomalies appear during a calibrated measurement which may indicate different loss and impedance values for the Line standards.

**Examples**

```plaintext
SENS:CORR:COLL:CKIT:TRL:LRLC 1
SENSe:CORrection:COLLect:CKIT:TRLoption:LRLChar off
```

### Query Syntax

SENSe:CORRection:COLLect:CKIT:TRLoption:LRLChar?

**Return Type** Boolean

**Default** OFF

---

### SENSe:CORRection:COLLect:CKIT:TRLoption:RPLane <char>

---

4102
Applicable Models: All

(Read-Write) Sets the reference impedance when using this cal kit. Learn more.

Before sending this command, select a cal kit using SENS:CORR:COLL:CKIT:SELect.

Parameters

<char> Choose from:

**THRU**  The THRU standard definition is used to establish the measurement reference plane. Select if the THRU standard is zero-length or very short.

**REFLect**  The REFLECT standard definition is used to establish the position of the measurement reference plane. Select if the THRU standard is not appropriate AND the delay of the REFLECT standard is well defined. Also, select If a flush short is used for the REFLECT standard because a flush short provides a more accurate phase reference than a Thru standard.

Examples

SENS:CORR:COLL:CKIT:TRL:RPL THRU

SENSe:CORRection:COLLect:CKIT:TRLoption:RPLane?

Return Type  Character

Default  THRU
Perform actions on calibration sets.

SENSe<cnum>:CORRection:CSET:ACTivate <string>, <bool>

**Applicable Models:** All

This command replaces **SENS:CORR:CSET:GUID**

*(Read-Write)* Selects and applies a Cal Set to the specified channel.

Use **SENS:CORR:CSET:CAT?** to list the Cal Sets.

**Parameters**

- `<cnum>`  Any existing channel number. If unspecified, value is set to 1
- `<string>`  Cal Set to make active. Specify the Cal Set by **GUID** or **Name**. Use **SENS:CORR:CSET:CAT?** to list the available Cal Sets in either format.
- `<bool>`  Should the Cal Set stimulus values be applied to the channel. Choose from:
ON (1) Apply the Cal Set stimulus values to the channel.

OFF (0) Do NOT apply the Cal Set stimulus values. If the Cal Set stimulus values do not match the channel stimulus values, then the following will occur:

- If interpolation is ON, then interpolation will be attempted. This may fail if the channel frequency is outside the range of the Cal Set.
- If interpolation is OFF, the selection will be abandoned and an error is returned:

### Examples

```plaintext
SENS:CORR:CSET:ACT "My2Port",1
```

```plaintext
sense:correction:cset:activate? name
'returns
"My2Port"
```

### Query Syntax

SENSe<num>:CORRection:CSET:ACTivate? [GUID|NAME]

Returns the name of the Cal Set that is applied to the specified channel. Choose from GUID or NAME to specify which string is returned. If unspecified, the GUID of the Cal Set is returned. If no Cal Set is applied to the specified channel, then "No Calset Selected" is returned.

**Return Type** String

**Default** Not Applicable

---

**Applicable Models:** N522xB, N523xB, N524xB, M937xA, P937xA

This command is replaced by CSET:CAT?

(Read-only) Returns a list of Cal Sets.

**Parameters**

- `<char>` Optional argument. The list is returned in one of the following formats. Both return comma-separated string lists.

  - **GUID** Cal Sets are listed by GUID (Default if unspecified).
  - **NAME** Cal Sets are listed by Name

**Examples**

```plaintext
SENS:CORR:CSET:CAT?
'returns:
{FD6F633E-9719-11d5-8D6C-00108334AE96},{1B03B2CE-971A-11d5-8D6C-00108334AE96}
```
SENSe<cnum>:CORRection:CSET:COPY <string>

Applicable Models: All

(Write-only) Creates a new Cal Set and copies the current Cal Set data into it. Use this command to manipulate data on a Cal Set without corrupting the original cal data.

Parameters

- `<cnum>` Channel number using the Cal Set to be copied. If unspecified, value is set to 1
- `<string>` Name of the new Cal Set.

Examples

```
SENS2:CORR:CSET:COPY 'My2Port'
```

Query Syntax Not Applicable

Default Not Applicable

---

SENSe<cnum>:CORRection:CSET:CREate [name]

Applicable Models: All

(Write-only) Creates an empty Cal Set and attaches it to the specified channel. This command is ONLY necessary before remotely filling the Cal Set with error term data. (For Advanced Users).

A Cal Set is automatically created, applied to the channel, and saved at the completion of a guided cal according to the preference setting `SENS:CORR:PREF:CSET:SAVE`.

Parameters

- `<cnum>` Any existing channel number. If unspecified, value is set to 1
- `[name]` Optional argument. Name of the Cal Set. Spaces or punctuation are NOT allowed. If unspecified, a unique name is chosen in the form "Calset_N" where N is a unique number.

Examples

```
SENS:CORR:CSET:CRE 'My2Port'
```

Query Syntax Not Applicable

Default Not Applicable
SENSe<cnum>:CORRection:CSET:CREate:DEFault [<csetname>], [<correctiontype>]

Applicable Models: All

(Write-only) Creates a unity Cal Set useful for debugging or to quickly test a prototype of automation software.

Parameters

- `<cnum>` Any existing channel number. If unspecified, value is set to 1
- `[<csetname>]` Optional argument. Name of the Cal Set. Spaces or punctuation are NOT allowed. If unspecified, a unique name is chosen in the form "Calset_N" where N is a unique number.
- `[<correctiontype>]` Optional argument. Specifies the correction type to use as the default. In general, “Full NP(X,Y,Z,...)” where N is the number of ports covered in the calset, and “X,Y,Z” are a port list.

  - "Full 2P(1,2)"
    - 2 port S-parameter correction including Port 1 and Port 2
  - "Full 3P(2,3,4)"
    - 3 port S-parameter correction including Port 2, Port 3, and Port 4
  - "Full 2P+(1,2)"
    - 2 port S-parameter correction with power correction including Port 1 and Port 2
  - "Full 1P(3)"
    - 1 port S-parameter correction on Port 3
  - "ResponseTracking(a1)"
    - Response tracking term for the a1 receiver

Examples

- 'This example applies 2-port error correction as if the system were perfect. All error terms will be 1 or 0. SENS:CORR:CSET:CRE:DEF 'My2Port', 'Full 2P(1,2)'

Query Syntax

Not Applicable

Default

Not Applicable

SENSe<cnum>:CORRection:CSET:DATA <eterm, portA, portB>[<rec>,] <block>

Applicable Models: All
(Read-Write) Read or Write a specific error term from/to the Cal Set currently attached to the specified channel. (For Advanced Users). The command can be used only for the error terms listed. See **SENS:CORR:CSET:ETERM** to get and put error term data using a string argument for all error terms.

**Parameters**

<**cnun**> Any existing channel number. If unspecified, value is set to 1

<**eterm, portA, portB**> Error Term, Port pair of the specified error term.

Although not all error terms use two port numbers, two are required by the VNA in all cases. Each port number must be between 1 and the number of ports on the VNA.

**EDIR** - directivity

portA: the port at which directivity is measured.

portB: Not used, but must be a valid VNA port number.

**ESRM** - source match

portA: the port at which source match is measured.

portB: Not used, but must be a valid VNA port number.

**ERFT** - reflection tracking

portA: the port at which reflection tracking is measured.

portB: Not used, but must be a valid VNA port number.

**ELDM** - load match

portA: the port at which load match is measured.

portB: the source port.

Load match is measured with a cable connected between the measured port (portA) and the source port (portB).

The cal system requires that the complete matrix of loadmatch arrays be filled. In most cases you can measure loadmatch once at a port, driven by any other port. Then use that data for all variations of the receive port. (The exception is the 3-port VNA models, which requires the loadmatch-measured port to be driven by every other port.)

For example: Measure the loadmatch at port2 while driving port1. Then upload
this same data to the following arrays:

ELDM,2,1,<data>
ELDM,2,3,<data>
ELDM,2,4,<data>

**ETRT** - transmission tracking

portA: the receive port
portB: the source port for this measurement

**EXTLK** - crosstalk

portA: the receive port
portB: the source port for this measurement

**ERSPT** - response tracking.

portA: Not used, but must be a valid VNA port number.
portB: Not used, but must be a valid VNA port number.

**ERSPI** - response isolation.

portA: Not used, but must be a valid VNA port number.
portB: Not used, but must be a valid VNA port number.

**<rec> <string>** - Specify the VNA receiver for which the Eterm applies.

Required ONLY when Eterm is response tracking (**ERSPT**) or response isolation (**ERSPI**).

Logical receiver notation is allowed.

A full 4-port calibration requires the following terms be uploaded:
Reflection terms

Transmission terms

<Block> (Block). Error term data. A Real / Imaginary data pair for each data point.

Format is set using FORM:DATA command.

For REAL binary formats, refer to Getting Data from the Analyzer using SCPI.

Example

'Set the directivity term with a cal set using 5 points

Query Syntax

SENSe<cnum>:CORRection:CSET:DATA? <eterm,portA, portB>,<rec>

Query Examples

'Read the response isolation eterms for the port 1 reference receiver

sens:corr:cset:data? ERSPI,1,1,'R1'

'Same receiver using logical receiver notation
SENSe<cnum>:CORRection:CSET:DEACtivate

**Applicable Models:** All

*(Write-only)* Unselects a Cal Set from the specified channel.

**Parameters**

- `<cnum>`: Channel number to have Cal Set unselected.

**Examples**

```
SENS:CORR:CSET:DEAC
sense2:correction:cset:deactivate
```

**Query Syntax**

Not Applicable

Default

Not Applicable

---

SENSe:CORRection:CSET:DELete <string> - **Superseded**

**Applicable Models:** N522xB, N523xB, N524xB, M937xA, P937xA

This command is replaced by `CSET:DEL`.

*(Write-only)* Deletes a Cal Set from the set of available Cal Sets. This method immediately updates the Cal Set file on the hard drive. If the Cal Set is currently being used by a channel or does not exist, this request will be denied and an error is returned.

**Parameters**

- `<string>`: Cal Set to be deleted. Specify the Cal Set by **GUID** or **Name**. Use `SENS:CORR:CSET:CAT?` to list the available Cal Sets in either format.

**Examples**

```
sense2:correction:cset:delete 'MyCalSet'
```

SENSe<cnum>:CORRection:CSET:DESCription <string>
Applicable Models: All

(Read-Write) Sets or returns the descriptive string assigned to the selected Cal Set. Change this string so that you can easily identify each Cal Set. Apply and select the Cal Set using `SENS:CORR:CSET:ACT`.

**Parameters**

- `<cnum>`: Any existing channel number. If unspecified, value is set to 1
- `<string>`: The descriptive string associated with the currently-selected Cal Set

**Examples**

```
SENS:CORR:CSET:DESC 'MyCalSet'
sense2:correction:cset:description 'thisCalSet'
```

**Query Syntax**

`SENS<channel>:CORRection:CSET:DESCription?`

**Return Type**

String

**Default**

Not Applicable

---

**SENS<channel>:CORRection:CSET:ETERm[:DATA] <string>,<data>**

Applicable Models: All

(Read-Write) Sets or returns error term data for all VNA measurements. This command modifies a calset that is currently in use by the channel. To see the effects of this modification you need to save the calset and turn correction off and then on again. The commands are as follows:

`SENS:CORR:CSET:SAVE`

`SENS:CORR:STATe OFF`

`SENS:CORR:STATe ON`

**Parameters**

- `<cnum>`: Any existing channel number. If unspecified, value is set to 1
- `<string>`: (String) Error term to read or write. The error term is specified using the EXACT case-sensitive string displayed in the Cal Set Viewer utility. See `SENS:CORR:CSET:DATA` for a description of port numbers.
- `<data>`: (Block) Error term data. A Real / Imaginary data pair for each data point.

Format is set using `FORM:DATA` command.

For REAL binary formats, refer to [Getting Data from the Analyzer using SCPI](#)

**Examples**

```
SENS:CORR:CSET:ETERM "Directivity(1,1)" , 0.237,-1.422, 0.513, 0.895  ' set directivity(source error term for 2 points
SENS:CORR:CSET:ETERM? "Directivity(1,1)"  'read
```

###-ref

###SENSe<cnum>:CORRection:CSET:ETERm:CATalog?**

**Applicable Models**: All

*(Read-only)* Returns a list of error term names found in the current Cal Set that is applied to the specified channel.

#### Parameters

#### Examples

```
SENs:CORr:CSET:ETER:CAT?

'For a 1-port cal, returns

"Directivity(1,1),ReflectionTracking(1,1),SourceMatch(1,1)"
```

### Return Type
- **String**
- **Default**: Not Applicable

---

## SENSe<cnum>:CORRection:CSET:FLATten <string>

**Applicable Models**: All

*(Write-only)* When a Cal Set that was produced by a calibration has been interpolated or otherwise modified (for example, by Fixturing operations) this command saves the modified Cal Set to the VNA hard drive so that it can be reused. There is no User Interface equivalent for this command.

### Background

When a Cal Set is selected for use by a channel, the channel reads the Cal Set from disk (primary Cal Set). If the channel aligns perfectly with the Cal Set, the primary Cal Set is used directly. In this case, the active Cal Set is the primary Cal Set.

When processing occurs on the error terms due to interpolation or modification due to the use of fixturing, the channel will generate a temporary "memory-resident" Cal Set. In this case, the active Cal Set is the memory-resident Cal Set. This FLATten command allows you to save the active Cal Set to disk.

Depending on the measurement conditions, this flattening of the Cal Set can improve performance, especially if the Cal Set is applied often (using multiple recall states) or used by many channels. Flattening a version of the Cal Set for each channel can avoid the interpolation or the fixturing operations.
processing that would otherwise occur when the Cal Set is selected or the instrument state is recalled.

You will have to manage the application of such a Cal Set as the VNA itself will have no way to determine what processing had been done once the flatten command is used. For example, if fixture de-embedding occurred prior to the flatten command, that Cal Set should then be applied WITHOUT fixturing on, because fixturing is already embedded in that Cal Set. It is your responsibility to apply the Cal Set properly.

If you want to repeatedly de-embed multiple networks (i.e. concatenate multiple 2-port de-embedding files) you can use the flatten command to create a new primary Cal Set after each de-embed, and sequentially add additional de-embed networks.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;cnum&gt;</td>
<td>Channel number on which the modified Cal Set resides. If unspecified, value is set to 1</td>

Query Syntax: Not Applicable

Default: Not Applicable

SENSe<cnum>:CORRection:CSET:GENerate:RECeiver <receiverName>

Applicable Models: All Models

This command converts the selected Cal Set from an S-parameter Cal Set to an S-parameter+Power Cal Set. This command requires a Cal Set to be selected.

There are 2 modes for using this command:

Mode 1:

The <receiverName> is optional. If not specified, then ResponseTracking(a1) is set to 1, and the rest of ResponseTracking() terms are computed to be consistent with the S-parameter calibration terms.

Mode 2:

Use this pattern when there is already a receiver calibration for one of the receivers. In that case, this command can be used to transfer the receiver calibration to the other receivers.

If <receiverName> is specified, it must be either 'a1','a2','a3', etc or 'b1','b2','b3'. The ResponseTracking term for this receiver must already be added to the Cal Set, or else this
command will generate an error. This command will then compute the ResponseTracking() terms for all of the other receivers in a manner consistent with the S-parameter calibration terms.

**Parameters**

- `<cnum>` Channel number on which the modified Cal Set resides. If unspecified, value is set to 1.
- `<receiverName>` Name of the receiver ('a1', 'a2', 'a3', etc., or 'b1', 'b2', 'b3', etc.)

**Examples**

```
SENS:CORR:CSET:GEN:REC 'a1'
```

**Query Syntax**

```
SENSe<cnum>:CORRection:CSET:GENerate:RECeiver?
```

**Default** Not Applicable

---

**SENSe<cnum>:CORRection:CSET:GUID <string> Superseded**

**Applicable Models:** N522xB, N523xB, N524xB, M937xA, P937xA

This command is replaced by **SENS:CORR:CSET:ACTivate**.

**(Read-Write)** Selects the Cal Set identified by the string parameter (GUID) and applies it to the specified channel.

- A Cal Set cannot be selected for a channel which is not ON.
- If the stimulus settings of the selected Cal Set differ from those of the selected channel, the instrument will automatically change the channel's settings to match the Cal Set.

**Parameters**

- `<cnum>` Any existing channel number. If unspecified, value is set to 1
- `<string>` GUID of the desired Cal Set. The curly brackets and hyphens must be included.

**Examples**

```
```

**Query Syntax**

```
SENSe<cnum>:CORRection:CSET:GUID?
```

Returns the GUID of the currently-selected Cal Set for the specified channel.

**Return Type** String

**Default** Not Applicable
SENSe<cnum>:CORRection:CSET:ITEM:CATalog?

Applicable Models: All

(Read-only) Returns the names of the items in the Cal Set.

Parameters

Examples

SENS:CORR:CSET:ITEM:CAT?
"Created By,Firmware Revision,Model Number,Serial Number" 'Example returned item names.'

Return Type String

If no Cal Set is applied on the current channel, the following error message is displayed:

+163, "Requested Cal Set was not found in Cal Set Storage."

Default Not Applicable

SENSe<cnum>:CORRection:CSET:ITEM[:DATA]? <itemName>

Applicable Models: All

(Read-only) Read the value of the Cal Set item. The Cal Set item is added by the VNA firmware to every Cal Set.

About Cal Set Items

A Cal Set item is a named value. You can list the named values using CSET:ITEM:CATalog? or SENS:CORR:CSET:ITEM:CATalog?

You can query the value of a specific item by asking for its data: CSET:ITEM:DATA?

For example, one of the items added by the VNA firmware to every Cal Set is named 'Created By'. The value attached to this item is the name of the VNA Measurement Class or Channel that created the Cal Set. When an SMC cal is performed, you can query the Cal Set for the 'Created By' item, and it will return 'Scalar Mixer/Converter'. The same query on an NFx channel returns 'Noise Figure Converters'.

Parameters

<cnun> Any existing channel number. If unspecified, value is set to 1

<itemName> (String) Item added by the VNA firmware to the currently loaded Cal Set.

Examples

SENS:CORR:CSET:ITEM? "Model Number"

"N5242B" 'Example returned Model Number value.'

Return Type String

If no Cal Set is applied on the current channel, the following error message is
displayed:

+163, "Requested Cal Set was not found in Cal Set Storage."

**Default** Not Applicable

---

### SENSE<cnump>:CORRection:CSET:NAME <string>

**Applicable Models:** All

(Read-Write) Sets or queries the name of the Cal Set currently applied to the specified channel.

**Parameters**

- `<cnump>`: Any existing channel number. If unspecified, value is set to 1
- `<string>`: Name of the Cal Set. Spaces or punctuation NOT allowed.

**Examples**

```
SENS:CORR:CSET:NAME 'MyCalSet'
sense2:correction:cset:name 'thisCalSet'
```

**Query Syntax**

SENSe<cnump>:CORRection:CSET:NAME?

**Return Type** String

**Default** Not Applicable

---

### SENSE<cnump>:CORRection:CSET:SAVE [<char>]

**Applicable Models:** All

This command is NOT necessary after completion of a calibration. A Cal Set is automatically created, applied to the channel, and saved at the completion of a guided cal according to the preference setting SENS:CORR:PREF:CSET:SAVE.

(Read Write)

Saves the channel's Cal Set to the VNA hard drive. For example, use this command after writing data to a Cal Set using SENS:CORR:CSET:DATA (For Advanced Users).

The file name is saved as "CSETx.cst" where x is the user number assigned to `<char>`, and .cst specifies a Cal Set and instrument state. This is not the same syntax as a file saved through the default choices from the front panel, which is "at00x.cst". For more information on the file naming syntax, see the MMEMory subsystem. Learn more about Instrument/Cal States.

**Parameters**

- `<cnump>`: Any existing channel number. If unspecified, value is set to 1
[<char>] Optional argument. Choose from:

USER01
USER02...
and so forth, until...
USER10

If <char> is NOT specified, changes that may have been made are saved to the cal set and NOT to the *.cst file.

**Examples**

```
SENS:CORR:CSET:SAVE USER03
sense2:correction:cset:save user09
'save changes to only the cal set
SENS:CORR:CSET:SAVE
```

**Query Syntax**

`SENS<cnun>:CORRection:CSET:SAVE?`

Queries the last correction set saved.

**Return Type**

Character

**Default**

Not applicable

---

`SENS<cnun>:CORRection:CSET[:SELect] <char>` **Superseded**

**Applicable Models:** N522xB, N523xB, N524xB, M937xA, P937xA

This command is replaced by `MMEM:LOAD`

(Read-Write) Recalls a *.cst file from memory. The file name is "CSETx.cst" where x is the user number assigned to <char>. Learn more about .cst files

For more information on the file naming syntax, see the **MMEMory** subsystem.

**Note:** This command does NOT select a Cal Set for a channel. To select a Cal Set, use `SENS:CORR:CSET:ACTivate`

**Parameters**

- `<cnum>` Any existing channel number. If unspecified, value is set to 1
- `<char>` Choose from:
  - **DEF** - Presets the analyzer
  - USER01 - Restores User01 calibration data
<table>
<thead>
<tr>
<th>USER02</th>
<th>Restores User02 calibration data through...</th>
</tr>
</thead>
<tbody>
<tr>
<td>USER10</td>
<td>Restores User10 calibration data</td>
</tr>
</tbody>
</table>

**Examples**

| SENS:CORR:CSET DEF | sense2:correction:cset:select user02 |

**Query Syntax**

SENS<cnm>:CORRection:CSET[:SElect]?

**Return Type**

- **Default**: DEF

---

**SENS<cnm>:CORRection:CSET:STANdard[:DATA] <string>,<data>**

**Applicable Models:** All

*(Read-Write)* Sets or returns standard data. Standard data is available for Unguided Cals ONLY.

**Note:** The “Standards data” container in the calset is intended for internal use only. External access is provided for use in diagnosing calibration problems. Users should not form any expectations as to the presence of the data or the naming conventions used.

**Parameters**

- `<cnum>`: Any existing channel number. If unspecified, value is set to 1
- `<string>`: (String) Cal standard to read or write. The standard is specified using the EXACT case-sensitive string displayed in the Cal Set Viewer utility. See SENS:CORR:CSET:DATA for a description of port numbers.
- `<data>`: (Block). Acquisition data. A Real / Imaginary data pair for each data point. Format is set using FORM:DATA command.

For REAL binary formats, refer to Getting Data from the Analyzer using SCPI.

**Examples**

| SENS:CORR:CSET:STAN 'S11C(1,1), 0.237,-1.422, 0.513, 0.895 ' | Set acquisition data for two points. |
| SENS:CORR:CSET:STAN:DATA? "S11C(1,1)" | *Read data* |

**Query Syntax**

SENS<cnm>:CORRection:CSET:STANdard[:DATA]? (string)

**Return Type**

- **Default**: Block data
  - **Not Applicable**
**SENSe:CORRection:CSET:STAND:d:CATalog?**

**Applicable Models:** All

*(Read-only)* Returns a list of available standard name found in the current Cal Set that is applied to the specific channel.

**Parameters**

**Examples**

```
SENS:CORR:CSET:STAN:CAT?
```

**Return Type** String

**Default** Not Applicable

---

**SENSe<ch>:CORRection:CSET:STIMulus? [num]**

**Applicable Models:** All

*(Read-only)* Returns the source or response stimulus values for the Cal Set that is currently used by channel `<ch>`. Values are returned in the format specified by `FORM:DATA` (Block or ASCII).

**Parameters**

- `<ch>` Channel number to query Cal Set stimulus values. If unspecified, value is set to 1
- `[num]` Optional argument. Range of frequencies to return. These values would be different when FOM (Opt S93080A) is enabled.

  - 0 - returns source frequencies. Default setting if not specified.
  - 1 - returns response frequencies.
  - 2 - returns primary frequencies.

**Examples**

```
SENS:CORR:CSET:STIM?
```

```
sense:correction:cset:stimulus 1
```

**Return Type** Numeric

**Default** Not Applicable

---

**SENSe:CORRection:CSET:TSET:ALLPorts? <cset>**
Applicable Models: All

(Read-only) Reads the port mapping used for the specified Cal Set. The returned values are the physical ports. The POSITION of the returned values corresponds to the logical ports.

For example, with an N44xx test set, if the returned string is "PNA 1,TS 2,PNA 2, TS 4" this means:

- VNA 1 is assigned to logical port 1
- TS 2 is assigned to logical port 2
- VNA 2 is assigned to logical port 3
- TS 4 is assigned to logical port 4

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>&lt;cset&gt;</code></td>
<td>(String) Name or GUID of the Cal Set. Use SENS:CORR:CSET:CAT? to read the list of available Cal Set names or GUIDs.</td>
<td></td>
</tr>
</tbody>
</table>

Examples

SENS:CORR:CSET:TSET:ALLP? "MyCalSet"

Return Type: String

Default: Not Applicable

SENSe:CORRrection:CSET:TSET:TYPe? `<cset>`

Applicable Models: All

(Read-only) Reads the test set type (model) used for the specified Cal Set.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>&lt;cset&gt;</code></td>
<td>(String) Name or GUID of the Cal Set. Use SENS:CORR:CSET:CAT? to read the list of available Cal Set names or GUIDs.</td>
<td></td>
</tr>
</tbody>
</table>

Examples

SENS:CORR:CSET:TSET:TYPe? "MyCalSet"
'returns "N44xx"

Return Type: String

Default: Not Applicable
SENSe<ch>:CORRection:CSET:TYPE:CATalog? [format]

Applicable Models: All

(Read-only) Query the Cal Types available in the selected Cal Set. The output is a comma separated list of Guids or a Cal Type names. Learn more about applying Cal Types using SCPI.

Use CALC:MEAS:CORR:TYPE to apply a Cal Type.

Parameters

<ch> Any existing channel number. If unspecified, value is set to 1

[format] (Optional) Format of the output of cal types. choose from:

NAME - (default) returns a list of cal type string names.

GUID - returns a list of cal type GUIDs

Examples

SENS:CORR:CSET:TYPE:CAT? NAME
SENS2:CORRection:CSET:TYPE:CAT?

Return Type String

Default Not Applicable

Default

OFF (0)

SENSe<cnum>:CORRection:EXTension:AUTO:LOSS <bool>

Applicable Models: All

(Read-Write) Specifies whether or not to include loss correction as part of automatic port extension. Learn more about Loss Compensation in port extension.

Parameters

$cnum$ Any existing channel number. If unspecified, value is set to 1
$bool$ ON (or 1) - Includes Loss correction.
OFF (or 0) - Does NOT include Loss correction.

Examples

```
SENS:CORR:EXT:AUTO:LOSS 1
sense2:correction:extension:auto:loss off
```

Query Syntax

SENSe<cnum>:CORRection:EXTension:AUTO:LOSS?

Return Type

Boolean

Default

OFF (0)

SENSe<cnum>:CORRection:EXTension:AUTO:MEASure <char>
Applicable Models: All

(Write-only) Measures either an OPEN or SHORT standard. When this command is sent, the VNA acquires the measurement with which to set automatic port extensions. This command should be preceded by the CALCulate:PARameter:MNUMber <num> where num is the trace number of a measurement on the specified channel. Learn more about which standard to measure.

**Parameters**

- `<cnum>` Any existing channel number. If unspecified, value is set to 1
- `<char>` Standard to be measured. Choose from:

  - OPEN Measure OPEN standard
  - SHORT Measure SHORT standard

**Examples**

```
SENS:CORR:EXT:AUTO:MEAS OPEN
sense2:correction:extension:auto:measure short
```

**Query Syntax** Not Applicable

**Default** Not Applicable

---

SENSe<cnum>:CORRection:EXTension:AUTO:PORT<n> <bool>

Applicable Models: All

(Read-Write) Enables and disables automatic port extensions on the specified port.

**Parameters**

- `<cnum>` Any existing channel number. If unspecified, value is set to 1
- `<n>` VNA Port number to enable or disable for automatic port extensions.
- `<bool>` ON (or 1) - Enable
  
  OFF (or 0) - Disable

**Examples**

```
SENS:CORR:EXT:AUTO:PORT2 0
sense2:correction:extension:auto:port4 on
```

**Query Syntax** SENSce<cnum>:CORRection:EXTension:AUTO:PORT<n>?

**Return Type** Boolean

**Default** All ports ON (enabled)

---

SENSe<cnum>:CORRection:EXTension:AUTO:RESet
Applicable Models: All

(Write-only) Clears old port extension delay and loss data in preparation for acquiring new data. Send this command prior to sending a new series of SENS:CORR:EXT:AUTO:MEAS. If acquiring both OPEN and SHORT standards, do not send this command between those acquisitions.

Parameters
<cnun> Any existing channel number. If unspecified, value is set to 1

Examples
SENS:CORR:EXT:AUTO:RES
sense2:correction:extension:auto:reset

Query Syntax
Not Applicable

Default
Not Applicable

SENSe<cnun>:CORRection:EXTension:AUTO:STARt <value>

(Read-Write) Set the start frequency for custom user span. Learn more about User Span.

Parameters
<cnun> Any existing channel number. If unspecified, value is set to 1
<value> User span start value. Must be within the frequency range of the active channel and less than the value set by SENS:CORR:EXT:AUTO:STOP.

Examples
SENS:CORR:EXT:AUTO:STAR 1E9
sense2:correction:extension:auto:start 200e6

Query Syntax
SENSe<cnun>:CORRection:EXTension:AUTO:STARt <value>?

Return Type
Numeric

Default
Start frequency of the current active channel.
Applicable Models: All

(Read-Write) Set the stop frequency for custom user span. Learn more about User Span.

Parameters

- `<cnum>`: Any existing channel number. If unspecified, value is set to 1.
- `<value>`: User span stop value. Must be within the frequency range of the active channel and greater than the value set by SENS:CORR:EXT:AUTO:STARt.

Examples

```
SENS:CORR:EXT:AUTO:STOP 1E9
sense2:correction:extension:auto:stop 200e6
```

Query Syntax

```
SENSe<cnum>:CORRection:EXTension:AUTO:STOP <value>?
```

Return Type: Numeric

Default: Stop frequency of the current active channel.

SENSe<cnum>:CORRection:EXTension:PORT<pnum>:DISTance <value> Superseded

Applicable Models: All

(Read-Write) Sets and returns the port extension delay in physical length (distance).

Parameters

- `<cnum>`: Any existing channel number. If unspecified, value is set to 1.
- `<pnum>`: Port Number that will receive the delay setting. If unspecified, value is set to 1.
- `<value>`: Physical length of fixture of added transmission line. First specify units with SENS:CORR:EXT:PORT:UNIT.

Examples

```
SENS:CORR:EXT:PORT1:DIST 12
sense2:correction:extension:port2:distance .003
```

Query Syntax

```
SENSe<cnum>:CORRection:EXTension:PORT<pnum>:DISTance?
```

Return Type: Numeric

Default: 0

SENSe<cnum>:CORRection:EXTension:PORT<pnum>:FREQuency<n> <value> Superseded
Applicable Models: All

The command set of `SENSe<cnum>:CORRection:EXTension:PORT:XXXX` is changed to `CALCulate:FSIMulator:DRAFt:EXTension:PORT:YYYY` and `CALCulate:FSIMulator::EXTension:PORT:YYYY`?

Learn about Using Fixture Simulator.

(Read-Write) Sets and returns the frequency for the Freq and Loss pair number and for the specified port number.

Learn about Loss Compensation values.

### Parameters

- `<cnum>`: Any existing channel number. If unspecified, value is set to 1.
- `<pnum>`: Port Number that will receive the freq/loss settings. If unspecified, value is set to 1.
- `<n>`: Freq and Loss pair number. Choose from 1 or 2. If unspecified, value is set to 1.
- `<value>`: Frequency value. Choose a frequency within the frequency span of the VNA.

Learn about Using Fixture Simulator.

*(Read-Write)* Sets and returns the media type of the added fixture or transmission line.

See also SENSe:CORR:EXT:PORT:SYSMedia

**Note:** This command affects ALL measurements on the specified channel.

**Parameters**

- **<cnum>** Any existing channel number. If unspecified, value is set to 1
- **<pnum>** Port Number for which media type is being set. If unspecified, value is set to 1.
- **<char>** Medium type. Choose from:
  - COAX
  - WAVEguide

**Examples**

```
SENS:CORR:EXT:PORT:MED COAX
sense2:correction:extension:port2:medium waveguide
```

**Query Syntax**

SENSe<cnum>:CORRection:EXTension:PORT<pnum>:MEDium?

**Return Type**

Character

**Default**

COAX
SENSe<cnm>:CORRection:EXTension:PORT:SYSMedia <bool> Superseded

Applicable Models: All

The command set of SENSe<cnm>:CORRection:EXTension:PORT:XXXX is changed to CALCulate:FSIMulator:DRAFt:EXTension:PORT:YYYY and CALCulate:FSIMulator::EXTension:PORT:YYYY?

Learn about Using Fixture Simulator.

(Read-Write) Sets and returns the state of coupling with the system Media type. Learn more.

Note: This command potentially affects ALL measurements on the VNA.

Parameters

- <cnm> Any existing channel number. If unspecified, value is set to 1
- <bool> Coupling state. Choose from:
  - ON (or 1) - Media type is coupled with the system setting.
  - OFF (or 0) - Media type is NOT coupled with the system setting.

Examples

SENSe:CORR:EXT:PORT:SYSM 1
SENSe:CORR:EXT:PORT:SYSMedia off

Query Syntax

SENSe<cnm>:CORRection:EXTension:PORT:SYSMedia?

Return Type

Boolean

Default

1 or ON (Coupled)

---

SENSe<cnm>:CORRection:EXTension:PORT<pn>:SYSVelocity <bool> Superseded

Applicable Models: All

The command set of SENSe<cnm>:CORRection:EXTension:PORT:XXXX is changed to CALCulate:FSIMulator:DRAFt:EXTension:PORT:YYYY and CALCulate:FSIMulator::EXTension:PORT:YYYY?

Learn about Using Fixture Simulator.

(Read-Write) Sets and returns the state of coupling with the system Velocity Factor value. Learn more.

Note: This command potentially affects ALL measurements on the VNA.

Parameters

- <cnm> Any existing channel number. If unspecified, value is set to 1
- <pn> Port Number for which system Velocity Factor coupling is being set. If unspecified, value is set to 1.
Coupling state. Choose from:

- **ON** (or 1) - Velocity Factor is coupled with the system setting.
- **OFF** (or 0) - Velocity Factor is NOT coupled with the system setting.

**Examples**

```
SENS:CORR:EXT:PORT:SYSV 1
sense2:correction:extension:port2:sysvelocity off
```

**Query Syntax**

```
SENSe<cnum>:CORRection:EXTension:PORT<pnum>:SYSVelocity?
```

**Return Type**

Boolean

**Default**

1 or ON (Coupled)

---

**SENSe<cnum>:CORRection:EXTension:PORT<pnum>[:TIME] <num> Superseded**

**Applicable Models:** All

(Read-Write) Sets the extension delay value in time at the specified port. Must also set `SENS:CORR:EXT ON`.

**Note:** This command affects ALL measurements on the specified channel.

**Parameters**

- `<cnum>` Any existing channel number. If unspecified, value is set to 1
- `<pnum>` Port Number that will receive the extension. If unspecified, value is set to 1.
- `<num>` The port extension in seconds; may include suffix. Choose a number between: -1E18 and 1E18

**Examples**

```
SENS:CORR:EXT:PORT 2MS
sense2:correction:extension:port2 .00025
```

**Query Syntax**

```
SENSe<cnum>:CORRection:EXTension:PORT<pnum>[:TIME]?
```

**Return Type**

Numeric

**Default**

0

---

**SENSe<cnum>:CORRection:EXTension:PORT:UNIT <char> Superseded**
Applicable Models: All

(Read-Write) Sets and returns the units for specifying port extension delay in physical length (distance).

Parameters

- `<cnum>` Any existing channel number. If unspecified, value is set to 1.
- `<char>` Units for delay in distance. Choose from:
  - METer
  - FEET
  - INCH

Examples

```
SENS:CORR:EXT:PORT:UNIT MET
sense2:correction:extension:port:unit inch
```

Query Syntax

`SENSe<cnum>:CORRection:EXTension:PORT:UNIT?`

Return Type

Character

Default

METer

SENSe<cnum>:CORRection:EXTension:PORT<pnum>:VELFactor <value> Superseded

Applicable Models: All

(Read-Write) Sets and returns the velocity factor of the fixture or added transmission line.

Parameters

- `<cnum>` Any existing channel number. If unspecified, value is set to 1
- `<pnum>` Port Number for which velocity factor is being set. If unspecified, value is set to 1.
- `<value>` Velocity Factor.

Set `SENS:CORR:EXT:PORT:SYSV` to use the system velocity factor.
SENSe<cnum>:CORRection:EXTension:PORT<pnum>:WGCutoff <value> Superseded

Applicable Models: All

Learn about Using Fixture Simulator.

(Read-Write) Sets and returns the cutoff (minimum) frequency of the added waveguide fixture or transmission line.

**Parameters**

- `<cnum>` Any existing channel number. If unspecified, value is set to 1
- `<pnum>` Port Number for which media type is being set. If unspecified, value is set to 1.
- `<value>` Cutoff frequency in Hz.

This value is ignored when SENS:CORR:EXT:PORT:MED is set to COAX for the same port.

**Examples**

SENSe:CORR:EXT:PORT:WGC 1e8

SENSe2:CORR:EXT:PORT2:WGC 100MHz

**Query Syntax**

SENSe<cnum>:CORRection:EXTension:PORT<pnum>:WGCutoff?

**Return Type**

Numeric

**Default**

System Media Cutoff Frequency
**Applicable Models:** N522xB, N523xB, N524xB, M937xA, P937xA

*(Read-Write)* Sets the extension value at the specified receiver. Must also set SENS:CORR:EXT ON.

**Note:** Before using this command you must select a measurement using CALC:MEAS:DEF. You can select one measurement for each channel.

**Parameters**

- `<cnum>` Any existing channel number. If unspecified, value is set to 1
- `<Rnum>` Number of the receiver that will receive the extension. If unspecified, value is set to 1
  Choose from:
  - 1 for Receiver A
  - 2 for Receiver B
- `<num>` The electrical length in seconds; may include suffix. Choose a number between:
  - -10 and 10

**Examples**

- `SENS:CORR:EXT:REC 2MS`
- `sense2:correction:extension:receiver2:time .00025`

**Query Syntax**

`SENSe<cnum>:CORRection:EXTension:RECeiver<Rnum>[:TIME]?

**Return Type**

- Numeric

**Default**

- 0

**SENSe<cnum>:CORRection:EXTension[:STATe] <ON | OFF> Superseded**
Applicable Models: All

*(Read-Write)* Turns port extensions ON or OFF.

### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>&lt;cnum&gt;</code></td>
<td>Any existing channel number. If unspecified, value is set to 1</td>

<td>`&lt;ON</td>
<td>OFF&gt;`</td>
</tr>
<tr>
<td></td>
<td>OFF (or 0) - turns port extensions is OFF.</td>
</tr>
</tbody>
</table>

### Examples

```plaintext
SENS:CORR:EXT ON
sense2:correction:extension:state off
```

### Query Syntax

```
SENSe<cn>u>m>:CORRection:EXTension[:STATe]?
```

### Return Type

Boolean (1 = ON, 0 = OFF)

### Default

OFF
Sense:Correction:Collect:Guided Commands

Performs and applies a SmartCal (Guided) calibration and other error correction features.

Important Notes:

- To perform a **Guided Calibration**, use ONLY Sens:Corr:Coll:Guided commands. See the "Guided" example programs for clarification.

- ALWAYS send ALL measurement setup commands BEFORE initializing a remote calibration.

SENSe<ch>:CORRection:COLLect:GUIDed:ABORt
Applicable Models: All

(Write-only) Aborts the acquiring of a guided calibration that has been INITialized but has not yet been concluded using the SAVE command. If at least one Cal standard has already been measured, and the Calibration Window is being displayed, this command also closes the Calibration Window and re-tiles the other measurement windows.

Parameters

<ch>  Channel being calibrated, depending on the CHAN:MODE setting. If unspecified, value is set to 1.

Examples

SENS:CORR:COLL:GUID:ABOR
sense2:correction:collect:guided:abort

Query Syntax

Not Applicable

Default  Not Applicable

SENSe:<ch>CORRection:COLLect:GUIDed[:ACQuire] STAN<n>[,sync]

Applicable Models: All

(Write-only) Initiates the measurement of the specified calibration standard. Executing this command with an unnecessary standard has no affect.

The measured data is stored and used for subsequent calculations of error correction coefficients. All standards must be measured before a calibration can be completed. Any measurement can be repeated until the SENS:CORR:COLL:GUID:SAVE command is executed.

Query the user prompt description using SENS:CORR:COLL:GUID:DESC ?

Query the required calibration steps using SENS:CORR:COLL:GUID:STEP?

Parameters

<ch>  Channel being calibrated, depending on the CHAN:MODE setting. If unspecified, value is set to 1.

STAN<n>  Choose from: STAN1, STAN2, etc. through STANn where n is the number of cal standard connection steps for the calibration.

Note: You do not necessarily have to invoke these connection steps in sequential order, but you must issue this command for all of the steps to be able to complete the calibration.

[sync]  Optional argument. Choose from:

SYNChronous - blocks SCPI commands during standard measurement
ASYNchronous - does NOT block SCPI commands during standard measurement.

Learn more about this argument

Examples
SENSe:CORRection:COLLect:GUIDed:ADAPter:CREate? <conn1>, <conn2>

Applicable Models: All

(Read-only) Specifies the use of a THRU adapter to be used during the Guided Cal Unknown THRU and Adapter Removal Cal. Returns an adapter index <n> which is used to refer to the adapter in several related commands. See Cal Thru Methods. While the choice of which end of the adapter is <conn1> and <conn2> is arbitrary, it is necessary to remember which will be used on each test port.

The settings for this command remain until Preset, or the command is sent using a different setting, or until the ZERO command is sent.

Parameters
<ch> Channel being calibrated, depending on the CHAN:MODE setting. If unspecified, value is set to 1.
<conn1> Adapter port 1 connector type. Use SENS:CORR:COLL:GUID:CONN:CAT? to return a list of valid connector types.
<conn2> Adapter port 2 connector type.

Examples See example using this command.

Return Type Numeric
Default Not Applicable

SENSe<ch>:CORRection:COLLect:GUIDed:ADAPter:COUNt?
Applicable Models: All

(Read-Only) Returns the number of THRU adapters that have been created for this calibration using SENS:CORR:COLL:GUID:ADAP:CREate.

Parameters

<ch> Channel being calibrated, depending on the CHAN:MODE setting. If unspecified, value is set to 1.

Examples

See example using this command.

Return Type Numeric

Default Not Applicable

SENSe:<ch>CORRection:COLLect:GUIDed:ADAPter:COUNt:ZERO

Applicable Models: All

(Write-only) Removes all adapters that have been defined for calibrations on the specified channel using SENS:CORR:COLL:GUID:ADAP:CREate.

Parameters

<ch> Channel being calibrated, depending on the CHAN:MODE setting. If unspecified, value is set to 1.

Examples

SENSe:CORRection:COLLect:GUIDed:ADAPter:COUNt:ZERO

Query Syntax Not Applicable

Default Not Applicable

SENSe<ch>:CORRection:COLLect:GUIDed:ADAPter<n>:DELay[:VALue] <coax>, [<wphase>], [<wdelay>]
Applicable Models: All

(Write-only) Specifies the adapter delay and optionally waveguide delay and optional phase offset (degrees) of adapter \(<n>\).

The settings for this command remain until Preset, or the command is sent using a different setting, or until the ZERO command is sent.

**Parameters**

- **<ch>** Channel being calibrated, depending on the CHAN:MODE setting. If unspecified, value is set to 1.
- **<n>** Adapter index number that was returned from SENS:CORR:COLL:GUID:ADAP:CREate?
- **<coax>** Delay value of coax adapter \(<n>\) in seconds. If the adapter has no coax connector, enter 0.
- **<wphase>** Waveguide phase offset in degrees. If the adapter has no waveguide connector, do not enter a value.
- **<wdelay>** Waveguide delay in seconds. If the adapter has no waveguide connector, do not enter a value.

**Examples**

See example using this command.

**Default** Not Applicable

---

SENSe<ch>:CORRection:COLLect:GUIDed:ADAPter<n>:DESCription <string>

Applicable Models: All

(Write-only) Specifies the adapter description for use as the guided cal connection prompts.

The settings for this command remain until Preset, or the command is sent using a different setting, or until the ZERO command is sent.

**Parameters**

- **<ch>** Channel being calibrated, depending on the CHAN:MODE setting. If unspecified, value is set to 1.
- **<n>** Adapter index number that was returned from SENS:CORR:COLL:GUID:ADAP:CREate?
- **<string>** Adapter description.

**Examples**

See example using this command.
### SENSE:CORRection:COLLect:GUIDed:ADAPter<n>:PATHs <port pairs>

**Applicable Models:** All

*(Write-only)* Specifies the port pairs for which the adapter will be used for a THRU connection.

For example, for a 3-port cal on channel 1 using ports 1, 2, and 3, to use adapter 1 between the ports (1 to 2) and (1 to 3) the following command is used: `SENSe1:CORRection:COLLect:GUIDed:ADAPter1:PATH 1,2,1,3`.

The adapter must have the same DUT connectors as the ports that are already specified for these ports.

The settings for this command remain until Preset, or the command is sent using a different setting, or until the ZERO command is sent.

**Parameters**

- `<ch>` Channel being calibrated, depending on the CHAN:MODE setting. If unspecified, value is set to 1.
- `<n>` Adapter index number that was returned from `SENSe:CORRection:COLLect:GUIDed:ADAPter:CREate?`.
- `<port pair>` Ports for which the adapter will be used. The orientation is not critical, as the VNA will align the connector types as necessary. The minimum number of Thru connections required is the number of ports to calibrated -1.

**Examples**

See example using this command.

---

### SENSE:CORRection:COLLect:GUIDed:CHANnel:MODE <bool>

---
Applicable Models: All

(Read-Write) Determines whether or not to honor the channel <ch> argument in guided calibration SCPI commands.

Parameters

<bool>  **OFF (0)**  Honor all <ch> arguments. This means the <ch> channel is calibrated regardless of which channel is currently active.

**ON (1)**  Legacy behavior. Behavior is specified by the following table:

<table>
<thead>
<tr>
<th>&lt;ch&gt; channel type</th>
<th>Active channel type</th>
<th>Behavior</th>
</tr>
</thead>
<tbody>
<tr>
<td>Std or App</td>
<td>Std or App</td>
<td></td>
</tr>
<tr>
<td>Std</td>
<td>Std</td>
<td>Active chan cal'd</td>
</tr>
<tr>
<td>Std</td>
<td>App</td>
<td>&quot;Channel not found&quot; error</td>
</tr>
<tr>
<td>App</td>
<td>Std</td>
<td>&lt;ch&gt; chan cal'd</td>
</tr>
<tr>
<td>App</td>
<td>App</td>
<td>&lt;ch&gt; chan cal'd</td>
</tr>
</tbody>
</table>

Learn about Standard vs Application channels.

Examples

```
SENS:CORR:COLL:GUID:CHAN:MODE 0
sense:correction:collect:guided:channel:mode ON
```

Query Syntax  SENSE:CORRection:COLLect:GUIDed:CHANnel:MODE?

Return Type  Boolean

Default  OFF - This is the default beginning with A.09.50

ON - Default before A.09.50

```
```
Applicable Models: All

(Read-only) This command replaces SENS:CORR:COLL:GUID:CKIT:PORT:CAT?

Returns a comma-separated list of valid kits that use the specified connector type. This includes mechanical cal kits, applicable characterizations found within ECal modules currently connected to the VNA, and all user characterizations stored in VNA disk memory. For ECal modules, the returned list includes the serial numbers. See ECal User Characterization commands.

Use items in the list to select the kit to be used with the SENS:CORR:COLL:GUID:CKIT:PORT and SENSE<ch>:CORRection:COLLect:GUIDed:PSENsor<pnum>:CKIT commands.

Parameters

Examples  SENS:CORR:COLL:GUID:CKIT:CAT? "Type N (50) male"

Return Type String

Default Not Applicable

Applicable Models: All

(Read-only) This command is replaced by SENS:CORR:COLL:GUID:CKIT:CAT?.

Returns a comma-separated list of valid kits for the specified VNA port. In addition to mechanical calibration kits, this will include applicable characterizations found within ECal modules currently connected to the VNA.

Use items in the list to select the kit to be used with the SENS:CORR:COLL:GUID:CKIT:PORT command.

Note: The serial number is returned for ALL ECal modules that are connected with the connector type of the specified port. Previously, the returned list would include the serial numbers to distinguish the ECal modules only when two or more identical ECal models were connected to the VNA.

Parameters

<pnum> Any existing port number. If unspecified, value is set to 1

Examples  SENS:CORR:COLL:GUID:CKIT:PORT1:CAT?

'When "Type N (50) male" is specified for connector type, returns:

"85054D, 85032F"
When two identical ECal modules are connected for the connector type, the return string includes serial numbers "85092-60010 ECal 10675, 85092-60010 ECal 00758"

**Return Type** String

**Default** Not Applicable

**Applicable Models:** All

(Read-Write) Specifies the calibration kit (mechanical or ECal) for each port to be used during a guided calibration. An unused port does NOT need to have a specified Cal Kit.

1. Specify the connector type for the port with SENS:CORR:COLL:GUID:CONN:PORT.

2. Query the valid available kits for the connector on each port with SENS:CORR:COLL:GUID:CKIT:PORT:CAT?

3. Specify the kit using this command.

4. Perform a query of this command. If the <kit> parameter was incorrectly entered, an error will be returned.

When using this command to specify the cal kit for the output of a VMC calibration mixer, specify port 3. If port 3 is already used for the output of the DUT mixer, then specify port 4. Learn more.

**Parameters**

- `<ch>` Channel being calibrated, depending on the CHAN:MODE setting. If unspecified, value is set to 1.

- `<pnum>` Any existing port number. If unspecified, value is set to 1

- `<kit>` Calibration kit to be used for the specified port. **Case-sensitive.**

When using an ECal module, include the characterization name in the <kit> string. Use SENSe:CORR:COLL:GUID:CKIT:CAT? to read the list of characterizations available in the module and in VNA disk memory.

If two or more identical ECal modules are connected to the VNA, the serial number must be included to distinguish the ECal modules.

**Examples**

'Note: All of the following examples specify port 1 only'

'Mechanical Cal kit

SENS:CORR:COLL:GUID:CKIT:PORT1 '85055A'
Standard ECal modules

SENS:CORR:COLL:GUID:CKIT:PORT1 "N4691-60004 ECal"

Non-factory ECal characterizations are specified as follows:

SENS:CORR:COLL:GUID:CKIT:PORT1 "N4691-60004 User 1 ECal"

When two or more ECal modules with the same model number are connected, also specify the serial number as follows:

SENS:CORR:COLL:GUID:CKIT:PORT1 "N4691-60004 ECal 01234"

When Disk Memory ECal user characterizations are used, specify both the User char and the serial number as follows:

SENS:CORR:COLL:GUID:CKIT:PORT1 "N4691-60004 MyDskChar ECal 01234"

Query Syntax

SENSe:CORRection:COLLect:GUIDed:CKIT:PORT<pnum>[:SELect]?

Return Type

String - If the <kit> parameter was incorrectly entered while writing, an error will be returned.

Default

Not Applicable

SENSe:CORRection:COLLect:GUIDed:CONNector:CATalog?

Applicable Models: All

(Read only) Returns a list of valid connectors based on the connector descriptions of the available cal kits. Use an item from the returned list to specify a connector for SENS:CORR:COLL:GUID:CONN:PORT

Here are the more common connector types:
<table>
<thead>
<tr>
<th>Waveguide</th>

</table>

**Examples**

```
```

**Returns:**

Type N (50) female, Type N (50) male, APC 7 (50), 3.5 mm (50) male, 3.5 mm (50) female, User Connector A

**Return Type** Comma separated string values

**Default** Not Applicable

**Applicable Models:** All

*(Read-Write)* Specifies a DUT connector type for every port during the Guided Calibration procedure. Valid DUT connector names are stored within calibration kits. Some cal kits may include both male and female DUT connectors. Therefore, specifying the DUT connector gender may be required.

The VNA remembers previous Guided Cal settings. Therefore, for completeness, unused ports can either be defined as "Not used" or use the SENS:CORR:COLL:GUID:ABORt command to clear all ports. The ABORt command is a more thorough approach and more convenient. See Guided Cal examples.
A single port with a valid <conn> name indicates a 1-Port calibration will be performed.

Two ports with valid <conn> names indicate either a 2-Port SOLT or TRL calibration will be performed depending on the standards definition found within the cal kit and the capability of the VNA.

Three ports with valid <conn> names indicate a 3-Port calibration will be performed, and so forth.

Follow these steps to ensure port connectors are specified correctly:

2. Set a connector type for each port using this command. If the connector type was incorrectly entered, an error will be returned.
3. Specify the cal kit to use for each port with SENS:CORR:COLL:GUID:CKIT:PORT

Parameters

- `<ch>`: Channel being calibrated, depending on the CHAN:MODE setting. If unspecified, value is set to 1.
- `<pnum>`: Any existing port number. If unspecified, value is set to 1.
- `<conn>`: String - DUT connector type to connect with VNA port `<pnum>`. Case-sensitive.

Examples

- Specifying a 2-port cal (1 & 2) on a 4-port VNA
  - SENS:CORR:COLL:GUID:CONN:PORT1 'Type N (50) female'
  - SENS:CORR:COLL:GUID:CONN:PORT2 'Type N (50) male'
  - SENS:CORR:COLL:GUID:CONN:PORT3 'Not used'
  - SENS:CORR:COLL:GUID:CONN:PORT4 'Not used'

Query Syntax

SENS:CORR:COLL:GUID:CONN:PORT<pnum>[:SELect]?

Return Type

String

Default

Not Applicable

SENSe<ch>:CORR:COLL:GUID:DATA STAN<n>, <meas parameter>, [<ECal state num>],[<data>]

Applicable Models: All

(Read-Write) Sets and returns the measurement data for a specified measurement parameter of a particular step of a guided cal (and for a specific state of an ECal if the step is an ECal step). The measurement data is complex real-and-imaginary pairs where the number of points is the current number of points on the channel, and is in ASCII or binary format as dictated by the current setting of
the FORMat:DATA command.

The query returns measurement data once it has been uploaded. The Cal Wizard will also perform the acquisition as in a normal calibration and then use the query to see the data per ECal state.

**Note:** This command only applies to cals of standard S-parameter channels.

**Parameters**

- `<ch>`: Any existing channel number. If unspecified, value is set to 1.

- `STAN<n>`: Choose from: STAN1, STAN2, etc. through STANn where n is the number of cal standard connection steps for the calibration.

  **Note:** You do not necessarily have to invoke these connection steps in sequential order.

- `<meas parameter>`: Measurement parameters for standard S-parameter channels.

- `<data>`: Measurement data to upload.

- ` [<ECal state num>]`: ECal state number.

**Examples**

```
Query Syntax: SENSE:CORRelction:COLLection:GUIDed::DATA? STAN<n>, <meas parameter>, [<ECal state num>]

Return Type: Depends on FORMat:DATA

Default: Not Applicable

Applicable Models: All

(Read-only) Returns a comma-delimited CSV string of measurement parameters (with parameter names) for STANn at State x. The measurement parameters have to be measured in the specified step number of a guided calibration. If the parameter name is a not an S-parameter, an underscore is inserted (for example, b1/a1,1 becomes b1/a1_1).

Note: This command only applies to cals of standard S-parameter channels.

Parameters:

- <ch>: Any existing channel number. If unspecified, value is set to 1.
- STAN<n>: Choose from: STAN1, STAN2, etc. through STANn where n is the number of cal standard connection steps for the calibration.

Note: You do not necessarily have to invoke these connection steps in sequential order.

Examples:

- SENS:CORR:COLL:GUID:DATA:CAT? STAN1,1
  "S11"
  See an example that uses this command.

Return Type: String

Default: Not Applicable
**SENSe<ch>:CORRection:COLLect:GUIDed:DESCription? <step>**

**Applicable Models:** All

*(Read-only)* Returns the connection description for the specified calibration step.

**Parameters**

- `<ch>` Channel being calibrated, depending on the CHAN:MODE setting. If unspecified, value is set to 1.
- `<step>` A number from 1 to the number of steps required to complete the calibration (Use SENS:CORR:COLL:GUID:STEP? to query the number of steps)

**Examples**

```
SENS:CORR:COLL:GUID:DESC? 10

'Returns:
Connect APC 7 Open to port3
```

**Return Type** String

**Default** Not Applicable

**SENSe<ch>:CORRection:COLLect:GUIDed:DMATch:APPLy[:IMMediate] [string]**

**Applicable Models:** N522xB, N523xB, N524xB

*(Write-only)* Specifies a Delta Match Cal Set to be used for delta match correction.

If the User-performed Cal Set GUID or Name is not specified, then the Global Delta Match Cal Set is applied.

An error is returned if the specified Cal Set does not meet the following Delta Match criteria:

- Must have been performed using ECal or as a guided mechanical cal (not Unguided).
- Must have the same start freq, stop freq, and number of points as the channel being calibrated.
- Must calibrate the ports that are required by the TRL or Unknown Thru cal as indicated by SENS:CORR:COLL:GUID:DMATch:APPLy:PORTs?

The Global Delta Match Cal can ALWAYS be applied.

Learn more about Delta match calibration.

See example of a complete Global Delta Match calibration.

See example where Delta Match is applied to a calibration.

**Parameters**
<ch> Channel being calibrated, depending on the CHAN:MODE setting. If unspecified, value is set to 1.

[string] Optional argument. GUID or Name of the User-performed Delta Match Cal Set to apply.

If unspecified, the Global Delta Match Cal Set is applied.

Examples
- `SENS:CORR:COLL:GUID:DMAT:APPL`
- `SENSe:correction:collect:guided:dmatch:apply:immediate
  "{2B893E7A-971A-11d5-8D6C-00108334AE96}"`
- `SENS:CORR:COLL:GUID:DMAT:APPL "MyDMatchCalset"`

Query Syntax Not Applicable

Default Not Applicable

---

`SENSe<ch>:CORRection:COLLect:GUIDed:DMATch:APPLy:PORTs?`

Applicable Models: N522xB, N523xB, N524xB

(Read-only) Returns the port numbers for which delta match correction is required. 0 (zero) is returned if the Cal does NOT require Delta Match correction for one of the following reasons:

- The Cal does NOT involve Unknown THRU or TRL. You specify this using SENS:CORR:COLL:GUID:METH <UNKN | TRL>.

- The Cal DOES involve Unknown THRU or TRL, but the delta match data can be calculated by the Unknown Thru or TRL Cal. Learn how this is possible. However, you can force the Cal to use the Delta Match data from a Cal Set.

Learn more about Delta match calibration.

See example of a complete Delta Match calibration.

Parameters

<ch> Channel being calibrated, depending on the CHAN:MODE setting. If unspecified, value is set to 1.

Examples
- `SENS:CORR:COLL:GUID:APPL:PORT?`
  - Returns: 1,2,3

Return Type Numeric

Default Not Applicable
**SENSe<ch>:CORRection:COLLect:GUIDed:DMATch[:INITiate] <conn>,<cKit>**

**Applicable Models:** N522xB, N523xB, N524xB

*(Write-only)* Initiates a global delta match calibration.

Learn more about Global Delta Match calibration.

See example of a complete Delta Match calibration.

**Parameters**

- `<ch>` Channel being calibrated, depending on the CHAN:MODE setting. If unspecified, value is set to 1.
- `<conn>` **String**. Connector type for port 1. All other ports are set automatically.
- `<cKit>` **String** Cal Kit for all ports. If incorrectly entered while writing, an error is returned.

**Examples**

```
SENS:CORR:COLL:GUID:DMAT APC 3.5 female,"85052B"
```

**Query Syntax** Not Applicable

**Default** Not Applicable

---

**SENSe<ch>:CORRection:COLLect:GUIDed:ECAL:ACQ <cal method>. <port list>, [calset]**

**Applicable Models:** All

*(Write only)* Execute the Ecal calibration with specified Ecal using SENS:CORR:COLL:GUID:ECAL:SEL . If ECal module is not specified, the first Ecal in the list is used. One item that we discussed is that this command needs to be overlapped. That's because it can be quite slow to finish an ecal, and slow operations need to be implemented using overlapped SCPI. Otherwise, the client will time out and will be unable to poll for completion. So, the command must be followed with either a *OPC? or a *OPC and serial poll.

**Parameters**

- `<ch>` Channel to be calibrated, depending on the CHAN:MODE setting. If unspecified, value is set to 1.
- `<cal method>` **String** Calibration Method.
  
  SOLT: using defined through
  
  SOLR: using undefined through
ERESponse: Enhanced Response

<port list> Array Port number to be calibrated. If enhanced response (ERESponse) is selected, the first port number is the stimulus port and the second port number is the response port.

[calset] Optional argument. Cal Set name

If NOT specified, behavior depends on the SENS:CORR:PREFerence:CSET:SAVE setting.

If specified, choose an existing Cal Set, either by name or by GUID.

- By Cal Set name: include quotes.
- Query all Cal Set GUIDs with SENS:CORR:CSET:CAT?

An error is reported if the Cal Set is not found.

The Cal Set is either supplemented or overwritten depending on the method, connectors, and ports selected. Learn more about Cal Sets.

Examples

' Full 2 port cal with defined through for ports 2 and 3
SENS:CORR:COLL:GUID:ECAL:ACQ SOLT,2,3

' Enhance Response Cal for ports 4 (Stimulus) and 1 (Response)
SENS:CORR:COLL:GUID:ECAL:ACQ ERES,4,1

' Full 2 port cal with calset and undefined through for ports 1 to 4
SENS:CORR:COLL:GUID:ECAL:ACQ SOLR,1,2,3,4,"MyCalSet"

Query Syntax Not Applicable

Default Not Applicable

Applicable Models: All
Specifies the Ecal Kit for Ecal Calibration. This is a new command that specifies the ECal kit to be used in the new 1-shot ECal execution command. If not specified, the 1-shot command will internally select the top one from the connected ECal kits (like the basic cal and start cal dialogs are doing.)

The top ecal kit in the list can be determined in two ways: by an internal module number that is dependent on the order in which the ecals are enumerated on the USB. Or it could be an alphabetical sorting by name. This default selection will allow the user to use generic test code but only if there is only one ECal connected.

Parameters

- `<ch>` Channel to be calibrated, depending on the CHAN:MODE setting. If unspecified, value is set to 1.
- `<ecal kit>` Ecal kit to be used for the specified port. **Case-sensitive.**

Include the characterization name in the `<kit>` string. Use SENSe:CORR:COLL:GUID:CKIT:CAT? to read the list of characterizations available in the module and in VNA disk memory.

If two or more identical ECal modules are connected to the VNA, the serial number must be included to distinguish the ECal modules.

Examples

- **Standard ECal modules**
  
  SENSe:CORR:COLL:GUID:ECAL "N4691-60004 ECal"

- **Non-factory ECal characterizations are specified as follows:**
  
  SENS:CORR:COLL:GUID:ECAL "N4691-60004 User 1 ECal"

- **When two or more ECal modules with the same model number are connected, also specify the serial number as follows:**
  
  SENS:CORR:COLL:GUID:ECAL "N4691-60004 ECal 01234"

- **When Disk Memory ECal user characterizations are used,** specify both the User char and the serial number as follows:
  
  SENS:CORR:COLL:GUID:ECAL "N4691-60004 MyDskChar ECal 01234"

Query Syntax

SENSe:CORRection:COLLect:GUIDed:ECAL[:SELect]?

Return Type

String - If the `<kit>` parameter was incorrectly entered while writing, an error will be returned.

Default

Not Applicable
SENSe<ch>:CORRection:COLLect:GUIDed:ETERms:COMPute [cal set name]

**Applicable Models:** All

_(Write-only)_ Computes the error correction terms, turns Correction ON, and saves the calibration to an existing, specified Cal Set.

The cal acquisition process does not conclude as with the SAVE command. This command leaves the cal acquisition in memory to allow re-measuring/re-computing. To conclude the cal acquisition process, use the SENS:CORR:COLL:GUID:ABOR . command.

Learn all about Cal Sets.

**Note:** This command is NOT supported for application channels (Gain Compression, SMC/VMC, Noise Figure, IMD and so forth). Use SENS:CORR:COLL:GUID:SAVE and save to a cal register. You can then use SENS:CORR:CSET:COPY to copy the cal register to a named Cal Set.

- Use this command instead of specifying the optional name or GUID argument in SENS:CORR:COLL:GUID:INIT .
- Use SENS:CORRection:CSET commands to get names of existing Cal Sets.
- The cal data is also saved to the channel Cal Register.
- If all of the required standards have not been measured, the calibration will not complete properly.

**For Calibrate All Channels**

When this command is used during a Cal All session, the <cal set name> argument sets the User Cal Set prefix. All generated Cal Sets will be preceded with this string name.

- Cal Set prefix can also be set using SYST:CAL:ALL:CSET:PREFix . When the Cal Set prefix has already been set with SYST:CAL:ALL:CSET:PREFix , this command overwrites it.
- When <cal set name> is an empty string, a User Cal Set will not be saved. Only Cal Registers will be saved.

**Parameters**

- **<ch>** Channel being calibrated, depending on the CHAN:MODE setting. If unspecified, value is set to 1.
- **<cal set name>** _String_ - Name of an existing Cal Set to be overwritten.

See Calibrate All Channels note (above).
### SENSe<ch>:CORRection:COLLect:GUIDed:ETERms:LOAD[:CSET] <cset>,<calPort> [,csPort]

**Applicable Models:** All

(Write-only) Loads 1-port error terms from a Cal Set into the current Guided Cal sequence. When the Cal steps are recomputed, connection steps are removed due to the loading of the error terms.

This command must be sent after the INIT command. This command was implemented to facilitate calibrating a large matrix of external ports and most users will not need to use this command.

See example of how to use this command.

#### Parameters

- `<ch>` Channel being calibrated, depending on the CHAN:MODE setting. If unspecified, value is set to 1.
- `<cset>` **String** Name of User Cal Set in which the error terms reside.
- `<pnum>` **Integer** Port number of the current cal to receive error terms.
- `[csPort]` **Integer** Optional argument. Port number associated with the error terms in the Cal Set. If unspecified, the same port number as `<calPort>` is used.

### Examples

See example

### Query Syntax

Not Applicable

### Default

Not Applicable
steps, issue the acquisition commands, query the connection description strings, and subsequently complete a guided calibration. See example calibration programs.

**Parameters**

<ch> Channel to be calibrated, depending on the CHAN:MODE setting. If unspecified, value is set to 1.

[string] Optional argument. Cal Set name or GUID enclosed in quotes.

If NOT specified, behavior depends on the SENS:CORR:PREFERENCE:CSET:SAVE setting.

If specified, choose an *existing* Cal Set, either by name or by GUID.

- By Cal Set name: include quotes.
- Query all Cal Set GUIDs with SENS:CORR:CSET:CAT?

An error is reported if the Cal Set is not found.

The Cal Set is either supplemented or overwritten depending on the method, connectors, and ports selected. Learn more about Cal Sets.

[bool] Optional argument. To set this argument, also set the first optional argument. See example below.

**OFF (0)** If Cal Set stimulus settings differ from the existing channel, do not change channel stimulus settings. The Cal Set is saved to the current setting of the SENS:CORR:PREF:CSET:SAVE command. This is the default setting if not specified.

**ON (1)** If Cal Set stimulus settings differ from the existing channel, change the channel stimulus settings to match the Cal Set settings.

[char] Optional argument. To set this argument, also set the first two optional arguments. See example below.

**SYNChronous** - blocks further SCPI commands while processing this command. (default setting).

**ASYNchronous** - does NOT block further SCPI commands while processing this command.

Learn more about this argument

**Examples**

`SENS:CORR:COLL:GUID:INIT`

' *set first optional argument*

Applicable Models: All

(Read-Write) Specifies amount to increment (increase) the channels averaging factor during measurement of isolation standards in a guided calibration.

Note: If the channel has averaging turned OFF and the value of <num> is greater than 1, averaging will be turned ON only during the isolation measurements and with the averaging factor equal to <num>.

Parameters

<ch> Channel being calibrated, depending on the CHAN:MODE setting. If unspecified, value is set to 1.

<num> Amount to increment the averaging factor for the isolation measurement. The maximum averaging factor for the channel is 65536 (2^16).

Examples

'Measure isolation on all paths for the cal
SENSe:CORR:COLL:GUID:ISOL ALL

'Remove the port pairs 1-to-2 and 1-to-3 from the list of paths on which to measure isolation
SENSe:CORR:COLL:GUID:ISOL:PATHs REMove,1,2,1,3

Query Syntax

Return Type

Numeric

Default

8 - If this command is NOT sent, but isolation is measured, then averaging will be turned ON with factor set to 8 during the isolation measurements.
Applicable Models: All

(Read-Write) Specifies the paths (port pairs) to make isolation measurements on during a guided calibration.

Parameters

<ch> Channel being calibrated, depending on the CHAN:MODE setting. If unspecified, value is set to 1.

<char> ALL Measure isolation on all pairings of the ports that are to be calibrated.

NONE Do not measure isolation on any pairing of the ports to be calibrated. (Default behavior).

ADD Add one or more specific pairings of ports to the list of port pairings for which isolation will be measured.

REMove Remove one or more specific pairings of ports from the list of port pairings for which isolation will be measured. If many paths are to be measured, it may be easier to first send ALL, then REMove and specify the paths to remove.

<p1a, p2a...> For use when <char> is ADD or REMove.

Specify Port numbers in pairs:

- For 3-port cals, specify up to 3 pairs.
- For 4-port cals, specify up to 6 pairs.

p1a, p1b (Path1 - port A and port B)
p2a, p2b (Path2 - port A and port B)
p3a, p3b (Path3 - port A and port B)

Examples

'Measure isolation on all paths for the cal
SENS:CORR:COLL:GUID:ISOL ALL

'Remove the port pairs 1-to-2 and 1-to-3 from the list of paths on which to measure isolation
sense:correction:collect:guided:isolation:paths REMove,1,2,1,3

Query Syntax
SENSe<ch>:CORRrection:COLLect:GUIDed:ISOLation:PATHs?

Note: if isolation is not be measured on any of the paths, the query returns 0.

**Applicable Models:** All

*(Read-only)* Designed to be used for an iterative cal standard such as a sliding load, this command returns the number of iterative measurement acquisitions that has been made for the specified step. Zero (0) is returned if the step has not yet been measured.

For most cal steps that have already been measured, this command returns 1.

**Parameters**

<ch> Channel being calibrated, depending on the CHAN:MODE setting. If unspecified, value is set to 1.

<step> Guided Cal step number for which the acquisition number will be returned.

Use SENS:CORR:COLL:GUID:STEP? to query the number of steps in the calibration.

**Examples**

SENSe:CORR:COLL:GUID:ITER:COUNt? 4

'Example return:

5

See example program

**Return Type** Numeric

**Default** Not Applicable

Applicable Models: All

(Read-only) Designed to be used for an iterative cal standard such as a sliding load, this command returns the minimum number of required iterative measurement acquisitions for the specified step.

For most connection steps this will return 1, but for an iterative cal standard such as a sliding load, it will return a number such as 5.

Parameters

<ch> Channel being calibrated, depending on the CHAN:MODE setting. If unspecified, value is set to 1.

<step> Guided Cal step number for which to return the number of iterative measurement acquisitions that have been made. Use SENS:CORR:COLL:GUID:STEP? to query the number of steps in the calibration.

Examples

'Example return:

5

See example program

Return Type Numeric

Default Not Applicable
Applicable Models: All

(Write-only) Resets the specified guided cal connection step as unmeasured. This clears all previous measurements made for that step.

**Parameters**

- `<ch>`: Channel being calibrated, depending on the CHAN:MODE setting. If unspecified, value is set to 1.
- `<step>`: Guided Cal step number to reset. Use SENS:CORR:COLL:GUID:STEP? to query the number of steps in the calibration.

**Examples**

```
```

See example program

**Return Type** Not Applicable

**Default** Not Applicable

---

**SENSe<ch>:CORRection:COLLect:GUIDed:LIST:COUNt?**

Applicable Models: All

(Read-only) Returns the number of measurement steps required to complete the current guided calibration. This command is the same as the SENS:CORR:COLL:GUID:STEP command.

**Parameters**

- `<ch>`: Any existing channel number. If unspecified, value is set to 1.

**Examples**

```
SENS:CORR:COLL:GUID:LIST:COUN?
sense2:correction:collect:guided:list:count?
```

**Return Type** Numeric

**Default** 0

---

**SENSe<ch>:CORRection:COLLect:GUIDed:LIST:STEP<ListCount>:COUNt?**
**Applicable Models:** All

(Read-only) Returns the number of standards for step[n]. This is generally 1 unless the standard is an isolation standard or a composite standard.

**Parameters**

- `<ch>` Any existing channel number. If unspecified, value is set to 1.
- `<ListCount>` Step number from 1 to 1000.

**Examples**

```
sense2:correction:collect:guided:list:step1:count?
```

**Return Type** Numeric

**Default** 1

---

**Applicable Models:** All

(Read-only) Returns the step description.

**Parameters**

- `<ch>` Any existing channel number. If unspecified, value is set to 1.
- `<ListCount>` Step number from 1 to 1000.

**Examples**

```
sense2:correction:collect:guided:list:step1:description?
```

**Return Type** String

**Default** Not Applicable

---

**SENS<ch>:CORRection:COLLect:GUIDed:LIST:STEP<ListCount>:LABel?**
(Read-only) Returns the label for the complete standard used in the step. If the standard is a composite standard, the label is for the composite device.

**Parameters**

- `<ch>` Any existing channel number. If unspecified, value is set to 1.
- `<ListCount>` Step number from 1 to 1000.

**Examples**

```
SENS:CORR:COLL:GUID:LIST:STEP:LAB?
sense2:correction:collect:guided:list:step1:label?
```

**Return Type** String

**Default** Not Applicable

---

**SENS<ch>:CORRection:COLLect:GUIDed:LIST:STEP<ListCount>:PORTs?**

(Read-only) Returns the number of ports on the standard used in the step. If the standard is a composite standard, the number of ports applies to the composite. So if the composite standard is an offset line connected to a load, the composite device is a 1 port device.

**Parameters**

- `<ch>` Any existing channel number. If unspecified, value is set to 1.
- `<ListCount>` Step number from 1 to 1000.

**Examples**

```
sense2:correction:collect:guided:list:step1:ports?
```

**Return Type** Numeric

**Default** Not Applicable

---

**SENS<ch>:CORRection:COLLect:GUIDed:LIST:STEP<ListCount>:STANdard<StandardCount>:**
Applicable Models: All

(Read-only) Returns the label for the one of the standards used in the step. If the step contains only a single standard, the response to this query is identical to SENS:CORR:COLL:GUID:LIST:STEP:LAB?

Parameters

- `<ch>` Any existing channel number. If unspecified, value is set to 1.
- `<ListCount>` Step number from 1 to 1000.
- `<StandardCount>` Standard number from 1 to 3.

Examples

sense2:correction:collect:guided:list:step1:standard2:label?

Return Type String

Default Not Applicable

Applicable Models: All

(Read-only) Returns the number of ports on one of the standard used in the step. If the step contains only a single standard, the response to this query is identical to SENS:CORR:COLL:GUID:LIST:STEP:PORT?

Parameters

- `<ch>` Any existing channel number. If unspecified, value is set to 1.
- `<ListCount>` Step number from 1 to 1000.
- `<StandardCount>` Standard number from 1 to 3.

Examples

Return Type Numeric

Default Not Applicable

Applicable Models: All

(Read-only) Returns the enumeration for the type of standard that describes one of the standard devices used in the step. If the step contains only a single standard, the response to this query is identical to SENS:CORR:COLL:GUID:LIST:STEP:STYP?

The following list of enumerations is currently defined:

OPEN | SHORt | LOAD | REFLection | THRU | LINE | ECAL | ISOLation | COMPosite | SENSor | PHASeref | MIXer

Parameters

- `<ch>` Any existing channel number. If unspecified, value is set to 1.
- `<ListCount>` Step number from 1 to 1000.
- `<StandardCount>` Standard number from 1 to 3.

Examples

```
sense2:correction:collect:guided:list:step1:standard2:stype?
```

Return Type: Enumeration

Default: OPEN

---

Applicable Models: All

(Read-only) Returns the list of VNA test ports to which one of the standards is attached. If the step contains only a single standard, the response to this query is identical to SENS:CORR:COLL:GUID:LIST:STEP:TPORts?

Parameters

- `<ch>` Any existing channel number. If unspecified, value is set to 1.
- `<ListCount>` Step number from 1 to 1000.
- `<StandardCount>` Standard number from 1 to 3.

Examples

```
sense2:correction:collect:guided:list:step1:standard2:tports?
```

Return Type: Numeric

Default: Not Applicable

---

**Applicable Models:** All

*(Read-only)* Returns the enumeration for the type of standard device used in the step.

The following list of enumerations is currently defined:

OPEN | SHORt | LOAD | REFLection | THRU | LINE | ECAL | ISOLation | COMPosite | SENSor | PHASeref | MIXer

**Parameters**

- `<ch>`  Any existing channel number. If unspecified, value is set to 1.
- `<ListCount>`  Step number from 1 to 1000.

**Examples**

```
sense2:correction:collect:guided:list:step1:stype?
```

**Return Type**  Enumeration

**Default**  OPEN

---

**Applicable Models:** All

*(Read-only)* Returns the list of VNA test ports to which the standard(s) in this step is attached.

**Parameters**

- `<ch>`  Any existing channel number. If unspecified, value is set to 1.
- `<ListCount>`  Step number from 1 to 1000.

**Examples**

```
sense2:correction:collect:guided:list:step1:tports?
```

**Return Type**  Numeric

**Default**  Not Applicable

---

**SENSe:CORRRection:COLLect:GUIDed:METHod <char>**  Superseded
Applicable Models: All

(Read-Write) Selects from one of several algorithms available for performing the THRU portion of a guided calibration. Learn more about THRU methods.

Parameters

<char>  
DEFAULT - Informs guided calibrations to use the default algorithm when computing the number of needed standards acquisition steps. (default selection if omitted.)

ADAP - Use the adapter removal algorithm

FLUSH - Use with insertable devices.

UNKN - Use the Unknown THRU algorithm with calibrations for non-insertable devices.

DEFINED - Use the THRU definition that you stored in the cal kit file, or ECal module.

TRL - Select TRL Cal Type for guided cals. Valid for "TRL ready" Cal Kits with properly assigned TRL cal classes.

SOLT - Select SOLT Cal Type for guided cals. Valid for any kit with properly assigned SOLT cal classes.

Examples

SENS:CORR:COLL:GUID:METH ADAP
sense:correction:collect:guided:method unkn

Query Syntax

SENSe:CORRection:COLLect:GUIDed:METHod?

Return Type

Character

Default

DEFAULT

SENS<ch>:CORRection:COLLect:GUIDed:PACQuire STAN<n>
(Write-only) Show the Cal Window, and optionally one or more other specific windows before acquiring a Cal standard. This command will cause the Cal Window to display the specific measurements that are to be made for that particular Cal standard to facilitate the connection of standards.

**Parameters**

- `<ch>`: Channel being calibrated, depending on the CHAN:MODE setting. If unspecified, value is set to 1.
- `STAN<n>`: Choose from: STAN1, STAN2, etc. through STANn where n is the number of cal standard connection steps for the calibration.

**Note:** You do not necessarily have to invoke these connection steps in sequential order.

**Examples**

- `SENS:CORR:COLL:GUID:PACquire STAN2`
- `sense:correction:collect:guided:pacquire STAN5`

See an example that uses this command.

**Query Syntax**

- Not Applicable

**Default**

- Not Applicable

---

```
SENS<ch>:CORRection:COLLect:GUIDed:PATH:CMEThod
<port1>,<port2>,<caltype1[,caltype2]>
```

**Applicable Models:** All

**Note:** This command replaces SENS:CORR:COLL:GUID:METH.

(Read-Write) Specifies the calibration method for each port pair.

**Note:** Sending this command will overwrite the VNAs SmartCal determinations for the most accurate cal method for your connector settings and Cal Kits. Send this command ONLY if you have a deliberate reason for overwriting the SmartCal logic. You can send the query form of this command to learn the cal method determined by SmartCal.

See Thru Pairs Sequence to learn how to send this and other Thru commands.

After sending this command, send the query form to be sure that the command was accepted. If not, then the chosen Cal method is not compatible with the specified Thru method. For example, if the specified Thru method is Unknown Thru, an attempt to set Enhanced Response Cal should be
Parameters

<ch> Channel being calibrated, depending on the CHAN:MODE setting. If unspecified, value is set to 1.

<port1> First port of the pair to be calibrated.

<port2> Second port of the pair to be calibrated.

<caltype1[caltype2]> (String) Cal type for the port pair, enclosed in a single pair of quotes. NOT case-sensitive.

**caltype1** Choose from:

- TRL
- SOLT
- QSOLTN
- EnhRespN
- TransRespN

For the last two arguments, replace N with the port to be used as the source port, which MUST be one of the port pair.

**caltype2** Optional argument. Use only when performing an adapter removal cal on the pair. This argument specifies the Cal type on the second port. Caltype1 then specifies the Cal type of the first port.

Choose from the same arguments as caltype1.

Examples

```
SENS:CORR:COLL:GUID:PATH:CMEThod 2,3,"QSOLTN2"
sense:correction:collect:guided:path:cmethod 2,3,"solt,trl"
```

Query Syntax  
SENS<ch>:CORRection:COLLect:GUIDed:PATH:CMEThod? <port1>,<port2>

If only one caltype is returned then its NOT adapter removal.

**Return Type** String

**Default** The most accurate Cal method for the current cal.
SENSe<ch>:CORR:COLL:GUID:PATH:TMETHod
<port1>,<port2>,<thruType1[,thruType2]>

Applicable Models: All

Note: This command replaces SENS:CORR:COLL:GUID:METH.

(Read-Write) Specifies the calibration THRU method for each port pair.

Note: Sending this command will overwrite the VNAs SmartCal determination for the thru method. Send this command ONLY if you have a deliberate reason for overwriting the SmartCal logic. You can send the query form of this command to learn the THRU method determined by SmartCal.

See Thru Pairs Sequence to learn how to send this and other Thru commands.

Learn more about Thru methods.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;ch&gt;</td>
<td>Channel being calibrated, depending on the CHAN:MODE setting. If unspecified, value is set to 1.</td>
</tr>
<tr>
<td>&lt;port1&gt;</td>
<td>First port of the port pair to be calibrated.</td>
</tr>
<tr>
<td>&lt;port2&gt;</td>
<td>Second port of the port pair to be calibrated.</td>
</tr>
<tr>
<td>&lt;thruType1[,thruType2]&gt;</td>
<td>(String) Thru methods for port pair, enclosed in a single pair of quotes. NOT case-sensitive.</td>
</tr>
</tbody>
</table>

thruType1  Calibration Thru method. Choose from:

- **Defined Thru**  Measures a Thru for which there is a stored definition in the Cal kit of the lowest-numbered port of the pair. For example, if the port pair is 1,2, then the cal kit for port 1 MUST contain a Defined Thru.

- **Zero Thru**  Measures a Zero length Thru, also known as Flush-Thru.

- **Undefined Thru** (Also known as Unknown Thru)  A Thru type for which there is NOT a stored definition in the Cal Kit. Valid ONLY for SOLT cal type.

- **Undefined Thru using a Defined Thru** (ECal modules ONLY) Measures the internal Thru as an Unknown Thru.

thruType2  Optional argument. Use ONLY when Adapter Removal Cal is specified for the pair using SENS:CORR:COLL:GUID:PATH:CMETHod. When specifying ThruType2, this is the only valid argument: "Defined Thru, Defined Thru"
Examples

```
SENS:CORR:COLL:GUID:PATH:TMETHod 2,3,"Zero Thru"
```

```
sense:correction:collect:guided:path:tmethod 2,3,"Defined Thru,Defined Thru"
```

Query Syntax

```
SENSe<ch>:CORRection:COLLect:GUIDed:PATH:TMETHod?
<port1>,<port2>
```

Always returns two parts:

- If the second part of the string is empty, adapter removal is NOT being performed.
- If the string is "Defined Thru, Defined Thru", adapter removal IS being performed.

**Return Type** String

**Default** The most accurate Thru method for the current cal.

**SENSe<ch>:CORRection:COLLect:GUIDed:PCAL:APPLy <bool>**

**Applicable Models:** All

(Read-Write) When enabled, and the following conditions are met, the user's existing source power calibration array will be used when acquiring calibration standard data:

- The user is performing a vector calibration only (no power).
- A valid source cal is present in the channel being calibrated.
- The user has elected to enable this feature (via GUI or SCPI).

**Note:** This command **MUST** be sent **AFTER** setting up the connectors and kits for the calibration session. Otherwise, the firmware can not determine which ports are going to be used in the calibration session. Therefore, it can not check if there is an applicable power calibration, because power calibrations are per port.

If this command is sent before setting connectors and kits, the following error is displayed:

```
+3068,"The request to use existing source cal array during calibration was refused."
```

**Parameters**

- `<ch>` Channel being calibrated, depending on the CHAN:MODE setting. If unspecified, value is set to 1.
Choose from:

**OFF (0)** Do not use existing source power calibration array when acquiring calibration standard data:

**ON (1)** Use existing source power calibration array when acquiring calibration standard data:

---

---

**SENS<ch>:CORR:COLL:GUID:PORTS?**

**Applicable Models:** All

*(Read-only)* Returns the list of ports being calibrated by an active calibration session.

**Parameters**

- `<ch>` Any existing channel number. If unspecified, value is set to 1.

**Examples**

```plaintext
SENS:CORR:COLL:GUID:PORT?
sense2:correction:collect:guided:ports?
```

**Return Type**

List of numbers

**Default**

Not Applicable

---

Applicable Models: All

(Read-Write) Specifies the behavior for guided cal steps that involve a sliding load in a cal that is about to be performed. Send this command BEFORE sending the Guided INIT command.

Although the term 'Preference' is used in the command, this is NOT a VNA preference. This setting does NOT survive instrument preset or reboot. It remains ONLY for the duration of the Guided Cal.

Parameters

<char> Behavior when measurements of sliding load are acquired. Choose from:

**DIALog** - The Sliding load dialog box appears when the acquire command is received for a sliding load step. All slide positions are measured (with a user-interface prompt) from a single invocation of the acquire command.

**ITERate** - Each invocation of the acquire command for a sliding load step measures a single slide position and increments the slide position counter. No Move Sliding Load prompt is presented on the VNA screen.

Examples

```
SENS:CORR:COLL:GUID:PREF:SLID ITER
```

See example program

Query Syntax

```
SENSe<ch>:CORRection:COLLect:GUIDed:PREFerence:SLIDingload?
```

Return Type

Character

Default

DIALog

SENS<ch>:CORRection:COLLect:GUIDed:SAVE[:IMMediate] [bool]

Applicable Models: All

(Write-only) Completes the guided cal by computing the error correction terms, turning Correction ON, and saving the calibration to a Cal Set. If all of the required standards have not been measured, the calibration will not complete properly.

Learn all about Cal Sets.

Parameters

<ch> Channel being calibrated, depending on the CHAN:MODE setting. If unspecified, value is set to 1.

[bool] Optional argument. If unspecified, the default behavior is the current VNA preference setting of SENS<ch>:CORRection:PREFerence:CSET:SAVE.

**OFF (0)**  Save cal data ONLY to a Cal Register.
ON (1) Save cal data to a Cal Register and a User Cal Set. The filename is automatically generated.

- For application channels (Gain Compression, SMC/VMC, Noise Figure, IMD and so forth), this command saves ONLY to a Cal Register. Use SENS:CORR:CSET:COPY to copy the cal register to a named calset.

- For a Calibrate All Channels session, this argument is ignored. Instead, use SYST:CAL:ALL:CSET:PREFix .

Examples

```
SENS:CORR:COLL:GUID:SAVE
sense2:correction:collect:guided:save:immediate 0
```

Query Syntax

Not Applicable

Default

Not Applicable

SENSe<ch>:CORRection:COLLect:GUIDed:SAVE:CSET <cal set name or guid>

Applicable Models: All

(Write-only) Completes the guided cal by computing the error correction terms, turning Correction ON, and saving the calibration to an existing, specified Cal Set. This command performs the same function as SENSe:CORRection:COLLect:GUIDed:SAVE , except this command allows the name or GUID of the Cal Set to be specified.

Learn all about Cal Sets.

Note: This command is NOT supported for application channels (Gain Compression, SMC/VMC, Noise Figure, IMD and so forth). Use SENS:CORR:COLL:GUID:SAVE and save to a cal register. You can then use SENS:CORR:CSET:COPY to copy the cal register to a named Cal Set.

- Use this command instead of specifying the optional name or GUID argument in SENS:CORR:COLL:GUID:INIT .
- Use SENS:CORRection:CSET commands to get names or GUIDs of existing Cal Sets.
- The cal data is also saved to the channel Cal Register.
- If all of the required standards have not been measured, the calibration will not complete properly.

For Calibrate All Channels

When this command is used during a Cal All session, the <cal set name> argument sets the User Cal Set prefix. All generated Cal Sets will be preceded with this string name.
- Cal Set prefix can also be set using SYST:CAL:ALL:CSET:PREFix. When the Cal Set prefix has already been set with SYST:CAL:ALL:CSET:PREFix, this command overwrites it.

- When <cal set name> is an empty string, a User Cal Set will not be saved. Only Cal Registers will be saved.

**Parameters**

- `<ch>`  Channel being calibrated, depending on the CHAN:MODE setting. If unspecified, value is set to 1.
- `<cal set name or guid>`  String - Name or GUID of an existing Cal Set to be overwritten. If specifying a GUID, curly brackets must be included.

**Examples**

```plaintext
sense:correction:collect:guided:save:cset "MyCalSet"
```

**Query Syntax**  Not Applicable

**Default**  Not Applicable

---

**SENSe<ch>:CORRection:COLLect:GUIDed:STATes[:CATalog]?: STAN<n>**

**Applicable Models:** All

(Read-only) Returns an array of ecal states used for the standard number.

**Parameters**

- `<ch>`  Any existing channel number. If unspecified, value is set to 1.
- `STAN<n>`  Choose from:STAN1, STAN2, etc. through STANn where n is the number of cal standard connection steps for the calibration.

**Note:** You do not necessarily have to invoke these connection steps in sequential order.

**Examples**

```plaintext
SENS:CORR:COLL:GUID:STAT? STAN1
```

**Return Type**  String

**Default**  Not Applicable

---

**SENSe<ch>:CORRection:COLLect:GUIDed:STEPs?**
Applicable Models: All

(Read-only) Returns the number of measurement steps required to complete the current guided calibration. This command is sent after the `SENS:CORR:COLL:GUID:INIT`, `SENS:CORR:COLL:GUID:CONN:PORT` and `SENS:CORR:COLL:GUID:CKIT:PORT` commands.

**Parameters**

- `<ch>` Any existing channel number. If unspecified, value is set to 1.

**Examples**

<table>
<thead>
<tr>
<th>Example</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>SENS:CORR:COLL:GUID:STEP?</code></td>
<td></td>
</tr>
<tr>
<td><code>sense2:correction:collect:guided:steps?</code></td>
<td></td>
</tr>
</tbody>
</table>

**Return Type** Numeric

**Default** Not Applicable

---

SENSe<ch>:CORRection:COLLect:GUIDed:THRU:PORTs <t1a, t1b, t2a, t2b, t3a, t3b...>

Applicable Models: All

(Read-Write) For calibrating more than 2-ports ONLY. Specifies the port pairs for the Thru connections of the calibration. Send the query form of this command to learn the Thru pairs determined by SmartCal.

**Note:** Sending this command will overwrite the VNAs SmartCal determinations for the thru ports. Send this command ONLY if you have a deliberate reason for overwriting the SmartCal logic.

See Thru Pairs Sequence to learn how to send this and other Thru commands.

**Parameters**

- `<ch>` Channel being calibrated, depending on the CHAN:MODE setting. If unspecified, value is set to 1.
- `<t1a,t1b...>` Always specify port numbers in pairs: For example: 1,2 or 1,2,1,3
  - For 3-port cals, specify two or three pairs.
  - For 4-port cals, specify from three up to six pairs.

**Examples**

<table>
<thead>
<tr>
<th>Example</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>SENS:CORR:COLL:GUID:THRU:PORT 1,2,1,3,1,4</code></td>
<td>'4-port measurement'</td>
</tr>
<tr>
<td><code>sense:correction:collect:guided:thru:ports 1,2,2,3</code></td>
<td>'3-port measurement'</td>
</tr>
</tbody>
</table>

**Query Syntax** `SENSe<ch>:CORRection:COLLect:GUIDed:THRU:PORTs?`

**Return Type** Numeric
**Default**  Port pairings that were used in the previous cal.

### THRU Pairs sequence

The SmartCal logic always determines the best calibration based on your specified connectors and ports.

The following three commands overwrite the SmartCal logic. Send these commands ONLY if you have a deliberate reason for overwriting the SmartCal logic.

- `sens:corr:coll:guid:THRU:PORTS <p1, p2>`
- `sens:corr:coll:guid:path:tmet <p1,p2, thrutype>`
- `sens:corr:coll:guid:path:cmet <p1,p2, calmethod>`

When sending one or more of these commands, they must be sent in the following sequence with the other commands listed here.

**Note:** The **GUID:INIT** command is sent before and after these commands.

1. `SENS:CORR:COLL:GUID:CONN:PORT(N)`
2. `SENS:CORR:COLL:GUID:CKIT:PORT (N)`
3. `SENS:CORR:COLL:GUID:INIT`
4. `SENS:CORR:COLL:GUID:THRU:PORTS <P1, P2>`
5. `SENS:CORR:COLL:GUID:PATH:TMET <P1,P2, THRUTYPE>`
6. `SENS:CORR:COLL:GUID:PATH:CMET <P1,P2, CALMETHOD>`
8. `SENS:CORR:COLL:GUID:INIT`

```plaintext
```
**Applicable Models:** N522xB, N523xB, N524xB

*(Write-only)* Initializes a cable repeatability characterization for the specified channel and port. Learn more about Dynamic Uncertainty.

The following existing commands are then used to perform the initialized repeatability or noise characterization:

SENSe<ch>:CORRection:COLLect:GUIDed:STEPs?

SENSe<ch>:CORRection:COLLect:GUIDed:ACQuire <stepNum>

SENSe<ch>:CORRection:COLLect:GUIDed:ITERations:RESet <stepNum>

SENSe<ch>:CORRection:COLLect:GUIDed:SAVE[:IMMediate]

SENSe<ch>:CORRection:COLLect:GUIDed:ABORt

**Parameters**

- **<ch>** Channel number of the characterization, depending on the CHAN:MODE setting. If unspecified, value is set to 1.
- **<pNum>** VNA port number on which the cable repeatability is to be performed.
- **<iterations>** Number of Iterative connections of the standards to be measured for the characterization.

**Examples**

See example program

**Query Syntax**

Not Applicable

**Default**

1

Applicable Models: N522xB, N523xB, N524xB

(Write-only) Initializes a noise characterization for the specified channel and ports. Learn more about Dynamic Uncertainty.

The following existing commands are used to perform the initialized noise characterization:

SENSe<ch>:CORRection:COLLect:GUIDed:STEpS?

SENSe<ch>:CORRection:COLLect:GUIDed:ACQuire <stepNum>

SENSe<ch>:CORRection:COLLect:GUIDed:ITERations:RESet <stepNum>

SENSe<ch>:CORRection:COLLect:GUIDed:SAVE[:IMMediate]

SENSe<ch>:CORRection:COLLect:GUIDed:ABORt

Parameters

<ch> Channel number of the characterization, depending on the CHAN:MODE setting. If unspecified, value is set to 1.

<firstPort> First VNA port number on which the noise characterization is to be performed.

<secondPort> Second VNA port number on which the noise characterization is to be performed.

<iterations> Number of Iterative measurements to be made for each connected standard.

Examples

SENSe1:CORR:COLL:GUID:UNC:CHAR:NOIS 1,2,5

See example program

Query Syntax Not Applicable

Default 1

SENSe<ch>:CORRection:COLLect:GUIDed:UNCertainty[:ENABle] <bool>

Applicable Models: N522xB, N523xB, N524xB

(Write-Read) Sets and returns the ON/OFF state which determines if the calibration that is about to be performed will support Dynamic Uncertainty for S-Parameters (Opt. S93015A/B).
Dynamic Uncertainty for S-Parameters is supported ONLY for calibrations on standard S-Parameter channels. Calibrations performed with that feature enabled do NOT support the use of ALL traditional GUIDed calibration commands.

Then these existing commands are used for performing calibration:

```
SENSe<ch>:CORRection:COLLect:GUIDed:INITiate[:IMMediate] [string][, bool][,char]
SENSe<ch>:CORRection:COLLect:GUIDed:STEPs?
SENSe<ch>:CORRection:COLLect:GUIDed:ACQuire <stepNum>
SENSe<ch>:CORRection:COLLect:GUIDed:SAVE[:IMMediate]
```

where these commands might also optionally be used in performing the calibration:

```
SENSe<ch>:CORRection:COLLect:GUIDed:ABORt
SENSe:CORRection:PREFerence:ECAL:ORIentation[:STATe] <ON|OFF>
SENSe:CORRection:PREFerence:ECAL:PMAP <module>, <string>
```

Dynamic Uncertainty must be enabled using this command before starting the calibration procedure because this command controls the way connectors and calkits are assigned to ports during calibration. Therefore, this command must be enabled before any of the following commands to ensure that the connector and calkit settings will be set/queried correctly:

```
SENSe<ch>:CORRection:COLLect:GUIDed:CKIT:CATalog?
SENSe<ch>:CORRection:COLLect:GUIDed:CONNector:CATalog?
```

**Parameters**
<bool> Enable ON/OFF state. Choose from:

**ON** or **1** – The next calibration INITialized for the channel will support Dynamic Uncertainties for S-Parameters.

**OFF** or **0** - - The next calibration INITialized for the channel will NOT support Dynamic Uncertainties for S-Parameters.

**Examples**

```plaintext
SENS1:CORR:COLL:GUID:UNC:ON

See example program
```

**Query Syntax**

`SENSe<ch>:CORRection:COLLect:GUIDed:UNCertainty[:ENABle]?`

**Return Type**

Boolean

**Default**

OFF
Controls an IMD and IMDx calibration. These commands supplement the Guided Cal commands.

SENSe<cnum>:CORRection:IMD:CALibration:FREQuencies <char>

Applicable Models: N522xB, N524xB

(Read-Write) Sets and returns the frequencies at which an IMD source power cal is performed.

Parameters

- <cnum> Any existing channel number; if unspecified, value is set to 1.
- <char> Choose from:

  - CENTer - Perform source power calibration at only the center frequencies, midway between the main tones.
  - ALL - Perform source power calibration at all main tone frequencies.

Examples

SENSe<channel>:CORRection:IMD:CALibration:FREQuencies ALL

Query Syntax

SENSe<cnum>:CORRection:IMD:CALibration:FREQuencies?

Return Type

Character

Default

CENTer

SENSe<cnum>:CORRection:IMD:CALibration:METHod <char>

Applicable Models: N522xB, N524xB

(Read-Write) Sets and returns the method by which the match-correction portion of an IMD calibration is performed. Learn more.

Parameters

- <cnum> Any existing channel number; if unspecified, value is set to 1.
- <char> Choose from:

  - MATCH - Performs a full 2-port cal for full match-correction.
  - RESPONSE - Performs only a response (normalization) cal instead of a full 2-port cal.

Examples

SENSe<channel>:CORRection:IMD:CALibration:METHod MATCH

Query Syntax

SENSe<cnum>:CORRection:IMD:CALibration:METHod?

Return Type

Character
**SENSe<cnum>[:CORRection]: IMD:LO<n>:PCAL[:STATe] <bool>**

**Applicable Models:** N522xB, N524xB

*(Read-Write)* Sets and returns whether or not the LO power cal step is included in the cal steps when an IMDX cal is performed.  Learn more.

**Parameters**

- `<cnum>` Any existing channel number; if unspecified, value is set to 1.
- `<n>` LO Stage. Choose 1.
- `<char>` LO Power Cal state. Choose from:
  - **O** or **OFF** - Skips over the LO Power Cal when calibrating.
  - **1** or **ON** - Includes a step for LO Power Cal when calibrating

**Examples**

```plaintext
SENSe:CORR:IMD:LO1:PCAL 0
sense2:correction:imd:lo1:pcal:state on
```

**Query Syntax**

SENSe<cnum>:CORRection:IMD:LO<n>:PCAL[:STATe]?

**Return Type**

Boolean

**Default** 0 or OFF

**SENSe<cnum>[:CORRection]: IMD:MPRoduct <num>**

**Applicable Models:** N522xB, N524xB

*(Read-Write)* Sets and returns the maximum intermod product frequencies to be calibrated. All lower product frequencies are also calibrated.

**Parameters**

- `<cnum>` Any existing channel number; if unspecified, value is set to 1.
- `<char>` Maximum IM products to calibrate. Choose from:
  - **2** - second order products
  - **3** - third order products
  - **5** - fifth order products
7 - seventh order products
9 - ninth order products

**Examples**

```
SENS:CORR:IMD:MPR 5
sense2:correction:imd:mproduct 9
```

**Query Syntax**

`SENSe<cnum>::CORRection:IMD:MPRoduct?`

**Return Type**

Numeric

**Default**

3

---

**SENSe<cnum>::CORRection:IMD:POWer <num>**

**Applicable Models:** N522xB, N524xB

*(Read-Write)* Sets and returns the power level at which to perform the source power calibration using a power sensor.

**Parameters**

- `<cnum>`: Any existing channel number; if unspecified, value is set to 1.
- `<num>`: Power level. Choose a value between the min and max power level of the VNA.

**Examples**

```
SENS:CORR:IMD:POW -5
sense2:correction:imd:power 5
```

**Query Syntax**

`SENSe<cnum>::CORRection:IMD:POWer?`

**Return Type**

Numeric

**Default**

0

---

**SENSe<cnum>::CORRection:IMD:SENSor:CKIT <string>**
Applicable Models: N522xB, N524xB

(Read-Write) Sets and returns the cal kit to be used for calibrating at the port 1 reference plane when the power sensor connector is different from the DUT port 1. This effectively removes the effects of an adapter that is used to connect the power sensor.

**Parameters**

- **<cnum>** Any existing channel number; if unspecified, value is set to 1.
- **<string>** Cal Kit enclosed in quotes. First set the DUT connector for port 1 and the connector of the power sensor. Then use `SENS:CORR:COLL:GUID:CKIT:PORT1:CAT?` to return a list of valid cal kits.

**Examples**

```
SENS:CORR:IMD:SENS:CKIT "85052B"
```

**Query Syntax**

`SENSe<cnum>::CORRection:IMD:SENSor:CKIT?`

**Return Type** String

**Default** Depends on the specified connectors

---

SENSe<cnum>::CORRection:IMD:SENSor:CONNector <string>

Applicable Models: N522xB, N524xB

(Read-Write) Sets and returns the power sensor connector type which is used to perform the Source Power Cal portion of an IMD calibration.

**Parameters**

- **<cnum>** Any existing channel number; if unspecified, value is set to 1.

**Examples**

```
SENS:CORR:IMD:SENS:CONN "APC 3.5 male"
sense2:correction:imd:sensor:connector "Ignored"
```

**Query Syntax**

`SENSe<cnum>::CORRection:IMD:SENSor:CONNector?`

**Return Type** String

**Default** "Ignored"

---

SENSe<cnum>::CORRection:IMD:SORDer:INCLude <bool>
Applicable Models: N522xB, N524xB

(Read-Write) Sets and returns whether to include the second order products in the calibration. These frequencies of these products can be far from the main tones.

Parameters

- `<cnum>` Any existing channel number; if unspecified, value is set to 1.
- `<bool>` Choose from:
  - **ON** (or **1**) - Include 2nd order products
  - **OFF** (or **0**) - Do NOT include 2nd order products

Examples

```
SENS:CORR:IMD:SORD:INCL ON
```

Query Syntax

```
SENSe<cnum>::CORRection:IMD:SORDer:INCLUDe?
```

Return Type

Boolean

Default

OFF or 0
Note: These commands are replaced with Sense:Corr:Guided commands.

The commands in this topic are common to perform both SMC and VMC calibrations.

A **calibration session** is a term used to describe an instance of a SMC or VMC calibration. The session number is chosen in the SENSE:CORR:COLL:SESS:INITiate command. All other commands refer to that session number. For more commands, see SESS:SMC and SESS:VMC.

Commands to read (**STEP?**) and describe (**DESC?**) each step are provided to facilitate a remote user interface.

- SCPI Command Tree

SENSe<ch>:CORRection:COLLect:SESSion<n>:ACQuire <step>[,sync]
Applicable Models: N522xB, N524xB

(Write only) Acquire a calibration measurement.

Parameters

- `<ch>` Any existing channel number. If unspecified, value is set to 1.
- `<n>` Session number of the calibration.
  
  Learn about Cal sessions.

- `<step>` Step number to acquire. Use `SENS:CORR:COLL:SESS:STEPS?` to find the number of steps required for the calibration.

  [sync] Optional argument. Choose from:

  - **SYNChronous** - blocks SCPI commands during standard measurement (default behavior).
  - **ASYNchronous** - does NOT block SCPI commands during standard measurement.

  Learn more about this argument

Examples

```
SENSe2:CORR:COLL:SESS6:ACQ 5,ASYN;*OPC?
```

Query Syntax

Not Applicable

Default

Not Applicable

---

SENSe<ch>:CORRection:COLLect:SESSION<n>:CKIT:PORT<p>:CATalog?

Applicable Models: N522xB, N524xB

(Read only) Returns a list of cal kits that are compatible with the connector on port `<p>`. The port connector type is set with `SENS:CORR:COLL:SESS:CONN:PORT`.

Parameters

- `<ch>` Any existing channel number. If unspecified, value is set to 1.
- `<n>` Session number of the calibration.
  
  Learn about Cal sessions.

- `<p>` VNA port number connector to query for compatible cal kits.
  
  For VMC, output port of the calibration mixer, specify 3 unless already used for the output of the mixer. Otherwise, specify 4.
Examples

Return Type
Comma separated string values

Default
Not Applicable

Applicable Models: N522xB, N524xB

(Read-Write) Set or return the Cal Kit for the specified port. Use SENS:CORR:COLL:SESS:CKIT:PORT:CAT? to list compatible Cal Kits.

Parameters

<ch> Any existing channel number. If unspecified, value is set to 1

<n> Session number of the calibration.

Learn about Cal sessions.

<p> VNA port number connector for which a cal kit is to be specified.

For VMC, output port of the calibration mixer, specify 3 unless already used for the output of the mixer. Otherwise, specify 4.

<calkit> Cal Kit Name

Examples

SENS:CORR:COLL:SESS:CKIT:PORT:SEL 85091A

Query Syntax

Return Type
String

Default
Not Applicable

Applicable Models: N522xB, N524xB

(Read-Write) Set the connector type and sex for the specified port number. Catalog valid connector types using `SENS:CORR:COLL:GUID:CONN:CAT?`.

Parameters
<ch> Any existing channel number. If unspecified, value is set to 1
<n> Session number of the calibration. Learn about Cal sessions.
<p> VNA port number connector for which to specify a connector type.
$conn$ Name of the connector type

Examples `SENS2:CORR:COLL:SESS6:CONN:PORT1:SEL "N Type"`

Query Syntax `SENSe<ch>:CORR:COLL:SESS<n>:CONN:PORT<p>[:SELect]?`

Return Type String
Default Not Applicable

SENSe<ch>:CORR:COLL:SESS<n>:DESC? <step>

Applicable Models: N522xB, N524xB

(Read-only) Returns the connection prompt for the step. List the number of steps in the calibration using `SENS:CORR:COLL:SESS:STEPS?`.

Parameters
<ch> Any existing channel number. If unspecified, value is set to 1
<n> Session number of the calibration. Learn about Cal sessions.
<step> Step number

Return Type Numeric
Default Not Applicable

SENSe<ch>:CORR:COLL:SESS<n>:DONE
Applicable Models: N522xB, N524xB

(Write only) Ends the calibration session. First use SAVE? to calculate error terms and save the CalSet.

Parameters

<ch> Any existing channel number. If unspecified, value is set to 1
<n> Session number of the calibration.

Examples

SENS1:CORR:COLL:SESS6:SAVE?
SENS1:CORR:COLL:SESS6:DONE

Query Syntax

Not Applicable

Default

Not Applicable

SENSe<ch>:CORRection:COLLect:SESSion<n>:INITiate <string>

Applicable Models: N522xB, N524xB

(Write only) Initiates an SMC or VMC calibration session. Use the session number for subsequent SMC or VMC commands.

Parameters

<ch> Any existing channel number. If unspecified, value is set to 1
<n> Session number. Choose from 1 to the max number of channels. If the session number already exists it will be terminated and a new session initiated.
<string> Name of the calibration. Choose from:

"VMC" or "VectorMixerCal.VMCType"
"SMC" or "ScalarMixerCal.SMCType"

Examples

SENS1:CORR:COLL:SESS6:INITiate "VectorMixerCal.VMCType"

Query Syntax

Not Applicable

Default

Not Applicable

SENSe<ch>:CORRection:COLLect:SESSion<n>:SAVE?
Applicable Models: N522xB, N524xB

(Read only) Finish the SMC or VMC calibration, compute error terms, populate and save the Cal Set, and return the GUID of the Cal Set.

Note: The destination (Cal Register or User Cal Set) is determined by the setting of the SENS:CORR:PREFerence:CSET:SAVE command.

Parameters
- `<ch>` Any existing channel number. If unspecified, value is set to 1
- `<n>` Session number of the calibration.

Examples
SENSe1:CORRection:COLLect:SESS6:SAVE?

Return Type
String specifying the GUID of the Cal Set produced by this session.

Default
Not Applicable

SENSe[ch>:CORRection:COLLect:SESSion<n>:STEPs?

Applicable Models: N522xB, N524xB

(Write-Read) Returns the number of steps required by the Calibration.

To ensure this query always completes successfully, first send the write command: SENS:CORR:COLL:SESS:STEP without the `<n>` argument, then send the query.

Parameters
- `<ch>` Any existing channel number. If unspecified, value is set to 1
- `<n>` Session number of the calibration.

Examples
SENSe1:CORR:COLL:SESS6:STEP?

Return Type
Numeric

Default
Not Applicable
Note: These commands (commonly known as "Session" commands) were replaced with Sens:Corr:Coll:Guid:SMC commands.

Performs scalar (SMC) calibration on a frequency converting device.

**NOTE:** To configure a power meter and sensor see `SOURce:POWer:` commands.

```
SENSe<ch>:CORRection:COLLect:SESSion<n >:SMC:ECAL:CHARacteriza <mod> ,<char>
```

**Applicable Models:** N522xB, N523xB, N524xB

(Read-Write) Specifies the ECal module and characterization to be used for the SMC calibration.

**Parameters**

- `<ch>` Any existing channel number. If unspecified, value is set to 1
- `<n>` Session number of the calibration. Learn about Cal sessions.
- `<mod>` 1 - Electronic Calibration Module
- `<char>` Specifies which characterization within the ECal module from which to read the confidence data.

- 0 Factory characterization (data that was stored in the ECal module by Keysight). Default if not specified.
- 1 User characterization #1
- 2 User characterization #2
- 3 User characterization #3
- 4 User characterization #4
- 5 User characterization #5
### Examples

SENS:CORR:COLL:SESS:SMC:ECAL:CHAR 1,2

### Query Syntax

### Return Type

*Default:* Numeric

### Parameters

- `<ch>` Any existing channel number. If unspecified, value is set to 1
- `<n>` Session number of the calibration. Learn about Cal sessions.
- `<p>` Apply network to input or output of mixer. Choose from:
  - 1 - Input of mixer
  - 2 - Output of mixer
- `<string>` Filename of the S2P used for embedding or de-embedding. Use the full path name, file name, and .S2P suffix, enclosed in quotes.

### Applicable Models:

N522xB, N523xB, N524xB

### (Read-Write) Specifies the S2P filename to embed or de-embed on the input or output of your mixer measurement. Learn more.

### Examples

SENS:CORR:COLL:SESS:SMC:FSIM:NETW1:FIL "c:\users\public\network analyzer\documents/WaveguideAdapt.S2P"

### Query Syntax

SENS<ch>:CORRection:COLLect:SESSion<n>:SMC:FSIMulator:NETWork<x>:FILename?

### Return Type

*Default:* String

**Applicable Models:** N522xB, N523xB, N524xB

*(Read-Write)* Allows you to embed (add) or de-embed (remove) circuit network effects on the input and output of your mixer measurement. [Learn more.]

**Parameters**

- `<ch>` Any existing channel number. If unspecified, value is set to 1
- `<n>` Session number of the calibration. [Learn about Cal sessions.]
- `<p>` Apply network to input or output of mixer. Choose from:
  - 1 - Input of mixer
  - 2 - Output of mixer
- `<char>` Choose from:
  - **NONE** - Do nothing with effects of S2P file.
  - **EMBed** - Add effects of S2P file from the measurement results.
  - **DEEMbed** - Remove effects of S2P file from the measurement results.

**Examples**

<table>
<thead>
<tr>
<th>Query Syntax</th>
<th>Return Type</th>
<th>Default</th>

</table>

**Query Syntax**

**Examples**

SENSe<ch>:CORRection:COLLect:SESSION<n>:SMC:IMPort <calName>, <dataset>
Applicable Models: N522xB, N523xB, N524xB

(Write-only) Imports existing Source Power Cal data into the SMC calibration.

**Parameters**

- `<ch>`  Any existing channel number. If unspecified, value is set to 1
- `<n>`  Session number of the calibration.

  Learn about Cal sessions.

- `<calName>`  (String) Name of existing Cal Set from which power meter data is imported.
- `<dataset>`  (String) Name of the data set. Use POWER_STEP

**Examples**

```
```

**Query Syntax** Not Applicable

**Default** NONE

---

SENSe<ch>:CORRection:COLLect:SESSion<n>:SMC:PHASe:DELay <num>

**Applicable Models:** N522xB, N523xB, N524xB

(Read-Write) Set and return the known delay through the calibration mixer. Learn more.

**Parameters**

- `<ch>`  Any existing channel number. If unspecified, value is set to 1
- `<n>`  Session number of the calibration.

  Learn about Cal sessions.

- `<char>`  Known delay through the calibration mixer in seconds.

**Examples**

```
```

**Query Syntax** SENSe<ch>:CORRection:COLLect:SESSion<n>:SMC:PHASe:DELay?

**Return Type** Numeric

**Default** 0 seconds

---

SENSe<ch>:CORRection:COLLect:SESSion<n>:SMC:PHASe:METHod <char>
Applicable Models: N522xB, N523xB, N524xB

(Read-Write) Set and return the method of setting the delay through the calibration mixer. Learn more.

Parameters

- `<ch>` Any existing channel number. If unspecified, value is set to 1
- `<n>` Session number of the calibration.
  
  Learn about Cal sessions.

- `<char>` Choose from:
  
  
  - **MIXer** - use the S2P file set with `SENS:CORR:COLL:SESS:SMC:PHAS:MIX`

Examples

Query Syntax

`SENSe<ch>:CORRection:COLLect:SESSion<n>:SMC:PHASe:METHod?`

Return Type

- **Character**
  
  Default: **FIXed**

---

`SENSe<ch>:CORRection:COLLect:SESSion<n>:SMC:PHASe:MIXer <string>`

Applicable Models: N522xB, N523xB, N524xB

(Write-only) Set the filename of the S2P file used to characterize the calibration mixer. Learn more.

Parameters

- `<ch>` Any existing channel number. If unspecified, value is set to 1
- `<n>` Session number of the calibration.
  
  Learn about Cal sessions.

- `<string>` Calibration mixer filename. Use the following rules to specify path names:
  
  - The default folder is "c:\users\public\network analyzer\documents"
  
  - You can change the active directory using `MMEMory:CDIRectory`.
  
  - Specify only the file name if using the active directory.
  
  - You can also use an absolute path name to specify the folder and file.
SENSe<ch>:CORRection:COLLect:SESSion<n>:SMC:PWRCal:SEParate <bool>

Applicable Models: N522xB, N523xB, N524xB

(Read-Write) Specifies whether to use a Thru standard or to use two power sensor connections during the power cal of an SMC calibration.

This command must be sent BEFORE the INITiate command and all the other calibration commands.

Parameters

<ch> Any existing channel number. If unspecified, value is set to 1
<n> Session number of the calibration.

Examples

SENS:CORR:COLL:SESS:INIT "SMC"
SENS:CORR:COLL:SESS:SMC:PWRC:SEP 1

Query Syntax

Return Type

Boolean

Default

0 or OFF

SENSe<ch>:CORRection:COLLect:SESSion<n>:SMC:PWRCal:SRCPort <string> Obsolete
Specifies which port to calibrate.

**Note:** Beginning with Rev 6.0, this command is no longer necessary. Because of improved calibration techniques, **Both** is always selected although a power meter measurement is performed only on port 1.

**Parameters**

- `<ch>` Any existing channel number. If unspecified, value is set to 1
- `<n>` Session number of the calibration.

Learn about Cal sessions.

- `<char>`
  - '1' Source port 1 (SMC forward direction)
  - '2' Source port 2 (SMC reverse direction)
  - 'BOTH' (both forward and reverse directions)

**Examples**

```
SENS:CORR:COLL:SESS:SMC:PWRC:SRCP 'both'
```

**Query Syntax**

**Return Type** String

**Default** 1

---

**Applicable Models:** N522xB, N523xB, N524xB

Sets ECAL Auto-Orientation ON or OFF. If setting auto-orientation OFF, you must manually specify the orientation of the ECAL module with `SENS:CORR:COLL:SESS:SMC:TWOP:ECAL:PORTmap`.

**Parameters**

- `<ch>` Any existing channel number. If unspecified, value is set to 1
- `<n>` Session number of the calibration.

Learn about Cal sessions.

- `<bool>`
  - OFF or 0 = Orientation OFF
  - ON or 1 = Orientation ON

**Examples**

```
```

**Query Syntax**

**SENSe<ch>:CORRection:COLLect:SESSION<n>:SMC:TWOPort:ECAL:PORTmap <mod>, <string>**

**Applicable Models:** N522xB, N523xB, N524xB

*(Read-Write)* Specifies the manual orientation (which ports of the module are connected to which ports of the VNA) when auto-orientation is OFF.

**Parameters**

- `<ch>` Any existing channel number. If unspecified, value is set to 1
- `<n>` Session number of the calibration.
  
  Learn about Cal sessions.
- `<mod>` 1 - Electronic Calibration Module
- `<string>` Format in the following manner:
  
  Aw,Bx,Cy,Dz

  where

  - A, B, C, and D are literal ports on the ECAL module
  - w,x,y, and z are substituted for VNA port numbers to which the ECAL module port is connected.

  Ports of the module which are not used are omitted from the string.

**For example**, on a 4-port ECAL module with

- port A connected to VNA port 2
- port B connected to VNA port 3
- port C not connected
- port D connected to VNA port 1

the string would be: A2,B3,D1
If either the receive port or source port (or load port for 2-port cal) of the CALC:PAR:SELected measurement is not in this string and orientation is OFF, an attempt to perform an ECal calibration will fail.

**SENSe<ch>:CORRection:COLLect:SESSion<n >:SMC:TWOPort:METHod <string>**

**Applicable Models:** N522xB, N523xB, N524xB

*(Read-Write)* Specifies the guided ECal method for performing the thru portion of the calibration.

**Parameters**

- `<ch>` Any existing channel number. If unspecified, value is set to 1
- `<n>` Session number of the calibration.
  
  Learn about Cal sessions.
- `<string>` ECAL Method: Choose from:
  
  - 'DEFAULT' - Default
  - 'ADAP' - Adapter removal
  - 'FLUSH' - Flush Through
  - 'UNKN' - Unknown Thru

**SENSe<ch>:CORRection:COLLect:SESSion<n >:SMC:TWOPort:OMITisolat <bool>**
Applicable Models: N522xB, N523xB, N524xB

(Read-Write) Select to omit or perform the isolation portion of the ECAL.

Parameters

<ch> Any existing channel number. If unspecified, value is set to 1

<n> Session number of the calibration.

<bool> ON or 1 - Omit isolation

OFF or 0 - Perform isolation

Examples

SENS:CORR:COLL:SESS:SMC:TWOPort:OMIT 1

Query Syntax

Return Type

Boolean

Default

1

SENSe<ch>:CORRection:COLLect:SESSion<n >:SMC:TWOPort:OPTion <string>

Applicable Models: N522xB, N523xB, N524xB

(Read-Write) Sets the SMC calibration to ECAL or MECHanical

Parameters

<ch> Any existing channel number. If unspecified, value is set to 1

<n> Session number of the calibration.

Learn about Cal sessions.

<char> Choose from:

'ECAL' Electronic Calibration Module -

Note: This selection assumes there is only one ECal module on the USB and so it selects the first enumerated module on the bus, and the factory characterization on that ECal module, to be used for the cal.

'MECH' Mechanical Calibration Kit

Examples

SENS:CORR:COLL:SESS:SMC:TWOPort:OPTion 'ECAL'

Query Syntax

SENS:CORR:COLL:SESS:SMC:TWOPort:OPTion?
Return Type  String
Default     ECAL
Note: These commands (commonly known as "Session" commands) were replaced with Sens:Corr:Coll:Guid:VMC commands.

Performs a vector (VMC) calibration on a frequency converting device.

SENSe<ch>:CORRection:COLLect:SESSion<n> :VMC:FSIMulator:NETWork<x>:MODE <char>

See Also

- Example Programs
- Learn about VMC Calibration
- Synchronizing the Analyzer and Controller
Applicable Models: N522xB, N524xB

(Read-Write) Allows you to embed (add) or de-embed (remove) circuit network effects on the input and output of your mixer measurement. Learn more.

Parameters

<ch> Any existing channel number. If unspecified, value is set to 1

<n> Session number of the calibration.

Learn about Cal sessions.

<x> Apply network to input or output of mixer. Choose from:

1 - Input of mixer
2 - Output of mixer

<char> Choose from:

NONE - Do nothing with effects of S2P file.

EMBed - Add effects of S2P file from the measurement results.

DEEMbed - Remove effects of S2P file from the measurement results.

Examples

Query Syntax

SENS<ch>:CORRection:COLLect:SESSion<n>:VMC:FSIMulator:NETWork<x>:MODE?

Return Type Character

Default NONE

SENS<ch>:CORRection:COLLect:SESSion<n>:VMC:FSIMulator:NETWork<x>:Filename <string>
Applicable Models: N522xB, N524xB

(Read-Write) Specifies the S2P filename to embed or de-embed on the input or output of your mixer measurement. Learn more.

Parameters

- `<ch>` Any existing channel number. If unspecified, value is set to 1
- `<n>` Session number of the calibration. Learn about Cal sessions.
- `<x>` Apply network to input or output of mixer. Choose from:
  - 1 - Input of mixer
  - 2 - Output of mixer
- `<string>` Filename of the S2P used for embedding or de-embedding. Use the full path name, file name, and .S2P suffix, enclosed in quotes.

Examples

```
```

Query Syntax

```
SENS<ch>:CORRection:COLLect:SESSion<n>
:VMC:FSIMulator:NETWork<x>:FILename?
```

Return Type

String

Default

Not Applicable

---

Applicable Models: N522xB, N524xB

(Read-Write) Specifies the .S2P filename used for mixer characterization. Use the VMC:MIXer:CHARacterize:CAL: OPTion command to load the file for mixer characterization. Once loaded, use this command to query the current filename or set a new filename.

Parameters

- `<ch>` Any existing channel number. If unspecified, value is set to 1
- `<n>` Session number of the calibration. Learn about Cal sessions.
- `<string>` Filename of the S2P used for mixer characterization. Use the full path name, file name, and .S2P suffix, enclosed in quotes.

**Applicable Models:** N522xB, N524xB

*(Read-Write)* Sets the mixer characterization method to ECal, Mechanical, or read from a file.

**Parameters**

- `<ch>` Any existing channel number. If unspecified, value is set to 1
- `<n>` Session number of the calibration.

*Learn about Cal sessions.*

- `<char>`
  - **ECAL** - Electronic Calibration Module
  - **MECH** - Mechanical Calibration Kit
  - **FILE, <filename>** - Retrieve a mixer characterization file. Also specify the filename of the S2P used for mixer characterization. Use the full path name, file name, and .S2P suffix. Use the `VMC:CHARacterize:CAL:FILename` command to query the filename..

**Examples**

```

'or

FILE,'c:\users\public\network analyzer\documents/Mixer001.s2p'
```

```
the filename
```

**Query Syntax**

**Return Type**

String

**Default**

MECH
Applicable Models: N522xB, N524xB

(Read-Write) Specifies the direction in which to characterize the calibration mixer. Learn more about the calibration mixer.

Parameters

- `<ch>` Any existing channel number. If unspecified, value is set to 1
- `<n>` Session number of the calibration. Learn about Cal sessions.
- `<bool>`
  - OFF (0) - Characterize the calibration mixer in the SAME direction as that specified in the mixer setup.
  - ON (1) - Characterize the calibration mixer in the REVERSE direction as that specified in the mixer setup.

Examples

```
```

Query Syntax

```
```

Return Type

- Boolean

Default

- OFF

SENS<ch>:CORRection:COLLect:SESSion<n> :VMC:MIXer:ECAL:CHARacteriza <mod>,<char>

Applicable Models: N522xB, N524xB

(Read-Write) Specifies the ECal module and characterization to be used for the mixer characterization portion of the calibration.

Parameters

- `<ch>` Any existing channel number. If unspecified, value is set to 1
- `<n>` Session number of the calibration. Learn about Cal sessions.
- `<mod>` 1 - Electronic Calibration Module
- `<char>` Characterization number in the specified ECAL module. Choose from:
  - 0 Factory characterization (data that was stored in the ECAL module by Keysight). Default if not specified.
  - 1 User characterization #1
2  User characterization #2
3  User characterization #3
4  User characterization #4
5  User characterization #5

Examples
SENS:CORR:COLL:SESS:VMC:MIX:ECAL:CHAR 1,0

Query Syntax

Return Type
Numeric
Default
1,0

SENSe<ch>:CORRection:COLLect:SESSion<n>:VMC:OPERation <string>

Applicable Models: N522xB, N524xB

(Read-Write) Sets the port mapping for the mixer characterization with ECAL. This command is required if SENS:CORR:COLL:SESS:VMC:MIX:CHAR:CAL:OPT ECAL is specified.

Parameters
<ch>  Any existing channel number. If unspecified, value is set to 1
<n>  Session number of the calibration.

Learn about Cal sessions.

<mod>  1 - Electronic Calibration Module
<string>  Choose from:

"A1" - ECAL module port A is connected to VNA port 1
"B1" - ECAL module port B is connected to VNA port 1

Examples
SENS:CORR:COLL:SESS:VMC:PORT?

Query Syntax
SENS:CORR:COLL:SESS:VMC:MIX:PORTmap?

Return Type
String
Default
"A1"
Applicable Models: N522xB, N524xB

(Read-Write) Perform either full VMC calibration or mixer characterization only.

**Parameters**

- `<ch>` Any existing channel number. If unspecified, value is set to 1
- `<n>` Session number of the calibration.
- `<char>` 'CAL' - full calibration and mixer characterization
  'CHAR' - mixer characterization only (no reference mixer required) - Saves an .S2P file with the filename specified in `SENS<ch>:CORR:COLL:SESSION<n>:VMC:CHARacterize:CAL:FILENAME <filename>`. If none is specified, a filename is automatically generated and can be queried using the filename command.

**Examples**

```
SENS:CORR:COLL:SESSION<n>:VMC:OPER 'CAL'
```

**Query Syntax**

`SENS:CORR:COLL:SESSION<n>:VMC:OPER?`

**Return Type**

String

**Default**

CAL

---

Applicable Models: N522xB, N524xB

(Read-Write) Specifies the ECal module and characterization to be used for the VMC calibration.

**Parameters**

- `<ch>` Any existing channel number. If unspecified, value is set to 1
- `<n>` Session number of the calibration.
- `<mod>` 1 - Electronic Calibration Module
- `<char>` Characterization number in the specified ECAL module. Choose from:
  - 0 Factory characterization (data that was stored in the ECal module by Keysight). Default if not specified.
  - 1 User characterization #1

Applicable Models: N522xB, N524xB

(Read-Write) Sets ECAL orientation for the VMC ECal.

Parameters

- <ch> Any existing channel number. If unspecified, value is set to 1
- <n> Session number of the calibration.
  
  Learn about Cal sessions.

- <bool> ON or 1 - Perform orientation
- OFF or 0 - Do NOT perform orientation

Examples

Usage:

```
SENSe:CORR:COLL:SESS:VMC:TWOP:ECAL:CHAR 1,1
```

Query Syntax

```
```

Return Type

Integer

Default

```
1,0
```
**Applicable Models:** N522xB, N524xB

*(Read-Write)* Specifies the manual orientation (which ports of the module are connected to which ports of the VNA) when orientation is turned off.

**Parameters**

- `<ch>` Any existing channel number. If unspecified, value is set to 1
- `<n>` Session number of the calibration. Learn about Cal sessions.
- `<mod>` 1 - Electronic Calibration Module
- `<string>` Port Map, formatted in the following manner:

  \[Aw,Bx,Cy,Dz\]

  where:

  - A, B, C, and D are literal ports on the ECAL module.
  - w, x, y, z are substituted for VNA port numbers to which the ECAL module port is connected.
  - Ports of the module which are not used are omitted from the string.

For example, on a 4-port ECal module with:

- port A connected to VNA port 2
- port B connected to VNA port 3
- port C not connected
- port D connected to VNA port 1

the string would be: A2,B3,D1

If either the receive port or source port (or load port for 2-port cal) of the measurement is not in this string and orientation is OFF, an attempt to perform an ECal will fail.

**Examples**

```
```

**Query Syntax**

**Return Type**

string

**Default**

"A1,B2"
SENSe<ch>:CORRection:COLLect:SESSion<n> :VMC:TWOPort:METHod <string>

Applicable Models: N522xB, N524xB

(Read-Write) Specifies the guided ECAL method for performing the thru portion of the calibration.

**Parameters**

- `<ch>` Any existing channel number. If unspecified, value is set to 1
- `<n>` Session number of the calibration.

Learn about Cal sessions.

- `<char>`
  - 'DEFAULT' - Default
  - 'ADAP' - Adapter removal
  - 'FLUSH' - Flush Through
  - 'UNKN' - Unknown Thru

**Examples**

SENSe:CORR:COLL:SESS:VMC:TWOP:METH 'ADAP'
SENSe2:CORR:COLL:SESSion6:VMC:TWOPort:METHod 'FLUSH'

**Query Syntax**

SENSe:CORR:COLL:SESS:VMC:TWOP:METH?

**Return Type**

- String
- Default: DEFAULT

---

SENSe<ch>:CORRection:COLLect:SESSion<n> :VMC:TWOPort:OMITisolat <bool>

Applicable Models: N522xB, N524xB

(Read-Write) Select to omit or perform the isolation portion of the ECAL.

**Parameters**

- `<ch>` Any existing channel number. If unspecified, value is set to 1
- `<n>` Session number of the calibration.

Learn about Cal sessions.

- `<bool>`
  - ON or 1 - omit isolation
  - OFF or 0 - perform isolation

**Examples**

SENSe:CORR:COLL:SESS:VMC:TWOP:OMIT 1

---

**SENSe<cnum>:COUPle <ALL | NONE>**

**Applicable Models:** All

*(Read-Write)* Sets the sweep mode as Chopped or Alternate.

**Learn about Alternate Sweep**

**Parameters**

- `<cnum>` Any existing channel number; if unspecified, value is set to 1.
- `<ALL | NONE>`
  - **ALL** - Sweep mode set to Chopped - reflection and transmission measured on the same sweep.
  - **NONE** - Sweep mode set to Alternate - reflection and transmission measured on separate sweeps. Improves Mixer bounce and Isolation measurements. Increases sweep time.

**Examples**

```
SENS:COUP ALL
sense2:couple none
```

**Query Syntax**

SENSe<cnum>:COUPle?

**Return Type**

Character

**Default**

ALL

---

**SENSe<cnum>:COUPle:PARameter[:STATe] <bool>**
Applicable Models: All

(Read-Write) Turns ON and OFF Time Domain Trace Coupling. All of the measurements in the specified channel are coupled.

- To select Transform parameters to couple, use `CALC:MEAS:TRAN:COUP:PAR`
- To select Gating parameters to couple, use `CALC:MEAS:FILT:COUP:PAR`

Learn more about **Time Domain Trace Coupling**.

**Parameters**

- `<cnum>` Any existing channel number; if unspecified, value is set to 1.
- `<bool>` **ON (or 1)** - Turns ON Time Domain Trace Coupling.
  
  **OFF (or 0)** - Turns OFF Time Domain Trace Coupling.

**Examples**

```
SENS:COUP:PAR 0
sense2:couple:parameter:state on
```

**Query Syntax**

`SENS<cnum>:COUPl:PARameter[:STATe]`?

**Return Type** Boolean

**Default** ON (or 1)
Controls the PXI DC measurement.

SENSe:DC:

| CURRent:RANGe
| SAMPles
| DPOint
| POINts
| TIME
| VOLTage:RANGe

Click on a keyword to view the command details.

SENSe<ch>:DC:CURRent:RANGe <name>, <num>

Applicable Models: M937xA, M9485A, P937xA

(Read-Write) Sets and reads the range (in Amps) used for sensing current, which must be higher than the maximum current you expect to measure. This command is available for PXI SMU only. This is the same function with “IKtM911xMeasurement Interface” section, “SenseCurrentRange” property of the M911x driver.

Parameters

- `<ch>` Any existing channel number. If unspecified, value is set to 1.
- `<name>` String. DC Meter Name.
  
  "SMU*C" or “SMU*V” represents the SMU DC Meter name. “*” is the SMU module number. “C” means current measurement, “V” means voltage measurement.
- `<num>` Range in Amps (3, 0.001 or 0.0001)

Examples

```
SOUR:DC:CURR:RANG "SMU1", 10
```

Query Syntax

```
SENSe<ch>:DC:CURRent:RANGe? <name>
```
SENSe<ch>:DC:SAMPles:DPOint <name>, <num>

**Applicable Models:** M937xA, M9485A, P937xA

*(Read-Write)* Sets and reads the trigger offset in the measurement sweep. A negative value specifies pre-trigger samples, and a positive value specifies post-trigger delay samples. This command is available for PXI SMU only. This is the same function with “IKtM911xMeasurementSweep Interface” section, “OffsetPoints” property of the M911x driver.

**Parameters**

- `<ch>` Any existing channel number. If unspecified, value is set to 1.
- `<name>` String. DC Meter Name.
  
  "SMU*C" or "SMU*V" represents the SMU DC Meter name. "*" is the SMU module number. “C” means current measurement, “V” means voltage measurement.
- `<num>` Offset points value. Value range: 1 to 100000, step 1,

**Examples**

```
SOUR:DC:SAMP:DPO "SMU1", 10
```

**Query Syntax**

SENSe<ch>:DC:SAMPles:DPOint? <name>

**Return Type** Numeric

**Default** 3

SENSe<ch>:DC:SAMPles:POINTs <name>, <num>
Applicable Models: M937xA, M9485A, P937xA

(Read-Write) Sets and reads the DC measurement number of sample counts per one point measurement. This command is available for both PXI SMU and Digital/Analog I/O M9341B. For PXI SMU, this is the same function with “IKtM911xMeasurementSweep Interface” section, “Points” property of the M911x driver.

Parameters

  <ch>  Any existing channel number. If unspecified, value is set to 1.
  <name>  String. DC Meter Name.

[SMU] "SMU*C” or “SMU*V” represents the SMU DC Meter name. “*” is the SMU module number. “C” means current measurement, “V” means voltage measurement.

[M9341B] "AI1", "AI2", "AI3", "AI4", "AOC1" or" AOC2"

  <num>  Sample count value. Value range: 1 to 100000, step 1 (SMU),

Examples

SOUR:DC:SAMP:POINT "SMU1", 1000

Query Syntax  SENSE<ch>:DC:SAMPLes:POINTs? <name>

Return Type  Numeric

Default  3255 (SMU), 500 (M9341B)

SENSe<ch>:DC:SAMPles:TIME <name>, <num>
"AI1", "AI2", "AI3", "AI4", "AOC1" or "AOC2",

<num> Measurement time in seconds

[SMU] M9111A sample time is 5.12 usec per point.

[SMU] M9111A sample time is 5.12 usec per point.

[M9341B] Only one value can be set for one M9341B module. Its sample time
is 20 nsec per point.

Examples

SOUR:DC:SAMP:TIME "SMU1C", 1000

Query Syntax
SENSe<ch>:DC:SAMPLes:TIME? <name>

Return Type
Numeric

Default 0.0166656 (SMU), 0.00001 (M9341B)

SENSe<ch>:DC:VOLTage:RANGe <name>, <num>

Applicable Models: M937xA, M9485A, E5080A, P937xA

(Read-Write) Sets and reads the range (in Volts) used for sensing voltage, which must be higher than
the maximum current you expect to measure. This command is available for M937xA, M9485A with
Digital/Analog I/O M9341B or E5080A.

Parameters

<ch> Any existing channel number. If unspecified, value is set to 1.

<string> String. DC Meter Name.

"AI1", "AI2", "AI3", or "AI4"

<num> Range in Volts (M937xA, M9485A: 1, 5 or 10) (E5080A: 1 or 10)

Examples

SOUR:DC:CURR:RANG "AI1", 10

Query Syntax
SENSe<ch>:DC:VOLTage:RANGe? <name>

Return Type
Numeric

Default 10

### SENSE<ch>:DIQ:FREQuency:RANGe:ADD

**Applicable Models:** N522xB, N524xB

*(Write-only)* Adds a frequency range using the next available range name. For example, with the default F1 range name present, sending this command will create F2. On the Measurement Setup dialog this is the New setting.

**Parameters**

- `<ch>` The Differential IQ channel number. If unspecified, value is set to 1.

**Examples**

```
SENSe:DIQ:FREQ:RANG:ADD
sense2:diq:frequency:range:add
```

**Query Syntax**

Not applicable

**Default** Not applicable

### SENSE<ch>:DIQ:FREQuency:RANGe:COUNt?

**Applicable Models:** N522xB, N524xB

*(Read-only)* Returns the number of frequency ranges in the DIQ channel.

**Parameters**

- `<ch>` The Differential IQ channel number. If unspecified, value is set to 1.

**Examples**

```
SENSe:DIQ:FREQ:RANG:COUN?
```

**Return Type** Numeric

**Default** 1
**SENSe<ch>:DIQ:FREQuency:RANGe<rNum>:COUPle:DIVisor <value>**

**Applicable Models:** N522xB, N524xB

*(Read-Write)* Sets and reads the value by which the coupled range will be divided to achieve the frequency range specified by `<rNum>`.

On the **Frequency Range** dialog under **Coupling**, this is the **Divisor** setting.

**Parameters**

- `<ch>`: The Differential IQ channel number. If unspecified, value is set to 1.
- `<rNum>`: Frequency range number.
- `<value>`: Divisor value. Choose a positive or negative integer.

**Examples**

```
SENSe:DIQ:FREQ:RANGe:COUPle:DIV 1
sense2:diq:frequency:range2:couple:divisor 2
```

**Query Syntax**

```
SENSe<ch>:DIQ:FREQuency:RANGE<rNum>:COUPle:DIVisor?
```

**Return Type**

Integer

**Default**

1

**SENSe<ch>:DIQ:FREQuency:RANGe<rNum>:COUPle:ID <value>**

**Applicable Models:** N522xB, N524xB

*(Read-Write)* Sets and reads the frequency range to couple settings to.

On the **Frequency Range** dialog under **Coupling**, this is the **range to Couple To** setting.

**Parameters**

- `<ch>`: The Differential IQ channel number. If unspecified, value is set to 1.
- `<rNum>`: Frequency range number to be coupled. Range 1 can NOT be coupled to another range.
- `<value>`: Frequency range number to couple to. This range should be already created using SENS:DIQ:FREQ:RANGE:ADD

**Examples**

```
SENSe:DIQ:FREQ:RANG2:COUPle:ID 3
sense2:diq:frequency:range2:couple:id 1
```

**Query Syntax**

```
SENSe<ch>:DIQ:FREQuency:RANGE<num>:COUPle:ID?
```

**Return Type**

Integer
SENSe<ch>:DIQ:FREQuency:RANGe<rNum>:COUPle:MULTiplier <value>

Applicable Models: N522xB, N524xB

(Read-Write) Sets and reads the value by which the coupled range will be multiplied to achieve the frequency range specified by <rNum>.

On the Frequency Range dialog under Coupling, this is the Multiplier setting.

Parameters
- <ch> The Differential IQ channel number. If unspecified, value is set to 1.
- <rNum> Frequency range number.
- <value> Multiplier value. Choose a positive or negative integer.

Examples
- SENS:DIQ:FREQ:RANG1:COUP:MULT 2
- sense2:diq:frequency:range2:couple:multiplier 1

Query Syntax
SENSe<ch>:DIQ:FREQuency:RANGe<num>:COUPle:MULTiplier?

Return Type
- Integer
- Default 1

SENSe<ch>:DIQ:FREQuency:RANGe<rNum>:COUPle:OFFSet <value>

Applicable Models: N522xB, N524xB

(Read-Write) Sets and reads the frequency range number to be used as an offset. The frequencies of the range <rNum> will be offset from the 'coupled to' range by this frequency range. The SENS:DIQ:FREQ:RANG:COUP:UCON command determines whether the offset is positive or negative.

On the Frequency Range dialog under Coupling, this is the Offset setting.

Parameters
- <ch> The Differential IQ channel number. If unspecified, value is set to 1.
- <rNum> Frequency range number.
- <value> Offset range number. The resulting range must be within the frequency range of the analyzer.
<table>
<thead>
<tr>
<th>Examples</th>
<th>SENS:DIQ:FREQ:RANG1:COUP:OFFS 2</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>sense2:diq:frequency:range3:couple:offset 2 'range 3 is offset from the 'coupled to' range by the frequencies defined by range 2</td>
</tr>
</tbody>
</table>

**Query Syntax**  
SENS<ch>:DIQ:FREQuency:RANGe<num>:COUPle:OFFSet?

**Return Type**  
Numeric

**Default**  
1

**SENSe<ch>:DIQ:FREQuency:RANGe<num>:COUPle:STATe <value>**

**Applicable Models:** N522xB, N524xB

(Read-Write) Sets and reads the ON / OFF state of frequency range coupling.

On the Frequency Range dialog under **Coupling**, this is the **Couple (On|Off)** setting.

**Parameters**

- `<ch>` The Differential IQ channel number. If unspecified, value is set to 1.
- `<rNum>` Frequency range number.
- `<value>` (Boolean) Choose from:
  - ON or 1 - Range is coupled
  - OFF or 0 - Range is NOT coupled

<table>
<thead>
<tr>
<th>Examples</th>
<th>SENS:DIQ:FREQ:RANG1:COUP:STAT 1</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>sense2:diq:frequency:range2:couple:state off</td>
</tr>
</tbody>
</table>

**Query Syntax**  
SENS<ch>:DIQ:FREQuency:RANGe<num>:COUPle:STATe?

**Return Type**  
Boolean

**Default**  
OFF (0)

**SENSe<ch>:DIQ:FREQuency:RANGe<num>:COUPle:UCONvert <value>**
**Applicable Models:** N522xB, N524xB

(Read-Write) Sets and reads the state of the Up / Down conversion setting.

On the **Frequency Range** dialog under **Coupling**, this is the Up (On|Off) setting.

**Parameters**

- `<ch>`: The Differential IQ channel number. If unspecified, value is set to 1.
- `<rNum>`: Frequency range number.
- `<value>`: (Boolean) Choose from:
  - ON or 1 - The offset range is ADDED to the 'coupled to' frequency range.
  - OFF or 0 - The offset range is SUBTRACTED from to the 'coupled to' frequency range.

**Examples**

```
SENS:DIQ:FREQ:RANG1:COUP:UCONvert 1
sense2:diq:frequency:range2:couple:uconvert off
```

**Query Syntax**

```
SENSe<ch>:DIQ:FREQuency:RANGe<num>:COUPle:UCONvert?
```

**Return Type**

Boolean

**Default**

OFF

---

**SENSe<ch>:DIQ:FREQuency:RANGe<rNum>:DELETE**

**Applicable Models:** N522xB, N524xB

(Write-only) Deletes the specified frequency range.

On the **Measurement Setup dialog** this is the **Remove** setting.

**Parameters**

- `<ch>`: The Differential IQ channel number. If unspecified, value is set to 1.
- `<rNum>`: Frequency range number to delete.

**Examples**

```
SENS:DIQ:FREQ:RANG1:DEL
sense2:diq:frequency:range2:delete
```

**Query Syntax**

Not Applicable

**Default**

Not Applicable
SENSe<ch>:DIQ:FREQuency:RANGe<rNum>:IFBW <value>

Applicable Models: N522xB, N524xB

(Read-Write) Sets and reads the receiver IF bandwidth setting.

On the Frequency Range dialog under Frequency, this is the IFBW setting.

Parameters

<ch>  The Differential IQ channel number. If unspecified, value is set to 1.
<rNum> (Integer) Frequency range number.
<value> (Numeric) IF Bandwidth in Hz. The list of valid IF Bandwidths is different depending on the analyzer model. (See the list.) If an invalid number is specified, the analyzer will round up to the closest valid number.

Examples

<table>
<thead>
<tr>
<th>Command</th>
</tr>
</thead>
<tbody>
<tr>
<td>SENS:DIQ:FREQ:RANG1:IFBW 1e3</td>
</tr>
<tr>
<td>sense2:diq:frequency:range2:ifbw 100e3</td>
</tr>
</tbody>
</table>

Query Syntax  SENSe<ch>:DIQ:FREQuency:RANGe<num>:IFBW?

Return Type  Numeric

Default  1e5

SENSe<ch>:DIQ:FREQuency:RANGe<rNum>:STARt <value>

Applicable Models: N522xB, N524xB

(Read-Write) Sets and reads the start value for the specified frequency range.

On the Frequency Range dialog under Frequency, this is the Start setting.

Parameters

<ch>  The Differential IQ channel number. If unspecified, value is set to 1.
<rNum> (Integer) Frequency range number.
<value> (Numeric) Frequency range start value. Choose a value within the frequency range of the analyzer.

Examples

<table>
<thead>
<tr>
<th>Command</th>
</tr>
</thead>
<tbody>
<tr>
<td>SENS:DIQ:FREQ:RANG1:STAR 1e9</td>
</tr>
<tr>
<td>sense2:diq:frequency:range2:start 20e6</td>
</tr>
</tbody>
</table>

Query Syntax  SENSe<ch>:DIQ:FREQuency:RANGe<num>:STARt?

Return Type  Numeric

Default  Start frequency of the analyzer
SENSe<ch>:DIQ:FREQuency:RANGe<rNum>:STOP <value>

Applicable Models: N522xB, N524xB

(Read-Write) Sets and reads the stop value for the specified frequency range.

On the Frequency Range dialog under Frequency, this is the Stop setting.

**Parameters**

- `<ch>`: The Differential IQ channel number. If unspecified, value is set to 1.
- `<rNum>`: (Integer) Frequency range number.
- `<value>`: (Numeric) Frequency range stop value. Choose a value within the frequency range of the analyzer.

**Examples**

- `SENS:DIQ:FREQ:RANG1:STOP 10e9`
- `sense2:diq:frequency:range2:stop 500e6`

**Query Syntax**

`SENSe<ch>:DIQ:FREQuency:RANGe<num>:STOP?`

**Return Type**

Numeric

**Default**

Maximum frequency of the analyzer.

---

SENSe<ch>:DIQ:LOAD <filename>[,<type>]

Applicable Models: N522xB, N524xB

(Write-only) Recalls the list of parameters and frequency ranges settings from a previously-saved *.xml file.

Use `SENSe:DIQ:SAVE` to store the files.

**Note:** The Frequency Range settings and the DIQ Parameters are saved and recalled from a single *.xml file.

**Parameters**

- `<ch>`: The Differential IQ channel number. If unspecified, value is set to 1.
- `<filename>`: (String) Full path (optional) and filename with or without the *.xml extension. If the full path is not provided, the file is saved to the D:\drive.
- `<type>`: (Character) Choose the type of settings to be recalled:

  **PLIS** - just the parameters.
FRANge - just the frequency settings.

ALL - both parameters and frequency settings.

Examples

```
SENS:DIQ:LOAD "myDIQfile",ALL
sense2:diq:load "D:\myDIQfile.xml",plist
```

Query Syntax Not Applicable

Default PLISt

SENSe<ch>:DIQ:SAVE <filename>

Applicable Models: N522xB, N524xB

(Write-only) Stores the list of parameters and frequency ranges settings to an*.xml file for recall at a later time.

Use SENSe:DIQ:LOAD to recall files.

Note: The Frequency Range settings and the DIQ Parameters are saved and recalled from a single *.xml file.

Parameters

- `<ch>` The Differential IQ channel number. If unspecified, value is set to 1.
- `<filename>` (String) Full path (optional) and filename with or without the *.xml extension. If the full path is not provided, the file is saved to the D:\ drive.

Examples

```
SENS:DIQ:SAVE "myDIQfile"
sense2:diq:save "D:\myDIQfile.xml"
```

Query Syntax Not Applicable

Default Not Applicable

SENSe<ch>:DIQ:PARameter:CATalog?
**Applicable Models:** N522xB, N524xB

(Read-only) Returns a list of all existing parameters.

**Parameters**

- `<ch>` The Differential IQ channel number. If unspecified, value is set to 1.
- `<name>` (String) Comma-separated list of parameters, each parameter in the form “name:expression”.

**Examples**

```text
SENS:DIQ:PAR:CAT?
sense2:diq:parameter:catalog?
'Example of returned parameters
"IPwrF1:a1_F1","OPwrF1:b2_F1","GainF1:b2_F1/a1_F1"
```

**Default** Not Applicable

---

**SENSe<ch>:DIQ:PARameter:DEFine <name>,<expression>**

**Applicable Models:** N522xB, N524xB

(Write-only) Create a new parameter for Differential IQ channel. Use `CALCulate:MEASure:DEFine` to create a new trace with the new parameter.

Use `CALCulate:MEASure:PARameter` to change the parameter of one of the existing traces to the new parameter.

**Parameters**

- `<ch>` The Differential IQ channel number. If unspecified, value is set to 1.
- `<name>` (String) Parameter name.
  
  **Note:** Do not use underscores in the parameter name. For example, b2_f1 cannot be used as a parameter name. However, b2f1 is a valid parameter name.

- `<expression>` (String) Parameter expression using receiver names and mathematical expressions.

**Examples**

```text
SENS:DIQ:PAR:DEF "myNewParam","(a1_F1+b1_F2)/c1"
sense2:diq:parameter:define "myNewParam","(a1_F1+b1_F2)/c1"
```

**Query Syntax** Not Applicable

**Default** Not Applicable
SENSe<ch>:DIQ:PARAMeter:DELete <name>

**Applicable Models:** N522xB, N524xB

*(Write-only)* Deletes the named parameter.

**Parameters**

- `<ch>`: The Differential IQ channel number. If unspecified, value is set to 1.
- `<name>`: *(String)* Parameter name that was used when the parameter was created.

**Examples**

```
SENSe:DIQ:PAR:DEL "myNewParam"
sense2:diq:parameter:delete "myNewParam"
```

**Query Syntax**

Not Applicable

**Default**

Not Applicable

---

SENSe<ch>:DIQ:PORT<port>:MATCH:RANGe <value>[,<src>]

**Applicable Models:** N522xB, N524xB

*(Read-Write)* Sets and reads the existing frequency ranges over which Match Correction is to be performed.

On the *Source Configuration* dialog under *Match Correction*, this is the *Match Frequency Range* setting.

**Parameters**

- `<ch>`: The Differential IQ channel number. If unspecified, value is set to 1.
- `<port>`: *(Integer)* Source port number.
- `<value>`: *(String)* Frequency ranges, including the "F<n>" , where <n> is the range number. Separate each range with a comma.

While this argument can be used to make settings for ALL ports, it is designed to access ports such as an external source, true mode balanced port, or one of the Source outputs on the 2-port VNA-x model with multiple sources such as "Port 1 Src2". Otherwise, the `<port>` argument performs the same function. If both arguments are specified, [src] takes priority.

**Examples**

```
SENSe:DIQ:PORT1:MATC:RANG "F1,F2,F3"
sense2:diq:port3:match:range "F1", "Port 1 Src2"
```
### Query Syntax

```
SENSe<ch>:DIQ:PORT:RANGe? [src]
```

**Return Type**  
String

**Default**  
Depends on `<port>`

---

**SENSe<ch>:DIQ:PORT<port>:MATCH:RRECeiver <value>[,<src>]**

**Applicable Models:** N522xB, N524xB

*(Read-Write)* Sets and reads the reference receiver to be used to perform Match Correction.

On the **Source Configuration** dialog under **Match Correction**, this is the **Reference Receiver** setting.

**Parameters**

- `<ch>`  
The Differential IQ channel number. If unspecified, value is set to 1.
- `<port>`  
(Integer) Source port number.
- `<value>`  
(String) Choose any of the reference receivers in the analyzer using logical receiver notation. [Learn more.](#)

These would be "a_" where _ is the test port number.

- `<src>`  

While this argument can be used to make settings for ALL ports, it is designed to access ports such as an external source, true mode balanced port, or one of the Source outputs on the 2-port VNA-x model with multiple sources such as "Port 1 Src2". Otherwise, the `<port>` argument performs the same function. If both arguments are specified, `[src]` takes priority.

**Examples**

- `SENSe:DIQ:PORT2:MATC:RREC "a2" 'port 2 reference receiver`
- `SENSe:DIQ:PORT3:MATC:RREC "a1","Port 1 Src2"`

---

**SENSe<ch>:DIQ:PORT<port>:MATCH:STATe <value>[,<src>]**

**Query Syntax**  
```
SENSe<ch>:DIQ:PORT:RRECeiver? [src]
```

**Return Type**  
String

**Default**  
Depends on `<port>`

---

4242
Applicable Models: N522xB, N524xB

(Read-Write) Sets and reads the Match Correction ON/OFF state.

On the Source Configuration dialog under Match Correction, this is the Match Correction ON setting.

Parameters

- `<ch>`  The Differential IQ channel number. If unspecified, value is set to 1.
- `<port>` (Integer) Source port number.
- `<value>` (Boolean) Choose from:
  - ON or 1 - Perform Match Correction
  - OFF or 0 - Do not perform Match Correction.

While this argument can be used to make settings for ALL ports, it is designed to access ports such as an external source, true mode balanced port, or one of the Source outputs on the 2-port VNA-x model with multiple sources such as "Port 1 Src2". Otherwise, the `<port>` argument performs the same function. If both arguments are specified, `[src]` takes priority.

Examples

```
SENS:DIQ:PORT1:MATC:STAT 1
sense2:diq:port3:match:state off,"Port 1 Src2"
```

Query Syntax

SENSe<ch>:DIQ:PORT:STATe? [src]

Return Type

Boolean

Default

OFF

SENSe<ch>:DIQ:PORT<port>:MATCh:TRCeiver <value>,<src>]
Applicable Models: N522xB, N524xB

(Read-Write) Sets and reads the test port receiver to be used to perform Match Correction.

On the Source Configuration dialog under Match Correction, this is the Test Receiver setting.

**Parameters**

- `<ch>`: The Differential IQ channel number. If unspecified, value is set to 1.
- `<port>`: (Integer) Source port number.
- `<value>`: (String) Choose any of the test port receivers in the analyzer using logical receiver notation. Learn more.

These would be "b_" where _ is the test port number.

While this argument can be used to make settings for ALL ports, it is designed to access ports such as an external source, true mode balanced port, or one of the Source outputs on the 2-port VNA-x model with multiple sources such as "Port 1 Src2". Otherwise, the `<port>` argument performs the same function. If both arguments are specified, [src] takes priority.

**Examples**

```plaintext
SENS:DIQ:PORT3:MATC:TREC "b3"

sense2:diq:port3:match:treceiver "b1","Port 1 Src2"
```

**Query Syntax**

SENSe<ch>:DIQ:PORT:TRECiever? [src]

**Return Type**

String

**Default**

Depends on `<port>`

SENSe<ch>:DIQ:PORT<port>:PHASE:PARameter <value>[,<src>]
Applicable Models: N522xB, N524xB

(Read-Write) Sets and reads the receivers to be used to measure the phase of the sources. The phase measurement will be the difference between these two receivers.

Select the receivers based on your application. You are responsible to make sure that your DUT configuration routes the signals of interest to the correct receivers. Otherwise, the phase will not be properly controlled.

On the Source Configuration dialog under Phase, this is the Control Receiver setting.

Parameters

- `<ch>` The Differential IQ channel number. If unspecified, value is set to 1.
- `<port>` (Integer) Source port number.
- `<value>` (String) Phase parameter using the following syntax:

  \[ r\text{Cont}/r\text{Ref} \]

  Where:

  - `r\text{Cont}` is the receiver used to measure the controlled source.
  - `r\text{Ref}` is the receiver used to measure the reference source.

Only logical receiver notation (a1,b1) is available. Learn more.

Enclose the entire parameter in quotes.

While this argument can be used to make settings for ALL ports, it is designed to access ports such as an external source, true mode balanced port, or one of the Source outputs on the 2-port VNA-x model with multiple sources such as "Port 1 Src2". Otherwise, the `<port>` argument performs the same function. If both arguments are specified, `[src]` takes priority.

Examples

<table>
<thead>
<tr>
<th>Query Syntax</th>
<th>Return Type</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>SENS:DIQ:PORT1:PHAS:PAR &quot;a1/a3&quot;</td>
<td>String</td>
<td>Not applicable</td>
</tr>
<tr>
<td>sense2:diq:port3:phase:parameter &quot;b2/a2&quot;,&quot;Port 1 Src2&quot;</td>
<td>String</td>
<td>Not applicable</td>
</tr>
</tbody>
</table>

SENSe<ch>:DIQ:PORT<port>:PHASe:REFerence <value>[,<src>]

Applicable Models: N522xB, N524xB

(Read-Write) Sets and reads the port to be used as a reference when controlling phase for the specified <port>.

On the Source Configuration dialog under Phase, this is the Refer To setting.

Parameters

- `<ch>` The Differential IQ channel number. If unspecified, value is set to 1.
- `<port>` (Integer) Source port number.
- `<value>` (String) Reference port. Use SOUR:CAT? to return a list of valid port names.

The two internal VNA sources are available ONLY at specific ports. For example on a 4-port PNA-X, the possible port pairings are: 1/3, 1/4, 2/3, or 2/4. Port 1 can NOT be paired with Port 2, and Port 3 can NOT be paired with Port 4. Learn more about these limitations.

While this argument can be used to make settings for ALL ports, it is designed to access ports such as an external source, true mode balanced port, or one of the Source outputs on the 2-port VNA-x model with multiple sources such as "Port 1 Src2". Otherwise, the `<port>` argument performs the same function. If both arguments are specified, [src] takes priority.

Examples

<table>
<thead>
<tr>
<th>Query Syntax</th>
<th>Return Type</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>SENS:DIQ:PORT1:PHAS:REF &quot;port 2&quot;</td>
<td>String</td>
<td>Depends on &lt;port&gt;</td>
</tr>
<tr>
<td>sense2:diq:port3:phase:reference &quot;Port 3&quot;,&quot;Port 1 Src2&quot;</td>
<td>String</td>
<td>Depends on &lt;port&gt;</td>
</tr>
</tbody>
</table>

Query Syntax

SENSe<ch>:DIQ:PORT<port>:PHASe:REFeReference? [src]

Return Type

String

Default

Depends on <port>
**Applicable Models:** N522xB, N524xB

*(Read-Write)* Sets and reads the start value for a phase sweep.

On the *Source Configuration* dialog under *Phase*, this is the *Start Phase* setting.

**Parameters**

- `<ch>`: The Differential IQ channel number. If unspecified, value is set to 1.
- `<port>`: (Integer) Source port number.
- `<value>`: (Numeric) Start phase sweep value in degrees. Choose any positive or negative value.

While this argument can be used to make settings for ALL ports, it is designed to access ports such as an external source, true mode balanced port, or one of the Source outputs on the 2-port VNA-x model with multiple sources such as "Port 1 Src2". Otherwise, the `<port>` argument performs the same function. If both arguments are specified, `[src]` takes priority.

**Examples**

```
SENS:DIQ:PORT1:PHAS:STAR -90
sense2:diq:port3:phase:start 0,"Port 1 Src2"
```

**Query Syntax**

`SENSe<ch>:DIQ:PORT<port>:PHASe:STARt? [src]`

**Return Type**

Numeric

**Default**

0

`SENSe<ch>:DIQ:PORT<port>:PHASe:STATe <value>[,<src>]`
**Applicable Models:** N522xB, N524xB

*(Read-Write)* Sets and reads the ON/ OFF state of phase control.

On the **Source Configuration** dialog under **Phase**, this is the **Phase State** setting.

### Parameters

- `<ch>` The Differential IQ channel number. If unspecified, value is set to 1.
- `<port>` (Integer) Source port number.
- `<value>` (Character) Phase control state. Choose from:
  - **OFF** - Phase is NOT set or controlled.
  - **CONTrolled** - Phase is measured and iterated to within the specified tolerance. Specify the receivers and iteration properties using the **Source:Phase** commands.
  - **OPENloop** - Phase is set, but receivers are NOT used to measure and iterate the phase of the source. Therefore, the setting of phase is not as accurate or stable. Open Loop mode can be used with phase sweep (for example, from 0 to 360 degrees). However, each sweep may not start at 0 degrees. NO settings on the Phase Control Setup dialog are used in Open Loop.

Note: After selecting Open Loop, set each source to ON (not Auto).

While this argument can be used to make settings for ALL ports, it is designed to access ports such as an external source, true mode balanced port, or one of the Source outputs on the 2-port VNA-x model with multiple sources such as "Port 1 Src2". Otherwise, the `<port>` argument performs the same function. If both arguments are specified, [src] takes priority.

### Examples

```plaintext
SENS:DIQ:PORT1:PHAS:STAT OFF
sense2:diq:port3:phase:state controlled,"Port 1 Src2"
```

### Query Syntax

```
SENSe<ch>:DIQ:PORT<port>:PHASe:STATe? [src]
```

### Return Type

- **Character**

### Default

- **OFF**

```
SENSe<ch>:DIQ:PORT<port>:PHASe:STOP <value>[,<src>]
```
Applicable Models: N522xB, N524xB

(Read-Write) Sets and reads the stop value for a phase sweep.

On the Source Configuration dialog under Phase, this is the Stop Phase setting.

**Parameters**

- `<ch>`: The Differential IQ channel number. If unspecified, value is set to 1.
- `<port>`: (Integer) Source port number.
- `<value>`: (Numeric) Stop phase sweep value in degrees. Choose any positive or negative value.

While this argument can be used to make settings for ALL ports, it is designed to access ports such as an external source, true mode balanced port, or one of the Source outputs on the 2-port VNA-x model with multiple sources such as "Port 1 Src2". Otherwise, the `<port>` argument performs the same function. If both arguments are specified, [src] takes priority.

**Examples**

- `SENS:DIQ:PORT1:PHASE:STOP 270`
- `sense2:diq:port3:phase:stop "Port 1 Src2"

**Query Syntax**

`SENSe<ch>:DIQ:PORT<port>:PHASE:STOP? [src]`

**Return Type**

Numeric

**Default**

0

`SENSe<ch>:DIQ:PORT<port>:PHASE:SWEep[:STATe] <value>[,<src>]`
**Applicable Models:** N522xB, N524xB

*(Read-Write)* Sets and reads the ON / OFF state of phase sweep.

On the **Source Configuration** dialog under **Phase**, this is the **Sweep Phase (On|Off)** setting.

**Parameters**

- **<ch>** The Differential IQ channel number. If unspecified, value is set to 1.
- **<port>** (Integer) Source port number.
- **<value>** (Boolean) Choose from:
  - ON or 1 - Sweep phase.
  - OFF or 0 - Do not sweep phase.

While this argument can be used to make settings for ALL ports, it is designed to access ports such as an external source, true mode balanced port, or one of the Source outputs on the 2-port VNA-x model with multiple sources such as "Port 1 Src2". Otherwise, the `<port>` argument performs the same function. If both arguments are specified, `[src]` takes priority.

**Examples**

```
SENS:DIQ:PORT1:PHAS:SWE 1
sense2:diq:port3:phase:sweep:state off,"Port 1 Src2"
```

**Query Syntax**

```
SENSe<ch>:DIQ:PORT<port>:PHASe:SWEep[:STATe]? [src]
```

**Return Type** Boolean

**Default** OFF

---

**SENSe<ch>:DIQ:PORT<port>:POWer:ALC:MODE <value>[,<src>]**

**Applicable Models:** N522xB, N524xB

*(Read-Write)* Sets and reads the leveling mode to be used for the specified source port.

On the **Source Configuration** dialog under **Power**, this is the **Leveling Mode** setting.

**Parameters**

- **<ch>** The Differential IQ channel number. If unspecified, value is set to 1.
- **<port>** (Integer) Source port number.
<value> (String) Leveling mode. Choose from:

"Internal" - Standard internal analyzer leveling mode.

"Internal-<n>,<p>" - Receiver Leveling, where:

<n> is the receiver name.
<p> is the source port to be leveled.

"Open Loop" - Open loop leveling, used during pulse conditions with the internal source modulators. NOT available on all models. No leveling is used in setting the source power. The lowest settable power, without attenuation, is limited to -30dBm. The source power level accuracy is very compromised. Use a source power calibration to make the source power somewhat more accurate.

"Open Loop-<n>,<p>" - Open loop leveling, where:

<n> is the receiver name.
<p> is the source port to be leveled

While this argument can be used to make settings for ALL ports, it is designed to access ports such as an external source, true mode balanced port, or one of the Source outputs on the 2-port VNA-x model with multiple sources such as "Port 1 Src2". Otherwise, the <port> argument performs the same function. If both arguments are specified, [src] takes priority.

Examples

SENS:DIQ:PORT1:POW:ALC:MODE "Internal"
sense2:diq:port3:power:alc:mode "Internal-a2,1","Port 1 Src2"

Query Syntax

SENSe<ch>:DIQ:PORT<port>:POWer:ALC:MODE? [src]

Return Type

String

Default

"Internal"

SENSe<ch>:DIQ:PORT<port>:POWer:ATTenuation <value>[,.<src>]
Applicable Models: N522xB, N524xB

(Read-Write) Sets and reads the amount of source attenuation. Sending this command will set SENS:DIQ:PORT:POW:ATT:AUTO OFF

On the Source Configuration dialog under Power, this is the Source Attenuation setting.

Parameters

- `<ch>` The Differential IQ channel number. If unspecified, value is set to 1.
- `<port>` (Integer) Source port number.
- `<value>` (Numeric) Source Attenuation value. Choose from 0 to the maximum amount of source attenuation in the correct step size.

Rounding will occur when the selected value can not be achieved.

See attenuators for all VNA models.

While this argument can be used to make settings for ALL ports, it is designed to access ports such as an external source, true mode balanced port, or one of the Source outputs on the 2-port VNA-x model with multiple sources such as "Port 1 Src2". Otherwise, the `<port>` argument performs the same function. If both arguments are specified, [src] takes priority.

Examples

```
SENS:DIQ:PORT1:POW:ATT 10
sense2:diq:port3:power:attenuation 0,"Port 1 Src2"
```

Query Syntax

`SENSe<ch>:DIQ:PORT<port>:POWer:ATTenuation? [src]`

Return Type

Numeric

Default

0

`SENSe<ch>:DIQ:PORT<port>:POWer:ATTenuation:AUTO <value>[,<src>]`
Applicable Models: N522xB, N524xB

(Read-Write) Sets and reads the ON/ OFF state of auto range source attenuation.

On the Source Configuration dialog under Power, this is the Auto range source attenuator setting.

Parameters

- **<ch>** The Differential IQ channel number. If unspecified, value is set to 1.
- **<port>** (Integer) Source port number.
- **<value>** (Boolean) Choose from:
  - ON or 1 - Auto range the source attenuation.
  - OFF or 0 - Do not Auto range the source attenuation.

While this argument can be used to make settings for ALL ports, it is designed to access ports such as an external source, true mode balanced port, or one of the Source outputs on the 2-port VNA-x model with multiple sources such as "Port 1 Src2". Otherwise, the <port> argument performs the same function. If both arguments are specified, [src] takes priority.

Examples

```
SENSe:DIQ:PORT1:POW:ATT:AUTO 1
sense2:diq:port3:power:attenuation:auto off,"Port 1 Src2"
```

<table>

</thead>
</table>

SENSe<ch>:DIQ:PORT<port>:POWer:STARt <value>[,<src>]
Applicable Models: N522xB, N524xB

(Read-Write) Sets and reads the start value of a power sweep.

On the **Source Configuration** dialog under **Power**, this is the **Start Power** setting.

**Parameters**

- `<ch>` The Differential IQ channel number. If unspecified, value is set to 1.
- `<port>` (Integer) Source port number.
- `<value>` (Numeric) Power sweep start value in dBm. Choose start and stop value within a single attenuator range of the analyzer (generally about 30 dB).

While this argument can be used to make settings for ALL ports, it is designed to access ports such as an external source, true mode balanced port, or one of the Source outputs on the 2-port VNA-x model with multiple sources such as "Port 1 Src2". Otherwise, the `<port>` argument performs the same function. If both arguments are specified, `[src]` takes priority.

**Examples**

```
SENS:DIQ:PORT1:POW:STAR -10
sense2:diq:port3:power:start 0,"Port 1 Src2"
```

**Query Syntax**

```
SENS<ch>:DIQ:PORT<port>:POWer:STARt? [src]
```

**Return Type** Numeric

**Default** -5 dBm

```
SENS<ch>:DIQ:PORT<port>:POWer:STOP <value>[,<src>]
```
(Read-Write) Sets and reads the stop value of a power sweep.

On the Source Configuration dialog under Power, this is the Stop Power setting.

**Parameters**

- `<ch>` The Differential IQ channel number. If unspecified, value is set to 1.
- `<port>` (Integer) Source port number.
- `<value>` (Numeric) Power sweep stop value in dBm. Choose start and stop value within a single attenuator range of the analyzer (generally about 30 dB).

While this argument can be used to make settings for ALL ports, it is designed to access ports such as an external source, true mode balanced port, or one of the Source outputs on the 2-port VNA-x model with multiple sources such as "Port 1 Src2". Otherwise, the `<port>` argument performs the same function. If both arguments are specified, `[src]` takes priority.

**Examples**

```
SENS:DIQ:PORT1:POW:STOP 0
sense2:diq:port3:power:stop 2,"Port 1 Src2"
```

**Query Syntax**

SENSe<ch>:DIQ:PORT<port>:POWer:STOP? [src]

**Return Type** Numeric

**Default** -5 dBm

---

SENSe<ch>:DIQ:PORT<port>:POWer:SWEep[:STATe] <value>[,<src>]
Applicable Models: N522xB, N524xB

(Read-Write) Sets and reads the state of sweeping power.

On the Source Configuration dialog under Power, this is the Sweep Power (On|Off) setting.

Parameters

- `<ch>` The Differential IQ channel number. If unspecified, value is set to 1.
- `<port>` (Integer) Source port number.
- `<value>` (Boolean) Sweep Power state. Choose from:
  - ON or 1 - Perform power sweep.
  - OFF or 0 - Do not perform power sweep.

While this argument can be used to make settings for ALL ports, it is designed to access ports such as an external source, true mode balanced port, or one of the Source outputs on the 2-port VNA-x model with multiple sources such as "Port 1 Src2". Otherwise, the `<port>` argument performs the same function. If both arguments are specified, `[src]` takes priority.

Examples

```
SENS:DIQ:PORT1:POW:SWE 1
sense2:diq:port3:power:sweep:state off, "Port 1 Src2"
```

Query Syntax

SENSe<ch>:DIQ:PORT<port>:POWer:SWEep[:STATe]? [src]

Return Type

Boolean

Default

OFF

SENSe<ch>:DIQ:PORT<port>:RANGe <value>[,<src>]
Applicable Models: N522xB, N524xB

(Read-Write) Sets and reads the frequency range number to which the specified source port will be set.

At the top of the Source Configuration dialog this is the Frequency Range setting.

Parameters

<ch> The Differential IQ channel number. If unspecified, value is set to 1.
<port> (Integer) Source port number.
<value> (Integer) Frequency range number.

While this argument can be used to make settings for ALL ports, it is designed to access ports such as an external source, true mode balanced port, or one of the Source outputs on the 2-port VNA-x model with multiple sources such as "Port 1 Src2". Otherwise, the <port> argument performs the same function. If both arguments are specified, [src] takes priority.

Examples

SENS:DIQ:PORT1:RANG 1
sense2:diq:port3:range 2,"Port 1 Src2"

Query Syntax

SENSe<ch>:DIQ:PORT:RANGe? [src]

Return Type

Integer

Default

1

SENSe<ch>:DIQ:PORT<port>:STATe <value>[,<src>]
Applicable Models: N522xB, N524xB

(Read-Write) Sets and reads the ON / OFF state of the source specified by <port>.

At the top of the Source Configuration dialog this is the Source State setting.

Parameters

- <ch> The Differential IQ channel number. If unspecified, value is set to 1.
- <port> (Integer) Source port name.
- <value> (Character) Choose from:

  AUTO - Source power is turned ON at the specified test port when required by the measurement. This is the most common (default) setting. Auto sources are turned OFF when other sources are performing Match Correction sweeps.

  ON - Source power is ALWAYS ON, regardless of measurements that are in process. Use this setting to supply source power to a DUT port that always requires power, such as an LO port. This could turn OFF power at another test port. Learn about internal second source restrictions.

  OFF - Source power is never ON, regardless of the measurement requirements. Use this setting to prevent damage to a sensitive DUT test port.

  While this argument can be used to make settings for ALL ports, it is designed to access ports such as an external source, true mode balanced port, or one of the Source outputs on the 2-port VNA-x model with multiple sources such as "Port 1 Src2". Otherwise, the <port> argument performs the same function. If both arguments are specified, [src] takes priority.

Examples

```
SENS:DIQ:PORT1:STAT Auto
sense2:diq:port3:state On, "Port 1 Src2"
```

Query Syntax

```
SENSe<ch>:DIQ:PORT:STATe? [src]
```

Return Type

Character

Default

Auto
Modulation Distortion Measurement

Defines the modulation distortion settings including measurement, RF path, modulation source name, and sweep frequency and power.

```sql
SENSe<cnum>:DISTortion:ADC:FILTER:TYPE <enum>
```
Applicable Models: All with Option S93070xB or S95070A/B

(Read-Write) Selects between a narrow and wide IF filter anti-aliasing path.

Parameters

- `<cnum>` Any existing Modulation Distortion channel. If unspecified, value is set to 1.
- `<enum>` Choose from:

  - **NARRow** - Selects the ADC 11 MHz IF filter path.
  - **WIDE** - Selects the ADC 38 MHz IF filter path.
  - **AUTO** - Automatically set the ADC Filter setting based on the ADC Sampling Frequency.

Examples

```
SENS:DIST:ADC:FILT:TYPE WIDE
```

Query Syntax

```
SENSe<cnum>:DISTortion:ADC:FILTer:TYPE?
```

Return Type

Enumeration

Default

AUTO

---

Applicable Models: All with Option S93070xB or S95070A/B

(Write-only) This command launches the Receiver IF Cal. The optional argument allows the user to run the command with asynchronous behavior.

Parameters

- `<cnum>` Any existing Modulation Distortion channel. If unspecified, value is set to 1.
- `[SYNChronous | ASYNchronous]` Optional argument. Choose from:

  - **SYNChronous** - Blocks SCPI commands during standard measurement (default behavior).
  - **ASYNchronous** - Does NOT block SCPI commands during standard measurement.

Examples

```
SENS:DIST:CORR:COLL:IF:ACQuire [SYNChronous | ASYNchronous]
```

Learn more about this argument

Return Type

Not applicable
SENS<sup>cnum</sup>:DISTortion:EVM:NORMalize <num>

**Applicable Models:** All with Option S93070xB or S95070A/B

*(Read-Write)* Sets and returns the scaling factor applied to the EVM measurements. Enter a value between 0.1 and 1.0.

**Parameters**
- `<cnum>`: Any existing Modulation Distortion channel. If unspecified, value is set to 1.
- `<num>`: Scaling factor number between 0.1 and 1.0.

**Examples**
- `SENS:DIST:EVM:NORM 1`

**Query Syntax**
- `SENS<cnum>:DISTortion:EVM:NORMalize?`

**Return Type**
- Numeric

**Default**
- 1.0

--------

SENS<sup>cnum</sup>:DISTortion:FREQuency:TUNE:IMMediate

**Applicable Models:** All with Option S93070xB or S95070A/B

*(Write-only)* Auto tunes all measurement bands for the modulation distortion channel.

**Parameters**
- `<cnum>`: Any existing Modulation Distortion channel. If unspecified, value is set to 1.

**Examples**
- `SENS:DIST:FREQ:TUNE:IMM`

**Return Type**
- Not applicable

**Default**
- Not applicable

--------

SENS<sup>cnum</sup>:DISTortion:MEASure:BAND<bnum>:ACP:LOWer:IBW <num>
Applicable Models: All with Option S93070xB or S95070A/B

(Read-Write) Sets and returns the integration bandwidth (IBW) of the lower ACP measurement (ACPLo). The IBW is used to determine total signal power within a specified frequency span. For example, to calculate the total power of a signal composed of 100 tones spaced 1 MHz apart over a 100 MHz span, the signal power would be integrated over an IBW of 100 MHz.

![ACPLo Signal ACPUp](image)

**Parameters**

- `<cnum>` Any existing Modulation Distortion channel. If unspecified, value is set to 1.
- `<bnum>` Band number from 1 - 100. If unspecified, value is set to 1.
- `<num>` Lower ACP integration bandwidth.

**Examples**

```
SENS:DIST:MEAS:BAND:ACP:LOW:IBW 100 MHz
```

**Query Syntax**

```
SENSe<cnum>:DISTortion:MEASure:BAND<bnum>:ACP:LOWer:IBW?
```

**Return Type** Numeric

**Default** 100 MHz

```
SENSe<cnum>:DISTortion:MEASure:BAND<bnum>:ACP:LOWer:OFFSet <num>
```
**Applicable Models:** All with Option S93070xB or S95070A/B

*(Read-Write)* Sets and returns the lower ACP measurement offset (ACPLo). Offsets the lower ACP integration bandwidth relative to the LO used to generate the modulated signal.

![Diagram of ACPLo Signal ACPUp with 0 Hz SA Display](image)

**Parameters**
- `<cnum>` Any existing Modulation Distortion channel. If unspecified, value is set to 1.
- `<bnum>` Band number from 1 - 100. If unspecified, value is set to 1.
- `<num>` Lower ACP offset.

**Examples**
```
SENS:DIST:MEAS:BAND:ACP:LOW:OFFS -100 MHz
```

**Query Syntax**
```
SENS<cnum>:DISTortion:MEASure:BAND<bnum>:ACP:LOWer:OFFSet?
```

**Return Type** Numeric

**Default** -100 MHz

```
SENS<cnum>:DISTortion:MEASure:BAND<bnum>:ACP:UPPer:IBW <num>
```
Applicable Models: All with Option S93070xB or S95070A/B

(Read-Write) Sets and returns the integration bandwidth (IBW) of the upper ACP measurement (ACPUp). The IBW is used to determine total signal power within a specified frequency span. For example, to calculate the total power of a signal composed of 100 tones spaced 1 MHz apart over a 100 MHz span, the signal power would be integrated over an IBW of 100 MHz.

Parameters
- `<cnum>` Any existing Modulation Distortion channel. If unspecified, value is set to 1.
- `<bnum>` Band number from 1 - 100. If unspecified, value is set to 1.
- `<num>` Upper ACP integration bandwidth.

Examples
```
SENS:DIST:MEAS:BAND:ACP:UPP:IBW 100 MHz
```

Query Syntax
```
SENSe<cnum>:DISTortion:MEASure:BAND<bnum>:ACP:UPPer:IBW?
```

Return Type
Numeric

Default
100 MHz

```
SENSe<cnum>:DISTortion:MEASure:BAND<bnum>:ACP:UPPer:OFFSet <num>
```
**Applicable Models:** All with Option S93070xB or S95070A/B

**(Read-Write)** Sets and returns the upper ACP measurement offset (ACPUp). Offsets the upper ACP integration bandwidth relative to the LO used to generate the modulated signal.

![ACPLo Signal ACPUp](image)

**Parameters**
- `<cnum>` Any existing Modulation Distortion channel. If unspecified, value is set to 1.
- `<bnum>` Band number from 1 - 100. If unspecified, value is set to 1.
- `<num>` Upper ACP offset.

**Examples**

```
SENS:DIST:MEAS:BAND:ACP:UPP:OFFS 100 MHz
```

**Query Syntax**

```
SENSe<cnum>:DISTortion:MEASure:BAND<bnum>:ACP:UPPer:OFFSet?
```

**Return Type** Numeric

**Default** 100 MHz

---

**SENSe<cnum>:DISTortion:MEASure:BAND<bnum>:ADD**

**Applicable Models:** All with Option S93070xB or S95070A/B

**(Write-only)** Adds a new distortion measurement band.

**Parameters**
- `<cnum>` Any existing modulation distortion channel. If unspecified, value is set to 1
- `<bnum>` Band number from 1 - 100. If unspecified, value is set to 1.

**Examples**

```
SENS:DIST:MEAS:BAND:ADD
```

**Query Syntax**

Not applicable

**Default** Not Applicable
SENSe<cnun>:DISTortion:MEASure:BAND<bnum>:AUTofill

**Applicable Models:** All with Option S93070xB or S95070A/B

*(Write-only)* Automatically fills in the measurement settings for all bands from the currently active modulation file loaded in the source. Learn more.

**Parameters**
- `<cnun>` Any existing modulation distortion channel. If unspecified, value is set to 1.
- `<bnum>` Band number from 1 - 100. If unspecified, value is set to 1.

**Examples**
- SENSe:DIST:MEAS:BAND:AUT

**Query Syntax**
- Not applicable

**Default**
- Not Applicable

SENSe<cnun>:DISTortion:MEASure:BAND<bnum>:CARRier:IBW <num>

**Applicable Models:** All with Option S93070xB or S95070A/B

*(Read-Write)* Sets and returns the carrier (Signal) integration bandwidth (IBW) for the distortion measurement. The IBW is used to determine total signal power within a specified frequency span. For example, to calculate the total power of a signal composed of 100 tones spaced 1 MHz apart over a 100 MHz span, the signal power would be integrated over an IBW of 100 MHz.

![ACPLo Signal ACPIp

- Hz

SA Display

**Parameters**
- `<cnun>` Any existing Modulation Distortion channel. If unspecified, value is set to 1.
- `<bnum>` Band number from 1 - 100. If unspecified, value is set to 1.
- `<num>` Carrier integration bandwidth.

**Examples**
- SENSe:DIST:MEAS:BAND:CARR:IBW 100 MHz

**Query Syntax**
- SENSe<cnun>:DISTortion:MEASure:BAND<bnum>:CARRier:IBW?
SENSe<cnum>:DISTortion:MEASure:_BAND<bnum>:CARRier:OFFSet <num>

**Applicable Models:** All with Option S93070xB or S95070A/B

*(Read-Write)* Sets and returns the carrier offset (Signal). Offsets the Carrier integration bandwidth relative to the Carrier LO used to generate the modulation signal.

**Parameters**
- `<cnum>` Any existing Modulation Distortion channel. If unspecified, value is set to 1.
- `<bnum>` Band number from 1 - 100. If unspecified, value is set to 1.
- `<num>` Carrier offset.

**Examples**
- `SENS:DIST:MEAS:BAND:CARR:OFFS 0`

**Query Syntax**
- `SENSe<cnum>:DISTortion:MEASure:_BAND<bnum>:CARRier:OFFSet?`

**Return Type** Numeric
- **Default** 0

SENSe<cnum>:DISTortion:MEASure:_BAND<bnum>:COUNt?
Applicable Models: All with Option S93070xB or S95070A/B

(Read-only) Queries the total number of distortion measurement bands.

Parameters

- `<cnum>` Any existing channel number. If unspecified, value is set to 1
- `<bnum>` Band number from 1 - 100. If unspecified, value is set to 1.

Examples

```
SENS:DIST:MEAS:BAND:COUN?
```

Return Type Numeric

Default Not Applicable

---

SENS<cnm>:DISTortion:MEASure:BAND<bnum>:DELete

Applicable Models: All with Option S93070xB or S95070A/B

(Write-only) Deletes the specified distortion measurement band.

Parameters

- `<cnum>` Any existing modulation distortion channel. If unspecified, value is set to 1
- `<bnum>` Band number from 1 - 100. If unspecified, value is set to 1.

Examples

```
SENS:DIST:MEAS:BAND:DEL 2
```

Query Syntax Not applicable

Default Not Applicable

---

SENS<cnm>:DISTortion:MEASure:BAND<bnum>:INITialize
Applicable Models: All with Option S93070xB or S95070A/B

(Write-only) This command ignores any specified band number and deletes all existing bands and adds a single default band back into the Measurement Band Table.

Parameters

- `<cnum>` Any existing modulation distortion channel. If unspecified, value is set to 1
- `<bnum>` Band number from 1 - 100. If unspecified, value is set to 1.

Examples

```
SENS:DIST:MEAS:BAND:INIT 2
```

Query Syntax

Not applicable

Default

Not Applicable

---

SENSe<cnum>:DISTortion:MEASure:BAND<bnum>:NAME <string>

Applicable Models: All with Option S93070xB or S95070A/B

(Read-Write) Assigns a name to the specified distortion measurement band.

Parameters

- `<cnum>` Any existing modulation distortion channel. If unspecified, value is set to 1
- `<bnum>` Band number from 1 - 100. If unspecified, value is set to 1.
- `<string>` String. Distortion measurement band name.

Examples

```
SENS:DIST:MEAS:BAND:NAME "NewBand"
```

Query Syntax

SENSe<cnum>:DISTortion:MEASure:BAND<bnum>:NAME?

Return Type

String

Default

"New Band"

---

SENSe<cnum>:DISTortion:MEASure:BAND<bnum>:NOTCh:IBW <num>
Applicable Models: All with Option S93070xB or S95070A/B

(Read-Write) Sets and returns the notch integration bandwidth (IBW) for an NPR Notch modulation measurement. The IBW is used to determine total signal power within a specified frequency span. For example, to calculate the total power of a notch composed of 1000 tones spaced 100 kHz apart over a 100 MHz span, the notch power would be integrated over an IBW of 100 MHz.

Parameters
- `<cnum>` Any existing Modulation Distortion channel. If unspecified, value is set to 1.
- `<bnum>` Band number from 1 - 100. If unspecified, value is set to 1.
- `<num>` Notch integration bandwidth.

Examples
```
SENS:DIST:MEAS:BAND:NOTC:IBW 10 MHz
```

Query Syntax
```
SENS<cnum>:DISTortion:MEASure:BAND<bnum>:NOTCh:IBW?
```

Return Type
Numeric

Default
10 MHz

```
SENS<cnum>:DISTortion:MEASure:BAND<bnum>:NOTCh:OFFSet <num>
```
Applicable Models: All with Option S93070xB or S95070A/B

(Read-Write) Sets and returns the notch offset for an NPR Notch modulation measurement. The offset settings are relative to the carrier center frequency (0 Hz).

**Parameters**
- `<cnum>`: Any existing Modulation Distortion channel. If unspecified, value is set to 1.
- `<bnum>`: Band number from 1 - 100. If unspecified, value is set to 1.
- `<num>`: Notch offset.

**Examples**
```
SENS:DIST:MEAS:BAND:NOTC:OFFS 0
```

**Query Syntax**
```
SENS<cnum>:DISTortion:MEASure:BAND<bnum>:NOTCh:OFFSet?
```

**Return Type**
Numeric

**Default**
0

```
SENS<cnum>:DISTortion:MEASure:BAND<bnum>:TYPE <enum>
```
Applicable Models: All with Option S93070xB or S95070A/B

(Read-Write) Set and read the modulation distortion type.

Parameters

- `<cnum>` Any existing Modulation Distortion channel. If unspecified, value is set to 1.
- `<bnum>` Band number from 1 - 100. If unspecified, value is set to 1.
- `<enum>` Choose from:
  - ACPEVM
  - ACP
  - BPWR
  - EVM
  - NPR

Learn about these settings.

Examples

```
SENS:DIST:MEAS:BAND:TYPE ACPEVM
```

Query Syntax

```
SENSe<cnum>:DISTortion:MEASure:BAND<bnum>:TYPE?
```

Return Type

Enumeration

Default

ACPEVM

Applicable Models: All with Option S93070xB or S95070A/B

(Read-Write) Sets and returns the frequency span window used for modeling the DUT’s gain and distortion.

Parameters

- `<cnum>` Any existing Modulation Distortion channel. If unspecified, value is set to 1.
- `<num>` Distortion measurement DUT analysis bandwidth in Hz.

Examples

```
SENS:DIST:MEAS:CORR:APER 500000 Hz
```

Query Syntax

```
SENSe<cnum>:DISTortion:MEASure:CORRelation:APERture?
```

Return Type

Numeric
**SENSe<cnum>:DISTortion:MEASure:CORRelation:APERture:AUTO[:STATe] <bool>**

**Applicable Models:** All with Option S93070xB or S95070A/B

(Read-Write) Enable or disable automatic calculation of the frequency span window used for modeling the DUT's gain and distortion.

**Parameters**

- `<cnum>` Any existing modulation distortion channel. If unspecified, value is set to 1.
- `<bool>` Choose from:

  - 0 - **OFF** - Disable DUT analysis bandwidth settings.
  - 1 - **ON** - Enable DUT analysis bandwidth settings.

**Examples**

```
SENS:DIST:MEAS:CORR:APER :AUTO 1
```

**Query Syntax**

`SENSe<cnum>:DISTortion:MEASure:COR Relation:APERture:AUTO[:STATe]?

**Return Type**

Boolean

**Default** 0

---

**SENSe<cnum>:DISTortion:MEASure:FILTer <enum>**

**Applicable Models:** All with Option S93070xB or S95070A/B

(Read-Write) Sets the measurement filter to either None (default) or RRC (root-raised-cosine filter) for EVM and ACP measurements only.

**Parameters**

- `<cnum>` Any existing Modulation Distortion channel. If unspecified, value is set to 1.
- `<enum>` Choose from:

  - **NONE** - Do not use the measurement filter.
  - **RRC** - Select the RRC measurement filter.

**Examples**

```
SENS:DIST:MEAS:FILTER RRC
```

**Query Syntax**

`SENSe<cnum>:DISTortion:MEASure:FILT?

**Return Type**

Enumeration
**SENSe<cnum>:DISTortion:MEASure:FILTer:ALPHa <num>**

**Applicable Models:** All with Option S93070xB or S95070A/B

*(Read-Write)* Sets and returns the Alpha factor of the measurement filter.

**Parameters**

- **<cnum>** Any existing Modulation Distortion channel. If unspecified, value is set to 1.
- **<num>** Alpha factor of the measurement filter (0 to 1).

**Examples**

```
SENS:DIST:MEAS:FILT:ALPH 1
```

**Query Syntax**

`SENSe<cnum>:DISTortion:MEASure:FILTer:ALPHa?`

**Return Type**

Numeric

**Default**

0

---

**SENSe<cnum>:DISTortion:MEASure:FILTer:SRATe <num>**

**Applicable Models:** All with Option S93070xB or S95070A/B

*(Read-Write)* Sets and returns the Symbol Rate of the filter. If `SENSe:DISTortion:MEASure:FILTer:SRATe:AUTO[:STATe]` is ON, the symbol rate from the file is used. If no Symbol Rate is indicated in the file, then the Symbol Rate will be approximated from the bandwidth of the signal.

**Parameters**

- **<cnum>** Any existing Modulation Distortion channel. If unspecified, value is set to 1.
- **<num>** Symbol rate of the measurement filter (10 MHz to 50 GHz).

**Examples**

```
SENS:DIST:MEAS:FILT:SRAT 10E6
```

**Query Syntax**

`SENSe<cnum>:DISTortion:MEASure:FILTer:ALPHa?`

**Return Type**

Numeric

**Default**

0

---

**SENSe<cnum>:DISTortion:MEASure:FILTer:SRATe:AUTO[:STATe] <bool>**
**Applicable Models:** All with Option S93070xB or S95070A/B

**Parameters**

- `<cnum>`: Any existing modulation distortion channel. If unspecified, value is set to 1.
- `<bool>`: Choose from:
  - **0 - OFF**: Do not use Symbol Rate from file.
  - **1 - ON**: Use Symbol Rate from file.

**Examples**

```
SENS:DIST:MEAS:FILT:SRAT:AUTO 1
```

**Query Syntax**

`SENSe<cnum>:DISTortion:MEASure:FILTer:SRATe:AUTO[:STATe]?

**Return Type**

Boolean

**Default**

1

**SENSe<cnum>:DISTortion:MODulate:SOURce <string>**

**Applicable Models:** All with Option S93070xB or S95070A/B

**Parameters**

- `<cnum>`: Any existing modulation distortion channel. If unspecified, value is set to 1
- `<string>`: String. Distortion modulation source name.

**Examples**

```
SENS:DIST:MOD:SOUR "MyModSource"
```

**Query Syntax**

`SENSe<cnum>:DISTortion:MODulate:SOURce?

**Return Type**

String

**Default**

Not Applicable

**SENSe<cnum>:DISTortion:PATH:DUT:INPut <num>**
Applicable Models: All with Option S93070xB or S95070A/B

(Read-Write) Sets and returns the VNA port number connected to the DUT input.

Parameters
- `<cnum>` Any existing Modulation Distortion channel. If unspecified, value is set to 1.
- `<num>` VNA port number connected to the DUT input.

Examples
- `SENS:DIST:PATH:DUT:INPut 1`

Query Syntax
- `SENSe<cnum>:DISTortion:PATH:DUT:INPut?`

Return Type
- Numeric

Default
- 1

---

SENSe<cnum>:DISTortion:PATH:DUT:NOMinal:GAIN <num>

Applicable Models: All with Option S93070xB or S95070A/B

(Read-Write) Sets and returns the nominal DUT gain.

Parameters
- `<cnum>` Any existing Modulation Distortion channel. If unspecified, value is set to 1.
- `<num>` Nominal DUT gain in dB.

Examples
- `SENS:DIST:PATH:DUT:NOM:GAIN 0 dB`

Query Syntax
- `SENSe<cnum>:DISTortion:PATH:DUT:NOMinal:GAIN?`

Return Type
- Numeric

Default
- 0

---

SENSe<cnum>:DISTortion:PATH:DUT:NOMinal:NF <num>
Applicable Models: All with Option S93070xB or S95070A/B

(Read-Write) Sets and returns the nominal DUT noise figure. This value is used by the EVM measurement. This setting adds noise to the measurement for more realistic results. Setting the noise figure to a low value (-200 dB) will make EVM measurements without the effects of noise.

Parameters

- `<cnum>` Any existing Modulation Distortion channel. If unspecified, value is set to 1.
- `<num>` Nominal DUT noise figure in dB.

Examples

```
SENS:DIST:PATH:DUT:NOM:NF 0 dB
```

Query Syntax

```
SENSe<cnum>:DISTortion:PATH:DUT:NOMinal:NF?
```

Return Type

Numeric

Default

0

---

**SENSe<cnum>:DISTortion:PATH:DUT:OUTPut <num>**

Applicable Models: All with Option S93070xB or S95070A/B

(Read-Write) Sets and returns the VNA port number connected to the DUT output.

Parameters

- `<cnum>` Any existing Modulation Distortion channel. If unspecified, value is set to 1.
- `<num>` VNA port number connected to the DUT output.

Examples

```
SENS:DIST:PATH:DUT:OUTP 2
```

Query Syntax

```
SENSe<cnum>:DISTortion:PATH:DUT:OUTPut?
```

Return Type

Numeric

Default

2

---

**SENSe<cnum>:DISTortion:PATH:SOURce:ATTenuation:INCLude <bool>**
**Applicable Models:** All with Option S93070xB or S95070A/B

**Parameters**
- `<cnum>` Any existing Modulation Distortion channel. If unspecified, value is set to 1.
- `<bool>` Choose from:
  - **0 - OFF** - Do not include attenuator.
  - **1 - ON** - Include attenuator.

**Examples**

```
SENS:DIST:PATH:SOUR:ATT:INCL 1
```

**Query Syntax**

```
SENSe<cnum>:DISTortion:PATH:SOURce:ATTenuation:INCLude?
```

**Return Type**
Boolean

**Default**
1

---

**SENSe<cnum>:DISTortion:PATH:SOURce:NOMinal:AMPLifier <num>**

**Applicable Models:** All with Option S93070xB or S95070A/B

**Parameters**
- `<cnum>` Any existing Modulation Distortion channel. If unspecified, value is set to 1.
- `<num>` Nominal source amplifier gain in dB.

**Examples**

```
SENS:DIST:PATH:SOUR:NM:AMPL 0 dB
```

**Query Syntax**

```
SENSe<cnum>:DISTortion:PATH:SOURce:NOMinal:AMPLifier?
```

**Return Type**
Numeric

**Default**
0

---

**SENSe<cnum>:DISTortion:PULSe:RECeiver:AUTO <bool>**
### Applicable Models:
All with Option S93070xB or S95070A/B

**Read-Write** Enables or disables receiver timing auto generation from the source pulse timing.

**Parameters**

- `<cnum>` Any existing modulation distortion channel. If unspecified, value is set to 1.
- `<bool>` Choose from:
  - **0 - OFF** - Do not auto generate receiver timing.
  - **1 - ON** - Auto generate receiver timing.

**Examples**

```
SENS:DIST:PULS:REC:AUTO 1
```

**Query Syntax**
`SENSe<cnum>:DISTortion:PULSe:RECeiver:AUTO?`

**Return Type** Boolean

**Default** 1

---

### SENSE<cnum>:DISTortion:SWEep:CARRier:FREQuency <num>

**Applicable Models:** All with Option S93070xB or S95070A/B

**Read-Write** Sets and returns the carrier center frequency.

**Parameters**

- `<cnum>` Any existing Modulation Distortion channel. If unspecified, value is set to 1.
- `<num>` Carrier center frequency.

**Examples**

```
SENS:DIST:SWE:CARR:FREQ 1.5 GHz
```

**Query Syntax**
`SENSe<cnum>:DISTortion:SWEep:CARRier:FREQuency?`

**Return Type** Numeric

**Default** 1.5 GHz

---

### SENSE<cnum>:DISTortion:SWEep:DWELl <num>

---
Applicable Models: All with Option S93070xB or S95070A/B

*(Read-Write)* Sets and returns the delay in seconds before the test signal to allow the RF source to settle.

**Parameters**

- `<cnum>` Any existing Modulation Distortion channel. If unspecified, value is set to 1.
- `<num>` Delay time in seconds.

**Examples**

```
SENS:DIST:SWE:DWEL .1
```

**Query Syntax**

`SENSe<cnum>:DISTortion:SWEep:LEVel?`

**Return Type**

Numeric

**Default**

0

---

**SENSe<cnum>:DISTortion:SWEep:POWer:CARRier:LEVel <num>**

Applicable Models: All with Option S93070xB or S95070A/B

*(Read-Write)* Sets and returns the carrier power level used for the distortion test at either the input or output of the DUT.

**Parameters**

- `<cnum>` Any existing Modulation Distortion channel. If unspecified, value is set to 1.
- `<num>` Power level.

**Examples**

```
SENS:DIST:SWE:POW:CARR:LEV -10 dBm
```

**Query Syntax**

`SENSe<cnum>:DISTortion:SWEep:POWer:CARRier:LEVel?`

**Return Type**

Numeric

**Default**

-10 dBm

---

**SENSe<cnum>:DISTortion:SWEep:POWer:CARRier:LEVel:PORT <enum>**
**Applicable Models:** All with Option S93070xB or S95070A/B

**Parameters**

- `<cnum>` Any existing Modulation Distortion channel. If unspecified, value is set to 1.
- `<enum>` Choose from:
  - **DIN1** - DUT input.
  - **DOUT2** - DUT output.

**Examples**

```plaintext
SENS:DIST:SWE:POW:CARR:LEV:PORT DIN1
```

**Query Syntax**

```
SENSe<cnum>:DISTortion:SWEep:POWer:CARRier:LEVel:PORT?
```

**Return Type**  
Enumeration

**Default**  
DIN1

---

**SENSe<cnum>:DISTortion:SWEep:POWer:CARRier:LIST<index>:TYPE <enum>**

**Applicable Models:** All with Option S93070xB or S95070A/B

**Parameters**

- `<cnum>` Any existing Modulation Distortion channel. If unspecified, value is set to 1.
- `<index>` Power sweep row number. If unspecified, value is set to 1.
- `<enum>` Choose from:
  - **RAMP** - Selects a ramp type power sweep.
  - **LIST** - Selects a list of power values to define a power sweep.

**Examples**

```plaintext
SENS:DIST:SWE:POW:CARR:LEV1:TYPE RAMP
```

**Query Syntax**

```
SENSe<cnum>:DISTortion:SWEep:POWer:CARRier:LEVel<index>:TYPE?
```

**Return Type**  
Enumeration

**Default**  
RAMP

---

**SENSe<cnum>:DISTortion:SWEep:POWer:CARRier:LIST<index>:ADD**
**Applicable Models:** All with Option S93070xB or S95070A/B

*(Write-only)* Adds a new row to the power sweep list table.

**Parameters**

- `<cnum>` Any existing Modulation Distortion channel. If unspecified, value is set to 1
- `<index>` Power sweep row number. If unspecified, value is set to 1.

**Examples**

```
SENS:DIST:SWE:POW:CARR:LIST1:ADD
```

**Query Syntax** Not applicable

**Default** Not Applicable

---

**SEnSe`<cnum>`:DIStortion:SWEep:POWer:CARRier:LIST`<index>`:DELeTe**

**Applicable Models:** All with Option S93070xB or S95070A/B

*(Write-only)* Deletes the specified row from the power sweep list table.

**Parameters**

- `<cnum>` Any existing Modulation Distortion channel. If unspecified, value is set to 1
- `<index>` Power sweep row number. If unspecified, value is set to 1.

**Examples**

```
SENS:DIST:SWE:POW:CARR:LIST1:DEL
```

**Query Syntax** Not applicable

**Default** Not Applicable

---

**SEnSe`<cnum>`:DIStortion:SWEep:POWer:CARRier:LIST`<index>`:LEVel `<num>`**
Applicable Models: All with Option S93070xB or S95070A/B

(Read-Write) Sets and returns the power level used for the specified row in the power sweep list table.

Parameters
  <cnum> Any existing Modulation Distortion channel. If unspecified, value is set to 1.
  <index> Power sweep row number. If unspecified, value is set to 1.
  <num> Power level.

Examples

<table>
<thead>
<tr>
<th>Query Syntax</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>SENS:DIST:SWE:POW:CARR:LIST1:LEV -20 dBm</td>
<td>Not Applicable</td>
</tr>
</tbody>
</table>

SENSe<cnum>:DISTortion:SWEep:POWer:CARRier:LIST<index>:LOAD <fileName>

Applicable Models: All with Option S93070xB or S95070A/B

(Write-only) Specifies the file path to recall a previous power sweep list file.

Parameters
  <cnum> Any existing Modulation Distortion channel. If unspecified, value is set to 1.
  <index> Power sweep row number. If unspecified, value is set to 1.
  <fileName> (String) Power sweep file name (*.csv).

Examples

<table>
<thead>
<tr>
<th>Query Syntax</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>SENS:DIST:SWE:POW:CARR:LIST1:LOAD &quot;C:/myPowerSweepList.csv&quot;</td>
<td>Not applicable</td>
</tr>
</tbody>
</table>

SENSe<cnum>:DISTortion:SWEep:POWer:CARRier:LIST<index>:NBW <num>

<table>
<thead>
<tr>
<th>Query Syntax</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Not applicable</td>
</tr>
</tbody>
</table>
**Applicable Models:** All with Option S93070xB or S95070A/B

(Read-Write) Sets and returns the noise bandwidth setting used for the specified row in the power sweep list table.

**Parameters**
- `<cnum>`: Any existing Modulation Distortion channel. If unspecified, value is set to 1.
- `<index>`: Power sweep row number. If unspecified, value is set to 1.
- `<num>`: Noise bandwidth value.

**Examples**
- `SENS:DIST:SWE:POW:CARR:LIST1:NBW 100 Hz`

**Query Syntax**
- `SENSe<cnum>:DISTortion:SWEep:POWer:CARRier:LIST<index>:NBW?`

**Return Type**
- Numeric

**Default**
- 100 Hz

---

**SENSe<cnum>:DISTortion:SWEep:POWer:CARRier:LIST<index>:NBW:MODE <enum>**

**Applicable Models:** All with Option S93070xB or S95070A/B

(Read-Write) Selects the noise bandwidth mode in the power sweep list table.

**Parameters**
- `<cnum>`: Any existing Modulation Distortion channel. If unspecified, value is set to 1.
- `<index>`: Power sweep row number. If unspecified, value is set to 1.
- `<enum>`: Choose from:
  - **FIXed** - Sets all noise bandwidth values in the power sweep list table to the same value.
  - **CUSTom** - Each noise bandwidth setting in the power sweep list table may be different.
  - **AUTO** - The Noise BW setting will be used for the minimum power level. As the power level increases, the Noise BW will increase automatically. This results in faster measurements and ensures that the noise error is approximately the same for each power level.

**Examples**

**Query Syntax**
- `SENSe<cnum>:DISTortion:SWEep:POWer:CARRier:LIST<index>:NBW:MODE?`
Return Type  Enumeration
Default      FIXed

SENSe<cnum>:DISTortion:SWEep:POWer:CARRier:LIST<index>:POINts <num>

Applicable Models: All with Option S93070xB or S95070A/B

(Read-Write) Sets and returns the number of power points to measure for the power sweep list measurement.

Parameters
- <cnum>      Any existing Modulation Distortion channel. If unspecified, value is set to 1.
- <index>     Power sweep row number. If unspecified, value is set to 1.
- <num>       Number of power points to measure.

Examples  SENS:DIST:SWE:POW:CARR:LIST1:POIN 10

Query Syntax  SENSe<cnum>:DISTortion:SWEep:POWer:CARRier:LIST<index>:POINts?

Return Type  Numeric
Default      11

SENSe<cnum>:DISTortion:SWEep:POWer:CARRier:LIST<index>:RECeiver:ATTenuation <num>

Applicable Models: All with Option S93070xB or S95070A/B

(Read-Write) Sets and returns the receiver attenuation for the specified row in the power sweep list table.

Parameters
- <cnum>      Any existing Modulation Distortion channel. If unspecified, value is set to 1.
- <index>     Power sweep row number. If unspecified, value is set to 1.
- <num>       Receiver attenuation value.

Examples  SENS:DIST:SWE:POW:CARR:LIST1:REC:ATT 0

Query Syntax  SENSe<cnum>:DISTortion:SWEep:POWer:CARRier:LIST<index>:RECeiver:ATTenuation?

Return Type  Numeric
Applicable Models: All with Option S93070xB or S95070A/B

(Read-Write) Selects the receiver attenuation mode in the power sweep list table.

Parameters

- `<cnum>`: Any existing Modulation Distortion channel. If unspecified, value is set to 1.
- `<index>`: Power sweep row number. If unspecified, value is set to 1.
- `<enum>`: Choose from:
  - **FIXed**: Sets all receiver attenuation values in the power sweep list table to the same value.
  - **CUSTOM**: Each receiver attenuation setting in the power sweep list table may be different.

Examples

```
```

Query Syntax

```
```

Return Type: Enumeration

Default: `FIXed`

---

Applicable Models: All with Option S93070xB or S95070A/B

(Write-only) Specifies the file path to save a power sweep list file.

Parameters

- `<cnum>`: Any existing Modulation Distortion channel. If unspecified, value is set to 1.
- `<index>`: Power sweep row number. If unspecified, value is set to 1.
- `<fileName>`: (String) Power sweep file name (*.csv).

Examples

```
SENS:DIST:SWE:POW:CARR:LIST1:SAVE "C:/myPowerSweepList.csv"
```

Query Syntax: Not applicable

Default: Not applicable
SENSe<cnum>:DIStortion:SWeep:POWer:CARRier:LIST<index>:SOURce:ATTenuation <num>

Applicable Models: All with Option S93070xB or S95070A/B

(Read-Write) Sets and returns the source attenuation for the specified row in the power sweep list table.

Parameters
- <cnum>: Any existing Modulation Distortion channel. If unspecified, value is set to 1.
- <index>: Power sweep row number. If unspecified, value is set to 1.
- <num>: Source attenuation value.

Examples
- SENSe<getNum>:DIStortion:SWeep:POWer:CARRier:LIST1:SOURce:ATTenuation 0 dB

Query Syntax
SENSe<cnum>:DIStortion:SWeep:POWer:CARRier:LIST<index>:SOURce:ATTenuation?

Return Type
Numeric

Default
0 dB

Applicable Models: All with Option S93070xB or S95070A/B

(Read-Write) Selects the source attenuation mode in the power sweep list table.

Parameters
- <cnum>: Any existing Modulation Distortion channel. If unspecified, value is set to 1.
- <index>: Power sweep row number. If unspecified, value is set to 1.
- <enum>: Choose from:
  - FIXed: Sets all source attenuation values in the power sweep list table to the same value.
  - CUSTOM: Each source attenuation setting in the power sweep list table may be different.

Examples

Query Syntax
SENSe<cnum>:DISTortion:SWEep:POWer:CARRier:RAMP:LEVel<index>:STARt <num>

Applicable Models: All with Option S93070xB or S95070A/B

(Read-Write) Sets and returns the starting power level for the power sweep ramp measurement.

Parameters

- <cnum> Any existing Modulation Distortion channel. If unspecified, value is set to 1.
- <index> Power sweep row number. If unspecified, value is set to 1.
- <num> Starting power level.

Examples

```
```

Query Syntax

```
SENSe<cnum>:DISTortion:SWEep:POWer:CARRier:RAMP:LEVel<index>:STARt?
```

Return Type

Numeric

Default

-20 dBm

---

SENSe<cnum>:DISTortion:SWEep:POWer:CARRier:RAMP:LEVel<index>:STOP <num>

Applicable Models: All with Option S93070xB or S95070A/B

(Read-Write) Sets and returns the stop power level for the power sweep ramp measurement.

Parameters

- <cnum> Any existing Modulation Distortion channel. If unspecified, value is set to 1.
- <index> Power sweep row number. If unspecified, value is set to 1.
- <num> Stop power level.

Examples

```
```

Query Syntax

```
SENSe<cnum>:DISTortion:SWEep:POWer:CARRier:RAMP:LEVel<index>:STOP?
```

Return Type

Numeric
SENSe<cnump>:DISTortion:SWEep:POWER:CARRier:RAMP:NBW:AUTO <bool>

**Applicable Models:** All with Option S93070xB or S95070A/B

*(Read-Write)* Enable or disable increasing noise bandwidth at high powers automatically for faster measurements.

**Parameters**
- `<cnump>` Any existing modulation distortion channel. If unspecified, value is set to 1.
- `<bool>` Choose from:
  - **0 - OFF** - Disable auto-increase NBW at high powers.
  - **1 - ON** - Enable auto-increase NBW at high powers.

**Examples**
- `SENSe<cnump>:DISTortion:SWEep:POWER:CARRier:RAMP:NBW:AUTO 1`

**Query Syntax**

**Return Type** Boolean

**Default** 0

---

**Applicable Models:** All with Option S93070xB or S95070A/B

*(Read-Write)* Sets and returns the number of power points to measure for the power sweep ramp measurement.

**Parameters**
- `<cnump>` Any existing Modulation Distortion channel. If unspecified, value is set to 1.
- `<num>` Number of power points to measure.

**Examples**

**Query Syntax**

**Return Type** Numeric

**Default** 11
SENSe<cnum>:DISTortion:SWEep:POWer:SPARam:LEVel <num>

Applicable Models: All with Option S93070xB or S95070A/B

(Read-Write) Sets and returns the power level used to measure the DUT S-parameters when operating in its linear region. These S-parameters are used to calculate distortion.

Parameters
- <cnum> Any existing Modulation Distortion channel. If unspecified, value is set to 1.
- <num> Power level.

Examples

```
SENS:DIST:SWE:POW:SPAR:LEV -30 dBm
```

Query Syntax
SENSe<cnum>:DISTortion:SWEep:POWer:SPARam:LEVel?

Return Type
Numeric

Default
-30 dBm

SENSe<cnum>:DISTortion:SWEep:RETRace:POWer <enum>

Applicable Models: All with Option S93070xB or S95070A/B

(Read-Write) Keeps RF power ON at the End of Sweep.

Parameters
- <cnum> Any existing Modulation Distortion channel. If unspecified, value is set to 1.
- <enum> Choose from:
  - AUTO- RF Power is not forced off at the end of a sweep.
  - OFF- RF Power will turn off at the end of a sweep.

Examples

```
SENS:DIST:SWE:RETR:POW
```

Query Syntax
SENSe<cnum>:DISTortion:SWEep:RETRace:POWer?

Return Type
Enumeration

Default
AUTO

SENSe<cnum>:DISTortion:SWEep:SPARam:BWIDth <num>
**Applicable Models:** All with Option S93070xB or S95070A/B

(Read-Write) Sets and returns the IF bandwidth for the linear S21 sweep.

**Parameters**

- `<cnum>`: Any existing Modulation Distortion channel. If unspecified, value is set to 1.
- `<num>`: IF bandwidth.

**Examples**

```
SENS:DIS:SWEP:SPAR:BWID 1 kHz
```

**Query Syntax**

```
SENSe<cnum>:DISTortion:SWEep:SPARam:BWIDth?
```

**Return Type** Numeric

**Default** 1 kHz

---

**SENSe<cnum>:DISTortion:SWEep:SPARam:REUSE <bool>**

**Applicable Models:** All with Option S93070xB or S95070A/B

(Read-Write) Enable or disable the re-use of the previous linear S-parameter measurements if available and skip sweep.

**Parameters**

- `<cnum>`: Any existing modulation distortion channel. If unspecified, value is set to 1.
- `<bool>`: Choose from:
  - 0 - OFF - Disable linear power sweep.
  - 1 - ON - Enable linear power sweep.

**Examples**

```
SENS:DIS:SWEP:SPAR:REUS 1
```

**Query Syntax**

```
SENSe<cnum>:DISTortion:SWEep:SPARam:RESUe?
```

**Return Type** Boolean

**Default** 0

---

**SENSe<cnum>:DISTortion:SWEep:SPARam[:STATe] <bool>**

---
Applicable Models: All with Option S93070xB or S95070A/B

(Read-Write) Enable or disable S-parameter sweep. If disabled, curve fitting (smoothing) is used instead of the S-parameter sweep. Curve fitting can be adjusted by varying the window aperture using the SENSe:DISTortion:MEASure:CORRelation:APERture command.

### Parameters

- `<cnum>` Any existing modulation distortion channel. If unspecified, value is set to 1.
- `<bool>` Choose from:
  - **0 - OFF** - Disable S-parameter sweep and use curve fitting.
  - **1 - ON** - Enable S-parameter sweep.

### Examples

</tr>
</tbody>
</table>

### Query Syntax

SENSe<cnum>:DISTortion:SWEep:SPARam:STEP <num>

Applicable Models: All with Option S93070xB or S95070A/B

(Read-Write) Sets and returns the step size for the linear S21 sweep.

### Parameters

- `<cnum>` Any existing Modulation Distortion channel. If unspecified, value is set to 1.
- `<num>` Linear S21 step size.

### Examples

<table>
<thead>
<tr>
<th>Query Syntax</th>
<th>Return Type</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>SENSe&lt;cnum&gt;:DISTortion:SWEep:SPARam:STEP?</td>

<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
**Applicable Models:** All with Option S93070xB or S95070A/B

*(Read-Write)* Selects a chirp signal from the external signal generator.

**Parameters**

- `<cnum>` Any existing Modulation Distortion channel. If unspecified, value is set to 1.
- `<enum>` Choose from:

  **ECHirp** - Selects a chirp signal.

**Examples**

```
SENS:DIST:SWE:SPAR:TYPE ECH
```

**Query Syntax**

```
SENSe<cnum>:DISTortion:SWEep:SPARam:TYPE?
```

**Return Type** Enumeration

**Default** ECHirp

---

**SENSe<cnum>:DISTortion:SWEep:TYPE <enum>**

**Applicable Models:** All with Option S93070xB or S95070A/B

*(Read-Write)* Selects between a fixed or power sweep type of sweep.

**Parameters**

- `<cnum>` Any existing Modulation Distortion channel. If unspecified, value is set to 1.
- `<enum>` Choose from:

  **FIXed** - Measures a modulated signal with a fixed carrier LO frequency and power level.

  **POWer** - Sweeps the total power of the modulated signal. This power may be defined at the input or output of the DUT.

**Examples**

```
SENS:DIST:SWE:TYPE POW
```

**Query Syntax**

```
SENSe<cnum>:DISTortion:SWEep:TYPE?
```

**Return Type** Enumeration

**Default** FIXed

---

**SENSe<cnum>:DISTortion:TABLE:CATalog?**
(Read-only) Returns a list of existing band names from the Measurement Band Table.

**Parameters**

- `<cnum>`: Any existing Modulation Distortion channel. If unspecified, value is set to 1.

**Examples**

```
SENS:DIST:TABL:CAT?
sense2:distortion:table:catalog?
```

**Return Type**: String

**Default**: Not applicable

---

**SENSe<cnum>:DISTortion:TABLE:DATA:CATalog?**

(Read-only) Returns a list of data parameter names corresponding to the currently specified Measurement Type using the SENSe:DISTortion:MEASure:BAND:TYPE command.

**Parameters**

- `<cnum>`: Any existing Modulation Distortion channel. If unspecified, value is set to 1.

**Examples**

```
SENS:DIST:MEAS:BAND:TYPE ACP
SENS:DIST:TABL:DATA:CAT?

"ACP LoOut2 dBc,ACP LoOut2 dBm,ACP LoOut2 dBM/Hz,ACP LoDist21 dBc,ACP LoIBW,ACP LoOffsFreq,ACP UpIn1 dBc,ACP UpIn1 dBm,ACP UpIn1 dBm/Hz,ACP UpOut2 dBc,ACP UpOut2 dBm,ACP UpOut2 dBM/Hz,ACP UpDist21 dBc,ACP UpIBW,ACP UpOffsFreq"
```

**Return Type**: String

**Default**: Not applicable

---

**SENSe<cnum>:DISTortion:TABLE:DATA:VALue? <bandid>,<paramName>**
**Applicable Models:** All with Option S93070xB or S95070A/B

*(Read-only)* Returns a list of data values from the Distortion Table for the specified band and parameter name.

**Parameters**
- `<cnum>` Any existing Modulation Distortion channel. If unspecified, value is set to 1.
- `<bandid>` Band number.
- `<paramName>` Parameter name. For example, "ACP LoOut2 dBc".

**Examples**
- `sense2:distortion:table:data:value? 1,"ACP LoOut2 dBc"

**Return Type** Numeric

**Default** Not applicable

---

**SENSe<cnum>:DISTortion:TABLE:DISPLAY:CATalog?**

**Applicable Models:** All with Option S93070xB or S95070A/B

*(Read-only)* Returns the currently displayed Distortion Table parameters.

**Parameters**
- `<cnum>` Any existing Modulation Distortion channel. If unspecified, value is set to 1.

**Return Type** String of Character values, separated by commas

**Example**
- `SENSe:DIStortion:TABLE:DISPLAY:CATalog?: "Carrier Out2 dBm,Carrier IBW,EVM DistEq21 dBc,ACP LoOut2 dBc,ACP UpOut2 dBc"

**Default** Not applicable

---

**SENSe<cnum>:DISTortion:TABLE:DISPLAY:DELeete <paramName>**
Applicable Models: All with Option S93070xB or S95070A/B

(Write-only) Deletes the specified parameter from the Distortion Table.

Parameters
- <cnum> Any existing Modulation Distortion channel. If unspecified, value is set to 1.
- <paramName> Distortion Table parameter name.

Examples
SENS:DIST:TABL:DISP:DEL "Carrier IBW"

Return Type: String
Default: Not Applicable

SENSe<cnum>:DISTortion:TABLE:DISPLAY:FEED <paramName>

Applicable Models: All with Option S93070xB or S95070A/B

(Write-only) Adds the specified parameter to the Distortion Table.

Parameters
- <cnum> Any existing Modulation Distortion channel. If unspecified, value is set to 1.
- <paramName> Distortion Table parameter name.

Examples
SENS:DIST:TABL:DISP:FEED "Carrier IBW"

Return Type: String
Default: Not Applicable

SENSe<cnum>:DISTortion:TABLE:DISPLAY:FONT <enum>

Applicable Models: All with Option S93070xB or S95070A/B

(Read-Write) Selects between a small- and medium-sized font displayed below the trace area of the display.

Parameters
- <cnum> Any existing Modulation Distortion channel. If unspecified, value is set to 1.
- <enum> Choose from:
  - SMALL - Sets the font size to small.
  - MEDIUM - Sets the font size to medium.

Examples
SENS:DIST:TABL:DISP:FONT SMAL

Query Syntax
SENSe<cnum>:DISTortion:TABLE:DISPLAY:FONT?

Return Type: Enumeration
SENSe<cnum>:DISTortion:TABLE:DISPLAY:SAVE <filepath>

**Applicable Models:** All with Option S93070xB or S95070A/B

*(Write-only)* Specifies the file path to save a modulation distortion table file.

**Parameters**
- `<cnum>` Any existing Modulation Distortion channel. If unspecified, value is set to 1.
- `<filepath>` (String) Modulation distortion table path and file name (*.csv).

**Examples**
```
SENS:DIST:TABLE:DISPLAY:SAVE "C:/myModDistortionTable.csv"
```

**Query Syntax** Not applicable

**Default** Not applicable

SENSe<cnum>:DISTortion:TABLE:DISPLAY:SORT <enum>

**Applicable Models:** All with Option S93070xB or S95070A/B

*(Read-Write)* Selects between sorting the modulation distortion table by band or by power.

**Parameters**
- `<cnum>` Any existing Modulation Distortion channel. If unspecified, value is set to 1.
- `<enum>` Choose from:
  - `BAND` - Sort modulation distortion table by band.
  - `POWER` - Sort modulation distortion table by power.

**Examples**
```
SENS:DIST:TABLE:DISPLAY:SORT POW
```

**Query Syntax** 
```
SENSe<cnum>:DISTortion:TABLE:DISPLAY:SORT?
```

**Return Type** Enumeration

**Default** `BAND`

SENSe<cnum>:SA:BW:NOISe <num>
Applicable Models: All with Option S93070xB or S95070A/B

(Read-Write) Sets and returns the noise bandwidth. The Noise Bandwidth is equal to the Resolution BW divided by the Vector Average factor. You cannot directly set the Resolution BW or Vector Average in a Modulation Distortion channel. Resolution BW is always set to its maximum value for the given signal chosen. Vector Average is automatically set depending on the noise bandwidth setting.

Parameters
<cnun> Any existing Modulation Distortion channel. If unspecified, value is set to 1.
<num> Noise bandwidth value.

Examples SENS:SA:BAND:NOIS 100

Query Syntax SENSe<cnun>:SA:BANDwidth:NOISe?

Return Type Numeric

Default 100

SENSe<cnun>:SA:BANDwidth:NOISe:AUTO <bool>

Applicable Models: All with Option S93070xB or S95070A/B

(Read-Write) Enable or disable setting the noise bandwidth to its maximum possible value. This results in the fastest possible sweep but increases the noise floor. If Auto is enabled, then the Vector Average is set to 1, resulting in the widest noise bandwidth.

Parameters
<cnun> Any existing modulation distortion channel. If unspecified, value is set to 1.
<bool> Choose from:

0 - OFF - Disable auto noise bandwidth settings.
1 - ON - Enable auto noise bandwidth settings.

Examples SENS:SA:BAND:NOIS:AUTO 1

Query Syntax SENSe<cnun>:SA:BANDwidth:NOISe:AUTO?

Return Type Boolean

Default 0
DUT Control

When you use the PXI VNAs, you can control the M9341B 8 bit IO through the VNA firmware. The following commands are available when the launcher includes the M9341B.

```
SENSe:DUTControl:M9341:[MODule]
  | [:STATe]
  | :IOTYpe
  | :LEVEL
  | :PIO
    | :TYPE
    | :LEVEL
  | :RFFE
    | :CLOck
    | :CSEQUence
      | :SADDreess
      | :TYPE
      | :BCOunt
      | :ADDreess
  | [:WRITe]:DATA
  | :READ:DATA
  | :COUNt
```

Click on a keyword to view the command details.
**Applicable Models:** All PXIe VNAs

**Parameters**

- `<cnum>`: Any existing channel number; if unspecified, value is set to 1. This command is common for all channels and the setting is ignored.

- `<mod>`: Module number of M9341B. The number starts from 1 for the leftmost module of M9341B.

- `<bool>`: Module control state. Choose from:
  - **O** or **OFF**: Skips to control the M9341A/B at the specified channel.
  - **1** or **ON**: Enables to control the M9341A/B at the specified channel.

**Examples**

```
SENS:DUTC:M9341
sense2:dutcontrol:m9341?
```

**Query Syntax**

```
:SENSe<cnum>:DUTControl:M9341[:MODule<mnum>][:STATe]?
```

**Return Type**

Boolean

**Default**

OFF or 0

---

:SENSe<cnum>:DUTControl:M9341[:,MODule<mod>]:IOTYpe<iogroup> <iofunc>

**Applicable Models:** All PXIe VNAs

**Parameters**

- `<cnum>`: Any existing channel number; if unspecified, value is set to 1. This command is common for all channels and the setting is ignored.

- `<mod>`: Module number of M9341B. The number starts from 1 for the leftmost module of M9341B.

- `<iogroup>`: IO group number. Value range, 1 to 4.
  - 1: Group 1 (pins No. 1 and 2)
  - 2: Group 2 (pins No. 3 and 4)
  - 3: Group 3 (pins No. 5 and 6)
  - 4: Group 4 (pins No. 7 and 8)
<iofunc>  set the IO function for the io group. <PARallel | RFFE>.

Examples

SENS:DUTC:M9341:IOTY1 PAR
sense2:dutcontrol:m9341:module2:iotype RFFE

Return Type  Char

Default  PARallel

:SENSe<cnum>:DUTControl:M9341[:MODule<mod>]:LEVel <lvl>

Applicable Models:  All PXIe VNAs

(Read-Write) Sets and reads the output voltage level of the M9341B 8bit I/O

Parameters

<cnum>  Any existing channel number; if unspecified, value is set to 1.

<mod>  Module number of M9341B. The number starts from 1 for the leftmost module of M9341B.

<lvl>  IO level in volt. Value range: 0.9 to 3.5. Step 0.05.

Examples

SENS:DUTC:M9341:LEV 1.5
sense2:dutcontrol:m9341:module2:level?

Query Syntax  :SENSe<cnum>:DUTControl:M9341[:MODule<mnum>]:LEVel?

Return Type  Numeric

Default  1.2

:SENSe<cnum>:DUTControl:M9341[:MODule<mod>]:PIO<iopin>:TYPE <dir>
Applicable Models: All PXIe VNAs

(Read-Write) Sets and reads the signal direction type of Parallel IO, for each IO pin. This setting is valid when the io pin function is selected as parallel IO.

**Parameters**

- `<cnum>` Any existing channel number; if unspecified, value is set to 1.
- `<mod>` Module number of M9341B. The number starts from 1 for the leftmost module of M9341B.
- `<iopin>` IO pin number
- `<dir>` IO direction. Choose from: **IN** or **OUT**

**Examples**

SENS:DUTC:M9341:PIO:TYPE IN  
sense2:dutcontrol:m9341:module2:pio2:type?

**Query Syntax**

:SENSe<cnum>:DUTControl:M9341[:MODule<mod>]:PIO<iopin>:TYPE?

**Return Type** Character

**Default** OUT

---

:SENSe<cnum>:DUTControl:M9341[:MODule<mod>]:PIO<iopin>:LEVel <lvl>

Applicable Models: All PXIe VNAs

(Read-Write) Sets and reads the signal level of IO pin, high or low. This setting is valid when the io pin function is selected as parallel IO.

If the IO type is IN, this command shall be a read-only command. Write command will cause error.

**Parameters**

- `<cnum>` Any existing channel number; if unspecified, value is set to 1.
- `<mod>` Module number of M9341B. The number starts from 1 for the leftmost module of M9341B.
- `<iopin>` IO pin number
- `<lvlr>` Signal level. Choose from: **HIGH** or **LOW**

**Examples**

SENS:DUTC:M9341:PIO:LEV LOW  
sense2:dutcontrol:m9341:module2:pio2:level?

**Query Syntax**

:SENSe<cnum>:DUTControl:M9341[:MODule<mod>]:PIO<iopin>:LEVel?

**Return Type** Char
Applicable Models: All PXIe VNAs

(Read-Write) Sets and reads the RFFE clock rate.

Parameters

- `<cnum>`: Any existing channel number; if unspecified, value is set to 1. This command is common for all channels and the setting is ignored.
- `<mod>`: Module number of M9341B. The number starts from 1 for the leftmost module of M9341B.
- `<clk>`: Clock rate in Hz. Value range, 25kHz to 25000kHz. Possible values are 50000/n, with integer n, 2000 to 2. User can use suffix such as “kHz” and so on.

Examples

```
:SENSe<cnx>:DUTControl:M9341[:MODule<mod>]:RFFE:CLOCK 25KHZ
sense2:dutcontrol:m9341:module2:rffe:clock?
```

Query Syntax

`:SENSe<cnx>:DUTControl:M9341[:MODule<mn>]:RFFE:CLOCk?`

Return Type

numeric

Default 50000

```
:SENSe<cnx>:DUTControl:M9341[:MODule<mod>]:RFFE<rffech>:CSEQuence<csnum>:SADD<adrs>
```
Applicable Models: All PXIe VNAs

(Read-Write) Sets and reads the secondary address (“SA” in GUI) for the specified command sequence.

Parameters

- `<cnum>`: Any existing channel number; if unspecified, value is set to 1. This command is common for all channels and the setting is ignored.
- `<mod>`: Module number of M9341B. The number starts from 1 for the leftmost module of M9341B.
- `<rffech>`: RFFE channel number. 1 to 4
- `<csnum>`: RFFE command sequence number. 1 to 16.
- `<adrs>`: DUT RFFE secondary address. 0 to 15.

Examples:

- `sense2:dutcontrol:m9341:module2:rffe:csequence2:saddress?`

Query Syntax:

- `:SENS<cnum>:DUTControl:M9341[:MODule<mod>]:RFFE<rffech>:CSEQuence<csnum>:SADDress?`

Return Type:
- numeric

Default:
- 0

Applicable Models: All PXIe VNAs

(Read-Write) Sets and reads the command sequence type for the specified command sequence.

Parameters

- `<cnum>`: Any existing channel number; if unspecified, value is set to 1. This command is common for all channels and the setting is ignored.
- `<mod>`: Module number of M9341B. The number starts from 1 for the leftmost module of M9341B.
- `<rffech>`: RFFE channel number. 1 to 4.
- `<csnum>`: RFFE command sequence number. 1 to 16.
- `<adrs>`: RFFE command sequence type. Choose from:
  - **R0WRite**: Register 0 Write
  - **RREad**: Register Read
**RWRite** : Register Write

**ERRead** : Extended Register Read

**ERWRite** : Extended Register Write

**Examples**

```
:SENS:DUTC:M9341:RFFE:CSEQ:TYPE R0WR
sense2:dutcontrol:m9341:module2:rffe:csequence2:type?
```

**Query Syntax**

`:SENSe<cnum>:DUTControl:M9341[:MODule<mnum>]:RFFE<rffech>:CSEQuence<csnum>:TYPE?`

**Return Type**

Char

**Default**

RREad

---

**:SENSe<cnum>:DUTControl:M9341[:MODule<mod>]:RFFE<rffech>:CSEQuence<csnum>:BCOunt<byt>**

**Applicable Models:** All PXIe VNAs

*(Read-Write)* Sets and reads the byte count for the specified command sequence.

**Parameters**

- `<cnum>` Any existing channel number; if unspecified, value is set to 1. This command is common for all channels and the setting is ignored.
- `<mod>` Module number of M9341B. The number starts from 1 for the leftmost module of M9341B
- `<rffech>` RFFE channel number. 1 to 4
- `<csnum>` RFFE command sequence number. 1 to 16.
- `<byt>` **Byte Count value. Integer value. The value range is coupled with command sequence type**

<table>
<thead>
<tr>
<th>Command sequence type</th>

</tbody>
</table>
Examples
sense2:dutcontrol:m9341:module2:rffe:csequence2:bcount?

Query Syntax
:SENS<cnum>:DUTControl:M9341[:MODule<mnum>]:RFFE<rffech>:CSEQuence<csnum>:BCOUnt?

Return Type
Numeric

Default 1

SENSe<cnum>:DUTControl:M9341[:MODule<mod>]:RFFE<rffech>:CSEQuence<csnum>:ADDR<adrs>

Applicable Models: All PXIe VNAs

(Read-Write) Sets and reads the address value for the specified command sequence.

Parameters
- `<cnum>` Any existing channel number; if unspecified, value is set to 1. This command is common for all channels and the setting is ignored.
- `<mod>` Module number of M9341B. The number starts from 1 for the leftmost module of M9341B.
- `<rffech>` RFFE channel number. 1 to 4.
- `<csnum>` RFFE command sequence number. 1 to 16.
- `<adrs>` Address value. Integer value. The value range is coupled with command sequence type setting.

<table>
<thead>
<tr>

</tr>
</tbody>
</table>

Examples
sense2:dutcontrol:m9341:module2:rffe:csequence2:address?

Query Syntax
:SENS<cnum>:DUTControl:M9341[:MODule<mnum>]:RFFE<rffech>:CSEQuence<csnum>
**SENSe<cnum>:DUTControl:M9341[:MODule<mnum>]:RFFE<rffech>:CSEQuence<csnum>:WRITe:DATA**

**Applicable Models:** All PXIe VNAs

*(Read-Write)* Sets and reads the data values for the specified command sequence.

This command works if the command sequence type is “Register 0 Write” or “Register Write” or “Extended Register Write”. If the command sequence type is “Register Read” or “Extended Register Read”, this command will cause error.

**Parameters**

- `<cnum>` Any existing channel number; if unspecified, value is set to 1. This command is common for all channels and the setting is ignored.
- `<mod>` Module number of M9341B. The number starts from 1 for the leftmost module of M9341B.
- `<rffech>` RFFE channel number. 1 to 4.
- `<csnum>` RFFE command sequence number. 1 to 16.
- `<adrs>` comma separated list of data values. The value length is coupled with byte count setting. If data list length does not match with byte count setting, write command will cause error.

**Examples**

```
:SENSe:DUTCONtrol:M9341:RFFE:CSEQ:WRITe:DATA 10
sense2:dutcontrol:m9341:module2:rffe:csequence2:write:data?
```

**Query Syntax**

```
:SENSe<cnum>:DUTControl:M9341[:MODule<mnum>]:RFFE<rffech>:CSEQuence<csnum>:READ:DATA?
```

**Return Type**

Comma separated numeric values

**Default** 0
**Applicable Models:** All PXIe VNAs

*(Read only)* Reads the data and parity value pairs from DUT for the specified command sequence.

**Parameters**

- `<cnum>`: Any existing channel number; if unspecified, value is set to 1. This command is common for all channels and the setting is ignored.
- `<mod>`: Module number of M9341B. The number starts from 1 for the leftmost module of M9341B.
- `<rffech>`: RFFE channel number. 1 to 4.
- `<csnum>`: RFFE command sequence number. 1 to 16.

**Examples**

```
sense2:dutcontrol:m9341:module2:rffe:csequence2:read:data?
```

**Query Syntax**

`:SENSe<cnum>:DUTControl:M9341[:MODule<mnum>]:RFFE<rffech>:CSEQuence<csnum>:READ:DATA?`

**Return Type**

Comma separated numeric values, list of data and parity pairs.

Ex. Byte count is 3 case, return values are below:

```
[data#1],[parity#1],[data#2],[parity#2],[data#3],[parity#3]
```

**Default**

Not applicable

---

**SENSe<cnum>:DUTControl:M9341[:MODule<mnum>]:RFFE<rffech>:CSEQuence<csnum>:COUNT <cnt>**

**Applicable Models:** All PXIe VNAs

*(Read-Write)* Sets and reads the the number of RFFE Command Sequence. If user set the larger value than previously set, new RFFE command sequences will be added with the default parameter value.

**Parameters**

- `<cnum>`: Any existing channel number; if unspecified, value is set to 1. This command is common for all channels and the setting is ignored.
- `<mod>`: Module number of M9341B. The number starts from 1 for the leftmost module of M9341B.
- `<rffech>`: RFFE channel number. 1 to 4.
- `<cnt>`: RFFE Command Sequence count. 1 to 16.

**Examples**

```
sense2:dutcontrol:m9341:module2:rffe:csequence2:count?
sense2:dutcontrol:m9341:module2:rffe:csequence2:count 10
```

```
Query Syntax: SENSe<cnum>:DUTControl:M9341[:MODule<mnum>:]:RFFE<rfech>:CSEQUence<csnum>

Return Type: Numeric

Default: 0
Controls the frequency offset settings which cause stimulus and response frequencies to be different.

**Note:** These commands replace the previous FOM commands. Although the old commands will continue to work, they can NOT be mixed with these new commands.

SENSe<cnum>:FOM[:STATe] <bool>
**Applicable Models:** All with FOM Options (S9x080A/B, S9x082A/B, S9x083A/B)

(Read-Write) Turns Frequency Offset ON and OFF. Frequency offset settings are not enabled until this setting is ON.

Send this command (FOM ON) AFTER sending other FOM settings to avoid 'out-or-range' errors.

**Parameters**

- <cnum> Any existing channel number; if unspecified, value is set to 1.
- <bool> ON (or 1) - turns FOM ON.
- OFF (or 0) - turns FOM OFF.

**Examples**

```plaintext
SENS:FOM 1
sense2:fom:state on
```

**Query Syntax**

```plaintext
SENSe<cnum>:FOM:STATe?
```

**Return Type**

Boolean

**Default**

OFF

---

**SENSe<cnum>:FOM:CATalog?**

**Applicable Models:** All with FOM Options (S9x080A/B, S9x082A/B, S9x083A/B)

(Read-only) Returns a comma-separated list of available range names in the VNA.

Use **SENS:FOM:CAT?** to see a list of available range names.

Use **SENS:FOM:COUNI?** to see a list of available range numbers.

Use **SENS:FOM:RNUM?** to see the range number for a specific name.

Use **SENS:FOM:RANG:NAME?** to see the range name for a specific number.

External devices can appear in the list of range names. Learn more.

**Parameters**

- <cnum> Any existing channel number; if unspecified, value is set to 1.

**Examples**

```plaintext
SENS:FOM:CAT?
returns
"Primary, Source, Receivers"
```

**Return Type**

String
SENSe<cnum>:FOM:COUNT?

**Applicable Models:** All with FOM Options (S9x080A/B, S9x082A/B, S9x083A/B)

*(Read-only)* Returns the number of valid range numbers in the VNA.

**Parameters**
- `<cnum>` Any existing channel number; if unspecified, value is set to 1.

**Examples**
- `SENSe:FOM:COUN?`
- `sense2:fom:count?`

**Query Syntax** `SENSe<cnum>:FOM:COUNT?`

**Return Type** Numeric

**Default** Not Applicable

SENSe<cnum>:FOM:DISPLAY:SELECT <string>

**Applicable Models:** All with FOM Options (S9x080A/B, S9x082A/B, S9x083A/B)

*(Read-Write)* Select the range to be displayed on the VNA x-axis. All traces in the channel have this same x-axis scaling.

**Parameters**
- `<cnum>` Any existing channel number; if unspecified, value is set to 1.
- `<string>` Range name. Case insensitive. Use `SENSe:FOM:CAT?` to see a list of available frequency range names.

**Examples**
- `SENSe:FOM:DISPLAY:SELECT "source2"`
- `sense2:fom:display:select "source"`

**Query Syntax** `SENSe<cnum>:FOM:DISPLAY:SELECT?`

**Return Type** String

**Default** Receivers
Applicable Models: All with FOM Options (S9x080A/B, S9x082A/B, S9x083A/B)

(Read-only) Returns the number of a specified range name.

The FOM range items are typically numbered as follows:

1. Primary
2. Source
3. Receivers
4. Source2 (if present)
5. Source3 (if present)

Use SENS:FOM:CAT? to see a list of available range names.

Use SENS:FOM:COUNt? to see a list of available range numbers.

Use SENS:FOM:RANG:NAME? to see the range name for a specific number.

External devices can appear in the list of range names. Learn more.

Parameters

- `<cnum>` Any existing channel number; if unspecified, value is set to 1.
- `<string>` Range name for which a number is being queried. Case insensitive.

Examples

<table>
<thead>
<tr>
<th>SENS:FOM:RNUM? &quot;receivers&quot;</th>
</tr>
</thead>
<tbody>
<tr>
<td>sense2:fom:rnum? &quot;Source2&quot;</td>
</tr>
</tbody>
</table>

Return Type

- Numeric
- Default: Not Applicable

SENSe<cnum>:FOM:RANGe<n>:COUPled <bool>
Applicable Models: All with FOM Options (S9x080A/B, S9x082A/B, S9x083A/B)

(Read-Write) Sets and returns the state of coupling (ON or OFF) of the specified range to the primary range.

Parameters

<cn> Any existing channel number; if unspecified, value is set to 1.
<n> Range number to couple to primary range. An error is returned when attempting to couple to the Primary range (1).

Use SENS:FOM:CAT? to see a list of available range names.

Use SENS:FOM:COUNt? to see a list of available range numbers.

Use SENS:FOM:RNUM? to see the range number for a specific name.

Use SENS:FOM:RANG:NAME? to see the range name for a specific number.

<bool> ON (or 1) - Couple range to primary range.
OFF (or 0) - Do NOT couple to primary range.

Examples
SENS:FOM:RANG:COUP 1
sense2:fom:range2:coupled 0

Query Syntax
SENSe<cn>:FOM:RANGE<n>:COUPled?

Return Type
Boolean

Default
ON (or 1) Coupled

SENSe<cn>:FOM:RANGE<n>:FREQuency:CW <num>
**Applicable Models:** All with FOM Options (S9x080A/B, S9x082A/B, S9x083A/B)

*(Read-Write)* Sets and returns the CW frequency.

This setting is valid for the primary range, or if the specified range is already *uncoupled* from the primary range and if the *sweep type* is CW.

**Parameters**

- `<cnum>` Any existing channel number; if unspecified, value is set to 1.
- `<n>` Range number. If unspecified, value is set to 1.

  Use `SENS:FOM:CAT?` to see a list of available range names.

  Use `SENS:FOM:COUNT?` to see a list of available range numbers.

  Use `SENS:FOM:RNUM?` to see the range number for a specific name.

  Use `SENS:FOM:RANG:NAME?` to see the range name for a specific number.

- `<num>` CW frequency value in Hz. Choose any frequency within the range of the VNA.

**Examples**

```
SENS:FOM:RANG:FREQ:CW 1e9
sense2:fom:range2:frequency:cw 10000000
```

**Query Syntax**

`SENSe<cnum>:FOM:RANGE<n>:FREQuency:CW?`

**Return Type**

Numeric

**Default**

Center frequency of the VNA.

```
SENSe<cnum>:FOM:RANGE<n>:FREQuency:DIVisor <num>
```
Applicable Models: All with FOM Options (S9x080A/B, S9x082A/B, S9x083A/B)

(Read-Write) Sets and returns the divisor value.

This setting is valid only if the specified range is coupled to the primary range.

Parameters

- `<cnum>` Any existing channel number; if unspecified, value is set to 1.
- `<n>` Range number. If unspecified, value is set to 1.

Use SENS:FOM:CAT? to see a list of available range names.

Use SENS:FOM:COUNt? to see a list of available range numbers.

Use SENS:FOM:RNUM? to see the range number for a specific name.

Use SENS:FOM:RANG:NAME? to see the range name for a specific number.

- `<num>` Divisor value (unitless).

Examples

```
SENS:FOM:RANG:FREQ:DIV 3
sense2:fom:range2:frequency:divisor 0
```

Query Syntax

SENS<cnum>:FOM:RANGe<n>:FREQuency:DIVisor?

Return Type Numeric

Default 1

SENSe<cnum>:FOM:RANGe<n>:FREQuency:MUlTiplier <num>

Applicable Models: All with FOM Options (S9x080A/B, S9x082A/B, S9x083A/B)

(Read-Write) Sets and returns the multiplier value to be used when coupling this range to the primary range.

This setting is valid only if the specified range is coupled to the primary range.

Parameters

- `<cnum>` Any existing channel number; if unspecified, value is set to 1.
- `<n>` Range number. If unspecified, value is set to 1.

Use SENS:FOM:CAT? to see a list of available range names.

Use SENS:FOM:COUNt? to see a list of available range numbers.

Use SENS:FOM:RNUM? to see the range number for a specific name.
Use `SENS:FOM:RANG:NAME?` to see the range name for a specific number.

**<num>**
Multiplier value. (Unitless)

**Examples**
```
SENS:FOM:RANG:FREQ:MULT 1
sense2:fom:range2:frequency:multiplier 2
```

**Query Syntax**
`SENSc<num>:FOM:RANGe<n>:FREQuency:MUlTiplier?`

**Return Type**
Numeric

**Default**
1

---

**SENSe<cnum>:FOM:RANGe<n>:FREQuency:OFFSet <num>**

**Applicable Models:** All with FOM Options (S9x080A/B, S9x082A/B, S9x083A/B)

*(Read-Write)* Sets and returns the offset value to be used when coupling this range to the primary range. Learn more about offset value.

This setting is valid only if the specified range is coupled to the primary range.

**Parameters**

- **<cnum>**
  Any existing channel number; if unspecified, value is set to 1.

- **<n>**
  Range number. If unspecified, value is set to 1.

  Use `SENS:FOM:CAT?` to see a list of available range names.

  Use `SENS:FOM:COUNt?` to see a list of available range numbers.

  Use `SENS:FOM:RNUM?` to see the range number for a specific name.

  Use `SENS:FOM:RANG:NAME?` to see the range name for a specific number.

- **<num>**
  Offset value. (Unitless)

**Examples**
```
SENS:FOM:RANG:FREQ:OFFS 1E9
sense2:fom:range2:frequency:offset 10000000
```

**Query Syntax**
`SENSc<num>:FOM:RANGe<n>:FREQuency:OFFSet?`

**Return Type**
Numeric

**Default**
0

---

**SENSe<cnum>:FOM:RANGe<n>:FREQuency:STARt <num>**

---

4322
**Applicable Models**: All with FOM Options (S9x080A/B, S9x082A/B, S9x083A/B)

(Read-Write) Sets and returns the Start value of frequency range. Also specify Stop frequency.

This setting is valid for the primary range, or if the specified range is already uncoupled from the primary range and if the sweep type is LOG or LINear.

**Parameters**

- `<cnum>`: Any existing channel number; if unspecified, value is set to 1.
- `<n>`: Range number. If unspecified, value is set to 1.

Use `SENS:FOM:CAT?` to see a list of available range names.

Use `SENS:FOM:COUNT?` to see a list of available range numbers.

Use `SENS:FOM:RNUM?` to see the range number for a specific name.

Use `SENS:FOM:RANG:NAME?` to see the range name for a specific number.

- `<num>`: Start value in Hz. Choose any frequency within the range of the VNA.

**Examples**

```
SENSe<FOM<RANG:NAME? 1GHz
sense2:fom:range2:frequency:start 100000000
```

**Query Syntax**

`SENSe<cnum>:FOM:RANGe<n>:FREQuency:STARt?`

**Return Type**

Numeric

**Default**

Minimum frequency of the VNA.

---

**SENSe<cnum>:FOM:RANGe<n>:FREQuency:STOP <num>**

**Applicable Models**: All with FOM Options (S9x080A/B, S9x082A/B, S9x083A/B)

(Read-Write) Sets and returns the Stop value of frequency range. Also specify Start frequency.

This setting is valid for the primary range, or if the specified range is already uncoupled from the primary range and if the sweep type is LOG or LINear.

**Parameters**

- `<cnum>`: Any existing channel number; if unspecified, value is set to 1.
- `<n>`: Range number. If unspecified, value is set to 1.

Use `SENS:FOM:CAT?` to see a list of available range names.

Use `SENS:FOM:COUNT?` to see a list of available range numbers.
Use **SENS:FOM:RNUM?** to see the range number for a specific name.

Use **SENS:FOM:RANG:NAME?** to see the range name for a specific number.

**Examples**

```plaintext
SENS:FOM:RANG:FREQ:STOP 1e12  
sense2:fom:range2:frequency:stop 10000000000
```

**Query Syntax**

`SENSe<cnum>:FOM:RANGe<n>:FREQuency:STOP?`

**Return Type**

Numeric

**Default**

Maximum frequency of the VNA.

---

**SENSe<cnum>:FOM:RANGe<n>:NAME?**

**Applicable Models:** All with FOM Options (S9x080A/B, S9x082A/B, S9x083A/B)

*(Read-only)* Returns the name of range<n>.

The FOM range items are typically named as follows:

1. Primary
2. Source
3. Receivers
4. Source2 (if present)
5. Source3 (if present)

Use **SENS:FOM:CAT?** to see a list of available range names.

Use **SENS:FOM:COUNt?** to see a list of available range numbers.

Use **SENS:FOM:RNUM?** to see the range number for a specific name.

**Parameters**

- **<cnum>** Any existing channel number; if unspecified, value is set to 1.
- **<n>** Range number. If unspecified, value is set to 1.

**Examples**

```plaintext
SENSe:FOM:RANGe2:NAME?
```

**Return Type**

String

**Default**

Not Applicable
SENSe<cnum>:FOM:RANGe<n>:SWEep:TYPE <char>

Applicable Models: All with FOM Options (S9x080A/B, S9x082A/B, S9x083A/B)

(Read-Write) Sets and returns the sweep type to be used with the specified range.

This setting is valid only if the specified range is already uncoupled from the primary range.

Learn about Unsupported Sweep Type combinations.

Parameters

<cnum> Any existing channel number; if unspecified, value is set to 1.
<n> Range number. If unspecified, value is set to 1.

Use SENS:FOM:CAT? to see a list of available range names.

Use SENS:FOM:COUNt? to see a list of available range numbers.

Use SENS:FOM:RNUM? to see the range number for a specific name.

Use SENS:FOM:RANG:NAME? to see the range name for a specific number.

<char> Sweep type. Choose from:

CW - Also specify CW frequency.

LINear - Also specify frequency Start/Stop or Center/Span

LOG - Also specify frequency Start/Stop or Center/Span

PHASE - See all Phase sweep settings.

POWER - Also specify power Start/Stop or Center/Span

SEGMENT - Also specify segment sweep settings.

Examples

SENS:FOM:RANG:SWE:TYPE LOG
sense2:fom:range2:sweep:type linear:

Query Syntax

SENSe<cnum>:FOM:RANGe<n>:SWEep:TYPE?

Return Type

Character

Default

Linear
Sense:FOM:Range:Segment Commands

Constructs a segment table for a specified **UNCOPLED** FOM range.

**Note:** Do NOT use Sens:Segment commands for FOM segment sweep.

![Diagram of SENSEe:FOM:RANGEe:SEGMen command structure]

Click on a red keyword to view the command details.

**SENSe<cnum>:FOM:RANGe<n>:SEGMen<s>:ADD**
**Applicable Models:** All with FOM Options (S9x080A/B, S9x082A/B, S9x083A/B)

(Write-only) Adds a segment.

**Parameters**

- `<cnum>` Any existing channel number; if unspecified, value is set to 1.
- `<n>` Range number. If unspecified, value is set to 1.
- `<s>` Segment number to add. If unspecified, value is set to 1. Segment numbers must be sequential. If a new number is added where one currently exists, the existing segment and those following are incremented by one.

**Examples**

Two Segments exist (1 and 2). The following command will add a new segment (1). The existing (1 and 2) will become (2 and 3) respectively.

```
sense2:fom:range2:segment:add
```

**Query Syntax**

Not Applicable

**Default**

Not Applicable

---

**SENSe<cnum>:FOM:RANGe<n>:SEGMent<s>:BWIDth[:RESolution] <num>**

**Applicable Models:** All with FOM Options (S9x080A/B, S9x082A/B, S9x083A/B)

(Read-Write) Sets the IF Bandwidth for the specified segment. First set SENS:FOM:RANGe:SEGM:BWIDth:CONTrol ON. All subsequent segments that are added assume the new IF Bandwidth value.

Valid either for Receiver range or for Primary range when coupled to Receiver.

**Parameters**

- `<cnum>` Any existing channel number; if unspecified, value is set to 1.
- `<n>` Range number. If unspecified, value is set to 1.
- `<s>` Segment number for which to set independent IF Bandwidth.
- `<num>` IF Bandwidth in Hz. The list of valid IF Bandwidths is different depending on the VNA model. See the list of valid IFBW values. If an invalid number is specified, the analyzer will round up to the closest valid number.

**Examples**

```
SENSe:FOM:RANG:SEGM:BWIDth 100
sense2:fom:range2:segment4:bwidth:resolution 1e3
```

**Query Syntax**

SENSe<cnum>:FOM:RANGe<n>:SEGMent<s>:BWIDth[:RESolution]?

**Return Type**

Numeric
SENSe<cnum>:FOM:RANGe<n>:SEGMent:BWIDth[:RESolution]:CONTrol <bool>

Applicable Models: All with FOM Options (S9x080A/B, S9x082A/B, S9x083A/B)

(Read-Write) Specifies whether the IF Bandwidth resolution can be set independently for each segment. When set, each segment added after this will be set to ON automatically.

Valid either for Receiver range or for Primary range. Primary range value is ignored unless Receiver is coupled to Primary.

Parameters

- <cnum> Any existing channel number; if unspecified, value is set to 1.
- <n> Range number. If unspecified, value is set to 1.
- <bool> ON (or 1) - turns Bandwidth control ON. Bandwidth can be set for each segment

  OFF (or 0) - turns Bandwidth control OFF. Use the channel IF bandwidth setting instead.

Examples

SENSe:FOM:RANGe:SEGMeNT:BWIDth:CONT 0
sense2:fom:range2:segment:bwidth:resolution:control 1

Query Syntax

SENSe<cnum>:FOM:RANGe<n>:SEGMent:BWIDth[:RESolution]:CONTrol?

Return Type

Boolean

Default

OFF

SENSe<cnum>:FOM:RANGe<n>:SEGMent:COUNt?
**Applicable Models:** All with FOM Options (S9x080A/B, S9x082A/B, S9x083A/B)

*(Read-only)* Returns the number of segments that exist for the specified range.

**Parameters**
- `<cnum>` Any existing channel number; if unspecified, value is set to 1.
- `<n>` Range number. If unspecified, value is set to 1.

**Examples**
- `SENS: FOM: RANG: SEGM: COUN?`
- `sense2: fom: range2: segment: count?`

**Return Type** Numeric

**Default** Not Applicable

**SENSe`<cnum>`: FOM: RANG`<n>`: SEGM`<s>`: DELete**

**Applicable Models:** All with FOM Options (S9x080A/B, S9x082A/B, S9x083A/B)

*(Write-only)* Deletes the specified sweep segment.

**Parameters**
- `<cnum>` Any existing channel number; if unspecified, value is set to 1.
- `<n>` Range number. If unspecified, value is set to 1.
- `<s>` Number of the segment to delete. If unspecified, value is set to 1.

**Examples**
- `SENS: FOM: RANG: SEGM3: DEL`
- `sense2: fom: range2: segment4: delete`

**Query Syntax** Not Applicable

**Default** Not Applicable

**SENSe`<cnum>`: FOM: RANG`<n>`: SEGMeNT: DELete: ALL**
**Applicable Models:** All with FOM Options (S9x080A/B, S9x082A/B, S9x083A/B)

*(Write-only)* Deletes all sweep segments in the specified range.

**Parameters**

- `<cnum>` Any existing channel number; if unspecified, value is set to 1.
- `<n>` Range number. If unspecified, value is set to 1.

**Examples**

```
SENS:FOM:RANG:SEGM:DEL:ALL
sense2:fom:range2:segment:delete:all
```

**Query Syntax** Not Applicable

**Default** Not Applicable

---

**SENSe<cnum>:FOM:RANGe<n>:SEGMent<s>:FREQuency:CENTer <num>**

**Applicable Models:** All with FOM Options (S9x080A/B, S9x082A/B, S9x083A/B)

*(Read-Write)* Sets and returns the center frequency for the specified sweep segment. Also specify segment frequency span.

**Parameters**

- `<cnum>` Any existing channel number; if unspecified, value is set to 1.
- `<n>` Range number. If unspecified, value is set to 1.
- `<s>` Segment number to modify. Choose any existing segment number.
- `<num>` Center Frequency in Hz. Choose any number between the minimum and maximum frequency of the analyzer.

**Examples**

```
SENS:FOM:RANG:SEGM:FREQ:CENT 1GHz
sense2:fom:range2:segment4:frequency:center 1e9
```

**Query Syntax** `SENSe<cnum>:FOM:RANGe<n>:SEGMent<s>:FREQuency:CENTer?`

**Return Type** Numeric

**Default** Stop Frequency of the previous segment. If first segment, start frequency of the analyzer.

---

**SENSe<cnum>:FOM:RANGe<n>:SEGMent<s>:FREQuency:SPAN <num>**
Applicable Models: All with FOM Options (S9x080A/B, S9x082A/B, S9x083A/B)

(Read-Write) Sets and returns the span frequency for the specified sweep segment. Also specify segment center frequency.

Parameters
- `<cnum>` Any existing channel number; if unspecified, value is set to 1.
- `<n>` Range number. If unspecified, value is set to 1.
- `<s>` Segment number to modify. Choose any existing segment number.
- `<num>` Frequency span in Hz. Choose any number between the minimum and maximum frequency of the analyzer.

Examples
```
SENS:FOM:RANG:SEGM:FREQ:SPAN 1GHz
sense2:fom:range2:segment4:frequency:span 1e9
```

Query Syntax
```
SENSe<cnum>:FOM:RANGe<n>:SEGMent<s>:FREQuency:SPAN?
```

Return Type Numeric

Default If first segment, frequency span of the analyzer. Otherwise 0.

---

SENS<cnum>:FOM:RANGe<n>:SEGMent<s>:FREQuency:STARt <num>

Applicable Models: All with FOM Options (S9x080A/B, S9x082A/B, S9x083A/B)

(Read-Write) Sets and returns the start frequency for the specified sweep segment. Also specify segment stop frequency.

All other segment Start and Stop Frequency values that are larger than this frequency are changed to this frequency.

Parameters
- `<cnum>` Any existing channel number; if unspecified, value is set to 1.
- `<n>` Range number. If unspecified, value is set to 1.
- `<s>` Segment number to modify. Choose any existing segment number.
- `<num>` Start frequency in Hz. Choose any number between the minimum and maximum frequency of the analyzer.

Examples
```
SENS:FOM:RANG:SEGM:FREQ:STAR 1GHz
sense2:fom:range2:segment4:frequency:start 1e9
```

Query Syntax
```
SENSe<cnum>:FOM:RANGe<n>:SEGMent<s>:FREQuency:STARt?
```

---

4331
SENSe<cnump>:FOM:RANGen>:SEGMenst<s>:FREQuency:STOP <nump>

Applicable Models: All with FOM Options (S9x080A/B, S9x082A/B, S9x083A/B)

(Read-Write) Sets and returns the stop frequency for the specified sweep segment. Also specify segment start frequency.

All other segment Start and Stop Frequency values that are larger than this frequency are changed to this frequency.

Parameters

- <cnump> Any existing channel number; if unspecified, value is set to 1.
- <n> Range number. If unspecified, value is set to 1.
- <s> Segment number to modify. Choose any existing segment number.
- <nump> Stop frequency in Hz. Choose any number between the minimum and maximum frequency of the analyzer.

Examples

- sense2:fom:range2:segment4:frequency:stop 1e9

Query Syntax

SENSe<cnump>:FOM:RANGen>:SEGMenst<s>:FREQuency:STOP?

Return Type

- Numeric

Default

- Stop Frequency of the previous segment. If first segment, start frequency of the analyzer.
Applicable Models: All with FOM Options (S9x080A/B, S9x082A/B, S9x083A/B)

(Read-Write) Sets the Port Power level for the specified sweep segment. First set SENS:FOM:RANG:SEGM:POW:CONTrol ON.

When port power is Coupled, setting port power for one port will apply port power for all source ports. All subsequent segments that are added assume the new Power Level value.

Valid either for Source ranges or for Primary range when coupled to the source.

Parameters

- `<cnum>` Any existing channel number; if unspecified, value is set to 1.
- `<n>` Range number. If unspecified, value is set to 1.
- `<s>` Segment number to modify. Choose any existing segment number.
- `<p>` Port number of the source. If unspecified, value is set to 1.
- `<num>` Power level in dBm.

Note: The range of settable power values depends on the VNA model and if source attenuators are installed. To determine the range of values, send SOUR:POW? MAX and SOUR:POW? MIN. (SOUR:POW:ATT:AUTO must be set to ON).

Actual achievable leveled power depends on frequency.

Examples

- `sense2:fom:range2:segment4:power2:level 5`

Query Syntax

SENSe<cnum>:FOM:RANGe<n>:SEGMent<s>:POWer<p>[:LEVel]? Return Type

Numeric Default

0

SENSe<cnum>:FOM:RANGe<n>:SEGMent:POWer[:LEVel]:CONTrol <bool>
**Applicable Models:** All with FOM Options (S9x080A/B, S9x082A/B, S9x083A/B)

*(Read-Write)* Specifies whether Power Level is to be set independently for each segment.

Valid either for Source ranges or for Primary range. Primary range value is ignored unless Source is coupled to Primary.

**Parameters**

- `<cnum>` Any existing channel number; if unspecified, value is set to 1.
- `<n>` Range number. If unspecified, value is set to 1.
- `<bool>` ON (or 1) - Power level will be set for each segment.
  
  OFF (or 0) - Use the channel power level setting.

**Examples**

```
SENS:FOM:RANG:SEGM:POW:CONT 0
sense2:fom:range2:segment:power:control on
```

**Query Syntax**

```
SENSe<cnum>:FOM:RANGe<n>:SEGMent:POWer[:LEVel]:CONTrol?
```

**Return Type** Boolean

**Default** OFF (or 0)

---

**SENSe<cnum>:FOM:RANGe<n>:SEGMent<s>[:STATe] <bool>**

**Applicable Models:** All with FOM Options (S9x080A/B, S9x082A/B, S9x083A/B)

*(Read-Write)* Turns the specified sweep segment ON or OFF.

**Parameters**

- `<cnum>` Any existing channel number; if unspecified, value is set to 1.
- `<n>` Range number. If unspecified, value is set to 1.
- `<s>` Segment number to be turned ON or OFF. Choose any existing segment number.
- `<bool>` ON (or 1) - turns segment ON.
  
  OFF (or 0) - turns segment OFF.

**Examples**

```
SENS:FOM:RANG:SEGM 0
sense2:fom:range2:segment:state on
```

**Query Syntax**

```
SENSe<cnum>:FOM:RANGe<n>:SEGMent<s>[:STATe]?
```

**Return Type** Boolean
SENSe\textless\textit{cnum}\textgreater;:FOM:RANG\textless\textit{n}\textgreater;:SEG\textit{m}ent\textless\textit{s}\textgreater;:SWEep:POINts \textless\textit{num}\textgreater;

**Applicable Models:** All with FOM Options (S9x080A/B, S9x082A/B, S9x083A/B)

*(Read-Write)* Sets the number of data points for the specified sweep segment.

**Parameters**

\textless\textit{cnum}\textgreater; Any existing channel number; if unspecified, value is set to 1.

\textless\textit{n}\textgreater; Range number. If unspecified, value is set to 1.

\textless\textit{s}\textgreater; Segment number to modify. Choose any existing segment number.

\textless\textit{num}\textgreater; Number of points in the segment. The total number of points in all segments cannot exceed 20001. A segment can have as few as 1 point.

**Examples**

```
sense2:fom:range2:segment4:sweep:points 201
```

**Query Syntax**

SENSe\textless\textit{cnum}\textgreater;:FOM:RANG\textless\textit{n}\textgreater;:SEG\textit{m}ent\textless\textit{s}\textgreater;:SWEep:POINts?

**Return Type** Numeric

**Default** 21

SENSe\textless\textit{cnum}\textgreater;:FOM:RANG\textless\textit{n}\textgreater;:SEG\textit{m}ent\textless\textit{s}\textgreater;:SWEep:TIME \textless\textit{num}\textgreater;

**Applicable Models:** All with FOM Options (S9x080A/B, S9x082A/B, S9x083A/B)

*(Read-Write)* Sets the time the VNA takes to sweep the specified segment.

Valid ONLY for receiver ranges.

**Parameters**

\textless\textit{cnum}\textgreater; Any existing channel number; if unspecified, value is set to 1.

\textless\textit{n}\textgreater; Range number. If unspecified, value is set to 1.

\textless\textit{s}\textgreater; Segment number for which to set sweep time.

\textless\textit{num}\textgreater; Sweep time in seconds. Choose a number between 0 and 100

**Examples**

```
SENS:FOM:RANG:SEG:M:SWE:TIME 1
sense2:fom:range2:segment3:sweep:time .1
```

**Query Syntax**

SENSe\textless\textit{cnum}\textgreater;:FOM:RANG\textless\textit{n}\textgreater;:SEG\textit{m}ent\textless\textit{s}\textgreater;:SWEep:TIME?
SENSe<cnum>:FOM:RANGe<n>:SEGMenT:SWEep:TIME:CONTrol <bool>

**Applicable Models:** All with FOM Options (S9x080A/B, S9x082A/B, S9x083A/B)

*(Read-Write)* Specifies whether Sweep Time can be set independently for each sweep segment.

Valid either for Receiver ranges or for Primary range. Primary range value is ignored unless Receiver is *coupled* to Primary.

**Parameters**

- `<cnum>` Any existing channel number; if unspecified, value is set to 1.
- `<n>` Range number. If unspecified, value is set to 1.
- `<bool>` **ON** (or 1) - Sweep time will be set for each segment.
  **OFF** (or 0) - Use the channel sweep time setting.

**Examples**

- `SENSe:FOM:RANG:SEG:SWEP:TIME:CONT 1`
- `sense2:fom:range2:segment:sweep:time:control off`

**Query Syntax**

`SENSe<cnum>:FOM:RANGe<n>:SEGMenT:SWEep:TIME:CONTrol?`

**Return Type** Boolean

**Default** OFF
Sets the sweep frequencies of the analyzer.

SENSe<cnum>:FREQuency:CENTer <num>
### SENS:FREQ:CENT

**Applicable Models:** All

**(Read-Write)** Sets the center frequency of the analyzer.

**Note:** When the sweep type is "segment sweep", this command is not used.

#### Parameters

- `<cnum>`: Any existing channel number. If unspecified, value is set to 1
- `<num>`: Center frequency. Choose any number between the **minimum** and **maximum** frequency limits of the analyzer. Units are Hz.

This command will accept **MIN** or **MAX** instead of a numeric parameter. See [SCPI Syntax](#) for more information.

#### Examples

```plaintext
SENS:FREQ:CENT 1000000
sense2:frequency:center 1mhz
sense2:frequency:center 1e6
```

#### Query Syntax

SENS<cnum>:FREQuency:CENTer?

#### Return Type

**Numeric**

#### Default

Center of the analyzer's frequency span

---

### SENS<cnum>:FREQ:CENT:STEP:AUTO

**Applicable Models:** All

**(Read-Write)** Sets and reads how the center frequency step size is set. When TRUE, center steps by 5% of span. When FALSE, center steps by STEP:SIZE value.

#### Parameters

- `<cnum>`: Any existing channel number. If unspecified, value is set to 1
- `<bool>`: Choose from:
  - **ON** (or 1) - Step size is set automatically.
  - **OFF** (or 0) - Step size is set manually using `SENS:FREQ:CENT:STEP:SIZE`.

#### Examples

```plaintext
SENS:FREQ:CENT:STEP:AUTO 1
```

#### Query Syntax

SENS<cnum>:FREQuency:CENTer:STEP:AUTO?

#### Return Type

**Boolean**

#### Default

OFF
SENSe<cnum>:FREQuency:CENTer:STEP:SIZE <num>

Applicable Models: All

(Read-Write) Sets the center frequency step size of the analyzer. This command sets the manual step size (only valid when STEP:AUTO is FALSE).

Parameters
- <cnum> Any existing channel number. If unspecified, value is set to 1
- <num> Step size in Hz. Choose a value below the stop frequency of the analyzer.

Examples
```
SENS:FREQ:CENT:STEP:SIZE 1e9
```

Query Syntax
```
SENSe<cnum>:FREQuency:CENTer:STEP:SIZE?
```

Return Type
Numeric

Default
Default is 40 MHz. When STEP:AUTO is TRUE, this value is ignored.

SENSe<cnum>:FREQuency[:CW | :FIXed] <num>

Applicable Models: All

(Read-Write) Sets the Continuous Wave (or Fixed) frequency. Must also send `SENS:SWEEP:TYPE CW` to put the analyzer into CW sweep mode.

Parameters
- <cnum> Any existing channel number. If unspecified, value is set to 1
- <num> CW frequency. Choose any number between the minimum and maximum frequency limits of the analyzer. Units are Hz.

This command will accept MIN or MAX instead of a numeric parameter. See SCPI Syntax for more information.

Examples
```
SENS:FREQ 1000000
SENS:FREQ:CW MIN
sense2:frequency:fixed 1mhz
```

Query Syntax
```
SENSe<cnum>:FREQuency[:CW | :FIXed]?
```

Return Type
Numeric

Default
1 GHz

SENSe<cnum>:FREQuency:SPAN <num>
Applicable Models: All

(Read-Write) Sets the frequency span of the analyzer.

Note: When the sweep type is "segment sweep", this command is not used.

Parameters

<cnm> Any existing channel number. If unspecified, value is set to 1
<num> Frequency span in Hz. Choose any number from 70 (minimum) and the maximum frequency span of the analyzer.

This command will accept MIN or MAX instead of a numeric parameter. See SCPI Syntax for more information.

Examples

<table>
<thead>
<tr>
<th>Command</th>
</tr>
</thead>
<tbody>
<tr>
<td>SENS:FREQ:SPAN 1000000</td>

</table>

Query Syntax

SENSe<cnm>:FREQuency:SPAN?

Return Type

Numeric

Default

Maximum frequency span of the analyzer

---

SENSe<cnm>:FREQuency:SPAN:FULL

Applicable Models: All

(Write-Only) Sets the frequency span to the entire frequency range of the analyzer.

Parameters

<cnm> Any existing channel number. If unspecified, value is set to 1

Examples

<table>
<thead>
<tr>
<th>Command</th>
</tr>
</thead>
<tbody>
<tr>
<td>SENS:FREQ:SPAN:FULL</td>
</tr>
</tbody>
</table>

Query Syntax

Not Applicable

Default

Maximum frequency span of the analyzer

---

SENSe<cnm>:FREQuency:STARt <num>
**Applicable Models:** All

(Read-Write) Sets the start frequency of the analyzer.

**Note:** When the sweep type is "segment sweep", this command is not used.

**Parameters**

- `<cnum>`: Any existing channel number. If unspecified, value is set to 1
- `<num>`: Start frequency. Choose any number between the **MIN** and **MAX** frequency limits of the analyzer. Units are Hz.

If FREQ:START is set greater than FREQ:STOP, then the stop frequency is set to the start frequency + frequency span.

This command will accept **MIN** or **MAX** instead of a numeric parameter. See **SCPI Syntax** for more information.

**Examples**

```plaintext
SENSe:FREQ:STAR 1000000
sense2:FREQ:START MIN
```

**Query Syntax**

`SENSe<cnum>:FREQuency:STARt?`

**Return Type**

Numeric

**Default**

Minimum frequency of the analyzer

---

**SENSe<cnum>:FREQuency:STOP <num>**

**Applicable Models:** All

(Read-Write) Sets the stop frequency of the analyzer.

**Note:** When the sweep type is "segment sweep", this command is not used.

**Parameters**

- `<cnum>`: Any existing channel number. If unspecified, value is set to 1
- `<num>`: Stop frequency. Choose any number between 70 (minimum) and **maximum** frequency limits of the analyzer. Units are Hz.

If FREQ:STOP is set less than FREQ:START, then the start frequency is set to the stop frequency - frequency span.

This command will accept **MIN** or **MAX** instead of a numeric parameter. See **SCPI Syntax** for more information.

SENSe<ch>:GCSetup:AMODe <enum>

Applicable Models: All with Gain Compression Option

(Read-Write) Set and read the method by which gain compression data is acquired.

Parameters

<ch> Any existing GCA channel. If unspecified, value is set to 1.
<enum> Choose from:
  - PFREQuency - 2D Power Per Frequency
  - FPOWer - 2D Frequency Per Power
  - SMARtsweep - Smart Sweep
SENSe<ch>:GCSetup:COMPression:ALGorithm <enum>

Applicable Models: All with Gain Compression Option

(Read-Write) Set and read the algorithm method used to compute gain compression.

Parameters

- `<ch>` Any existing GCA channel. If unspecified, value is set to 1.
- `<enum>` Algorithm method. Choose from:
  
  1. **CFLG** - compression from linear gain
  2. **CFMG** - compression from maximum gain
  3. **BACKoff** - compression from BackOff
  4. **XYCOM** - X/Y Compression
  5. **SAT** - compression from saturation

Examples

SENSe:GCS:COMP:ALG BACK

SENSe:gcsetup:compression:algorithm XYcom

Query Syntax

SENSe<ch>:GCSetup:COMPression:ALGorithm? 

Return Type

Enumeration

Default

CFLG

SENSe<ch>:GCSetup:COMPression:BACKoff:LEVel <num>
Applicable Models: All with Gain Compression Option

**Parameters**

- `<ch>` Any existing GCA channel. If unspecified, value is set to 1.
- `<num>` Backoff value in dB. Choose a value between 1 and 99.

**Examples**

- SENS:GCS:COMP:BACK:LEV 10
- sense:gcsetup:compression:backoff:level 5

**Query Syntax**

SENS<ch>:GCSetup:COMPression:BACKoff:LEVel?

**Return Type** Numeric

**Default** 10

---

SENSe<ch>:GCSetup:COMPression:DELTa:X <num>

Applicable Models: All with Gain Compression Option

(Read-Write) Set and read the 'X" value in the delta X/Y compression algorithm.

**Parameters**

- `<ch>` Any existing GCA channel. If unspecified, value is set to 1.
- `<num>` X value in dB. Choose a value from .01 to 10.

**Examples**

- SENS:GCS:COMP:DEL:T:X 9
- sense:gcsetup:compression:delta:X 8

**Query Syntax**

SENSe<ch>:GCSetup:COMPression:DELTa:X?

**Return Type** Numeric

**Default** 10

---

SENSe<ch>:GCSetup:COMPression:DELTa:Y <num>
Applicable Models: All with Gain Compression Option

(Read-Write) Set and read the 'Y' value in the delta X/Y compression algorithm.

Parameters
- `<ch>` Any existing GCA channel. If unspecified, value is set to 1.
- `<num>` Y value in dB. Choose a value from .01 to 10.

Examples
- SENS:GCS:COMP:DELT:Y 9
- sense:gcsetup:compression:delta:y 8

Query Syntax
- SENSE<ch>:GCSsetup:COMPression:DELTa:Y?

Return Type
- Numeric

Default
- 9

SENSe<ch>:GCSetup:COMPression:INTerpolate[:STATe] <bool>

Applicable Models: All with Gain Compression Option

(Read-Write) Sets whether or not interpolation should be performed on 2D measured compression data. Applies ONLY to 2D acquisition modes.

Parameters
- `<ch>` Any existing GCA channel. If unspecified, value is set to 1.
- `<bool>` Choose from:
  - ON or (1) Interpolate the results
  - OFF or (0) Do NOT interpolate the results but return the value closest to compression.

Examples
- SENS:GCS:COMP:INT 1
- sense:gcsetup:compression:interpolate off

Query Syntax
- SENSE<ch>:GCSsetup:COMPression:INTerpolation?

Return Type
- Boolean

Default
- OFF

SENSe<ch>:GCSetup:COMPression:LEVel <num>
**Applicable Models:** All with Gain Compression Option

(Read-Write) Set and read the desired gain reduction (from reference gain).

This value is used for Compression from Linear Gain and Compression from Maximum Gain.

Use `SENS:GCS:COMP:ALG CFLG` to set this compression algorithm.

**Parameters**

- `<ch>` Any existing GCA channel. If unspecified, value is set to 1.
- `<num>` Compression level in dB. Choose a value between .01 and 100.

**Examples**

```
SENS:GCS:COMP:LEV 1
sense:gcsetup:compression:level 3
```

**Query Syntax** `SENSe<ch>:GCSetup:COMPression:LEVel?`

**Return Type** Numeric

**Default** 1

---

**SENSe<ch>:GCSetup:COMPression:PHASe:LEVel <num>**

**Applicable Models:** All with Gain Compression Option

(Read-Write) Set and read the desired phase to measure compression. This is only used when `SENSe:GCSetup:COMPression:PHASe:MODE` is set to PHASe or BOTH.

**Parameters**

- `<ch>` Any existing GCA channel. If unspecified, value is set to 1.
- `<num>` Phase level in degrees. Choose a value between .01 and 360.

**Examples**

```
SENS:GCS:COMP:PHAS:LEV 0.01
sense:gcsetup:compression:phase:level 0.01
```

**Query Syntax** `SENSe<ch>:GCSetup:COMPression:PHASe:LEVel?`

**Return Type** Numeric

**Default** 2

---

**SENSe<ch>:GCSetup:COMPression:PHASe:MODE <enum>**
Applicable Models: All with Gain Compression Option

(Read-Write) Set and read compression format to be either magnitude, phase, or magnitude and phase. This option is only available with the 2D type of compression sweeps.

Parameters

- `<ch>` Any existing GCA channel. If unspecified, value is set to 1.
- `<enum>` Choose from:
  - **MAGNitude** - compression against magnitude
  - **PHASE** - compression against phase
  - **BOTH** - compression against magnitude and phase

Examples

```
SENS:GCS:COMP:PHAS:MODE PHAS
sense:gcsetup:compression:phase:mode both
```

Query Syntax

SENSe<ch>:GCSetup:COMPression:PHASe:MODE?

Return Type

Enumeration

Default

MAGNitude

SENSe<ch>:GCSetup:COMPression:SATuration:LEVel <num>

Applicable Models: All with Gain Compression Option

(Read-Write) Set and read the deviation dB from the maximum Pout. This is the point of saturation.

Use **SENS:GCS:COMP:ALG CFLG** to set this compression algorithm.

Parameters

- `<ch>` Any existing GCA channel. If unspecified, value is set to 1.
- `<num>` Saturation level in dB. Choose a value between .01 and 10.

Examples

```
SENS:GCS:COMP:SAT:LEV 1
sense:gcsetup:compression:saturation:level 3
```

Query Syntax

SENSe<ch>:GCSetup:COMPressionSATuration:LEVel?

Return Type

Numeric

Default

.1 dB

SENSe<ch>:GCSetup:EOSoperation <enum>
**Applicable Models:** All with Gain Compression Option

*(Read-Write)* This setting is used to protect a sensitive device from too much power during the sweep retrace. Other instrument settings or channels may over-ride this setting. [Learn more.](#)

**Parameters**

- `<ch>` Any existing GCA channel. If unspecified, value is set to 1.
- `<enum>` End Of Sweep operation. Choose from:
  - STANdard Use the default VNA method. [Learn more.](#)
  - POFF Always turn power OFF while waiting.
  - PSTArt Sweep Start power
  - PSTOp Sweep Stop power.

**Examples**

```
SENS:GCS:EOS PSTA
sense:gcsetup:eosoperation standard
```

**Query Syntax**

`SENSe<ch>:GCSetup:EOSoperation?`

**Return Type**

Enumeration

**Default**

STANdard

---

**SENSe<ch>:GCSetup:MIIXer:REFerence <bool>**

**Applicable Models:** All with Gain Compression Option

*(Read-Write)* Set and read the state of the mixer reference. This option is only available in Gain Compression for Converters (GCX), and is only used when `SENSe:GCSetup:COMPression:PHASE:MODE` is set to PHASE or BOTH.

To improve the noise of the phase measurements in GCX, an optional user supplied external reference can be added to the R1 loop. The LO for the reference mixer should be common with the LO for the DUT mixer. After this hardware is added, and this command is set to ON, the GCX application will use the reference mixer to improve the phase measurements.

**Parameters**

- `<ch>` Any existing GCA channel. If unspecified, value is set to 1.
<bool> Choose from:

ON or (1) Enable mixer reference.

OFF or (0) Disable mixer reference.

Examples
SENS:GCS:MIX:REF 1
sense:gcsetup:mixer:reference off

Query Syntax SENSE<ch>:GCSetup:MIXer:REFerence?

Return Type Boolean

Default OFF

SENSe<ch>:GCSetup:PMAP <in>,<out>

Applicable Models: All with Gain Compression Option

(Write-only) Set the DUT-to-VNA port mapping for the Gain Compression measurement.

Parameters

<ch> Any existing GCA channel. If unspecified, value is set to 1.

<in> VNA port which is connected to the DUT input.

<out> VNA port which is connected to the DUT output.

Examples SENS:GCS:PMAP 1,2
sense:gcsetup:pmap 2,1

Query Syntax Not Applicable

Default 1,2

SENSe<ch>:GCSetup:PMAP:INPut?
Applicable Models: All with Gain Compression Option

(Read-only) Read the VNA port number to be connected to the DUT Input.

Use SENS:GCS:PORTMap to set the port mapping.

Parameters

Parameters

Parameters

<ch> Any existing GCA channel. If unspecified, value is set to 1.

Examples

Examples

Examples

SENS:GCS:PMAP:INP?

sense:gcsetup:pmap:input?

Return Type Numeric

Default 1

SENSe<ch>:GCSetup:PMAP:OUTPut?

Applicable Models: All with Gain Compression Option

(Read-only) Read the VNA port number to be connected to the DUT Output.

Parameters

Parameters

Parameters

<ch> Any existing GCA channel. If unspecified, value is set to 1.

Examples

Examples

Examples

SENS:GCS:PMAP:OUTP?

sense:gcsetup:pmap:output?

Return Type Numeric

Default 2

SENSe<ch>:GCSetup:PMAP:SOURce:OVERride <bool>
Applicable Models: All with Gain Compression Option

(Read-Write) This function is used when GCX channels with a reference mixer and one GCA channel without a reference mixer are set up simultaneously and you want to use the same path configuration for all channels. This remaps the source port to Port 1.

This is only used when \texttt{SENSe:GCSetup:COMPression:PHASe:MODE} is set to \texttt{PHASe} or \texttt{BOTH}.

Parameters

\begin{itemize}
\item \texttt{<ch>} Any existing GCA/GCX channel. If unspecified, value is set to 1.
\item \texttt{<bool>} Choose from:
\begin{itemize}
\item \texttt{ON} or (1) Use same path configuration for all channels.
\item \texttt{OFF} or (0) Do not use the same path configuration for all channels.
\end{itemize}
\end{itemize}

Examples
\begin{verbatim}
SENS:GCS:PMAP:SOUR:OVER 1
sense:gcsetup:pmap:source:override off
\end{verbatim}

Query Syntax \texttt{SENSe<ch>:GCSetup:POWer:LINear:INPut:COMPute:APERture?}

Return Type Boolean

Default OFF

SENSe<ch>:GCSetup:POWer:LINear:INPut:COMPute:APERture <num>

Applicable Models: All with Gain Compression Option

(Read-Write) Set and read the aperture to use when computing the linear input power.

This is only used when \texttt{SENSe:GCSetup:COMPression:PHASe:MODE} is set to \texttt{PHASe} or \texttt{BOTH}. In that mode, the linear input power is computed using a least squares fit of the linear region. This command sets the width, or aperture, of the linear input region. The default is 5%.

Parameters

\begin{itemize}
\item \texttt{<ch>} Any existing GCA channel. If unspecified, value is set to 1.
\item \texttt{<num>} Input percentage. Choose a value from 0 to 25.
\end{itemize}

Examples
\begin{verbatim}
SENS:GCS:POW:LIN:INP:COMP:APER 5
\end{verbatim}

Query Syntax \texttt{SENSe<ch>:GCSetup:POWer:LINear:INPut:COMPute:APERture?}

Return Type Numeric
SENSe<ch>:GCSetup:POWer:LINear:INPut:LEVel <num>

Applicable Models: All with Gain Compression Option

(Read-Write) Set and read the input power at which Linear Gain and all S-parameters are measured.

Parameters

- `<ch>`: Any existing GCA channel. If unspecified, value is set to 1.
- `<num>`: Input power level in dBm. Choose a value from +30 to (-30).

Examples

```
SENSe:GCS:POW:LIIN:INP:LEVL 0
sense:gcsetup:power:linear:input:level -10
```

Query Syntax

`SENSe<ch>:GCSetup:POWer:LINear:INPut:LEVel?`

Return Type

Numeric

Default

-25 dBm

SENSe<ch>:GCSetup:POWer:REVerse:LEVel <num>

Applicable Models: All with Gain Compression Option

(Read-Write) Set and read the reverse power level to the DUT. This is applied to the DUT output port when making reverse measurements like S22.

Parameters

- `<ch>`: Any existing GCA channel. If unspecified, value is set to 1.
- `<num>`: Reverse power level in dBm. Choose a value from +30 to (-30).

Examples

```
SENSe:GCS:POW:REVE:LEVL 0
sense:gcsetup:power:reverse:level -5
```

Query Syntax

`SENSe<ch>:GCSetup:POWer:REVerse:LEVel?`

Return Type

Numeric

Default

-5
**Applicable Models:** All with Gain Compression Option

(Read-Write) Set and read the start power level.

**Parameters**

- `<ch>` Any existing GCA channel. If unspecified, value is set to 1.
- `<num>` Start power level in dBm. Choose a value from +30 to (-30).

**Examples**

```
SENS:GCS:POW:STAR:LEV 0
sense:gcsetup:power:start:level -5
```

**Query Syntax**

SENSe<ch>:GCSetup:POWer:STARt:LEVel?

**Return Type** Numeric

**Default** -25

SENSe<ch>:GCSetup:POWer:STOP:LEVel <num>

**Applicable Models:** All with Gain Compression Option

(Read-Write) Set and read the stop power level.

**Parameters**

- `<ch>` Any existing GCA channel. If unspecified, value is set to 1.
- `<num>` Stop power level in dBm. Choose a value from +30 to (-30).

**Examples**

```
SENS:GCS:POW:STOP:LEV 0
sense:gcsetup:power:stop:level -5
```

**Query Syntax**

SENSe<ch>:GCSetup:POWer:STOP:LEVel?

**Return Type** Numeric

**Default** -5

SENSe<ch>:GCSetup:SAFE:CPADjustment <num>
**Applicable Models:** All with Gain Compression Option

*(Read-Write)* Set and read the Safe Sweep COARSE power adjustment. [Learn more.]

**Parameters**

- `<ch>` Any existing GCA channel. If unspecified, value is set to 1.
- `<num>` Coarse power adjustment setting in dBm. Choose a value between 0 and 6.

**Examples**

```
SENS:GCS:SAFE:CPAD 2
sense:gcsetup: safe:cpadjustment 3.5
```

**Query Syntax**

`SENSe<ch>:GCSetup:SAFE:CPADjustment?`

**Return Type** Numeric

**Default** 3.0

---

**SENSe<ch>:GCSetup:SAFE:DC:MLimit <num>**

**Applicable Models:** All with Gain Compression Option

*(Read-Write)* Set and read the maximum limit of the external DC device.

**Parameters**

- `<ch>` Any existing GCA channel. If unspecified, value is set to 1.
- `<num>` Maximum DC level.

**Examples**

```
SENS:GCS:SAFE:DC:MLIM -5
```

**Query Syntax**

`SENSe<ch>:GCSetup:SAFE:DC:MLIMIT?`

**Return Type** Numeric

**Default** -5

---

**SENSe<ch>:GCSetup:SAFE:DC:PARameter <value>**
Applicable Models: All with Gain Compression Option

(Read-Write) Set and read the name of the external DC device.

Parameters

<ch> Any existing GCA channel. If unspecified, value is set to 1.

<value> (String) Name of the external DC device.

Examples

SENS:GCS:SAFE:DC:PAR "MyDCDevice"

sense:gcsetup:safe:dc:parameter "MYDCDevice"

Query Syntax

SENSe<ch>:GCSetup:SAFE:DC:PARameter?

Return Type String

Default Not Applicable

SENSe<ch>:GCSetup:SAFE:ENABle <bool>

Applicable Models: All with Gain Compression Option

(Read-Write) Set and read the (ON | OFF) state of Safe Sweep mode.

Parameters

<ch> Any existing GCA channel. If unspecified, value is set to 1.

<num> (Boolean) - Safe Sweep state. Choose from:

OFF (or 0) - Disable Safe Sweep

ON (or 1) - Enable Safe Sweep

Examples

SENS:GCS:SAFE:ENAB 0

sense:gcsetup:safe:enable 1

Query Syntax

SENSe<ch>:GCSetup:SAFE:ENABle?

Return Type Boolean

Default 0

SENSe<ch>:GCSetup:SAFE:FPADjustment <num>
Applicable Models: All with Gain Compression Option

(Read-Write) Set and read the Safe Sweep FINE power adjustment. Learn more

Parameters

- `<ch>` Any existing GCA channel. If unspecified, value is set to 1.
- `<num>` Fine power adjustment setting in dBm. Choose a value between 0 and 3.

Examples

```
SENS:GCS:SAFE:FPAD 2
sense:gcsetup:safe:fpadjustment .5
```

Query Syntax

SENS<ch>:GCSetup:SAFE:FPADjustment?

Return Type
Numeric

Default
1.0 dBm

SENSe<ch>:GCSetup:SAFE:FTHReshold <num>

Applicable Models: All with Gain Compression Option

(Read-Write) Set and read the compression level in which Safe Sweep changes from the COARSE power adjustment to the FINE power adjustment. Learn more

Parameters

- `<ch>` Any existing GCA channel. If unspecified, value is set to 1.
- `<num>` Threshold setting in dB. Choose a value between 0 and 3.

Examples

```
SENS:GCS:SAFE:FTHR .1
sense:gcsetup:SAFE:fthreshold .75
```

Query Syntax

SENS<ch>:GCSetup:SAFE:FTHReshold?

Return Type
Numeric

Default
0.5 dB

SENSe<ch>:GCSetup:SAFE:MLimit <num>
(Read-Write) When the VNA port that is connected to the DUT Output measures this value, the input power to the DUT is no longer incremented at that frequency. Safe Mode must be enabled with SENS:GCS:SAFE:ENAB ON Learn more

**Parameters**

- `<ch>` Any existing GCA channel. If unspecified, value is set to 1.
- `<num>` Maximum power limit in dBm. Choose a value from -100 to +100

**Examples**

```
SENS:GCS:SAFE:MLIM 20
sense:gcsetup:Safe:mlimit 30
```

**Query Syntax**

```
SENSe<ch>:GCSetup:SAFE:MLIMit?
```

**Return Type**

Numeric

**Default**

30

SENSe<ch>:GCSetup:SFAilures?

**Applicable Models:** All with Gain Compression Option

(Read-only) Returns a comma-separated list of the frequency indexes that were out of tolerance for SMART Sweep mode, or at the power limit for 2D acquisition modes. Zero (0) is the first frequency data point.

Must be Single triggered. Invalid results occur if the GCA channel is continuously sweeping.

**Parameters**

- `<ch>` Any existing GCA channel. If unspecified, value is set to 1.

**Examples**

```
SENS:GCS:SFA?
sense:gcsetup:sfailures?
```

**Return Type**

Comma-separated list of frequency indexes.

**Default**

Not Applicable

SENSe<ch>:GCSetup:SMARt:CDC <bool>
Applicable Models: All with Gain Compression Option

(Read-Write) Set and read the DC readings at the compression point in the last iteration of a smart sweep. Taking only these DC readings improves measurement speed.

Parameters

<ch> Any existing GCA channel. If unspecified, value is set to 1.
<bool> Choose from:

ON or (1) Enable reading DC value at compression point in the last iteration of a smart sweep.

OFF or (0) Disable reading DC value at compression point in the last iteration of a smart sweep.

Examples

SENS:GCS:SMAR:CDC 1
sense:gcsetup:smart:cdc off

Query Syntax
SENS<ch>:GCSetup:SMARt:CDC?

Return Type
Boolean

Default
OFF

SENSe<ch>:GCSetup:SMARt:MITerations <num>

Applicable Models: All with Gain Compression Option

(Read-Write) Set and read the maximum permitted number of iterations which SMART Sweep may utilize to find the desired compression level, to within the specified tolerance.

Parameters

<ch> Any existing GCA channel. If unspecified, value is set to 1.
<num> Maximum number of iterations. Choose a value between 1 and 500

Examples

SENS:GCS:SMAR:MIT 5
sense:gcsetup:smart:miterations 3

Query Syntax
SENSe<ch>:GCSetup:SMARt:MITerations?

Return Type
Numeric

Default
20

SENSe<ch>:GCSetup:SMARt:SIterations <bool>
Applicable Models: All with Gain Compression Option

(Read-Write) Set and read enable for showing intermediate results for each iteration of SMART Sweep

Parameters

<ch> Any existing GCA channel. If unspecified, value is set to 1.
<bool> Choose from:

ON or (1) Compression traces are updated after each iteration.
OFF or (0) Compression traces are updated after ALL iterations are complete.

Examples

SENSe<ch>:GCSetup:SMART:SIT 1
sense:gcsetup:smart:siterations off

Query Syntax
SENSe<ch>:GCSetup:SMART:SITerations?

Return Type Boolean

Default OFF

SENSe<ch>:GCSetup:SMART:STIME <num>

Applicable Models: All with Gain Compression Option

(Read-Write) Set and read the amount of time SMART Sweep will dwell at the first point where the input power changes by the Backoff or X level. Applies only to SMART Sweep when Backoff or XY compression methods are selected. Learn more.

Parameters

<ch> Any existing GCA channel. If unspecified, value is set to 1.
<num> Settling time in seconds. Choose any positive value.

Examples

SENSe<ch>:GCSetup:SMART:STIM 1
sense:gcsetup:smart:stime .1

Query Syntax
SENSe<ch>:GCSetup:SMART:STIME?

Return Type Numeric

Default 0

SENSe<ch>:GCSetup:SMART:TOLerance <num>
**Applicable Models:** All with Gain Compression Option

(Read-Write) Set and read the acceptable range SMART Sweep will allow for the measured compression level.

**Parameters**

- `<ch>` Any existing GCA channel. If unspecified, value is set to 1.
- `<num>` Tolerance level in dBm. Choose a value between .01 and 10

**Examples**

```
SENS:GCS:SMAR:TOL .1
sense:gcsetup:smart:tolerance .05
```

**Query Syntax**

```
SENSe<ch>:GCSetup:SMART:TOLerance?
```

**Return Type** Numeric

**Default** .05

**SENSe<ch>:GCSetup:SWEep:FREQuency:POINts <num>**

**Applicable Models:** All with Gain Compression Option

(Read-Write) Set and read the number of data points in each frequency sweep. Learn more

**Parameters**

- `<ch>` Any existing GCA channel. If unspecified, value is set to 1.
- `<num>` Frequency points. Do not exceed the max number of data points.

**Examples**

```
SENS:GCS:SWE:FREQ:POIN 201
sense:gcsetup:sweep:frequency:points 101
```

**Query Syntax**

```
SENSe<ch>:GCSetup:SWEep:FREQuency:POINts?
```

**Return Type** Numeric

**Default** 201

**SENSe<ch>:GCSetup:SWEep:POWer:POINts <num>**
**Applicable Models:** All with Gain Compression Option

*(Read-Write)* Set and read the number of data points in each power sweep. Applies ONLY to 2D acquisition modes.

**Parameters**
- `<ch>` Any existing GCA channel. If unspecified, value is set to 1.
- `<num>` Power points. Do not exceed the max number of data points.

*See Data Points Limit*

**Examples**
```
SENS:GCS:SWE:POW:POIN 50
sense:gcsetup:sweep:power:points 21
```

**Query Syntax**
```
SENSe<ch>:GCSetup:SWEep:POWer:POINts?
```

**Return Type**
Numeric

**Default**
21

---

**SENSe<ch>:GCSetup:SWEep:POWer:SMOoth <bool>**

**Applicable Models:** All with Gain Compression Option

*(Read-Write)* Set and read the state of the power smoothing. This is only available in Gain Compression for Converters (GCX). This is only used when `SENSe:GCSetup:COMPression:PHASE:MODE` is set to PHASE or BOTH.

This enables an optional smoothing procedure of the power sweep.

**Parameters**
- `<ch>` Any existing GCA channel. If unspecified, value is set to 1.
- `<bool>` Choose from:

  - **ON** or (1) Enable power smoothing.
  - **OFF** or (0) Disable power smoothing.

**Examples**
```
SENS:GCS:SWE:POW:SMO 1
sense:gcsetup:sweep:power:smooth:off
```

**Query Syntax**
```
SENSe<ch>:GCSetup:SWEep:POWer:SMOoth?
```

**Return Type**
Boolean

**Default**
OFF
SENSe<ch>:GCSetup:SWEep:POWer:SMOoth:APERture <num>

**Applicable Models:** All with Gain Compression Option

*(Read-Write)* Set and read the power smoothing aperture in percent. This is only available in Gain Compression for Converters (GCX). This is only used when SENSE:GCSetup:COMPression:PHASe:MODE is set to PHASe or BOTH. It is only applied when smoothing has been enabled.

This SCPI command configures the smoothing aperture used. The default is 25%.

**Parameters**

- `<ch>` Any existing GCA channel. If unspecified, value is set to 1.
- `<num>` Power smoothing aperture.

**Examples**

```
SENSe:GCS:SWE:POW:SMO:APER 10
sense:gcsetup:sweep:power:smooth:aperture 10
```

**Query Syntax**

SENSe<ch>:GCSetup:SWEep:POWer:SMOoth:APERture?

**Return Type**

Numeric

**Default**

25
Sense:IF Commands

Controls the DSP filters for use with the VNA X.

| VALUE |

- Click on a red keyword to view the command details.
- Synchronizing the Analyzer and Controller
For any of the Filter "Stage" parameters to take effect, SENS:IF:FILT:AUTO must be set to OFF (MANUAL) and mode, and SENS:IF:FILT:CMOD must be set to OFF.

Stage2 settings are ignored when using DSP 5 versions.

Programs that control these settings, or state files that are saved, will yield different results when run or recalled on VNAs with DSP 4 versions versus DSP 5 versions. Learn more about DSP versions.

**Critical Note:** These commands act on the selected measurement. You can select one measurement for each channel using Calc:Par:Select.

```
SENSe<cnum>:IF:BANDwidth:FILTer <enum>
```

**Applicable Models:** N524xB

(Read-Write) Sets and returns the IF bandwidth filter shape. Learn more.

**Critical Note**

**Parameters**

- `<cnum>` Existing channel number. If unspecified, `<cnum>` is set to 1.
- `<enum>` (String) Filter shape. Chose from:
  - **STANdard**: Legacy filter. This filter is the fastest, but has side lobes that rise to ~-32 dBC.
  - **GAUSSian**: The Gaussian filter takes longer to acquire a point but has no side lobes.

**Examples**

```
SENS:IF:BAND:FILT GAUS
sense2:if:bandwidth:filter standard
```

**Query Syntax**

```
SENSe<cnum>:IF:BANDwidth:FILTer?
```
SENSe<cnm>:IF:FILT:CMOD <bool>

**Return Type**  String

**Default**  STANdard

**Applicable Models:** N524xB

*(Read-Write)* Sets and returns whether the VNA configures the 3-stage digital filter settings or they will be configured manually. When making manual settings, also send `SENS:IF:FILT:CMOD OFF` which routes the IF through the 3-stage filter.

**Critical Note**

**Parameters**

- `<cnm>`  Existing channel number. If unspecified, `<cnm>` is set to 1.
- `<bool>`  (Boolean)

- **ON** (or 1) - Automatic: VNA controls digital filter settings.
- **OFF** (or 0) - Manual: You control digital filter settings using other Sens:IF commands.

**Examples**

SENS:IF:FILT:CMOD 1
sense2:if:filter:auto 0

**Query Syntax**

SENS<cnm>:IF:FILT:CMOD?  

**Return Type**  Boolean

**Default**  ON

SENSe:IF:FILT:CMODe <bool>
Applicable Models: N524xB

(Read-Write) Sets and returns the ADC capture mode modeled as a 2-pole switch in the above diagram. The switch either bypasses or routes the IF through the 3-stage digital filter.

Critical Note

Parameters

<bool> (Boolean)

**ON** (or 1) - The digital filters are bypassed and the raw ADC readings are taken directly. With DSP 4 versions, a maximum of 4096 data points per sweep can be acquired.

With DSP 5 versions, the VNA maximum data points per sweep can be acquired.

Learn more about DSP Versions.

**OFF** (or 0) - The digital filters are used to process IF information. The filters can be configured automatically or manually using SENS:IF:FILT:AUTO.

Examples

SENS:IF:FILT:CMOD 1
sense2:if:filter:cmode 0

Query Syntax

SENSe<cnum>:IF:FILTer:CMODe?

Return Type

Boolean

Default

OFF

SENSe<cnum>:IF:FILTER:ERRors?

Applicable Models: N524xB

(Read-only) Returns the error string associated with the digital filters. The return string has three fields separated by commas: "stage1 status, stage2 status, stage3 status"

Each of these fields can contain one or more of the following error codes:

- **NO ERROR**
- **NUMBER-OF-COEFFICIENTS** - the number of coefficients is excessive for that filter-stage
- **COEFFICIENT VALUE** - one or more coefficients are out of range for that filter-stage
- **SUM-OF-COEFFICIENTS** - the sum of all coefficients is excessive for that filter-stage,
- **FREQUENCY** - the frequency for Stage 1 is out of range (only applies stage1 field),
- **PARAMETER** - one or more parameters are out of range (only applies to stage 3 field)
Critical Note

Parameters

<cnum> Existing channel number. If unspecified, <cnum> is set to 1.

<n> Stage number. Choose 1, 2, or 3.

<coef> Filter coefficients.

For stages 1 and 2, values can be sent as integers or in floating point format. If floating point, the values are truncated to integers. The valid range is 0 to 131071.

For stage 3: An array of floating point values. The valid range is any value within range of a floating point.

Examples

SENS:IF:FILT:ERR?

'example return strings''

NO ERROR, NO ERROR, NO ERROR

indicates no errors,

*SUM-OF-COEFFICIENTS, NO ERROR, NO ERROR

indicates that the sum of all filter coefficients exceed the maximum value for the Stage-1 filter,

*COEFFICIENT *SUM-OF-COEFFICIENTS, NO ERROR, *PARAMETER

indicates a problems with Stage 1 coefficients and a problem with one or more of the parameters associated with the Stage 3 filter.

Return Type

String

Default

Not Applicable

SENS<channel>:IF:FILT:STAG<n>:COEF<coeffs>

Applicable Models: N524xB

(Read-Write) Sets and returns the digital filter coefficients of the specified stage.

Note: Stage2 settings are ignored when using DSP Version 5. Learn more.

Critical Note

Parameters

<cnum> Existing channel number. If unspecified, <cnum> is set to 1.

<n> Stage number. Choose 1, 2, or 3.

<coef> Filter coefficients.

For stages 1 and 2, values can be sent as integers or in floating point format. If floating point, the values are truncated to integers. The valid range is 0 to 131071.

For stage 3: An array of floating point values. The valid range is any value within range of a floating point.

Examples

SENS:IF:FILT:STAG2:COEF 0,0.1,0.7,0.7,0.1

sense2:if:filter:stage3:coefficients

+0.0E+000,+6.4E+001,+2.56E+002

Query Syntax

SENS<channel>:IF:FILT:STAG<n>:COEF<coeffs>?
**Example**

`SENS:IF:FILT:STAG2:COEF?`

**Return Type**

Floating point values

**Default**

Stage dependent

---

`SENS<cnum>:IF:FILTer:STAGe<n>:COUNt? [char]`

**Applicable Models:** N524xB

(Read-only) Returns the number of taps in the digital filter of the specified stage. The filter sample count setting is only used when `SENS:IF:FILTer:AUTO` is set to False (MANUAL).

**Note:** Stage2 settings are ignored when using DSP Version 5. Learn more.

**Critical Note**

**Parameters**

- `<cnum>`: Existing channel number. If unspecified, `<cnum>` is set to 1.
- `<n>`: Stage number. Choose 1, 2, or 3
- `[char]`: Optional parameter. Choose from:
  - **MIN**: returns the minimum number of coefficients for the specified stage. Stage1: 10, Stage2: 1, Stage3: 2
  - **MAX**: returns the maximum number of coefficients for the specified stage. Stage1 & 2: 1024, Stage3: 102400

**Examples**

`SENS:IF:FILT:STAG2:COUN?`

`sense2:if:filter:stag1:count? max`

**Return Type**

Numeric

**Default**

Stage dependent

---

`SENS<cnum>:IF:FILTer:STAGe1:FREQuency <value>`

---

4371
Applicable Models: N524xB

(Read-Write) Sets and returns the Numerically Controlled Oscillator (NCO) frequency. This command is only used when SENSe:IF:FILTER:AUTO is set to False (Manual).

Critical Note

Parameters

- `<cnum>` Existing channel number. If unspecified, `<cnum>` is set to 1.
- `<value>` Stage 1 Frequency. Min value= 0 Hz

With DSP 4 versions, Max value= 15 MHz.

With DSP 5 versions, Max value = 38 MHz.

Or programmatically use the Max and Min queries to determine the range of settable values.

Learn more about DSP versions.

Examples

```
SENS:IF:FILT:STAGE1:FREQ 9e6
Sense2:if:filter:stage1:frequency 9.2e6
```

Query Syntax

```
SENSe<cnum>:IF:FILTER:STAGE1:FREQuency?
'returns the current parameter value

SENSe<cnum>:IF:FILTER:STAGE1:FREQuency? Min
'returns the minimum frequency value.

SENSe<cnum>:IF:FILTER:STAGE1:FREQuency? Max
'returns the maximum frequency value.
```

Return Type

Numeric

Default
Nominal IF Frequency. Learn more

SENSe<cnum>:IF:FILTER:STAGE3:CATalog?
**Applicable Models:** N524xB

*(Read-only)* Returns a list of strings for the currently supported filter types that can be used for the stage 3 filter. This command is only used when `SENS:IF:FIL:T:AUTO` is set to False (Manual). See `SENS:IF:FILT:STAGE3:TYPE` for a list of currently supported filter types.

**Critical Note**

**Parameters**

- **<cnum>** Existing channel number. If unspecified, `<cnum>` is set to 1.

**Examples**

```plaintext
SENS:IF:FILT:STAGE3:CAT?
sense2:if:filter:stage3:catalog?
```

**Return Type**

String array

**Default**

Not Applicable

---

**SENSe<cnum>:IF:FILTER:STAGE3:PARAMeter <p>, <value>**

**Applicable Models:** N524xB

*(Read-Write)* Sets and returns the Stage 3 filter parameters.

Must first select the filter type (`SENS:IF:FILT:STAGE3:TYPE`) before setting these parameters.

Use `SENS:IF:FILT:STAGE3:PCAT?` to return a list of the available parameters for the currently selected filter type.

**Critical Note**

**Parameters**

- **<cnum>** Existing channel number. If unspecified, `<cnum>` is set to 1.
- **<p>** (String) Filter parameter. Case Sensitive. Choose from:
  - "C" - Tap count (Tukey, RECT, PWIN)
  - "P" - Period (PWIN ONLY)
  - "D" - Delay (PWIN ONLY)
  - "W" - Width (PWIN ONLY)
  - "R" - Ramp Count (PWIN ONLY)
  - "M" - Number of times to repeat the user-supplied array for each data point (COEF ONLY)
- **<value>** (Numeric) Parameter Value for the specified stage 3 parameter. Use the query form to return the minimum and maximum values for the specified parameter.
Examples
SENS:IF:FILT:STAGe3:PAR "C", 64
sense2:if:filter:stage3:parameter "d", 0.5E-6

Query Syntax
SENSe<cnum>:IF:FILTer:STAGe3:PARameter? <p>
returns the current parameter value

SENSe<cnum>:IF:FILTer:STAGe3:PARameter? <p>, Min
returns the minimum parameter value.

SENSe<cnum>:IF:FILTer:STAGe3:PARameter? <p>, Max
returns the maximum parameter value.

Examples
SENS:IF:FILT:STAGe3:PAR? "C"
sense2:if:filter:stage3:parameter? "d", min

Return Type
Numeric

Default
RECT: C = 1

PWIN: C=1E6, P=10ms, D=50us, W=50us, R=7

TUKEY: C=1

COEF: M=1

SENSe<cnum>:IF:FILTer:STAGe3:PCATalog?
Applicable Models: N524xB

(Read-only) Returns a list of the available parameters for the currently selected filter type.

Critical Note

Parameters
<cnum> Existing channel number. If unspecified, <cnum> is set to 1.

Examples
SENS:IF:FILT:STAGe3:PCAT?
sense2:if:filter:stage3:pcatalog?

Return Type
String

Default
Not Applicable

SENSe<cnum>:IF:FILTer:STAGe3:TYPE <value>
**Applicable Models:** N524xB

*(Read-Write)* Sets and returns the Stage 3 filter type. This command is only used when `SENSe:IF:FILTer:AUTO` is set to False (Manual).

**Critical Note**

**Parameters**

- `<cnum>` Existing channel number. If unspecified, `<cnum>` is set to 1.
- `<value>` (String) Filter type. Chose from:
  - "RECT" Rectangular Window Filter
  - "TUKEY" Tukey Filter
  - "PWIN" Pulse Window Filter
  - "COEF" User-supplied array

**Examples**

```
SENS:IF:FILT:STAGe3:TYPE RECT
sense2:if:filter:stage3:type pwin
```

**Query Syntax**

`SENSe<cnum>:IF:FILTer:STAGe3:TYPE?`

**Return Type**

String

**Default** "TUKEY"

---

**SENSe<cnum>:IF:FREQuency:AUTO <bool>**

**Applicable Models:** N524xB

*(Read-Write)* Sets and returns the method for specifying the way the IF Frequency is determined.

**Critical Note**

**Parameters**

- `<cnum>` Existing channel number. If unspecified, `<cnum>` is set to 1.
- `<bool>` (Boolean)
  - **ON** (or 1) - Automatic. VNA determines the setting for the IF frequency. The IF frequency is based on many VNA settings, including measurement frequency. Therefore, it is NOT possible to read the IF frequency that is being used.
  - **OFF** (or 0) - Manual. Use `SENS:IF:FREQ` to set the frequency.

**Examples**

```
SENS:IF:FREQ:AUTO 1
sense2:if:frequency:auto 0
```

**Query Syntax**

`SENSe<cnum>:IF:FREQuency:AUTO?`
SENS<cnm>:IF:FREQuency[:VALue] <value>

**Applicable Models:** N524xB

(Read-Write) Sets and returns the IF frequency for ALL receiver paths being used for the specified channel. To set this frequency, **SENS:IF:FREQ:AUTO** must be set to OFF (Manual). Also returns the maximum and minimum allowable frequency settings. [Learn more.]

**Critical Note**

**Parameters**

- `<cnm>`: Existing channel number. If unspecified, `<cnm>` is set to 1.
- `<value>`: (Numeric) Frequency value. Use the Max and Min Queries to determine the range of this setting. (SENS:IF:FREQ? Max)

**Examples**

```
SENS:IF:FREQ 9.1e6
sense2:if:frequency:value 8.9e6
```

**Query Syntax**

SENS<cnm>:IF:FREQuency?

'returns the current frequency setting

SENS<cnm>:IF:FREQuency? Max

'returns the maximum allowable frequency setting

SENS<cnm>:IF:FREQuency? Min

'returns the minimum allowable frequency setting

**Return Type**

- **Numeric**
- **Default**: 9 MHz
## Sense:IMD Commands

**Blue** commands are superseded.

**Other Swept IMD commands**

- **CALCulate:MEASure:DEFine** - creates a Swept IMD measurement.
- **Swept IMD Calibration** - these are supplemental to the **Guided Cal** commands.
- Use std channel commands to set Source and Receiver Attenuation.
- SENS:ROLE:DEVice “RF2” - use an external source for f2.

- SCPI Command Tree

SENSe<cnum>:IMD:SWEep:TYPE <char>

Applicable Models: N522xB, N524xB

(Read-Write) Sets and returns the sweep type for the IMD measurement.

Parameters

- <cnum> Channel number of the IMD measurement. If unspecified, value is set to 1.
- <char> Sweep type. Choose from:

  - **FCENter** - (Center Frequency) Maintaining a constant tone spacing (DeltaF) and tone powers (P1 and P2), the center frequency (FC) is swept from Start to Stop.
  
  - **DFRequency** - (Delta Frequency) The center frequency (FC) is held constant. The tone spacing is increased from StartDeltaF to StopDeltaF.
  
  - **POWER** - The main tone frequencies are specified as either F1 and F2, or as FC and DeltaF. These frequencies are held constant while the power of each tone is stepped from the Start Power to the Stop Power.
  
  - **CW** - The main tone frequencies (F1 and F2) and power levels (P1 and P2) are held constant. Measurements are taken for the specified Number of Points.
  
  - **SEGMent** - Not available for IMDx. Same as FCen ter sweep, except that the center frequencies for the sweep are constructed using the standard segment sweep commands.
  
  - **LOPower** - All frequencies are fixed while the LO power is swept from Start to Stop power.

For each sweep type, use the commands that follow:
FCENTer:

- SENS:IMD:FREQ:FCEN:STAR
- SENS:IMD:FREQ:FCEN:STOP
- SENS:IMD:FREQ:FCEN:CENT
- SENS:IMD:FREQ:FCEN:SPAN
- SENS:IMD:FREQ:DFR:[CW]
- SENS:IMD:TPOW:F1
- SENS:IMD:TPOW:F2

DFRequency

- SENS:IMD:FREQ:DFR:STAR
- SENS:IMD:FREQ:DFR:STOP
- SENS:IMD:FREQ:FCEN:[CW]
- SENS:IMD:TPOW:F1
- SENS:IMD:TPOW:F2

POWer

- SENS:IMD:FREQ:F1:[CW]
- SENS:IMD:FREQ:F2:[CW]
- SENS:IMD:FREQ:FCEN:[CW]
- SENS:IMD:FREQ:DFR:[CW]
- SENS:IMD:TPOW:F1:STAR
- SENS:IMD:TPOW:F1:STOP
- SENS:IMD:TPOW:F2:STAR
- SENS:IMD:TPOW:F2:STOP

CW

- SENS:IMD:FREQ:F1:[CW]
- SENS:IMD:FREQ:F2:[CW]
- SENS:IMD:FREQ:FCEN:[CW]
- SENS:IMD:FREQ:DFR:[CW]
- SENS:IMD:TPOW:F1
- SENS:IMD:TPOW:F2

**SEGMent - Not available for IMDx.**

- SENS:IMD:FREQ:DFR:[CW]
- SENS:IMD:TPOW:F1
- SENS:IMD:TPOW:F2
- Use the standard segment sweep commands to set freq start and stop

**LOPower - IMDx ONLY**

- SENS:MIX:LO:POW:STAR
- SENS:MIX:LO:POW:STOP
- SENS:IMD:FREQ:F1:[CW]
- SENS:IMD:FREQ:F2:[CW]
- SENS:IMD:FREQ:FCEN:[CW]
- SENS:IMD:FREQ:DFR:[CW]
- SENS:IMD:TPOW:F1
- SENS:IMD:TPOW:F2

**Query Syntax**  SENS<cnun>:IMD:SWEep:TYPE?

**Return Type**  Character

**Default**  FCENTer

SENS<cnun>:IMD:CSO:NDPRoducts <num>
**Applicable Models:** N522xB, N524xB

*(Read-Write)* Sets and returns the “N = number of distortion products” value for the calculation of the CSO parameter. Learn more.

### Parameters
- `<cnum>` Channel number of the IMD measurement. If unspecified, value is set to 1.
- `<num>` Number of distortion products.

### Examples
- `SENS:IMD:CSO:NDPR 30`
- `sense2:imd:cso:ndproducts 7`

### Query Syntax
- `SENSe<cnum>:IMD:CSO:NDPRoducts?`

### Return Type
- Numeric

### Default
- 40

---

**SENSe<cnum>:IMD:CSO:NORMalized:POWer <num>**

**Applicable Models:** N522xB, N524xB

*(Read-Write)* Sets and returns the CSO Power for POWER normalization mode. Valid only with measurement parameters: CSO2Lo and CSO2Hi and for Normalization Modes dBm and dBmV. Learn more.

### Parameters
- `<cnum>` Channel number of the IMD measurement. If unspecified, value is set to 1.
- `<num>` Power level. The units are determined by `Sens:IMD:Norm:Mode`, which must be set first.

### Examples
- `SENS:IMD:CSO:NORM:POW 0`

### Query Syntax
- `SENSe<cnum>:IMD:CSO:NORMalized:POWer?`

### Return Type
- Numeric

### Default
- 0

---

**SENSe<cnum>:IMD:CSO:OFFSet <num>**
Applicable Models: N522xB, N524xB

(Read-Write) Sets and returns the offset that is applied to CSO measurements. Valid only with measurement parameters: CSO2Lo and CSO2Hi. Learn more.

Parameters

- `<cnum>` Channel number of the IMD measurement. If unspecified, value is set to 1.
- `<num>` Offset value in dBm

Examples

- `SENS:IMD:CSO:OFFS 3`
- `sense2:imd:cs:offset 7`

Query Syntax `SENSe<cnum>:IMD:CSO:OFFSet?`

Return Type Numeric

Default 0

SENSe<cnum>:IMD:CTB:NCARriers <num>

Applicable Models: N522xB, N524xB

(Read-Write) Sets and returns the “N = Total number of carriers” value used in the calculation of the XMOD parameter. Learn more.

Parameters

- `<cnum>` Channel number of the IMD measurement. If unspecified, value is set to 1.
- `<num>` Number of carriers.

Examples

- `SENS:IMD:CTB:NCAR 10`
- `sense2:imd:ctb:ncarriers 50`

Query Syntax `SENSe<cnum>:IMD:CTB:NCARriers?`

Return Type Numeric

Default 40

SENSe<cnum>:IMD:CTB:NORMalized:POWer <num>
Applicable Models: N522xB, N524xB

(Read-Write) Sets and returns the CTB Power. Valid only with measurement parameters: CTBLo and CTBHi and for Normalization Modes dBm and dBmV. Learn more.

**Parameters**

- `<cnum>` Channel number of the IMD measurement. If unspecified, value is set to 1.
- `<num>` Power level. The units are determined by `Sens:IMD:Norm:Mode`, which must be set first.

**Examples**

<table>
<thead>
<tr>
<th>Command</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>SENS:IMD:CTB:NORM:POW 0</code></td>
</tr>
<tr>
<td><code>sense2:imd:ctb:normalized:power -5</code></td>
</tr>
</tbody>
</table>

**Query Syntax** `Sense<cnum>:IMD:CTB:NORMALized:POWer?`

**Return Type** Numeric

**Default** 0

---

SENSe<cnum>:IMD:CTB:OFFSet <num>

Applicable Models: N522xB, N524xB

(Read-Write) Sets and returns the offset that is applied to CTB measurements. Valid only with measurement parameters: CTB, CTBLo, CTBHi, CTBE, CTBELo, and CTBEHi. Learn more.

**Parameters**

- `<cnum>` Channel number of the IMD measurement. If unspecified, value is set to 1.
- `<num>` Offset value in dBm

**Examples**

<table>
<thead>
<tr>
<th>Command</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>SENS:IMD:CTB:OFFS 3</code></td>
</tr>
<tr>
<td><code>sense2:imd:ctb:offset 7</code></td>

**Query Syntax** `SENSe<cnum>:IMD:CTB:OFFSet?`

**Return Type** Numeric

**Default** 0

---

SENSe<cnum>:IMD:FREQuency:DFRequency[:CW] <num>
Applicable Models: N522xB, N524xB

(Read-Write) Sets and returns fixed tone spacing.

Parameters

- `<cnum>` Channel number of the IMD measurement. If unspecified, value is set to 1.
- `<num>` Tone spacing frequency in Hz. The F1 and F2 tones MUST be within the frequency range of the VNA.

Examples

```
SENS:IMD:FREQ:DFR 1e6
sense2:imd:frequency:dfrequency:cw 2e7
```

Query Syntax

SENSe<cnum>:IMD:FREQuency:DFRequency[:CW]?

Return Type

Numeric

Default

1 MHz

---

SENSe<cnum>:IMD:FREQuency:DFRequency:STARt <num>

Applicable Models: N522xB, N524xB

(Read-Write) Sets and returns the starting main tone separation for sweep type = DFRequency (delta frequency).

Parameters

- `<cnum>` Channel number of the IMD measurement. If unspecified, value is set to 1.
- `<num>` Starting tone separation between F1 and F2 in Hz. Both F1 and F2 tones MUST be within the frequency range of the VNA where:

  \[
  F1 \text{ (start)} = \text{FREQ:FCEN} - \text{DFR:Start} / 2
  \]

  \[
  F2 \text{ (start)} = \text{FREQ:FCEN} + \text{DFR:Start} / 2
  \]

Examples

```
SENS:IMD:FREQ:DFR:STAR 1e6
sense2:imd:frequency:dfrequency:start 2e7
```

Query Syntax

SENSe<cnum>:IMD:FREQuency:DFRequency:STARt?

Return Type

Numeric

Default

1 MHz

---

SENSe<cnum>:IMD:FREQuency:DFRequency:STOP <num>
Applicable Models: N522xB, N524xB

(Read-Write) Sets and returns the stopping main tone separation for sweep type = DFRequency (delta frequency).

**Parameters**

- `<cnum>` Channel number of the IMD measurement. If unspecified, value is set to 1.
- `<num>` Stopping tone separation between F1 and F2 in Hz. Both F1 and F2 tones MUST be within the frequency range of the VNA where:

  \[
  F1 \text{ (stop)} = FREQ:FCEN - DFR:Stop / 2
  \]
  \[
  F2 \text{ (stop)} = FREQ:FCEN + DFR:Stop / 2
  \]

**Examples**

```
SENS:IMD:FREQ:DFR:STOP 1e6
sense2:imd:frequency:dfrequency:stop 2e7
```

**Query Syntax**

`SENSe<cnum>:IMD:FREQuency:DFRequency:STOP?`

**Return Type** Numeric

**Default** 10 MHz

---

`SENSe<cnum>:IMD:FREQuency:F1[:CW] <num>`

Applicable Models: N522xB, N524xB

(Read-Write) Sets and returns the frequency of the F1 tone.

**Parameters**

- `<cnum>` Channel number of the IMD measurement. If unspecified, value is set to 1.
- `<num>` F1 tone frequency in Hz. The F1 and F2 tones MUST be within the frequency range of the VNA.

**Examples**

```
SENS:IMD:FREQ:F1 1e9
sense2:imd:frequency:F1:cw 2e7
```

**Query Syntax**

`SENSe<cnum>:IMD:FREQuency:F1[:CW]?`

**Return Type** Numeric

**Default** 0.9995 GHz

---

`SENSe<cnum>:IMD:FREQuency:F2[:CW] <num>`
(Read-Write) Sets and returns the frequency of the F2 tone.

Parameters

- `<cnum>`: Channel number of the IMD measurement. If unspecified, value is set to 1.
- `<num>`: F2 tone frequency in Hz. The F1 and F2 tones MUST be within the frequency range of the VNA.

Examples

```
SENS:IMD:FREQ:F2 1e9
sense2:imd:frequency:F2: cw 2e7
```

Query Syntax

SENSe<cnum>:IMD:FREQuency:F2[:CW]?

Return Type: Numeric

Default: 1.0005 GHz

---

SENSe<cnum>:IMD:FREQuency:FCENter[:CW] <num>

Applicable Models: N522xB, N524xB

(Read-Write) Sets and returns the center frequency of the main tones.

Parameters

- `<cnum>`: Channel number of the IMD measurement. If unspecified, value is set to 1.
- `<num>`: Tone center frequency in Hz. The F1 and F2 tones MUST be within the frequency range of the VNA.

Examples

```
SENS:IMD:FREQ:FCEN 1e9
sense2:imd:frequency:fcenter: cw 2e7
```

Query Syntax

SENSe<cnum>:IMD:FREQuency:FCENter[:CW]?

Return Type: Numeric

Default: 1.0 GHz

---

SENSe<cnum>:IMD:FREQuency:FCENter:CENTer <num>
Applicable Models: N522xB, N524xB

(Read-Write) Sets and returns the sweep center frequency when sweeping the main tones.

Parameters

- `<cnum>`: Channel number of the IMD measurement. If unspecified, value is set to 1.
- `<num>`: Center frequency in Hz. The F1 and F2 tones MUST be within the frequency range of the VNA.

Examples

```
SENS:IMD:FREQ:FCEN:CENT 1e9
sense2:imd:frequency:fcenter:fcen 2e7
```

Query Syntax

SENSe<cnum>:IMD:FREQuency:FCENter:CENTer?

Return Type

Numeric

Default

13.255 GHz

SENSe<cnum>:IMD:FREQuency:FCENter:SPAN <num>

Applicable Models: N522xB, N524xB

(Read-Write) Sets and returns the frequency span when sweeping the main tones.

Parameters

- `<cnum>`: Channel number of the IMD measurement. If unspecified, value is set to 1.
- `<num>`: Frequency span in Hz. The F1 and F2 tones MUST be within the frequency range of the VNA.

Examples

```
SENS:IMD:FREQ:FCEN:SPAN 1e9
sense2:imd:frequency:fcenter:span 2e7
```

Query Syntax

SENSe<cnum>:IMD:FREQuency:FCENter:SPAN?

Return Type

Numeric

Default

26.489 GHz

SENSe<cnum>:IMD:FREQuency:FCENter:STARt <num>
(Read-Write) Sets and returns the start frequency when sweeping the main tones.

**Parameters**

- `<cnum>`
  - Channel number of the IMD measurement. If unspecified, value is set to 1.
- `<num>`
  - Start frequency in Hz. The F1 and F2 tones MUST be within the frequency range of the VNA.

**Examples**

```
SENS:IMD:FREQ:FCEN:STAR 1e9
sense2:imd:frequency:fcenter:start 2e7
```

**Query Syntax**

SENSe<cnum>:IMD:FREQuency:FCENter:STARt?

**Return Type**

Numeric

**Default**

10.5 MHz

---

SENSe<cnum>:IMD:FREQuency:FCENter:STOP <num>

(Read-Write) Sets and returns the stop frequency when sweeping the main tones.

**Parameters**

- `<cnum>`
  - Channel number of the IMD measurement. If unspecified, value is set to 1.
- `<num>`
  - Stop frequency in Hz. The F1 and F2 tones MUST be within the frequency range of the VNA.

**Examples**

```
SENS:IMD:FREQ:FCEN:STOP 1e9
sense2:imd:frequency:fcenter:stop 2e9
```

**Query Syntax**

SENSe<cnum>:IMD:FREQuency:FCENter:STOP?

**Return Type**

Numeric

**Default**

26.4995 GHz

---

SENSe:IMD:HOPRoduct?
Applicable Models: N522xB, N524xB

(Read-only) Returns the highest order product that can be measured by SweptIMD.

**Parameters**

None

**Examples**

SENS:IMD:HOPR?

'always returns 9

**Return Type**

Numeric

**Default**

9

SENSe<cnm>:IMD:HOPRduct:ACTive?

(Read-only) Returns the highest order product measured by SweptIMD.

**Parameters**

<cnm> Channel number of the IMD measurement. If unspecified, value is set to 1.

**Examples**

SENS:IMD:HOPR:ACT?

**Return Type**

Numeric

**Default**

Not applicable

SENSe<cnm>:IMD:IFBWidth:MAIN <num>

Applicable Models: N522xB, N524xB

(Read-Write) Sets and returns the IF Bandwidth for measurement of the main F1 and F2 tones. Learn more about setting IFBW for IMD.

**Parameters**

<cnm> Channel number of the IMD measurement. If unspecified, value is set to 1.

<num> Choose from: 1 | 2 | 3 | 5 | 7 | 10 | 15 | 20 | 30 | 50 | 70 | 100 | 150 | 200 | 300 | 500 | 700 | 1k | 1.5k | 2k | 3k | 5k | 7k | 10k | 15k | 20k | 30k | 50k | 70k | 100k | 150k | 200k | 280k | 360k | 600k

If an invalid number is specified, the analyzer will round up to the closest valid number.

**Examples**

SENS:IMD:IFBW:MAIN 280e3

sense2:imd:ifbwidth:main 150K

**Query Syntax**

SENSe<cnm>:IMD:IFBWidth:MAIN?
SENSe<cnum>:IMD:IFBWidth:IMTone <num>

**Applicable Models:** N522xB, N524xB

*(Read-Write)* Sets and returns the IF Bandwidth for measurement of the intermodulation products. Learn more about setting IFBW for IMD.

**Parameters**

- **<cnum>** Channel number of the IMD measurement. If unspecified, value is set to 1.
- **<num>** Choose from: 1 | 2 | 3 | 5 | 7 | 10 | 15 | 20 | 30 | 50 | 70 | 100 | 150 | 200 | 300 | 500 | 700 | 1k | 1.5k | 2k | 3k | 5k | 7k | 10k | 15k | 20k | 30k | 50k | 70k | 100k | 150k | 200k | 280k | 360k | 600k

If an invalid number is specified, the analyzer will round up to the closest valid number.

**Examples**

```
SENSe:IMD:IFBW:IMT 50
sense2:imd:ifbwidth:imtone 200
```

**Query Syntax**

SENSe<cnum>:IMD:IFBWidth:IMTone?

**Return Type** Numeric

**Default** 1 kHz

SENSe<cnum>:IMD: Normalized:MODE <char>
Applicable Models: N522xB, N524xB

(Read-Write) Sets and returns the method by which CTB and CSO calculations are performed.

Parameters

<cnun> Channel number of the IMD measurement. If unspecified, value is set to 1.
<char> Normalization mode. Choose from:

NONE - the normalized power is not used in calculation

NCARrier - CTB and CSO is corrected by subtracting 10*\log(N/2), where

- \( N = \# \) of carriers for CTB
- \( N = \# \) of distortion products for CSO

DBM - the composited normalized power for CTB or CSO is treated as a dBm value

DBMV - the composited normalized power for CTB or CSO is treated as a dBmV value.

Note: Power values are stored using the currently-set units. Therefore, first set units with this command, then set power values using:

Examples

SENS:IMD:NORM:MODE NCAR
sense2:imd:normalized:mode none

Query Syntax

SENSe<cnun>:IMD:NORMalized:MODE?

Return Type

Character

Default

NCARrier

SENSe<cnun>:IMD:PMAP <input>,<output>
Applicable Models: N522xB, N524xB

(Write-only) Sets the input port and output port of an IMD or IMDx channel. This setting is necessary only when using the limited port mapping feature. Learn more.

Parameters

- `<cnum>` Channel number of the IMD measurement. If unspecified, value is set to 1.
- `<input>` VNA port connected to the DUT Input. Choose from 1 or 3. When input is 3, an external combiner must be used.
- `<output>` VNA port connected to the DUT Output.
  - When input is 1, output must be 2.
  - When input is 3, output must be 4.

Examples

```
SENS:IMD:PMAP 3,4
sense2:imd:pmap 3,4
```

Query Syntax Not Applicable

Default 1,2

SENSe<cnum>:IMD:PMAP:INPut?

Applicable Models: N522xB, N524xB

(Read-only) Returns the VNA test port to be connected to the DUT input for an IMD or IMDx channel. Set the VNA port to DUT mapping using SENS:IMD:PMAP

Parameters

- `<cnum>` IMD channel number. If unspecified, value is set to 1.

Examples

```
SENS:IMD:PMAP:INP?
sense2:imd:pmap:input?
```

Default 1

SENSe<cnum>:IMD:PMAP:OUTPut?
Applicable Models: N522xB, N524xB

(Read-only) Returns the VNA test port to be connected to the DUT output for an IMD or IMDx channel. Set the VNA port to DUT mapping using SENS:IMD:PMap

**Parameters**

- `<cnum>` IM3 channel number. If unspecified, value is set to 1.

**Examples**

```
SENS:IMD:PMap:OutP?
sense2:imd:pmap:output?
```

**Default** 2

**SENSe<cnum>:IMD:SORDer:ACTive?**

(Read-only) Returns the state of whether or not 2nd order parameters are measured. A "1" or "ON" indicates 2nd order parameters are measured.

**Parameters**

- `<cnum>` Channel number of the IMD measurement. If unspecified, value is set to 1.

**Examples**

```
SENS:IMD:SORD:ACT?
```

**Return Type** Boolean

**Default** Not applicable

**SENSe<cnum>:IMD:TPOWer:COUPle[:STATe] <bool>**

Applicable Models: N522xB, N524xB

(Read-Write) Sets and returns the state of power coupling for F1 and F2. Learn more about tone power.

**Parameters**

- `<cnum>` Channel number of the IMD measurement. If unspecified, value is set to 1.
- `<bool>` Tone power level coupling state. Choose from:

  **ON (or 1)** - F1 and F2 power is coupled.

  **OFF (or 0)** - F1 and F2 power is NOT coupled. Set power levels individually.

**Examples**

```
SENS:IMD:TPower:COUPLE 0
sense2:imd:tpower:couple:state ON
```

**Query Syntax**

```
SENSe<cnum>:IMD:TPower:COUPLE[:STATe]?
```
SENSe<cnump>:IMD:TPOWer:EQUalize:STATe <bool> - **Superseded**

**Applicable Models:** N522xB, N524xB

*(Read-Write) This command is replaced with SENS:IMD:TPOW:LEV*

Sets and returns the state of Equal Tone Power setting. Learn more about tone power.

**Parameters**

- `<cnump>` Channel number of the IMD measurement. If unspecified, value is set to 1.
- `<bool>` Equal Tone Power state. Choose from:
  - **ON (or 1)** - Equalize f1 and f2 power.
  - **OFF (or 0)** - Do NOT equalize f1 and f2 power. Use source power cal.

**Examples**

```
SENS:IMD:TPOW:EQU 0
sense2:imd:tpower:equalize:state ON
```

**Query Syntax**

`SENSe<cnump>:IMD:TPOWer:EQUalize:STATe?`

**Return Type** Boolean

**Default** OFF

SENSe<cnump>:IMD:TPOWer:F1 <num>
Applicable Models: N522xB, N524xB

(Read-Write) Sets and returns the power level of the F1 tone. When SENS:IMD:TPOW:COUP ON (tone power is coupled), setting either F1 or F2 power sets both. Learn more about tone power.

Parameters

- <cnum> Channel number of the IMD measurement. If unspecified, value is set to 1.
- <num> Tone power level in dBm. Choose a value between +30 dBm and -30 dBm.

Examples

```
SENS:IMD:TPOW:F1 0
sense2:imd:tpower:F1 -10
```

Query Syntax

SENS<cnum>:IMD:TPOWer:F1?

Return Type

Numeric

Default

-24 dBm

SENSe<cnum>:IMD:TPOWe:F2 <num>

Applicable Models: N522xB, N524xB

(Read-Write) Sets and returns the power level of the F2 tone. When SENS:IMD:TPOW:COUP ON (tone power is coupled), setting either F1 or F2 power sets both. Learn more about tone power.

Parameters

- <cnum> Channel number of the IMD measurement. If unspecified, value is set to 1.
- <num> Tone power level in dBm. Choose a value between +30 dBm and -30 dBm.

Examples

```
SENS:IMD:TPOW:F2 0
sense2:imd:tpower:F2 -10
```

Query Syntax

SENS<cnum>:IMD:TPOWer:F2?

Return Type

Numeric

Default

-24 dBm

SENSe<cnum>:IMD:TPOWe:F1:STARt <num>
Applicable Models: N522xB, N524xB

(Read-Write) Sets and returns the start power level of the F1 tone. Learn more about tone power.

Parameters

- `<cnum>` Channel number of the IMD measurement. If unspecified, value is set to 1.
- `<num>` Start power in dBm. Choose a value between +30 dBm and -30 dBm.

Examples

```
SENS:IMD:TPOW:F1:STAR 0
sense2:imd:tpower:F1:start -10
```

Query Syntax

SENSe<cnun>:IMD:TPOwer:F1:STARt?

Return Type Numeric

Default -24 dBm

SENSe<cnun>:IMD:TPOwer:F1:STOP <num>

Applicable Models: N522xB, N524xB

(Read-Write) Sets and returns the stop power level of the F1 tone. Learn more about tone power.

Parameters

- `<cnum>` Channel number of the IMD measurement. If unspecified, value is set to 1.
- `<num>` Stop power in dBm. Choose a value between +30 dBm and -30 dBm.

Examples

```
SENS:IMD:TPOW:F1:STOP 0
sense2:imd:tpower:F1:stop 10
```

Query Syntax

SENSe<cnun>:IMD:TPOwer:F1:STOP?

Return Type Numeric

Default -10 dBm

SENSe<cnun>:IMD:TPOwer:F2:STARt <num>
**Applicable Models:** N522xB, N524xB

(Read-Write) Sets and returns the start power level of the F2 tone. Learn more about tone power.

**Parameters**

- `<cnum>`: Channel number of the IMD measurement. If unspecified, value is set to 1.
- `<num>`: Start power in dBm. Choose a value between +30 dBm and -30 dBm.

**Examples**

```
SENS:IMD:TPOW:F2:STAR 0
sense2:imd:tpower:F2:start -10
```

**Query Syntax**

`SENSe<cnum>:IMD:TPOWer:F2:STARt?`

**Return Type**

Numeric

**Default**

-24 dBm

---

**SENSe<cnum>:IMD:TPOWer:F2:STOP <num>**

**Applicable Models:** N522xB, N524xB

(Read-Write) Sets and returns the stop power level of the F2 tone. Learn more about tone power.

**Parameters**

- `<cnum>`: Channel number of the IMD measurement. If unspecified, value is set to 1.
- `<num>`: Stop power in dBm. Choose a value between +30 dBm and -30 dBm.

**Examples**

```
SENS:IMD:TPOW:F2:STOP 0
sense2:imd:tpower:F2:stop 10
```

**Query Syntax**

`SENSe<cnum>:IMD:TPOWer:F2:STOP?`

**Return Type**

Numeric

**Default**

-10 dBm

---

`SENSe<cnum>:IMD:TPOWer:LEVel <char>`
**Applicable Models:** N522xB, N524xB

*(Read-Write)* This command replaces SENS:IMD:TPOW:EQU and SENS:IMD:TPOW:SET

Sets and returns the tone power leveling mode.

**Parameters**

<cnомер>  Channel number of the IMD measurement. If unspecified, value is set to 1.
<char>  Choose from:

- **NONE** - *(Set Input Power)* The specified f1 and f2 power levels are set at the DUT input.

- **INPut** - *(Set Input Power, receiver leveling)* The specified f1 and f2 power levels are set at the DUT input using receiver leveling at the input reference receiver.

- **EQUal** - *(Set Input Power, equal tones at output)* The specified f1 and f2 power levels are set at the DUT input and a measurement is made at the output.

- **OUTPut** - *(Set Output Power, receiver leveling)* The specified f1 and f2 power levels are set at the DUT output.

Learn more about these choices.

**Examples**

```plaintext
SENS:IMD:TPOW:LEV INP
sense2:imd:tpower:level output
```

**Query Syntax**

`SENSe<cnомер>:IMD:TPOWer:LEV?`

**Return Type**

Character

**Default**

NONE

**SENSe<cnомер>:IMD:TPOWer:SET <char>** - *Superseded*
Applicable Models: N522xB, N524xB

(Read-Write) This command is replaced with SENS:IMD:TPOW:LEV

Sets and returns whether tone power is specified at the DUT input or output.

**Parameters**

- `<cnum>` Channel number of the IMD measurement. If unspecified, value is set to 1.
- `<char>` Choose from:

  **INPUT** - Specified power level is set at the DUT input.
  
  **OUTPUT** - Specified power level is set at the DUT output.

**Examples**

```
SENS:IMD:TPOW:SET INPUT
sense2:imd:tpower:set output
```

**Query Syntax** SENSE<cnum>:IMD:TPOWer:SET?

**Return Type** Character

**Default** INPUT
Controls IM Spectrum measurement configuration.

**Query Syntax**
Not Applicable

**Default**
1,2

SENS<e<cnum>:IMS:PMAP:INPut?

**Applicable Models:** N522xB, N524xB

*(Read-only)* Returns the VNA test port to be connected to the DUT input for an IMS or IMSx channel. Set the VNA port to DUT mapping using SENS:IMS:PMAP

**Parameters**

<e<cnum> IMS channel number. If unspecified, value is set to 1.

**Examples**

- SENS:IMS:PMAP:INP?
- sense2:ims:pmap:input?

**Default**
1

SENS<e<cnum>:IMS:PMAP:OUTPut?

**Applicable Models:** N522xB, N524xB

*(Read-only)* Returns the VNA test port to be connected to the DUT output for an IMS or IMSx channel. Set the VNA port to DUT mapping using SENS:IMS:PMAP

**Parameters**

<e<cnum> IMS channel number. If unspecified, value is set to 1.

**Examples**

- SENS:IMS:PMAP:OUTP?
- sense2:ims:pmap:output?

**Default**
2

SENS<e<cnum>:IMS:RBW <num>
Applicable Models: N522xB, N524xB

(Read-Write) Sets and returns the Resolution Bandwidth for the IM Spectrum measurement.

Parameters

<table>

Examples

```
SENS:IMS:RESP:STAR 1e9
sense2:ims:response:start 100e6
```

Query Syntax

SENSe<cnum>:IMS:RESPonse:STARt?

Return Type Numeric

Default 950 MHz
SENSe<cnum>:IMS:RESPonse:STOP <num>

Applicable Models: N522xB, N524xB

(Read-Write) Sets and returns the receiver Stop frequency for the IM Spectrum measurement. Valid ONLY when Tracking is NOT enabled and when Sweep Type = Linear. Otherwise, this setting is ignored.

Parameters

- <cnum> Channel number of the IMSpectrum measurement. If unspecified, value is set to 1.
- <num> Stop frequency in Hz. Choose a frequency within the range of the VNA.

Examples

```
SENS:IMS:RESP:STOP 26e9
sense2:ims:response:stop 100e6
```

Query Syntax
SENSe<cnum>:IMS:RESPonse:STOP?

Return Type Numeric

Default 1.05 MHz

SENSe<cnum>:IMS:RESPonse:CENTer <num>

Applicable Models: N522xB, N524xB

(Read-Write) Sets and returns the receiver Center frequency for the IM Spectrum measurement. Valid ONLY when Tracking is NOT enabled and when Sweep Type = Linear. Otherwise, this setting is ignored.

Parameters

- <cnum> Channel number of the IMSpectrum measurement. If unspecified, value is set to 1.
- <num> Center frequency in Hz. Choose a frequency within the range of the VNA.

Examples

```
SENS:IMS:RESP:CENT 26e9
sense2:ims:response:center 100e6
```

Query Syntax
SENSe<cnum>:IMS:RESPonse:CENTer?

Return Type Numeric

Default 1.0 GHz

SENSe<cnum>:IMS:RESPonse:SPAN <num>
Applicable Models: N522xB, N524xB

(Read-Write) Sets and returns the Span of receiver frequencies for the IM Spectrum measurement. Valid ONLY when Tracking is NOT enabled and when Sweep Type = Linear. Otherwise, this setting is ignored.

Parameters

- `<cnum>`: Channel number of the IMSpectrum measurement. If unspecified, value is set to 1.
- `<num>`: Frequency span in Hz. All receiver frequencies should be within the range of the VNA.

Examples

```
SENS:IMS:RESP:SPAN 10e9
sense2:ims:response:span 100e6
```

Query Syntax

```
SENSe<cnum>:IMS:RESPonse:SPAN?
```

Return Type: Numeric

Default: 100 MHz

---

SENSe<cnum>:IMS:STIMulus:DFRequency <num>

Applicable Models: N522xB, N524xB

(Read-Write) Sets and returns the DeltaF (tone spacing) for the IM Spectrum measurement. Valid ONLY when Tracking is NOT enabled. Otherwise, this setting is ignored.

Parameters

- `<cnum>`: Channel number of the IMSpectrum measurement. If unspecified, value is set to 1.
- `<num>`: Delta frequency in Hz. All stimulus settings MUST be within the frequency range of the VNA.

Examples

```
SENS:IMS:STIM:DFR 1e6
sense2:ims:stimulus:dfrequency 100e6
```

Query Syntax

```
SENSe<cnum>:IMS:STIMulus:DFRequency?
```

Return Type: Numeric

Default: 10 MHz

---

SENSe<cnum>:IMS:STIMulus:FCENter <num>
Applicable Models: N522xB, N524xB

(Read-Write) Sets and returns the Center frequency for the IM Spectrum measurement. Valid ONLY when Tracking is NOT enabled. Otherwise, this setting is ignored.

Parameters

- `<cnum>`  Channel number of the IMSpectrum measurement. If unspecified, value is set to 1.
- `<num>`  Center frequency in Hz. All stimulus settings MUST be within the frequency range of the VNA.

Examples

```
SENS:IMS:STIM:FCEN 1e6
sense2:ims:stimulus:fcenter 100e6
```

Query Syntax  SENSe<cnum>:IMS:STIMulus:FCENter?

Return Type  Numeric

Default  1.0 GHz

SENSe<cnum>:IMS:STIMulus:F1FRequency <num>

Applicable Models: N522xB, N524xB

(Read-Write) Sets and returns the F1 frequency for the IM Spectrum measurement. Valid ONLY when Tracking is NOT enabled. Otherwise, this setting is ignored.

Parameters

- `<cnum>`  Channel number of the IMSpectrum measurement. If unspecified, value is set to 1.
- `<num>`  F1 frequency in Hz. All stimulus settings MUST be within the frequency range of the VNA.

Examples

```
SENS:IMS:STIM:F1FR 1e6
sense2:ims:stimulus:f1frequency 100e6
```

Query Syntax  SENSe<cnum>:IMS:STIMulus:F1FRequency?

Return Type  Numeric

Default  995 MHz

SENSe<cnum>:IMS:STIMulus:F2FRequency <num>
Applicable Models: N522xB, N524xB

(Read-Write) Sets and returns the F2 frequency for the IM Spectrum measurement. Valid ONLY when Tracking is NOT enabled. Otherwise, this setting is ignored.

Parameters

- `<cnum>` Channel number of the IMSpectrum measurement. If unspecified, value is set to 1.
- `<num>` F2 frequency in Hz. All stimulus settings MUST be within the frequency range of the VNA.

Examples

```
SENS:IMS:STIM:F2FR 1e6
sense2:ims:stimulus:f2frequency 100e6
```

Query Syntax

```
SENSe<cnum>:IMS:SWEep:TYPE <char>
```

Return Type

Numeric

Default

1.005 MHz

SENSe<cnum>:IMS:SWEep:TYPE <char>

Applicable Models: N522xB, N524xB

(Read-Write) Sets and returns the method in which the spectrum of signals to view are specified. When Tracking is enabled the frequency of the main tones (f1 and f2) are always determined by the Swept IMD channel.

Parameters

- `<cnum>` Channel number of the IMSpectrum measurement. If unspecified, value is set to 1.
- `<char>` IM Spectrum sweep type. Choose from:
  
  - **LINear** When Tracking is enabled, allows tuning the Response Settings (receiver) to any values within the frequency range of the VNA. When Tracking is NOT enabled also allows setting the Stimulus (sources) to any values within the frequency range or the VNA.
  
  - **SECond** The receiver is tuned to view the 2nd order products (f2-f1 and f1+f2) of the main tones that are currently specified in Stimulus Settings. When Tracking is enabled, the main tones are specified in the Swept IMD channel.
  
  - **THIRd** The receiver is tuned to view the 3rd order products (2f1 -f2 and 2f2-f1) of the main tones that are currently specified in Stimulus Settings. When Tracking is enabled, the main tones are specified in the Swept IMD channel.
The frequency range is set to $N \times \Delta F$. This algorithm will NOT tune the receivers to view the EVEN order products.

### Examples

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SENS:IMS:SWEep:TYPE LIN</td>
<td></td>
</tr>
<tr>
<td>sense2:ims:sweep:type nth</td>
<td></td>
</tr>
</tbody>
</table>

### Query Syntax

SENSe<cnum>:IMS:SWEep:TYPE? | Character | Default: NTH

### Return Type

SENSe<cnum>:IMS:SWEep:ORDer <num>

**Applicable Models:** N522xB, N524xB

(Read-Write) Sets and returns the order number of signals to view when SENS:IMS:SWE:TYPE NTH is specified.

#### Parameters

- **<cnum>** Channel number of the IMSpectrum measurement. If unspecified, value is set to 1.
- **<num>** Order number of IM products to view. The frequency range is set to $N$ (this number) x DeltaF (set with SENS:IMS:STIM:DFR).

### Examples

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SENS:IMS:SWEep:ORD 5</td>
<td></td>
</tr>
<tr>
<td>sense2:ims:sweep:order 12</td>
<td></td>
</tr>
</tbody>
</table>

### Query Syntax

SENSe<cnum>:IMS:SWEep:ORDer? | Numeric | Default: 9

### Return Type

SENSe<cnum>:IMS:TPOWer:COUPle[:STATe] <bool>
Applicable Models: N522xB, N524xB

(Read-Write) Sets and returns the state of power coupling for F1 and F2.

Parameters

- `<cnum>` Channel number of the IMSpectrum measurement. If unspecified, value is set to 1.
- `<bool>` Tone power level coupling. Choose from:
  - **ON (or 1)** - F1 and F2 power is coupled.
  - **OFF (or 0)** - F1 and F2 power is NOT coupled. Set power levels individually.

Examples

```plaintext
SENS:IMS:TPOW:COUP 0
sense2:ims:tpower:couple:state ON
```

Query Syntax

```
SENSe<cnum>:IMS:TPOWer:COUPle[:STATe]?
```

Return Type

Boolean

Default

ON

SENS<e>:IMS:TPOWer:EQUalize:STATe <bool> - Superseded

Applicable Models: N522xB, N524xB

(Read-Write) This command is replaced with SENS:IMS:TPOW:LEV

Sets and returns the state of Equal Tone Power setting. Learn more about tone power.

Parameters

- `<cnum>` Channel number of the IMSpectrum measurement. If unspecified, value is set to 1.
- `<bool>` Equal Tone Power state. Choose from:
  - **ON (or 1)** - Equalize f1 and f2 power.
  - **OFF (or 0)** - Do NOT equalize f1 and f2 power. Use source power cal.

Examples

```plaintext
SENS:IMS:TPOW:EQU 0
sense2:ims:tpower:equalize:state ON
```

Query Syntax

```
SENSe<cnum>:IMS:TPOWer:EQUalize:STATe?
```

Return Type

Boolean
SENSe<cnum>:IMS:STIMulus:TPOWer:F1 <value>

**Applicable Models:** N522xB, N524xB

**(Read-Write)** Sets and returns the power level of the F1 tone. When SENS:IMS:TPOW:COUP ON (tone power is coupled), setting either F1 or F2 power sets both. This setting is ignored if SENS:IMS:TRAC:STAT is enabled.

**Parameters**
- `<cnum>`: Channel number of the IMSpectrum measurement. If unspecified, value is set to 1.
- `<value>`: F1 tone power level in dBm. Choose a value between +30 dBm and -30 dBm.

**Examples**
- SENS:IMS:STIM:TPOW:F1 -10
- sense2:ims:stimulus:tpower:f1 0

**Query Syntax**
SENSe<cnum>:IMS:STIMulus:TPOWer:F1?

**Return Type**
Numeric

**Default**
-20

SENSe<cnum>:IMS:STIMulus:TPOWer:F2 <value>

**Applicable Models:** N522xB, N524xB

**(Read-Write)** Sets and returns the power level of the F2 tone. When SENS:IMS:TPOW:COUP ON (tone power is coupled), setting either F1 or F2 power sets both. This setting is ignored if SENS:IMS:TRAC:STAT is enabled.

**Parameters**
- `<cnum>`: Channel number of the IMSpectrum measurement. If unspecified, value is set to 1.
- `<value>`: F2 tone power level in dBm. Choose a value between +30 dBm and -30 dBm.

**Examples**
- SENS:IMS:STIM:TPOW:F2 -10
- sense2:ims:stimulus:tpower:f2 0

**Query Syntax**
SENSe<cnum>:IMS:STIMulus:TPOWer:F2?

**Return Type**
Numeric

**Default**
-20
SENSe<nun>:IMS:TPower:LEVel <char>

Applicable Models: N522xB, N524xB

(Read-Write) This command replaces SENS:IMS:TPOW:EQU and SENS:IMS:TPOW:SET

Sets and returns the tone power leveling mode.

Parameters

<cnun>  Channel number of the IMD measurement. If unspecified, value is set to 1.
<char>  Choose from:

NONE - (Set Input Power) The specified f1 and f2 power levels are set at the DUT input.

INPUT - (Set Input Power, receiver leveling) The specified f1 and f2 power levels are set at the DUT input using receiver leveling at the input reference receiver.

EQUAL - (Set Input Power, equal tones at output) The specified f1 and f2 power levels are set at the DUT input and a measurement is made at the output.

OUTPUT - (Set Output Power, receiver leveling) The specified f1 and f2 power levels are set at the DUT output.

Learn more about these choices.

Examples

<table>
<thead>
<tr>
<th>Query Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SENS:IMS:TPow:LEV INPUT</td>
<td>SET Input Power</td>
</tr>
<tr>
<td>sense2:ims:tpower:level output</td>
<td>SET Output Power</td>
</tr>
</tbody>
</table>

Query Syntax  SENSe<nun>:IMS:TPOWer:LEV?
Return Type  Character
Default  NONE

SENSe<nun>:IMS:TPower:SET <char> - Superseded
Applicable Models: N522xB, N524xB

(Read-Write) This command is replaced with `SENS:IMS:TPOW:LEV`

Sets and returns whether tone power is specified at the DUT input or output.

Parameters

- `<cnum>` Channel number of the IMSpectrum measurement. If unspecified, value is set to 1.
- `<char>` Choose from:
  - `INPUT` - Specified power level is set at the DUT input.
  - `OUTPUT` - Specified power level is set at the DUT output.

Examples

```
SENS:IMS:TPOW:SET INPUT
sense2:ims:tpower:set output
```

Query Syntax

`SENSe<cnum>:IMS:TPower:SET?`

Return Type

Character

Default

`INPUT`

---

`SENSe<cnum>:IMS:TRACking:CHANnel <num>`

Applicable Models: N522xB, N524xB

(Read-Write) Sets and returns the IMD channel number to which the IM Spectrum channel is coupled.

Parameters

- `<cnum>` IMS channel. If unspecified, value is set to 1.
- `<num>` Existing IMD channel to which frequency and power settings are coupled.

Examples

```
SENS:IMS:TRAC:CHAN 2
sense2:ims:tracking:channel 1
```

Query Syntax

`SENSe<cnum>:IMS:TRACking:CHANnel?`

Return Type

Numeric

Default

First IMD channel

---

`SENSe<cnum>:IMS:TRACking:MSENable <bool>`
**Applicable Models:** N522xB, N524xB

*(Read-Write)* Sets and returns the step sweep mode for the IM Spectrum channel.

**Parameters**

- `<cnum>`: IMS channel. If unspecified, value is set to 1.
- `<bool>`: Choose from:
  - **OFF (or 0)** - Automatic Step
  - **ON (or 1)** - Manual Step

**Examples**

```plaintext
SENS:IMS:TRAC:MSEN 1
sense2:ims:tracking:msenable 0
```

**Query Syntax**

`SENSe<cnum>:IMS:TRACking:MSENable?`

**Return Type**

Boolean

**Default**

0 - Automatic

---

**SENSe<cnum>:IMS:TRACking:SINDex <num>**

**Applicable Models:** N522xB, N524xB

*(Read-Write)* When `SENS:IMS:TRAC:MSEN = Manual`, sets and returns the data point number at which a sweep is performed.

**Parameters**

- `<cnum>`: IMS channel. If unspecified, value is set to 1.
- `<num>`: Step index. Choose from 1 to the specified number of points.

**Examples**

```plaintext
SENS:IMS:TRAC:SINDex 201
sense2:ims:tracking:sindex 1
```

**Query Syntax**

`SENSe<cnum>:IMS:TRACking:SINDex?`

**Return Type**

Numeric

**Default**

1

---

**SENSe<cnum>:IMS:TRACking:STATe <bool>**
Applicable Models: N522xB, N524xB

(Read-Write) When an IMD channel exists, allows the IM Spectrum frequency and power setting to track (couple with) the IMD channel settings.

Parameters

- `<cnum>` IMS channel. If unspecified, value is set to 1.
- `<bool>` Tracking state. Choose from:
  - **ON (or 1)** - IM Spectrum frequency and power settings track the IMD channel settings.
  - **OFF (or 0)** - IM Spectrum frequency and power settings are specified in the IMS channel.

Examples

```
SENS:IMS:TRAC:STAT 0
sense2:ims:tracking:state ON
```

Query Syntax

```
SENSe<cnum>:IMS:TRACking:STATe?
```

Return Type

Boolean

Default

OFF

**Default** Not Applicable
SENSe<ch>:MIxED:AVOidspurs <bool>

Applicable Models: N522xB, N523xB, N524xB

(Read Write) Sets and returns the state of the avoid spurs feature. Learn more about avoid spurs.

Parameters
   <ch> Any existing channel number. If unspecified, value is set to 1
   <bool> Avoid spurs state. Choose from
           0 - Avoid spurs OFF
           1 - Avoid spurs ON

Examples
   SENS:MIX:AVO
   sense2:mixer:avoidspurs 1

**Examples**

SENS:MIX:CALC Output
SENSe<ch>:MIXer:DISCard

Applicable Models: All

(Write only) Cancels changes that have been made to the Converter setup and reverts to the previously-saved setup. Same as the Cancel button on the mixer setup dialog box.

Parameters

<ch> Any existing channel number. If unspecified, value is set to 1

Examples 

Query Syntax Not Applicable

Default Not Applicable

SENSe<ch>:MIXer:IF:FREQuency:SIDeband <char>

Applicable Models: All

(Read-Write) When two LO stages are used, sets or returns whether to select the sum or difference for the IF1 product. (Input + or - LO1 = IF1)

- This setting corresponds to the buttons on LO1 on the Mixer setup dialog
- This setting is ignored when ONE LO stage is selected.
- Also set SENS:MIX:OUTP:FREQ:SID to LOW or HIGH to determine the output frequency of the mixer.

See Note

Parameters

<ch> Any existing channel number. If unspecified, value is set to 1.

<char> Sideband value. Choose from

LOW - Difference (-)

HIGH - Sum (+)

`SENS<ch>:MIXer:INPut:POWer:STOP?`

**Return Type**

Numeric

**Default**

Not Applicable

---

**SENSe<ch>:MIXer:INPut:POWer:USENominal <bool>**

**Applicable Models:** All

(Read-Write) Toggles the Use Nominal Incident Power setting ON and OFF. This setting is ONLY to be used with SMC measurements. Learn more about Nominal Incident Power.

**Parameters**

- **<ch>**
  - Any existing channel number. If unspecified, value is set to 1.
- **<value>**
  - (boolean) - Nominal Incident Power State. Choose from:
    - **ON (1)** - Turn nominal incident power ON
    - **OFF (0)** - Turn nominal incident power OFF

**Examples**

- `SENS:MIX:INP:POW:USEN 1`
- `SENS2:MIXer:INPut:POWer:USENominal OFF`

`SENS<ch>:MIXer:INPut:POWer:USENominal?`

**Return Type**

Boolean

**Default**

OFF

---

**SENSe<ch>:MIXer:LO<n>:FREQuency:DENominator <value>**
Applicable Models: All

(Read-Write) Sets or returns the denominator value of the LO Fractional Multiplier. See Note

Parameters

<ch> Any existing channel number. If unspecified, value is set to 1.
<n> LO stage number. Choose 1 or 2.
<value> LO denominator.

Examples

SENS:MIX:LO:FREQ:DEN 5
SENS2:MIXer:LO2:FREQ:DENominator 4

Query Syntax

SENSe<ch>:MIXer:LO<n>:FREQuency:DENominator?

Return Type

Numeric

Default

1

SENSe<ch>:MIXer:LO<n>:FREQuency:FIXed <value>

Applicable Models: All

(Read-Write) Sets or returns the fixed frequency of the specified mixer LO. See Note

Parameters

<ch> Any existing channel number. If unspecified, value is set to 1.
<n> LO stage number. Choose 1 or 2
<value> LO frequency.

Examples

SENS:MIX:LO:FREQ:FIX 1e9
SENS2:MIXer:LO2:FREQ:FIXed 1000000000

Query Syntax

SENSe<ch>:MIXer:LO<n>:FREQuency:FIXed?

Return Type

Numeric

Default

Not Applicable

SENSe<ch>:MIXer:LO<n>:FREQuency:ILTI <bool>
Applicable Models: All

*(Read-Write)* Specifies whether to use the Input frequency that is **greater than** the LO or **less than** the LO. To learn more, see the mixer setup dialog box help.

Parameters

- **<ch>**: Any existing channel number. If unspecified, value is set to 1.
- **<n>**: LO stage number. Choose 1 or 2
- **<bool>**: ON (1) - Use the Input that is Greater than the specified LO.
  
  OFF (0) - Use the Input that is Less than the specified LO.

Examples

```
SENS:MIX:LO1:FREQ:ILTI 1
sense2:mixer:lo2:frequency:ilti ON
```

Query Syntax

```
SENSe<ch>:MIXer:LO<n>:FREQuency:ILTI?
```

Return Type: Boolean

Default: OFF

---

**SENSe<ch>:MIXer:LO<n>:FREQuency:MODE <char>**

Applicable Models: All

*(Read-Write)* Sets or returns the LO sweep mode.

Parameters

- **<ch>**: Any existing channel number. If unspecified, value is set to 1.
- **<n>**: LO stage number. Choose 1 or 2
- **<char>**: LO sweep mode. Choose either FIXED or SWEPT

Examples

```
SENS:MIX:LO:FREQ:MODE FIXED
SENSe2:MIXer:LO2:FREQ:MODE swept
```

Query Syntax

```
SENSe<ch>:MIXer:LO<n>:FREQuency:MODE?
```

Return Type: Character

Default: Fixed

---

**SENSe<ch>:MIXer:LO<n>:FREQuency:NUMerator <value>**
Applicable Models: All

(Read-Write) Sets or returns the numerator value of the LO Fractional Multiplier. See Note

Parameters
<ch> Any existing channel number. If unspecified, value is set to 1.
<n> LO stage number. Choose 1 or 2
<value> LO Numerator.

Examples
SENS:MIX:LO:FREQ:NUM 5
SENSe2:MIXer:LO2:FREQ:NUMerat0r 4

Query Syntax
SENS<ch>:MIXer:LO<n>:FREQuency:NUMerator?

Return Type
Numeric

Default
Not Applicable

SENSe<ch>:MIXer:LO<n>:FREQuency:STARt <value>

Applicable Models: All

(Read-Write) Sets or returns the LO start frequency value. See Note

Parameters
<ch> Any existing channel number. If unspecified, value is set to 1.
<n> LO stage number. Choose 1 or 2
<value> LO Start Frequency in Hertz.

Examples
SENS:MIX:LO:FREQ:STAR 5E9

Query Syntax
SENS<ch>:MIXer:LO<n>:FREQuency:STARt?

Return Type
Numeric

Default
Not Applicable

SENSe<ch>:MIXer:LO<n>:FREQuency:STOP <value>
Applicable Models: All

(Read-Write) Sets or returns the LO stop frequency value. See Note

Parameters

- `<ch>` Any existing channel number. If unspecified, value is set to 1.
- `<n>` LO stage number. Choose 1 or 2
- `<value>` LO Stop Frequency in Hertz.

Examples

```
SENS:MIX:LO:FREQ:STOP 5E9
```

Query Syntax

```
SENSe<ch>:MIXer:LO<n>:FREQuency:STOP?
```

Return Type Numeric

Default Not Applicable

---

SENSe<ch>:MIXer:LO<n>:NAME <value>

Applicable Models: All

(Read-Write) Sets or returns the name of the VNA internal source or external source to use as the LO in a converter measurement.

Important Note: This setting is immediately send to the channel configuration. First set and apply mixer frequency settings, then send this command. Otherwise, ‘invalid setting’ errors may occur. See Remotely Specifying a Source Port.

Parameters

- `<ch>` Any existing channel number. If unspecified, value is set to 1.
- `<n>` LO stage number. Choose 1 or 2.
- `<value>` (string) - LO Source name. Use `Source:CAT?` to return a list of valid source ports. An external source must be configured and selected to be valid. Learn more about external source configuration.

Examples

```
SENS:MIX:LO:NAME "MySource"
```

Query Syntax

```
SENSe<ch>:MIXer:LO<n>:NAME?
```

Return Type String

Default "Not Controlled"

---

SENSe<ch>:MIXer:LO<n>:POWer <value>
Applicable Models: All

(Read-Write) Sets or returns the LO Power fixed value.

Parameters

- `<ch>` Any existing channel number. If unspecified, value is set to 1.
- `<n>` LO stage. Choose 1 or 2
- `<value>` LO Power in dBm

Examples

```
SENS:MIX:LO:POW 9
```

Query Syntax

```
SENSe<ch>:MIXer:LO<n>:POWer?
```

Return Type

Numeric

Default

Not Applicable

---

SENSe<ch>:MIXer:LO<n>:POWer:STARt <value>

Applicable Models: All

(Read-Write) For an LO power sweep, sets or returns the LO power start value.

Parameters

- `<ch>` Any existing channel number. If unspecified, value is set to 1.
- `<n>` LO stage. Choose 1
- `<value>` LO start power in dBm

Examples

```
SENS:MIX:LO1:POW:STARt -10
```

Query Syntax

```
SENSe<ch>:MIXer:LO1:POWer:STARt?
```

Return Type

Numeric

Default

- 20 dBm

---

SENSe<ch>:MIXer:LO<n>:POWer:STOP <value>
**Applicable Models:** All

*(Read-Write)* For an LO power sweep, sets or returns the LO power stop value.

**Parameters**

- `<ch>` Any existing channel number. If unspecified, value is set to 1.
- `<n>` LO stage. Choose 1
- `<value>` LO stop power in dBm

**Examples**

```
SENS:MIX:LO1:POW:STOP 10
```

**Query Syntax**

`SENSe<ch>:MIXer:LO1:POWer:STOP?`

**Return Type**

Numeric

**Default**

-10 dBm

---

**SENSe<ch>:MIXer:LOAD <name>**

**Applicable Models:** All

*(Write-only)* Loads a previously-configured mixer attributes file (.mxr)

**Parameters**

- `<ch>` Any existing channel number. If unspecified, value is set to 1.
- `<name>` Path and file name (including .mxr extension) to load.

**Examples**

```
SENSe:MIXer:LOAD "C:\Program Files(x86)\Keysight\Network Analyzer\Documents\Mixer\MyMixer.mxr"
```

**Default**

Not Applicable

---

**SENSe<ch>:MIXer:NORMALize:POINt <value>**
Applicable Models: All

(Read-Write) Sets or returns the data point for normalizing the phase measurement. Learn more.

**Parameters**

- `<ch>` Channel number of the SMC measurement. If unspecified, value is set to 1.
- `<value>` Normalization data point. Choose a data point number between 1 and the max number of data points in the sweep that has the least amount of expected noise.

**Examples**

SEN:$\text{S}:\text{MIX:} \text{NORM:} \text{POIN} \ 101$

sense2:.mixer:normalize:point 50

**Query Syntax**

SEN$\text{S}<\text{ch}>:\text{MIXer:} \text{NORMalize:} \text{POINt}$?

**Return Type** Numeric

**Default** Middle point in the sweep

SEN$\text{S}<\text{ch}>:\text{MIXer:} \text{OUTPut:} \text{FREQuency:} \text{FIXed} \ <\text{value}>$

**Applicable Models:** All

(Read-Write) Sets or returns the output fixed frequency of the mixer. See Note

**Parameters**

- `<ch>` Any existing channel number. If unspecified, value is set to 1.
- `<value>` Output fixed frequency in Hertz.

**Examples**

SEN$\text{S}<\text{ch}>:\text{MIXer:} \text{OUTPut:} \text{FREQuency:} \text{FIX} \ 5e9$

**Query Syntax**

SEN$\text{S}<\text{ch}>:\text{MIXer:} \text{OUTPut:} \text{FREQuency:} \text{FIXed}$?

**Return Type** Numeric

**Default** Not Applicable

SEN$\text{S}<\text{ch}>:\text{MIXer:} \text{OUTPut:} \text{FREQuency:} \text{MODE} \ <\text{char}>$
Applicable Models: All

(Read-Write) Sets or returns the Output sweep mode.

**Parameters**

- `<ch>` Any existing channel number. If unspecified, value is set to 1.
- `<char>` Output sweep mode. Choose either **FIXED** or **SWEPT**

**Examples**

```
SENS:MIX:OUTP:FREQ:MODE FIXED
SENS2:MIXer:OUTput:FREQuency:MODE swept
```

**Query Syntax**

SENS<ch>:MIXer:OUTPut:FREQuency:MODE?

**Return Type** Character

**Default** Fixed

---

SENS<ch>:MIXer:OUTPut:FREQuency:SIDeband <value>

Applicable Models: All

(Read-Write) Specify whether to select the sum (High) or difference (Low) products.

- When one LO is used: Input + or - LO1 = Output frequency
- When two LOs are used: IF1 + or - LO2 = Output frequency

Use **SENS:MIX:IF:FREQ:SID** when two LOs are used to determine the IF1 frequency.

Use **Sens:Mixer:Stage** to set 1 or 2 LOs

See Note

**Parameters**

- `<ch>` Any existing channel number. If unspecified, value is set to 1.
- `<value>` Sideband value. Choose from

  - **LOW** - Low or Difference (-)
  - **HIGH** - High or Sum (+)

**Examples**

```
SENS:MIX:OUTP:FREQ:SID LOW
SENS2:MIXer:OUTput:FREQuency:SIDeband HIGH
```

**Query Syntax**

SENS<ch>:MIXer:OUTPut:FREQuency:SIDeband?

**Return Type** Character
SENSe<ch>:MIXer:OUTPut:FREQuency:STARt <value>

**Applicable Models:** All

*(Read-Write)* Sets or returns the Output start frequency of the mixer. [See Note]

**Parameters**
- `<ch>` Any existing channel number. If unspecified, value is set to 1.
- `<value>` Output start frequency

**Examples**
- `SENSe:MIX:OUTP:FREQ:STAR 1e9`
- `SENSe2:MIXer:OUTPut:FREQ:STARt 1000000000`

**Query Syntax** `SENSe<ch>:MIXer:OUTPut:FREQuency:STARt?`

**Return Type** Numeric

**Default** Not Applicable

SENSe<ch>:MIXer:OUTPut:FREQuency:STOP <value>

**Applicable Models:** All

*(Read-Write)* Sets or returns the Output stop frequency of the mixer. [See Note]

**Parameters**
- `<ch>` Any existing channel number. If unspecified, value is set to 1.
- `<value>` Output stop frequency

**Examples**
- `SENSe:MIX:OUTP:FREQ:STOP 1e9`
- `SENSe2:MIXer:OUTPut:FREQ:STOP 1000000000`

**Query Syntax** `SENSe<ch>:MIXer:OUTPut:FREQuency:STOP?`

**Return Type** Numeric

**Default** Not Applicable

SENSe<ch>:MIXer:PHASe <bool>
Applicable Models: N522xB, N523xB, N524xB

(Read Write) Sets and returns the state of SMC Phase measurements and calibrations. Learn more.

In the User Interface, there are two "enable phase" checkboxes: in the Phase Settings dialog and in the Calibration Wizard. Checking one enables both. This single command also enables both.

Parameters
<ch> Any existing channel number. If unspecified, value is set to 1
<bool> Include Phase measurement state. Choose from
ON or 1 - Include phase in SMC measurements
OFF or 0 - Do NOT include phase in SMC measurements

Examples
SENS:MIX:PHAS 1
sense2:mixer:phase off

Query Syntax
SENS<ch>:MIXer:PHASe?

Return Type
Boolean
Default
0 (OFF)

SENSe<ch>:MIXer:PMap <in>,<out>

Applicable Models: All

(Write-only) Sets the VNA to DUT port map for FCA measurements. Use SENS:MIX:PMAP:INP? and SENS:MIX:PMAP:OUTP? to read these values. Learn about selectable FCA DUT ports.

Changing the ports may limit your ability to use an internal second source. If a selected port is shared by one of the sources, then that source will not be available as an LO source. Learn more about Internal second sources.

Parameters
<ch> Any existing channel number. If unspecified, value is set to 1.
<in> VNA port to connect to the DUT input.

- For SMC, choose any unused VNA port.
- For VMC, set to 1.

<out> VNA port to connect to the DUT output. Choose any unused port for SMC and VMC.
**SENSe<ch>:MIXer:PMAP:INPut?**

**Applicable Models:** All

*(Read-only)* Returns the VNA port that is mapped to the DUT input. Use `SENS:MIX:PMAP` to set this value.

Learn about selectable FCA DUT ports.

**Parameters**

- `<ch>` Any existing channel number. If unspecified, value is set to 1.

**Examples**

<table>
<thead>
<tr>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>SENS:MIX:PMAP?</code></td>
</tr>
<tr>
<td><code>sense2:mixer:pmap?</code></td>
</tr>
</tbody>
</table>

**Default** 1

**SENSe<ch>:MIXer:PMAP:OUTPut?**

**Applicable Models:** All

*(Read-only)* Returns the VNA port that is mapped to the DUT output. Use `SENS:MIX:PMAP` to set this value.

Learn about selectable FCA DUT ports.

**Parameters**

- `<ch>` Any existing channel number. If unspecified, value is set to 1.

**Examples**

<table>
<thead>
<tr>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>SENS:MIX:PMAP?</code></td>
</tr>
<tr>
<td><code>sense2:mixer:pmap:output?</code></td>
</tr>
</tbody>
</table>

**Default** 2

**SENSe<ch>:MIXer:RECalculate**
Applicable Models: All

(Write only) Repeats the last calculation that was performed, including all ON (state) segments in segment table.

**Parameters**
- `<ch>` Any existing channel number. If unspecified, value is set to 1

**Examples**
- **SENS:MIX:REC**

**Query Syntax** Not Applicable

**Default** Not Applicable

---

**SENS<ch>:MIX:REV <bool>**

**Applicable Models:** All

(Read-Write) Sets whether to include SC12 sweeps during measurements.

**Parameters**
- `<ch>` Any existing channel number. If unspecified, value is set to 1.
- `<bool>` (Boolean) Choose from:
  - **ON (1)** - Include the SC12 (reverse) sweep.
  - **OFF (0)** - Do NOT Include the SC12 (reverse) sweep.

**Examples**
- **SENS:MIX:REV 1**
- **sense2:mixer:reverse ON**

**Query Syntax** **SENS<ch>:MIX:REV?**

**Return Type** Boolean

**Default** ON (1)

---

**SENS<ch>:MIX:ROLE:CATalog?** - Superseded
Applicable Models: All

(Read-only) This command is replaced with SENSE:ROLE:CATalog which can be used by all channels.

Returns a list of valid roles for the IMD Converter application.

Parameters

- `<ch>` Any existing channel number. If unspecified, value is set to 1.

Examples

- SENSE:MIX:ROLE:CAT?
- sense2:mixer:role:catalog?

Default Not Applicable

SENSe<ch>:MIXer:ROLE:DEVice <role>,<source> Superseded

Applicable Models: All

(Read-Write) This command is replaced with SENSE:ROLE:DEVice which can be used by all channels.

Assigns a configured external source to the specified role for the converter application.

Parameters

- `<ch>` Any existing channel number. If unspecified, value is set to 1.
- `<role>` (String) Role to which the external source is assigned. Choose from:
  - For IMDX and IMSX, choose from:
    - "RF2"
    - "LO1"
    - "LO2"
  - For all other converter applications, choose from:
    - "LO1"
    - "LO2"
- `<source>` (String) Source name from Source Configuration dialog.

Examples

- SENS:MIX:ROLE:DEV "LO1","LO1Name"
- sense2:mixer:role:device "LO1","LO1Name"

Query Syntax

SENSe<ch>:MIXer:ROLE:DEVice? <source>

Return Type String
**SENSe<ch>:MIXer:SAVE <name>**

**Applicable Models:** All

*(Write-only)* Saves the settings for the mixer/ converter test setup to a mixer attributes file.

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;ch&gt;</td>
<td>Any existing channel number. If unspecified, value is set to 1.</td>
</tr>
<tr>
<td>&lt;name&gt;</td>
<td>Path and file name (including .mxrx extension) to save.</td>
</tr>
</tbody>
</table>

**Examples**

```
SENSe:MIXer:SAVE "C:\Program Files(x86)\Keysight\Network Analyzer\Documents\Mixer\MyMixer.mxr"
```

**Default** Not Applicable

---

**SENSe<ch>:MIXer:STAGe <n>**

**Applicable Models:** All

*(Read-Write)* Number of IF stages (LOs) used in the mixer.  See Note

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;ch&gt;</td>
<td>Any existing channel number. If unspecified, value is set to 1.</td>
</tr>
<tr>
<td>&lt;n&gt;</td>
<td>Number of stages. Choose either 1 or 2</td>
</tr>
</tbody>
</table>

**Examples**

```
SENSe1:MIXer:LO1:FREQ:NUMerator 6
SENSe1:BWID 1000
SENSe1:MIXer:SEGment1:ADD 165
'New segments will reset stage to single stage mode. Therefore, always add dual stage setting after adding segments
SENSe1:MIXer:STAGE 2
```

**Query Syntax**  SENSe<ch>:MIXer:STAGe?

**Return Type**  Numeric

**Default**  1

---

**SENSe<ch>:MIXer:XAXis <char>**
Applicable Models: All

(Read-Write) Sets or returns the swept frequency range to display on the X-axis for the IMDx or NFx channel.

For FCA and GCX measurements, use \texttt{CALC:MEAS:MIXer:XAXis}

**Parameters**

- \texttt{<ch> Channel number of the IMDx or NFx Converter measurement. If unspecified, value is set to 1.}
- \texttt{<char> Frequency range to display on the X-Axis. NOT case-sensitive. Choose from:}
  - \texttt{INPUT} - Input frequency range
  - \texttt{LO\_1} - LO frequency range
  - \texttt{LO\_2} - LO 2 frequency range
  - \texttt{OUTPUT} - Output frequency range

If the specified frequency range is not swept, the default swept range is used.

**Examples**

\begin{verbatim}
SENSe:MIXer:XAXis INPUT
sense2:mixer:xaxis LO_1
\end{verbatim}

**Return Type** Character

**Default** Search is made in the following order until a swept range is found:

1. OUTPUT
2. INPUT (If the OUTPUT is fixed)
3. Number of Points (If ALL ranges are fixed)
Sense:Mixer:ELO Commands

Click on a keyword to view the command details.

Note: The Find Now feature on the Embedded LO dialog is performed remotely by doing a 'Single Sweep' with ELO enabled.
See example program.

- Example Programs
- Learn about Embedded LO Settings
- Synchronizing the Analyzer and Controller
- SCPI Command Tree

**Note:** The Embedded LO **DIAGnostic** commands read data from the various broadband and precise tuning sweeps, similar to the textual and graphical data that are available in the user interface.

---

**SENSe<ch>:MIXer:ELO:LO:DELTa <num>**

**Applicable Models:** N522xB, N524xB

*(Read-Write)* Sets and returns LO Frequency Delta. There is usually no need to set this value. Read this value to determine the difference between the LO Frequency that is stated in the Mixer dialog box and the last measured LO Frequency.

**Parameters**

- `<ch>` Any existing channel number. If unspecified, value is set to 1
- `<num>` LO Frequency delta in Hertz.

**Examples**

```plaintext
SENS:MIX:ELO:LO:DELTa 10.3
```

**Query Syntax**

`SENSe<ch>:MIXer:ELO:LO:DELTa?`

**Return Type**

Numeric

**Default**

Not Applicable

---

**SENSe<ch>:MIXer:ELO:LO:RESet**
Applicable Models: N522xB, N524xB

(Write-only) Resets the LO Delta Frequency to 0 (zero).

Parameters

<ch>  Any existing channel number. If unspecified, value is set to 1

Examples

SENS:MIX:ELO:LO:RES
sense2:mixer:elo:lo:reset

Query Syntax  Not Applicable

Default  Not Applicable

SENSe<ch>:MIXer:ELO:NORMalize:POINt <num>

Applicable Models: N522xB, N524xB

(Read-Write) Sets and returns the sweep data point around which to perform broadband and precise tuning.

Parameters

<ch>  Any existing channel number. If unspecified, value is set to 1

<num>  Mixer Sweep data point. Choose a data point number, between 1 and the max number of data points in the sweep, that has the least amount of expected noise.

Examples

SENS:MIX:ELO:LO:NORM:POIN 200
sense2:mixer:elo:normalize:point 101

Query Syntax  SENSe<ch>:MIXer:ELO:NORMalize:POINt?

Return Type  Numeric

Default  Center point in the sweep span

SENSe<ch>:MIXer:ELO:RESet
Applicable Models: N522xB, N524xB

(Write-only) Resets the LO Frequency Delta and Tuning parameters to their default settings.

**Parameters**

- **<ch>** Any existing channel number. If unspecified, value is set to 1

**Examples**

```plaintext
SENS:MIX:ELO:RES
sense2:mixer:elo:reset
```

**Query Syntax**

- Not Applicable

**Default**

- Not Applicable

SENSe<ch>:MIXer:ELO:STATe <bool>

**Applicable Models:** N522xB, N524xB

(Read-Write) Sets and returns the ON |OFF state of Embedded LO.

**Parameters**

- **<ch>** Any existing channel number. If unspecified, value is set to 1
- **<bool>** ON | OFF state. Choose from
  - 0 - Embedded LO OFF
  - 1 - Embedded LO ON

**Examples**

```plaintext
SENS:MIX:ELO:STAT 1
sense2:mixer:elo:state 0
```

**Query Syntax**

- SENSe<ch>:MIXer:ELO:STATe?

**Return Type**

- Boolean

**Default**

- OFF

SENSe<ch>:MIXer:ELO:TUNing:IFBW <num>
Applicable Models: N522xB, N524xB

(Read-Write) Sets and returns the IF Bandwidth for Broadband and Precise tuning sweeps.

Parameters

- `<ch>`  Any existing channel number. If unspecified, value is set to 1
- `<num>`  IF Bandwidth

Examples

```
SENS:MIX:ELO:TUN:IFBW 10kHz
sense2:mixer:elo:tuning:ifbw 20e3
```

Query Syntax

SENSe<ch>:MIXer:ELO:TUNing:IFBW?

Return Type  Numeric

Default  30kHz

SENSe<ch>:MIXer:ELO:TUNing:INTerval <num>

Applicable Models: N522xB, N524xB

(Read-Write) Sets and returns how often a tuning sweep is performed.

Parameters

- `<ch>`  Any existing channel number. If unspecified, value is set to 1
- `<num>`  Tuning sweep interval

Examples

```
SENS:MIX:ELO:TUN:INT 2
sense2:mixer:elo:tuning:interval 1
```

Query Syntax

SENSe<ch>:MIXer:ELO:TUNing:INTerval?

Return Type  Numeric

Default  1

SENSe<ch>:MIXer:ELO:TUNing:ITERations <num>
Applicable Models: N522xB, N524xB

(Read-Write) Sets and returns the maximum number of tuning iterations to achieve the precise tolerance.

**Parameters**

<ch> Any existing channel number. If unspecified, value is set to 1

<num> Number of tuning iterations. Choose a number between 1 and 100.

**Examples**

```
SENS:MIX:ELO:TUN:ITER 5
sense2:mixer:elo:tuning:iterations 3
```

**Query Syntax**

```
SENSe<ch>:MIXer:ELO:TUNing:ITERations?
```

**Return Type** Numeric

**Default** 5

---

SENSe<ch>:MIXer:ELO:TUNing:MODE <char>

Applicable Models: N522xB, N524xB

(Read-Write) Sets and returns the method used to determine the embedded LO Frequency.

**Parameters**

<ch> Any existing channel number. If unspecified, value is set to 1

<char> Tuning mode. Choose from:

- **BROADband** Both broadband and precise tuning
- **PRECise** Precise tuning only
- **NONE** No tuning; just apply the LO Frequency Delta value.

**Examples**

```
SENS:MIX:ELO:TUN:MODE BRO
sense2:mixer:elo:tuning:mode precise
```

**Query Syntax**

```
SENSe<ch>:MIXer:ELO:TUNing:MODE?
```

**Return Type** Character

**Default** BROadband

---

SENSe<ch>:MIXer:ELO:TUNing:NBW <num>
Applicable Models: N522xB, N524xB

(Read-Write) Sets and returns the Noise Bandwidth for Broadband and Precise tuning sweeps.

**Parameters**

- `<ch>` Any existing channel number. If unspecified, value is set to 1
- `<num>` Noise Bandwidth

**Examples**

- `SENS:MIX:ELO:TUN:NBW 3.2kHz`
- `sense2:mixer:elo:tuning:nbw 3.2e3`

**Query Syntax**

SENSe<ch>:MIXer:ELO:TUNing:NBW?

**Return Type**

Numeric

**Default**

3.2 kHz

---

SENSe<ch>:MIXer:ELO:TUNing:RESet

Applicable Models: N522xB, N524xB

(Write-only) Resets the tuning parameters to their default values.

**Parameters**

- `<ch>` Any existing channel number. If unspecified, value is set to 1

**Examples**

- `SENS:MIX:ELO:TUN:RES`
- `sense2:mixer:elo:tuning:reset`

**Query Syntax**

Not Applicable

**Default**

Not Applicable

---

SENSe<ch>:MIXer:ELO:TUNing:SPAN <num>
Applicable Models: N522xB, N524xB

(Read-Write) Sets and returns the frequency span for the broadband tuning sweep.

**Parameters**

- `<ch>` Any existing channel number. If unspecified, value is set to 1
- `<num>` Broadband frequency span in Hz.

**Examples**

- SENS:MIX:ELO:TUN:SPAN 1e6
- sense2:mixer:elo:tuning:span 1mhz

**Query Syntax**

SENSe<ch>:MIXer:ELO:TUNing:SPAN?

**Return Type**

Numeric

Default: 3 MHz

SENSe<ch>:MIXer:ELO:TUNing:TOLerance <num>

Applicable Models: N522xB, N524xB

(Read-Write) Sets and returns the tuning tolerance for precise tuning.

**Parameters**

- `<ch>` Any existing channel number. If unspecified, value is set to 1
- `<num>` Tuning tolerance in Hz. Choose a number between .001 and 1e3.

**Examples**

- SENS:MIX:ELO:TUN:TOL .5
- sense2:mixer:elo:tuning:tolerance 1

**Query Syntax**

SENSe<ch>:MIXer:ELO:TUNing:TOLerance?

**Return Type**

Numeric

Default: 1 Hz

SENSe<ch>:MIXer:ELO:DIAGnostic:CLEar
Applicable Models: N522xB, N524xB

(Write-only) Clears current diagnostic information.

**Parameters**

- `<ch>` Any existing channel number. If unspecified, value is set to 1

**Examples**

<table>
<thead>
<tr>
<th>Syntax</th>
</tr>
</thead>
<tbody>
<tr>
<td>SENS:MIX:ELO:DIAG:CLEar</td>
</tr>
<tr>
<td>sense2:mixer:elo:diagnostic:clear</td>
</tr>
</tbody>
</table>

**Query Syntax** Not Applicable

**Default** Not Applicable

SENSe<ch>:MIXer:ELO:DIAGnostic:STATus?

Applicable Models: N522xB, N524xB

(Read-only) Returns a string that describes the result of the last tuning sweeps.

**Parameters**

- `<ch>` Any existing channel number. If unspecified, value is set to 1

**Examples**

<table>
<thead>
<tr>
<th>Syntax</th>
</tr>
</thead>
<tbody>
<tr>
<td>SENS:MIX:ELO:DIAG:STAT?</td>
</tr>
<tr>
<td>sense2:mixer:elo:diagnostic:status</td>
</tr>
</tbody>
</table>

**Return Type** String

**Default** Not Applicable

SENSe<ch>:MIXer:ELO:DIAGnostic:SWEep:COUNt?

Applicable Models: N522xB, N524xB

(Read-only) Returns the number of tuning sweeps used for the latest embedded LO measurement.

**Parameters**

- `<ch>` Any existing channel number. If unspecified, value is set to 1

**Examples**

<table>
<thead>
<tr>
<th>Syntax</th>
</tr>
</thead>
<tbody>
<tr>
<td>SENS:MIX:ELO:DIAG:SWEep:COUNt</td>
</tr>
<tr>
<td>sense2:mixer:elo:diagnostic:sweep:count?</td>
</tr>
</tbody>
</table>

**Return Type** Numeric

**Default** Not Applicable
SENSe<ch>:MIXer:ELO:DIAGnostic:SWEep<n>:LO:DELTa?

Applicable Models: N522xB, N524xB

(Read-only) Returns the LO frequency delta from the specified tuning sweep.

Parameters

<ch>  Any existing channel number. If unspecified, value is set to 1

<n>  Tuning sweep number. Use SENS:MIX:ELO:DIAG:SWE:COUNT? to find the number of sweeps taken.

Examples

SENSe:MIX:ELO:DIAG:SWEep2:LO:DELTa?
sense2:mixer:elo:diagnostic:sweep1:lo:delta?

Return Type  Numeric

Default  Not Applicable

SENSe<ch>:MIXer:ELO:DIAGnostic:SWEep<n>:MARKer:ANNotation?

Applicable Models: N522xB, N524xB

(Read-only) Returns the Y-axis marker value from the specified tuning sweep. This command assumes that a marker was used. Use SENS:MIX:ELO:DIAG:SWE:MARK:STATE? to confirm if a marker was used for the tuning sweep.

Parameters

<ch>  Any existing channel number. If unspecified, value is set to 1

<n>  Tuning sweep number. Use SENS:MIX:ELO:DIAG:SWE:COUNT? to find the number of sweeps taken.

Examples

SENSe:MIX:ELO:DIAG:SWEep2:MARKer:ANN?

Return Type  Numeric

Default  Not Applicable

SENSe<ch>:MIXer:ELO:DIAGnostic:SWEep<n>:MARKer:POSition?
Applicable Models: N522xB, N524xB

(Read-only) Returns the X-axis marker position from the specified tuning sweep.

Parameters

- `<ch>`: Any existing channel number. If unspecified, value is set to 1
- `<n>`: Tuning sweep number. Use SENS:MIX:ELO:DIAG:SWE:COUNt? to find the number of sweeps taken.

Examples

Return Type: Numeric

Default: Not Applicable

SENSe<ch>:MIXer:ELO:DIAGnostic:SWEep<n>:MARKer:STATE?

Applicable Models: N522xB, N524xB

(Read-only) Returns whether or not a marker was used for the specified tuning sweep.

Parameters

- `<ch>`: Any existing channel number. If unspecified, value is set to 1
- `<n>`: Tuning sweep number. Use SENS:MIX:ELO:DIAG:SWE:COUNt? to find the number of sweeps taken.

Examples

Return Type: Numeric

Default: Not Applicable

SENSe<ch>:MIXer:ELO:DIAGnostic:SWEep<n>:PARameter?
Applicable Models: N522xB, N524xB

(Read-only) Returns the name of the parameter of the specified tuning sweep.

Parameters

- `<ch>` Any existing channel number. If unspecified, value is set to 1
- `<n>` Tuning sweep number. Use SENS:MIX:ELO:DIAG:SWE:COUN? to find the number of sweeps taken.

Examples

```
SENS:MIX:ELO:DIAG:SWE2:PAR?
sense2:mixer:elo:diagnostic:sweep1:parameter?
```

Return Type String - either "VC21" or "B,1"

Default Not Applicable

---

SENSe<ch>:MIXer:ELO:DIAGnostic:SWEep<n>:TITL?

Applicable Models: N522xB, N524xB

(Read-only) Returns the title of the specified tuning sweep.

Parameters

- `<ch>` Any existing channel number. If unspecified, value is set to 1
- `<n>` Tuning sweep number. Use SENS:MIX:ELO:DIAG:SWE:COUN? to find the number of sweeps taken.

Examples

```
SENS:MIX:ELO:DIAG:SWE2:TITL?
sense2:mixer:elo:diagnostic:sweep1:title?
```

Return Type String

Default Not Applicable

---

SENSe<ch>:MIXer:ELO:DIAGnostic:SWEep<n>:X:ANNotation?
Applicable Models: N522xB, N524xB

(Read-only) Returns the X-Axis annotation of the specified tuning sweep.

**Parameters**

- `<ch>` Any existing channel number. If unspecified, value is set to 1
- `<n>` Tuning sweep number. Use `SENS:MIX:ELO:DIAG:SWE:COUNT?` to find the number of sweeps taken.

**Examples**

```
sense2:mixer:elo:diagnostic:sweep1:x:annotation?
```

**Return Type** String - either "Hz" or "s"

**Default** Not Applicable

---

`SENSe<ch>:MIXer:ELO:DIAGnostic:SWEep<n>:X:STARt?`

Applicable Models: N522xB, N524xB

(Read-only) Returns the start value of the specified tuning sweep.

**Parameters**

- `<ch>` Any existing channel number. If unspecified, value is set to 1
- `<n>` Tuning sweep number. Use `SENS:MIX:ELO:DIAG:SWE:COUNT?` to find the number of sweeps taken.

**Examples**

```
sense2:mixer:elo:diagnostic:sweep1:x:start?
```

**Return Type** Numeric

**Default** Not Applicable

---

`SENSe<ch>:MIXer:ELO:DIAGnostic:SWEep<n>:X:STOP?`
### Applicable Models:
N522xB, N524xB

(Read-only) Returns the stop value of the specified tuning sweep.

**Parameters**

- `<ch>`: Any existing channel number. If unspecified, value is set to 1
- `<n>`: Tuning sweep number. Use `SENS:MIX:ELO:DIAG:SWE:COUN?` to find the number of sweeps taken.

**Examples**

<table>
<thead>
<tr>
<th>Command</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>SENS:MIX:ELO:DIAG:SWE2:X:STOP?</code></td>
</tr>
<tr>
<td><code>sense2:mixer:elo:diagnostic:sweep1:x:stop?</code></td>
</tr>
</tbody>
</table>

**Return Type**

- Numeric
- **Default**: Not Applicable

---

### Applicable Models:
N522xB, N524xB

(Read-only) Returns Y-axis annotation value of the specified tuning sweep.

**Parameters**

- `<ch>`: Any existing channel number. If unspecified, value is set to 1
- `<n>`: Tuning sweep number. Use `SENS:MIX:ELO:DIAG:SWE:COUN?` to find the number of sweeps taken.

**Examples**

<table>
<thead>
<tr>
<th>Command</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>sense2:mixer:elo:diagnostic:sweep1:y:annotation?</code></td>
</tr>
</tbody>
</table>

**Return Type**

- String - either "U" or "Phase"
- **Default**: Not Applicable

---

---

**SENSe:MULTiplexer<id>:ADDResS <address>**

**Applicable Models:** N522xB, N523xB, N524xB, E5080A

*(Read-Write)* Sets and returns the address for the external test set at the specified ID. This command should be immediately preceded by the SENSe:MULT:TYPE command.

**Note:** This command is not applicable to the E509xA USB test sets, on which the address is set by DIP switches on the rear panel.

**Parameters**

- `<id>`  
  Id of the external test set. If unspecified, Id is assumed to be 1. Must be previously set by the SENSe:MULT:TYPE command.

- `<address>`  
  Integer  
  The test set address.

- For a GPIB test set (N44xx and some specials), this is the GPIB address.

- For a test set I/O test set (some specials), it is the position of the test set in the chain (starting at 0).

**Examples**

```
SENS:MULT1:TYPE "Z5623A_K66"  ' use K66 test set, and reference it through ID 1
SENS:MULT1:ADDR 0  ' first test set in sequence
' All subsequent commands using SENS:MULT1 will refer to this test set
```

**Query Syntax**  
SENSe:MULTiplexer<id>:ADDResS?

**Return Type**  
Numeric

**Default**  
Not Applicable
SENSe<cnum>:MULTiplexer<id>:ALLPorts <string>

**Applicable Models:** N522xB, N523xB, N524xB, E5080A

*(Read-Write)* Sets or gets the port selections for all available ports on the specified channel.

**Parameters**

- `<cnum>`: Any existing channel number. If unspecified, value is set to 1.
- `<id>`: Id of the external test set. If unspecified, Id is assumed to be 1. Must be previously set by the SENSe:MULT:TYPE command.
- `<string>`: Comma-separated list of port selections, one for each port. Each port selection must correspond to one of the values returned by SENSe:MULT:PORT:CAT?.

Do NOT include + and -.  

**Examples**

```plaintext
' for channel 5 and test set 1, set port 1 to T1,
' port 2 to A, port 3 to R2+, port 4 to R3-.
SENS5:MULT1:ALLP "T1,A,R2,R3 "
```

**Query Syntax** SENSe<cnum>:MULTiplexer<id>:ALLPorts?

**Return Type** STRING

**Default** Not Applicable

---

SENSe:MULTiplexer<id>:CATalog?

**Applicable Models:** N522xB, N523xB, N524xB, E5080A

*(Read-Only)* Returns a comma-separated list of the external test sets models that are currently supported. Choose one of these items to send SENSe:MULT1:TYPE.

**Examples** SENSe:MULT:CAT?

**Return Type** String

**Default** Not Applicable

---

SENSe:MULTiplexer<id>:COUNt?
Applicable Models: N522xB, N523xB, N524xB, E5080A

(Read-Only) Returns the total number of ports of the specified test set.

Returns 0 if no test set is connected (GPIB test sets only).

**Parameters**

- `<id>`  
  Id of the external test set. If unspecified, Id is assumed to be 1. Must be previously set by the SENSe:MULT:TYPE command.

**Examples**

- `SENS:MULT1:COUN?`
- `sense:multiplexer2:count?`

**Return Type**  
Numeric

**Default**  
Not Applicable

---

SENSe:MULTiplexer<id>:DISPlay[:STATe] <bool>

**Applicable Models:** N522xB, N523xB, N524xB, E5080B, M980xA

(Red-Write) Turns ON and OFF the display of the test set control status bar. This status bar indicates the test set that is being controlled and the current port mappings of the active channel.

**Note:** To use this command with the M980xA PXI VNA, the firmware version must be A.15.xx.xx and above, and the S94702A AMX VNA Plugin license is required. This command is effective only in the standard class.

**Parameters**

- `<id>`  
  Id of the external test set. If unspecified, Id is assumed to be 1.

- `<bool>`  
  
  ON (1) Turns ON when in multiport mode.

  OFF (0) Turns OFF when not in multiport mode.

**Examples**

- `SENS:MULT1:DISP 1`
- `sense:multiplexer2:display:state on`

**Query Syntax**  
SENSe:MULTiplexer<id>:DISPlay[:STATe]?

**Return Type**  
Boolean

**Default**  
OFF (0)

---

SENSe:MULTiplexer<id>:INCount?
Applicable Models: N522xB, N523xB, N524xB, E5080B, M980xA

(Read-Only) Returns the number of test set input ports (VNA connection ports).

Note: To use this command with the M980xA PXI VNA, the firmware version must be A.15.xx.xx and above, and the S94702A AMX VNA Plugin license is required.

Parameters

- `<id>`: Id of the external test set. If unspecified, Id is assumed to be 1.

Examples

```
SENS3:MULT1:INC?  ' returns the number of input ports for test set 1 on channel 3
```

Return Type: Numeric

Default: Not Applicable

SENSe<cnum>:MULTiplexer:LABel <string>

Applicable Models: N522xB, N523xB, N524xB, E5080A

(Read-Write) Sets and returns the display label for the testset on the specified channel. The label appears in a status bar at the bottom of the VNA display when SENS:MULT:DISP is set to ON.

Note: This command does not apply to the use of the E509xA test sets.

Parameters

- `<cnum>`: Any existing channel number. If unspecified, value is set to 1.
- `<string>`: Display label text.

Examples

```
SENS3:MULT:LAB 'High-power output'
```

Query Syntax

SENSe<cnum>:MULTiplexer:LABel?

Return Type: String

Default: Not Applicable

SENSe<cnum>:MULTiplexer<id>:OUTPut:<grp>[[:DATA]] <num>
**Applicable Models:** N522xB, N523xB, N524xB, E5080B, M980xA

*(Read-Write)* Sets or returns the output port data for specified group of the E5092A's control lines. The output port data is set at the beginning of each sweep of the specified channel.

**Note:** To use this command with the M980xA PXI VNA, the firmware version must be A.15.xx.xx and above, and the S94702A AMX VNA Plugin license is required. This command can be used only in the standard class.

**Parameters**

- `<cnum>`: Any existing channel number. If unspecified, value is set to 1.
- `<id>`: Id of the external test set either 1 or 2. If unspecified, Id is assumed to be 1.
- `<grp>`: A | B | C | D
- `<num>`: An integer specifying the decimal value of the control line. Values are obtained by adding weights from the following table that correspond to individual lines.

The output port data range is between 0 to 255 (0=All lines are turned OFF and 255 all lines are turned ON).

<table>
<thead>
<tr>
<th>Line</th>
<th>Weight</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>1</td>
</tr>
<tr>
<td>2</td>
<td>2</td>
</tr>
<tr>
<td>3</td>
<td>4</td>
</tr>
<tr>
<td>4</td>
<td>8</td>
</tr>
<tr>
<td>5</td>
<td>16</td>
</tr>
<tr>
<td>6</td>
<td>32</td>
</tr>
<tr>
<td>7</td>
<td>64</td>
</tr>
<tr>
<td>8</td>
<td>128</td>
</tr>
</tbody>
</table>

**Examples**

- `SENS:MULT1:STAT ON`
- `SENS3:MULT1:OUTP:B 8`
  ' let the control line B output the data 8 at the beginning of channel-3 sweep.

**Query Syntax**

```
SENSe<cnum>:MULTiplexer<id>:OUTPut<grp>[:DATa]?
```

**Return Type**

Numeric

**Default**

0
SENSe<cnum>:MULTiplexer<id>:OUTPut<grp>:VOLTage[:DATA] <volt>

Applicable Models: N522xB, N523xB, N524xB, E5080B, M980xA

*(Read-Write)* Sets or returns the output voltage for specified group of the E5092A's control lines. The output voltage is set at the beginning of each sweep of the specified channel.

**Note:** To use this command with the M980xA PXI VNA, the firmware version must be A.15.xx.xx and above, and the S94702A AMX VNA Plugin license is required. This command is effective only in the standard class.

**Parameters**

- `<cnum>` Any existing channel number. If unspecified, value is set to 1.
- `<id>` Id of the external test set either 1 or 2. If unspecified, Id is assumed to be 1.
- `<grp>` A | B | C | D
- `<volt>` Output voltage range for <grp> is between 0 to 5.2V and resolution is 10mV.

**Examples**

```
SENSe:MULT1:STAT ON
SENSe:MULT3:OUTP:B:VOLT 4.2
'Set the control line B voltage to 4.2 V at the beginning of channel-3 sweep.
```

**Query Syntax**

SENSe<cnum>:MULTiplexer<id>:OUTPut<grp>:VOLTage[:DATa]?

**Return Type** Numeric

**Default** 0 V

---

SENSe<cnum>:MULTiplexer<id>:OUTPut[:DATa] <num>

Applicable Models: N522xB, N523xB, N524xB, E5080B, M980xA

*(Read-Write)* Sets or returns the control line value for the specified channel. The output port data is set at the beginning of each sweep of the specified channel. If this command is used when the test set is the E5092A, it reads/writes data just for "group A" of the test set's output lines.

**Note:** To use this command with the M980xA PXI VNA, the firmware version must be A.15.xx.xx and above, and the S94702A AMX VNA Plugin license is required. This command is effective only in the standard class.

**Parameters**

- `<cnum>` Any existing channel number. If unspecified, value is set to 1.
- `<id>` Id of the external test set. If unspecified, Id is assumed to be 1.
- `<numr>` An integer specifying the decimal value of the control line. Values are obtained
by adding weights from the following table that correspond to individual lines.

<table>
<thead>
<tr>
<th>Line</th>
<th>Weight</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>1</td>
</tr>
<tr>
<td>2</td>
<td>2</td>
</tr>
<tr>
<td>3</td>
<td>4</td>
</tr>
<tr>
<td>4</td>
<td>8</td>
</tr>
<tr>
<td>5</td>
<td>16</td>
</tr>
<tr>
<td>6</td>
<td>32</td>
</tr>
<tr>
<td>7</td>
<td>64</td>
</tr>
<tr>
<td>8</td>
<td>128</td>
</tr>
</tbody>
</table>

Note:
- The E5092A interprets SENS:MULT1:OUTP 0 as all lines OFF.

Refer to your test set documentation for setting control line values.

Examples

SENS:MULT1:STAT ON
SENS3:MULT1:OUTP 48
' let the control line output the data 48 at the beginning of channel-3 sweep.

Query Syntax
SENSe<cnum>:MULTiplexer<id>:OUTPut[:DATa]?

Return Type Numeric

Default Not Applicable

SENSe:MULTiplexer<id>:PORT<pnum>:CATalog?
Applicable Models: N522xB, N523xB, N524xB, E5080B, M980xA

(Read-Only) Returns a comma-separated list of valid measurement port selections for the specified VNA connection port.

**Note:** To use this command with the M980xA PXI VNA, the firmware version must be A.15.xx.xx and above, and the S94702A AMX VNA Plugin license is required.

**Parameters**

- `<id>`: Id of the external test set. If unspecified, Id is assumed to be 1.
- `<pnum>`: The VNA connection port number (1 to 4) for which to return the valid test set measurement port selections.

If the E5092A’s configuration is E5092_28, this parameter specifies the individual switch number (1 to 4: SP4T switches, 5 to 10: SPDT switches).

**Examples**

```
SENS:MULT1:PORT3:CAT?   ' returns the valid port selections for port 3
```

**Return Type**

String

**Default**

Not Applicable

---

**SENSe<cnum>:MULTiplexer<id>:PORT<pnum>:SESelect <string>**

Applicable Models: N522xB, N523xB, N524xB, E5080B, M980xA

(Write-Only) Sets a port mapping for a single port. The test set RF measurement path is switched at the specified channel. If this command creates a conflict with an existing port, the VNA will resolve the conflict.

**Note:** To use this command with the M980xA PXI VNA, the firmware version must be A.15.xx.xx and above, and the S94702A AMX VNA Plugin license is required. This command is effective only in the standard class.

**Parameters**

- `<cnum>`: Channel number of the measurement. If unspecified, value is set to 1.
- `<id>`: Id of the external test set. If unspecified, Id is assumed to be 1.
- `<pnum>`: The VNA connection port number (1 to 4).

  If the E5092A’s configuration is E5092_28, this parameter specifies the individual switch number (1 to 4: SP4T switches, 5 to 10: SPDT switches).

- `<string>`: The label of the E5092A’s measurement port.

  If the E5092A’s configuration is E5092_28, this parameter specifies the label of individual switch number.
### Labels of E5092A’s measurement ports in E5092_13 / 16 / 22 / X10 modes

### Examples

```plaintext
SENS1:STAT ON
SENS1:MULT1:TYP 'E5092_22'
SENS1:MULT1:PORT1:SEL 'A2'
' set E5092A to 22-port config and let port-1 be connected to 'A2' at the beginning of channel-1 sweep.
```
SENSe:MULTiplexer<id>:STATe <bool>

**Applicable Models:** N522xB, N523xB, N524xB, E5080B, M980xA

*(Read-Write)* Enables and disables (ON/OFF) the port mapping and control line output of the specified test set. Turning this state on will let the E5092A’s paths be switched at the beginning of the sweep for the channel specified by `<cnum>` of `SENS<cnum>:MULT<id>:PORT<pnum>:SEL <string>.

If the specified test set is not connected or not ON, then setting State ON will report an error. All other properties can be set when the test set is not connected.

When this command is set to ON, then the display of the test set status bar (SENS:MULT:DISP) is also set to ON.

**Note:** To use this command with the M980xA PXI VNA, the firmware version must be A.15.xx.xx and above, and the S94702A AMX VNA Plugin license is required.
This command is effective only in the standard class.

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;id&gt;</td>
<td>Id of the external test set. If unspecified, Id is assumed to be 1.</td>

<td>ON(1) Enables test set control. OFF (0) Disables test set control.</td>
</tr>
</tbody>
</table>

**Examples**

- `SENS:MULT1:STAT 1`
- `sense2:multiplexer2:state on`

**Query Syntax**

`SENSe<cnum>:MULTiplexer<id>:STATe?`

**Return Type**

Boolean

**Default**

OFF (0)

---

`SENSe<cnum>:MULTiplexer<id>:TSET9:OUTPut[:DATA] <data>` Superseded

**Applicable Models:** N522xB, N523xB, N524xB, E5080A

**Note:** This command is replaced with SENS:MULT:OUTP

**(Read-Write)** Sets the control lines of the specified E5091A. Control lines, provided through a E5091A front panel connector, are used to control external equipment such as a part handler. See your E5091A documentation to learn more about control lines.

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>

**SENSe<cnum>:MULTiplexer<id>:TSET9:PORT1 <char> Superseded**

**Applicable Models:** N522xB, N523xB, N524xB, E5080A

**Note:** This command is replaced with SENS:MULT:ALLPorts which sets ALL ports to the specified outputs.

**(Read-Write)** Switches Port 1 of the specified E5091A to one of the available outputs.

**Parameters**

- `<cnum>` Any existing channel number; if unspecified, value is set to 1.
- `<id>` Id of the E5091A test set. Choose from 1 or 2. Learn how to set ID value.
- `<char>` Output port to be switched to. Choose from:
  - A

**Examples**

```
SENS:MULT1:TSET9:PORT1 A
```

**Query Syntax**

```
SEnSe<cnum>:MULTiplexer<id>:TSET9:PORT1?
```

**Return Type**

Character

**Default**

A

**SENSe<cnum>:MULTiplexer<id>:TSET9:PORT2 <char> Superseded**

---

4468
**Applicable Models:** N522xB, N523xB, N524xB, E5080A

**Note:** This command is replaced with SENS: MULT: ALLPorts which sets ALL ports to the specified outputs.

*(Read-Write)* Switches Port 2 of the specified E5091A to one of the available outputs.

**Parameters**
- `<cnum>`: Any existing channel number; if unspecified, value is set to 1.
- `<id>`: Id of the E5091A test set. Choose from 1 or 2. Learn how to set ID value.
- `<char>`: Output port to be switched to. Choose from:
  - **T1**: If Port 1 already is connected to T1, then Port 1 will be switched to A.
  - **T2**

**Examples**
```
SENS: MULT1: TSET9: PORT2 T2
```

**Query Syntax**
```
SENSe<cnum>: MULTiplexer<id>: TSET9: PORT2?
```

**Return Type**
Character

**Default**
T1

---

**SENSe<cnum>: MULTiplexer<id>: TSET9: PORT3 <char> Superseded**

**Applicable Models:** N522xB, N523xB, N524xB, E5080A

**Note:** This command is replaced with SENS: MULT: ALLPorts which sets ALL ports to the specified outputs.

*(Read-Write)* Switches Port 3 of the specified E5091A to one of the available outputs.

**Parameters**
- `<cnum>`: Any existing channel number; if unspecified, value is set to 1.
- `<id>`: Id of the E5091A test set. Choose from 1 or 2. Learn how to set ID value.
- `<char>`: Output port to be switched to. Choose from:
  - **R1** (R1+)
  - **R2** (R2+)
  - **R3** (R3+) If option 007 (7port), R2 is selected.

**Examples**
```
SENS: MULT1: TSET9: PORT3 R2
```
SENSe<cnum>:MULTiplexer<id>:TSET9:PORT4 <char> **Superseded**

**Applicable Models:** N522xB, N523xB, N524xB, E5080A

**Note:** This command is replaced with SENS:MULT:ALLPorts which sets ALL ports to the specified outputs.

**Parameters**
- `<cnum>`: Any existing channel number; if unspecified, value is set to 1.
- `<id>`: Id of the E5091A test set. Choose from 1 or 2. Learn how to set ID value.
- `<char>`: Output port to be switched to. Choose from:
  - **R1** (R1-)
  - **R2** (R2-)
  - **R3** (R3-) If option 007 (7port), R2 is selected.

**Examples**

```
SENSe:MULT1:TSET9:PORT4 R2
```

**Query Syntax**

SENSe<cnum>:MULTiplexer<id>:TSET9:PORT4?  
**Return Type** Character  
**Default** R1

---

**SENSe:.MULTiplexer<id>:TYPE <name>**
Applicable Models: N522xB, N523xB, N524xB, E5080B, M980xA

(Read-Write) Specifies the configuration of the E5092A test set.

Note: To use this command with the M980xA PXI VNA, the firmware version must be A.15.xx.xx and above, and the S94702A AMX VNA Plugin license is required.

Parameters

- `<name>` String  The name of the type of test set. Must be one of the items in the list returned by the SENSe:MULT:CATalog? query – E5092_13, E5092_16, E5092_22, E5092_28, E5092_X10
- `<id>` Id of the external test set. Set by this command. Use consecutive values starting at 1.

Examples

```
SENS:_MULT1:TYPE 'E5092_22' ' set E5092A to 22-port config.
```

Query Syntax

`SENSe:MULTiplexer<id>:TYPe?`

Return Type

String

Default

Not Applicable
Controls the Noise Figure / NFX configuration and calibration.

**Other Noise Figure SCPI commands**

The calibration commands listed in this topic are supplemental to the Guided Cal commands.

- **CALCulate:MEASure:DEFine** - creates a noise figure measurement.
- **CONTroll:NOISe:SOURce** or **OUTPut:MANual:NOISe[:STATE]** - turns the Noise Source ON and OFF.
- **SENSe:PATH:CONF:ELEMent[:STATE]** - sets the port 1 and port 2 noise switches.
- **SENS:CORR:ENR:CAL**: manage ENR data - usually not necessary.
- **SYST:PREF:ITEM:SWIT:DEF**: Sets the default setting of the Noise Tuner switch
- **SENS:CORR:NOISe** commands - noise calibration
- **SENS:CORR:Guided** commands - performs most of noise cal.

### SENSE<ch>:NOISe:AVERage[:COUNt] <num>

**Applicable Models**: All with with Noise Figure Option (S9x029A/B, 028, 029)

*(Read-Write)* Set and read the averaging factor for the noise receiver. Learn more

**Parameters**

- **<ch>** Noise Figure channel number. If unspecified, value is set to 1.
- **<num>** Averaging value. Choose any number from 1 to 16000.

**Examples**

```
SENS:NOIS:AVER 20
sense:noise:average:count 10
```

**Query Syntax**

SENSe:NOISe:AVERage[:COUNt]?

**Return Type**

Numeric

**Default**

1

### SENSE<ch>:NOISe:AVERage:STATe <bool>
Applicable Models: VNAs with Noise Figure Option (S9x029A/B, 028, 029)

(Read-Write) Turns noise averaging ON and OFF.

Parameters

- `<ch>` Noise Figure channel number. If unspecified, value is set to 1.
- `<bool>` Averaging state. Choose from
  - 0 - Noise averaging OFF
  - 1 - Noise averaging ON

Examples

```
SENS:NOIS:AVER:STAT 0
sense:noise:average:state 1
```

Query Syntax `SENSe:NOISe:AVERage:STATe?`

Return Type Boolean

Default O - OFF

---

SENSe[ch]>NOISe:BWIDth[:RESolution] <num>

Applicable Models: All with Noise Figure Option (S9x029A/B, 028, 029)

(Read-Write) Set and read the bandwidth of the noise receiver. Learn more

Parameters

- `<ch>` Noise Figure channel number. If unspecified, value is set to 1.
- `<num>` Bandwidth value. Choose from:
  - For `Sens:Noise:Receiver` = NOISe (Opt 029) choose from: 800 KHz, 2 MHz, 4 MHz, 8 MHz, or 24 MHz or the numerical equivalent, such as 8e6 and so forth.
  - For `Sens:Noise:Receiver` = NORMal (Opt 028) choose from: 720 kHz or 1.2 MHz
  - If the value does not match one of these, it is rounded up to the next valid bandwidth value.

Examples

```
SENS:NOIS:BWID 2e6
sense:noise:bwidth:resolution 8mhz
```

Query Syntax `SENSe:NOISe:BWIDth[:RESolution]?`

Return Type Numeric
SENSe<ch>:NOISe:CALibration:METHod <string>

**Applicable Models:** All with Noise Figure Option (S9x029A/B, 028, 029)

(Read-Write) Set and read the method for performing a calibration on a noise channel.

**Parameters**
- `<ch>` Noise Figure channel number. If unspecified, value is set to 1.
- `<string>` Calibration method. NOT case-sensitive. Choose from:
  - "VectorFull" or "Vector"
  - "SParameter" (Not available for NFX measurements)
  - "ScalarFull" or "Scalar"

**Examples**
- `SENSe:NOISe:CAL:METH "Vector"`
- `SENSe:NOISe:CAL:METH "SParameter"

**Query Syntax** `SENSe:NOISe:CALibration:METHod?`

**Return Type** String

**Default** "VectorFull"

SENSe<ch>:NOISe:CALibration:RMETHod <string>
Applicable Models: All with Noise Figure Option (S9x029A/B, 028, 029)

(Read-Write) Set and read the method used to characterize the noise receivers. Learn more.

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;ch&gt;</td>
<td>Noise Figure channel number. If unspecified, value is set to 1.</td>
</tr>
<tr>
<td>&lt;string&gt;</td>
<td>Receiver characterization method. NOT case-sensitive. Choose from:</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>• &quot;NoiseSource&quot; - Use a noise source. This selection is NOT allowed when a standard VNA receiver is used as the noise receiver (SENS:NOIS:RECNORM).</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>• &quot;PowerMeter&quot; - Use a power meter. <strong>NOTE:</strong> This selection is NOT allowed when the Noise Bandwidth is 8 MHz or 24 MHz.</td>
</tr>
</tbody>
</table>

**Examples**

```
SENS:NOIS:CAL:RMET "PowerMeter"
sense:noise:calibration:rmethod "noisesource"
```

**Query Syntax**

```
SENSe:NOISe:CALibration:RMEThod?
```

**Return Type**

String

**Default**

"NoiseSource"

SENSe<ch>:NOISe:ENR:FILename <string>

Applicable Models: All with Noise Figure Option (S9x029A/B, 028, 029)

(Read-Write) Set and read the path and name of the ENR file associated with the noise source.

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;ch&gt;</td>
<td>Noise Figure channel number. If unspecified, value is set to 1.</td>
</tr>
<tr>
<td>&lt;string&gt;</td>
<td>Full path, filename, and extension of the ENR file.</td>
</tr>
</tbody>
</table>

**Examples**

```
SENS:NOIS:ENR:FIL "c:\Program Files(x86)\Keysight\Network Analyzer\Documents\ENR\346C.enr"
sense:noise:enr:filename "c:\Program Files(x86)\Keysight\Network Analyzer\Documents\ENR\346C.enr"
```

**Query Syntax**

```
SENSe:NOISe:ENR:FILename?
```

**Return Type**

String

**Default**

Not applicable

SENSe<ch>:NOISe:ENR <INTernal | FILE >
Applicable Models: All with Noise Figure Option (S9x029A/B, 028, 029)

(Read-Write) Specifies whether to use the ENR file stored internally on the USB sensor or to use specified .enr file (located on the VNA).

**Note:** 1) If FILE is used, the .enr file should be specified using `SENSe<ch>:NOISe:ENR:FILEnname <string>`
2) If INT is used, then "SENSe:NOISe:ENR:FILEnname?" returns “Internal”

**Parameters**

- **<ch>** Noise Figure channel number. If unspecified, value is set to 1.
- **<INTernal | FILE>** Choose from:
  - INTernal = use internal file on the USB
  - FILE = use separate .enr file.

**Examples**

```
SENS:NOIS:ENR INT
sense:noise:enr file
```

**Query Syntax**

SENSe:NOISe:ENR?

**Return Type**

Characters

**Default**

Not applicable

---

SENSe<ch>:NOIS:EXDC:NAME <string>

**Applicable Models:** All with Noise Figure Option (S9x029A/B, 028, 029)

(Read-Write) Set and read the external DC source name in order to control the noise source.

**Parameters**

- **<ch>** Noise Figure channel number but this number is ignored for this command.
- **<string>** DC source name. The DC source should be defined in the external device dialog in advance.

**Examples**

Add DC-biased Noise Source named "NoiseSource1". Open NF channel before sending following commands.

```
SYSTem:CONFigure:EDEVice:ADD "NoiseSource1"
SYSTem:CONFigure:EDEVice:DTYPE "NoiseSource1","DC Source"
SYSTem:CONFigure:EDEVice:DRIVer "NoiseSource1", "DC Source"
SYSTem:CONFigure:EDEVice:IOConfig "NoiseSource1", "GPIB0::23::INSTR"
```
SYSTEM:CONFigure:EDEVice:LOAD "NoiseSourceSettings.xml", "NoiseSource1"

SENSe:NOISe:EXDC:NAME "NoiseSource1"

NOTE: NoiseSourceSettings.xml has setting information about waiting time and SCPI commands to DC Source. Create this xml file before sending SCPI commands.

---

Query Syntax  SENSe:NOISe:EXDC:NAME?
Return Type  String
Default  ""

---

SENSe<ch>:NOISe:GAIN <num>

Applicable Models: All with Noise Figure Option (S9x029A/B, 028, 029)

(Read-Write) Set and read the amount of gain for the noise receiver. This setting is NOT used when Sens:Noise:Receiver = NORMal (Opt 028)

Parameters
- <ch>  Noise Figure channel number. If unspecified, value is set to 1.
- <num>  Gain value. Choose from:
  - 0 - Low gain; select if the gain of your DUT is relatively high (>35 dB).
  - 15 - Medium gain; select if the gain of your DUT is about average (20 dB to 45 dB)
  - 30 - High gain; select if the gain of your DUT is relatively low (<30 dB).

Learn more about Noise Receiver Gain setting.

If the value does not match one of these, it is rounded up to the next legal value.

Examples
- SENS:NOIS:GAIN 15
- sense:noise:gain 0

Query Syntax  SENSe:NOIS:GAIN?
Return Type  Numeric
Default  30

---

SENSe<ch>:NOISe:GAIN:CTCheck <bool>

---
Applicable Models: All with Noise Figure Option (S9x029A/B, 028, 029)

(Read-Write) Turns noise threshold checking ON and OFF.

**Parameters**

- `<ch>`  Noise Figure channel number. If unspecified, value is set to 1.
- `<bool>`  Threshold checking state. Choose from
  
  - 0 - Noise threshold checking OFF
  - 1 - Noise threshold checking ON

**Examples**

```plaintext
SENS:NOIS:GAIN:CTC 0
sense:noise:gain:ctcheck 1
```

**Query Syntax**  
SENSe:NOISe:GAIN:CTCheck?

**Return Type**  
Boolean

**Default**  
O - OFF

SENSe<ch>:NOISe:IMPedance:COUNt <num>

Applicable Models: All with Noise Figure Option (S9x029A/B, 028, 029)

(Read-Write) Sets the number of impedance states to use during calibrated measurements.

**Parameters**

- `<ch>`  Noise Figure channel number. If unspecified, value is set to 1.
- `<num>`  Number of impedance states to use. Choose between 4 and the maximum number allowed by the noise tuner device. The more states that are used, the more accurate, and slower, the measurement. If the specified number exceeds the capability of the device, the measurement will use the maximum number of states the device allows.

**Examples**

```plaintext
SENS:NOIS:IMP:COUN 5
sense:noise:impedance:count 7
```

**Query Syntax**  
SENSe:NOISe:IMPedance:COUNt?

**Return Type**  
Numeric

**Default**  
4

SENSe<ch>:NOISe:NARrowband[:STATe] <bool>
Applicable Models: All with Noise Figure Option (S9x029A/B, 028, 029) (Excepts M9485A, M980xA, P50xxA)

(Read-Write) Turns narrowband noise figure compensation ON and OFF

Parameters

- <ch> Noise Figure channel number. If unspecified, value is set to 1.
- <bool> Compensation state. Choose from

  0 or OFF - Narrowband noise compensation OFF

  1 or ON - Narrowband noise compensation ON

Examples

- `SENS:NOIS:NARR 0`
- `sense:noise:narrowband:state 1`

Query Syntax

`SENSe:NOISe:NARRowband[:STATe]?`

Return Type

Boolean

Default

O - OFF

SENSe<ch>:NOISe:PMAP <in>,<out>

Applicable Models: All with Noise Figure Option (S9x029A/B, 028, 029)

(Write-only) Set the DUT-to-VNA port mapping for Noise Figure. Port mapping is allowed without restriction when the standard PNA receiver is used (`SENSe:NOISe:RECeiver` is set to `NORMal`). When the low-noise receiver is selected (`SENSe:NOISe:RECeiver` is set to `NOISe`) the following restrictions apply:

- If the low-noise receiver is selected, the DUT output port must be port 2.
- On high-frequency PNAs that have an internal tuner on port 1, the input port must be port 1 if the internal tuner is selected as the noise tuner. Conversely, if the input port is something other than 1, the internal tuner cannot be selected.
- For PNAs that have a maximum frequency of 26.5 GHz or less, any port can be selected as the DUT input port.
- If a vector calibration is desired, the tuner must be connected to the selected input port.

Use the `SENSe:NOISe:PMAP:INPut?` and `SENSe:NOISe:PMAP:OUTPut?` commands to read the DUT input and output ports.

Parameters

- <ch> Any existing NF or NFX channel. If unspecified, value is set to 1.
<in> VNA port which is connected to the DUT input.
<out> VNA port which is connected to the DUT output.

**Examples**

SENS:NOIS:PMAP 1,2  
*sense:noise:pmap 2,1*

See example program

**Query Syntax**

Not Applicable

**Default**

1,2

---

**SENSe<ch>:NOISe:PMAP:INPut?**

**Applicable Models:** All with Noise Figure Option (S9x029A/B, 028, 029)

(Read-only) Read the VNA port number to be connected to the DUT Input.

Use SENS:NOISE:PMAP to set the port mapping.

**Parameters**

<ch> Any existing NF or NFX channel. If unspecified, value is set to 1.

**Examples**

SENS:NOIS:PMAP:INP?  
sense:noise:pmap:input?

**Return Type**

Numeric

**Default**

1

---

**SENSe<ch>:NOISe:PMAP:OUTPut?**

**Applicable Models:** All with Noise Figure Option (S9x029A/B, 028, 029)

(Read-only) Read the VNA port number to be connected to the DUT Output.

**Parameters**

<ch> Any existing NF or NFX channel. If unspecified, value is set to 1.

**Examples**

SENS:NOIS:PMAP:OUTP?  
sense:noise:pmap:output?

**Return Type**

Numeric

**Default**

2
SENSe<ch>:NOISe:PULL[:STATe] <bool>

**Applicable Models:** All with Noise Figure Option (S9x029A/B, 028, 029)

*(Read-Write)* Enables and disables the use of source pull technique to compute S22. [Learn more.](#)

**Parameters**

- `<ch>` Noise Figure channel number. If unspecified, value is set to 1.
- `<bool>` Source pull technique state. Choose from:
  - **OFF** or **0** - Disable use of source pull technique.
  - **ON** or **1** - Enable use of source pull technique.

**Examples**

```
SENS:NOIS:PULL 0
sense2:noise:pull:state ON
```

**Query Syntax** SENSe:NOISe:PULL[:STATe]?

**Return Type** Boolean

**Default** 0 - OFF

---

SENSe<ch>:NOISe:RECeiver <char>

**Applicable Models:** All with Noise Figure Option (S9x029A/B, 028, 029) (Excepts M9485A, M980xA, P50xxA)

*(Read-Write)* Sets and returns the noise receiver to use for noise measurements.

**Parameters**

- `<ch>` Noise Figure channel number. If unspecified, value is set to 1.
- `<char>` Noise receiver. Choose from:
  - **NORMal** The standard VNA receiver. (Opt 028 and Opt 029)
  - **NOISe** The low-noise receivers. (Opt 029 only)

**Examples**

```
SENS:NOIS:REC NORM
sense2:noise:receiver noise
```

**Query Syntax** SENSe:NOISe:RECeiver?

**Return Type** Character

**Default** NOISe
SENSe<ch>:NOISe:SNP? [string]

**Applicable Models:** All with Noise Figure Option (S9x029A/B, 028, 029) (Except M9485A)

*(Read-Only)* Returns S-parameter and noise parameter data for vector noise figure measurements.

Noise parameters are NOT valid for NFX or Scalar noise figure measurements. Learn more about [noise parameters](#).

**Parameters**

<ch> Noise Figure channel number. If unspecified, value is set to 1.

If unspecified, only S-parameter data is saved.

**Examples**

SENSe:NOISe:SNP?

sense2:noise:snp? "NoiseParameter"

**Return Type** Comma-separated values

Data is returned in this order:

1. <all frequencies | point number>

2. <real S11> <imag S11> <real S21> <imag S21> <real S12> <imag S12> <real S22> <imag S22>

Then if noise parameters are specified:

3. <NFMin dB> <mag GammaOpt> <phase GammaOpt> <Rn/Z0>

The data display format depends on MMEM:STOR:TRAC:FORM:SNP

**Default** Not Applicable

SENSe<ch>:NOISe:SNP:SAVE <filename>, [data]

**Applicable Models:** All with Noise Figure Option (S9x029A/B, 028, 029)

*(Write-only)* Saves the S-parameters and vector noise parameters to an S2P file. For NFX channels, mixer setup information is included as comments at the beginning of the file.

Learn more about [noise parameters](#).

The format of the snp data is set with MMEM:STOR:TRAC:FORM:SNP.
The following is sample data for two data points from a Noise Figure measurement:

```
! Keysight Technologies,N5242A,USxxxxxxx,A.09.85
! pnan-nn Thu Nov 01 12:26:27 2012

```

**Parameters**

- `<ch>`: Noise Figure channel number. If unspecified, value is set to 1.
- `<filename>`: Path (optional), filename and suffix of location to store SNP data. If path is not specified, the current path is used.
  
  If unspecified, only S-parameter data is saved.

**Examples**

```
SENS:NOIS:SNP:SAVE "MySparams.s2p"

sense2:noise:snp:save "C:\Program Files(x86)\Keysight\Network Analyzer\Documents\MyNoiseParams.s2p", "NoiseParameter"
```

**Query Syntax**

- **Default**: Not Applicable

```
SENS<ch>:NOISe:SOURce:CKIT <string>
```
**Applicable Models:** All with Noise Figure Option (S9x029A/B, 028, 029)

*(Read-Write)* Set and read the Cal Kit that will be used for the Noise Source adapter.

An adapter is always necessary to connect a 346C Noise Source to the VNA port 2. Select a Cal Kit that is the same type and gender as the noise source connector.

If the Noise Source mates directly to VNA port 2, then set this type to "None".

**Parameters**

- `<ch>` Noise Figure channel number. If unspecified, value is set to 1.
- `<string>` Cal Kit. Case sensitive.

To read possible cal kit strings for the adapter:

- Change the port connector type to that of the noise source using:
  ```
  SENS:CORR:COLL:GUID:CONN:PORT<n>
  ```
- Then read the possible cal kit strings for that port using:
  ```
  ```

**Examples**

```bash
SENS:NOIS:SOUR:CKIT "N4691-60004 ECal"
```

**Query Syntax**

```
SENSe:NOISe:SOURce:CKIT?
```

**Return Type**

String

**Default**

Not applicable

```
SENSe<ch>:NOISe:SOURce:CONNector <string>
```
Applicable Models: All with Noise Figure Option (S9x029A/B, 028, 029)

(Read-Write) Set and read the Noise Source connector type and gender. The Keysight 346C has an "APC 3.5 male" connector.

Parameters

- <ch> Noise Figure channel number. If unspecified, value is set to 1.
- <string> Noise source connector type and gender. Case sensitive.

Examples

```
SENS:NOIS:SOUR:CONN "APC 3.5 male"
sense:noise:source:connector "APC 3.5 female"
```

Query Syntax

`SENS:NOIS:SOUR:CONN?`

Return Type

String

Default

Not applicable

---

SENSe<ch>:NOIS:SWEep:TlMe?

Applicable Models: All with Noise Figure Option (S9x029A/B, 028, 029)

(Read-only) Returns the APPROXIMATE time the channel will take to make one noise receiver sweep given the current setup. This, along with the sweep time for a standard receiver measurement and the following calculations, can tell you how long a “single” sweep would take so that you can set an appropriate "timeout" in your program.

To calculate the total sweep time:

Noise Figure on amplifiers (Vector Correction ON):

- \( 2 \times SSwpTime + X \times NoiseReceiverSweepTime \)
- Where \( X \) = the number of noise receiver impedance state sweeps. (Default is 4).

Noise Figure on converters (NFX) correction on - increased number of sweeps due to extra mixer sweeps and source pulling:

- \( 4 \times SSwpTime + X \times NoiseReceiverSweepTime \) (without source pulling)
- \( 8 \times SSwpTime + X \times NoiseReceiverSweepTime \) (with source pulling)
- Where \( X \) = the number of noise receiver impedance state sweeps. (Default is 4).
**Note:** The number of sweeps to perform a noise measurement is annotated at the bottom of the Noise Figure screen.

### Parameters

- `<ch>`  
  Noise Figure channel number. If unspecified, value is set to 1.

### Examples

- `SENS:NOIS:SWE:TIM?`
- `sense:noise:sweep:time?`

### Return Type

- **Double**
- **Default:** Not applicable

---

**SENSe<ch>:NOISe:TEMPerature:AMBient <num>**

**Applicable Models:** All with Noise Figure Option (S9x029A/B, 028, 029)

*(Read-Write)* Sets the temperature at which the current noise measurement is occurring. [Learn more](#)

### Parameters

- `<ch>`  
  Noise Figure channel number. If unspecified, value is set to 1.
- `<num>`  
  Ambient temperature in Kelvin.

### Examples

- `SENS:NOIS:TEMP:AMB 292`
- `sense:noise:temperature 289`

### Query Syntax

- `SENSe:NOISe:TEMPerature:AMBient?`

### Return Type

- **Numeric**
- **Default:** 295

---

**SENSe<ch>:NOISe:TUNer:FILE:NAME <string>**
Applicable Models: All with Noise Figure Option (S9x029A/B, 028, 029) (Except M9485A)

(Read-Write) Set and read a custom noise tuner file to be used instead of the one generated automatically based on the state. This is considered an "expert user" feature and is therefore the responsibility of the user to provide a calibration file that yields proper results. Specify the full path of the file. If the full path is not specified, the noise tuner file must be stored in the C:\Users\Public\Documents\Network Analyzer directory. To enable the custom noise tuner file, the SENSE:NOISE:TUNer:FILE:STATE must be set to ON.

Parameters

- `<ch>` Noise Figure channel number. If unspecified, value is set to 1.
- `<string>` Noise tuner file name.

Examples

```
SENS:NOIS:TUN:FILE:NAME "MyNoiseFile.tm"
sense:noise:tuner:file:name "MyNoiseFile.tm"
```

Query Syntax

SENSe:NOIs:TUNer:FILE:NAME?

Return Type

String

Default

Not applicable

SENSe<ch>:NOIS:TUNer:FILE[:STATe] <bool>

Applicable Models: All with Noise Figure Option (S9x029A/B, 028, 029) (Except M9485A)

(Read-Write) Sets the state of the custom noise tuner file specified using the SENSE:NOISE:TUNer:FILE:NAME command.

Parameters

- `<ch>` Noise Figure channel number. If unspecified, value is set to 1.
- `<bool>` Custom noise tuner file state. Choose from:
  - OFF or 0 - Disable custom noise tuner file
  - ON or 1 - Enable custom noise tuner file

Examples

```
SENS:NOIS:TUN:FILE 1
sense2:noise:tuner:file:state ON
```

Query Syntax

SENSe:NOIS:TUNer:FILE[:STATe]?

Return Type

Boolean

Default

0 - OFF
SENSe<ch>:NOISe:TUNer:ID <string>

**Applicable Models:** All with Noise Figure Option (S9x029A/B, 028, 029) (Except M9485A)

*(Read-Write)* Set and read the identity of the noise tuner. This is an ECal model and serial number string. To read the identities of the connected ECal modules, use **SENSe:CORRection:CKIT:ECAL:LIST?** and **SENSe:CORRection:CKIT:ECAL<mod>:INFormation?**

**Parameters**
- `<ch>` Noise Figure channel number. If unspecified, value is set to 1.
- `<string>` ECal model and serial number string. The ECal module must be connected when this command is sent.

**Examples**
- `SENSe:NOIS:TUN:ID "N4691-60004 ECal 02822`n
- `sense:noise:tuner:id "N4691-60004 ECal 02822"

**Query Syntax** **SENSe:NOISe:TUNer:ID?**

**Return Type** String

**Default** Not applicable

SENSe<ch>:NOISe:TUNer:INPut <string>

**Applicable Models:** All with Noise Figure Option (S9x029A/B, 028, 029) (Except M9485A)

*(Read-Write)* Sets and reads the port of the ECal noise tuner that is connected to the VNA SOURCE OUT.

**Parameters**
- `<ch>` Noise Figure channel number. If unspecified, value is set to 1.
- `<string>` ECal port identifier. Case sensitive.

**Examples**
- `SENSe:NOIS:TUN:INP "B"

- `sense:noise:tuner:input "A"

**Query Syntax** **SENSe:NOISe:TUNer:INPut?**

**Return Type** String

**Default** "B"

SENSe<ch>:NOISe:TUNer:ORIent[:STATe] <bool>
Applicable Models: All with Noise Figure Option (S9x029A/B, 028, 029) (Except M9485A)

(Read-Write) Sets the state of auto orientation for a noise tuner during Noise Figure for NFX.

Parameters

<ch> Noise Figure channel number. If unspecified, value is set to 1.
<bool> Auto-orientation state. Choose from:

OFF or 0 - Disable Auto-orientation
ON or 1 - Enable Auto-orientation

Examples

SENSe:NOISe:TUNer:ORIent 0
sense2:noise:tuner:orient:state ON

Query Syntax

SENSe:NOISe:TUNer:ORIent[:STATe]?

Return Type

Boolean

Default

1 - ON

SENSe<ch>:NOISe:TUNer:OUTPut <string>

Applicable Models: All with Noise Figure Option (S9x029A/B, 028, 029) (Except M9485A)

(Read-Write) Sets and reads the port of the ECal noise tuner that is connected to the CPLR THRU.

Parameters

<ch> Noise Figure channel number. If unspecified, value is set to 1.
<string> ECal port identifier. Case sensitive.

Examples

SENSe:NOISe:TUNer:OUTP "B"
sense:noise:tuner:output "A"

Query Syntax

SENSe:NOISe:TUNer:OUTPut?

Return Type

String

Default

"A"

SENSe<ch>:NOISe:USBSource:CATalog?
**Applicable Models:** All with Noise Figure Option (S9x029A/B, 028, 029)

*(Read only)* Returns a comma separated list of connected USB Noise Sources, identified by their `usbNsSrcID`: “ModelNumber SerialNumber.”

**Parameters**
- `<ch>` Noise Figure channel number. If unspecified, value is set to 1.

**Examples**
- `SENS:NOIS:USB:S:CAT?`
- `sense:noise:usbsource:catalog?`

**Return Type** String
- **Default** Not applicable

---

```plaintext
SENS<ch>:NOISe:USBSource:ENR:SAVE " usbNsSrcID ","filename"
```

**Applicable Models:** All with Noise Figure Option (S9x029A/B, 028, 029)

*(Write only)* This writes the ENR file stored in USB Noise Sensor to the filename specified by “filename”

**Note:** When a full path is not given, the .enr file will be written to the default folder. Change the default folder name using `MMemory:CDIrectory`.

**Parameters**
- `<ch>` Noise Figure channel number. If unspecified, value is set to 1.

**Examples**
- `SENS:NOIS:ENR:SAVE "U1831C MY12345678","C:\myUSBsensor.enr"
- `sense:noise:enr:save "U1231C MY12345678", "my.enr"

**Query Syntax** None
- **Default** Not applicable

---

```plaintext
SENS<ch>:NOISe:USBSource[:SELect] "usbNsSrcID"
```
**Applicable Models:** All with Noise Figure Option (S9x029A/B, 028, 029)

**Parameters**

- `<ch>`: Noise Figure channel number. If unspecified, value is set to 1.

**Examples**

```plaintext
SENS:NOIS:USBSEL "U1831C MY12345678"

sense:noise:usbsource:select "U1831C MY12345678"
```

**Query Syntax**

SENS:NOISE:USBSource?

**Return Type**

String

**Default**

Not applicable

---

**SENSe<ch>:NOISe:USBSource:TEMPerature? "usbNsSrcID"**

**Applicable Models:** All with Noise Figure Option (S9x029A/B, 028, 029)

**Parameters**

- `<ch>`: Noise Figure channel number. If unspecified, value is set to 1.

**Examples**

```plaintext
SENS:NOIS:USBSTEMP? "U1831C MY12345678"

sense:noise:usbsource:temperature? "U1831C MY12345678"
```

**Return Type**

Numeric

**Default**

Not applicable

---

**Note:** This can be used to help determine what temperature to use for the noise source temperature during calibration. Learn more about ConfigureNSDiag.

The commands to set the noise source connector temperature for calibration remotely are:

- **Smart Cal:** `SENSe<ch>:CORRection:TCOLd:USER:VALue<num>`
- **Cal All:** `SYSTem:CALibrate:ALL[1-250]:MCLass:PROPerty:VALue[:STATE] "Noise Source Temperature",<value>`
Sense:Offset Commands **Superseded**

**Note:** These commands are replaced by the Sense:FOM commands which include the features of the new FOM dialog. Although these old commands will continue to work, they can NOT be mixed with the new commands.

Sets the offset frequency functions, causing the stimulus and response frequencies to be different.

SENSe<cnum>:OFFSet:CW <bool>

**Applicable Models:** N522xB, N523xB, N524xB

**(Read-Write)** Turns stimulus CW Override mode ON or OFF. Use this setting to establish a fixed (CW) stimulus frequency while measuring the Response over a swept frequency range.

**Parameters**

- `<cnum>` Any existing channel number. If unspecified, value is set to 1
- `<bool>` ON (or 1) - turns CW override ON.
  
  OFF (or 0) - turns CW override OFF.

**Examples**

```
SENS:OFFS:CW ON
sense2:offset:off
```

**Query Syntax**

SENSe<cnum>:OFFSet:CW?

**Return Type**

Boolean

**Default**

OFF
SENSe<cnum>:OFFSet:DIVisor <num>

Applicable Models: N522xB, N523xB, N524xB

(Read-Write) Specifies (along with the multiplier) the value to multiply by the stimulus.

Parameters
<cnun> Any existing channel number. If unspecified, value is set to 1
<num> Divisor value. Range is 1 to 1000

Examples
SENSe:OFFS:DIV 3
sense2:offset:divisor 2

Query Syntax SENSe<cnum>:OFFSet:DIVisor?
Return Type Numeric
Default 1

SENSe<cnum>:OFFSet:MULTiplier <num>

Applicable Models: N522xB, N523xB, N524xB

(Read-Write) Specifies (along with the divisor) the value to multiply by the stimulus.

Parameters
<cnun> Any existing channel number. If unspecified, value is set to 1
<num> Multiplier value. Range is +/- 1000. Negative multipliers cause the stimulus to sweep in decreasing direction. For mixer measurements, this would be for setups requiring the RF frequency to be less than LO frequency

Examples
SENSe:OFFS:MULT 2
sense2:offset:multiplier 4

Query Syntax SENSe<cnum>:OFFSet:MULTiplier?
Return Type Numeric
Default 1

SENSe<cnum>:OFFSet:OFFSet <num>
**Applicable Models:** N522xB, N523xB, N524xB

(Read-Write) Specifies an absolute offset frequency in Hz. For mixer measurements, this would be the LO frequency.

**Parameters**

- `<cnum>` Any existing channel number. If unspecified, value is set to 1
- `<num>` Offset frequency. Range is +/- 1000 GHz. Offsets can be positive or negative

**Examples**

```
SENS:OFFS:OFFS 1GHz
sense2:offset:offset 1e9
```

**Query Syntax**

`SENSe<cnum>:OFFSet:OFFSet?`

**Return Type** Numeric

**Default** 0 Hz

---

`SENSe<cnum>:OFFSet:STARt?`

**Applicable Models:** N522xB, N523xB, N524xB

(Read-Only) Returns the response start frequency

**Parameters**

- `<cnum>` Any existing channel number. If unspecified, value is set to 1

**Examples**

```
SENS:OFFS:STAR?
sense2:offset:start?
```

**Return Type** Numeric

**Default** Not applicable

---

`SENSe<cnum>:OFFSet:[STATe] <bool>`
**Applicable Models:** N522xB, N523xB, N524xB

(Read-Write) Enables Frequency Offset Mode on ALL measurements that are present on the active channel. This immediately causes the source and receiver to tune to separate frequencies. The receiver frequencies are specified with the other SENS:OFFSet commands. To make the stimulus settings use the SENS:FREQ commands.

Tip: To avoid unnecessary errors, first make other offset frequency settings, then set Frequency Offset ON.

**Parameters**

- `<cnum>` Any existing channel number. If unspecified, value is set to 1
- `<bool>` ON (or 1) - turns Frequency Offset ON.
  
  OFF (or 0) - turns Frequency Offset OFF.

**Examples**

```latex
SENS:OFFS ON
sense2:offset:state off
```

**Query Syntax**

SENSe<cnun>:OFFSet:[STATe]?

**Return Type** Boolean

**Default** OFF (0)

---

**SENSe<cnun>:OFFSet:STOP?**

**Applicable Models:** N522xB, N523xB, N524xB

(Read-Only) Returns the response stop frequency.

**Parameters**

- `<cnun>` Any existing channel number. If unspecified, value is set to 1

**Examples**

```latex
SENS:OFFS:STOP
sense2:offset:stop
```

**Return Type** Numeric

**Default** Not applicable

SENSe:PATH:CONFig:CATalog?
Applicable Models: N522xB, N523xB, N524xB

(Read-only) Returns a list of configuration names stored in the VNA.

<table>
<thead>
<tr>
<th><strong>Examples</strong></th>
<th><strong>SENSe:PATH:CONF:CAT?</strong></th>
</tr>
</thead>
</table>

**Return Type** Comma-separated list of double-quoted strings

**Default** Not Applicable

SENSe<ch>:PATH:CONF:COPY <num>

Applicable Models: N522xB, N523xB, N524xB

(Write-only) Copies the mechanical switch and attenuator settings from the specified channel <num> to channel <ch>.

To avoid potential conflicts, all port couplings in the calling channel will be turned OFF and all port attenuator settings will be set to manual before copying the switch or attenuator settings. The two channels CAN be of different measurement classes.

Use SYSTem:MACRo:COPY:CHANnel to copy ALL settings from one channel to another.

**Parameters**

- `<ch>` Channel number to copy mechanical settings to. If unspecified, value is set to 1.
- `<num>` Channel number to copy mechanical settings from.

**Examples**

'Copies mechanical settings from chan 2 to chan 1.'

`SENS1:PATH:CONF:COPY 2`

**Return Type** Not Applicable

**Default** Not Applicable

SENSe:PATH:CONF:DELe<te <string>
**Applicable Models:** N522xB, N523xB, N524xB

**(Write-only)** Deletes the specified configuration name from the VNA. The factory configurations cannot be deleted. This is the only method of distinguishing a factory configuration from a user-named configuration.

**Parameters**

- `<string>` Configuration name to be deleted.

**Examples**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SENS:PATH:CONF:DEL &quot;MyMixer&quot;</td>
<td>Delete configuration &quot;MyMixer&quot;</td>
</tr>
</tbody>
</table>

**Return Type** Not Applicable

**Default** Not Applicable

---

**SENS:**PATH:CONF:DTEx <string>

**Applicable Models:** N522xB, N523xB, N524xB

**(Read-Write)** Write and read descriptive text associated with the configuration. This text is displayed in the path configuration dialog. Text is generally used to describe external connections that must be made manually to complete the configuration setup.

**Parameters**

- `<string>` Descriptive text enclosed in quotes. Double quotes are not allowed within the descriptive text.

**Examples**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SENS:PATH:CONF:DTEX &quot;Connect J1 jumper on the rear panel.&quot;</td>
<td>Set descriptive text</td>
</tr>
</tbody>
</table>

**Query Syntax**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SENS&lt;ch&gt;:PATH:CONF:DTEx?</td>
<td>Query descriptive text</td>
</tr>
</tbody>
</table>

**Return Type** String

**Default** Not Applicable

---

**SENS<ch>:PATH:CONFig:ELEMent:CATalog?**
**Applicable Models:** N522xB, N523xB, N524xB

*(Read-only)* Returns the names of configurable elements as a comma-delimited list of strings.

See a list of configurable elements and settings for various VNA models.

**Parameters**

- `<ch>` Any existing channel number; if unspecified, value is set to 1.

**Examples**

```
SENS:PATH:CONF:ELEM:CAT?
returns
"Combiner", "Src1", "Src2"
```

**Default** Not Applicable

**SENSe<ch>:PATH:CONFig:ELEMent[:STATE] <elem>, <setting>**

**Applicable Models:** N522xB, N523xB, N524xB, M9485A with M9341B, M937xA with M9341B, P937xA, M980xA and P500xA, E5080B

*(Read-Write)* Write or read the setting of a specified element in the current configuration.

This command is used for both RF path and IF path configuration.

- RF Configuration elements and values
- IF Configuration elements and values (Includes IF Path, Pulse, and DSP elements)

**Parameters**

- `<ch>` Any existing channel number; if unspecified, value is set to 1.
- `<elem>` Name of the element for which a setting is to be made.

  "Disable" or "Enable"

**Examples**

```
SENS:PATH:CONF:ELEM "Combiner","Normal"
```

**Query Syntax**

```
SENSe<ch>:PATH:CONFig:ELEMent? "Combiner"
```

Returns the current state of the Combiner element.

**Return Type** String
SENSe<ch>:PATH:CONFig:ELEMent:VALue:CATalog? <element>

**Applicable Models:** N522xB, N523xB, N524xB

*(Read-only)* Returns the list of valid settings that can be used with the specified element.

See a list of configurable elements and settings for various VNA models.

**Parameters**

- `<ch>` Any existing channel number; if unspecified, value is set to 1.
- `<element>` String. Element name for which to return valid settings.

**Examples**

```plaintext
returns "Normal", "Reversed"
```

**Default** Not Applicable

---

SENSe<ch>:PATH:CONFig:NAME?

**Applicable Models:** N522xB, N523xB, N524xB

*(Read-only)* Returns the name of the current configuration only if NO individual element settings had been changed since selecting or storing a configuration. When element settings change, the path configuration name is cleared.

**Parameters**

- `<ch>` Any existing channel number; if unspecified, value is set to 1.

**Examples**

```plaintext
SENS:PATH:CONF:NAME?
returns "Default"
```

**Return Type** String

**Default** Not Applicable

---

SENSe<ch>:PATH:CONFig:SELect <string>
Applicable Models: N522xB, N523xB, N524xB

(Write only) Loads the named configuration onto the specified channel.

**Note:** Loading a stored configuration will over-write MANY RF and IF path configuration settings. Make your measurement settings AFTER recalling a stored configuration, NOT before.

Use `SENS:PATH:CONF:CAT?` to return the configuration names that are stored on the VNA.

**Parameters**

- `<ch>` Any existing channel number; if unspecified, value is set to 1.
- `<string>` Configuration name. "Default" is the default factory configuration.

**Examples**

```
SENS:PATH:CONF:SEL 'default'
sense2:path:CONF:select "MyMixer"
```

**Query Syntax**

Not Applicable

**Default**

"Default"

---

`SENSe<ch>:PATH:CONFig:STORe <name>`

Applicable Models: N522xB, N523xB, N524xB

(Write only) Saves the path configuration currently associated with channel `<ch>` to the specified configuration name.

**Parameters**

- `<ch>` Any existing channel number; if unspecified, value is set to 1.
- `<name>` String. Configuration name. Factory configurations can NOT be overwritten. Specifying the name of a pre-defined factory configuration will result in an error.

**Examples**

```
SENS:PATH:CONF:STOR "MyMixer"
```

**Query Syntax**

Not Applicable

**Default**

Not Applicable
Phase Noise Commands

Defines the settings for phase noise measurements. Option S93031xB is required and applies ONLY to instruments with serial prefix 6021 and above.

```
SENSe<ch>:PN:ADJust:CONFigure:FREQuency:CHECK <bool>
```
Applicable Models: N522xB, N524xB with Phase Noise Option S93031xB

(Read-Write) Enables and disables check for carrier. This is a narrow band search that expects the carrier to exist around the user-specified carrier frequency.

Parameters
<ch> Channel number of the measurement (optional).
<bool> Choose from:

0 - OFF - Disable check for carrier.
1 - ON - Enable check for carrier.

Examples
SENS:PN:ADJ:CONF:FREQ:CHEC ON
sense2:pn:adjust:configure:frequency:check ON

Query Syntax
SENSe<ch>:PN:ADJust:CONFigure:FREQuency:CHECk?
Return Type
Boolean
Default
ON

SENSe<ch>:PN:ADJust:CONFigure:FREQuency:LIMit:HIGH <value>

Applicable Models: N522xB, N524xB with Phase Noise Option S93031xB

(Read-Write) Sets and returns the high frequency limit to use during a broadband carrier search. The SENSe:PN:ADJust:CONFigure:FREQuency:SEARch[:STATe] command enables/disables the carrier search.

Parameters
<ch> Channel number of the measurement (optional).
(value> Carrier search high frequency limit.

Examples
sense2:pn:adjust:configure:frequency:limit:high 1e9

Query Syntax
SENSe<ch>:PN:ADJust:CONFigure:FREQuency:LIMit:HIGH?
Return Type
Numeric
Default
1 GHz

SENSe<ch>:PN:ADJust:CONFigure:FREQuency:LIMit:LOW <value>
**Applicable Models:** N522xB, N524xB with Phase Noise Option S93031xB

*(Read-Write)* Sets and returns the low frequency limit to use during a broadband carrier search. The `SENSe:PN:ADJust:CONFigure:FREQuency:SEARch[:STATe]` command enables/disables the carrier search.

**Parameters**

- `<ch>` Channel number of the measurement (optional).
- `<value>` Carrier search low frequency limit.

**Examples**

- `sense2:pn:adjust:configure:frequency:limit:high 1e6`

**Query Syntax**

`SENSe<ch>:PN:ADJust:CONFigure:FREQuency:LIMit:LOW?`

**Return Type**

Numeric

**Default**

1 MHz

---

**SENSe<ch>:PN:ADJust:CONFigure:FREQuency:SEARch[:STATe] <bool>**

*(Read-Write)* Enables and disables a broadband carrier search within the range specified using the `SENSe:PN:ADJust:CONFigure:FREQuency:LIMit:LOW` and `SENSe:PN:ADJust:CONFigure:FREQuency:LIMit:HIGH` commands.

**Parameters**

- `<ch>` Channel number of the measurement (optional).
- `<bool>` Choose from:
  - 0 - OFF - Disable search.
  - 1 - ON - Enable search.

**Examples**

- `SENSe:PN:ADJ:CONF:FREQ:SEAR ON`
- `sense2:pn:adjust:configure:frequency:search:state ON`

**Query Syntax**

`SENSe<ch>:PN:ADJust:CONFigure:FREQuency:SEARch[:STATe]?`

**Return Type**

Boolean

**Default**

ON

---

**SENSe<ch>:PN:ADJust:CONFigure:LEVel:THReshold <value>**

4507
Applicable Models: N522xB, N524xB with Phase Noise Option S93031xB

(Read-Write) Sets and returns the threshold to use during a carrier search.

Parameters

- `<ch>` Channel number of the measurement (optional).
- `<value>` Carrier search threshold in dBm.

Examples

```
SENS:PN:ADJ:CONF:LEV:THR -20
sense2:pn:adjust:configure:level:threshold -20
```

Query Syntax

```
SENSe<ch>:PN:ADJust:CONFigure:LEVel:THReshold?
```

Return Type

Numeric

Default

-20 dBm

SENSe<ch>:PN:BWIDth[:RESolution]:RATio <value>

Applicable Models: N522xB, N524xB with Phase Noise Option S93031xB

(Read-Write) Sets and returns the resolution bandwidth ratio, which is the specified resolution bandwidth percentage of every half decade offset frequency.

Example:

Start Offset = 1 kHz

Stop Offset = 100 kHz

RBW Ratio = 10%

1 kHz - 3 kHz: RBW = 100 Hz (10% of 1 kHz)

3 kHz - 10 kHz: RBW = 300 Hz (10% of 3 kHz)

10 kHz - 30 kHz: RBW = 1 kHz (10% of 10 kHz)

30 kHz - 100 kHz: RBW = 3 kHz (10 % of 30 kHz)

Parameters

- `<ch>` Channel number of the measurement (optional).
- `<value>` Resolution bandwidth ratio in %.
SENSe<ch>:PN:FAVerage:FACTor <value>

**Applicable Models:** N522xB, N524xB with Phase Noise Option S93031xB

*(Read-Write)* Sets and returns the FFT average factor number. The average factor is multiplied by the default average count for each frequency range. The default average count of the lower frequency range is 1 and at the higher offset frequency range is a larger count.

**Parameters**

- `<ch>`: Channel number of the measurement (optional).
- `<value>`: FFT average factor number from 1 to 10,000.

**Examples**

```
SENS:PN:FAV:FACT 10
sense2:pn:faverage:factor 10
```

**Query Syntax**

SENSe<ch>:PN:FAVerage:FACTor?

**Return Type**

Numeric

**Default**

1

SENSe<ch>:PN:NTYPE <enum>
**Applicable Models:** N522xB, N524xB with Phase Noise Option S93031xB

(Read-Write) Sets and returns the noise type to phase or residual noise.

**Parameters**

- `<ch>`  Channel number of the measurement (optional).
- `<enum>`  (Enumeration) Choose from:

  - **PNOise** - Phase noise measurement.
  - **RESidual** - Residual (additive) noise measurement.

**Examples**

```
SENS:PN:NTYP PNO
sense2:pn:ntype residual
```

**Query Syntax**  
`SENSe<ch>:PN:NTYPe?`

**Return Type**  
Enumeration

**Default**  
PNOise

---

**SENSe<ch>:PN:RECeiver <rcvr>**

**Applicable Models:** N522xB, N524xB with Phase Noise Option S93031xB

(Read-Write) Sets and returns the receiver for the phase noise measurement or receiver ratios for residual phase noise measurements.

**Parameters**

- `<ch>`  Channel number of the measurement (optional).
- `<rcvr>`  (String) Receiver string.

Choose from:

- a1, a2, a3, a4, b1, b2, b3, b4, b2/a1, b1/a2.

**Note:** The b2/a1 and b1/a2 ratios are for residual phase noise measurements. For example, b2/a1 measures the additive phase noise at b2 relative to a1.

**Examples**

```
SENS:PN:REC "b2"
sense:pn:receiver "b2"
```

**Query Syntax**  
`SENSe<ch>:PN:RECeiver?`

**Return Type**  
String
### SENSe<ch>:PN:RESidual:INPut <dutInput>

**Applicable Models:** N522xB, N524xB with Phase Noise Option S93031xB

(Read-Write) Sets and returns receiver at the DUT input for residual phase noise measurements.

**Parameters**

- `<ch>` Channel number of the measurement (optional).
- `<dutInput>` *(String)* Receiver string for DUT input.

Choose from:

a1, a2, a3, a4, b1, b2, b3, b4.

**Examples**

```
SENS:PN:RES:INP "a1"
sense:pn:residual:input "a1"
```

**Query Syntax**

`SENSe<ch>:PN:RESidual:INPut?`

**Return Type** String

**Default** a1

### SENSe<ch>:PN:RESidual:OUTPut <dutOutput>

**Applicable Models:** N522xB, N524xB with Phase Noise Option S93031xB

(Read-Write) Sets and returns receiver at the DUT output for residual phase noise measurements.

**Parameters**

- `<ch>` Channel number of the measurement (optional).
- `<dutOutput>` *(String)* Receiver string for DUT output.

Choose from:

a1, a2, a3, a4, b1, b2, b3, b4.

**Examples**

```
SENS:PN:RES:OUT "b2"
sense:pn:residual:output "b2"
```

**Query Syntax**

`SENSe<ch>:PN:RESidual:OUTPut?`

**Return Type** String

**Default** b2
SENSe<ch>:PN:SWEep:CARRier:FREQuency <value>

**Applicable Models:** N522xB, N524xB with Phase Noise Option S93031xB

*(Read-Write)* Sets and returns the carrier frequency.

**Parameters**

- **<ch>** Channel number of the measurement (optional).
- **<value>** Carrier frequency.

**Note:** This command will accept MIN or MAX instead of a numeric parameter. See SCPI Syntax for more information.

**Examples**

```plaintext
SENSe<ch>:PN:SWEep:CARRier:FREQ 1 GHz
sense2:pn:sweep:carrier:frequency max
```

**Query Syntax**

SENSe<ch>:PN:SWEep:CARRier:FREQuency?

**Return Type**

Numeric

**Default** 1 GHz

---

SENSe<ch>:PN:SWEep:NOISe:MODE<enum>

**Applicable Models:** N522xB, N524xB with Phase Noise Option S93031xB

*(Read-Write)* Sets and returns the sweep noise mode.

**Parameters**

- **<ch>** Channel number of the measurement (optional).
- **<enum>** *(Enumeration)* Choose from:

  - **FAST** - Fastest measurement speed with lowest accuracy.
  - **NORMal** - Between fastest and slowest measurement speed and accuracy.
  - **BEST** - Slowest measurement speed with highest accuracy.
### Examples

- `SENS:PN:SWE:NOIS:MODE NORM`
- `sense2:pn:sweep:noise:mode fast`

### Query Syntax

SENSe<ch>:PN:SWEep:NOISe:MODE?

### Return Type

Enumeration

### Default

NORMal
This command is superseded by the `SOURce:POWer:ATTenuation:RECeiver:TEST` command.

Learn about Receiver Attenuation

`SENS<cnm>:POWer:ATTenuator <rcvr>,<num>`

**Applicable Models:** N522xB, N523xB, N524xB

*(Read-Write)* Sets the attenuation level for the specified receiver.

**Note:** Attenuation cannot be set with Sweep Type set to Power

**Note:** For M980xA/P50xxA/E5080B Receiver Gain, use `SENS:SOUR:REC:GAIN`.

**Parameters**

- `<cnm>` Any existing channel number. If unspecified, value is set to 1
- `<rcvr>` Receiver to get attenuation. Choose from:
  - `ARECeiver` - receiver A
  - `BRECeiver` - receiver B
  - `CRECeiver` - receiver C
  - `DRECeiver` - receiver D

Receiver attenuation can NOT be set using logical receiver notation.

- `<num>` Attenuation value in dB. To determine how many receiver attenuators, the maximum receiver attenuation, and attenuation step size, for a VNA model, see [VNA Models and Options](#). If a number other than these is entered, the analyzer will select the next lower valid value. For example, if 19 is entered for the E8361A/C, then 10 dB attenuation will be selected.

**Examples**

```
SENS:POW:ATT AREC,10
sense2:power:attenuator breceiver,30
```

**Query Syntax**

```
SENS<cnm>:POWer:ATTenuator? <rec>
```

**Return Type**

Numeric

**Default**

0
Sense: Pulse Commands

Configures the 5 pulse generators in the PNA-X.

Beginning with A.09.50, these commands can also be used to control an external Pulse Generator.

Learn more.

SENSe:PULSe

### Pulse Definitions

![Pulse Definitions](image)

- $D =$ Delay; the time before each pulse begins
- $W =$ Width; the time the pulse is ON
- $P =$ Period; one complete pulse cycle
- Duty Cycle $= \frac{W}{P}$

**Important:** If $D + W$ is greater than $P$, then undefined VNA behavior results. There is NO error message or warning.

**SENSe:PULSe:CATalog?**
**Applicable Models:** All with Pulsed RF Measurement Option

*(Read-only)* Returns the string names of internal and configured external pulse generators.

**Parameters**

| None |

**Examples**

| SENS:PULS:CAT? |

**Default**

| Not Applicable |

---

**SENSe<ch>:PULSe<n>:DELay <value>[,<name>]**

**Applicable Models:** All with Pulsed RF Measurement Option

*(Read-Write)* Sets the pulse delay. The amount of time before a new pulse begins.

*See Pulse Definition diagram.*

**Parameters**

- `<ch>` Any existing channel number; if unspecified, value is set to 1.
- `<n>` Internal pulse generator number. Choose from 0 to 4.
  
  0 is the generator that pulses the ADC.
- `<value>` Delay value in seconds. Choose a value from about 33ns to about 70 seconds.
- `<name>` Optional. String name of the pulse generator.
  
  Required for use with *external pulse generators*.

Use **SENSe:PULSe:CAT?** to return the names of configured pulse generators.

If specified, `<n>` is ignored.

If unspecified, `<n>` is required for internal pulse generators.

**Examples**

| SENS:PULS1:DEL .5 |
| SENS:PULS:DEL .5, "My81110" |

**Query Syntax**

| SENSE<ch>:PULSe<n>:DELay? [,<name>] |

**Return Type**

| Numeric |

**Default**

| 0 |

---

**SENSe<ch>:PULSe<n>:DINCrement <value>[,<name>]**
**Applicable Models:** All with Pulsed RF Measurement Option (Except M980xA, P50xxA, E5080B)

(Read-Write) Sets the pulse delay increment. The delay increments with each pulse by the `<value>` amount.

For example, in this diagram the delay starts as 1. On the second pulse, delay=2. On the third pulse, delay=3.

**Important:** If \( D + W \) is greater than \( P \), then undefined VNA behavior results. There is NO error message or warning. Delay includes the incremented value.

This is useful for pulse profiling.

![Diagram](image)

See Pulse Definition diagram.

**Parameters**

- `<ch>` Any existing channel number; if unspecified, value is set to 1.
- `<n>` Pulse generator number. Choose from 0 to 4.
  - 0 is the generator that pulses the ADC.
- `<value>` Delay increment value in seconds.
- `<name>` Optional. String name of the pulse generator.
  - Required for use with external pulse generators.
  - Use `SENSe:PULSe:CAT?` to return the names of configured pulse generators.

If specified, `<n>` is ignored.

If unspecified, `<n>` is required for internal pulse generators.

**Examples**

```
SENS:PULS1:DINC .5
SENS:PULS:DINC .5, "My81110"
```

**Query Syntax**

`SENSe<ch>:PULSe<n>:DINCrement? [<name>]`

**Return Type**

Numeric

**Default**

0
SENSe:PULSe<n>:HDELay:ADC?

**Applicable Models:** All with Pulsed RF Measurement Option

(Read-only) Returns the ADC delay for pulse measurements.

**Parameters**

<n> Internal pulse generator number. Choose from 1 to 4.

0 is the generator that pulses the ADC.

**Examples**

```
SENS : PULS : HDEL : ADC?
```

**Default** Not Applicable

SENSe<ch>:PULSe<n>:HDELay:MODulator <value>

**Applicable Models:** All with Pulsed RF Measurement Option

(Read-Write) Sets the time lag between the pulse drive signal and the actual RF output.

The following diagram shows Pulse1 used as the pulse drive signal.
Parameters

chw> Any existing channel number; if unspecified, value is set to 1.

<\n> Internal pulse generator number. Choose from 1 to 4.

0 is the generator that pulses the ADC.

<\text{value}> Delay value in seconds.

Examples

<table>
<thead>
<tr>

<td>50 ns</td>
</tr>
</tbody>
</table>

SENSe<ch>:PULSe<n>:HDELay[:STATe] <value>

Applicable Models: All with Pulsed RF Measurement Option

(Read-Write) Enables/disables modulator and ADC delays for pulse measurements.

Parameters

chw> Any existing channel number; if unspecified, value is set to 1.

<\n> Pulse generator number. Choose from 0 to 4.

0 is the generator that pulses the ADC.

<\text{value}> Boolean

ON (or 1) - turns delays ON.

OFF (or 0) - turns delays OFF.

Examples

<table>
<thead>
<tr>
<th>Query Syntax</th>
<th>Return Type</th>
<th>Default</th>
</tr>
</thead>
<tbody>

</tbody>
</table>

SENSe<ch>:PULSe<n>:INVert <value>[,<name>]

4521
**Applicable Models:** All with Pulsed RF Measurement Option

*(Read-Write)* Sets whether to invert the polarity of the pulse.

**Parameters**

- `<ch>` Any existing channel number; if unspecified, value is set to 1.
- `<n>` Pulse generator number. Choose from 0 to 4. 0 is the generator that pulses the ADC.
- `<value>` Boolean
  - ON (or 1) - Invert the pulse generator polarity. This causes the pulse ON time to be active low and OFF be active high.
  - OFF (or 0) - Do NOT Invert the pulse generator polarity.
- `<name>` Optional. String name of the pulse generator. Required for use with external pulse generators.

Use `SENSe:PULSe:CAT?` to return the names of configured pulse generators.

If specified, `<n>` is ignored.

If unspecified, `<n>` is required for internal pulse generators.

**Examples**

```
SENSe:PULS1:INV 1
SENSe:PULS:INV 1, "My81110"
```

**Query Syntax**

`SENSe<ch>:PULSe<name>:INVert?` [optional `<name>`]

**Return Type**

Boolean

**Default**

OFF (0)

```
SENSe<ch>:PULSe<name>:MTIMing:DEVice <device>[,<name>]
```
**Applicable Models:** All with Pulsed RF Measurement Option and Modulation Distortion Option

*(Read-Write)* Sets and reads the device being controlled by the pulse generator output.

**Parameters**

- `<ch>` Any existing channel number; if unspecified, value is set to 1.
- `<n>` Pulse generator number. Choose from 1 to 4.
  
  0 is the generator that pulses the ADC.
- `<device>` Pulse Device. Choose from:
  
  - **ADCTrigger** - (Pulse0 only) Pulse 0 is used to trigger the ADC.
  - **RFMOdul** - Indicates that the pulse signal is used to drive the RF modulator. Only one pulse generator output can be used to drive an RF source. If you try to set more than one pulse generator output to **RFMOdul**, then the other one will be set to **UserN** (where "N" is the pulse generator number).
  - **ADCActivity** - (Pulse4 only) Pulse4 can also be set to monitor ADC activity. This selection outputs a signal on Pulse4 when the ADC is active. This is the same as **SENSe:PULSe4:OPTion**.
  - **USR1** through **USR4** - Labels for user convenience. These labels do not connect the pulse generator to any specific hardware. These selections may be used to control a DUT, DC biases, or other signals.
- `<name>` Optional. String name of the pulse generator.
  
  Required for use with external pulse generators.
  
  Use **SENSe:PULSe:CAT?** to return the names of configured pulse generators.

If specified, `<n>` is ignored.

If unspecified, `<n>` is required for internal pulse generators.

**Examples**

```
SENSe:PULS:MTIM:DEV RFMOdul
```

**Query Syntax**

```
SENSe<ch>:PULSe:MTIMing:DEVice?
```

**Return Type**

Character

**Default**

RFMOdul
Applicable Models: N522xB, N524xB

(Read-Write) Sets the specific PULSe4 behavior to either “ALL” ADC ACTivity or “TRACe" ADC Activity, WHEN Pulse4 has been set to display ADC activity using the SENSE:PULSe4:OPTion command.

“ALL” ADC Activity enables PULSe4 to indicate all ADC activity, even ADC measurements that are not displayed as final trace data. An example are background measurements used for receiver leveling, but that are never displayed on a trace.

“TRACe” ADC Activity enables PULSe4 to indicate only the ADC activity that ends up displayed in a VNA trace.

Parameters

<ch> Any existing channel number; if unspecified, value is set to 1.
<char> ADC activity. Choose from:

ALL - Pulse 4 output pin indicates all ADC activity.

TRACe - Pulse 4 output pin indicates ADC being used for final measurements.

Examples

<table>
<thead>
<tr>
<th>Query Syntax</th>
<th>Return Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>SENS:PULS4:MODE TRACe</td>
<td>Character</td>
</tr>
</tbody>
</table>

SENSe<ch>:PULSe4:OPTion <bool>

Applicable Models: All with Pulsed RF Measurement Option

(Read-Write) Turns pulse4 output ON and OFF. Enable pulse4 to use an oscilloscope connected to pin 13 of the PULSE I/O connector on the rear panel of the VNA to display when the ADC is making measurements.

Note: The pulse output must be on using SENSE:PULSe4[:STATE] ON to view ADC activity.

Parameters

<ch> Any existing channel number; if unspecified, value is set to 1.
<bool> Choose from:

ON (or 1) - Pulse 4 output pin indicates ADC activity.

OFF (or 0) - Pulse 4 output pin indicates legacy behavior (pulse generator number 4 output).

Examples

<table>
<thead>
<tr>
<th>Query Syntax</th>
<th>Return Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>SENS:PULS4:OPT 1</td>
<td>Character</td>
</tr>
</tbody>
</table>
SENSe<ch>:PULSe:PERiod <value>[,<name>]

**Applicable Models:** All with Pulsed RF Measurement Option

(Read-Write) Sets the pulse-period (1/PRF) for ALL pulse generators.

The resolution of the period is:

DSP version: **4.0** = 16.667nS.

DSP version: **5.0** = 10nS

Learn more about DSP version.

See Pulse Definition diagram.

**Parameters**

- `<ch>` Any existing channel number; if unspecified, value is set to 1.
- `<value>` Pulse period in seconds. Choose a value from about 33ns to about 70 seconds.
- `<name>` Required for use with an external pulse generator.
  
  String name of the external pulse generator.

  If unspecified, the period for the internal pulse generators are set.

  Use `SENSe:PULSe:CAT?` to return the names of configured pulse generators.

**Examples**

```
SENS:PULS:PERiod .05
SENS:PULS:PER .01, "My81110"
```

**Query Syntax**

`SENSe<ch>:PULSe<ch>:PULSe:PERiod? [,<name>]`

**Return Type** Numeric

**Default** 1e-3 sec
**Applicable Models:** All with Pulsed RF Measurement Option

*(Read-Write)* Turns the pulse output ON and OFF.

**Parameters**

- `<ch>` Any existing channel number; if unspecified, value is set to 1.
- `<n>` Pulse generator number. Choose from 0 to 4.
  
  0 is the generator that pulses the ADC.
- `<value>` Boolean
  
  ON (or 1) - turns pulse output ON.
  
  OFF (or 0) - turns pulse output OFF.
- `<name>` Optional. String name of the pulse generator.
  
  Required for use with external pulse generators.
  
  Use `SENSe:PULSe:CAT?` to return the names of configured pulse generators.

  If specified, `<n>` is ignored.
  
  If unspecified, `<n>` is required for internal pulse generators.

**Examples**

```
SENSe:PULS1 1
SENSe:PULS 1, "My81110"
```

**Query Syntax**

`SENSe<ch>:PULSe<name>:STATe`?

**Return Type**

Boolean

**Default**

OFF

`SENSe<ch>:PULSe<n>:SUBPointtrig` <bool>
**Applicable Models:** All with Pulsed RF Measurement Option (Except M980xA, P50xxA, E5080B)

(Read-Write) Enables / Disables subpoint triggering. When enabled and performing **Point Averaging**, each rising edge of P0 triggers a subpoint (one of N acquisitions in an N point average). Must also enable the P0 generator using **SENS:PULS0:STAT**.

Learn more about the PNA-X pulse generators.

### Parameters

- `<ch>`: Any existing channel number; if unspecified, value is set to 1.
- `<n>`: Pulse generator number. **Must be 0** as this is the generator that triggers the ADC.
- `<bool>`: ON (or 1) - turns subpoint triggering ON.
  
  OFF (or 0) - turns subpoint triggering OFF.

### Examples

```
SENS:PULS0:SUBP 1
```

### Query Syntax

```
SENSe<ch>:PULSe0:SUBPointtrig?
```

### Return Type

Boolean

### Default

OFF

---

**SENS<ch>:PULSe:TPOLarity `<char>`**

**Applicable Models:** All with Pulsed RF Measurement Option

(Read-Write) Sets the polarity of the trigger signal to which the internal pulse generators will respond when being externally triggered at the PulseSyncIn pin.

**Note:** This feature requires DSP version: **4.0 FPGA: 34** or higher. [Learn more.](#)

Learn more about the PNA-X pulse generators.

### Parameters

- `<ch>`: Any existing channel number; if unspecified, value is set to 1.
- `<char>`: Pulse polarity. Choose from:
  
  **POSitive** - VNA responds to rising edge or HIGH level

  **NEGative** - VNA responds to falling edge or LOW level.

  Set Edge or Level triggering using **SENS:PULS:TTYPe**.

### Examples

```
SENS:PULS:TPOL NEG
```
SENSe<ch>:PULSe<n>:TTYPe <char>

Applicable Models: All with Pulsed RF Measurement Option (Except M980xA, P50xxA, E5080B)

(Read-Write) Sets the type of trigger signal to which the internal pulse generators will respond when being externally triggered at the PulseSyncIn pin.

Note: This feature requires DSP version: **4.0 FPGA: 34** or higher. [Learn more](#).

Learn more about the PNA-X pulse generators.

**Parameters**

- `<ch>` Any existing channel number; if unspecified, value is set to 1.
- `<char>` Trigger type. Choose from:
  - **EDGE** - VNA responds to the edge (rising or falling) of a signal
  - **LEVEL** - VNA responds to the level (HIGH or LOW) of a signal

Set polarity using `SENS:PULS:TPOL`

**Examples**

```
SENS:PULS:TTYP EDGE
```

**Query Syntax**

SENSe<ch>:PULSe<n>:TTYPe?

**Return Type** Character

**Default** LEVel - Also the type used when the PNA-X does not have the required DSP hardware.

**SENSe<ch>:PULSe<n>:WIDTh <value> [,.<name>]**
**Applicable Models:** All with Pulsed RF Measurement Option

*(Read-Write)* Sets the pulse width. The amount of time that the pulse is ON.

See Pulse Definition diagram.

**Parameters**

- `<ch>` Any existing channel number; if unspecified, value is set to 1.
- `<n>` Pulse generator number. Choose from 0 to 4.
  
  0 is the generator that pulses the ADC.
- `<value>` Pulse width in seconds. Choose a value from about 33ns to about 70 seconds.
- `<name>` Optional. String name of the pulse generator.

Required for use with external pulse generators.

Use `SENSe:PULSe:CAT?` to return the names of configured pulse generators.

If specified, `<n>` is ignored.

If unspecified, `<n>` is required for internal pulse generators.

**Examples**

- `SENS:PULS.WIDT .5`
- `SENS:PULS.WIDT .5, "My81110"`

**Query Syntax**

- `SENSe<ch>:PULSe<n>:WIDTH? [<name>]`

**Return Type**

- Numeric

**Default**

- `1e-4 sec`
SENSe:ROSCillator:CONTrol:AUTO <bool>

Applicable Models: N522xB, N524xB

(Read-Write) Enables selecting between locking to an external reference without the ability to change the reference frequency, or select internal or external reference with the ability to change the reference frequency.

Parameters

<bool>

ON (or 1) This is the default behavior which locks to an external reference without the ability to change the reference frequency.

OFF (or 0) Leaves the reference in its current state and all changes to the reference behavior must be made through the SCPI commands in this topic or by using the Reference dialog.

Examples

SENSe:ROSCillator:EXTernal:FREQuency
Applicable Models: M980xA, P50xxA/B, P93xxB, E5080B, N522xB, N524xB

(Read-Write) Set and read Reference Oscillator frequency at the reference input connector. 100 MHz reference is typical for M980xA, P50xxA/B, P93xxB E5080B.

**Parameters**

<num> 1E+7 or 1E+8

1E+7: accepts 10 MHZ reference
2E+7: accepts 20 MHZ reference
1E+8: accepts 100 MHz reference

**Examples**

SENSe:ROSCillator:EXT:FREQ 1E7
sense:roscillator:external:frequency 1E7

**Query Syntax**

SENSe:ROSCillator:EXT:FREQ?

**Return Type** Numeric

**Default** 1E+7

---

SENSe:ROSCillator:OUTPut:FREQuency

Applicable Models: M980xA, P50xxA/B, P93xxB, E5080B, N522xB, N524xB

(Read-Write) Set and read Reference Oscillator frequency outputted from the reference output connector. 100 MHz reference is typical for M980xA, P50xxA, E5080B.

**Parameters**

<num> 1E+7 or 1E+8

1E+7: outputs 10 MHz reference.
1E+8: outputs 100 MHz reference

**Examples**

SENSe:ROSCillator:OUTPut:FREQuency 1E8
sense:roscillator:output:frequency 1E8

**Query Syntax**

SENSe:ROSCillator:OUTPut:FREQuency?

**Return Type** Numeric

**Default** 1E+7
**SENSe:ROSCillator:SOURce?**

Applicable Models: M980xA, P50xxA/B, P93xxB, N522xB, N523xB, N524xB, E5080A/B

(Read-only) Applying a signal to the Reference Oscillator connector automatically sets the Reference Oscillator to EXTernal. This command allows you to check that it worked.

- **EXTERNal** is returned when a signal is present at the Reference Oscillator connector.
- **INTERNAL** is returned when NO signal is present at the Reference Oscillator connector.

<table>
<thead>
<tr>
<th>Examples</th>
<th>SENS:ROSC:SOUR?</th>
<th>sense:roscillator:source?</th>
</tr>
</thead>
<tbody>
<tr>
<td>Return Type</td>
<td>Character</td>
<td></td>
</tr>
<tr>
<td>Default</td>
<td>Not applicable</td>
<td></td>
</tr>
</tbody>
</table>

**SENSe:ROSCillator:SOURce <state>**

Applicable Models: M937xA, P93xxA/B, M980xA, P50xxA/B

(Write-only) Set and read the Reference Oscillator state.

**Note:** This setting is NOT cleared with Preset. However, it does clear when the M937xA software is restarted.

**Note:** Using the signal from PXI Chassis backplane degrades the measurement performance especially absolute measurement. This is due to worse phase noise on the reference signal from backplane.

**Parameters**

- **<state>** Choose from the following:
  - INTernal - Use the internal Reference Oscillator.
  - EXTernal - Use an external Reference Oscillator. Use SENSE:ROSCillator:SOURce:CONDition? to determine if the M937xA is locked to the external oscillator.
  - PXIBackplane - Use an external Reference Oscillator via PXI Chassis backplane (PXI only)

| Examples  | SENS:ROSC:SOUR INT | sense:roscillator:source external |
SENSe:ROSCillator:SOURce:CONDition?

**Applicable Models:** M937xA, P93xxB, M980xA, P50xxA/B, N522xB, N524xB

(Read-only) Reads the Reference Oscillator 'locked' condition.

When SENS:ROSC:SOUR is set to Internal, this command will always return "LOCKed".

When SENS:ROSC:SOUR is set to External, then this function takes about 100 usec to read the state of the hardware.

**Examples**

```
SENSe:ROSCillator:COND?
sense:roscillator:source:condition?
```

**Return Type** Character

**Default** Not applicable
Spectrum Analyzer Commands

Controls the Spectrum Analyzer Application.

**SA Marker Settings**

Sets and reads the bandwidth of the band density marker.

CALCulate:MEASure:SA:MARKer:BDENsity:BW
CALCulate:SA:MARKer:BDENsity:BW

Returns the band density level in dBm/Hz from the band density marker.

CALCulate:MEASure:SA:MARKer:BDENsity:DATA?
CALCulate:SA:MARKer:BDENsity:DATA?

Marker to SA
CALC:MEAS:MARKer:SET SA

Read Band Power
CALC:MEAS:SA:MARK:BPOWer:DATA?

Set and read Band Power
CALC:MEAS:SA:MARK:BPOWer:SPAN

Set Band Power State
CALC:MEAS:SA:MARK:BPOWer[:STATe]

Read occupied bandwidth center frequency
CALC:MEAS:SA:MARK:OCCBand:CENTer?

Set and read occupied bandwidth percentage of span
CALC:MEAS:SA:MARK:OCCBand:PERCent

Read the occupied bandwidth power.
CALC:MEAS:SA:MARK:OCCBand:POWer?
Read occupied bandwidth span
CALC:MEAS:SA:MARK:OCCBand:SPAN?

Set occupied bandwidth state
CALC:MEAS:SA:MARK:OCCBand[:STATE]

Sets and reads the state of the band density noise marker.
CALCulate:MEASure:SA:MARKer:BDENsity:NOISe[:STATE]
CALCulate:SA:MARKer:BDENsity:NOISe[:STATE]

Sets and reads the bandwidth of the band power density marker.
CALCulate:MEASure:SA:MARKer:BDENsity:POWer:BW
CALCulate:SA:MARKer:BDENsity:POWer:BW

Sets and reads the state of the band power density marker.
CALCulate:MEASure:SA:MARKer:BDENsity:POWer[:STATE]
CALCulate:SA:MARKer:BDENsity:POWer[:STATE]

Sets and reads the bandwidth of the band tone density marker.
CALCulate:SA:MARKer:BDENsity:TONE:BW

Sets and reads the state of the band tone
CALCulate:MEASure:SA:MARKer:BDENsity:TONE[:STATE]
CALCulate:SA:MARKer:BDENsity:TONE[:STATE]
density marker.
Sets and reads the spacing of the band tone density marker.

CALCulate:SA:MARKer:BDENsity:TONE:TSPacing

Sets and reads the frequency span used by Power Density to normalize the power.

CALCulate:MEASure:SA:MARKer:BDENsity:EQSPan
CALCulate:SA:MARKer:BDENsity:EQSPan

Other SA commands

- CALCulate:MEASure:DEFine - creates an SA measurement.
- SA Calibration uses the Guided Calibration commands.

End of Sweep Processing

The SENS:SA:DATA:KEEP commands keep the memory buffer of the last full sweep in memory for further processing. This is not done by default because keeping the whole data in memory requires large amounts of memory and processing (for example, in the case of wide span or low RBW).

Before the implementation of this function, raw data could be sent to a file (ascii or binary) or the fifo, as this can be done while sweeping with no need to keep the whole data in memory.
This option is still available.

With each sweep, the data buffers are filled, and are erased if a new speed is started. In other words, this feature works well in the logic of “Single” sweeps with a wait for OPC: (operation complete). You must ensure that a full sweep is in the buffers before pulling out raw data.

The receiver list can be either ALL, or a comma separated list of valid receivers.

One command defines a list of receivers and another command reads which receivers are currently kept in memory. Only the receivers currently defined for measurement traces can be kept in memory.

---

**SENS<ch>:SA:ADC:ACQTime?**

**Applicable Models:** All with Spectrum Analysis Options (S9x09xxA/B, S9x09xA/B)

*(Read-only)* Returns the LO acquisition time which is the ADC Record Size x ADC Sampling Frequency (10 nsec or 40 nsec) x (1 + Stacking) x (Video Average.Coefficient).

**Parameters**

- `<ch>`: Channel number of the measurement. If unspecified, value is set to 1.

**Examples**

- `SENS:SA:ADC:ACQT?`
- `sense2:sa:adc:acqtime?`

**Default**

Not applicable

---

**SENS<ch>:SA:ADC:DITHer[:STATe] <bool>**
(Read-Write) Set and read the ON/OFF state of the dither setting

**Parameters**

- `<ch>` Any existing SA channel. If unspecified, value is set to 1.
- `<bool>` Choose from:
  - **0 - OFF** - Dither OFF.
  - **1 - ON** - Dither ON.

Learn about these settings.

**Examples**

```
SENS:SA:ADC:DITH 1
```

**Query Syntax**

```
SENSe<ch>:SA:ADC:DITH?
```

**Return Type** Boolean

**Default** 0

---

**SENSe<ch>:SA:ADC:FILTer <num>**

(Read-Write) Set and read the ADC filter cutoff frequency. The entered frequency value is rounded to the closest value supported by the VNA (11 MHz or 38 MHz).

**Parameters**

- `<ch>` Any existing SA channel. If unspecified, value is set to 1.
- `<num>` Choose 11 MHz or 38 MHz.

Learn about these settings.

**Examples**

```
SENS:SA:ADC:FILTer 11MHz
```

**Query Syntax**

```
SENSe<ch>:SA:ADC:FILTer?
```

**Return Type** Numeric

**Default** 11 MHz
SENSe<ch>:SA:ADC:FILTer:AUTO <bool>

Applicable Models: All with Spectrum Analysis Options (S9x09xxA/B, S9x09xA/B) (Except M98x0A, P50xxA)

(Read-Write) Set and read how the ADC filter is set. When ON, the ADC filter is set based on the start and stop frequencies and the ADC sampling frequency.

Parameters

<ch> Any existing SA channel. If unspecified, value is set to 0.
<bool> Choose from:

0 - OFF - ADC filter is set manually using SENSe:SA:ADC:FILT.

1 - ON - ADC filter is set automatically.

Learn about these settings.

Examples SENSe<ch>:SA:ADC:FILTer:AUTO ON

Query Syntax SENSe<ch>:SA:ADC:FILTer:AUTO?

Return Type Boolean

Default 1

SENSe<ch>:SA:ADC:MREC:PERiod <value>

Applicable Models: All with Spectrum Analysis Options (S9x09xxA/B, S9x09xA/B) (Except M98x0A, P50xxA)

(Read-Write) Set and read the period to wait between ADC record chunks.

Parameters

<ch> Any existing SA channel. If unspecified, value is set to 1.
,value> Choose a value between 64 and 33554432

Learn about these settings.

Examples SENSe<ch>:SA:ADC:MREC:PER 256

Query Syntax SENSe<ch>:SA:ADC:MREC:PERiod?

Return Type Integer

Default 64
SENSe<ch>:SA:ADC:MREC:SIZE <value>

**Applicable Models:** All with Spectrum Analysis Options (S9x09xxA/B, S9x09xA/B) (Except M98x0A, P50xxA)

*(Read-Write)* Set and read the size of the ADC record chunks.

**Parameters**

- `<ch>` Any existing SA channel. If unspecified, value is set to 1.
- `<value>` Choose a value between 1 and (ADC record size / 2).

Learn about these settings.

**Examples**

<table>
<thead>
<tr>
<th>Query Syntax</th>
<th>Return Type</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>SENS:SA:ADC:MREC:SIZE 256</td>
<td>Integer</td>
<td>32</td>
</tr>
</tbody>
</table>

**SENSe:SA:ADC:MREC[:STATe] <bool>**

**Applicable Models:** All with Spectrum Analysis Options (S9x09xxA/B, S9x09xA/B) (Except M98x0A, P50xxA)

*(Read-Write)* Set and read the ON/OFF state of the multiple recording function. Multiple recording allows the ADC Record Size to be divided and acquired in smaller "chunks" and also to specify a wait period between these acquisitions.

**Parameters**

- `<ch>` Any existing SA channel. If unspecified, value is set to 1.
- `<bool>` Choose from:
  - **0 - OFF** - ADC record size "chunking" OFF.
  - **1 - ON** - ADC record size "chunking" ON.

Learn about these settings.

**Examples**

<table>
<thead>
<tr>

<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>SENS:SA:ADC:MREC 0</td>
<td>Boolean</td>
<td>0</td>
</tr>
</tbody>
</table>
SENSe<ch>:SA:ADC:OVERload:COUNt?

**Applicable Models:** All with Spectrum Analysis Options (S9x09xxA/B, S9x09xA/B)

*(Read-only)* Read the count of ADCs/receivers in overload status for the previous sweep. The count is cleared if a new sweep is started. Zero indicates no overload.

**Parameters**

- `<ch>` Any existing SA channel. If unspecified, value is set to 1.

**Examples**

```
SENS:SA:ADC:OVER:COUN? 0
```

**Return Type** Integer

**Default** Not applicable

SENSe<ch>:SA:ADC:OVERload:LIST?

**Applicable Models:** All with Spectrum Analysis Options (S9x09xxA/B, S9x09xA/B)

*(Read-only)* Read the list of measured receivers in overload status for the previous sweep. The list is cleared if a new sweep is started.

**Parameters**

- `<ch>` Any existing SA channel. If unspecified, value is set to 1.

**Examples**

```
SENS:SA:ADC:OVER:LIST? "b2,b4"
```

**Return Type** String

**Default** Not applicable

SENSe<ch>:SA:ADC:OVERload:PERCent <num>
**Applicable Models:** All with Spectrum Analysis Options (S9x09xxA/B, S9x09xA/B)

**(Read-Write)** Set and read the ADC overload threshold percentage.

**Parameters**

- `<ch>` Any existing SA channel. If unspecified, value is set to 1.
- `<num>` ADC overload threshold percentage.

**Examples**

```
SENS:SA:ADC:OVER:PERC 80
```

**Query Syntax**

```
SENSe<ch>:SA:ADC:OVERload:PERCent?
```

**Return Type** Numeric

**Default** 80

---

```
SENSe<ch>:SA:ADC:RANGe:PERCent[:MAXimum]?
```

**Applicable Models:** All with Spectrum Analysis Options (S9x09xxA/B, S9x09xA/B)

**(Read-only)** Read the maximum ADC percentage range of all receivers in use. For example, if the ADC range is -8190 to +8190 and the current min and max ADC values are (for this sweep) -4000 and +4195, then the percentage range is 50%. An incorrect request will return 0.0 or 100.0 depending on the request.

**Parameters**

- `<ch>` Any existing SA channel. If unspecified, value is set to 1.

**Examples**

```
SENS:SA:ADC:RANG:PERC:MAX?
```

**Return Type** Integer

**Default** Not applicable

---

```
SENSe<ch>:SA:ADC:RANGe:PERCent:MINimum?
```
**Applicable Models:** All with Spectrum Analysis Options (S9x09xxA/B, S9x09x/A/B)

*(Read-only)* Read the minimum ADC percentage range of all receivers in use. For example, if the ADC range is -8190 to +8190 and the current min and max ADC values are (for this sweep) -4000 and +4195, then the percentage range is 50%. An incorrect request will return 0.0 or 100.0 depending on the request.

**Parameters**

- `<ch>` Any existing SA channel. If unspecified, value is set to 1.

**Examples**

```
SENS:SA:ADC:RANG:PERC:MIN?
```

**Return Type**

Integer

**Default**

Not applicable

**SENSe<ch>:SA:ADC:RANGe:PERCent:RECeiver? <recName>**

**Applicable Models:** All with Spectrum Analysis Options (S9x09xxA/B, S9x09x/A/B)

*(Read-only)* Read the ADC percentage range for the specified receiver. For example, if the ADC range is -8190 to +8190 and the current min and max ADC values are (for this sweep) -4000 and +4195, then the percentage range is 50%. An incorrect request will return 0.0 or 100.0 depending on the request.

**Parameters**

- `<ch>` Any existing SA channel. If unspecified, value is set to 1.
- `<recName>` (String) Receiver name

**Examples**

```
SENS:SA:ADC:RANG:PERC:REC? "b2"
```

**Return Type**

Integer

**Default**

Not applicable

**SENSe<ch>:SA:ADC:RECord:SIZE:FORCe[:STATe] <bool>**
Applicable Models: All with Spectrum Analysis Options (S9x09xxA/B, S9x09xA/B)

(Read-Write) Set and read the ADC record size mode.

Parameters

- `<ch>` Any existing SA channel. If unspecified, value is set to 1.
- `<bool>` Choose from:

  0 - OFF - ADC record size set automatically.

  1 - ON - Manually set ADC record to specified size.

Examples

SENS:SA:ADC:REC:SIZE:FORC:STAT 1

Query Syntax

SENSe<ch>:SA:ADC:REC:SIZE:FORC[:STATe]?  

Return Type  

Boolean

Default  

0

SENSe<ch>:SA:ADC:RECord:SIZE:FORCE:VALue <num>

Applicable Models: All with Spectrum Analysis Options (S9x09xxA/B, S9x09xA/B)

(Read-Write) Set and read the integer size value for the force ADC record size feature.

Parameters

- `<ch>` Any existing SA channel. If unspecified, value is set to 1.
- `<num>` ADC record size.

Examples

SENS:SA:ADC:REC:SIZE:FORCE:VAL 64

Query Syntax

SENSe<ch>:SA:ADC:REC:SIZE:FORCE:VAL?

Return Type  

Numeric

Default  

Not applicable
**Applicable Models:** All with Spectrum Analysis Options (S9x09xxA/B, S9x09xA/B)

*(Read-only)* Read the current maximum available ADC record size.

**Parameters**

- `<ch>` Any existing SA channel. If unspecified, value is set to 1.

**Examples**

```
SENS:SA:ADC:REC:SIZE:MAX?
```

**Return Type** Integer

**Default** Not applicable

---

```
SENS<ch>:SA:ADC:RECord:SIZE:MIN?
```

**Applicable Models:** All with Spectrum Analysis Options (S9x09xxA/B, S9x09xA/B)

*(Read-only)* Read the current minimum available ADC record size.

**Parameters**

- `<ch>` Any existing SA channel. If unspecified, value is set to 1.

**Examples**

```
SENS<ch>:SA:ADC:REC:SIZE:MIN?
```

**Return Type** Integer

**Default** Not applicable

---

```
SENS<ch>:SA:ADC:RECord:SIZE:VALue?
```

**Applicable Models:** All with Spectrum Analysis Options (S9x09xxA/B, S9x09xA/B)

*(Read-only)* Read ADC record size value.

**Parameters**

- `<ch>` Any existing SA channel. If unspecified, value is set to 1.

**Examples**

```
```

**Return Type** Integer

**Default** Not applicable

---

```
SENS<ch>:SA:ADC:SAMPle:DECimation:FIR <bool>
```

---
**Applicable Models:** All with Spectrum Analysis Options (S9x09xxA/B, S9x09xA/B) (Except M98x0A, P50xxA)

(Read-Write) Set and read the FIR filter for 25 MHz decimation.

**Parameters**

- `<ch>` Any existing SA channel. If unspecified, value is set to 1.
- `<bool>` Choose from:
  - **0 - OFF** - Disable 25 MHz FIR filter.
  - **1 - ON** - Enable 25 MHz FIR filter.

**Examples**

```
SENS:SA:ADC:SAMP:DECimation:FIR 1
```

**Query Syntax**

```
SENSe<ch>:SA:ADC:SAMP:DECimation:FIR?
```

**Return Type**

Boolean

**Default**

0

---

**SENSe<ch>:SA:ADC:SAMP:RATE <num>**

**Applicable Models:** All with Spectrum Analysis Options (S9x09xxA/B, S9x09xA/B) (Except M98x0A, P50xxA)

(Read-Write) Set and read the ADC sampling frequency. The entered frequency is rounded to the closest value supported by the VNA (25 MHz or 100 MHz).

**Parameters**

- `<ch>` Any existing SA channel.
- `<num>` Choose from 100 MHz or 25 MHz.

Learn about these settings.

**Examples**

```
SENS:SA:ADC:SAMP:RATE 100MHz
```

**Query Syntax**

```
SENSe<ch>:SA:ADC:SAMP:RATE?
```

**Return Type**

Numeric

**Default**

100 MHz

---

**SENSe<ch>:SA:ADC:SAMP:RATE:AUTO <bool>**
Applicable Models: All with Spectrum Analysis Options (S9x09xxA/B, S9x09xA/B) (Except M98x0A, P50xxA)

(Read-Write) Set and read the ADC sample rate mode.

Parameters

<ch>  Any existing SA channel. If unspecified, value is set to 1.

<bool>  Choose from:

0 - OFF - Manually set ADC sampling rate using SENSE:SA:ADC:SAMPLE:RATE.

1 - ON - ADC sampling rate set automatically.

Learn about these settings.

Examples

```
SENS:SA:ADC:SAMP:RATE:AUTO 1
```

Query Syntax

SENSe<ch>:SA:ADC:SAMPle:RATE:AUTO?

Return Type  Boolean

Default  1

SENSe:SA:ADC:STAcking:STATe <bool>

Applicable Models: All with Spectrum Analysis Options (S9x09xxA/B, S9x09xA/B) (Except M98x0A, P50xxA)

(Read-Write) Set and read the ON/OFF state of the ADC sample stacking.

Parameters

<ch>  Any existing SA channel. If unspecified, value is set to 1.

<bool>  Choose from:

0 - OFF - ADC sample stacking OFF.

1 - ON - ADC sample stacking ON.

Learn about these settings.

Examples

```
SENS:SA:ADC:STAC:STAT 0
```

Query Syntax

SENSe<ch>:SA:ADC:STACking:STATe?

Return Type  Boolean
**SENSe<ch>:SA:ADC:STACking:VALue [<MAX>,] <value>**

**Applicable Models:** All with Spectrum Analysis Options (S9x09xxA/B, S9x09xA/B) (Except M98x0A, P50xxA)

*(Read-Write)* Set and read the ADC stacking value.

**Parameters**
- `<ch>` Any existing SA channel. If unspecified, value is set to 0 (no stacking).
- `[<MAX>]` Sets and reads the current maximum available stacking size.
- `<value>` Choose a value between 0 and 65535.

Learn about these settings.

**Examples**

```plaintext
SENSe:SA:ADC:STAC:VAL 1
```

**Query Syntax**

```
SENSe<ch>:SA:ADC:STACking:VALue? MAX
```

**Return Type**

Integer

**Default**

0

---

**SENSe<ch>:SA:BANDwidth[:RESolution] <num>**

**Applicable Models:** All with Spectrum Analysis Options (S9x09xxA/B, S9x09xA/B)

*(Read-Write)* Set and read the resolution bandwidth. Also set SENSe:SA:BAND:AUTO OFF.

**Parameters**
- `<ch>` Any existing SA channel. If unspecified, value is set to 1.
- `<num>` Choose a value between 6 Hz and 3 MHz. Attempting to set the bandwidth outside these bounds will force the bandwidth to the nearest bound.

Learn about these settings.

**Examples**

```plaintext
SENSe<ch>:SA:BAND 1e3
```

**Query Syntax**

```
SENSe<ch>:SA:BANDwidth[:RESolution]?
```

**Return Type**

Numeric

**Default**

100 kHz
SENSe<ch>:SA:BANDwidth:RESolution <enum>

**Applicable Models:** All with Spectrum Analysis Options (S9x09xxA/B, S9x09xA/B)

*(Read-Write)* Set and read the minimum and maximum resolution bandwidth.

**Parameters**

- `<ch>` Any existing SA channel. If unspecified, value is set to 1.
- `<enum>` Choose from:
  - **MAX**
  - **MIN**

**Examples**

- `SENS:SA:BAND:RES MAX`

**Query Syntax**

- `SENSe<ch>:SA:BANDwidth:RESolution? MIN`

**Return Type**

- Double

**Default**

- N/A

SENSe<ch>:SA:BANDwidth[:RESolution]:AUTO <bool>

**Applicable Models:** All with Spectrum Analysis Options (S9x09xxA/B, S9x09xA/B)

*(Read-Write)* Set and read how the resolution bandwidth is set. When ON, the resolution bandwidth is set based on Span/RBW ratio.

**Parameters**

- `<ch>` Any existing SA channel. If unspecified, value is set to 1.
- `<bool>` Choose from:
  - **0** - **OFF** - Res. BW is set manually using SENS:SA:BAND.
  - **1** - **ON** - Res. BW is set automatically.

**Examples**

- `SENS:SA:BAND:AUTO 1`

**Query Syntax**

- `SENSe<ch>:SA:BANDwidth[:RESolution]:AUTO?`

**Return Type**

- Boolean

**Default**

- 1
SENSe<ch>:SA:BANDwidth:RESolution:CATalog?

**Applicable Models:** All with Spectrum Analysis Options (S9x09xxA/B, S9x09xA/B)

*(Read-only)* Read the list of all Resolution Bandwidth values currently supported with spectrum analyzer current settings.

**Parameters**
- `<ch>` Any existing SA channel. If unspecified, value is set to 1.

**Examples**
- `SENS:SA:BAND:RES:CAT?`

**Default** Not applicable

SENSe<ch>:SA:BANDwidth:SEARch:OCCupied:MIN <num>

**Applicable Models:** All with Spectrum Analysis Options (S9x09xxA/B, S9x09xA/B)

*(Read-Write)* Set and read the minimum search frequency to use during an Occupied BW search measurement. Power below this frequency is ignored.

**Parameters**
- `<ch>` Any existing SA channel. If unspecified, value is set to 1.
- `<num>` Minimum search frequency value.

**Examples**

**Query Syntax**
- `SENSe<ch>:SA:BANDwidth:SEARch:OCCupied:MIN?`

**Return Type** Numeric

**Default** 250 MHz

SENSe<ch>:SA:BANDwidth:SHAPe <enum>
**Applicable Models:** All with Spectrum Analysis Options (S9x09xxA/B, S9x09xA/B)

(Read-Write) Set and read the resolution bandwidth shape.

**Parameters**

- `<ch>`: Any existing SA channel. If unspecified, value is set to 1.
- `<enum>`: Choose from:
  - GAUSsian
  - FLATtop
  - KAISeR
  - BLACkman
  - NONE

Learn about these settings.

**Examples**

SENS:SA:BAND:SHAPE GAUS

**Query Syntax**

SENSe<ch>:SA:BANDwidth:SHAPE?

**Return Type**

Enumeration

**Default**

GAUSsian

---

**SENS<ch>:SA:BANDwidth:VIDeo <enum>**

**Applicable Models:** All with Spectrum Analysis Options (S9x09xxA/B, S9x09xA/B)

(Read-Write) Set and read the minimum and maximum video bandwidth.

**Parameters**

- `<ch>`: Any existing SA channel. If unspecified, value is set to 1.
- `<enum>`: Choose from:
  - MAX
  - MIN

**Examples**

SENS:SA:BAND:VID MAX

**Query Syntax**

SENSe<ch>:SA:BANDwidth:VIDeo? MIN

**Return Type**

Double
**SENS<ch>:SA:BANDwidth:VIDeo <num>**

**Applicable Models:** All with Spectrum Analysis Options (S9x09xxA/B, S9x09xA/B)

*(Read-Write)* Set and read the Video bandwidth. Also set SENS:SA:BAND:VID:AUTO OFF.

**Parameters**

- `<ch>` Any existing SA channel. If unspecified, value is set to 1.
- `<num>` Choose a value between 3 Hz and 3 MHz. Going outside this range places the trace into a hold mode.

**Examples**

<table>
<thead>
<tr>
<th>Query Syntax</th>
<th>Return Type</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>SENS&lt;ch&gt;:SA:BANDvid 1e5</td>
<td>Numeric</td>
<td>100 kHz</td>
</tr>
</tbody>
</table>

**Query Syntax**

SENS<ch>:SA:BANDwidth:VIDeo?

**Return Type**

Numeric

**Default**

N/A

---

**SENS<ch>:SA:BANDwidth:VIDeo:AUTO <bool>**

**Applicable Models:** All with Spectrum Analysis Options (S9x09xxA/B, S9x09xA/B)

*(Read-Write)* Set and read how the video bandwidth is set. When ON, video bandwidth is set based on RBW/VBW ratio.

**Parameters**

- `<ch>` Any existing SA channel. If unspecified, value is set to 1.
- `<bool>` Choose from:
  - **0 - OFF** - Video BW is set manually using SENS:SA:BAND.
  - **1 - ON** - Video BW is set automatically.

**Examples**

<table>
<thead>
<tr>
<th>Query Syntax</th>
<th>Return Type</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>SENS&lt;ch&gt;:SA:BANDvid:AUTO 1</td>
<td>Boolean</td>
<td></td>
</tr>
</tbody>
</table>

**Query Syntax**

SENS<ch>:SA:BANDwidth:VIDeo:AUTO?

**Return Type**

Boolean
SENSe<ch>:SA:BANDwidth:VIDeo:AVERage:COUNt?

**Applicable Models:** All with Spectrum Analysis Options (S9x09xxA/B, S9x09xA/B)

*(Read-only)* Reads the number of Video bandwidth sweeps that are averaged together. This readout is displayed on the SA setup page.

**Parameters**
- `<ch>`: Any existing SA channel. If unspecified, value is set to 1.

**Examples**
- `SENSe<ch>:SA:BANDwidth:VIDeo:AVERage:COUNt?`

**Query Syntax**
- `SENSe<ch>:SA:BANDwidth:VIDeo:AVERage:COUNt?`

**Return Type**
- Numeric

**Default**
- 1

SENSe<ch>:SA:BANDwidth:VIDeo:AVER:TYPE <enum>

**Applicable Models:** All with Spectrum Analysis Options (S9x09xxA/B, S9x09xA/B)

*(Read-Write)* Set and read the averaging type.

**Parameters**
- `<ch>`: Any existing SA channel. If unspecified, value is set to 1.
- `<enum>`: Choose from:
  - VOLTage
  - POWer
  - LOG
  - VMAX (Voltage Max)
  - VMIN (Voltage Min)

Learn about these settings.

**Examples**
- `SENSe<ch>:SA:BANDwidth:VIDeo:AVER:TYPE VOLT`

**Query Syntax**
- `SENSe<ch>:SA:BANDwidth:VIDeo:AVER:TYPE?`
**Return Type**  Enumeration
**Default**  POWe

**SENS<ch>:SA:BANDwidth:VIDeo:RATio num**

**Applicable Models:** All with Spectrum Analysis Options (S9x09xxA/B, S9x09xA/B)

(Read-Write) Set and read the RBW / VBW ratio.

**Parameters**
- <ch>  Any existing SA channel. If unspecified, value is set to 1.
- <num>  RBW / VBW ratio.

Learn about these settings.

**Examples**  
SENS:SA:BAND:VID:RAT

**Query Syntax**  SENS<ch>:SA:BANDwidth:VIDeo:RATio?

**Return Type**  Numeric
**Default**  1.0

**Applicable Models:** All with Modulation Distortion (S9x070B) and Spectrum Analysis (S9x09xxA/B, S9x09xA/B)

(Write-only) Auto tunes all measurement bands for the modulation distortion channel.

**Parameters**
- <cnum>  Any existing Modulation Distortion channel. If unspecified, value is set to 1.

**Examples**  SENS:SA:COH:DIST:FREQ:TUNE:IMM

**Return Type**  Not applicable
**Default**  Not applicable

**Applicable Models:** All with Modulation Distortion (S9x070B) and Spectrum Analysis (S9x09xxA/B, S9x09xA/B, multitone only)

*(Read Only)* Return the last monitor result of LO feedthru monitor.

**Parameters**
- `<ch>` Any existing MOD channel. If unspecified, value is set to 1.

**Examples**

**Query Syntax**

**Return Type**
- Boolean (1 or 0) A "1" is pass and a "0" is fail.

**Default**
- Not applicable

---

**Applicable Models:** All with Modulation Distortion (S9x070B) and Spectrum Analysis (S9x09xxA/B, S9x09xA/B, multitone only)

*(Read Only)* Return the last monitor value of LO feedthru monitor.

**Parameters**
- `<ch>` Any existing MOD channel. If unspecified, value is set to 1.

**Examples**

**Query Syntax**

**Return Type**
- real (dBm for ABSolute type, dBc for BAND or ATONe types)

**Default**
- Not applicable

---

**SENSe<ch>:SA:COHerence:LO:FTHRu:MONitor:RECeiver <string>**
**Applicable Models:** All with Modulation Distortion (S9x070B) and Spectrum Analysis (S9x09xxA/B, S9x09xA/B, multitone only)

*(Read-Write)* Set and read the target receiver for LO Feedthru monitor. Select the reference receiver in most cases.

**Parameters**
- `<ch>` Any existing MOD channel. If unspecified, value is set to 1.
- `<String>` Specify the receiver port for LO Feedthru monitor.

**Examples**
```
SENS:SA:COH:LO:FTHR:MON:REC "a1"
```

**Query Syntax**
```
SENSe<ch>:SA:COHerence:LO:FTHRu:MONitor:RECeiver?
```

**Return Type** String

**Default** "a1"

---

**Applicable Models:** All with Modulation Distortion (S9x070B) and Spectrum Analysis (S9x09xxA/B, S9x09xA/B, multitone only)

*(Read-Write)* Set and read the LO feedthru monitoring state. Use SENS:SA:COH:LO:FTHR:MON:LAST:FAIL? to query the result. SYST:ERR? does not include the monitor fail result.

**Parameters**
- `<ch>` Any existing MOD channel. If unspecified, value is set to 1.
- `<bool>` Choose from:
  - 0 - OFF - LO feedthru monitor disabled.
  - 1 - ON - LO feedthru monitor enabled.

**Examples**
```
SENS:SA:COH:LO:FTHR:MON 1
```

**Query Syntax**
```
SENSe<ch>:SA:COHerence:LO:FTHRu:MONitor[:STATe]?
```

**Return Type** Boolean

**Default** OFF

---

```SENSe<ch>:SA:COHerence:LO:FTHRu:MONitor:TOLerance <real>`
**Applicable Models:** All with Modulation Distortion (S9x070B) and Spectrum Analysis (S9x09xxA/B, S9x09xA/B, multitone only)

**Parameters**

- `<ch>` Any existing MOD channel. If unspecified, value is set to 1.
- `<num>` Specify the threshold level. For ABSolute type: absolute tone level in dBm. For BAND or ATONe types: relative level in dBc.

**Examples**

```
```

**Query Syntax**

```
SENSe<ch>:SA:COHerence:LO::FTHRu:MONitor:TOLerance?
```

**Return Type**

real

**Default**

-40

---

**SENSe<ch>:SA:COHerence:LO:FTHRu:MONitor:TYPE <enum>**

*Applicable Models:* All with Modulation Distortion (S9x070B) and Spectrum Analysis (S9x09xxA/B, S9x09xA/B, multitone only)

*(Read-Write)* Set and read the monitoring method for LO feedthru monitor.

**Parameters**

- `<ch>` Any existing SA channel. If unspecified, value is set to 1.
- `<enum>` Choose from:
  - **BAND:** relative to total band power
  - **ATONe:** relative to average tone power
  - **ABSolute:** absolute tone power

**Examples**

```
SENS:SA:COH:MULT:DATA ALL
```

**Query Syntax**

```
SENSe<ch>:SA:COHerence:LO:FTHRu:MONitor:TYPE?
```

**Return Type**

Enum

**Default**

BAND

---

**SENSe<ch>:SA:COHerence:MULTitone:DATA <enum>**
**Applicable Models:** All with Spectrum Analysis Options (S9x09xxA/B, S9x09xA/B) (Except M98x0A, P50xxA)

*(Read-Write)* Set and read the data display mode.

**Parameters**

- `<ch>` Any existing SA channel. If unspecified, value is set to 1.
- `<enum>` Choose from:
  - **ALL**: Legacy SA mode - all frequency points are displayed.
  - **ZNTones**: All the frequencies that are not on the multi-tone coherence grid are set to -200 dBm before being displayed. This setting only has an effect if the coherence multitone mode is enabled.
  - **DNTones**: Deletes span frequencies that are not on the multitone grid.

**Examples**

```
SENS : SA : COHerence : MULT : DATA  ALL
```

**Query Syntax**

```SEnSe<ch>:SA:COHerence:MULTitone:DATA?```

**Return Type**

- Enum

**Default**

**SENSe<ch>:SA:COHerence:MULTitone:HREJect <num>**

**Applicable Models:** All with Spectrum Analysis Options (S9x09xxA/B, S9x09xA/B) (Except M98x0A, P50xxA)

*(Read-Write)* Set and read the number of test signal harmonics you want to be protected against. This adds constraints to the list of LOs used to cover the span.

**Parameters**

- `<ch>` Any existing SA channel. If unspecified, value is set to 1.
- `<num>` Number of test signal harmonics to be protected. The more this number is increased, the more constraints are added on the span LOs setting.

**Examples**

```
SENS : SA : COH : MULT : HREJ  0
```

**Query Syntax**

```SEnSe<ch>:SA:COHerence:MULTitone:HREJect?```

**Return Type**

- Integer

**Default**

0
SENSe<ch>:SA:COHerence:MULTitone:NYQReJect <num>

**Applicable Models:** All with Spectrum Analysis Options (S9x09xxA/B, S9x09xA/B) (Except M98x0A, P50xxA)

*(Read-Write)* Sets and returns the Nyquist protection level. Avoids Nyquist images of the IF higher order signal to fall back on multitone frequencies. This setting can only be set > 1 if the tone spacing of the multitone is not an integer divider of 100 MHz.

**Parameters**
- `<ch>` Any existing SA channel. If unspecified, value is set to 1.
- `<num>` Nyquist protection level.

**Examples**
```
SENS:SA:COH:MULT:NYQR 2
```

**Query Syntax**
```
SENSe<ch>:SA:COHerence:MULTitone:NYQReject?
```

**Return Type**
Integer

**Default**
0

SENSe<ch>:SA:COHerence:MULTitone:PERiod <num>

**Applicable Models:** All with Spectrum Analysis Options (S9x09xxA/B, S9x09xA/B) (Except M98x0A, P50xxA)

*(Read-Write)* Set and read the test signal repetition rate (in seconds). This value is 1/SA:COH:MULT:SPAC.

**Parameters**
- `<ch>` Any existing SA channel. If unspecified, value is set to 1.
- `<num>` Test signal repetition rate (in seconds).

**Examples**
```
SENS:SA:COH:MULT:PER 1E6
```

**Query Syntax**
```
SENSe<ch>:SA:COHerence:MULTitone:PERiod?
```

**Return Type**
Double

**Default**
1E6

SENSe<ch>:SA:COHerence:MULTitone:REFerence <num>
Applicable Models: All with Spectrum Analysis Options (S9x09xxA/B, S9x09xA/B) (Except M98x0A, P50xxA)

(Read-Write) Set and read the multitone image rejection offset frequency. If the multitone grid does not start from 0 Hz, this command is used to set its offset. To make this more convenient, this command accepts as well the frequency of any tone of the multitone grid (Hz).

Parameters
- `<ch>` Any existing SA channel. If unspecified, value is set to 1.
- `<num>` Offset frequency (in Hz).

Examples
- `SENSe:SA:COHerence:MULTitone:REF 0`

Query Syntax
- `SENSe<ch>:SA:COHerence:MULTitone:REFerence?`

Return Type
- Double

Default
- 0

SENSe<ch>:SA:COHerence:MULTitone:SPACing <num>

Applicable Models: All with Spectrum Analysis Options (S9x09xxA/B, S9x09xA/B) (Except M98x0A, P50xxA)

(Read-Write) Set and read the tone spacing of the multitone signal (in Hz). This value is 1/SA:COH:MULT:PER.

Parameters
- `<ch>` Any existing SA channel. If unspecified, value is set to 1.
- `<num>` Frequency spacing of multitone signal (in Hz).

Examples
- `SENSe:SA:COHerence:MULTitone:SPAC 1E6`

Query Syntax
- `SENSe<ch>:SA:COHerence:MULTitone:SPACing?`

Return Type
- Double

Default
- 1000000

SENSe<ch>:SA:COHerence:MULTitone[:STATe] <bool>
**Applicable Models:** All with Spectrum Analysis Options (S9x09xxA/B, S9x09xA/B) (Except M98x0A, P50xxA)

*(Read-Write)* Enables/disables multitone image rejection. When enabled, the window type is set to No Window and the list of RBW possible values is recomputed according to the multitone spacing. When disabled, the window type is set back to what it was before enabling and the RBW list is also set to the previous setting.

**Parameters**
- `<ch>` Any existing SA channel. If unspecified, value is set to 1.
- `<bool>` Choose from:
  - 0 - OFF - Multitone image rejection disabled.
  - 1 - ON - Multitone image rejection enabled.

**Examples**
- `SENS:SA:COH:MULT 1`

**Query Syntax**
- `SENSe<ch>:SA:COHerence:MULTitone[:STATe]?`

**Return Type**
- Boolean

**Default**
- OFF

**SENSe<ch>:SA:COHerence:MULTitone:VALid?**

**Applicable Models:** All with Spectrum Analysis Options (S9x09xxA/B, S9x09xA/B) (Except M98x0A, P50xxA)

*(Read-only)* Read the current multitone settings and determine if they are valid or not.

**Parameters**
- `<ch>` Channel number of the measurement. If unspecified, value is set to 1.

**Examples**
- `SENS:SA:COH:MULT:VAL?`
- `sense2:sa:coherence:multitone:valid?`

**Return Type**
- Boolean (ON, OFF, 1, 0) A "1" is valid and a "0" is invalid.

**Default**
- Not applicable

**SENSe<ch>:SA:COHerence:PHASe:DISPlay:LEVel <num>**
**Applicable Models:** All with Spectrum Analysis Options (S9x09xxA/B, S9x09xA/B) (Except M98x0A, P50xxA)

(Read-Write) Set and read the phase display minimum level.

**Parameters**
- `<ch>` Any existing SA channel. If unspecified, value is set to 1.
- `<num>` Phase display minimum level (in dBm).

Learn about these settings.

**Examples**
```
SENS:SA:COH:PHAS:DISP:LEV -60 dBm
```

**Query Syntax**
```
SENSe<ch>:SA:COHerence:PHASe:DISPlay:LEVel?
```

**Return Type** Double

**Default** -60 dBm

**SENSe<ch>:SA:COHerence:PHASe[:STATe] <bool>**

**Applicable Models:** All with Spectrum Analysis Options (S9x09xxA/B, S9x09xA/B) (Except M98x0A, P50xxA)

(Read-Write) Enables/disables phase computing.

**Parameters**
- `<ch>` Any existing SA channel. If unspecified, value is set to 1.
- `<bool>` Choose from:
  - **0 - OFF** - Phase computing disabled.
  - **1 - ON** - Phase computing enabled.

Learn about these settings.

**Examples**
```
SENS:SA:COH:PHAS:STAT 1
```

**Query Syntax**
```
SENSe<ch>:SA:COHerence:PHASe[:STATe]?
```

**Return Type** Boolean

**Default** OFF

**SENSe<ch>:SA:COHerence:PULSe:SEARch:COUNt <num>**
Applicable Models: All with Spectrum Analysis Options (S9x09xxA/B, S9x09xAX/B) (Except M98x0A, P50xxA)

(Read-Write) Set and read the maximum pulse search count for the next SENSe:SA:COHerence:PULSe:SEARch:EXECute.

Parameters
- <ch> Any existing SA channel. If unspecified, value is set to 1.
- <num> Any number between 10 and 500.

Examples
```
SENS:SA:COH:PULS:SEAR:COUN 100
```

Query Syntax
SENSe<ch>:SA:COHerence:PULSe:SEARch:COUNt?

Return Type
Integer

Default
100

SENSe<ch>:SA:COHerence:PULSe:SEARch:DUTY:TOLerance <num>

Applicable Models: All with Spectrum Analysis Options (S9x09xxA/B, S9x09xAX/B) (Except M98x0A, P50xxA)

(Read-Write) Set and read the duty cycle tolerance. Only solutions that ensure this tolerance will be accepted when performing SENSe:SA:COHerence:PULSe:SEARch:EXECute.

Parameters
- <ch> Any existing SA channel. If unspecified, value is set to 1.
- <num> The tolerance value as a percentage, any number between 2 and 100.

Examples
```
```

Query Syntax
SENSe<ch>:SA:COHerence:PULSe:SEARch:DUTY:TOLerance?

Return Type
Double

Default
40
**Applicable Models:** All with Spectrum Analysis Options (S9x09xxA/B, S9x09xA/B) (Except M98x0A, P50xxA)

*(Write-only)* Executes the pulse search.

**Parameters**
- `<ch>` Any existing SA channel. If unspecified, value is set to 1.

**Examples**

```
SENS:SA:COH:PULS:SEAR:EXEC
```

**Return Type** Not applicable

**Default** Not applicable

---

**SENSe<ch>:SA:COHerence:PULSe:SEARch:INITialize**

**Applicable Models:** All with Spectrum Analysis Options (S9x09xxA/B, S9x09xA/B) (Except M98x0A, P50xxA)

*(Write-only)* Sets all the search parameters to their default values:

- Count is set to 100.
- Tolerances for Duty cycle, period, width are all set to 40%.
- Search mode is set to WIDTH.
- Pulse period starting search point is set to the current pulse period.
- Pulse width starting search point is set to the current pulse width.

**Parameters**
- `<ch>` Any existing SA channel. If unspecified, value is set to 1.

**Examples**

```
SENS:SA:COH:PULS:SEAR:INIT
```

**Return Type** Not applicable

**Default** Not applicable

---

**SENSe<ch>:SA:COHerence:PULSe:SEARch:ITEM:COUNt?**

```
4573
```

4573
Applicable Models: All with Spectrum Analysis Options (S9x09xxA/B, S9x09xA/B) (Except M98x0A, P50xxA)

(Read-only) Returns the number of possible pulse configurations found after a SENSe:SA:COHerence:PULSe:SEARch:EXECute.

Parameters

[ch] Any existing SA channel. If unspecified, value is set to 1.

Examples

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;ch&gt;</td>
<td>Any existing SA channel. If unspecified, value is set to 1.</td>
</tr>
<tr>
<td>&lt;num&gt;</td>
<td>Item number from 1 to 500. If unspecified, value is set to 1.</td>
</tr>
</tbody>
</table>

Examples

</tr>
</thead>
</table>

Return Type

Integer

Default

Not applicable

SENSe<ch>:SA:COHerence:PULSe:SEARch:ITEM<num>:PERiod?

Applicable Models: All with Spectrum Analysis Options (S9x09xxA/B, S9x09xA/B) (Except M98x0A, P50xxA)

(Read-only) Returns the pulse period for found pulse configuration number num.

Parameters

[ch] Any existing SA channel. If unspecified, value is set to 1.
<br><br><br><br>[<num>] Item number from 1 to 500. If unspecified, value is set to 1.

Examples

<table>
<thead>
<tr>
<th>Examples</th>
<th>Description</th>
</tr>
</thead>
</table>

Return Type

Double

Default

Not applicable
(Write-only) Selects the found configuration number num, and applies it to the measurements.

**Parameters**

- `<ch>` Any existing SA channel. If unspecified, value is set to 1.
- `<num>` Item number from 1 to 500. If unspecified, value is set to 1.

**Examples**

```
```

**Return Type**

Not applicable

**Default**

Not applicable

---

**SENSe<ch>:SA:COHerence:PULSe:SEARch:ITEM<num>:WIDTh?**

(Read-only) Returns the pulse width for found pulse configuration number num.

**Parameters**

- `<ch>` Any existing SA channel. If unspecified, value is set to 1.
- `<num>` Item number from 1 to 500. If unspecified, value is set to 1.

**Examples**

```
```

**Return Type**

Double

**Default**

Not applicable

---

**SENSe<ch>:SA:COHerence:PULSe:SEARch:PERiod:TOLerance <num>**
Applicable Models: All with Spectrum Analysis Options (S9x09xxA/B, S9x09x(A/B) (Except M98x0A, P50xxA)

(Read-Write) Set and read the period tolerance. Only solutions that ensure this tolerance will be accepted when performing SENSe:SA:COHerence:PULSe:SEARch:EXECute.

Parameters

- `<ch>` Any existing SA channel. If unspecified, value is set to 1.
- `<num>` The tolerance value as a percentage, any number between 2 and 100.

Examples

```
```

Query Syntax

SENSe<ch>:SA:COHerence:PULSe:SEARch:PERiod:TOLerance?

Return Type

Double

Default

40

SENSe<ch>:SA:COHerence:PULSe:SEARch:PERiod[:VALue] <num>

Applicable Models: All with Spectrum Analysis Options (S9x09xxA/B, S9x09x(A/B) (Except M98x0A, P50xxA)

(Read-Write) Set and read the period starting point for the next SENSe:SA:COHerence:PULSe:SEARch:EXECute.

Parameters

- `<ch>` Any existing SA channel. If unspecified, value is set to 1.
- `<num>` Period value (unit seconds).

Examples

```
SENS:SA:COH:PULS:SEAR:PER:VAL 0.001
```

Query Syntax

SENSe<ch>:SA:COHerence:PULSe:SEARch:PERiod:VALue?

Return Type

Double

Default

Not applicable

SENSe<ch>:SA:COHerence:PULSe:SEARch:PRIority <enum>
**Applicable Models:** All with Spectrum Analysis Options (S9x09xxA/B, S9x09xA/B) (Except M98x0A, P50xxA)

*(Read-Write)* Set and read the priority choice for the search algorithm.

**Parameters**
- `<ch>` Any existing SA channel. If unspecified, value is set to 1.
- `<enum>` Choose from:
  - **PERiod**: Set the search priority to period.
  - **WIDTH**: Set the search priority to width.

**Examples**
```
SENS:SA:COH:PULS:SEAR:PRI PER
```

**Query Syntax**
```
SENSe<ch>:SA:COHerence:PULSe:SEARch:PRIority?
```

**Return Type**
Enumeration

**Default** WIDTH

---

**SENS<ch>:SA:COHerence:PULSe:SEARch:WIDTH:TOLerance <num>**

**Applicable Models:** All with Spectrum Analysis Options (S9x09xxA/B, S9x09xA/B) (Except M98x0A, P50xxA)

*(Read-Write)* Set and read the width tolerance. Only solutions that ensure this tolerance will be accepted when performing SENSe:SA:COHerence:PULSe:SEARch:EXECute.

**Parameters**
- `<ch>` Any existing SA channel. If unspecified, value is set to 1.
- `<num>` The tolerance value as a percentage, any number between 2 and 100.

**Examples**
```
```

**Query Syntax**
```
SENSe<ch>:SA:COHerence:PULSe:SEARch:WIDTH:TOLerance?
```

**Return Type**
Double

**Default** 40

---

**SENS<ch>:SA:COHerence:PULSe:SEARch:WIDTH[:VALue] <num>**
Applicable Models: All with Spectrum Analysis Options (S9x09xxA/B, S9x09xA/B) (Except M98x0A, P50xxA)

(Read-Write) Set and read the width starting point for the next SENSe:SA:COHerence:PULSe:SEARch:EXECute.

Parameters

- `<ch>` Any existing SA channel. If unspecified, value is set to 1.
- `<num>` Width value (unit: second)

Examples

```
```

Query Syntax

SENSe<ch>:SA:COHerence:PULSe:SEARch:WIDTh:VALue?

Return Type Double

Default Not applicable

SENSe<ch>:SA:COHerence:VECTor:AVERage[:STATe] <bool>

Applicable Models: All with Spectrum Analysis Options (S9x09xxA/B, S9x09xA/B) (Except M98x0A, P50xxA)

(Read-Write) Set and read the ON/OFF state of the vector averaging.

Parameters

- `<ch>` Any existing SA channel. If unspecified, value is set to 1.
- `<bool>` Choose from:

  0 - OFF - Vector averaging OFF.

  1 - ON - Vector averaging ON.

Examples

```
SENS:SA:COH:VECT:AVER:STAT 1
```

Query Syntax

SENSe<ch>:SA:COHerence:VECTor:AVERage:STATe?

Return Type Boolean

Default 0

SENSe<ch>:SA:COHerence:VECTor:AVERage:VALue <value>[,<enum>]

4578
**Applicable Models:** All with Spectrum Analysis Options (S9x09xxA/B, S9x09xA/B) (Except M98x0A, P50xxA)

*(Read-Write)* Set and read the vector averaging value. In addition, read the minimum and maximum values using MIN/MAX.

**Parameters**

- `<ch>` Any existing SA channel. If unspecified, value is set to 1.
- `<value>` Choose a value between 0 and 65536.

Learn about these settings.

- `<enum>`
  - **MIN** - Read the minimum value.
  - **MAX** - Read the maximum value.

**Examples**

- `SENS:SA:COH:VECT:AVER:VAL 1`
- `SENS:SA:COH:VECT:AVER:VAL MAX`

**Query Syntax**

`SENSe<ch>:SA:COHerence:VECTor:AVERage:VALue?`

**Return Type**

Integer

**Default**

1 (no averaging)

---

**SENSe<ch>:SA:DATA:BINs:COUNt?**

**Applicable Models:** All with Spectrum Analysis Options (S9x09xxA/B, S9x09xA/B)

*(Read-only)* Read the number of DFT points to be exported across the total RF span. Note that this number is modified by the SENSe:SA:COHerence:MULTitone:DATa ZNT setting: If coherent multitone mode is enabled, only the frequency points that are on the multitone grid are exported.

**Parameters**

- `<ch>` Any existing SA channel. If unspecified, value is set to 1.

**Examples**

- `SENS:SA:DATA:BIN:COUN?`

**Return Type**

Integer

**Default**

Not applicable

---

**SENSe<ch>:SA:DATA:FIFO[:STATe] <bool>**
**Applicable Models:** All with Spectrum Analysis Options (S9x09xxA/B, S9x09xA/B)

*(Read-Write)* Enables/disables exporting data to the FIFO (First-IN, First-OUT) data buffer. FIFO is a circular buffer that allows very fast Read-Write access.

**Parameters**
- `<ch>` Any existing SA channel. If unspecified, value is set to 1.
- `<bool>` Choose from:
  - **0 - OFF** - Export data to FIFO disabled.
  - **1 - ON** - Export data to FIFO enabled.

**Examples**
```
SENS:SA:DATA:FIFO 1
```

**Query Syntax**
```
SENSe<ch>:SA:DATA:FIFO[:STATe]
```

**Return Type** Boolean

**Default** 0

**Note:** FIFO commands are under SYTSem:FIFO, and a new set of commands has been added here for binary data.

---

**SENSe<ch>:SA:DATA:FILE:BINary[:STATe] <bool>**

**Applicable Models:** All with Spectrum Analysis Options (S9x09xxA/B, S9x09xA/B)

*(Read-Write)* Enables/disables binary file (*.bin) output. Data is not exported until the next new sweep occurs.

**Parameters**
- `<ch>` Any existing SA channel. If unspecified, value is set to 1.
- `<bool>` Choose from:
  - **0 - OFF** - Disable binary file output.
  - **1 - ON** - Enable binary file output.

**Examples**
```
SENS:SA:DATA:FILE:BIN 1
```

**Query Syntax**
```
SENSe<ch>:SA:DATA:FILE:BINary[:STATe]
```

**Return Type** Boolean

**Default** 0
SENSe<ch>:SA:DATA:FILE:ERASSe[:STATe] <bool>

**Applicable Models:** All with Spectrum Analysis Options (S9x09xxA/B, S9x09xA/B)

*(Read-Write)* Enables/disables erasing output data files after each sweep. When disabled, data is appended to the output file after each sweep which could lead to very large files sizes (and eventually fill the disk).

**Parameters**
- `<ch>` Any existing SA channel. If unspecified, value is set to 1.
- `<bool>` Choose from:
  - 0 - OFF - Erase data files after each sweep disabled.
  - 1 - ON - Erase data files after each sweep enabled.

**Examples**
```
SP:SA:DATA:FILE:ERA 1
```

**Query Syntax**
SENSe<ch>:SA:DATA:FILE:ERASSe[:STATe]?

**Return Type**
Boolean

**Default**
1

SENSe<ch>:SA:DATA:FILE:PREFix <string>

**Applicable Models:** All with Spectrum Analysis Options (S9x09xxA/B, S9x09xA/B)

*(Read-Write)* Set and return the file name prefix for the data file. The receivers selected in SENSe:SA:DATA:RECeivers:LIST will be appended to the specified prefix name with either "_X.txt" if a text file is exported (SENSe:SA:DATA:FILE:TEXT) or "_X.bin" if a binary file is exported (SENSe:SA:DATA:FILE:BINary). X is the receiver name.

**Parameters**
- `<ch>` Any existing SA channel. If unspecified, value is set to 1.
- `<string>` String. Specified prefix.

**Examples**
```
SP:SA:DATA:FILE:PREF "C:\TEMP\SA_DATA_OUT"
```

**Query Syntax**
SENSe<ch>:SA:DATA:FILE:PREFix?

**Return Type**
String

**Default**
"C:\TEMP\SA_DATA_OUT"

**Applicable Models:** All with Spectrum Analysis Options (S9x09xxA/B, S9x09xA/B)

*(Read-Write)* Enables/disables adding marker data to the text file (*.txt) output.

**Parameters**
- `<ch>` Any existing SA channel. If unspecified, value is set to 1.
- `<bool>` Choose from:
  - **0 - OFF** - Do not add marker data to the text file output.
  - **1 - ON** - Add marker data to the text file output.

**Examples**

```
SENS:SA:DATA:FILE:TEXT:MARK:STAT 1
```

**Query Syntax**

```
SENSe<ch>:SA:DATA:FILE:TEXT:MARKers[:STATE]?
```

**Return Type**

Boolean

**Default**

0

---

### SENSE<ch>:SA:DATA:FILE:TEXT[:STATE] <bool>

**Applicable Models:** All with Spectrum Analysis Options (S9x09xxA/B, S9x09xA/B)

*(Read-Write)* Enables/disables text file (*.txt) output. Data is not exported until the next new sweep occurs.

**Parameters**
- `<ch>` Any existing SA channel. If unspecified, value is set to 1.
- `<bool>` Choose from:
  - **0 - OFF** - Disable text file output.
  - **1 - ON** - Enable text file output.

**Examples**

```
SENS:SA:DATA:FILE:TEXT 1
```

**Query Syntax**

```
SENSe<ch>:SA:DATA:FILE:TEXT[:STATE]?
```

**Return Type**

Boolean

**Default**

0
SENSe<ch>:SA:DATA:FILE:TEXT:VERBose[:STATe] <bool>

**Applicable Models:** All with Spectrum Analysis Options (S9x09xxA/B, S9x09xA/B)

*(Read-Write)* Enables/disables exporting frequency and data for text files. Data is not exported until the next new sweep occurs.

**Parameters**

- `<ch>` Any existing SA channel. If unspecified, value is set to 1.
- `<bool>` Choose from:
  - **0 - OFF** - Disable text file output.
  - **1 - ON** - Enable text file output.

**Examples**

```
SENS:SA:DATA:FILE:TEXT:VERB:STAT 1
```

**Query Syntax**

SENSe<ch>:SA:DATA:FILE:TEXT:VERBose[:STATe]?

**Return Type** Boolean

**Default** 0

SENSe<ch>:SA:DATA:KEEP:FREQuencies:COUNt?

**Applicable Models:** All with Spectrum Analysis Options (S9x09xxA/B, S9x09xA/B)

*(Read-only)* Read the number of frequency domain points in memory. This command should be called only after a Single sweep, and after making sure the sweep is finished. Learn about these settings.

**Parameters**

- `<ch>` Any existing SA channel. If unspecified, value is set to 1.

**Examples**

```
SENS:SA:DATA:KEEP:FREQ:COUN?
```

**Return Type** Integer

**Default** Not applicable

SENSe<ch>:SA:DATA:KEEP:RECeivers:COUNt?
**Applicable Models:** NAll with Spectrum Analysis Options (S9x09xxA/B, S9x09xA/B)

*(Read-only)* Read the number of receivers that have been stored in memory. Learn about these settings.

**Parameters**
- `<ch>`  Any existing SA channel. If unspecified, value is set to 1.

**Examples**
- `SENS:SA:DATA:KEEP:REC:COUN?`

**Return Type**  Integer
**Default**  Not applicable

SENSe<ch>:SA:DATA:KEEP:RECeivers[:CURRent]?

**Applicable Models:** NAll with Spectrum Analysis Options (S9x09xxA/B, S9x09xA/B)

*(Read-only)* Read the current list of receivers that have been stored in memory. Learn about these settings.

**Parameters**
- `<ch>`  Any existing SA channel. If unspecified, value is set to 1.

**Examples**
- `SENS:SA:DATA:KEEP:REC?  "b2,a1"

**Return Type**  String
**Default**  Not applicable

SENSe<ch>:SA:DATA:KEEP:RECeivers:LIST <string>
Applicable Models: All with Spectrum Analysis Options (S9x09xxA/B, S9x09xA/B)

(Read-Write) Set and read the list of receivers to export. The order set using this command will determine the order in which data will be exported. Learn about these settings.

Parameters

- `<ch>` Any existing SA channel. If unspecified, value is set to 1.
- `<string>` String. Comma separated list of receivers. The “All” option will select all the currently working receivers of the current channel. If the user sets an empty list, this is equivalent to sending “ALL”.

Examples

```
SENS:SA:DATA:KEEP:RECeivers:LIST "A,B,a1,a2"
```

Query Syntax

```
SENSe<ch>:SA:DATA:KEEP:RECeivers:LIST?
```

Return Type String

Default Not applicable

**Note:** This list can contain receivers that are not currently measured in the channel. However, this is not an issue. To get the current list of receivers that export data, query SENS:SA:DATA:KEEP:REC?

---

Applicable Models: All with Spectrum Analysis Options (S9x09xxA/B, S9x09xA/B)

(Read-only) Read the scalar data. Scalar data is amplitude only values, when the Compute phase mode is not turned on. The resulting values are float numbers, as Volts RMS in a 50 Ohm load. The float number is the number that can be queried with the SENS:SA:DATA:KEEP:FREQuencies:COUNt? command. Learn about these settings.

Parameters

- `<ch>` Any existing SA channel. If unspecified, value is set to 1.
- `<recName>` (String) Receiver name
- `[position,Length]` Starting position of data and quantity. The default is 0, full span (the value is queried using the SENS:SA:DATA:KEEP:FREQuencies:COUNt? command).

Examples

```
SENS:SA:DATA:KEEP:SCAL:GET? "b2"
```

Return Type String

Default Not applicable

---

4585
SENSe<ch>:SA:DATA:KEEP[:STATe] <bool>

**Applicable Models:** All with Spectrum Analysis Options (S9x09xxA/B, S9x09xA/B)

*(Read-Write)* Set and read the ON/OFF state of the end of sweep processing. Learn about these settings.

**Parameters**
- `<ch>` Any existing SA channel. If unspecified, value is set to 1.
- `<bool>` Choose from:
  - **0 - OFF** - End of sweep processing OFF.
  - **1 - ON** - End of sweep processing ON.

**Examples**
```
SENS:SA:DATA:KEEP 1
```

**Query Syntax**
SENSe<ch>:SA:DATA:KEEP[:STATe]?

**Return Type** Boolean

**Default** 0

SENSe<ch>:SA:DATA:KEEP:VECTor:GET? <recName> [,position,Length]

**Applicable Models:** All with Spectrum Analysis Options (S9x09xxA/B, S9x09xA/B)

*(Read-only)* Read the vector data. Vector data is amplitude and phase, when the Compute phase mode is not turned on. The resulting values are 2 float numbers per frequency. The float number is the number that can be queried with the SENSe:SA:DATA:KEEP:FREQuencies:COUNt? command. Learn about these settings.

**Parameters**
- `<ch>` Any existing SA channel. If unspecified, value is set to 1.
- `<recName>` (String) Receiver name
- `[,.position,Length]` Starting position of data and quantity. The default is 0, full span (the value is queried using the SENSe:SA:DATA:KEEP:FREQuencies:COUNt? command).

**Examples**
```
```

**Return Type** String

**Default** Not applicable
SENSe<ch>:SA:DATA:RECeivers?

Applicable Models: All with Spectrum Analysis Options (S9x09xxA/B, S9x09xA/B)

(Read-only) Read the list of receivers that will be exported to a data file.

Parameters

<ch> Any existing SA channel. If unspecified, value is set to 1.

Examples

Examples

SENS:SA:DATA:RECeivers?

Return Type String

Default Not applicable

Note: The list is set with SENS:SA:DATA:REC:LIST can contain more receivers, this query will only return the ones that are currently measured and that are in the receiver list.

SENSe<ch>:SA:DATA:RECeivers:COUNt?

Applicable Models: NAll with Spectrum Analysis Options (S9x09xxA/B, S9x09xA/B)

(Read-only) Read the number of currently exported receivers.

Parameters

<ch> Any existing SA channel. If unspecified, value is set to 1.

Examples

SENS:SA:DATA:REC:COUN?

Return Type Integer

Default Not applicable

SENSe<ch>:SA:DATA:RECeivers:LIST <string>
Applicable Models: All with Spectrum Analysis Options (S9x09xxA/B, S9x09xA/B)

(Read-Write) Set and read the list of receivers to export. The order set using this command will determine the order in which data will be exported to the FIFO data buffer.

Parameters

- `<ch>` Any existing SA channel. If unspecified, value is set to 1.
- `<string>` String. Comma separated list of receivers. The “All” option will select all the currently working receivers of the current channel. If the user sets an empty list, this is equivalent to sending “ALL”.

Examples

```
SENS:SA:DATA:REC:LIST "A,B,a1,a2"
```

Query Syntax

```
SENSe<ch>:SA:DATA:RECeivers:LIST?
```

Return Type

String

Default

Not applicable

Note: This list can contain receivers that are not currently measured in the channel. However, this is not an issue. To get the current list of receivers that export data, query SENS:SA:DATA:REC?

SENSe<ch>:SA:DATA:SHARed:NAME <string>

Applicable Models: All with Spectrum Analysis Options (S9x09xxA/B, S9x09xA/B)

(Read-Write) Assigns a specified name to the Microsoft Windows shared data mechanism when SENSe:SA:DATA:SHARed:STATe is enabled.

Parameters

- `<ch>` Any existing SA channel. If unspecified, value is set to 1.
- `<string>` String. Memory file name.

Examples

```
SENS:SA:DATA:SHAR:NAM "Mem_Share"
```

Query Syntax

```
SENSe<ch>:SA:DATA:SHARed:NAME?
```

Return Type

String

Default

Not applicable

SENSe<ch>:SA:DATA:SHARed[:STATe] <bool>
Applicable Models: All with Spectrum Analysis Options (S9x09xxA/B, S9x09xA/B)

(Read-Write) Enables/disables exporting data to shared memory, which is the fastest way to transfer data between applications.

Parameters

- <ch> Any existing SA channel. If unspecified, value is set to 1.
- <bool> Choose from:
  - 0 - OFF - Disable memory sharing.
  - 1 - ON - Enable memory sharing.

Examples

```
SENS:SA:DATA:SHAR 1
```

Query Syntax

```
SENSe<ch>:SA:DATA:SHARed[:STATe]?
```

Return Type Boolean

Default 0

---

**SENSe<ch>:SA:DATA:SIZE?**

Applicable Models: All with Spectrum Analysis Options (S9x09xxA/B, S9x09xA/B)

(Read-only) Read the byte size of the data to be exported in binary mode.

Parameters

- <ch> Any existing SA channel. If unspecified, value is set to 1.

Examples

```
SENS:SA:DATA:SIZE?
```

Return Type Integer

Default Not applicable

**Note:** Returned number can exceed the maximum integer number size. In that case, an error will be raised. For that reason, we provide an access to larger numbers with the same query and LSB or MSB suffixes.

---

**SENSe<ch>:SA:DATA:SIZE:BIN?**
Applicable Models: All with Spectrum Analysis Options (S9x09xxA/B, S9x09xA/B)

(Read-only) Read the byte size of one data bin in binary mode.

Parameters
<ch> Any existing SA channel. If unspecified, value is set to 1.

Examples SENS:SA:DATA:SIZE:BIN?

Return Type Integer
Default Not applicable

SENSe<ch>:SA:DATA:SIZE:HIGH?

Applicable Models: All with Spectrum Analysis Options (S9x09xxA/B, S9x09xA/B)

(Read-only) Read the most significant bytes (MSB) of the byte size of the data to be exported.

Parameters
<ch> Any existing SA channel. If unspecified, value is set to 1.

Examples SENS:SA:DATA:SIZE:HIGH?

Return Type Integer
Default Not applicable

SENSe<ch>:SA:DATA:SIZE:LOW?

Applicable Models: All with Spectrum Analysis Options (S9x09xxA/B, S9x09xA/B)

(Read-only) Read the least significant bytes (LSB) of the byte size of the data to be exported.

Parameters
<ch> Any existing SA channel. If unspecified, value is set to 1.

Examples SENS:SA:DATA:SIZE:LOW?

Return Type Integer
Default Not applicable

SENSe<ch>:SA:DATA:STARt?
Applicable Models: All with Spectrum Analysis Options (S9x09xxA/B, S9x09xA/B)

(Read-only) Read the frequency of the first RF bin.

Parameters
- `<ch>`: Any existing SA channel. If unspecified, value is set to 1.

Examples
- `SENS:SA:DATA:STAR?`

Return Type: Double
Default: Not applicable

Note: This value can differ slightly from the SA Sweep start frequency, the frequency of the first RF bin is aligned with the current DFT grid.

SENSe<ch>:SA:DATA:THReshold[:STATe] <bool>

Applicable Models: All with Spectrum Analysis Options (S9x09xxA/B, S9x09xA/B)

(Read-Write) Enables/disables data level threshold mode. Set the threshold level using the SENSe:SA:DATA:THReshold:VALue command.

Parameters
- `<ch>`: Any existing SA channel. If unspecified, value is set to 1.
- `<bool>`: Choose from:
  - 0 - OFF: Disable threshold mode.
  - 1 - ON: Enable threshold mode.

Examples
- `SENS:SA:DATA:TH:STAT 1`

Query Syntax
- `SENSe<ch>:SA:DATA:THReshold[:STATe]?`

Return Type: Boolean
Default: 0

SENSe<ch>:SA:DATA:THReshold:VALue <num>
**Applicable Models:** All with Spectrum Analysis Options (S9x09xxA/B, S9x09xA/B)

*(Read-Write)* Set and read the threshold value (dBm). For text file output with verbose mode, only the frequencies with power greater than this threshold setting will be written to the file. This command can be used as a kind of simple spurious search.

**Parameters**

- `<ch>` Any existing SA channel. If unspecified, value is set to 1.
- `<num>` Threshold setting in dBm.

**Examples**

**Query Syntax**

SENSe<ch>:SA:DATA:THR:VALue?

**Return Type**

Real

**Default**

-60 dBm

---

**SENSe<ch>:SA:DATA:TYPE <enum>**

**Applicable Models:** All with Spectrum Analysis Options (S9x09xxA/B, S9x09xA/B)

*(Read-Write)* Set and read the data format.

**Parameters**

- `<ch>` Any existing SA channel. If unspecified, value is set to 1.
- `<enum>` Choose from:
  - **MAGDb** : Set data format to log magnitude in dBm.
  - **AMPVolt** : Set data format to linear magnitude in volts.
  - **PINT** : Set data format to Packed Integers: a more compact (2 bytes) numeric representation for dBm. Each set of 2 bytes is a short number `s`, to get the dBm value compute `(s/200.0 -36.165)`.

**Examples**

**Query Syntax**

SENSe<ch>:SA:DATA:TYPE?

**Return Type**

Enumeration

**Default**

MAGDB

---

**SENSe<ch>:SA:DATA:WFACtor?**
Applicable Models: All with Spectrum Analysis Options (S9x09xxA/B, S9x09xA/B)

(Read-only) Read the windowing factor for band power computation. This factor is derived from the window type (Gaussian, flat top, etc.). When doing the sum of linear power over a band, use this factor to compensate the side lobe effect of windowing to get an accurate band power value.

**Parameters**

<ch> Any existing SA channel. If unspecified, value is set to 1.

**Examples**

SENS:SA:DATA:WFACtor?

**Return Type** Real

**Default** Not applicable

SENSe:SA:DETector:BYPass:[STATe] <bool>

Applicable Models: All with Spectrum Analysis Options (S9x09xxA/B, S9x09xA/B)

(Read-Write) Set and read the ON/OFF state of the detector bypass setting.

**Parameters**

<ch> Any existing SA channel. If unspecified, value is set to 1.

<bool> Choose from:

0 - OFF - Detector bypass OFF.

1 - ON - Detector bypass ON.

Learn about these settings.

**Examples**

SENS:SA:DET:BYP 0

**Query Syntax**

SENSe<ch>:SA:DETector:BYPass:[STATe]?

**Return Type** Boolean

**Default** 0

SENSe<ch>:SA:DETector:FUNCtion <enum>
Applicable Models: All with Spectrum Analysis Options (S9x09xxA/B, S9x09xA/B)

(Read-Write) Set and read the detector type.

Parameters

  <ch> Any existing SA channel. If unspecified, value is set to 1.
  <enum> Choose from:

       PEAK
       AVERage
       SAMPlе
       NORMal
       NEGPeak
       PSAMple (Peak Sample)
       PAVerage (Peak Average)

Learn about these settings.

Examples

Query Syntax

SENSe<ch>:SA:DETector:FUNCtion?

Return Type

Enumeration

Default

PEAK

SENSe<ch>:SA:DFT:BANDwidth:AUTO <bool>
**Applicable Models:** All with Spectrum Analysis Options (S9x09xxA/B, S9x09xA/B)

*(Read-Write)* Set and read the default values for DFT bandwidth.

**Parameters**

- `<ch>` Any existing SA channel. If unspecified, value is set to 1.
- `<bool>` Choose from:

  0 - **OFF** - DFT minimum and maximum values are set manually:
  
  - **Narrow** - 500 kHz to 11 MHz
  - **Wide** - 500 kHz to 44 MHz

  1 - **ON** - DFT minimum and maximum values are set to their default values:
  
  - **Narrow** - 1 MHz to 10 MHz
  - **Wide** - 1 MHz to 34 MHz

**Examples**

```
SENS:SA:DFT:BAND:_AUTO 0
```

**Query Syntax**

```
SENSe<ch>:SA:DFT:BANDwidth:AUTO?
```

**Return Type** Boolean

**Default** 1

---

**SENS<ch>:SA:DFT:BANDwidth:NARRow:MAX <num>**

**Applicable Models:** All with Spectrum Analysis Options (S9x09xxA/B, S9x09xA/B) (Except M98x0A, P50xxA)

*(Read-Write)* Set and read the maximum value for narrow DFT bandwidth. The maximum narrow DFT bandwidth setting is 11 MHz. The SENSe:SA:DFT:BANDwidth:AUTO must be set to OFF to set this value manually.

**Parameters**

- `<ch>` Any existing SA channel. If unspecified, value is set to 1.
- `<num>` Max narrow DFT bandwidth.

**Examples**

```
```

**Query Syntax**

```
SENSe<ch>:SA:DFT:BANDwidth:NARRow:MAX?
```

**Return Type** Double

---

4595
**SENSe<ch>:SA:DFT:BANDwidth:NARRow:MIN <num>**

**Applicable Models:** All with Spectrum Analysis Options (S9x09xxA/B, S9x09xA/B) (Except M98x0A, P50xxA)

*(Read-Write)* Set and read the minimum value for narrow DFT bandwidth. The minimum narrow DFT bandwidth setting is 500 kHz. The SENSe:SA:DFT:BANDwidth:AUTO must be set to OFF to set this value manually.

**Parameters**
- `<ch>` Any existing SA channel. If unspecified, value is set to 1.
- `<num>` Minimum narrow DFT bandwidth.

**Examples**
```
SENSe<ch>:SA:DFT:BANDwidth:NARRow:MIN 5e5
```

**Query Syntax**
```
SENSe<ch>:SA:DFT:BANDwidth:NARRow:MIN?
```

**Return Type**
Double

**Default**
1e6

---

**SENSe<ch>:SA:DFT:BANDwidth:WIDE:MAX <num>**

**Applicable Models:** All with Spectrum Analysis Options (S9x09xxA/B, S9x09xA/B)

*(Read-Write)* Set and read the maximum value for wide DFT bandwidth. The maximum wide DFT bandwidth setting is 44 MHz. The SENSe:SA:DFT:BANDwidth:AUTO must be set to OFF to set this value manually.

**Parameters**
- `<ch>` Any existing SA channel. If unspecified, value is set to 1.
- `<num>` Max wide DFT bandwidth.

**Examples**
```
SENSe<ch>:SA:DFT:BANDwidth:WIDE:MAX 44e6
```

**Query Syntax**
```
SENSe<ch>:SA:DFT:BANDwidth:WIDE:MAX?
```

**Return Type**
Double

**Default**
34e6
SENSe<ch>:SA:DFT:BANDwidth:WIDE:MIN <num>

**Applicable Models:** All with Spectrum Analysis Options (S9x09xxA/B, S9x09xA/B)

*(Read-Write)* Set and read the minimum value for wide DFT bandwidth. The minimum wide DFT bandwidth setting is 500 kHz. The SENSe:SA:DFT:BANDwidth:AUTO must be set to OFF to set this value manually.

**Parameters**
- `<ch>` Any existing SA channel. If unspecified, value is set to 1.
- `<num>` Minimum wide DFT bandwidth.

**Examples**
```
SENS:SA:DFT:BAND:WIDE:MIN 5e5
```

**Query Syntax**
SENSe<ch>:SA:DFT:BANDwidth:WIDE:MIN?

**Return Type**
Double

**Default**
1e6

SENSe<ch>:SA:DFT:RECord:SIZE?

**Applicable Models:** All with Spectrum Analysis Options (S9x09xxA/B, S9x09xA/B)

*(Read-only)* Read the current DFT record size. This value is based on the SENSe:SA:ADC:RECord:SIZE:VALue and SENSe:SA:DFT:TYPE settings.

**Parameters**
- `<ch>` Any existing SA channel. If unspecified, value is set to 1.

**Examples**
```
SENS:SA:DFT:REC:SIZE?
```

**Return Type**
Integer

**Default**
Not applicable

SENSe<ch>:SA:DFT:RESolution?
**Applicable Models:** All with Spectrum Analysis Options (S9x09xxA/B, S9x09xA/B)

(Read-only) Read the DFT resolution.

**Parameters**

<ch>  Any existing SA channel. If unspecified, value is set to 1.

**Examples**

SENS:SA:DFT:RES?

**Default** Not applicable

**SENS<ch>:SA:DFT:TYPE <enum>**

**Applicable Models:** All with Spectrum Analysis Options (S9x09xxA/B, S9x09xA/B)

(Read-Write) Set and return the DFT record size type. The DFT SENSE:SA:DFT:RECORD:SIZE is based on the SENSE:SA:ADC:RECORD:SIZE:VALUE and the DFT record size type.

**Parameters**

<ch>  Any existing SA channel. If unspecified, value is set to 1.

<enum>  Choose from:

- **POW2** - Sets the DFT record size to the next power of 2 greater than or equal to the current ADC record size.

- **RADix** - Sets the DFT to the nearest equal or larger integer that can be decomposed with 2, 3, 5, 7, 11, 13 radixes.

- **ARBitrary** - Sets DFT record size equal to the ADC record size. If the current ADC record size is a large prime number, then the DFT can be very slow.

- **FASTest** - Sets the DFT record size as close as possible to the ADC record size (larger or equal) while optimizing processing speed.

**Examples**

SENS:SA:DFT:TYPE ARB

**Query Syntax**

SENS<ch>:SA:DFT:TYPE?

**Return Type**  Enumeration

**Default** RADix

**Note:** In previous releases the default was POW2.
**SENSe<ch>:SA:FFT:DITHer[:STATE] <bool>**

**Applicable Models:** All with Spectrum Analysis Options (S9x09xxA/B, S9x09xA/B)

*(Read-Write)* Set and read the ON/OFF state of the FFT grid dither setting

**Parameters**

- `<ch>` Any existing SA channel. If unspecified, value is set to 1.
- `<bool>` Choose from:
  - **0 - OFF** - Dither OFF.
  - **1 - ON** - Dither ON.

**Examples**

```
SENS:SA:FFT:DITH ON
```

**Query Syntax**

```
SENSe<ch>:SA:FFT:DITH?
```

**Return Type**

Boolean

**Default**

0

---

**SENSe<ch>:SA:FFT:RES?**

**Applicable Models:** All with Spectrum Analysis Options (S9x09xxA/B, S9x09xA/B)

*(Read-only)* Read the FFT resolution.

**Parameters**

- `<ch>` Any existing SA channel. If unspecified, value is set to 1.

**Examples**

```
SENS:SA:FFT:RES?
```

**Default**

---

**SENSe<ch>:SA:FREQuency:SPAN:BANDwidth[:RESolution]:RATio <value>**
Applicable Models: All with Spectrum Analysis Options (S9x09xxA/B, S9x09xA/B)

(Red-Write) Set and read the Frequency Span / RBW ratio.

Parameters

<ch> Any existing SA channel. If unspecified, value is set to 1.
[value> Frequency Span / RBW ratio. Choose a value between 1 and 200e9.

Learn about these settings.

Examples SENS:SA:FREQ:SPAN:BAND:RAT 100

Query Syntax SENSE<ch>:SA:FREQuency:SPAN:BANDwidth[:RESolution]:RATio ?

Return Type Integer

Default 106

SENSe<ch>:SA:FREQuency:TUNE:IMMediate [sync]

Applicable Models: All with Spectrum Analysis Options (S9x09xxA/B, S9x09xA/B)

(Write-only) Auto tunes and zooms in on a signal within a SA sweep.

Parameters

<ch> Any existing SA channel. If unspecified, value is set to 1.
[sync] SYNChronous - blocks SCPI commands during auto tune process (default behavior). When no sync is specified, sync is set to SYNChronous.

Note: The auto tune feature can take seconds to process, so a timeout error is likely to occur when sending other commands/queries before the completion of the auto tune process.

ASYNchronous - does NOT block SCPI commands during auto tune process.

Note: The ASYNchronous mode provides a method to check/wait remotely for completion of the auto tune process while allowing other commands/queries to be sent.

Note: In ASYNchronous mode, *OPC? will freeze the instrument and should not be used. Instead, use *OPC and *ESR? to check for completion.

Examples SENS:SA:FREQ:TUNE:IMM
SENSe<ch>:SA:IMAGe:REJect <enum>

**Applicable Models:** All with Spectrum Analysis Options (S9x09xxA/B, S9x09xA/B)

*(Read-Write)* Set and read the image reject mode.

**Parameters**
- `<ch>` Any existing SA channel. If unspecified, value is set to 1.
- `<enum>` Choose from:
  - NHIGH
  - NLOW
  - MIN
  - MHIGH
  - MLOW
  - NORMAL
  - BETTER
  - MAX

Learn about these settings.

**Examples**

```
SENS : SA : IMAG : REJ NLOW
```

**Query Syntax**

SENSe<ch>:SA:IMAGe:REJect?

**Return Type**

Enumeration

**Default**

NORMal

SENSe<ch>:SA:IMAGe:STRENgth <enum>
Applicable Models: All with Spectrum Analysis Options (S9x09xxA/B, S9x09xA/B)

(Read-Write) Sets and returns the image rejection strength. During the image rejection process, several LO acquisitions overlap at the same RF frequency. As a result, different RF signal values can be returned. This command sets the acceptable power differences between LOs in determining actual signals.

Parameters

- `<ch>` Any existing SA channel. If unspecified, value is set to 1.
- `<enum>` Choose from:
  - **WEAK**: 3 dB (approximate number, depends on RBW)
  - **NORMAL**: 1 dB (approximate number, depends on RBW)
  - **STROng**: 0.5 dB (approximate number, depends on RBW)

Examples

```
SENS:SA:IMAG:STREN STROng
```

Query Syntax

```
SENSe<ch>:SA:IMAGe:STRENgth?
```

Return Type

Enumeration

Default

MEDium

SENSe<ch>:SA:LO:BASeband[:STATe] <bool>

Applicable Models: All with Spectrum Analysis Options (S9x09xxA/B, S9x09xA/B)

(Read-Write) Enables and disables baseband sweep independent of the LO sweep to allow signals down to 1 Hz to be analyzed. Learn more.

Parameters

- `<ch>` Any existing SA channel. If unspecified, value is set to 1.
- `<bool>` Choose from:
  - **0 - OFF**: Disable SA baseband.
  - **1 - ON**: Enable SA baseband.

Examples

```
SENS:SA:LO:BA
```

Query Syntax

```
SENSe<ch>:SA:LO:BASeband[:STATe]?
```

Return Type

Boolean
SENSe<ch>:SA:LO:COUNt?

**Applicable Models:** All with Spectrum Analysis Options (S9x09xxA/B, S9x09xA/B)

*(Read-only)* Returns the number of LO acquisitions determined by the **Image Reject** selection and the span.

**Parameters**

- `<ch>` Channel number of the measurement. If unspecified, value is set to 1.

**Examples**

```
SENSe:SA:LO:COUNt?
sense2:sa:lo:count?
```

**Default** Not applicable

SENSe<ch>:SA:LO:FORCe:FREQuency <num>

**Applicable Models:** All with Spectrum Analysis Options (S9x09xxA/B, S9x09xA/B)

*(Read-Write)* Set and read enable force LO to the specified frequency.

**Parameters**

- `<ch>` Any existing SA channel. If unspecified, value is set to 1.
- `<num>` Frequency in Hz. Choose a value within the frequency range of the analyzer.

Learn about these settings.

**Examples**

```
SENSe:SA:LO:FORC:FREQ 1e9
```

**Query Syntax** SENSe<ch>:SA:LO:FORCe:FREQuency?

**Return Type** Numeric

**Default** 1 GHz

SENSe<ch>:SA:LO:FORCe:OFFSet:DIVider <num>
**Applicable Models:** All with Spectrum Analysis Options (S9x09xxA/B, S9x09xA/B)

*(Read-Write)* Set and read the divider in the equation for setting LO frequency. Learn more.

### Parameters
- `<ch>` Any existing SA channel. If unspecified, value is set to 1.
- `<num>` Divider in the equation for setting LO frequency.

### Examples
```
SENS:SA:LO:FORC:OFFS:DIV 1
```

### Query Syntax
```
SENSe<ch>:SA:LO:FORCe:OFFSet:DIVider?
```

### Return Type
Numeric

### Default
1

---

**SENSe<ch>:SA:LO:FORCe:OFFSet:MULtiplier <num>**

**Applicable Models:** All with Spectrum Analysis Options (S9x09xxA/B, S9x09xA/B)

*(Read-Write)* Set and read the multiplier in the equation for setting LO frequency. Learn more.

### Parameters
- `<ch>` Any existing SA channel. If unspecified, value is set to 1.
- `<num>` Multiplier in the equation for setting LO frequency.

### Examples
```
SENS:SA:LO:FORC:OFFS:MUL 1
```

### Query Syntax
```
SENSe<ch>:SA:LO:FORCe:OFFSet:MULtiplier?
```

### Return Type
Numeric

### Default
1
Applicable Models: All with Spectrum Analysis Options (S9x09xxA/B, S9x09xA/B)

(Read-Write) Set and read the source name in the equation for setting LO frequency. Learn more.

Parameters

- `<ch>`: Any existing SA channel. If unspecified, value is set to 1.

Examples

```
SENS:SA:LO:FORC:OFFS:SOUR "Port 1"
sense2:sa:lo:force:offset:source "Port 1 Src2"
```

Return Type: String

Default: Not applicable

---

**SENS<ch>:SA:LO:FORCE[:STATe] <bool>**

Applicable Models: All with Spectrum Analysis Options (S9x09xxA/B, S9x09xA/B)

(Read-Write) Set and read enable force LO to frequency mode.

Parameters

- `<ch>`: Any existing SA channel. If unspecified, value is set to 1.
- `<bool>`: Choose from:
  - **0** - OFF - Force LO to frequency is disabled.
  - **1** - ON - Manually set LO to specified frequency using SENS:SA:LO:FORCE:FREQuency. Only applied if Image Reject is set to None, LO High or None, LO Low.

Examples

```
SENS:SA:LO:FORCE 1
```

Query Syntax: `SENS<ch>:SA:LO:FORCE[:STATe]?`

Return Type: Boolean

Default: 0
SENSe<ch>:SA:LO:FREQ:FORCe <bool> *(Obsolete)*

Applicable Models: All with Spectrum Analysis Options (S9x09xxA/B, S9x09xA/B)

(Read-Write) Set and read enable force LO to frequency mode. This command is replaced by SENSe:SA:LO:FORCe[:STATe] .

Parameters

<ch> Any existing SA channel. If unspecified, value is set to 1.

<bool> Choose from:

0 - OFF - Force LO to frequency is disabled.

1 - ON - Manually set LO to specified frequency using SENSe:SA:LO:FREQ:VALue . Only applied if Image Reject is set to None, LO High or None, LO Low.

Examples SENSe:SA:LO:FREQ:FORC 1

Query Syntax SENSe<ch>:SA:LO:FREQ:FORC?

Return Type Boolean

Default 0

SENSe<ch>:SA:LO:FREQ:VALue <num> *(Obsolete)*

Applicable Models: All with Spectrum Analysis Options (S9x09xxA/B, S9x09xA/B)

(Read-Write) Set and read enable force LO to frequency. This command is replaced by SENSe:SA:LO:FORCe:FREQuency .

Parameters

<ch> Any existing SA channel. If unspecified, value is set to 1.

<num> Frequency in Hz. Choose a value within the frequency range of the analyzer.

Examples SENSe:SA:LO:FREQ:VAL 1e9

Query Syntax SENSe<ch>:SA:LO:FREQ:VAL?

Return Type Numeric

Default 1 GHz
SENSe<ch>:SA:LO:RANDom[:STATe] <bool>

Applicable Models: All with Spectrum Analysis Options (S9x09xxA/B, S9x09xA/B)

(Read-Write) Set and read the LO randomize state.

Parameters

<ch> Any existing SA channel. If unspecified, value is set to 1.
<char> Choose from:

0 - OFF - LO Randomize is set to OFF.
1 - ON - LO Randomize is set to ON.

Examples

Query Syntax
SENSe<ch>:SA:LO:RANDom[:STATe]?

Return Type
Boolean

Default
1

Applicable Models: All with Spectrum Analysis Options (S9x09xxA/B, S9x09xA/B)

(Read-Write) Set and read the DC sweep order. The SA may be programmed to loop through a series of spectrum measurements at multiple RF source frequencies, multiple RF source powers, and multiple DC voltages. These settings determine whether the DC sources are swept before the RF power and frequencies are swept, or whether the DC sources are swept after the RF power and frequencies are swept.

Parameters

<ch> Any existing SA channel. If unspecified, value is set to 1.
<enum> DC sweep order. Choose from:

DC - Sweep through each DC voltage step first then sweep through the next frequency.
RF - Sweep through each frequency step first then sweep through the next DC voltage.
**SENS**:SA:SOUR:DC:SWEep:FIRD <value>

**Applicable Models:** All with Spectrum Analysis Options (S9x09xxA/B, S9x09xA/B)

*(Read-Write)* Set and read the number of steps the source will make across the specified source DC range. This setting is common to all sources.

**Parameters**

- `<ch>`: Any existing SA channel. If unspecified, value is set to 1.
- `<value>`: Point count. Choose an integer value of 1 or higher.

**Examples**

- **SENSe**:SA:SOUR:DC:SWEep:POInT 100

**Query Syntax**: SENSe<ch>:SA:SOUR:DC:SWEep:POInT?

**Return Type**: Integer

**Default**: 1

---

**SENSe**:SA:SOURce:DC:SWEep[:STATe] <bool>

---
Applicable Models: All with Spectrum Analysis Options (S9x09xxA/B, S9x09xA/B)

(Read-Write) Set and read the ON/OFF state of the DC sources. If ON, the DC sources sweep between their start and stop voltages. If OFF, the DC sources are set to their start voltages.

Parameters

- `<ch>` Any existing SA channel. If unspecified, value is set to 1.
- `<bool>` Choose from:
  - 0 - OFF - DC sweep OFF.
  - 1 - ON - DC sweep ON.

Learn about these settings.

Examples

```
SENS:SA:SOUR:DC:SWE 1
```

Query Syntax

```
SENSe<ch>:SA:SOURce:DC:SWEep[:STATe]?
```

Return Type

Boolean

Default

0

---

SENS<ch>:SA:SOURce<port>:FREQuency:CW <num>[,src]

Applicable Models: All with Spectrum Analysis Options (S9x09xxA/B, S9x09xA/B)

(Read-Write) Set and read the source CW frequency.

Parameters

- `<ch>` Any existing SA channel. If unspecified, value is set to 1.
- `<port>` Source port number of the VNA. If unspecified, value is set to 1. To make settings for ports that are not simple numbers, use the [src] argument.
- `<num>` CW frequency in Hz. Choose a value within the frequency range of the analyzer.

While this argument can be used to make settings for ALL ports, it is designed to access ports such as an external source, or one of the Source outputs on the 2-port PNA-X model with multiple sources such as "Port 1 Src2". Otherwise, the `<port>` argument performs the same function. If both arguments are specified, [src] takes priority.
SENSe<ch>:SA:SOURce<port>:FREQuency:STARt <num>[,src]

**Applicable Models:** All with Spectrum Analysis Options (S9x09xxA/B, S9x09xA/B)

*(Read-Write)* Set and read the source start frequency.

**Parameters**

- `<ch>` Any existing SA channel. If unspecified, value is set to 1.
- `<port>` Source port number of the VNA. If unspecified, value is set to 1. To make settings for ports that are not simple numbers, use the [src] argument.
- `<num>` Start frequency in Hz. Choose a value within the frequency range of the analyzer.

While this argument can be used to make settings for ALL ports, it is designed to access ports such as an external source, or one of the Source outputs on the 2-port PNA-X model with multiple sources such as "Port 1 Src2". Otherwise, the `<port>` argument performs the same function. If both arguments are specified, [src] takes priority.

**Examples**

```
SENSe:SA:SOUR:FREQ:STAR 1e9
sense2:sa:source:frequency:star 1e9,"Port 1 Src2"
```

**Query Syntax**

`SENSe<ch>:SA:SOURce<port>:FREQuency:STARt?`

**Return Type** Numeric

**Default** Start frequency of the analyzer.

SENSe<ch>:SA:SOURce<port>:FREQuency:STOP <num>[,src]
Applicable Models: All with Spectrum Analysis Options (S9x09xxA/B, S9x09xA/B)

(Read-Write) Set and read the source stop frequency.

Parameters

- `<ch>` Any existing SA channel. If unspecified, value is set to 1.
- `<port>` Source port number of the VNA. If unspecified, value is set to 1. To make settings for ports that are not simple numbers, use the [src] argument.
- `<num>` Stop frequency in Hz. Choose a value within the frequency range of the analyzer.

While this argument can be used to make settings for ALL ports, it is designed to access ports such as an external source, or one of the Source outputs on the 2-port PNA-X model with multiple sources such as "Port 1 Src2". Otherwise, the <port> argument performs the same function. If both arguments are specified, [src] takes priority.

Examples

SENS:SA:SOUR:FREQ:STOP 1e10
sense2:sa:source:frequency:stop 1e9, "Port 1 Src2"

Query Syntax

SENSe<ch>:SA:SOURce<port>:FREQuency:STOP?

Return Type

Numeric

Default

Stop frequency of the analyzer.

SENSe<ch>:SA:SOURce:POW:SWEep:POINT:COUNt <value>
**Applicable Models:** All with Spectrum Analysis Options (S9x09xxA/B, S9x09xA/B)

*(Read-Write)* Set and read the number of steps the source will make across the specified source power range. This setting is common to all sources.

**Parameters**
- `<ch>` Any existing SA channel. If unspecified, value is set to 1.
- `<value>` Point count. Choose an integer value of 1 or higher.

**Examples**

```
SENS:SA:SOUR:POW:SWE:POIN:COUNT 100
```

**Query Syntax**

```
SENSe<ch>:SA:SOUR:POW:SWEep:POINt:COUNt?
```

**Return Type**

**Default**

1

**SENSe<ch>:SA:SOURce:POW:SWEep:REPeat:COUNt <value>**

**Applicable Models:** All with Spectrum Analysis Options (S9x09xxA/B, S9x09xA/B)

*(Read-Write)* Set and read the number of SA (receiver) sweeps for each Source Step. This setting is common to all sources.

**Parameters**
- `<ch>` Any existing SA channel. If unspecified, value is set to 1.
- `<value>` Repeat count. Choose an integer value of 1 or higher.

**Examples**

```
```

**Query Syntax**

```
SENSe<ch>:SA:SOUR:POW:SWEep:REPeat:COUNt?
```

**Return Type**

Integer

**Default**

1

**SENSe<ch>:SA:SOURce<port>:POWer:STARt <dBm> [.src]**
**Applicable Models:** All with Spectrum Analysis Options (S9x09xxA/B, S9x09xA/B)

*(Read-Write)* Set and read the source start power level. This command applies to Power or LFPower sweep types.

**Parameters**
- `<ch>` Any existing SA channel. If unspecified, value is set to 1.
- `<port>` Source port number of the VNA. If unspecified, value is set to 1. To make settings for ports that are not simple numbers, use the `[src]` argument.
- `<dBm>` Start power level in dBm. Choose a value within the power range of the source.

While this argument can be used to make settings for ALL ports, it is designed to access ports such as an external source, or one of the Source outputs on the 2-port PNA-X model with multiple sources such as "Port 1 Src2". Otherwise, the `<port>` argument performs the same function. If both arguments are specified, `[src]` takes priority.

**Examples**
```
SENS:SA:SOUR:POW:STAR 0
```

**Query Syntax**
```
SENS<ch>:SA:SOURce<port>:POWer:STARt?
```

**Return Type** Numeric

</tbody>
</table>
Applicable Models: All with Spectrum Analysis Options (S9x09xxA/B, S9x09xA/B)

(Read-Write) Set and read the sweep order. This command applies whenever frequency and power are being swept (LFPower sweep type). Otherwise, this setting is ignored. For example, if all the active sources are set to CW and/or LINear sweep type, or if all the active sources are set to CW and/or POWer sweep type, the sweep order is ignored. If any active source is set to LFPower sweep type, or if an active source is set to LINear sweep type and another active source is set to POWer sweep type, then the sweep order setting will be used.

Parameters

- `<ch>` Any existing SA channel. If unspecified, value is set to 1.
- `<enum>` Sweep order. Choose from:
  - `FREQ` - Sweep from Start to Stop frequency first followed by a power sweep.
  - `POWer` - Sweep power first then sweep from Start to Stop frequency.

Examples

```
SENS:SA:SOUR:SWE:FIR POW
```

Query Syntax

SENSe<cnum>:SEGMenť<snum>:ADD

**Applicable Models:** All

*(Write-only)* Adds a segment.

**Parameters**

- `<cnum>`: Any existing channel number. If unspecified, value is set to 1
- `<snum>`: Segment number to add. If unspecified, value is set to 1. Segment numbers must be sequential. If a new number is added where one currently exists, the existing segment and those following are incremented by one.

**Examples**

Two Segments exist (1 and 2). The following command will add a new segment (1). The existing (1 and 2) will become (2 and 3) respectively.

```plaintext
SENS:SEG1:ADD
sense2:segment1:add
```

**Query Syntax**

Not applicable. Use Sense:Segment:Count to determine the number of segments in a trace.

---

**See Also**

- Example: Upload and Download a Segment List
- Learn about Segment Sweep
- Synchronizing the Analyzer and Controller
- SCPI Command Tree
SENSe<cnum>:SEGMent:ARBitrary <ON | OFF>

Applicable Models: All

(Read-Write) Enables you to setup a segment sweep with arbitrary frequencies. The start and stop frequencies of each segment can overlap other segments. Also, each segment can have a start frequency that is greater than its stop frequency which causes a reverse sweep over that segment. Learn more about Arbitrary Segment Sweep.

Parameters

- `<cnum>`: Any existing channel number. If unspecified, value is set to 1.
- `<ON | OFF>`: ON (or 1) - Allows the setup of arbitrary segment sweep. OFF (or 0) - Prevents the setup of arbitrary segment sweep.

Examples

- SENS:SEG:M:ARB ON
- sense2:SEG:ARB OFF

Query Syntax

SENSe<cnum>:SEGMent:ARBitrary?

Return Type

Boolean (1 = ON, 0 = OFF)

Default

OFF

---

SENSe<cnum>:SEGMent<snum>:BWIDth:PORT<pnum>[:RESolution] <num>

Applicable Models: All

(Read-Write) Specifies whether the IF Bandwidth resolution can be set independently for each segment for the selected port and channel.

Parameters

- `<cnum>`: Any existing channel number. If unspecified, value is set to 1
- `<snum>`: Segment number to modify. Choose any existing segment number.
- `<pnum>`: Individual port number of the source: Port 1 to Port 2/Port 4. If unspecified, value is set to 1.
- `<num>`: IF Bandwidth of each segment in Hz. The list of valid IF Bandwidths is different depending on the VNA model. (Click to see the lists.) If an invalid number is specified, the analyzer will round up to the closest valid number.

Note: This command will accept MIN or MAX instead of a numeric parameter. See SCPI Syntax for more information.
SENSe<cnum>:SEGMen<snm>:BWIDth | BWIDth:PORT[:RESolution]:CONTrol <bool>

Applicable Models: All

(Read-Write) Turns ON or OFF the individual (Port 1 to Port n) IF Bandwidth control in the segment sweep table. This command can be turned ON when the SENS:SEGM:BWID:CONT is OFF.

Parameters
- <cnum>: Any existing channel number. If unspecified, value is set to 1
- <bool>: Specified the individual IFBW control, either ON or OFF.
  - ON or 1 - Turns ON the individual port IFBW control.
  - OFF or 0 - Turns OFF the individual port IFBW control.

Examples
- SENS:SEGm:BWID:PORT:CONT ON
- sense2:segment2:bandwidth:PORT:resolution:control off

Query Syntax
SENSe<cnum>:SEGMen<snm>:BWIDth | BWIDth:PORT[:RESolution]:CONTrol?

Return Type
Boolean

Default
OFF or 0

SENSe<cnum>:SEGMen<snm>:BWIDth[:RESolution] <num>
Applicable Models: All

(Read-Write) Sets the IF Bandwidth for the specified segment. First set SENS:SEGM:BWIDth:CONTrol ON. All subsequent segments that are added assume the new IF Bandwidth value.

Parameters
- `<cnum>`: Any existing channel number. If unspecified, value is set to 1
- `<snum>`: Segment number to modify. Choose any existing segment number.
- `<num>`: IF Bandwidth in Hz. The list of valid IF Bandwidths is different depending on the VNA model. (Click to see the lists.) If an invalid number is specified, the analyzer will round up to the closest valid number.

Note: This command will accept MIN or MAX instead of a numeric parameter. See SCPI Syntax for more information.

Examples
- `SENS:SEGM:BWID:RESolution max`

Query Syntax
- `SENSe<cnum>:SEGMent<snum>:BWIDth[:RESolution]?`

Return Type
- Numeric

Default
- Varies with VNA model.

SENSe<cnum>:SEGMent:BWIDth[:RESolution]:CONTrol <ON | OFF>

Applicable Models: All

(Read-Write) Specifies whether the IF Bandwidth resolution can be set independently for each segment. This command can be turned ON when the SENS:SEGM:BWID:PORT:CONT is OFF.

Parameters
- `<cnum>`: Any existing channel number. If unspecified, value is set to 1
- `<ON | OFF>`: ON (or 1) - turns Bandwidth control ON. Bandwidth can be independently set for each segment.
- OFF (or 0) - turns Bandwidth control OFF. Use the channel IF bandwidth setting SENS:BWID.

Examples
- `SENSe:SEGM:BWID:CONT ON`
- `sense2:segment:bwidth:control off`

Query Syntax
- `SENSe<cnum>:SEGMent:BWIDth[:RESolution]:CONTrol?`
SENSe<cnum>:SEGMent:COUNt?

Applicable Models: All

(Read-only) Queries the number of segments that exist in the specified channel.

Parameters

- **<cnum>** Any existing channel number. If unspecified, value is set to 1

Examples

SENSe:SEGM:COUNT?
sense2:segment:count?

Return Type Numeric
Default 1 segment

SENSe<cnum>:SEGment<snum>:DELete

Applicable Models: All

(Write-only) Deletes the specified sweep segment. When ALL segments are deleted, SENS:SWE:TYPE is automatically set to Linear because there are no segments to sweep.

- **<cnum>** Any existing channel number. If unspecified, value is set to 1
- **<snum>** Number of the segment to delete. If unspecified, value is set to 1

Examples

SENSe:SEGM:DEL
sense2:segment2:delete

Query Syntax Not applicable
Default Not Applicable

SENSe<cnum>:SEGment:DELete:ALL
Applicable Models: All

(Write-only) Deletes all sweep segments. When this command is executed, SENS:SWE:TYPE is automatically set to Linear because there are no segments to sweep.

Parameters

\(<\text{cnum}>\) Any existing channel number. If unspecified, value is set to 1

Examples

<table>
<thead>
<tr>
<th>Command</th>
</tr>
</thead>
<tbody>
<tr>
<td>SENS:SEGM:DEL:ALL</td>
</tr>
<tr>
<td>sense2:segment:delete:all</td>
</tr>
</tbody>
</table>

Query Syntax

Not applicable

Default

Not Applicable

SENSe<\text{cnum}>:SEGment<\text{snum}>:FREQuency:CENTer <\text{num}>

Applicable Models: All

(Read-Write) Sets the Center Frequency for the specified segment. The Frequency Span of the segment remains the same. The Start and Stop Frequencies change accordingly.

**Note**: All previous segment's Start and Stop Frequencies that are larger than the new Start Frequency are changed to the new Start Frequency. All following segment's start and stop frequencies that are smaller than the new Stop Frequency are changed to the new Stop Frequency.

Parameters

\(<\text{cnum}>\) Any existing channel number. If unspecified, value is set to 1
\(<\text{snum}>\) Segment number to modify. Choose any existing segment number.
\(<\text{num}>\) Center Frequency in Hz. Choose any number between the **minimum** and **maximum** frequency of the analyzer.

**Note**: This command will accept **MIN** or **MAX** instead of a numeric parameter. See SCPI Syntax for more information.

Examples

<table>
<thead>
<tr>
<th>Command</th>
</tr>
</thead>
<tbody>
<tr>
<td>SENS:SEGM:FREQ:CENT 1MHZ</td>
</tr>
<tr>
<td>sense2:segment2:frequency:center 1e9</td>
</tr>
</tbody>
</table>

Query Syntax

SENSe<\text{cnum}>:SEGment<\text{snum}>:FREQuency:CENTer?

Return Type

Numeric

Default

Stop Frequency of the previous segment. If first segment, start frequency of the analyzer.
SENSe<cn>:SEGMen<snum>:FREQuency:SPAN <num>

Applicable Models: All

(Read-Write) Sets the Frequency Span for the specified segment. The center frequency of the segment remains the same. The start and stop frequencies change accordingly.

Note: All previous segment's Start and Stop Frequencies that are larger than the new Start Frequency are changed to the new Start Frequency. All following segment's start and stop frequencies that are smaller than the new Stop Frequency are changed to the new Stop Frequency.

Parameters

<cnum> Any existing channel number. If unspecified, value is set to 1
<snum> Segment number to modify. Choose any existing segment number.
<num> Frequency Span in Hz. Choose any number between the minimum and maximum frequency of the analyzer.

Note: This command will accept MIN or MAX instead of a numeric parameter. See SCPI Syntax for more information.

Examples

SENS:SEG:FREQ:SPAN 1MHZ
sense2:segment2:frequency:span max

Query Syntax

SENSe<cn>:SEGMen<snum>:FREQuency:SPAN?

Return Type

Numeric

Default

If first segment, frequency span of the analyzer. Otherwise 0.

SENSe<cn>:SEGMen<snum>:FREQuency:START <num>

Applicable Models: All

(Read-Write) Sets the Start Frequency for the specified sweep segment.

Notes

All other segment Start and Stop Frequency values that are larger than this frequency are changed to this frequency.

To return the start and stop frequency of the entire sweep (all segments), Use SENS:FREQ:STARt and SENS:FREQ:STOP

Parameters

<cnum> Any existing channel number. If unspecified, value is set to 1
<snum> Segment number to modify. Choose any existing segment number.
### SENSE<cnm>:SEGM<snm>:FREQ:STAR <num>

**Applicable Models:** All

*(Read-Write)* Sets the Start Frequency for the specified sweep segment.

**Notes**

All other segment Start and Stop Frequency values that are larger than this frequency are changed to this frequency.

To return the start and stop frequency of the entire sweep (all segments), Use SENS:FREQ:START? and SENS:FREQ:STOP?

**Parameters**

- `<cnm>`: Any existing channel number. If unspecified, value is set to 1
- `<snm>`: Segment number to modify. Choose any existing segment number.
- `<num>`: Start Frequency in Hz. Choose any number between the `minimum` and `maximum` frequency of the analyzer.

**Examples**

<table>
<thead>
<tr>
<th>SENSE&lt;cnm&gt;:SEGM&lt;snm&gt;:FREQ:STAR 1MHZ</th>
</tr>
</thead>
<tbody>
<tr>
<td>sense2:segment2:frequency:start minimum</td>
</tr>
</tbody>
</table>

**Query Syntax**

SENSe<cnm>:SEGM<snm>:FREQ:STAR?

**Return Type**

Numeric

---

### SENSE<cnm>:SEGM<snm>:FREQ:STOP <num>

**Applicable Models:** All

*(Read-Write)* Sets the Stop Frequency for the specified sweep segment.

**Notes**

All other segment Start and Stop Frequency values that are larger than this frequency are changed to this frequency.

To return the start and stop frequency of the entire sweep (all segments), Use SENS:FREQ:START? and SENS:FREQ:STOP?

**Parameters**

- `<cnm>`: Any existing channel number. If unspecified, value is set to 1
- `<snm>`: Segment number to modify. Choose any existing segment number.
- `<num>`: Stop Frequency in Hz. Choose any number between the `minimum` and `maximum` frequency of the analyzer.

**Examples**

<table>
<thead>
<tr>
<th>SENSE&lt;cnm&gt;:SEGM&lt;snm&gt;:FREQ:STOP 1MHZ</th>
</tr>
</thead>
<tbody>
<tr>
<td>sense2:segment2:frequency:stop maximum</td>
</tr>
</tbody>
</table>

**Query Syntax**

SENSe<cnm>:SEGM<snm>:FREQ:STOP?

**Return Type**

Numeric
Default  If first segment, stop frequency of the analyzer. Otherwise, start frequency of the segment.

SENSe<cnum>:SEGMent:LIST <char>,<numSegs>,<data>

Applicable Models: All

(Read-Write) Reads or writes the entire list of values in the segment sweep table.

Note: For binary data transfer, specify 64-bit instead of 32-bit using FORMat[:DATA]. This is because higher frequencies used on VNA exceed the maximum value that can be represented by a 32-bit floating point number.

When sending/receiving this data as binary (FORMat[:DATA] REAL,64), use FORMat:BORDer to specify the correct 'endianness' (byte ordering) corresponding to your programming environment / computer platform.

Parameters

- **<cnum>** Any existing channel number. If unspecified, value is set to 1
- **<char>** Choose from:
  - **SSTOP** - Frequency values are Start and Stop for each segment.
  - **CSPAN** - Frequency values are Center and Span for each segment.
- **<numSegs>** Total number of sweep segments being input. This allows the VNA to determine how many values per-each-segment are in the input <data> block.
- **<data>** A list of segments specified using either a comma-separated string of data, or an array of double (real,64) depending on the state of FORM:DATA. Each segment is specified with a minimum of 4 and maximum of 7 values consecutively. The set of values that specify each segment should be in the following order:

  1. Segment state (Boolean 1 for ON and 0 for OFF)
  2. Number of Points in the segment
  3. Start Freq (when <char> is SSTOP), or Center Freq (when <char> is CSPAN)
  4. Stop Freq (when <char> is SSTOP), or Freq Span (when <char> is CSPAN)
  5. IFBW (optional for the Write)
  6. Dwell Time (optional for the Write)
  7. Power (optional for the Write) - see below.
The first four data elements must always be supplied. After those values, data must be supplied for successive optional elements. For example, to set dwell time values, you must also supply IFBW values, because IFBW (#5) precedes dwell time (#6) in the array order.

The IF Bandwidth, Sweep Time and Source Power Control settings do NOT affect the order in which elements are interpreted.

The number of elements to supply for Power depends on the following two settings:

1. Source Power Option - ON allows segments to have independent power levels.
2. Couple Ports = Off allows different power levels for each test port.

<table>
<thead>
<tr>
<th>CouplePorts</th>
<th>SourcePowerOption</th>
<th>Number of Elements</th>
</tr>
</thead>
<tbody>
<tr>
<td>False</td>
<td>False</td>
<td>Each port has its own channel-wide power setting, which is set using SOURce:POWer[:LEVel]. Provide exactly 7 elements per segment. The last element (power) is ignored.</td>
</tr>
<tr>
<td>False</td>
<td>True</td>
<td>Provide 6 elements + total number of ports. The first 7 elements are still interpreted the same. The remaining elements (in-order) are interpreted as the power levels to set on that segment for Ports 2 through N, where N is the total number of ports currently enabled for the VNA or for a VNA with multiport external test set.</td>
</tr>
<tr>
<td>True</td>
<td>False</td>
<td>Provide exactly 7 elements per segment. The last element (power) is ignored.</td>
</tr>
<tr>
<td>True</td>
<td>True</td>
<td>Provide exactly 7 elements per segment. The last element (power) is honored.</td>
</tr>
</tbody>
</table>

**Examples**

```
SENS:SEGM:LIST SSTOP,1,1,201,10E6,26.5E9,1E3,0,-10 1 segment,
```
state ON, 201 points, 10 MHz to 26.5 GHz, 1kHz IFBW, 0 dwell time, -10 dBm (port powers coupled)

sense2:segment:list? cspan

See Upload and Download a Segment List example program

Query Syntax
SENS<cnm>:SEGM<snm>:LIST? [char].

If unspecified, char is set to SSTOP.

The number of data elements per segment returned will be 6 + total number of source ports, regardless of the IF Bandwidth, Sweep Time and Source Power Control settings. For the N5264B, which has no source ports, the query will return just 6 values per segment. For all other VNA models, the last elements in each segment correspond to the power level for each port.

Return Type
Returns block data in the format specified by FORMat[:DATA].

Default
Not Applicable

SENS<cnm>:SEGM<snm>:NFBW <num>

Applicable Models: All with S93070xA/B or S95070A/B

(Read-Write) Sets or returns the noise figure bandwidth.

Parameters
- <cnm> Any existing channel number. If unspecified, value is set to 1
- <snm> Segment number to modify. Choose any existing segment number.
- <num> Noise figure bandwidth. Choose any number between the minimum and maximum IF bandwidth of the analyzer.

Note: This command will accept MIN or MAX instead of a numeric parameter. See SCPI Syntax for more information.

Examples
SENS:SEG:M:NFBW MIN
sense2:segment2:nfbw maximum

Query Syntax
SENS<cnm>:SEGM<snm>:NFBW?

Return Type
Numeric

Default
If first segment, stop frequency of the analyzer. Otherwise, start frequency of the segment.

SENS<cnm>:SEGM<snm>:NFBW:CONTrol <bool>
Applicable Models: All with S93070xA/B or S95070A/B

(Read-Write) Turns ON or OFF the noise figure bandwidth setting specified using SENSE:SEGMENT:NFBW.

Parameters
<cnm> Any existing channel number. If unspecified, value is set to 1.
<snum> Segment number to modify. Choose any existing segment number.
<bool> ON or 1 - Turns ON the noise figure bandwidth control.
OFF or 0 - Turns OFF the noise figure bandwidth control

Examples
SENSe:SEGm:NFBW:CONt ON
sense:segment:nfbw:control 1

Query Syntax
SENSe<cnm>:SEGm:POW:ATT:REC:CONT?

Return Type
Boolean.

Default
OFF or 0

SENSe<cnm>:SEGm:POW:ATT:REC:REC:CONT <bool>

Applicable Models: N522xB, N523xB, N524xB, M9485A

(Read-Write) Turns ON or OFF the individual receiver attenuator control in the segment sweep table.

Parameters
<cnm> Any existing channel number. If unspecified, value is set to 1.
<bool> ON or 1 - Turns ON the individual receiver attenuator control.
OFF or 0 - Turns OFF the individual receiver attenuator control

Examples
SENSe:SEGm:POW:ATT:REC:REC:CONt ON
sense:segment:power:attenuation:receiver:control 1

Query Syntax
SENSe<cnm>:SEGm:POW:ATT:REC:REC:CONT?

Return Type
Boolean. If querying for the standard (M9376A) port, the return value is 0

Default
OFF or 0

SENSe<cnm>:SEGm<snum>:POW<port>:ATT:REC:REF <num>
Applicable Models: N522xB, N523xB, N524xB, M9485A

(Read-Write) Sets the attenuation level for the specified reference attenuator for each segment.

**Parameters**

- `<cnum>`: Any existing channel number. If unspecified, value is set to 1.
- `<snum>`: Segment number to modify. Choose any existing segment number. If unspecified, value is set to 1.
- `<port>`: Port number of the VNA. If unspecified, value is set to 1.
- `<num>`: Attenuation value in dB. 0dB or 35dB.
  
  If a number other than these is entered, the analyzer will select the next lower valid value. For example, if 19dB is entered, then 0dB attenuation will be selected.

**Examples**

```
SENS:SEGM:POW2:ATT:REC:REF 0
```

**Query Syntax**

```
SENS<cnum>:SEGM<snum>:POW<port>:ATT<nnum>:REC:REF
```

**Return Type**

Numeric. If querying for the standard port, the return value is 0

**Default**

35

---

SENSe<cnum>:SEGM<snum>:POW<port>:ATT<nnum>:REC:TEST <num>

Applicable Models: N522xB, N523xB, N524xB, M9485A

(Read-Write) Sets the attenuation level for the specified test attenuator for each segment.

**Parameters**

- `<cnum>`: Any existing channel number. If unspecified, value is set to 1.
- `<snum>`: Segment number to modify. Choose any existing segment number. If unspecified, value is set to 1.
- `<port>`: Port number of the VNA. If unspecified, value is set to 1.
- `<num>`: Attenuation value in dB. 0dB or 35dB.

  If a number other than these is entered, the analyzer will select the next lower valid value. For example, if 19dB is entered, then 0dB attenuation will be selected.
SENSe<cnum>:SEGMent<snum>:POWer<port>[:LEVEL] <num>

**Applicable Models:** All

*(Read-Write)* Sets the Port Power level for the specified sweep segment. First set SENSe:SEGM:POW:CONTrol ON.

When port power is Coupled, setting port power for one port will apply port power for all source ports.

All subsequent segments that are added assume the new Power Level value.

**Parameters**

- `<cnum>`: Any existing channel number. If unspecified, value is set to 1
- `<snum>`: Segment number to modify. Choose any existing segment number.
- `<port>`: Port number of the source. If unspecified, value is set to 1.
- `<num>`: Power level.

**Note:** The range of settable power values depends on the VNA model and if source attenuators are installed. To determine the range of values, send SOUR:POW? MAX and SOUR:POW? MIN. (SOUR:POW:ATT:AUTO must be set to ON).

Actual achievable leveled power depends on frequency.

<table>
<thead>
<tr>
<th>Examples</th>
<th>SENSe:SEGM:POW 0</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>sense2:segment2:power1:level -10</td>
</tr>
</tbody>
</table>

**Query Syntax**

SENSe<cnum>:SEGMent<snum>:POWer<port>[:LEVEL]?

**Return Type**

Numeric

**Default**

0
SENSe<cnm>:SEGMent:POWer[:LEVel]:CONTrol <ON | OFF>

Applicable Models: All

(Read-Write) Specifies whether Power Level can be set independently for each segment.

Parameters

<cnm> Any existing channel number. If unspecified, value is set to 1
<ON | OFF> ON (or 1) - turns Power Level control ON. Power level can be set for each segment.
OFF (or 0) - turns Power Level control OFF. Use the channel power level setting.

Examples

SENSE:SEGM:POW:CONT ON
sense2:segment:power:level:control off

Query Syntax

SENSe<cnm>:SEGMent:POWer[:LEVel]:CONTrol?

Return Type

Boolean (1 = ON, 0 = OFF)

Default

OFF

SENSe<cnm>:SEGMent<snum>:SA:DTHReshold <num>

Applicable Models: All

(Read-Write) Sets or returns the SA data threshold for the segment.

Parameters

<cnm> Any existing channel number. If unspecified, value is set to 1
<snum> Segment number to modify. Choose any existing segment number.
<num> Data threshold (in dBm).

Examples

SENSE:SEGM:SA:DTHR -60
sense2:segment2:sa:dthreshold -60

Query Syntax

SENSe<cnm>:SEGMent<snum>:SA:DTHReshold?

Return Type

Numeric

Default

-60 dBm

SENSe<cnm>:SEGMent<snum>:SA:DTHReshold:CONTrol <ON | OFF>
Applicable Models: All

(Read-Write) Specifies whether SA Data Threshold can be set independently for each segment.

Parameters
- `<cnum>`: Any existing channel number. If unspecified, value is set to 1
- `<snum>`: Segment number to modify. Choose any existing segment number.
- `<ON | OFF>`: ON (or 1) - turns SA Data Threshold control ON.
  OFF (or 0) - turns SA Data Threshold control OFF.

Examples
- `SENS:SEGM:SA:DTHR:CONT ON`
- `sense2:segment:sa:dthreshold:control off`

Query Syntax
- `SENSe<cnum>:SEGMent<snum>:SA:DTHReshold:CONTrol?`

Return Type
- Boolean (1 = ON, 0 = OFF)

Default
- OFF

SENSe<cnum>:SEGMent<snum>:SA:MTReference <num>

Applicable Models: All

(Read-Write) Sets or returns the SA multitone reference for the segment.

Parameters
- `<cnum>`: Any existing channel number. If unspecified, value is set to 1
- `<snum>`: Segment number to modify. Choose any existing segment number.
- `<num>`: Multitone reference (in dBm).

Examples
- `SENS:SEGM:SA:MTR 0`
- `sense2:segment2:sa:mtreference 0`

Query Syntax
- `SENSe<cnum>:SEGMent<snum>:SA:MTReference?`

Return Type
- Numeric

Default
- 0

SENSe<cnum>:SEGMent<snum>:SA:MTReference:CONTrol <ON | OFF>
Applicable Models: All

(Read-Write) Specifies whether SA Reference Tone can be set independently for each segment.

Parameters
<cnun> Any existing channel number. If unspecified, value is set to 1
<snum> Segment number to modify. Choose any existing segment number.
<ON | OFF> ON (or 1) - turns SA Reference Tone control ON.
OFF (or 0) - turns SA Reference Tone control OFF.

Examples
SENS:SEGM:SA:MTR:CONT ON
sense2:segment:sa:mtreference:control off

Query Syntax
SENS<cnun>:SEGM<snun>:SA:MTRReference:CONTrol?

Return Type
Boolean (1 = ON, 0 = OFF)

Default
OFF

SENSe<cnun>:SEGM<snun>:SA:MTRReference:MAX?

Applicable Models: All

(Read-only) Queries the maximum value of the SA Reference Tone, which is the maximum frequency.

Parameters
<cnun> Any existing channel number. If unspecified, value is set to 1
<snum> Segment number to modify. Choose any existing segment number.

Examples
SENS:SEGM:SA:MTR:MAX?
sense2:segment:sa:mtreference:max?

Return Type
Numeric

Default
Not Applicable

SENSe<cnun>:SEGM<snun>:SA:MTRReference:MIN?
Applicable Models: All

(Read-only) Queries the minimum value of the SA Reference Tone.

**Parameters**
- `<cnum>`  Any existing channel number. If unspecified, value is set to 1
- `<snum>`  Segment number to modify. Choose any existing segment number.

**Examples**
- `SENS:SEGM:SA:MTR:MIN?`
- `sense2:segment:sa:mtrreference:min?`

**Return Type**  Numeric

**Default**  0

SENSe<cnum>:SEGMent<snum>:SA:VAVerage <num>

Applicable Models: All

(Read-Write) Sets or returns the SA vector averaging points for the segment.

**Parameters**
- `<cnum>`  Any existing channel number. If unspecified, value is set to 1
- `<snum>`  Segment number to modify. Choose any existing segment number.
- `<num>`  Vector average points.

**Examples**
- `SENS:SEGM:SA:VAV 10`
- `sense2:segment2:sa:vaverage 10`

**Query Syntax**  `SENSe<cnum>:SEGMent<snum>:SA:VAVerage?`

**Return Type**  Numeric

**Default**  1

SENSe<cnum>:SEGMent<snum>:SA:VAVerage:CONTrol <ON | OFF>`
Applicable Models: All

(Read-Write) Specifies whether SA Vector Averaging can be set independently for each segment.

**Parameters**

- `<cnum>`: Any existing channel number. If unspecified, value is set to 1
- `<snum>`: Segment number to modify. Choose any existing segment number.
- `<ON | OFF>`
  - ON (or 1) - turns SA Vector Averaging control ON.
  - OFF (or 0) - turns SA Vector Averaging control OFF.

**Examples**

```plaintext
SENS:SEGM:SA:VAV:CONT ON
sense2:segment:sa:vaverage:control off
```

**Query Syntax**

`SENSe<cnum>:SEGMent<snum>:SA:VAVerage:CONTrol?`

**Return Type**

Boolean (1 = ON, 0 = OFF)

**Default**

OFF

---

`SENSe<cnum>:SEGMent<snum>:SA:VIDeobw <num>`

Applicable Models: All

(Read-Write) Sets or returns the SA video bandwidth for the segment.

**Parameters**

- `<cnum>`: Any existing channel number. If unspecified, value is set to 1
- `<snum>`: Segment number to modify. Choose any existing segment number.
- `<num>`: Video bandwidth (in Hz).

**Examples**

```plaintext
SENS:SEGM:SA:VID 1E6
sense2:segment2:sa:videobw 1e6
```

**Query Syntax**

`SENSe<cnum>:SEGMent<snum>:SA:VIDeobw?`

**Return Type**

Numeric

**Default**

1E6 Hz

---

`SENSe<cnum>:SEGMent<snum>:SA:VIDeobw:CONTrol <ON | OFF>`
Applicable Models: All

(Read-Write) Specifies whether SA Video Bandwidth can be set independently for each segment.

Parameters

- `<cnum>` Any existing channel number. If unspecified, value is set to 1
- `<snum>` Segment number to modify. Choose any existing segment number.
- `<ON | OFF>` ON (or 1) - turns SA Video Bandwidth control ON.
  OFF (or 0) - turns SA Video Bandwidth control OFF.

Examples

```
SENS:SEGM:SA:VID:CONT ON
sense2:segment:sa:videobw:control off
```

Query Syntax

```
SENSe<cnum>:SEGMent<snum>:SA:VIDeobw:CONTrol?
```

Return Type

Boolean (1 = ON, 0 = OFF)

Default

OFF

SENSe<cnum>:SEGMent<snum>[:STATe] <ON | OFF>

Applicable Models: All

(Read-Write) Turns the specified sweep segment ON or OFF. At least ONE segment must be ON or Sweep Mode is automatically set to Linear.

Parameters

- `<cnum>` Any existing channel number. If unspecified, value is set to 1
- `<snum>` Segment number to be turned ON or OFF
- `<ON | OFF>` ON (or 1) - turns segment ON.
  OFF (or 0) - turns segment OFF.

Examples

```
SENS:SEGm ON
sense2:segment2:state off
```

Query Syntax

```
SENSe<cnum>:SEGMent<snum>[:STATe]?
```

Return Type

Boolean (1 = ON, 0 = OFF)

Default

OFF

SENSe<cnum>:SEGMent<snum>:SHLO

Applicable Models: N522xB, N523xB, N524xB, E5080A
(Read-Write) Sets or returns the Shift LO state of each segment in the segment sweep table for the selected channel.

**Notes:** The SENS:SEGM:SHLO:CONT command must first be set to ON before using this command.

### Parameters
- `<cnum>` Any existing channel number. If unspecified, value is set to 1
- `<snum>` Any existing segment number.

### Examples
- `SENS:SEGM2:SHLO`
- `sense2:segment2:shlo`

### Query Syntax
- `SENSe<cnum>:SEGMent<snum>:SHLO?`

### Return Type
- Numeric

### Default
- Not Applicable

---

`SENSe<cnum>:SEGMent:<snum>:SOURce<sport>:RECeiver<rport>:GAIN[:VALue] <string>`

**Applicable Models:** M980xA, P50xxA

(Read-Write) Sets the gain settings to a specified port on the specified sweep segment. SENS:SEGM:SOUR:REC:GAIN:CONT should be turned on when you us this. Use SENS:SOUR:REC:GAIN:CAT? to return a list of available gain states for the specified port.

### Parameters
- `<cnum>` Any existing channel number. If unspecified, value is set to 1
- `<snum>` Segment number to modify. Choose any existing segment number. If unspecified, value is set to 1.
- `<sport>` Source port number of the VNA. If unspecified, value is set to 1
- `<rport>` Receiver port number of the VNA. If unspecified, value is set to 1
- `<string>` Receiver gain state. Not case sensitive.

For M980xA, P50xxA choose from:

- Auto
- Low
- High

### Examples
SENSe<ch>:SEGMen<seg>:SOUR<port>:RECeiver<rport>:GAIN[:VALue]

**Query Syntax**
SENSe<ch>:SEGMen<seg>:SOUR<port>:RECeiver<rport>:GAIN[:VALue]

**Return Type**
String

**Default**
Auto

SENSe<ch>:SEGMen<seg>:SOUR<port>:RECeiver<rport>:GAIN<state>

**Applicable Models:** M980xA, P50xxA

*(Read-Write)* Sets the gain settings to all ports on the specified sweep segment. SENSe:SEGMen:SOUR:RECeiver:GAIN:CONT should be turned on when you use this. Use SENSe:SOUR:RECeiver:GAIN:CAT? to return a list of available gain states for the specified port.

**Parameters**

- `<ch>` Any existing channel number. If unspecified, value is set to 1
- `<seg>` Segment number to modify. Choose any existing segment number. If unspecified, value is set to 1.
- `<port>` This parameter is Ignored
- `<rport>` This parameter is Ignored
- `<state>` Receiver gain state. Not case sensitive.

For M980xA, P50xxA choose from:

- Auto
- Low
- High

**Examples**

SENSe:SEGMen2:SOUR1:RECeiver2:GAIN "Low" ' Low for S21 measurement in segment 2

SENSe:SEGMen2:SOUR1:RECeiver2:GAIN:"High" ' High for S22 measurement in Segment 1

SENSe:SEGMen2:SOUR1:RECeiver2:GAIN:CONT ON
SENSe:SEGMen2:SOUR1:RECeiver2:GAIN:ALL "Low" ' Low for all measurements in Segment 2
SENSe<cnum>:SEGMent<snum>:SOURce<port>:RECeiver<rport>:GAIN:CONTrol <bool>

**Applicable Models:** M980xA, P50xxA

*(Read-Write)* Sets and read the status of the segment receiver gain setting function. This must be turned ON when SENS:SEGM:SOUR:REC:GAIN or SENS:SEGM:SOUR:REC:GAIN:ALL is used.

**Parameters**

- `<cnum>`: Any existing channel number. If unspecified, value is set to 1
- `<snum>`: This parameter is Ignored.
- `<sport>`: This parameter is Ignored.
- `<rport>`: This parameter is Ignored.
- `<bool>`: ON or 1 - Turn the segment receiver gain setting function ON
  
  OFF or 0 - Turn the segment receiver gain setting function OFF

**Examples**

```
SENSe<cnm>:SEGMent<snum>:SOURce<port>:RECeiver<rport>:GAIN:CONT on
SENSe<cnm>:SEGMent<snum>:SOURce<port>:RECeiver<rport>:GAIN:CONT OFF
```

**Query Syntax**

SENSe<cnum>:SEGMent<snum>:SOURce<port>:RECeiver<rport>:GAIN:CONTrol ?

**Return Type**

Boolean

**Default**

OFF

SENSe<cnum>:SEGMent<snum>:SHLO:CONTrol <bool>

**Applicable Models:** N522xB, N523xB, N524xB, E5080A
(Read-Write) Turns ON or OFF the individual Shift LO state control in the segment sweep table.

**Parameters**

- `<cnum>` Any existing channel number. If unspecified, value is set to 1
- `<snum>` Any existing segment number.
- `<bool>` **ON or 1** - Turns ON the individual Shift LO state control.
  **OFF or 0** - Turns OFF the individual Shift LO state control.

**Examples**

```plaintext
SENS:SEG:M:SHLO:CONT ON  
sense2:segment2:shlo:control off
```

**Query Syntax**

`SENS<cnum>:SEGment<snum>:SHLO:CONTrol?`

**Return Type**

Boolean

**Default**

OFF or 0

---

`SENS<cnum>:SEGment<snum>:SWEep:DELay <num>`

**Applicable Models:** All

(Read-Write) Sets or returns the sweep delay time of the specified sweep segment.

**Notes:** The SENS:SEG:M:SWE:DEL:CONT command must first be set to ON before using this command.

**Parameters**

- `<cnum>` Any existing channel number. If unspecified, value is set to 1
- `<snum>` Any existing segment number.
- `<num>` Range of sweep delay time is between 0 to 1 and the resolution is 0.001.

**Notes:** If the specified variable is out of the allowable setup range, the minimum value (if the lower limit of the range is not reached) or the maximum value (if the upper limit of the range is exceeded) is set.

- `<unit>` s (second)

**Examples**

```plaintext
SENS:SEG:M:SWE:DEL  
sense2:segment2:sweep:delay
```

**Query Syntax**

`SENS<cnum>:SEGment<snum>:SWEep:DELay?`

**Return Type**

Numeric / Double precision floating point
**SENSe<cnum>:SEGMen<snum>:SWEep:DELay:CONTrol <bool>**

Applicable Models: All

(Read-Write) Turns ON or OFF the sweep delay time of the specified sweep segment.

**Parameters**
- `<cnum>` Any existing channel number. If unspecified, value is set to 1
- `<snum>` Any existing segment number.
- `<bool>` ON or 1 - Turns ON sweep delay time.
  OFF or 0 - Turns OFF sweep delay time.

**Examples**
```
SENS:SEGM:SWE:DEL:CONT ON
sense2:segment2:sweep:delay:control off
```

**Query Syntax**
SENSe<cnum>:SEGMen<snum>:SWEep:DELay:CONTrol?

**Return Type**
Boolean

**Default**
OFF or 0

---

**SENSe<cnum>:SEGMen<snum>:SWEep:DWELl <num>**

Applicable Models: All

(Read-Write) Sets or returns the sweep dwell time of the specified sweep segment.

**Notes:** The SENS:SEGm:SWE:DWELl:CONT command must first be set to ON before using this command.

**Parameters**
- `<cnum>` Any existing channel number. If unspecified, value is set to 1
- `<snum>` Any existing segment number.
- `<num>` Range of sweep dwell time

**Notes:** If the specified variable is out of the allowable setup range, the minimum value (if the lower limit of the range is not reached) or the maximum value (if the upper limit of the range is exceeded) is set.

- `<unit>` s (second)

**Examples**
```
SENS:SEGM:SWE:DWEL
sense2:segment2:sweep:dwell
```
SENSe <cnum>:SEGMen<snum>:SWEep:DWELl:CONTrol <bool>

Applicable Models: All

(Read-Write) Turns ON or OFF the sweep dwell time of the specified sweep segment.

Parameters
- <cnum> Any existing channel number. If unspecified, value is set to 1
- <snum> Any existing segment number.
- <bool> ON or 1 - Turns ON sweep dwell time.
  OFF or 0 - Turns OFF sweep dwell time.

Examples
- SENS:SEGM:SWE:DWEL:CONT ON
- sense2:segment2:sweep:dwell:control off

Query Syntax
SENSe <cnum>:SEGMen<snum>:SWEep:DWELl:CONTrol?

Return Type
Boolean

Default
OFF or 0

SENSe <cnum>:SEGMen<snum>:SWEep:GENeration <char>
Applicable Models: All

(Read-Write) Sets or returns the sweep mode of the specified sweep segment.

Notes: The SENS:SEGM:SWE:GEN:CONT command must first be set to ON before using this command.

Parameters

- `<cnum>` Any existing channel number. If unspecified, value is set to 1.
- `<snum>` Any existing segment number.
- `<char>` Select sweep mode from either of the following:
  - "ANALog": Sets the sweep mode to the auto mode.
  - "STEPped": Sets the sweep mode to the stepped mode.

Examples

SENSe<cnum>:SEGM<snuint>:SWEep:GENeration ANAL
sense2:segment2:sweep:generation stepped

Query Syntax
SENSe<cnum>:SEGM<snuint>:SWEep:GENeration?

Return Type
Character

Default
"ANAL"

SENSe<cnum>:SEGM<snuint>:SWEep:GENeration:CONTrol <bool>

Applicable Models: All

(Read-Write) Turns ON or OFF the sweep mode of the specified sweep segment.

Parameters

- `<cnum>` Any existing channel number. If unspecified, value is set to 1.
- `<snum>` Any existing segment number.
- `<bool>` ON or 1 - Turn ON sweep mode.
  OFF or 0 - Turn OFF sweep mode.

Examples

SENSe<cnum>:SEGM<snuint>:SWEep:GENeration:CONTrol ON
sense2:segment2:sweep:generation:control off

Query Syntax
SENSe<cnum>:SEGM<snuint>:SWEep:GENeration:CONTrol?

Return Type
Boolean

Default
OFF or 0
SENSe<cnum>:SEGMen<tn>:SWEep:POINts <num>

Applicable Models: All

(Read-Write) Sets the number of data points for the specified sweep segment.

Parameters

- <cnum> Any existing channel number. If unspecified, value is set to 1
- <snum> Any existing segment number. If unspecified, value is set to 1
- <num> Number of points in the segment. The total number of points in all segments cannot exceed 20001. A segment can have as few as 1 point.

Note: This command will accept MIN or MAX instead of a numeric parameter. See SCPI Syntax for more information.

Examples

```
SENS:SEG:M:SWE:POIN 51
sense2:segment2:sweep:points maximum
```

Query Syntax

SENSe<cnum>:SEGMen<tn>:SWEep:POINts?

Return Type Numeric

Default 21

---

SENSe<cnum>:SEGMen<tn>:SWEep:POINts:TOTal? <totalPoints>

Applicable Models: All

(Read-only) Queries the total point count from the active segments or from all segments.

Parameters

- <cnum> Any existing channel number. If unspecified, value is set to 1
- <snum> Any existing segment number.
- <totalPoints> Choose from:

  - **ACTive** - Returns the total point count of the active segments.
  - **ALL** - Returns the total point count of all segments.

Examples

```
sense2:segment:scan:points:total? all
```

Return Type Numeric

Default 21
SENSe<cnum>:SEGMent<snum>:SWEep:TIME <num>

Applicable Models: All

(Read-Write) Sets the time the analyzer takes to sweep the specified sweep segment.

Parameters

- `<cnum>` Any existing channel number. If unspecified, value is set to 1
- `<snum>` Any existing segment number.
- `<num>` Sweep time in seconds. Choose a number between 0 and 100

Note: This command will accept MIN or MAX instead of a numeric parameter. See SCPI Syntax for more information.

Examples

```
SENS:SEGM:SWE:TIME 1ms
sense2:segment2:sweep:time .001
```

Query Syntax

```
SENSe<cnum>:SEGMent<snum>:SWEep:TIME?
```

Return Type

Numeric

Default

Not Applicable

SENSe<cnum>:SEGMent<snum>:SWEep:TIME:CONTrol <ON | OFF>

Applicable Models: All

(Read-Write) Specifies whether Sweep Time can be set independently for each sweep segment.

Parameters

- `<cnum>` Any existing channel number. If unspecified, value is set to 1
- `<ON | OFF>` ON (or 1) - turns Sweep Time control ON. Sweep Time can be set for each segment.
  
  OFF (or 0) - turns Sweep Time control OFF. Uses the channel Sweep Time setting.

Examples

```
SENS:SEGM:SWE:TIME:CONT ON
sense2:segment:sweep:time:control off
```

Query Syntax

```
SENSe<cnum>:SEGMent<snum>:SWEep:TIME:CONTrol?
```

Return Type

Boolean (1 = ON, 0 = OFF)

Default

OFF

SENSe<cnum>:SEGMent<snum>:SWEep:TIME:TOTal? <totalTime>
**Applicable Models:** All

*(Read-only)* Queries the total sweep time of the active segments or of all segments.

**Parameters**

- `<cnum>` Any existing channel number. If unspecified, value is set to 1
- `<snum>` Any existing segment number.
- `<totalTime>` Choose from:
  - **ACTive** - Returns the total sweep time of the active segments.
  - **ALL** - Returns the total sweep time of all segments.

**Examples**

```plaintext
sense2:segment:sweep:time:total? all
```

**Return Type** Numeric

**Default** 0

---

**SENSe<cnum>:SEGMent:X:SPACing <char>**

**Applicable Models:** All

*(Read-Write)* Sets X-axis spacing ON or OFF

**Parameters**

- `<cnum>` Any existing channel number. If unspecified, value is set to 1
- `<char>`
  - **LINear** - turns X-axis point spacing OFF
  - **OBASe** - turns X-axis point spacing ON

**Examples**

```plaintext
SENS:SEGM:X:SPACing LIN
sense2:segment:spacing obase
```

**Query Syntax** `SENSe<cnum>:SEGMent:X:SPACing?`

**Return Type** Character

**Default** LINear
SENSe:SOUrce Command

SENSe:SOURce
  | PLLBandwidth
    | CATalog
    | [:VALue]
  | RECeiver
    | GAIN
    | ALL[:VALUE]
    | CATalog
    | LIST

- SCPI Command Tree

SENSe<cnum>:SOURce:PLLBandwidth:CATalog?

Applicable Models: M980xA, P50xxA, E5080B

(Read-Write) Lists PLL bandwidth type for SENSe<cnum>:SOURce:PLLBandwidth[:VALue].

Parameters
- <cnum> Any existing channel number. If unspecified, value is set to 1

Examples
- SENSe:SOUR1:PLL:CAT?
- sense:source2:pllbandwidth:catalog?

Query Syntax
SENSe<cnum>:SOURce:PLLBandwidth:CATalog?

Return Type
- <string>, available setting list with comma separated chars

Default
- Not applicable

SENSe<cnum>:SOURce:PLLBandwidth[:VALue] <type>
Applicable Models: M980xA, P50xxA, E5080B

(Read-Write) Sets and read the settings for PLL bandwidth for RF source and LO.

Parameters
- <cnum> Any existing channel number. If unspecified, value is set to 1
- <type> choose from:
  - AUTO: Use an appropriate PLL bandwidth automatically.
  - NARRow: Use the narrow PLL bandwidth. The phase noise of the RF and local sources decreases while the cycle time increases.

Examples
```
SENSe:SOUR1:PLL B NARR
sense:source2:pllbandwidth narrow
```

Query Syntax
```
SENSe<cnum>:PLLBandwidth[:VALue]?
```

Return Type
 Enumeration
 Default
 AUTO

SENSe<cnum>:SOURce<sport>:RECeiver<rport>:GAIN[:VALue] <string>

Applicable Models: M980xA, P50xxA, E5080B

(Read-Write) Sets the gain settings to a specified port. Use SEN:SOUR:REC:GAIN:CAT? to return a list of available gain states for the specified port.

Parameters
- <cnum> Any existing channel number. If unspecified, value is set to 1
- <sport> Source port number of the VNA. If unspecified, value is set to 1
- <rport> Receiver port number of the VNA. If unspecified, value is set to 1
- <string> Receiver gain state. Not case sensitive.

choose from:
- Auto
- Low
- High
SENSe<cnum>:SOURce<sport>:RECeiver<rport>:GAIN:ALL[:VALue] <string>

Applicable Models: M980xA, P50xxA, E5080B

*(Read-Write)* Sets the gain settings to all ports. Use SENSe:SOUR:REC:GAIN:CAT? to return a list of available gain states for the VNA.

**Parameters**

- `<cnum>`: Any existing channel number. If unspecified, value is set to 1
- `<sport>`: Ignored
- `<rport>`: Ignored
- `<string>`: Receiver gain state. Not case sensitive.

choose from:

- Auto
- Low
- High

**Examples**

SENSe:SOUR1:REC2:GAIN "Low" ' Low for all measurements
SENSe:SOUR2:REC2:GAIN:ALL:value "High" ' High for all measurements

SENSe<cnum>:SOURce<sport>:RECeiver<rport>:GAIN:CATalog

SENSe<cnum>:SOURce<sport>:RECeiver<rport>:GAIN:CATalog
Applicable Models: M980xA, P50xxA, E5080B

(Read only) Reads a list of valid state for the receiver gain on the specified port.

Parameters
  <cnum>  Any existing channel number. If unspecified, value is set to 1
  <sport> Source port number of the VNA. If unspecified, value is set to 1
  <rport> Receiver port number of the VNA. If unspecified, value is set to 1

Examples
SENSe:SOUR1:REC2:GAIN:CAT?
  sense:source2:receiver2:gain:catalog?

Query Syntax  SENSE<cnum>:SOURce<sport>:RECeiver<rport>:GAIN:CATalog?
Return Type  String (Comma-separated list of strings.) ("Auto,Low,High" is returned.)
Default  Auto

SENSe<cnum>:SOURce<sport>:RECeiver<rport>:GAIN:LIST?

Applicable Models: M980xA, P50xxA, E5080B

(Read only) Gets the data array for actual gain setting of each measurement points. High: 1, Low: 0. The number of returned data is the same as the NOP.

Parameters
  <cnum>  Any existing channel number. If unspecified, value is set to 1
  <sport> Source port number of the VNA. If unspecified, value is set to 1
  <rport> Receiver port number of the VNA. If unspecified, value is set to 1

Examples
SENSe:SOUR1:REC2:GAIN:LIST?
  sense:source2:receiver2:gain:list?

Query Syntax  SENSE<cnum>:SOURce<sport>:RECeiver<rport>:GAIN:LIST?
Return Type  Data block
Default  Not Applicable
**Sense:Sweep Commands**

Specifies the sweep functions of the analyzer.

```plaintext

  SRCPort
  STEP
  TIME
    | AUTO
    | START?
    | [:STOP]
  TRIGger
    | DELAY
```
SENSe<cnum>:SWEep:BLOCked?

**Applicable Models:** N522xB, N523xB, N524xB, M937xA, M9485A, P937xA

*(Read-only)* Reads whether the specified channel is currently 'blocked' from sweeping. Learn more about the Mechanical Devices dialog.

**Parameters**
- `<cnum>` Any existing channel number. If unspecified, value is set to 1

**Examples**
- `SENSe:SWEep:BLOC?
  sense2:sweep:blocked?`

**Return Type**
- Boolean
  - 0 - No, the channel is NOT blocked.
  - 1 - Yes, the channel is blocked.

**Default** N/A

SENSe<cnum>:SWEep:DWELl <num>
Applicable Models: All

(Read-Write) Sets the dwell time between each sweep point.

- Dwell time is ONLY available with SENSE:SWEep:GENeration set to STEPped; It is Not available in ANALOG.
- Sending dwell = 0 is the same as setting SENS:SWE:DWEL:AUTO ON. Sending a dwell time > 0 sets SENS:SWE:DWEL:AUTO OFF.

Parameters
- <cnum> Any existing channel number. If unspecified, value is set to 1
- <num> Dwell time in seconds.

This command will accept MIN or MAX instead of a numeric parameter. See SCPI Syntax for more information.

Examples
- SENS:SWE:DWEL .1
- sense2:sweep:dwell min

Query Syntax
- SENSE<cnum>:SWEep:DWELl?

Return Type
- Numeric
- Default 0 - (Note: dwell time set to 0 is the same as dwell:auto ON)

SENSe<cnum>:SWEep:DWELl:AUTO <ON | OFF>

Applicable Models: All

(Read-Write) Specifies whether or not to automatically calculate and set the minimum possible dwell time. Setting Auto ON has the same effect as setting dwell time to 0.

Parameters
- <cnum> Any existing channel number. If unspecified, value is set to 1
- <ON | OFF> ON (or 1) - turns dwell ON.
  - OFF (or 0) - turns dwell OFF.

Examples
- SENS:SWE:DWEL:AUTO ON
- sense2:sweep:dwell:auto off

Query Syntax
- SENSE<cnum>:SWEep:DWELl:AUTO?

Return Type
- Boolean (1 = ON, 0 = OFF)
- Default ON
SENSe<cnum>:SWEep:DWEL:Dwell:SDELay <num>

Applicable Models: All

(Read-Write) Specifies the time to wait just before acquisition begins for each sweep. This delay is in addition to Dwell Time and the following two External Trigger delays if enabled.

- **Trig:Delay** (global scope)
- **Sens:Swe:Trig:Delay** (channel scope)

**Parameters**

- `<cnum>` Any existing channel number. If unspecified, value is set to 1
- `<num>` Sweep delay in seconds.

This command will accept **MIN** or **MAX** instead of a numeric parameter. See SCPI Syntax for more information.

**Examples**

```
SENSe:SWEep:DWEL:Dwell:SDELay 1
sense2:sweep:dwell:sdelay .5
```

**Query Syntax**

SENSe<cnum>:SWEep:DWEL:Dwell:SDELay?

**Return Type** Numeric

**Default** 0

---

SENSe<cnum>:SWEep:GENeration <char>

Applicable Models: All

(Read-Write) Sets sweep as Stepped or Analog.

**Parameters**

- `<cnum>` Any existing channel number. If unspecified, value is set to 1
- `<char>` Choose from:
  - **STEPped** - source frequency is CONSTANT during measurement of each displayed point. More accurate than ANALog. Dwell time can be set in this mode.
  - **ANALog** - source frequency is continuously RAMPING during measurement of each displayed point. Faster than STEPped. Sweep time (not dwell time) can be set in this mode.
SENSe<cnum>:SWEep:GENeration:POINtsweep <bool>

**Applicable Models:** N522xB, N523xB, N524xB, M937xA, P937xA

*(Read-Write)* Turns ON and OFF point sweep mode. When enabled, the VNA measures both the forward and reverse parameters at each frequency point before stepping to the next frequency. Learn more.

**Parameters**
- `<cnum>` Any existing channel number. If unspecified, value is set to 1
- `<char>` Choose from:
  - **ON** or (1) - Enable point sweep mode.
  - **OFF** or (0) - Disable point sweep mode.

**Examples**

SENSe:SWE:GEN:POIN 1

sense2:sweep:generation:pointsweep off

**Query Syntax**

SENSe<cnum>:SWEep:GENeration:POINtsweep?

**Return Type**

Boolean

**Default**

OFF

SENSe<cnum>:SWEep:GROups:COUNt <num>
Applicable Models: All

(Read-Write) Sets the trigger count (groups) for the specified channel. Set trigger mode to group after setting this count.

Parameters

- `<cnum>`: Any existing channel number. If unspecified, value is set to 1
- `<num>`: Count (groups) number. Choose any number between: 1 and 2e6 (1 is the same as single trigger)

Examples

```
SENS:SWE:GRO:COUN 10
sense2:sweep:groups:count 50
```

Query Syntax

```
SENSe<cnum>:SWEep:GROups:COUNt?
```

Return Type

Numeric

Default

1

---

SENSe<cnum>:SWEep:LFEXtension:STATe <bool>

Applicable Models: N5222B, N5227B, N5242B, N5247B, N5290A, N5291A

(Read-Write) Turns ON or OFF low frequency extension for extending the range down to 1 kHz start frequency.

Parameters

- `<cnum>`: Any existing channel number. If unspecified, value is set to 1
- `<bool>`: Choose from:

  - **ON or 1** - Turns ON low frequency extension.
  - **OFF or 0** - Turns OFF low frequency extension.

Examples

```
SENS:SWE:LFEX:STAT ON
sense2:sweep:lfextension:state off
```

Query Syntax

```
SENSe<cnum>:SWEep:LFEXtension:STATe?
```

Return Type

Boolean

Default

OFF or 0

---

SENSe<cnum>:SWEep:MODE <char>
Applicable Models: All

(Read-Write) Sets the number of trigger signals the specified channel will ACCEPT.

See Triggering the VNA Using SCPI.

Parameters

- `<cnum>`: Any existing channel number. If unspecified, value is set to 1
- `<char>`: Trigger mode. Choose from:

  **HOLD** - channel will not trigger
  
  **CONTinuous** - channel triggers indefinitely
  
  **GROups** - channel accepts the number of triggers specified with the last SENS:SWE:GRO:COUN `<num>`. This is one of the VNA overlapped commands. Learn more.
  
  **SINGle** - channel accepts ONE trigger, then goes to HOLD.

Note: To perform simple, single-triggering, use SINGle which requires that TRIG:SOURce remain in the default (internal) setting.

Examples

```
SENS:SWE:MODE CONT
sense2:sweep:mode hold
```

Query Syntax

SENSe<cnum>:SWEep:MODE?

Return Type

Character

Default

CONTinuous

SENSe<cnum>:SWEep:POINts <num>
Applicable Models: All

(Read-Write) Sets the number of data points for the measurement.

**Parameters**

- `<cnum>` Any existing channel number. If unspecified, value is set to 1
- `<num>` Choose any number between 1 and the VNA maximum number of points.

This command will accept MIN or MAX instead of a numeric parameter. See SCPI Syntax for more information.

**Examples**

```
SENS:SWE:POIN 51
sense2:sweep:points max
```

**Query Syntax**

SENSe<cnun>:SWEep:POINts?

**Return Type**

Numeric

**Default**

201

SENSe<cnun>:SWEep:SLOCal:MAXimum <num>

Applicable Models: N522xB, N523xB, N524xB, E5080, M9485A, M980xA, P50xA

(Read-Write) Sets the Shift LO maximum frequency for the selected channel.

**Parameters**

- `<cnum>` Any existing channel number. If unspecified, value is set to 1
- `<num>` Range of shift LO maximum frequency is 1.5E8 to Maximum frequency.

**Examples**

```
SENS:SWE:SCLOC:MAX 1.5E8
sense2:sweep:slocal:maximum 1.5E8
```

**Query Syntax**

SENSe<cnun>:SWEep:SLOCal:MAXimum?

**Return Type**

Numeric / Double precision floating point

**Default**

Maximum frequency

SENSe<cnun>:SWEep:SLOCal:STATe <bool>
Applicable Models: N522xB, N523xB, N524xB, E5080, M9485A, M980xA, P50xA

(Read-Write) Turns ON or OFF the Shift LO mode for the selected channel.

Parameters

- `<cnum>` Any existing channel number. If unspecified, value is set to 1
- `<bool>` Select shift LO mode from either of the following:
  - **ON or 1** - Turns ON the Shift LO mode.
  - **OFF or 0** - Turns OFF the Shift LO mode.

Examples

```plaintext
SENS:SWE:SLOC:STAT ON
sense2:sweep:slocal:state off
```

Query Syntax

```
SENSe<cnum>:SWEep:SLOCal:STATe?
```

Return Type

Boolean

Default

OFF or 0

---

SENSe<cnum>:SWEep:SRCPort <1 | 2> **Superseded**

Applicable Models: All but M9485A

This command is superseded. The `Calc:Par:Def:Ext` and `Calc:Par:Mod:Ext` can now optionally include the source port.

(Read-Write) Sets the source port when making non S-parameter measurements. Has no effect on S-parameter measurements.

Parameters

- `<cnum>` Any existing channel number. If unspecified, value is set to 1
- `<1 | 2>` 1 - Source power comes out Port 1
  - 2 - Source power comes out Port 2

Examples

```plaintext
SENS:SWE:SRCP 1
sense2:sweep:srcport 2
```

Query Syntax

```
SENSe<cnum>:SWEep:SRCPort?
```

Return Type

Character

Default

1

---

SENSe<cnum>:SWEep:SPEed <char>
(Read-Write) Sets and returns the state of Fast Sweep mode. Learn more about Fast Sweep.

**Parameters**

- `<cnum>` Any existing channel number. If unspecified, value is set to 1
- `<char>` Fast Sweep mode. Choose from:
  - FAST - turns Fast Sweep Mode ON
  - NORMal - turns Fast Sweep Mode OFF (Normal Mode).

**Examples**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SENSe&lt;cnum&gt;:SWEep:SPE NORM</td>
<td>Turns Fast Sweep Mode OFF (Normal Mode)</td>
</tr>
<tr>
<td>sense2:sweep:speed fast</td>
<td>Turns Fast Sweep Mode ON</td>
</tr>
</tbody>
</table>

**Query Syntax**

SENSe<cnum>:SWEep:SPEed?

**Return Type** Character

**Default** NORMal

SENSe<cnum>:SWEep:STEP <num>

(Read-Write) Sets the frequency step size across the selected frequency range. This effectively sets the number of data points. Available ONLY when `Sweep Type` = Linear.

**Parameters**

- `<cnum>` Any existing channel number. If unspecified, value is set to 1
- `<num>` Frequency step size in Hz. Select any value up to the frequency range of the analyzer.

**Examples**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SENSe&lt;cnum&gt;:SWEep:STEP 1e6</td>
<td>Frequency step size in Hz</td>
</tr>
<tr>
<td>sense2:sweep:step 1000000</td>
<td>Frequency step size in Hz</td>
</tr>
</tbody>
</table>

**Query Syntax**

SENSe<cnum>:SWEep:STEP?

**Return Type** Numeric

**Default** NA

SENSe<cnum>:SWEep:SRCPort:EXTended
This command is a helper command for `CALC:MEAS:DEF`. The user would set the srcport with this command and then request a non S-parameter measurement from `CALC:MEAS:DEF`, such as "A".

**Parameters**

- `<cnum>` Any existing channel number. If unspecified, value is set to 1

**Examples**

```
SENS:SWE:SRCP:EXT
sense2:sweep:srcport:extended
```

**Query Syntax**

`SENSe<cnum>:SWEep:SRCPort:EXTended?`

**Return Type**

- **Default**: Not Applicable

---

`SENSe<cnum>:SWEep:TIME:AUTO <ON | OFF>`

**Applicable Models**: All

(Read-Write) Turns the automatic sweep time function ON or OFF.

**Parameters**

- `<cnum>` Any existing channel number. If unspecified, value is set to 1
- `<ON | OFF>`
  - **ON** (or 1) - turns the automatic sweep time ON.
  - **OFF** (or 0) - turns the automatic sweep time OFF.

**Examples**

```
SENS:SWE:TIME:AUTO
sense2:sweep:time:auto off
```

**Query Syntax**

`SENSe<cnum>:SWEep:TIME:AUTO?`

**Return Type**

- **Default**: Boolean (1 = ON, 0 = OFF)

---

`SENSe<cnum>:SWEep:TIME:STARt?`
(Read-only) Returns the time the first point of a Time Sweep is measured.

**Parameters**

- `<cnum>` Any existing channel number. If unspecified, value is set to 1

**Examples**

```plaintext
SENS:SWE:TIME:STAR?
sense2:sweep:time:start?
```

**Return Type** Numeric

**Default** Not Applicable

---

**SENSe<cnum>:SWEep:TIME[:STOP] <num>**

(Read-Write) Sets the time the analyzer takes to complete one sweep. If sweep time accuracy is critical, use ONLY the values that are attained using the up and down arrows next to the sweep time entry box. See Sweep Time.

**Parameters**

- `<cnum>` Any existing channel number. If unspecified, value is set to 1
- `<num>` Sweep time in seconds.

To select the fastest sweep speed, either send MIN as an argument to this command, or send SENS:SWE:TIME:AUTO 1.

This command will accept MIN or MAX instead of a numeric parameter. See SCPI Syntax for more information.

The MAX value will change based on point count, IFBW, and dwell time.

**Examples**

```plaintext
SENS:SWE:TIME 1ms
sense2:sweep:time .001
```

**Query Syntax**

SENSe<cnum>:SWEep:TIME[:STOP]?

**Return Type** Numeric

**Default** NA

---

**SENSe<cnum>:SWEep:TRIgger:DELay <num>**
**Applicable Models:** All

(Read-Write) Sets and reads the trigger delay for all measurements in the specified CHANNEL. This delay is only applied while TRIG:SOURce EXTernal and TRIG:SCOPe CURRent. After an external trigger is applied, the start of the sweep is delayed for the specified delay value plus any inherent latency.

To apply a trigger delay for all channels (Global), use TRIG:DEL

**Parameters**

- `<cnum>` Any existing channel number. If unspecified, value is set to 1
- `<num>` Trigger delay value in seconds. Range is from 0 to 3 seconds

**Examples**

```plaintext
SENS:SWE:TRIG:DElay .003
sense2:sweep:trigger:delay 1
```

**Query Syntax**

SENSe<cnum>:SWEep:TRIGger:DElay?

**Return Type**

Numeric

**Default**

0

---

**SENSe<cnum>:SWEep:TRIGger:MODE <char>**

**Applicable Models:** All

(Read-Write) Sets and reads the trigger mode for the specified channel. This determines what EACH signal will trigger. [Learn more.]

**Note:** Setting Point and Sweep mode forces Trigger:SCOPe = CURRent

**Parameters**

- `<cnum>` Any existing channel number. If unspecified, value is set to 1
- `<char>` Trigger mode. choose from:

  - **CHANnel** - Each trigger signal causes ALL traces in that channel to be swept.
  - **SWeep** - Each Manual or External trigger signal causes ALL traces that share a source port to be swept.
  - **POINt** - Each Manual or External trigger signal causes one data point to be measured.
  - **TRACe** - Allowed ONLY when SENS:SWE:GEN:POIN is enabled. Each trigger signal causes two identical measurements to be triggered separately - one trigger signal is required for each measurement. Other trigger mode settings cause two identical parameters to be measured simultaneously.
### Sense2:Sweep:Trigger:Mode Point

**Query Syntax**
```
SENSe<cnum>:SWEep:TRIGger:MODE?
```

**Return Type**
Character

**Default**
Channel

---

**SENSe<cnum>:SWEep:TRIGger:POINt <ON | OFF> Superseded**

**Applicable Models:** N522xB, N523xB, N524xB, M937xA, P937xA

This command is replaced with `SENS:SWE:TRIG:MODE POINT`

(Read-Write) Specifies whether the specified channel will measure one point for each trigger or all of the measurements in the channel. Setting any channel to POINt mode will automatically set the `TRIGger:SCOPe = CURRent`.

**Parameters**
- `<cnum>`: Any existing channel number. If unspecified, value is set to 1
- `<ON | OFF>`:
  - **ON** (or 1) - Channel measures one data point per trigger.
  - **OFF** (or 0) - All measurements in the channel made per trigger.

**Examples**
```
SENSe:SWEep:TRIG:POIN ON
sense2:sweep:trigger:point off
```

**Query Syntax**
```
SENSe<cnum>:SWEep:TRIGger:POINt?
```

**Return Type**
Boolean (1 = Point, 0 = Measurement)

**Default**
0 - Measurement

---

**SENSe<cnum>:SWEep:TYPE <char>**
Applicable Models: All

(Read-Write) Sets the type of analyzer sweep mode. First set sweep type, then set sweep parameters such as frequency or power settings.

Note: For SweptIMD channels, use SENS:IMD:SWE:TYPE SEGment

See Also: FCA Segment Sweep commands

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;cnum&gt;</td>
<td>Any existing channel number. If unspecified, value is set to 1</td>
</tr>
<tr>
<td>&lt;char&gt;</td>
<td>Choose from: LINear</td>
</tr>
</tbody>
</table>

Note: SWEEP TYPE cannot be set to SEGment if there are no segments turned ON. A segment is automatically turned ON when the analyzer is started.

Examples

SENS:SWE:TYPE LIN
sense2:sweep:type segment

Query Syntax
SENSe<cnum>:SWEep:TYPE?

Return Type Character
Default LINear

SENSe<cnum>:SWEep:TYPE:FACW <num>

Applicable Models: N522xB, N524xB, M937xA, P937xA

(Read-Write) Enables Fast CW sweep and sets the number of data points for the channel. Sweep Type must already be set to CW and FIFO must already be enabled.

See Also
FIFO commands
Example program
N5264B Measurement Receiver

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;cnum&gt;</td>
<td>Any existing channel number. If unspecified, value is set to 1</td>
</tr>
<tr>
<td>&lt;num&gt;</td>
<td>Number of data points to measure in Fast CW mode. This setting overwrites the standard number of points setting for the channel. The minimum value is 1.</td>
</tr>
</tbody>
</table>
The maximum value is $2^{32} - 1 = 2,147,483,647$. The "-1" indicates infinite point count (i.e., go forever). Any other value will produce invalid results.

If the data acquisition rate exceeds 400,000 points per second, the upper limit on the number of points is $1 \times 10^6$. The following are conditions that can cause the higher data rate:

- IFBW's $\geq 1$ MHz and internally triggered.
- fastCW sweeps that are externally triggered at a rate faster than 400,000 points per second.

Set to 0 to disable Fast CW.

### Examples

```
sens:swe:typ:facw 1e6
sense2:sweep:typ facw 1e3
```

### Query Syntax

SENSe<cnum>:Sweep:TYPE:FACW?

### Return Type

Numeric

### Default

0 - Disabled
Sense Switch

When you use the PXIe VNA, you can control the PXIe switch module through the VNA firmware. The following commands are available when the launcher includes the PXIe switch module.

```
SENSe:SWITch
 :M9161
  | :COUNT?
  | :MODule
   | :CHASsis
   | :CONTrol[:STATe]
   | :RESet:IMMediate
   | :SLOT
   | :SWITch:PATH
   | :SWITch:PATH:CATalog
 :M9155
  | :COUNT?
  | :MODule
   | :CHASsis
   | :CONTrol[:STATe]
   | RESet:IMMediate
   | :SLOT
   | :SWITch:PATH
   | :SWITch:PATH:CATalog
 :M9156
  | :COUNT?
  | :MODule
   | :CHASsis
   | :CONTrol[:STATe]
   | RESet:IMMediate
```
Click on a keyword to view the command details.

SENSe<cnun>:SWITch:M9161:COUNt?
**Applicable Models:** All PXIe VNAs

*(Read-only)* Returns the total number of M9161D switch modules that are connected to the VNA firmware.

### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;cnum&gt;</td>
<td>Any existing channel number; if unspecified, value is set to 1. This command is common for all channels and the setting is ignored.</td>
</tr>
</tbody>
</table>

### Examples

```
SENS:SWIT:M9161:COUN?
sense:switch:m9161:count
```

### Return Type

Numeric

### Default

Not applicable

---

**SENSe<cnum>:SWITch:M9161:MODule<mod>:CHASsis?**

**Applicable Models:** All PXIe VNAs

*(Read Only)* Returns the chassis number where the specified M9161D module is located.

### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;cnum&gt;</td>
<td>Any existing channel number; if unspecified, value is set to 1. This command is common for all channels and the setting is ignored.</td>
</tr>
<tr>
<td>&lt;mod&gt;</td>
<td>Module number of M9161D. The number starts from 1 for the left most module of M9161D.</td>
</tr>
</tbody>
</table>

### Examples

```
SENS:SWIT:M9161:MOD1:CHAS?
sense:SWITch:m9161:module2:chassis?
```

### Return Type

Numeric

### Default

Not applicable

---

**SENSe<cnum>:SWITch:M9161:MODule<mod>:CONTrol[:STATe] <bool>**
**Applicable Models:** All PXIe VNAs

*(Read-Write)* Sets and reads the status of M9161D control.

**Parameters**
- `<cnum>`: Any existing channel number; if unspecified, value is set to 1.
- `<mod>`: Module number of M9161D. The number starts from 1 for the leftmost module of M9161D.
- `<bool>`: Module control state. Choose from:
  - **O** or **OFF** - Skips to control the M9161D at the specified channel.
  - **1** or **ON** - Enables to control the M9161D at the specified channel.

**Examples**
- `SENS:SWIT:M9161:MOD1:CONT ON`
- `sense2:SWITch:M9161:module2:control 0`

**Query Syntax**
- `SENS<cnum>:SWITch:M9161:MODule<mod>:CONTrol[:STATe]?`

**Return Type**
- Boolean

**Default**
- 1 or ON

---

**SENSe<cnum>:SWITch:M9161:MODule<mod>:RES:IMMediate**

**Applicable Models:** All PXIe VNAs

*(Write Only)* Resets the switches in the specified module to "All Open" state immediately.

**Parameters**
- `<cnum>`: Any existing channel number; if unspecified, value is set to 1. This command is common for all channels and the setting is ignored.
- `<mod>`: Module number of M9161D. The number starts from 1 for the leftmost module of M9161D.

**Examples**
- `SENS:SWIT:M9161:MOD1:RES:IM`
- `sense:SWITch:M9161:module2:reset:immediate`

**Query Syntax**
- Not applicable

**Return Type**
- Not applicable

**Default**
- Not applicable
SENSe<cnum>:SWITch:M9161:MODule<mod>:SLOT?

Applicable Models: All PXIe VNAs

(Read Only) Reads the slot number where the specified M9161D is located.

Parameters
- <cnum>: Any existing channel number; if unspecified, value is set to 1. This command is common for all channels and the setting is ignored.
- <mod>: Module number of M9161D. The number starts from 1 for the leftmost module of M9161D.

Examples
SENSe:SWITch:M9161:MOD1:SLOT?
SENSe:SWITch:M9161:MOD2:SLOT?

Return Type: Numeric
Default: Not applicable

SENSe<cnum>:SWITch:M9161:MODule<mod>:SWITch:PATH <char>

Applicable Models: All PXIe VNAs

(Read-Write) Sets and reads the path for the M9161D switch.

Parameters
- <cnum>: Any existing channel number; if unspecified, value is set to 1.
- <mod>: Module number of M9161D. The number starts from 1 for the leftmost module of M9161D.
- <char>: Path. Choose from:
  - STATE1 to STATE4 - State 1 to 4
  - NSFSource - NF source switch (NF measurement only)
  - NFLO - NF LO switch (Option 720 only)
  - NFReceiver - NF receiver switch (NF measurement only)

Examples
SENSe:SWITch:M9161:MOD1:SWIT:PATH STAT1
SENSe:SWITch:M9161:MOD2:SWIT:PATH STATE4

Query Syntax
SENSe<cnum>:SWITch:M9161:MODule<mod>:SWITch:PATH?

Return Type: <char>
SENSe<cnum>:SWITch:M9161:MODule<mod>:SWITch:PATH:CATalog?

Applicable Models: All PXIe VNAs

(Read-Write) Lists the path of the M9161D for SENS:SWIT:M9161:MOD:SWIT:PATH.

Parameters

<cnum> Any existing channel number; if unspecified, value is set to 1.
<mod> Module number of M9161D. The number starts from 1 for the left most module of M9161D.

Examples

SENS:SWIT:M9161:MOD1:SWIT:PATH:CAT?
sense2:SWITch:M9161:module2:switch:path:catalog?

Query Syntax SENSSe<cnum>:SWITch:M9161:MODule<mod>:SWITch:PATH:CAT?

Return Type Comma-separated string

Default Not applicable

SENSe<cnum>:SWITch:M9155:COUNt?

Applicable Models: All PXIe VNAs

(Read-only) Returns the total number of M9155C/M9155CH40 switch modules that are connected to the VNA firmware.

Parameters

<cnum> Any existing channel number; if unspecified, value is set to 1. This command is common for all channels and the setting is ignored.

Examples

SENS:SWIT:M9155:COUN?
sense:switch:m9155:count

Return Type Numeric

Default

SENSe<cnum>:SWITch:M9155:MODule<mod>:CHASsis?
Applicable Models: All PXIe VNAs

(Read Only) Returns the chassis number where the specified M9155C/M9155CH40 module is located.

Parameters

<cnun> Any existing channel number; if unspecified, value is set to 1. This command is common for all channels and the setting is ignored.

<mod> Module number of M9155C/M9155CH40. The number starts from 1 for the leftmost module of M9155C/M9155CH40.

Examples

- SENSE:SWIT:M9155:MOD1:CHAS?
- sense:SWITch:m9155:module2:chassis?

Return Type Numeric

Default Not applicable

SENSe<cnun>:SWITch:M9155:MODule<mod>:CONTrol[:STATe] <bool>

Applicable Models: All PXIe VNAs

(Read-Write) Sets and reads the status of M9155C/M9155CH40 control.

Parameters

<cnun> Any existing channel number; if unspecified, value is set to 1.

<mod> Module number of M9155C/M9155CH40. The number starts from 1 for the leftmost module of M9155C/M9155CH40.

<bool> Module control state. Choose from:

0 or OFF - Skips to control the M9155C/M9155CH40 at the specified channel.

1 or ON - Enables to control the M9155C/M9155CH40 at the specified channel.

Examples

- SENS:SWIT:M9155:MOD1:CONT ON
- sense2:SWITch:m9155:module2:control 0

Query Syntax SENSe<cnun>:SWITch:M9155:MODule<mod>:CONTrol[:STATe]?

Return Type Boolean

Default 1 or ON
SENSe<cnum>:SWITch:M9155:MODule<mod>:RESet:IMMediate

**Applicable Models:** All PXIe VNAs

*(Write Only)* Resets the switches in the specified module to "All Open" state immediately.

**Parameters**

- `<cnum>`: Any existing channel number; if unspecified, value is set to 1. This command is common for all channels and the setting is ignored.
- `<mod>`: Module number of M9155C/M9155CH40 The number starts from 1 for the leftmost module of M9155C/M9155CH40.

**Examples**

```
SENSe:SWITch:M9155:MOD1:RESet:IMMediate
sense:SWITch:M9155:module2:RESet:IMMediate
```

**Query Syntax** Not applicable

**Return Type** Not applicable

**Default** Not applicable

SENSe<cnum>:SWITch:M9155:MODule<mod>:SLOT?

**Applicable Models:** All PXIe VNAs

*(Read Only)* Reads the slot number where the specified M9155C/M9155CH40 is located.

**Parameters**

- `<cnum>`: Any existing channel number; if unspecified, value is set to 1. This command is common for all channels and the setting is ignored.
- `<mod>`: Module number of M9155C/M9155CH40 The number starts from 1 for the leftmost module of M9155C/M9155CH40.

**Examples**

```
SENSe:SWITch:M9155:MOD1:SLOT?
sense:SWITch:M9155:module2:SLOT?
```

**Return Type** Numeric

**Default** Not applicable

SENSe<cnum>:SWITch:M9155:MODule<mod>:SWITch:PATH <char>
Applicable Models: All PXIe VNAs

(Read-Write) Sets and reads the path for the M9155C/M9155CH40 switch.

**Parameters**
- `<cnum>` Any existing channel number; if unspecified, value is set to 1.
- `<mod>` Module number of M9155C/M9155CH40. The number starts from 1 for the left most module of M9155C/M9155CH40.
- `<char>` Path. Choose from:
  - **STATe1** or **STATe2** - State 1 or 2
  - **NFSource** - NF source switch (NF measurement only)
  - **NFLO** - NF LO switch (Option 720 only)
  - **NFReceiver** - NF receiver switch (NF measurement only)

**Examples**
- `SENS:SWIT:M9155:MOD1:SWIT:PATH STAT1`
- `sense2:SWITCH:M9155:module2:switch:path state2`

**Query Syntax**
- `SENSe<cnum>:SWITch:M9155:MODule<mod>:SWITch:PATH?`

**Return Type** `<char>`

**Default** `STATe1`

---

**Applicable Models:** All PXIe VNAs

(Read-Write) Lists the path of the M9155C/M9155CH40 for `SENS:SWIT:M9155:MOD:SWIT:PATH`.

**Parameters**
- `<cnum>` Any existing channel number; if unspecified, value is set to 1.
- `<mod>` Module number of M9155C/M9155CH40. The number starts from 1 for the left most module of M9155C/M9155CH40.

**Examples**
- `sense2:SWITCH:M9155:module2:switch:path:catalog?`

**Query Syntax**
### SENSE<cnum>:SWITch:M9156:COUNt?

**Applicable Models:** All PXIe VNAs

*(Read-only)* Returns the total number of M9156C/M9156CH40 switch modules that are connected to the VNA firmware.

**Parameters**

- `<cnum>`: Any existing channel number; if unspecified, value is set to 1. This command is common for all channels and the setting is ignored.

**Examples**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
</table>

**Return Type** Numeric

**Default** Not applicable

### SENSE<cnum>:SWITch:M9156:MODule<mod>:CHASsis?

**Applicable Models:** All PXIe VNAs

*(Read Only)* Returns the chassis number where the specified M9156C/M9156CH40 module is located.

**Parameters**

- `<cnum>`: Any existing channel number; if unspecified, value is set to 1. This command is common for all channels and the setting is ignored.

- `<mod>`: Module number of M9156C/M9156CH40. The number starts from 1 for the left most module of M9156C/M9156CH40.

**Examples**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
</table>

**Return Type** Numeric

**Default** Not applicable
**SENSe<cnum>:SWITch:M9156:MODule<mod>:CONTroll [<STATe] <bool>**

**Applicable Models:** All PXIe VNAs

*(Read-Write)* Sets and reads the status of M9156C/M9156CH40 control.

**Parameters**
- `<cnum>`: Any existing channel number; if unspecified, value is set to 1.
- `<mod>`: Module number of M9156C/M9156CH4. The number starts from 1 for the leftmost module of M9156C/M9156CH40.
- `<bool>`: Module control state. Choose from:
  - OFF or O - Skips to control the M9165C/M9156CH40 at the specified channel.
  - ON or 1 - Enables to control the M9156C/M9156CH40 at the specified channel.

**Examples**
- SENS:SWIT:M9156:MOD1:CONT ON
- sense2:SWITch:M9156:module2:control 0

**Query Syntax** SENS<cnum>:SWITch:M9156:MODule<mod>:CONTroll[:STATe]?

**Return Type** Boolean

**Default** 1 or ON

---

**SENSe<cnum>:SWITch:M9156:MODule<mod>:RESet:IMMediate**

**Applicable Models:** All PXIe VNAs

*(Write Only)* Resets the switches in the specified module to "All Open" state immediately.

**Parameters**
- `<cnum>`: Any existing channel number; if unspecified, value is set to 1. This command is common for all channels and the setting is ignored.
- `<mod>`: Module number of M9156C/M9156CH40. The number starts from 1 for the leftmost module of M9156C/M9156CH40.

**Examples**
- SENS:SWIT:M9156:MOD1:RES:IMM
- sense:SWITch:M9156:module2:reset:immediate

**Query Syntax** Not applicable

**Return Type** Not applicable
SENSe<cnum>:SWITch:M9156:MODule<mod>:SLOT?

**Applicable Models:** All PXIe VNAs

(Read Only) Reads the slot number where the specified M9156C/M9155CH40 is located.

**Parameters**
- **<cnum>** Any existing channel number; if unspecified, value is set to 1. This command is common for all channels and the setting is ignored.
- **<mod>** Module number of M9156C/M9156CH40. The number starts from 1 for the leftmost module of M9156C/M9156CH40.

**Examples**
- `SENSe:SWITch:M9156:MOD1:SLOT?`
- `SENSe:SWITch:M9156:module2:slot?`

**Return Type** Numeric

**Default** Not applicable

SENSe<cnum>:SWITch:M9156:MODule<mod>:SWITch:PATH <char>

**Applicable Models:** All PXIe VNAs

(Read-Write) Sets and reads the path for the M9156C/M9156CH40 switch.

**Parameters**
- **<cnum>** Any existing channel number; if unspecified, value is set to 1.
- **<mod>** Module number of M9156C/M9156CH40. The number starts from 1 for the left most module of M9156C/M9156CH40.
- **<char>** Path. Choose from:
  - **STATE1** or **STATE2** - State 1 or 2
  - **NFSource** - NF source switch (NF measurement only)
  - **NFLO** - NF LO switch (Option 720 only)
  - **NFRReceiver** - NF receiver switch (NF measurement only)

Parameters

<i>cnum</i>  Any existing channel number; if unspecified, value is set to 1.
<i>mod</i>  Module number of P9165x. The number starts from 1 for the left most module of P9165x.
<i>char</i>  Path. Choose from:

- STATe0 to STATe16 - State 0 to 16

Examples

- SENS:SWIT:P9165:MOD1:SWIT:PATH STAT1
- sense2:SWITch:p9165:module2:switch:path state4

Query Syntax

SENS<enum>:SWITch:P9165:MODULE<mod>:SWITch:PATH?

Return Type

<i>enum</i>

Default

STATe1 or STATe2

---

SENS<enum>:SWITch:P9165:MODULEs<mod>:MODEL?

Applicable Models: All PXIe VNAs

(Read Only) Returns the model number of P9165x.

Parameters

<i>cnum</i>  Any existing channel number; if unspecified, value is set to 1.
<i>mod</i>  Module number of P9165x. The number starts from 1 for the left most module of P9165x.

Examples

- SENS:SWIT:P9165:MOD1:MODEL?
- sense:SWITch:p9165:module2:model?

Return Type  string

Default  Not applicable
SENSe:TDR Commands

These commands control bandwidth, DUT information, avoid spurious function, and sweep.

SENSe<cnum>:TDR:BWIDth[:RESolution] <value>

Applicable Models: All with TDR Options (S9x011A/B)

(Read-Write) This command sets the IF bandwidth value.

Parameters
- <cnum> Channel number of the measurement. If unspecified, <cnum> is set to 1.
- <value> IF bandwidth value in Hz.

Examples

<table>
<thead>
<tr>
<th>Syntax</th>
</tr>
</thead>
<tbody>
<tr>
<td>SENS:TDR:BWID:RES</td>
</tr>
<tr>
<td>sense:tdr:bwidth:resolution</td>
</tr>
</tbody>
</table>

Query Syntax  SENSSe<cnum>:TDR:BWIDth[:RESolution]?

Return Type  Double

Default  100 kHz

SENSe<cnum>:TDR:DLENgth:AUTO:IMMediate

Applicable Models: All with TDR Options (S9x011A/B)

(Write-only) This command executes auto DUT length setting.

Parameters
- <cnum> Channel number of the measurement. If unspecified, <cnum> is set to 1.

Examples

<table>
<thead>
<tr>
<th>Syntax</th>
</tr>
</thead>
<tbody>
<tr>
<td>SENS:TDR:DLEN:AUTO:IMM</td>

</tbody>
</table>

Default  Not Applicable

SENSe<cnum>:TDR:DLENgth:DATA <value>

Applicable Models: All with TDR Options (S9x011A/B)

(Read-Write) This command sets the DUT length value.

Parameters
- <cnum> Channel number of the measurement. If unspecified, <cnum> is set to 1.
- <value> DUT length value in seconds. The range is 6.26n to 416n

Examples

<table>
<thead>
<tr>
<th>Syntax</th>
</tr>
</thead>
<tbody>
<tr>
<td>SENS:TDR:DLEN:DATA</td>
</tr>
<tr>
<td>sense:tdr:dlength:data</td>
</tr>
</tbody>
</table>

Query Syntax  SENSSe<cnum>:TDR:DLENgth:DATA?

Return Type  Double

Default  6.26n

SENSe<cnum>:TDR:SPURious:AVOid:IMMediate
Applicable Models: All with TDR Options (S9x011A/B)

(Write-only) This command executes avoid spurious.

Parameters

- `<cnum>` Channel number of the measurement. If unspecified, `<cnum>` is set to 1.

Examples

```
SENS:TDR:SPUR:AVO:IMM
sense:tdr:spurious:avoid:immediate
```

Default Not Applicable

---

SENSe<cnum>:TDR:SPURious:AVOid:STATe?

Applicable Models: All with TDR Options (S9x011A/B)

(Read-only) This command queries the avoid spurious state. This command is used only with Hot TDR mode.

- This command is ON when :SENS:TDR:SPURious:AVOid:IMMediate command succeeds.
- This command is OFF when :SENS:TDR:SPURious:AVOid:IMMediate command fails to find a spur.

Parameters

- `<cnum>` Channel number of the measurement. If unspecified, `<cnum>` is set to 1.

Examples

```
SENS<TDR:SPURious:AVOid:STAT
sense:tdr:spurious:avoid:stat
```

Return Type

Boolean

1 - ON

0 - OFF

---

SENSe<cnum>:TDR:SPURious:INPut:DRATe <value>
Applicable Models: All with TDR Options (S9x011A/B)

(Read-Write) This command sets the value of input bit rate for avoid spurious.

Parameters

- **<cnum>**  
  Channel number of the measurement. If unspecified, <cnum> is set to 1.

- **<value>**  
  Value of input bit rate in bits per second (bps). The range is 1.21E6 to 60.8E9.

Examples

```
SENS:TDR:SPUR:INP:DRAT 1.5E9
sense:tdr:spurious:input:drate 1.5e9
```

Query Syntax

```
SENSe<cnum>:TDR:SPURious:INPut:DRATe?
```

Return Type

Double

Default

1E9

SENSe<cnum>:TDR:SPURious:STATe?

Applicable Models: All with TDR Options (S9x011A/B)

(Read-only) This command queries the Hot TDR mode status.

- To turn ON Hot TDR mode, use  
  `SENSe:TDR:SPURious:AVOid:IMMediate`

- To turn OFF Hot TDR mode, use  
  `SYSTem:PRESet`

Parameters

- **<cnum>**  
  Channel number of the measurement. If unspecified, <cnum> is set to 1.

Examples

```
SENS:TDR:SPUR:STAT?
sense:tdr:spurious:state?
```

Return Type

Boolean

```
1 - ON
0 - OFF
```

SENSe<cnum>:TDR:SWEep:AVERage <bool>
Applicable Models: All with TDR Options (S9x011A/B)

(Read-Write) This command sets the TDR averaging trigger state on/off. When averaging trigger is on, one trigger makes one averaging measurement. For example, if the averaging factor is set at 16, one trigger makes a measurement 16 times.

Parameters

- `<cnum>` Channel number of the measurement. If unspecified, `<cnum>` is set to 1.
- `<bool>` ON or 1 - Turns averaging trigger on.
- OFF or 0 - Turns averaging trigger off.

Examples

- `SENS:TDR:SWE:AVER ON`
- `sense:tdr:sweep:average on`

Query Syntax

- SENSE<cnum>:TDR:SWEep:AVERage?

Return Type

- Boolean

Default

- OFF

SENSe<cnum>:TDR:SWEep:MODE <enum>

Applicable Models: All with TDR Options (S9x011A/B)

(Read-Write) This command sets trigger mode.

Parameters

- `<cnum>` Channel number of the measurement. If unspecified, `<cnum>` is set to 1.
- `<enum>` Trigger mode. Choose from:
  - HOLD - Trigger is on hold until the conditions are met, then the trigger event starts.
  - SINGle - Trigger event is run once.
  - RUN - Trigger event runs continuously.

Examples

- `SENS:TDR:SWE:MODE RUN`
- `sense:tdr:sweep:mode run`

Query Syntax

- SENSE<cnum>:TDR:SWEep:MODE?

Return Type

- String

Default

- RUN

SENSe<cnum>:TDR:SWEep:SINGle
Applicable Models: All with TDR Options (S9x011A/B)

(Write-only) This command executes single trigger.

Parameters

<enum> Channel number of the measurement. If unspecified, <enum> is set to 1.

Examples

SENS:TDR:SWE:SING
sense:tdr:sweep:single

Default Not Applicable
SENSe<cnum>:X[:VALues]? - Superseded

Applicable Models: N522xB, N523xB, N524xB, M937xA, P937xA

Replaced with CALC:X?

(Read-only) Returns the stimulus values for the specified channel. If the channel is sweeping the source backwards, the values will be in descending order.

**Note:** To avoid frequency rounding errors, specify FORM:DATA <Real,64> or <ASCii, 0>

**Parameters**

- `<cnum>` Any existing channel number; if unspecified, value is set to 1.

**Examples**

<table>
<thead>
<tr>
<th></th>
<th>SENS:X?</th>
<th>sense2:x:values?</th>
</tr>
</thead>
</table>

**Return Type**

- Depends on FORM:DATA command

**Default**

- Not applicable
Service Commands

Controls and queries settings related with Service.

SERVice:
  :DUMMy:DUT:FILE
  :DUMMy:DUT:NOISe:STATe
  :LOGGing:CLEAR

SERVice:DUMMy:DUT:FILE <string>

SOURce<cnum>:CATalog?

**Applicable Models:** All

*(Read-only)* Returns a list of valid port names that can be controlled. Some ports only have string names, NOT numbers. All commands that require a port argument have provisions for specifying either a port number OR a string name.

See also: Remotely Specifying a Source Port.

**Parameters**

- `<cnum>` Any existing channel number. If unspecified, value is set to 1

**Examples**

- `SOUR:CAT?`  
  `source:catalog`  
  `'Some PNA-X models return  
  "Port 1,Port 2,Port 3,Port 4,Port 1 Src2,Source3"`

**Return Type**  
Comma-separated list of strings.

**Default**  
Not applicable
Applicable Models: M980xA, M981xAS

(Read-only) Returns the total number of M9810A vector modulator modules that are connected to the VNA firmware. Only one M9810A module can be installed, Hence, the return value could be 0 or 1.

Parameters

- `<cnum>`: Any existing channel number. If unspecified, value is set to 1

Examples

```
SOUR:M9810:COUNT?
source:m9810:coun?
```

Return Type: Numeric

Default: Not Applicable

SOURce<cnum>:M9810:MODule<mod>:ATTenuation[:VALue] <num>

Applicable Models: M980xA, M981xAS

(Read-Write) Sets the M9810A attenuation level for the selected channel. This command disables the automatic attenuation control (SOURce:M9810:MODule:ATTenuation:AUTO). The parameter `<mod>` should be 1 because only one M9810A can be installed.

Parameters

- `<cnum>`: Any existing channel number. If unspecified, value is set to 1
- `<num>`: Attenuation level (dB). The range is from 0 to 60 dB with the step size 10 dB.

Examples

```
SOUR:M9810:MODULE1:ATTENUATION 10
source:m9810:mod1:att?
```

Return Type: Numeric

Default: 0

SOURce<cnum>:M9810:MODule<mod>:ATTenuation:AUTO <bool>
(Read-Write) Enable/disable the automatic M9810A attenuation control. When the attenuation value (using SOURce:M9810:MODule:ATTenuation) is set, this setting is turned off automatically. The parameter <mod> should be 1 because only one M9810A can be installed.

**Parameters**

- **<cnum>** Any existing channel number. If unspecified, value is set to 1
- **<bool>** ON (or 1) - Enable the automatic attenuator control.  
  OFF (or 0) - Disable the automatic attenuator control.

**Examples**

- SOUR:M9810:MODULE1:ATTENUATION:AUTO 1
- source:m9810:mod1:att:auto?

**Return Type** Boolean (1 = ON, 0 = OFF)

**Default** ON

---

SOURce<cnum>:PORT:NUM? <string>

**Applicable Models:** N522xB, N523xB, N524xB

(Read-only) Returns a port number for a named source.

All source ports have string names: "Port 1", "Port 2", etc. All external sources have customized names.

To convert a string name to a port number use this query.

**Parameters**

- **<cnum>** Any existing channel number. If unspecified, value is set to 1
- **<string>** String names.

**Examples**

- SOUR:PORT:NUM? "MVG"
- source:port:num "port 1"

**Return Type** String

**Default** Not Applicable

---

SOURce<cnum>:POWer<port>:ALC[:MODE] <char>, [src]
Applicable Models: N522xB, N523xB, N524xB, M9485A

(Read-Write) Sets and returns the ALC mode for the specified channel and port. Use SOUR:POW:ALC:MODE:CAT? to return a list of valid ALC modes for the VNA.

Learn more about ALC mode.

Parameters

- `<cnum>` Any existing channel number. If unspecified, value is set to 1
- `<port>` Source port number of the VNA. If unspecified, value is set to 1. To make settings for ports that are not simple numbers, use the [src] argument.
- `<char>` ALC Mode.

For the PNA-X choose from:

- **Internal** Standard ALC loop
- **OPENloop** No ALC loop

To set Leveling Mode to Receiver Leveling, use the Receiver Leveling commands.

While this argument can be used to make settings for ALL ports, it is designed to access ports such as an external source, true mode balanced port, or one of the Source outputs on the 2-port PNA-X model with multiple sources such as "Port 1 Src2". Otherwise, the <port> argument performs the same function. If both arguments are specified, [src] takes priority.

Examples

```
SOUR:POW:ALC INT
source2:power2:alc:mode openloop
source:power:alc:mode openloop,"Port 1 Src2"
```

Query Syntax

SOURce<cnum>:POWer<port>:ALC:MODE? [src]

Return Type

Character

Default

INTernal
**Applicable Models:** N522xB, N523xB, N524xB, M9485A

(Read-only) Returns a list of valid ALC modes for the specified channel and port number. Use the returned values to set `SOUR:POW:ALC:MODE`.

**Parameters**

- `<cnum>` Any existing channel number. If unspecified, value is set to 1
- `<port>` Source port number of the VNA. If unspecified, value is set to 1. To make settings for ports that are not simple numbers, use the `[src]` argument.

While this argument can be used to make settings for ALL ports, it is designed to access ports such as an external source, true mode balanced port, or one of the Source outputs on the 2-port PNA-X model with multiple sources such as "Port 1 Src2". Otherwise, the `<port>` argument performs the same function. If both arguments are specified, `[src]` takes priority.

**Examples**

```
SOUR:POW:ALC:CAT?
source2:power2:alc:mode:catalog?
source:power:alc:mode:catalog? "INTernal,OPENloop,RxLeveling"
```

**Return Type** Comma-separated list of strings.

**Default** Not applicable

---

**SOURce<cnum>:POWer<port>:ATTenuation <num>, [src]**

**Applicable Models:** All

(Read-Write) Sets the attenuation level for the selected channel. Sending this command turns automatic attenuation control (`SOUR:POW:ATT:AUTO`) to OFF. If the ports are coupled, changing the attenuation on one port will also change the attenuation on all other ports. To turn port coupling OFF use `SOURce:POWer:COUPle OFF`.

**Note:** Attenuation cannot be set with **Sweep Type** set to **Power**

See `Sens:Power:ATT` to change receiver attenuation.

**Parameters**

- `<cnum>` Any existing channel number. If unspecified, value is set to 1
<port> Source port number of the VNA. If unspecified, value is set to 1. To make settings for ports that are not simple numbers, use the [src] argument.

<num> Attenuation value. The range of settable values depends on the VNA model. To determine the valid settings, do one of the following:

- See VNA models and options to see the range and step size for each model / option.
- Perform a query using MAX, then MIN, as an argument. Example: SOURce:POWer:ATT? Max However, this will not tell you the attenuation step size.

If an invalid attenuation setting is entered, the VNA will select the next lower valid value. For example, if 19 is entered, then for an E8361A, 10 dB attenuation will be selected.

**Note**: This command will accept MIN or MAX instead of a numeric parameter. See SCPI Syntax for more information.

While this argument can be used to make settings for ALL ports, it is designed to access ports such as an external source, true mode balanced port, or one of the Source outputs on the 2-port PNA-X model with multiple sources such as "Port 1 Src2". Otherwise, the <port> argument performs the same function. If both arguments are specified, [src] takes priority.

**Examples**

SOUR:POW:ATT 10

source2:power2:attenuation maximum

source:power:att 20, "Port 1 Src2"

**Query Syntax** SOURce<cnum>:POWer<port>:ATTenuation? [min/max] [src] [min/max,src]

**Return Type** Numeric

**Default** 0

SOURce<cnum>:POWer<port>:ATTenuation:AUTO <bool>, [src]
Applicable Models: N522xB, N523xB, N524xB, M937xA, P937xA

(Read-Write) Turns automatic attenuation control ON or OFF. Setting an attenuation value (using \texttt{SOURce:POWe\textsubscript{r}:ATTenuation <num>}) sets AUTO OFF.

**Parameters**

- \texttt{<cnum>} Any existing channel number. If unspecified, value is set to 1.
- \texttt{<port>} Source port number of the VNA. If unspecified, value is set to 1. To make settings for ports that are not simple numbers, use the [src] argument.
- \texttt{<bool>} ON (or 1) - turns coupling ON. The analyzer automatically selects the appropriate attenuation level to meet the specified power level.
- \texttt{OFF} (or 0) - turns coupling OFF. Attenuation level must be set using \texttt{SOURce:POWe\textsubscript{r}:ATTenuation <num>}.
- [src] \texttt{String}. (NOT case sensitive). Source port. Optional. Use \texttt{SOUR:CAT?} to return a list of valid port names.

While this argument can be used to make settings for ALL ports, it is designed to access ports such as an external source, true mode balanced port, or one of the Source outputs on the 2-port PNA-X model with multiple sources such as "Port 1 Src2". Otherwise, the \texttt{<port>} argument performs the same function. If both arguments are specified, [src] takes priority.

**Examples**

```
SOUR:POW2:ATT:Auto On
source2:power:attenuation:auto off
sour:pow:att:auto 1, "Port 1 Src2"
```

**Query Syntax** \texttt{SOURce<cnum>:POWer<port>:ATTenuation:RECeiver:REFerence <num>}

**Return Type** Boolean (1 = ON, 0 = OFF)

**Default** ON
Applicable Models: M9377A

(Read-Write) Sets the attenuation level for the specified reference attenuator/port.

Parameters

- `<cnum>` Any existing channel number. If unspecified, value is set to 1.
- `<port>` Port number of the VNA. If unspecified, value is set to 1.
- `<num>` Attenuation value in dB. 0dB (Low) or 35dB (High)

If a number other than these is entered, the analyzer will select the next lower valid value. For example, if 19dB is entered, then 0dB attenuation will be selected.

Examples

```
SOUR:POW2:ATT:REC:REF 0
source:power:attenuation:receiver:reference 35
```

Query

Syntax

```
SOURce<cnum>:POWer<port>:ATTenuation:RECeiver:REFerence?
```

Return

Type Numeric. If querying for the standard port, the return value is 0

Default 35

---

SOURce<cnum>:POWer<port>:ATTenuation:RECeiver:TEST <num>

Applicable Models: N522xB, N523xB, N524xB, M9485A, M980xA and P50xxA with option S9x090A

(Read-Write) Sets the attenuation level for the specified test attenuator/port.

Note: On M980xA and P50xxA, this command works only for Spectrum Analyzer channels. For S-parameter channels, use the Receiver Gain dialog or `SENSe:SOURce:RECeiver:GAIN:*` commands.

Parameters

- `<cnum>` Any existing channel number. If unspecified, value is set to 1.
- `<port>` Source port number of the VNA. If unspecified, value is set to 1.
- `<num>` Attenuation value in dB. 0dB (Low) or 35dB (High) / 0dB (Low) or 20dB (High) for M980xA and P50xxA.

If a number other than these is entered, the analyzer will select the next lower valid value. For example, if 19dB is entered, then 0dB attenuation will be selected.
Examples

SOUR:POW2:ATT:REC:TEST 0
source:power:attenuation:receiver:test 35

Query Syntax

SOURce<cnum>:POWer<port>:ATTenuation:RECeiver:TEST?

Return Type
Numeric. If querying for the standard port, the return value is 0

Default 35 for others / 0 for M980xA and P50xxA

SOURce<cnum>:POWer<port>:CENTer <num>

Applicable Models: All

(Read-Write) Sets the power sweep center power. Must also set:
SENS:SWE:TYPE POWer and SOURce:POWer:SPAN <num>.

Parameters

- <cnum> Any existing channel number. If unspecified, value is set to 1
- <num> Center power. Actual achievable leveled power depends on frequency.
- <port> If provided, this argument is ignored by the VNA.

Examples

SOUR:POW:CENT -15
source2:power:center -7

Query Syntax

SOURce<cnum>:POWer:CENTer?

Return Type
Numeric

Default 0 dBm

SOURce<cnum>:POWer<port>:COUPle <ON | OFF>
Applicable Models: All

(Read-Write) Turns Port Power Coupling ON or OFF.

Parameters

- `<cnum>`
  - Any existing channel number. If unspecified, value is set to 1
- `<ON | OFF>`
  - **ON** (or 1) - turns coupling ON. The same power level is used for both source ports.
  - **OFF** (or 0) - turns coupling OFF. Power level can be set individually for each source port.

Examples

```
SOUR:POW:COUP ON
source2:power:couple off
```

Query Syntax

`SOURce<cnum>:POWer:COUPle?`

Return Type

Boolean (1 = ON, 0 = OFF)

Default

ON

---

SOURce<cnum>:POWer:DETructor <char> OBSOLETE

(Read-Write) The VNA models with external leveling are now OBSOLETE.

Sets the source leveling loop as Internal or External.

Parameters

- `<cnum>`
  - Any existing channel number. If unspecified, value is set to 1
- `<char>`
  - **INTernal** - Internal leveling is applied to the source
  - **EXTernal** - External leveling is applied to the source through a rear-panel connector. ONLY provided on 3 GHz, 6 GHz, and 9 GHz VNA models.

Examples

```
SOUR:POW:DET INT
source2:power:detector external
```

Query Syntax

`SOURce<cnum>:POWer:DETrctor?`

Return Type

Character

Default

INTernal

---

SOURce<cnum>:POWer<port>[:LEVel][:IMMediate][:AMPLitude] <num>, [src]
Applicable Models: All

(Read-Write) Sets the RF power output level.

Note: When the sweep type is "segment sweep", and "independent port power per segment" is set, then this command is not used.

Parameters

- `<cnum>` Any existing channel number. If unspecified, value is set to 1
- `<port>` Source port number of the VNA. If unspecified, value is set to 1. To make settings for ports that are not simple numbers, use the `[src]` argument.
- `<num>` Source power in dBm.

Note: The range of settable power values depends on the VNA model and if source attenuators are installed. To determine the range of values, perform a query using MAX, then MIN, as an argument. (SOUR:POW:ATT:AUTO must be set to ON) Example: SOURce:POWer? Max

Actual achievable leveled power depends on frequency.

While this argument can be used to make settings for ALL ports, it is designed to access ports such as an external source, true mode balanced port, or one of the Source outputs on the 2-port PNA-X model with multiple sources such as "Port 1 Src2". Otherwise, the `<port>` argument performs the same function. If both arguments are specified, [src] takes priority.

Examples

- SOUR:POW1 5
- source2:power:level:immediate:amplitude maximum
- sour:pow 5, "Port 1 Src2"

Query Syntax

SOURce<cnm>:POWer[:LEVel][:IMMediate][:AMPLitude]? [src]

Return Type

Numeric

Default

0 dBm

SOURce<cnm>:POWer[:LEVel]:SLOPe <num>
Applicable Models: All

(Read-Write) Sets the RF power slope value.

Also enable the slope state using `SOUR:POW:SLOP:STAT ON`.

**Parameters**

- `<cnum>`: Any existing channel number. If unspecified, value is set to 1
- `<num>`: Slope value in db/GHz. Choose any value between -2 and 2 (0 is no slope).

**Examples**

- `SOUR:POW:SLOP .5234434`
- `source2:power:level slope -1.345`

**Query Syntax**

`SOURce<cnum>:POWer[:LEVel]:SLOPe?`

**Return Type**

Numeric

**Default**

0

---

SOURce<cnum>:POWer<port>:MODE <state>, [src]

Applicable Models: All

(Read-Write) Turns Power Slope ON or OFF. Set the slope using `SOUR:POW:SLOP`.

**Parameters**

- `<cnum>`: Any existing channel number. If unspecified, value is set to 1
- `<ON|OFF>`: ON (or 1) - turns slope ON.
- `OFF` (or 0) - turns slope OFF.

**Examples**

- `SOUR:POW:SLOP:STAT ON`
- `source2:power:slope:state off`

**Query Syntax**

`SOURce<cnum>:POWer[:LEVel]:SLOPe:STATe?`

**Return Type**

Boolean (1 = ON, 0 = OFF)

**Default**

OFF

---

4725
Applicable Models: All

(Read-Write) Sets the state of VNA source for the specified port.

**Parameters**

- `<cnum>` Any existing channel number. If unspecified, value is set to 1
- `<port>` Source port number of the VNA. If unspecified, `<port>` is set to 1. To make settings for ports that are not simple numbers, use the `[src]` argument.
- `<state>` Source state. Choose from:
  - **AUTO** Source power is turned ON when required for a measurement.
  - **ON** Source power is always ON regardless of the measurement.
  - **OFF** Source power is always OFF regardless of the measurement.
  - **NOCTL** Do not send OFF commands to the external sources. If an external source is in the OFF state, this option is used to stop sending OFF commands to the external source to increase sweep speed.

While this argument can be used to make settings for ALL ports, it is designed to access ports such as an external source, true mode balanced port, or one of the Source outputs on the 2-port PNA-X model with multiple sources such as "Port 1 Src2". Otherwise, the `<port>` argument performs the same function. If both arguments are specified, `[src]` takes priority.

**Examples**

- `SOUR:POW:MODE ON`
- `source2:power4:mode OFF`
- `sour:pow:mode on, "Port 1 Src2"

**Query Syntax**

`SOURce<cnum>:POWer<port>:MODE? [src]`

**Return Type**

Character

**Default**

Auto

`SOURce<cnum>:POWer<port>:PORT:STARt <num>, [src]`
Applicable Models: All

(Read-Write) Sets and reads the power sweep start power value for a specific port. This allows uncoupled forward and reverse power sweep ranges. Must also set SENS:SWE:TYPE POWer and SOUR:POW:COUPle OFF.

**Parameters**

- `<cnum>` Any existing channel number. If unspecified, value is set to 1
- `<port>` Source port number of the VNA. If unspecified, <port> is set to 1. To make settings for ports that are not simple numbers, use the [src] argument.
- `<num>` Start power in dBm.

**Note:** The range of settable power values depends on the VNA model and if source attenuators are installed. To determine the range of values, perform a query using MAX, then MIN, as an argument. (SOUR:POW:ATT:AUTO must be set to ON) Example: SOURce:POWer:STARt? MIN

Actual achievable leveled power depends on frequency.

While this argument can be used to make settings for ALL ports, it is designed to access ports such as an external source, true mode balanced port, or one of the Source outputs on the 2-port PNA-X model with multiple sources such as "Port 1 Src2". Otherwise, the <port> argument performs the same function. If both arguments are specified, [src] takes priority.

**Examples**

```
SOUR:POW1:PORT:STAR -15
```
```
source2:power:port:start 5, "bal port 1"
```

**Query Syntax** SOURce<cnum>:POWer<port>:PORT:STARt? [src]

**Return Type** Numeric

**Default** -10 dBm

SOURce<cnum>:POWer<port>:PORT:STOP <num>, [src]
Applicable Models: All

(Read-Write) Sets and reads the power sweep stop power value for a specific port. This allows uncoupled forward and reverse power sweep ranges. Must also set SENS:SWE:TYPE POWer and SOUR:POW:COUPle OFF.

**Note:** When the sweep type is "segment sweep", this command is not used.

**Parameters**

- `<cnum>`: Any existing channel number. If unspecified, value is set to 1
- `<port>`: Source port number of the VNA. If unspecified, `<port>` is set to 1. To make settings for ports that are not simple numbers, use the [src] argument.
- `<num>`: Stop power in dBm.

**Note:** The range of settable power values depends on the VNA model and if source attenuators are installed. To determine the range of values, perform a query using MAX, then MIN, as an argument. (SOUR:POW:ATT:AUTO must be set to ON) Example: SOURce:POWer:STARt? MIN

Actual achievable leveled power depends on frequency.

While this argument can be used to make settings for ALL ports, it is designed to access ports such as an external source, true mode balanced port, or one of the Source outputs on the 2-port PNA-X model with multiple sources such as "Port 1 Src2". Otherwise, the `<port>` argument performs the same function. If both arguments are specified, [src] takes priority.

**Examples**

SOUR:POW1:PORT:STOP -15
source2:power:port:stop 5, "bal port 1"

**Query Syntax**

SOURce<cnum>:POWer<port>:PORT:STOP? [src]

**Return Type**

- **Numeric**

  **Default**

  0 dBm

SOURce<cnum>:POWer<port>:SPAN <num>
Applicable Models: All

(Read-Write) Sets the power sweep span power. Must also set:

SENS:SWE:TYPE POWer and SOURce:POWer:CENTer <num>.

Parameters

- <cnum>: Any existing channel number. If unspecified, value is set to 1.
- <num>: Span power. Actual achievable leveled power depends on frequency.
- <port>: If provided, this argument is ignored by the VNA.

Examples

SOUR:POW:SPAN -15
source2:power:span -7

Query Syntax

SOURce<cnum>:POWer:SPAN?

Return Type

Numeric

Default

0 dBm

SOURce<cnum>:POWer<port>:STARt <num>

Applicable Models: All

(Read-Write) Sets the power sweep start power for ALL ports being used by the specified channel. Must also set:

SENS:SWE:TYPE POWer and SOURce:POWer:STOP <num>.

Note: This command is not recommended, however this command is supported for backwards compatibility. This command will limit the possible power setting to the available range on Port 1, even if other ports have a wider power range. It is recommended to use the SOURce:POWer:PORT:STARt command instead.

To set start power for a specific port, use SOUR:POW:PORT:STARt.

Note: When the sweep type is "segment sweep", this command is not used.

Parameters

- <cnum>: Any existing channel number. If unspecified, value is set to 1
- <num>: Start power.

Note: The range of settable power values depends on the VNA model and if source attenuators are installed. To determine the range of values, perform a
query using MAX, then MIN, as an argument. (SOUR:POW:ATT:AUTO must be set to ON) Example: SOURce:POWer:STARt? MIN

Actual achievable leveled power depends on frequency.

<port>  If provided, this argument is ignored by the VNA.

Examples  SOUR:POW:STAR -15
          source2:power:start -7

Query Syntax  SOURce<cnum>:POWer:STARt?

Return Type  Numeric

Default  0 dBm

SOURce<cnum>:POWer<port>:STOP <num>

Applicable Models: All

(Read-Write) Sets the power sweep stop power for ALL ports being used by the specified channel. Must also set: SENS:SWE:TYPE POWer and SOURce:POWer:START <num>.

To set start power for a specific port, use SOUR:POW:PORT:STOP.

Note: When the sweep type is "segment sweep", this command is not used.

Parameters

<cn>  Any existing channel number. If unspecified, value is set to 1
<num>  Stop power.

Note: The range of settable power values depends on the VNA model and if source attenuators are installed. To determine the range of values, perform a query using MAX, then MIN, as an argument. (SOUR:POW:ATT:AUTO must be set to ON) Example: SOURce:POWer:STOP? MAX

Actual achievable leveled power depends on frequency.

<port>  If provided, this argument is ignored by the VNA.

Examples  SOUR:POW:STOP -15
          source2:power:stop -7

Query Syntax  SOURce<cnum>:POWer:STOP?

Return Type  Numeric

Default  0 dBm
SOURce<cnum>:PULSe<port>:MODulator[:STATe] <ON | OFF>[src]

Applicable Models: All

(Read-Write) Turns pulse on and off with an external modulation source.

Parameters

<cnum> Any existing channel number. If unspecified, value is set to 1

<ON|OFF> ON (or 1) - turns pulse ON.
OFF (or 0) - turns pulse OFF.

<port> Source port number of the VNA. If unspecified, <port> is set to 1.

While this argument can be used to make settings for ALL ports, it is designed to access ports such as an external source, true mode balanced port, or one of the Source outputs on the 2-port PNA-X model with multiple sources such as "Port 1 Src2". Otherwise, the <port> argument performs the same function. If both arguments are specified, [src] takes priority.

Examples

SOUR:PULS:MOD:STAT ON, "MyMxg"
source2:pulse1:modulator:state off

Query Syntax SOURce<cnum>:PULSe<port>:MODulator[:STATe]?

Return Type Boolean (1 = ON, 0 = OFF)

Default OFF

SOURce<cnum>:PULSe:MODulator:EXISts? [src]
Applicable Models: All

(Read-only) Checks if pulse source exists.

Parameters

Examples

看了一眼: SOUR:PULS:MOD:EXIS?
source:pulse:modulator:exists? "MyMxg"

While this argument can be used to make settings for ALL ports, it is designed to access ports such as an external source, true mode balanced port, or one of the Source outputs on the 2-port PNA-X model with multiple sources such as "Port 1 Src2". Otherwise, the <port> argument performs the same function. If both arguments are specified, [src] takes priority.

Return Type

String

Default

SOURce<cnum>:MODulation<port>:ARB:CLOCk:SRATe <value> [,srcPort]

Applicable Models: N522xB, N523xB, N524xB, All with S9x070A/B

(Read-Write) Sets and reads the sample clock rate of the arbitrary waveform generator.

Parameters

- `<cnum>` Any existing channel number. If unspecified, value is set to 1
- `<port>` Source port number of the VNA. If unspecified, `<port>` is set to 1. To make settings for ports that are not simple numbers, use the [srcPort] argument.
- `<value>` Clock frequency in units of Hertz (Hz-MHz).

While this argument can be used to make settings for ALL ports, it is designed to access ports such as an external source, true mode balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model such as "Port 1 Src2". Otherwise, the `<port>` argument performs the same function. If both arguments are specified, [srcPort] takes priority.

Examples

SOUR:MOD1:ARB:LOC:SRAT 1E8
source2:modulation:arb:clock:srate 1E8

SOURce<cnum>:MODulation<port>:ARB:CLOCk:SRATe? [srcPort]

Return Type

Numeric

Default

0

SOURce<cnum>:MODulation<port>:ARB:DATA:I <propName> [,srcPort]
Applicable Models: N522xB, N523xB, N524xB, All with S9x070A/B

(Read-Write) Sets and reads the I data for I/Q modulation.

Parameters

- `<cnum>` Any existing channel number. If unspecified, value is set to 1
- `<port>` Source port number of the VNA. If unspecified, `<port>` is set to 1. To make settings for ports that are not simple numbers, use the `[srcPort]` argument.
- `<propName>` Array for I data

While this argument can be used to make settings for ALL ports, it is designed to access ports such as an external source, true mode balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model such as "Port 1 Src2". Otherwise, the `<port>` argument performs the same function. If both arguments are specified, `[srcPort]` takes priority.

Query Syntax
SOURce<cnum>:MODulation<port>:ARB:DATA:I? [srcPort]

Return Type Array
Default 0

---

SOURce<cnum>:MODulation<port>:ARB:DATA:Q <propName> [,.srcPort]

Applicable Models: N522xB, N523xB, N524xB, All with S9x070A/B

(Read-Write) Sets and reads the Q data for I/Q modulation.

Parameters

- `<cnum>` Any existing channel number. If unspecified, value is set to 1
- `<port>` Source port number of the VNA. If unspecified, `<port>` is set to 1. To make settings for ports that are not simple numbers, use the `[srcPort]` argument.
- `<propName>` Array for Q data

While this argument can be used to make settings for ALL ports, it is designed to access ports such as an external source, true mode balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model such as "Port 1 Src2". Otherwise, the `<port>` argument performs the same function. If both
Arguments are specified, [srcPort] takes priority.

**Query Syntax**  
`SOURce<cnum>:MODulation<port>:DARB:DATA:Q? [srcPort]`

**Return Type**  
Array

**Default**  
0

---

**SOURce<cnum>:MODulation<port>:AUTO:ACPR:GBANd <num>[,srcPort]**

**Applicable Models:** All with S93070xB or S9x070A/B

*(Read-Write)* Sets and reads the guard band between the end of the modulation signal and where ACPR is measured (SA channel only).

**Parameters**

- `<cnum>`: Any existing channel number. If unspecified, value is set to 1
- `<port>`: Source port number of the VNA. If unspecified, `<port>` is set to 1.
- `<num>`: Guard band for ACP measurement.

While this argument can be used to make settings for ALL ports, it is designed to access ports such as an external source, true mode balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model such as "Port 1 Src2". Otherwise, the `<port>` argument performs the same function. If both arguments are specified, [srcPort] takes priority.

**Examples**

```
SOUR:MOD1:AUTO:ACPR:GBAN 0 Hz
source2:modulation:auto:acpr:gband 0 Hz
```

**Query Syntax**  
`SOURce<cnum>:MODulation<port>:AUTO:ACPR:GBANd?`

**Return Type**  
Numeric

**Default**  
0 Hz

---

**SOURce<cnum>:MODulation<port>:AUTO:ACPR[:STATe] <bool>[,srcPort]**
Applicable Models: All with S93070xB or S9x070A/B

(Read-Write) Enable or disable Autoset ACPR markers (SA channel only).

**Parameters**

- `<cnum>` Any existing channel number. If unspecified, value is set to 1.
- `<port>` Source port number of the VNA. If unspecified, `<port>` is set to 1.
- `<bool>` Choose from:
  - **0 - OFF** - Disable ACPR markers.
  - **1 - ON** - Enable ACPR markers.

While this argument can be used to make settings for ALL ports, it is designed to access ports such as an external source, true mode balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model such as "Port 1 Src2". Otherwise, the `<port>` argument performs the same function. If both arguments are specified, `[srcPort]` takes priority.

**Examples**

```
SOUR:MOD1:AUTO:ACPR:STAT 1
source:modulation:auto:acpr:state on
```

**Query Syntax** SOURce<cnum>:MODulation<port>:AUTO:ACPR [:STATe]?

**Return Type** Boolean

**Default** OFF

```
SOURce<cnum>:MODulation<port>:AUTO:IMMediate [,srcPort]
```
Applicable Models: All with S93070xB or S9x070A/B

(Write-only) Adjusts frequencies and markers immediately if modulation settings are changed (SA channel only). This command depends on the status of the SA, NPR, and ACPR autoset booleans.

Parameters

- `<cnum>` Any existing channel number. If unspecified, value is set to 1
- `<port>` Source port number of the VNA. If unspecified, value is set to 1.

While this argument can be used to make settings for ALL ports, it is designed to access ports such as an external source, true mode balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model such as "Port 1 Src2". Otherwise, the `<port>` argument performs the same function. If both arguments are specified, `[srcPort]` takes priority.

Examples

SOUR1:MOD1:AUTO:IMM

Query Syntax

Not applicable

Default

Not applicable

SOURce<cnum>:MODulation<port>:AUTO:NPR:GBANd <num>[,srcPort]

Applicable Models: All with S93070xB or S9x070A/B

(Read-Write) Sets and reads the guard band on each side of the notch in an NPR measurement (SA channel only).

Parameters

- `<cnum>` Any existing channel number. If unspecified, value is set to 1
- `<port>` Source port number of the VNA. If unspecified, `<port>` is set to 1.
- `<num>` Guard band for NPR measurement.

While this argument can be used to make settings for ALL ports, it is designed to access ports such as an external source, true mode balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model such as "Port 1 Src2". Otherwise, the `<port>` argument performs the same function. If both arguments are specified, `[srcPort]` takes priority.
Examples

SOUR:MOD1:AUTO:NPR:GBAN 0 Hz
source2:modulation:auto:npr:gband 0 Hz

Query Syntax

SOURce<cnum>:MODulation<port>:AUTO:NPR[:STATe] <bool> [.srcPort]

Return Type

Numeric

Default

0 Hz

SOURce<cnum>:MODulation<port>:AUTO:NPR[:STATe] <bool> [.srcPort]

Applicable Models: All with S93070xB or S9x070A/B

(Read-Write) Enable or disable Autoset NPR markers (SA channel only).

Parameters

<cnum> Any existing channel number. If unspecified, value is set to 1.

<port> Source port number of the VNA. If unspecified, <port> is set to 1.

<bool> Choose from:

0 - OFF - Disable NPR markers.

1 - ON - Enable NPR markers.

While this argument can be used to make settings for ALL ports, it is designed to access ports such as an external source, true mode balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model such as "Port 1 Src2". Otherwise, the <port> argument performs the same function. If both arguments are specified, [srcPort] takes priority.

Examples

SOUR:MOD1:AUTO:NPR:STAT 1
source:modulation:auto:npr:state on

Query Syntax

SOURce<cnum>:MODulation<port>:AUTO:NPR [:STATe]?

Return Type

Boolean

Default

ON

SOURce<cnum>:MODulation<port>:AUTO:SA[:STATe] <bool>[.srcPort]
Applicable Models: All with S93070xB or S9x070A/B

(Read-Write) Enable or disable automatic updating of SA sweep settings and coherence settings if the
modulation settings are changed (SA channel only).

Parameters

- `<cnum>` Any existing channel number. If unspecified, value is set to 1.
- `<port>` Source port number of the VNA. If unspecified, `<port>` is set to 1.
- `<bool>` Choose from:
  - **0 - OFF** - Disable automatic updating.
  - **1 - ON** - Enable automatic updating.

While this argument can be used to make settings for ALL ports, it is designed to access ports such as an external source, true mode balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model such as "Port 1 Src2". Otherwise, the `<port>` argument performs the same function. If both arguments are specified, [srcPort] takes priority.

Examples

```
SOUR:MOD1:AUTO:SA:STAT 1
source:modulation:auto:sa:state on
```

Query Syntax

SOURce<cnum>:MODulation<port>:AUTO:SA [:STATe]?

Return Type

Boolean

Default

ON
**Applicable Models:** All with S93070xB or S9x070A/B

*(Read-Write)* Set and read the ACP modulation calibration state.

**Parameters**

- `<ch>` Any existing channel number. If unspecified, value is set to 1.
- `<port>` Source port number of the VNA. If unspecified, `<port>` is set to 1.
- `<bool>` Choose from:
  
  0 - **OFF** - Disable ACP calibration.
  1 - **ON** - Enable ACP calibration.

While this argument can be used to make settings for ALL ports, it is designed to access ports such as an external source, true mode balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model such as "Port 1 Src2". Otherwise, the `<port>` argument performs the same function. If both arguments are specified, `[srcPort]` takes priority.

**Examples**

```
SOUR:MOD1:CORR:COLL:ACP:ENAB 1
source2:modulation:correction:collection:acp:enable on
```

**Query Syntax**

SOURce<cnum>:MODulation<port>:CORRection:COLLection:ACP:ENABle ?

**Return Type** Boolean

**Default** OFF

```
SOURce<cnum>:MODulation<port>:CORRection:COLLection:ACP:ITERations <num>[,srcPort]
```
Applicable Models: All with Option S93070xB/9x070A/B, and/or All with Option S9x09xxA/B, S9x090A/B

(Read-Write) Sets and reads the maximum number of iterations used by the calibration routine. The calibration routine uses successive approximation.

Parameters

- `<cnum>`: Any existing channel number. If unspecified, value is set to 1
- `<port>`: Source port number of the VNA. If unspecified, `<port>` is set to 1.
- `<num>`: Maximum number of iterations.

While this argument can be used to make settings for ALL ports, it is designed to access ports such as an external source, true mode balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model such as "Port 1 Src2". Otherwise, the `<port>` argument performs the same function. If both arguments are specified, `[srcPort]` takes priority.

Examples

```
SOUR:MOD1:CORR:COLL:ACP:ITER 2
source2:modulation:correction:collection:acp:iterations 2
```

Query Syntax

SOURce<cnum>:MODulation<port>:CORRection:COLLection:ACP:ITERations?

Return Type

Numeric

Default

2

SOURce<cnum>:MODulation<port>:CORRection:COLLection:ACP:LOWer:ENAMEle <bool>[,srcPort]
Applicable Models: All with Option S93070xB/9x070A/B, and/or All with Option S9x09xxA/B, S9x090A/B

**Read-Write** Enables or disables the lower ACP (ACPLo) modulation calibration.

![ACPLo Signal ACPUp](image)

**Parameters**

- `<ch>`  Any existing channel number. If unspecified, value is set to 1.
- `<port>`  Source port number of the VNA. If unspecified, `<port>` is set to 1.
- `<bool>`  Choose from:
  
  **0 - OFF** - Disable lower ACP calibration.
  
  **1 - ON** - Enable lower ACP calibration.

  While this argument can be used to make settings for ALL ports, it is designed to access ports such as an external source, true mode balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model such as "Port 1 Src2". Otherwise, the `<port>` argument performs the same function. If both arguments are specified, [srcPort] takes priority.

**Examples**

```
SOUR:MOD1:CORR:COLL:ACP:LOW:ENAB 1
source2:modulation:correction:collection:acp:lower:enable on
```

**Query Syntax**

SOURce<cnum>:MODulation<port>:CORRection:COLLection:ACP:LOWer:ENABle ?

**Return Type**  Boolean

**Default**  OFF

SOURce<cnum>:MODulation<port>:CORRection:COLLection:ACP:LOWer:GBANd <num>[,srcPort]
**Applicable Models:** All with Option S93070xB/9x070A/B, and/or All with Option S9x09xxA/B, S9x090A/B

*(Read-Write)* Sets and reads the ACP lower frequency delta from the edge of the carrier to the beginning of the calibration span.

**Parameters**

- `<cnum>` Any existing channel number. If unspecified, value is set to 1
- `<port>` Source port number of the VNA. If unspecified, `<port>` is set to 1.
- `<num>` Guard band for lower ACP.

While this argument can be used to make settings for ALL ports, it is designed to access ports such as an external source, true mode balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model such as "Port 1 Src2". Otherwise, the `<port>` argument performs the same function. If both arguments are specified, `[srcPort]` takes priority.

**Examples**

```
SOUR:MOD1:CORR:COLL:ACP:LOW:GBAN 0 Hz
source2:modulation:correction:collection:acp:lower:gband 0 Hz
```

**Query Syntax**

SOURce<cnum>:MODulation<port>:CORRection:COLLection:ACP:LOWer:GBANd?

**Return Type** Numeric

**Default** 0 Hz
**Applicable Models:** All with Option S93070xB/9x070A/B, and/or All with Option S9x09xxA/B, S9x090A/B

(Read-Write) Sets and reads the maximum number of iterations used by the calibration routine. The calibration routine uses successive approximation.

### Parameters

- **<cnum>** Any existing channel number. If unspecified, value is set to 1
- **<port>** Source port number of the VNA. If unspecified, <port> is set to 1.
- **<num>** Maximum number of iterations.

While this argument can be used to make settings for ALL ports, it is designed to access ports such as an external source, true mode balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model such as "Port 1 Src2". Otherwise, the <port> argument performs the same function. If both arguments are specified, [srcPort] takes priority.

### Examples

```
source2:modulation:correction:collection:acp:lower:iterations 2
```

### Query Syntax

`SOURce<cnum>:MODulation<port>:CORRection:COLLection:ACP:LOWer:ITERations?`

### Return Type

Numeric

### Default

2

`SOURce<cnum>:MODulation<port>:CORRection:COLLection:ACP:LOWer:RECeiver <rcvr>[,srcPort]`
**Applicable Models:** All with Option S93070xB/9x070A/B, and/or All with Option S9x09xxA/B, S9x090A/B

*(Read-Write)* Sets and reads the receiver for the lower ACP modulation calibration.

**Parameters**

- `<cnum>` Any existing channel number. If unspecified, value is set to 1
- `<port>` Source port number of the VNA. If unspecified, `<port>` is set to 1.
- `<rcvr>` **String**. Calibration plane.
  
  For options S9x09xxA/B, S9x090A/B choose from:
  
  A, B, C, D, R1, R2, R3, R4, a1, a2, a3, a4, b1, b2, b3, b4.

  For options S93070xB, choose from:
  
  DUTIn1, DUTOut2, DUTOut3, DUTOut4, DUTOut5.

  While this argument can be used to make settings for ALL ports, it is designed to access ports such as an external source, true mode balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model such as "Port 1 Src2". Otherwise, the `<port>` argument performs the same function. If both arguments are specified, `[srcPort]` takes priority.

**Examples**

```
SOUR:MOD1:CORR:COLL:ACP:LOW:REC "R1"
source2:modulation:correction:collection:acp:lower:receiver 'R1'
```

**Query Syntax**

SOURce<cnum>:MODulation<port>:CORRection:COLLection:ACP:LOWer:RECeiver?

**Return Type** String

**Default** a1 (options S9x09xxA/B, S9x090A/B)

DUTIn1 (options S93070xB)
**Applicable Models:** All with Option S93070xB/9x070A/B, and/or All with Option S9x09xxA/B, S9x090A/B

*(Read-Write)* Sets and reads the calibration span for a lower ACP modulation calibration.

**Parameters**

- `<cnum>` Any existing channel number. If unspecified, value is set to 1.
- `<port>` Source port number of the VNA. If unspecified, `<port>` is set to 1.
- `<num>` Calibration span for lower ACP.

While this argument can be used to make settings for ALL ports, it is designed to access ports such as an external source, true mode balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model such as "Port 1 Src2". Otherwise, the `<port>` argument performs the same function. If both arguments are specified, `[srcPort]` takes priority.

**Examples**

```
SOUR:MOD1:CORR:COLL:ACP:LOW:SPAN 100 MHz
source2:modulation:correction:collection:acp:lower:span 100 MHz
```

**Query Syntax**

```
SOURce<cnum>:MODulation<port>:CORRection:COLLection:ACP:LOWer:SPAN?
```

**Return Type** Numeric

**Default** Signal Span

---

**Applicable Models:** All with Option S93070xB/9x070A/B, and/or All with Option S9x09xxA/B, S9x090A/B

*(Read-Write)* Sets and reads the desired ACP calibration tolerance for the lower ACP modulation calibration.

**Parameters**

- `<cnum>` Any existing channel number. If unspecified, value is set to 1.
- `<port>` Source port number of the VNA. If unspecified, `<port>` is set to 1.
- `<num>` Calibration tolerance in dBc.
While this argument can be used to make settings for ALL ports, it is designed to access ports such as an external source, true mode balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model such as "Port 1 Src2". Otherwise, the <port> argument performs the same function. If both arguments are specified, [srcPort] takes priority.

Examples

```
```

**Query Syntax**

`SOURce<cnum>:MODulation<port>:CORRection:COLLection:ACP:SPAN?`

**Return Type**

Numeric

**Default**

Signal Span

---

**SOURce<cnum>:MODulation<port>:CORRection:COLLection:ACP:TOLerance <num>[,srcPort]**
**Applicable Models:** All with Option S93070xB/9x070A/B, and/or All with Option S9x09xxA/B/S9x090A/B

*(Read-Write)* Sets and reads the desired ACP calibration tolerance for the ACP modulation calibration.

**Parameters**

- `<cnum>` Any existing channel number. If unspecified, value is set to 1
- `<port>` Source port number of the VNA. If unspecified, `<port>` is set to 1.
- `<num>` Calibration tolerance in dBC.

While this argument can be used to make settings for ALL ports, it is designed to access ports such as an external source, true mode balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model such as "Port 1 Src2". Otherwise, the `<port>` argument performs the same function. If both arguments are specified, `[srcPort]` takes priority.

**Examples**

```
SOUR:MOD1:CORR:COLL:ACP:TOL -40dBc
source2: modulation: correction: collection: acp: tolerance -40dBc
```

**Query Syntax**

SOURce<cnum>:MODulation<port>:CORRection:COLLection:ACP:TOLerance?

**Return Type** Numeric

**Default** -40
**Applicable Models:** All with Option S93070xB/9x070A/B, and/or All with Option S9x09xxA/B/S9x090A/B

*(Read-Write)* Enables or disables the upper ACP (ACPUp) modulation calibration.

**Parameters**

- `<ch>` Any existing channel number. If unspecified, value is set to 1.
- `<port>` Source port number of the VNA. If unspecified, `<port>` is set to 1.
- `<bool>` Choose from:
  - **0** - **OFF** - Disable upper ACP calibration.
  - **1** - **ON** - Enable upper ACP calibration.

While this argument can be used to make settings for ALL ports, it is designed to access ports such as an external source, true mode balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model such as "Port 1 Src2". Otherwise, the `<port>` argument performs the same function. If both arguments are specified, `[srcPort]` takes priority.

**Examples**

```
SOUR:MOD1:CORR:COLL:ACP:UPP:ENAB 1
source2:modulation:correction:collection:acp:upper:enable on
```

**Query Syntax**

SOURce<cnum>:MODulation<port>:CORRection:COLLection:ACP:UPPer:ENABle ?

**Return Type**

Boolean

**Default**

OFF
Applicable Models: All with Option S93070xB/9x070A/B, and/or All with Option S9x09xxA/B/S9x090A/B

(Read-Write) Sets and reads the ACP upper frequency delta from the edge of the carrier to the beginning of the calibration span.

Parameters

- `<cnum>`: Any existing channel number. If unspecified, value is set to 1
- `<port>`: Source port number of the VNA. If unspecified, `<port>` is set to 1.
- `<num>`: Guard band for upper ACP.

While this argument can be used to make settings for ALL ports, it is designed to access ports such as an external source, true mode balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model such as "Port 1 Src2". Otherwise, the `<port>` argument performs the same function. If both arguments are specified, `[srcPort]` takes priority.

Examples

```
SOUR:MOD1:CORR:COLL:ACP:UPP:GBAN 0 Hz
source2:modulation:correction:collection:acp:upper:gband 0 Hz
```

Query Syntax

SOURce<cnum>:MODulation<port>:CORRection:COLLection:ACP:UPPer:GBANd?

Return Type

Numeric

Default

0 Hz

SOURce<cnum>:MODulation<port>:CORRection:COLLection:ACP:UPPPer:ITERations <num>[,srcPort]
Applicable Models: All with Option S93070xB/9x070A/B, and/or All with Option S9x09xxA/B/S9x090A/B

(Read-Write) Sets and reads the maximum number of iterations used by the calibration routine. The calibration routine uses successive approximation.

**Parameters**

- `<cnum>`: Any existing channel number. If unspecified, value is set to 1.
- `<port>`: Source port number of the VNA. If unspecified, `<port>` is set to 1.
- `<num>`: Maximum number of iterations.

While this argument can be used to make settings for ALL ports, it is designed to access ports such as an external source, true mode balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model such as "Port 1 Src2". Otherwise, the `<port>` argument performs the same function. If both arguments are specified, `[srcPort]` takes priority.

**Default**

2

**Return Type**

Numeric

**Default**

2
**Applicable Models:** All with Option S93070x/B/9x070A/B, and/or All with Option S9x09xxA/B/S9x090A/B

(Read-Write) Sets and reads the receiver for the upper ACP modulation calibration.

**Parameters**

- `<cnum>` Any existing channel number. If unspecified, value is set to 1
- `<port>` Source port number of the VNA. If unspecified, `<port>` is set to 1.
- `<rcvr>` String. Calibration plane.

For options S9x09xxA/B, S9x090A/B choose from:

A, B, C, D, R1, R2, R3, R4, a1, a2, a3, a4, b1, b2, b3, b4.

For options S93070xB, choose from:

DUTIn1, DUTOOut2, DUTOOut3, DUTOOut4, DUTOOut5.

While this argument can be used to make settings for ALL ports, it is designed to access ports such as an external source, true mode balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model such as "Port 1 Src2". Otherwise, the `<port>` argument performs the same function. If both arguments are specified, `[srcPort]` takes priority.

**Examples**

```
SOUR:MOD1:CORR:COLL:ACP:UPP:REC "R1"
source2:modulation:correction:collection:acp:upper:receiver "R1"
```

**Query Syntax**

```
SOURce<cnum>:MODulation<port>:CORRection:COLLection:ACP:UPPer:RECeiver?
```

**Return Type** String

**Default** a1 (options S9x09xxA/B, S9x090A/B)

DUTIn1 (options S93070xB)
(Read-Write) Sets and reads the calibration span for an upper ACP modulation calibration.

**Parameters**

- `<cnum>` Any existing channel number. If unspecified, value is set to 1
- `<port>` Source port number of the VNA. If unspecified, `<port>` is set to 1.
- `<num>` Calibration span for upper ACP.

While this argument can be used to make settings for ALL ports, it is designed to access ports such as an external source, true mode balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model such as "Port 1 Src2". Otherwise, the `<port>` argument performs the same function. If both arguments are specified, `[srcPort]` takes priority.

**Examples**

```
SOUR:MOD1:CORR:COLL:ACP:UPP:SPAN 100 MHz
source2:modulation:correction:collection:acp:upper:span 100 Mhz
```

**Query Syntax**

SOURce`<cnum>`:MODulation`<port>`:CORRection:COLLection:ACP:UPPer:SPAN?

**Return Type** Numeric

**Default** Signal Span

(Read-Write) Sets and reads the desired ACP calibration tolerance for the upper ACP modulation calibration.

**Parameters**

- `<cnum>` Any existing channel number. If unspecified, value is set to 1
- `<port>` Source port number of the VNA. If unspecified, `<port>` is set to 1.
- `<num>` Calibration tolerance in dBc.
While this argument can be used to make settings for ALL ports, it is designed to access ports such as an external source, true mode balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model such as "Port 1 Src2". Otherwise, the <port> argument performs the same function. If both arguments are specified, [srcPort] takes priority.

**Applicable Models:** All with Option S93070xB/9x070A/B, and/or All with Option S9x09xxA/B/S9x090A/B

*(Write-only)* Sets the collection acquire.

**Parameters**

- `<cnum>` Any existing channel number. If unspecified, value is set to 1
- `<port>` Source port number of the VNA. If unspecified, value is set to 1.
- `<enum>` Choose from:
  - **SYNChronous**
  - **ASYNchronous**

While this argument can be used to make settings for ALL ports, it is designed to access ports such as an external source, true mode balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model such as "Port 1 Src2". Otherwise, the <port> argument performs the same function. If both arguments are specified, [srcPort] takes priority.

**Examples**

```
SOUR1:MOD1:CORR:COLL:ACQ SYNC
```

**Query Syntax**

Not applicable

**Default**

SYNChronous
**SOURce<cnum>:MODulation<port>:CORRection:COLLection:ACQuire:STATus? [,srcPort]**

**Applicable Models:** N522xB, N523xB, N524xB, All with S9x070A/B

*(Read-only)* Returns a message indicating if the calibration was successful or not.

**Parameters**

- `<cnum>` Any existing channel number. If unspecified, value is set to 1
- `<port>` Source port number of the VNA. If unspecified, value is set to 1.
- `[srcPort]` **String** *(NOT case sensitive)*. Source port. Optional. Use SOUR:CAT? to return a list of valid port names.

While this argument can be used to make settings for ALL ports, it is designed to access ports such as an external source, true mode balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model such as "Port 1 Src2". Otherwise, the `<port>` argument performs the same function. If both arguments are specified, `[srcPort]` takes priority.

**Examples**

```
SOUR:MOD:CORR:COL:ACQ:STAT?
"Calibration succeeded."
```

**Return Type** Comma-separated list of strings.

**Default** Not applicable

---

**SOURce<cnum>:MODulation<port>:CORRection:COLLection:APPend <bool>[,srcPort]**

**Applicable Models:** All with Option S93070xB/9x070A/B, and/or All with Option S9x09xxA/B/S9x090A/B

*(Read-Write)* Enable appending source modulation calibration data to the stored *.mdx file. If disabled, old calibration data in the *.mdx file will be overwritten.

**Parameters**

- `<ch>` Any existing channel number. If unspecified, value is set to 1.
- `<port>` Source port number of the VNA. If unspecified, `<port>` is set to 1.
- `<bool>` Choose from:
  - **0 - OFF** - Disable appending calibration data. Old calibration data in the *.mdx file will be overwritten.
  - **1 - ON** - Enable appending calibration data.
- `[srcPort]` **String** *(NOT case sensitive)*. Source port. Optional. Use SOUR:CAT? to return a list of valid port names.
While this argument can be used to make settings for ALL ports, it is designed to access ports such as an external source, true mode balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model such as "Port 1 Src2". Otherwise, the <port> argument performs the same function. If both arguments are specified, [srcPort] takes priority.

**Examples**

```
SOUR:MOD6:LOAD 'D:\ModulationFile\npr.csv'
...
SOUR:MOD6:CORR:COLL:APP 1
SOUR:MOD6:CORR:COLL:ACQ
```

**Query Syntax**

SOURce<cnum>:MODulation<port>:CORRection:COLLection:APPend ?

**Return Type**

Boolean

**Default**

OFF

SOURce<cnum>:MODulation<port>:CORRection:COLLection:DISTortion:ENABle <bool>[,srcPort]

**Applicable Models:** N524xB models with Option S93070xB, and/or N522xB, N523xB, N524xB with Option S9x09xxA/B, S9x090A/B

(Read-Write) Enable or disable the distortion calibration state. The distortion calibration minimizes the vector error of the modulation signal over the Cal Span.

**Parameters**

- `<ch>` Any existing channel number. If unspecified, value is set to 1.
- `<port>` Source port number of the VNA. If unspecified, <port> is set to 1.
- `<bool>` Choose from:
  - **0 - OFF** - Disable distortion calibration.
  - **1 - ON** - Enable distortion calibration.

While this argument can be used to make settings for ALL ports, it is designed to access ports such as an external source, true mode balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model such as "Port 1 Src2". Otherwise, the <port> argument performs the same function. If both arguments are specified, [srcPort] takes priority.
### SOUR:MOD1:CORR:COLL:DIST:ENAB 1

### SOURce<cnum>:MODulation<port>:CORRection:COLLection:DISTortion:ITERations

#### Applicable Models:
N524xB models with Option S93070xB, and/or N522xB, N523xB, N524xB with Option S9x09xxA/B, S9x090A/B

(Read-Write) Sets and reads the maximum number of distortion correction iterations used by the calibration routine. The calibration routine uses successive approximation.

**Parameters**
- `<cnum>`: Any existing channel number. If unspecified, value is set to 1
- `<port>`: Source port number of the VNA. If unspecified, <port> is set to 1.
- `<num>`: Maximum number of distortion correction iterations.

While this argument can be used to make settings for ALL ports, it is designed to access ports such as an external source, true mode balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model such as "Port 1 Src2". Otherwise, the `<port>` argument performs the same function. If both arguments are specified, [srcPort] takes priority.

**Examples**
```
SOUR:MOD1:CORR:COLL:DIST:ITER 3
source2:modulation:correction:collection:distortion:iterations 3

SOUR:MOD1:CORR:COLL:DIST:ITER 3
source2:modulation:correction:collection:distortion:iterations 3
```

**Query Syntax**
```
SOURce<cnum>:MODulation<port>:CORRection:COLLection:DISTortion:RECeiver?
```

**Return Type**
Numeric

**Default**
3
Applicable Models: N524xB models with Option S93070xB, and/or N522xB, N523xB, N524xB with Option S9x09xxA/B, S9x090A/B

(Read-Write) Sets and reads the receiver for distortion calibration.

Parameters

- `<cnum>` Any existing channel number. If unspecified, value is set to 1
- `<port>` Source port number of the VNA. If unspecified, `<port>` is set to 1.
- `<rcvr>` String. Calibration plane.

For options S9x09xxA/B, S9x090A/B choose from:
A, B, C, D, R1, R2, R3, R4, a1, a2, a3, a4, b1, b2, b3, b4.

For options S93070xB, choose from:
DUTIn1, DUTOut2, DUTOut3, DUTOut4, DUTOut5.

While this argument can be used to make settings for ALL ports, it is designed to access ports such as an external source, true mode balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model such as "Port 1 Src2". Otherwise, the `<port>` argument performs the same function. If both arguments are specified, `[srcPort]` takes priority.

Examples

```
SOUR:MOD1:CORR:COLL:DIST:REC "R1"
source2:modulation:correction:collection:distortion:receiver "R1"
```

Query Syntax

```
SOURce<cnum>:MODulation<port>:CORRection:COLLection:DISTortion:RECeiver?
```

Return Type

String

Default

- a1 (options S9x09xxA/B, S9x090A/B)
- DUTIn1 (options S93070xB)
Applicable Models: N524xB models with Option S93070xB, and/or N522xB, N523xB, N524xB with Option S9x09xxA/B, S9x090A/B

(Read-Write) Sets and reads the calibration span for a distortion calibration.

Parameters

- **<cnum>** Any existing channel number. If unspecified, value is set to 1
- **<port>** Source port number of the VNA. If unspecified, <port> is set to 1.
- **<num>** Calibration span.

While this argument can be used to make settings for ALL ports, it is designed to access ports such as an external source, true mode balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model such as "Port 1 Src2". Otherwise, the <port> argument performs the same function. If both arguments are specified, [srcPort] takes priority.

Examples

```
SOUR:MOD1:CORR:COLL:DIST:SPAN 1.5GHz
source2:modulation:correction:collection:distortion:span 1.5ghz
```

Query Syntax

```
SOURce<cnum>:MODulation<port>:CORRection:COLLection:DISTortion:SPAN?
```

Return Type

Numeric

Default

0

---

SOURce<cnum>:MODulation<port>:CORRection:COLLection:DISTortion:TOLerance <num>[,srcPort]

Applicable Models: N524xB models with Option S93070xB, and/or N522xB, N523xB, N524xB with Option S9x09xxA/B, S9x090A/B

(Read-Write) Sets and reads the desired distortion calibration tolerance.

Parameters

- **<cnum>** Any existing channel number. If unspecified, value is set to 1
- **<port>** Source port number of the VNA. If unspecified, <port> is set to 1.
- **<num>** Desired tolerance is the un-equalized EVM in dBc.

While this argument can be used to make settings for ALL ports, it is designed
to access ports such as an external source, true mode balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model such as "Port 1 Src2". Otherwise, the <port> argument performs the same function. If both arguments are specified, [srcPort] takes priority.

**Examples**

```
SOUR:MOD1:CORR:COLL:DIST:TOL -50 dBc
source2:modulation:correction:collection:distortion:tolerance -50 dBc
```

### Query Syntax

SOURce<n>:MODulation<port>:CORRection:COLLection:DISTortion:TOLerance?

### Return Type

Numeric

### Default

-40

---

**SOURce<n>:MODulation<port>:CORRection:COLLection:EQUalization:ENABle <bool>[,srcPort]**

**Applicable Models:** N524xB models with Option S93070xB, and/or N522xB, N523xB, N524xB with Option S9x09xxA/B, S9x090A/B

(Read-Write) Enable or disable the equalization calibration state.

**Note:** This command is the same as the SOURce:MODulation:CORRection:COLLection:FLATness:ENABle command.

**Parameters**

- **<ch>** Any existing channel number. If unspecified, value is set to 1.
- **<port>** Source port number of the VNA. If unspecified, <port> is set to 1.
- **<bool>** Choose from:
  - **0 - OFF** - Disable equalization calibration.
  - **1 - ON** - Enable equalization calibration.
- **[srcPort]** **String** (NOT case sensitive). Source port. Optional. Use SOUR:CAT? to return a list of valid port names.

While this argument can be used to make settings for ALL ports, it is designed to access ports such as an external source, true mode balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model such as "Port 1 Src2". Otherwise, the <port> argument performs the same function. If both arguments are specified, [srcPort] takes priority.

**Examples**

```
SOUR:MOD1:CORR:COLL:EQU:ENAB 1
source2:modulation:correction:collection:equalization:enable on
```
**Query Syntax**  
SOURce<cnum>:MODulation<port>:CORRection:COLLection:EQUalization:ENABle ?

**Return Type**  
Boolean

**Default**  
OFF

**Applicable Models:** N524xB models with Option S93070xB, and/or N522xB, N523xB, N524xB with Option S9x09xxA/B, S9x090A/B

*(Read-Write)* Sets and reads the maximum number of iterations used by the calibration routine. The calibration routine uses successive approximation.

**Note:** This command is the same as the SOURce:MODulation:CORRection:COLLection:FLATness:ITERations command.

**Parameters**

- `<cnum>`  
  Any existing channel number. If unspecified, value is set to 1
- `<port>`  
  Source port number of the VNA. If unspecified, `<port>` is set to 1.
- `<num>`  
  Maximum number of iterations.
- `[srcPort]`  
  **String** (NOT case sensitive). Source port. Optional. Use SOUR:CAT? to return a list of valid port names.

While this argument can be used to make settings for ALL ports, it is designed to access ports such as an external source, true mode balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model such as "Port 1 Src2". Otherwise, the `<port>` argument performs the same function. If both arguments are specified, [srcPort] takes priority.

**Return Type**  
Numeric

**Default**  
3
**Applicable Models:** N524xB models with Option S93070xB, and/or N522xB, N523xB, N524xB with Option S9x09xxA/B, S9x090A/B

(Read-Write) Sets and reads the receiver for equalization calibration.

**Note:** This command is the same as the SOURce:MODulation:CORRection:COLLection:FLATness:RECeiver command.

**Parameters**

- `<cnum>`  Any existing channel number. If unspecified, value is set to 1
- `<port>`  Source port number of the VNA. If unspecified, `<port>` is set to 1.
- `<rcvr>`  **String**. Calibration plane.

  For options S9x09xxA/B, S9x090A/B choose from:

  A, B, C, D, R1, R2, R3, R4, a1, a2, a3, a4, b1, b2, b3, b4.

  For options S93070xB, choose from:

  DUTIn1, DUTOu2t, DUTOu3t, DUTOu4t, DUTOu5t.

  While this argument can be used to make settings for ALL ports, it is designed to access ports such as an external source, true mode balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model such as "Port 1 Src2". Otherwise, the `<port>` argument performs the same function. If both arguments are specified, [srcPort] takes priority.

**Examples**

```plaintext
SOUR:MOD1:CORR:COLL:EQU:REC "R1"
source2:modulation:correction:collection:equalization:receiver "R1"
```

**Query Syntax**

SOURce<cnum>:MODulation<port>:CORRection:COLLection:EQUalization:RECeiver?

**Return Type**  String

**Default**  a1 (options S9x09xxA/B, S9x090A/B)

DUTIn1 (options S93070xB)
**Applicable Models:** N524xB models with Option S93070xB, and/or N522xB, N523xB, N524xB with Option S9x09xxA/B, S9x090A/B

*(Read-Write)* Sets and reads the calibration span for an equalization calibration.

**Note:** This command is the same as the `SOURce:MODulation:CORRection:COLLection:FLATness:SPAN` command.

**Parameters**

- `<cnum>` Any existing channel number. If unspecified, value is set to 1
- `<port>` Source port number of the VNA. If unspecified, `<port>` is set to 1.
- `<num>` Calibration span.

While this argument can be used to make settings for ALL ports, it is designed to access ports such as an external source, true mode balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model such as "Port 1 Src2". Otherwise, the `<port>` argument performs the same function. If both arguments are specified, `[srcPort]` takes priority.

**Examples**

```
SOUR:MOD1:CORR:COLL:EQU:SPAN 1.5GHz
source2:modulation:correction:collection:equalization:span 1.5ghz
```

**Query Syntax** `SOURce<cnum>:MODulation<port>:CORRection:COLLection:EQUalization:SPAN?`

**Return Type** Numeric

**Default** Signal Span

```
SOURce<cnum>:MODulation<port>:CORRection:COLLection:EQUalization:TOLerance <num>[,srcPort]
```
Applicable Models: N524xB models with Option S93070xB, and/or N522xB, N523xB, N524xB with Option S9x09x/A/B, S9x090/A/B

(Read-Write) Sets and reads the desired equalization calibration tolerance.

**Note:** This command is the same as the SOURce:MODulation:CORRection:COLLection:FLATness:TOLerance command.

**Parameters**

- `<cnum>` Any existing channel number. If unspecified, value is set to 1
- `<port>` Source port number of the VNA. If unspecified, `<port>` is set to 1.
- `<num>` Calibration equalization tolerance in dB-pk.

While this argument can be used to make settings for ALL ports, it is designed to access ports such as an external source, true mode balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model such as "Port 1 Src2". Otherwise, the `<port>` argument performs the same function. If both arguments are specified, `[srcPort]` takes priority.

**Examples**

```
SOUR:MOD1:CORR:COLL:EQU:TOL 0.100
source2:modulation:correction:collection:equalization:tolerance 0.100
```

**Query Syntax**

SOURce<cnum>:MODulation<port>:CORRection:COLLection:EQUalization:TOLerance?

**Return Type**

Numeric

**Default**

0.1

```plaintext
SOURce<cnum>:MODulation<port>:CORRection:COLLection:FAST:ENABle <bool>[,srcPort]
```
Applicable Models: N522xB, N523xB, N524xB

(Read-Write) Enable or disable a fast calibration with reduced accuracy.

Parameters

- `<ch>` Any existing channel number. If unspecified, value is set to 1.
- `<port>` Source port number of the VNA. If unspecified, `<port>` is set to 1.
- `<bool>` Choose from:

  0 - OFF - Disable fast calibration.

  1 - ON - Enable fast calibration.

While this argument can be used to make settings for ALL ports, it is designed to access ports such as an external source, true mode balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model such as "Port 1 Src2". Otherwise, the `<port>` argument performs the same function. If both arguments are specified, [srcPort] takes priority.

Examples

SOUR:MOD1:CORR:COLL:FAST:ENAB 1
source2:modulation:correction:collection:fast:enable on

Query Syntax

SOURce<cnum>:MODulation<port>:CORRection:COLLection:FAST:ENABle ?

Return Type

Boolean

Default

OFF

SOURce<cnum>:MODulation<port>:CORRection:COLLection:FLATness:ENABle <bool>[,srcPort]
Applicable Models: All with Option S93070xB/9x070A/B, and/or All with Option S9x09xxA/B/S9x090A/B

(Read-Write) Enable or disable the flatness calibration state.

Note: This command is the same as the SOURce:MODulation:CORRection:COLLection:EQUalization:ENABle command.

Parameters

- `<ch>` Any existing channel number. If unspecified, value is set to 1.
- `<port>` Source port number of the VNA. If unspecified, `<port>` is set to 1.
- `<bool>` Choose from:
  - **0 - OFF**: Disable flatness calibration.
  - **1 - ON**: Enable flatness calibration.

While this argument can be used to make settings for ALL ports, it is designed to access ports such as an external source, true mode balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model such as "Port 1 Src2". Otherwise, the `<port>` argument performs the same function. If both arguments are specified, `[srcPort]` takes priority.

Examples

- `SOUR:MOD1:CORR:COLL:FLAT:ENAB 1`
- `source2:modulation:correction:collection:flatness:enable on`

Query Syntax

SOURce<cnum>:MODulation<port>:CORRection:COLLection:FLATness:ENABle?

Return Type

Boolean

Default

OFF

SOURce<cnum>:MODulation<port>:CORRection:COLLection:FLATness:ITERations
<num>[,srcPort]
Applicable Models: All with Option S93070xB/9x070A/B, and/or All with Option S9x09xxA/B/S9x090A/B

(Read-Write) Sets and reads the maximum number of iterations used by the calibration routine. The calibration routine uses successive approximation.

**Note:** This command is the same as the SOURce:MODulation:CORRection:COLLection:EQUalization:ITERations command.

### Parameters

- `<cnum>` Any existing channel number. If unspecified, value is set to 1
- `<port>` Source port number of the VNA. If unspecified, `<port>` is set to 1.
- `<num>` Maximum number of iterations.

While this argument can be used to make settings for ALL ports, it is designed to access ports such as an external source, true mode balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model such as "Port 1 Src2". Otherwise, the `<port>` argument performs the same function. If both arguments are specified, `[srcPort]` takes priority.

### Examples

```
SOUR:MOD1:CORR:COLL:FLAT:ITER 3
```

### Query Syntax

```
SOURce<cnum>:MODulation<port>:CORRection:COLLection:FLATness:ITERations?
```

### Return Type

Numeric

### Default

3

```
SOURce<cnum>:MODulation<port>:CORRection:COLLection:FLATness:RECeiver <rcvr>[,srcPort]
```
Applicable Models: All with Option S93070xB/9x070A/B, and/or All with Option S9x09xxA/B/S9x090A/B

(Read-Write) Sets and reads the receiver for flatness modulation calibration.

Note: This command is the same as the SOURce:MODulation:CORRection:COLLection:EQUalization:RECeiver command.

Parameters

- `<cnum>` Any existing channel number. If unspecified, value is set to 1
- `<port>` Source port number of the VNA. If unspecified, <port> is set to 1.
- `<rcvr>` String. Calibration plane.
  - For options S9x09xxA/B, S9x090A/B choose from: A, B, C, D, R1, R2, R3, R4, a1, a2, a3, a4, b1, b2, b3, b4.
  - For options S93070xB, choose from: DUTIn1, DUTOut2, DUTOut3, DUTOut4, DUTOut5.

While this argument can be used to make settings for ALL ports, it is designed to access ports such as an external source, true mode balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model such as "Port 1 Src2". Otherwise, the <port> argument performs the same function. If both arguments are specified, [srcPort] takes priority.

Examples

```
SOUR:MOD1:CORR:COLL:FLAT:REC "R1"
source2:modulation:correction:collection:flatness:receiver "R1"
```

Query Syntax

SOURce<cnum>:MODulation<port>:CORRection:COLLection:FLATness:RECeiver?

Return Type

String

Default

- a1 (options S9x09xxA/B, S9x090A/B)
- DUTIn1 (options S93070xB)
Applicable Models: All with Option S93070xB/9x070A/B, and/or All with Option S9x09xxA/B/S9x090A/B

(Read-Write) Sets and reads the calibration span for a flatness modulation calibration.

Note: This command is the same as the SOURce:MODulation:CORRection:COLLection:EQUalization:SPAN command.

Parameters

- <cnum> Any existing channel number. If unspecified, value is set to 1
- <port> Source port number of the VNA. If unspecified, <port> is set to 1.
- <num> Calibration span.

While this argument can be used to make settings for ALL ports, it is designed to access ports such as an external source, true mode balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model such as "Port 1 Src2". Otherwise, the <port> argument performs the same function. If both arguments are specified, [srcPort] takes priority.

Examples

- SOUR:MOD1:CORR:COLL:FLAT:SPAN 1.5GHz
- source2:modulation:correction:collection:flatness:span 1.5ghz

Query Syntax

SOURce<cnum>:MODulation<port>:CORRection:COLLection:FLATness:SPAN?

Return Type

Numeric

Default

Signal Span
Applicable Models: All with Option S93070xB/9x070A/B, and/or All with Option S9x09xxA/B/S9x090A/B

(Read-Write) Sets and reads the desired flatness modulation calibration tolerance.

Note: This command is the same as the SOURce:MODulation:CORRection:COLLection:EQUalization:TOLerance command.

Parameters

- `<cnum>`: Any existing channel number. If unspecified, value is set to 1
- `<port>`: Source port number of the VNA. If unspecified, `<port>` is set to 1.
- `<num>`: Calibration flatness tolerance in dB-pk.

While this argument can be used to make settings for ALL ports, it is designed to access ports such as an external source, true mode balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model such as "Port 1 Src2". Otherwise, the `<port>` argument performs the same function. If both arguments are specified, `[srcPort]` takes priority.

Examples

```
SOUR:MOD1:CORR:COLL:FLAT:TOL 0.100
source2:modulation:correction:collection:flatness:tolerance 0.100
```

Query Syntax

```
SOURce<cnum>:MODulation<port>:CORRection:COLLection:FLATness:TOLerance?
```

Return Type

Numeric

Default

0.1
Applicable Models: All with Option S93070xB/9x070A/B, and/or All with Option S9x09xxA/B/S9x090A/B

(Read-Write) Sets and reads a fixed frequency to use for the source modulation calibration.

Parameters

- `<cnum>` Any existing channel number. If unspecified, value is set to 1
- `<port>` Source port number of the VNA. If unspecified, `<port>` is set to 1.
- `<num>` Fixed frequency to perform calibration.

While this argument can be used to make settings for ALL ports, it is designed to access ports such as an external source, true mode balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model such as "Port 1 Src2". Otherwise, the `<port>` argument performs the same function. If both arguments are specified, `[srcPort]` takes priority.

Examples

```
SOUR:MOD1:CORR:COLL:FREQ:FIX 10E9
source2:modulation:correction:collection:frequency:fixed 10E9
```

Query Syntax

```
SOURce<cnum>:MODulation<port>:CORRection:COLLection:FREQuency[:FIXed]?
```

Return Type

Numeric

Default

Not Applicable

---

SOURce<cnum>:MODulation<port>:CORRection:COLLection:FREQuency:POINts <num>[,srcPort]

Applicable Models: All with Option S93070xB/9x070A/B, and/or All with Option S9x09xxA/B/S9x090A/B

(Read-Write) Sets and reads the number of frequency measurement points to use for a swept frequency source modulation calibration.

Parameters

- `<cnum>` Any existing channel number. If unspecified, value is set to 1
- `<port>` Source port number of the VNA. If unspecified, `<port>` is set to 1.
- `<num>` Number of frequency points.
While this argument can be used to make settings for ALL ports, it is designed to access ports such as an external source, true mode balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model such as "Port 1 Src2". Otherwise, the <port> argument performs the same function. If both arguments are specified, [srcPort] takes priority.

**Examples**

```
SOUR:MOD1:CORR:COLL:FREQ:POIN 5
source2:modulation:correction:collection:frequency:points 5
```

**Query Syntax**

```
SOURce<cnum>:MODulation<port>:CORRection:COLLection:FREQuency:POINts?
```

**Return Type**

Numeric

**Default**

Not Applicable

---

**SOURce<cnum>:MODulation<port>:CORRection:COLLection:FREQuency:STARt <num>[,srcPort]**

**Applicable Models:** All with Option S93070xB/9x070A/B, and/or All with Option S9x09xxA/B/S9x090A/B

**(Read-Write)** Sets and reads the start frequency to use for a swept frequency source modulation calibration.

**Parameters**

- `<cnum>`: Any existing channel number. If unspecified, value is set to 1
- `<port>`: Source port number of the VNA. If unspecified, <port> is set to 1.
- `<num>`: Start frequency.

While this argument can be used to make settings for ALL ports, it is designed to access ports such as an external source, true mode balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model such as "Port 1 Src2". Otherwise, the <port> argument performs the same function. If both arguments are specified, [srcPort] takes priority.

```

**Return Type**

Numeric

**Default**

Not Applicable
SOURce<cnum>:MODulation<port>:CORRection:COLLection:FREQuency:STOP
<num>[,srcPort]

Applicable Models: All with Option S93070xB/9x070A/B, and/or All with Option S9x09xxA/B/S9x090A/B

(Read-Write) Sets and reads the stop frequency to use for a swept frequency source modulation calibration.

Parameters

- <cnum> Any existing channel number. If unspecified, value is set to 1
- <port> Source port number of the VNA. If unspecified, <port> is set to 1.
- <num> Stop frequency.

While this argument can be used to make settings for ALL ports, it is designed to access ports such as an external source, true mode balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model such as "Port 1 Src2". Otherwise, the <port> argument performs the same function. If both arguments are specified, [srcPort] takes priority.

**Default** 0 Hz

Applicable Models: N524xB models with Option S93070xB, and/or N522xB, N523xB, N524xB with Option S9x09xxA/B, S9x090A/B

(Read-Write) Sets and reads the desired LO feedthru modulation calibration tolerance.

**Parameters**

- `<cnum>` Any existing channel number. If unspecified, value is set to 1
- `<port>` Source port number of the VNA. If unspecified, `<port>` is set to 1.
- `<num>` Calibration LO feedthru tolerance in dBc

While this argument can be used to make settings for ALL ports, it is designed
to access ports such as an external source, true mode balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model such as "Port 1 Src2". Otherwise, the <port> argument performs the same function. If both arguments are specified, [srcPort] takes priority.

**Examples**

```
SOUR:MOD1:CORR:COLL:LO:FTHR:TOL -40.00
```

**Query Syntax**

```
SOURce<cnum>:MODulation<port>:CORRection:COLLection:LO:FTHRu:TOLerance?
```

**Return Type** Numeric

**Default** -40.00 dBc

---

**Applicable Models:** All with Option S93070xB/9x070A/B, and/or All with Option S9x09xxA/B/S9x090A/B

(Read-Write) Set and read the notch modulation calibration state.

**Parameters**

- `<ch>` Any existing channel number. If unspecified, value is set to 1.
- `<port>` Source port number of the VNA. If unspecified, `<port>` is set to 1.
- `<bool>` Choose from:
  - 0 - OFF - Disable Notch calibration.
  - 1 - ON - Enable Notch calibration.

While this argument can be used to make settings for ALL ports, it is designed to access ports such as an external source, true mode balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model such as "Port 1 Src2". Otherwise, the <port> argument performs the same function. If both arguments are specified, [srcPort] takes priority.

**Examples**

```
SOUR:MOD1:CORR:COLL:NOT:ENAB 1
```

**Query Syntax**

```
SOURce<cnum>:MODulation<port>:CORRection:COLLection:NOTch:ENABle?
```

**Return Type** Boolean

**Default** OFF

---

**SOURce<cnum>:MODulation<port>:CORRection:COLLection:NOTch:ITERations**

```
4786
```

4786
Applicable Models: All with Option S93070xB/9x070A/B, and/or All with Option S9x09xxA/B/S9x090A/B

(Read-Write) Sets and reads the maximum number of iterations used by the calibration routine. The calibration routine uses successive approximation.

Parameters

- `<num>`: Any existing channel number. If unspecified, value is set to 1.
- `<port>`: Source port number of the VNA. If unspecified, `<port>` is set to 1.
- `<num>`: Maximum number of iterations.

While this argument can be used to make settings for ALL ports, it is designed to access ports such as an external source, true mode balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model such as "Port 1 Src2". Otherwise, the `<port>` argument performs the same function. If both arguments are specified, `[srcPort]` takes priority.

Examples

```
SOUR:MOD1:CORR:COLL:NOT:ITER 2
source2:modulation:correction:collection:notch:iterations 2
```

Query Syntax

```
SOURce<cnum>:MODulation<port>:CORRection:COLLection:NOTch:ITERations?
```

Return Type

Numeric

Default

2

SOURce<cnum>:MODulation<port>:CORRection:COLLection:NOTch:RECeiver <rcvr>[,srcPort]
**Applicable Models:** All with Option S93070xB/9x070A/B, and/or All with Option S9x09xxA/B/S9x090A/B

**(Read-Write)** Sets and reads the receiver for an notch modulation calibration.

**Parameters**

- `<cnum>` Any existing channel number. If unspecified, value is set to 1
- `<port>` Source port number of the VNA. If unspecified, `<port>` is set to 1.
- `<rcvr>` **String**. Calibration plane.
  
  For options S9x09xxA/B, S9x090A/B choose from:
  
  A, B, C, D, R1, R2, R3, R4, a1, a2, a3, a4, b1, b2, b3, b4.

  For options S93070xB, choose from:
  
  DUTIn1, DUTOut2, DUTOut3, DUTOut4, DUTOut5.

  
  While this argument can be used to make settings for ALL ports, it is designed to access ports such as an external source, true mode balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model such as "Port 1 Src2". Otherwise, the `<port>` argument performs the same function. If both arguments are specified, `[srcPort]` takes priority.

**Examples**

```
SOUR:MOD1:CORR:COLL:NOT:REC "R1"
source2:modulation:correction:collection:notch:receiver "R1"
```

**Query Syntax**

**Return Type**

Enumeration

**Default**

FIX

SOURce<cnum>:MODulation<port>:CORRection[:STATe] <bool>[,srcPort]
Applicable Models: N522xB, N523xB, N524xB

(Read-Write) Set and read the modulation correction state.

Parameters

- `<cnum>`: Any existing channel number. If unspecified, value is set to 1.
- `<port>`: Source port number of the VNA. If unspecified, `<port>` is set to 1.
- `<bool>`: Choose from:
  - 0 - **OFF** - Disable modulation correction.
  - 1 - **ON** - Enable modulation correction.

While this argument can be used to make settings for ALL ports, it is designed to access ports such as an external source, true mode balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model such as "Port 1 Src2". Otherwise, the `<port>` argument performs the same function. If both arguments are specified, [srcPort] takes priority.

Examples

```
SOUR:MOD1:CORR:STAT 1
source:modulation:correction:state on
```

Query Syntax

`SOURce<cnum>:MODulation<port>:CORRection [:STATe]`?

Return Type

Boolean

Default

OFF

```
SOURce<cnum>:MODulation<port>:FILE? [,srcPort]
```
Applicable Models: N522xB, N523xB, N524xB

(Read-only) Returns the most recently used filename. For example, if a new file is loaded, then this file is returned.

Parameters

- `<cnum>` Any existing channel number. If unspecified, value is set to 1
- `<port>` Source port number of the VNA. If unspecified, value is set to 1.

While this argument can be used to make settings for ALL ports, it is designed to access ports such as an external source, true mode balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model such as "Port 1 Src2". Otherwise, the `<port>` argument performs the same function. If both arguments are specified, [srcPort] takes priority.

Examples

SOUR:MOD:FILE?
source:modulation1:file?

Return Type Comma-separated list of strings.

Default Not applicable

SOURce<cnum>:MODulation<port>:FILE:CORRection:CATalog? [,srcPort]

Applicable Models: All with Option S93070x/B/9x070A/B, and/or All with Option S9x09xxA/B/S9x090A/B

(Read-only) Returns a list of the calibrations stored in the .mdx file. Each calibration displayed in the list is for one power level. Calibrations may have been performed on multiple power levels during a single calibration. In this case, multiple calibrations will be saved in the .mdx file. Delete any of these calibrations using the SOURce:MODulation:FILE:CORRection:DELe command.

Parameters

- `<cnum>` Any existing channel number. If unspecified, value is set to 1
- `<port>` Source port number of the VNA. If unspecified, value is set to 1.

While this argument can be used to make settings for ALL ports, it is designed to access ports such as an external source, true mode balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model such as "Port 1
Src2. Otherwise, the <port> argument performs the same function. If both arguments are specified, [srcPort] takes priority.

**Examples**

```markdown
SOUR:MOD:FILE:CORR:CAT?
"ModCal_1,ModCal_2,ModCal_3,ModCal_4"
```

**Return Type** String

**Default** Not applicable

---

**SOURce<cnum>:MODulation<port>:FILE:CORRection:DELete <calName>**

**Applicable Models:** All with Option S93070xB/9x070A/B, and/or All with Option S9x09xxA/B/S9x090A/B

(Write-only) Deletes any of the calibration files stored in the .mdx file.

**Parameters**

- `<cnum>` Any existing channel number. If unspecified, value is set to 1
- `<port>` Source port number of the VNA. If unspecified, value is set to 1.
- `<calName>` **String**. Name of the source modulation calibration file.

**Examples**

```markdown
SOUR1:MOD1:FILE:CORR:DEL "ModCal_1"
```

**Query Syntax** Not applicable

**Default** Not applicable

---

**SOURce<cnum>:MODulation<port>:FILE:CORRection:FREQuency? <string>**

**Applicable Models:** All with Option S93070xB/9x070A/B, and/or All with Option S9x09xxA/B/S9x090A/B

(Read-only) Returns the frequency of the specified source modulation calibration file.

**Parameters**

- `<cnum>` Any existing channel number. If unspecified, value is set to 1
- `<port>` Source port number of the VNA. If unspecified, value is set to 1.
- `<String>` **String**. Source modulation calibration file name.

**Examples**

```markdown
SOUR:MOD:FILE:CORR:FREQ? "ModCal_1"
```

**Return Type** String

**Default** Not applicable

---

4801
**SOURce<cnum>:MODulation<port>:FILE:CORRection:POWer? <string>**

**Applicable Models:** All with Option S93070xB/9x070A/B, and/or All with Option S9x09xxA/B/S9x090A/B

*(Read-only)* Returns the power level of the specified source modulation calibration file.

**Parameters**
- `<cnum>` Any existing channel number. If unspecified, value is set to 1
- `<port>` Source port number of the VNA. If unspecified, value is set to 1.
- `<String>` *String*. Source modulation calibration file name.

**Examples**
```
SOUR:MOD:FILE:CORR:POW? "ModCal_1"
```

**Return Type** String

**Default** Not applicable

---

**SOURce<cnum>:MODulation<port>:FILE:INITialize [,srcPort]**

**Applicable Models:** All with Option S93070xB/9x070A/B, and/or All with Option S9x09xxA/B/S9x090A/B

*(Write-only)* Resets the modulation file to default values.

**Parameters**
- `<cnum>` Any existing channel number. If unspecified, value is set to 1
- `<port>` Source port number of the VNA. If unspecified, value is set to 1.

While this argument can be used to make settings for ALL ports, it is designed to access ports such as an external source, true mode balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model such as "Port 1 Src2". Otherwise, the `<port>` argument performs the same function. If both arguments are specified, `[srcPort]` takes priority.

**Examples**
```
SOUR1:MOD1:FILE:INIT
```

**Query Syntax** Not applicable

**Default** Not applicable

---

**SOURce<cnum>:MODulation<port>:FILE:LOAD <fileName>[,srcPort]**
Applicable Models: All with Option S93070xB/9x070A/B, and/or All with Option S9x09xxA/B/S9x090A/B

(Write-only) Specifies the file path to recall a previous modulation file. Current setting are overwritten with those in the file.

Parameters

- **<cnum>** Any existing channel number. If unspecified, value is set to 1
- **<port>** Source port number of the VNA. If unspecified, value is set to 1.
- **<fileName>** String. Modulation file name.

While this argument can be used to make settings for ALL ports, it is designed to access ports such as an external source, true mode balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model such as "Port 1 Src2". Otherwise, the <port> argument performs the same function. If both arguments are specified, [srcPort] takes priority.

SOURce<cnum>:MODulation<port>:FILE:SAVE <fileName>[,srcPort]

Applicable Models: All with Option S93070xB/9x070A/B, and/or All with Option S9x09xxA/B/S9x090A/B

(Write-only) Specifies the file path and file name to save a modulation file. If the file exists, it is overwritten.

Parameters

- **<cnum>** Any existing channel number. If unspecified, value is set to 1
- **<port>** Source port number of the VNA. If unspecified, value is set to 1.
- **<fileName>** String. Modulation file name.

While this argument can be used to make settings for ALL ports, it is designed to access ports such as an external source, true mode balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model such as "Port 1 Src2". Otherwise, the <port> argument performs the same function. If both arguments are specified, [srcPort] takes priority.
the Source 2 outputs on the 2-port 2-source PNA-X model such as "Port 1 Src2". Otherwise, the <port> argument performs the same function. If both arguments are specified, [srcPort] takes priority.

Applicable Models: All with Option S93070xB/9x070A/B, and/or All with Option S9x09xxA/B/S9x090A/B

(Read-Write) Sets and reads the number of compact modulation files to create. This function is useful to create several signals, compare them, then save the best signal.

Parameters
- `<cnum>` Any existing channel number. If unspecified, value is set to 1
- `<port>` Source port number of the VNA. If unspecified, `<port>` is set to 1.
- `<num>` Number of compact modulation files.

While this argument can be used to make settings for ALL ports, it is designed to access ports such as an external source, true mode balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model such as "Port 1 Src2". **Applicable Models:** All with Option S93070xB/9x070A/B, and/or All with Option S9x09xxA/B/S9x090A/B

**(Read-Write)** Specifies the file path of the original signal from which to create a compact signal.

**Note:** The original signal can be created from Signal Studio, Matlab, SystemVue, etc.

**Parameters**
- `<cnum>` Any existing channel number. If unspecified, value is set to 1
- `<port>` Source port number of the VNA. If unspecified, `<port>` is set to 1.
- `<fileName>` File name of original signal.

While this argument can be used to make settings for ALL ports, it is designed to access ports such as an external source, true mode balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model such as "Port 1 Src2". **Return Type**

Boolean

**Default**

OFF
Applicable Models: N524xB models with Option S93070xB, and/or N522xB, N523xB, N524xB with Option S9x09xxA/B, S9x090A/B

(Read-Write) Allows setup of multiple carriers when defining a multicarrier signal. Select 0 for none, or 1 - 9.

**Parameters**

- `<cnum>`: Any existing channel number. If unspecified, value is set to 1
- `<port>`: Source port number of the VNA. If unspecified, `<port>` is set to 1.
- `<nnum>`: Subcarrier index (1 - 9).
- `<num>`: Subcarrier number.

While this argument can be used to make settings for ALL ports, it is designed to access ports such as an external source, true mode balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model such as "Port 1 Src2". Otherwise, the `<port>` argument performs the same function. If both arguments are specified, `[srcPort]` takes priority.

**Applicable Models:** N524xB models with Option S93070xB, and/or N522xB, N523xB, N524xB with Option S9x09xxA/B, S9x090A/B

*(Read-Write)* Sets and reads the offset of the selected subcarrier.

**Parameters**

- `<cnum>` Any existing channel number. If unspecified, value is set to 1
- `<port>` Source port number of the VNA. If unspecified, `<port>` is set to 1.
- `<nnum>` Subcarrier index (1 - 9).
- `<num>` Subcarrier offset.

While this argument can be used to make settings for ALL ports, it is designed to access ports such as an external source, true mode balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model such as "Port 1 Src2". Otherwise, the `<port>` argument performs the same function. If both arguments are specified, `[srcPort]` takes priority.

**Examples**

```
```

**Query Syntax**

**Return Type** Numeric

**Default** 0

```
SOURce<cnum>:MODulation<port>:FILE:SIGNal:COMPact:SUBCarrier<nnum>:SPAN <num>[,srcPort]
```
Applicable Models: N524xB models with Option S93070xB, and/or N522xB, N523xB, N524xB with Option S9x09xxA/B, S9x090A/B

(Read-Write) Sets and reads the span of the selected subcarrier.

Parameters

- `<cnum>` Any existing channel number. If unspecified, value is set to 1
- `<port>` Source port number of the VNA. If unspecified, `<port>` is set to 1.
- `<nnum>` Subcarrier index (1 - 9).
- `<num>` Subcarrier span.

While this argument can be used to make settings for ALL ports, it is designed to access ports such as an external source, true mode balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model such as "Port 1 Src2". Otherwise, the `<port>` argument performs the same function. If both arguments are specified, `[srcPort]` takes priority.

Examples

SOUR:MOD1:FILE:SIGN:COMP:SUBC:NUMB 100E6

Query Syntax

SOURce<cnum>:MODulation<port>:FILE:SIGNal:COMPact:SUBCarrier<nnum>:SPAN?

Return Type

Numeric

Default

0
**Applicable Models:** All with Option S93070xB/9x070A/B, and/or All with Option S9x09xxA/B/S9x090A/B

(Read-Write) Sets and reads where to start the compact signal within the original signal. The compact signal is a slice of the original signal.

**Parameters**

- `<cnum>` Any existing channel number. If unspecified, value is set to 1
- `<port>` Source port number of the VNA. If unspecified, `<port>` is set to 1.
- `<num>` Compact signal start time.

While this argument can be used to make settings for ALL ports, it is designed to access ports such as an external source, true mode balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model such as "Port 1 Src2". Otherwise, the `<port>` argument performs the same function. If both arguments are specified, [srcPort] takes priority.

**Examples**

```
SOUR:MOD1:FILE:SIGN:COMP:TIME:STAR 0
```

**Query Syntax**

SOURce<cnum>:MODulation<port>:FILE:SIGNal:COMPact:TIME:STARt?

**Return Type** Numeric

**Default** 0

**Applicable Models:** All with Option S93070xB/9x070A/B, and/or All with Option S9x09xxA/B/S9x090A/B

(Read-only) Returns the calculated start time of the signal created from the original signal.

**Parameters**

- `<cnum>` Any existing channel number. If unspecified, value is set to 1
- `<port>` Source port number of the VNA. If unspecified, value is set to 1.

While this argument can be used to make settings for ALL ports, it is designed to access ports such as an external source, true mode balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model such as "Port 1 Src2". Otherwise, the `<port>` argument performs the same function. If both arguments are specified, [srcPort] takes priority.
the Source 2 outputs on the 2-port 2-source PNA-X model such as "Port 1 Src2". Otherwise, the <port> argument performs the same function. If both arguments are specified, [srcPort] takes priority.

SOURce<cnum>:MODulation<port>:FILE:SIGNal:DAC:SCALing <num>[,srcPort]
Applicable Models: All with Option S93070xB/9x070A/B, and/or All with Option S9x09xxA/B/S9x090A/B

*(Read-Write)* Sets and reads the scaling factor used for the waveform (full scale = 100%). This ensures that the DAC filter does not output a signal that is larger than the DAC's maximum output level, which can cause distortion in the system. Setting the scaling factor to 100% will usually cause excessive distortion.

**Parameters**

- `<cnum>` Any existing channel number. If unspecified, value is set to 1
- `<port>` Source port number of the VNA. If unspecified, `<port>` is set to 1.
- `<num>` DAC scale as a percentage of full scale.
- `[srcPort]` **String** *(NOT case sensitive)*. Source port. Optional. Use SOUR:CAT? to return a list of valid port names.

While this argument can be used to make settings for ALL ports, it is designed to access ports such as an external source, true mode balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model such as "Port 1 Src2". Otherwise, the `<port>` argument performs the same function. If both arguments are specified, `[srcPort]` takes priority.

**Examples**

SOUR:MOD1:FILE:SIGNal:DAC:SCAL 70

**Query Syntax**

SOURce<cnum>:MODulation<port>:FILE:SIGNal:DAC:SCALing?

**Return Type** Numeric

**Default** 70%
Applicable Models: All with Option S93070xB/9x070A/B, and/or All with Option S9x09xxA/B/S9x090A/B

(Write-only) Sets the NPR notch location type for the selected NPR Notch modulation type.

Parameters

- `<cnum>` Any existing channel number. If unspecified, value is set to 1
- `<port>` Source port number of the VNA. If unspecified, value is set to 1.
- `<enum>` Choose from:
  - **SYMMetric** - Symmetric locates the notch in the center of the signal span.
  - **ACARrier** - Avoid Carrier locates the notch near the center of the signal span but will be shifted to avoid the LO carrier feedthrough.
  - **CUSTom** - Allows the user to define the offset of the notch.

While this argument can be used to make settings for ALL ports, it is designed to access ports such as an external source, true mode balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model such as "Port 1 Src2". Otherwise, the `<port>` argument performs the same function. If both arguments are specified, [srcPort] takes priority.

Examples

```
SOUR1:MOD1:FILE:SIGN:NPR:NOTC1:LOC CUST
```

Query Syntax Not applicable

Default SYMMetric

SOURce<cnum>:MODulation<port>:FILE:SIGNal:NPR:NOTCh[1-3]:NUMBer <num>[,srcPort]
(Read-Write) Sets and reads the number of NPR notches in the modulated signal. A notch can be up to 10% of the Signal Span.

**Parameters**

- `<cnum>`: Any existing channel number. If unspecified, value is set to 1
- `<port>`: Source port number of the VNA. If unspecified, `<port>` is set to 1.
- `<num>`: Number of notches (1 - 3)

While this argument can be used to make settings for ALL ports, it is designed to access ports such as an external source, true mode balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model such as "Port 1 Src2". Otherwise, the `<port>` argument performs the same function. If both arguments are specified, `[srcPort]` takes priority.

**Examples**

```
SOUR:MOD1:FILE:SIGN:NPR:NOTC1:NUMB 1
```

**Query Syntax**

```
SOURce<cnum>:MODulation<port>:FILE:SIGNal:NPR:NOTCh:NUMBer?
```

**Return Type**

Numeric

**Default**

1

(Read-Write) Sets and reads the NPR notch offset frequency of the selected notch. This offset is the center frequency of the selected notch relative to the LO carrier frequency. Typically, the notch will have a 0 Hz offset, meaning it is centered on the LO carrier. If you have more than one notch, you can offset some of the notches from the carrier. For example, if you have three notches 1 MHz wide, you might set their offsets to -10 MHz, 0 MHz and +10 MHz so that they are spaced across the wideband carrier.

**Parameters**

- `<cnum>`: Any existing channel number. If unspecified, value is set to 1
- `<port>`: Source port number of the VNA. If unspecified, `<port>` is set to 1.
**SOURce<cnum>:MODulation<port>:FILE:SIGNal:NPR:NOTCh[1-3]:SPAN**

**Applicable Models:** All with Option S93070xB/9x070A/B, and/or All with Option S9x09xxA/B/S9x090A/B

*(Read-Write)* Sets and reads the span of the selected notch.

**Parameters**

- `<cnum>` Any existing channel number. If unspecified, value is set to 1
- `<port>` Source port number of the VNA. If unspecified, `<port>` is set to 1.
- `<num>` NPR notch offset.

While this argument can be used to make settings for ALL ports, it is designed to access ports such as an external source, true mode balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model such as "Port 1 Src2". Otherwise, the `<port>` argument performs the same function. If both arguments are specified, `[srcPort]` takes priority.

**Examples**

```
SOUR:MOD1:FILE:SIGN:NPR:NOTC:OFFS 0
```

**Query Syntax**

```
SOURce<cnum>:MODulation<port>:FILE:SIGNal:NPR:NOTCh:SPAN?
```

**Return Type** Numeric

**Default** 0
**Default** 10 MHz

```
SOURce<cnum>:MODulation<port>:FILE:SIGNal:OPTimize:ENABle <bool>[,srcPort]
```

**Applicable Models:** All with Option S93070xB/9x070A/B, and/or All with Option S9x09xxA/B/S9x090A/B

*(Read-Write)* Enables or disables signal optimization settings. When enabled, the calculated modulated signal will be optimized according to the constraints defined in this group box. If disabled, then the signal will not be optimized.

**Parameters**

- `<cnum>` Any existing channel number. If unspecified, value is set to 1
- `<port>` Source port number of the VNA. If unspecified, `<port>` is set to 1.
- `<bool>` Choose from:
  - **0 - OFF** - Disable signal optimization for NPR Notch modulation type.
  - **1 - ON** - Enable signal optimization for other modulation types (Compact, Flat Tones).

While this argument can be used to make settings for ALL ports, it is designed to access ports such as an external source, true mode balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model such as "Port 1 Src2". Otherwise, the `<port>` argument performs the same function. If both arguments are specified, `[srcPort]` takes priority.

**Examples**

```
SOUR:MOD1:FILE:SIGN:OPT:ENAB ON
```

**Query Syntax**

```
SOURce<cnum>:MODulation<port>:FILE:SIGNal:OPTimize:ENABle?
```

**Return Type** Boolean

**Default** OFF

```
```
**Applicable Models:** N524xB models with Option S93070xB, and/or N522xB, N523xB, N524xB with Option S9x09xxA/B, S9x090A/B

*(Read-Write)* Enables or disables a brick-wall filter for spectral leakage (for Compact signals only). The brick-wall filter is applied to the band-power span calculated for the signal. The brick-wall filter cuts of signals outside this span. Disable filter to retain signals outside the calculated band power span.

**Parameters**

- `<cnum>` Any existing channel number. If unspecified, value is set to 1
- `<port>` Source port number of the VNA. If unspecified, `<port>` is set to 1.
- `<bool>` Choose from:
  - **0 - OFF** - Disable brick-wall filter.
  - **1 - ON** - Enable brick-wall filter.

While this argument can be used to make settings for ALL ports, it is designed to access ports such as an external source, true mode balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model such as "Port 1 Src2". Otherwise, the `<port>` argument performs the same function. If both arguments are specified, `[srcPort]` takes priority.

**Examples**

```
SOUR:MOD1:FILE:SIGN:OPT:FILT:ENAB ON
```

**Query Syntax**

```
```

**Return Type** Boolean

**Default** ON
### Applicable Models
All with Option S93070xB/9x070A/B, and/or All with Option S9x09xxA/B/S9x090A/B

(Read-Write) Sets and reads the number of decimal digits limit for calculated frequencies.

#### Parameters
- `<cnum>` Any existing channel number. If unspecified, value is set to 1
- `<port>` Source port number of the VNA. If unspecified, `<port>` is set to 1.
- `<num>` Number of decimal digits.

While this argument can be used to make settings for ALL ports, it is designed to access ports such as an external source, true mode balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model such as "Port 1 Src2". Otherwise, the `<port>` argument performs the same function. If both arguments are specified, `[srcPort]` takes priority.

**SOURce<cnum>:MODulation<port>:FILE:SIGNal:OPTimize:HREJect**

*Parameters*

- `<cnum>`: Any existing channel number. If unspecified, value is set to 1
- `<port>`: Source port number of the VNA. If unspecified, `<port>` is set to 1.
- `<num>`: Tolerance value.

While this argument can be used to make settings for ALL ports, it is designed to access ports such as an external source, true mode balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model such as "Port 1 Src2". Otherwise, the <port> argument performs the same function. If both arguments are specified, [srcPort] takes priority.

### Examples

```
SOUR:MOD1:FILE:SIGN:OPT:FREQ:TOL 1
```

### Query Syntax

```
SOURce<cnum>:MODulation<port>:FILE:SIGNal:OPTimize:HREJect <num>[,srcPort]
```

### Return Type

Numeric

### Default

1%
Applicable Models: All with Option S93070xB/9x070A/B, and/or All with Option S9x09xxA/B/S9x090A/B

(Read-Write) Sets and reads the number of test signal harmonics you want to be protected against. This adds constraints to the list of LOs used to cover the span.

Parameters

- `<cnum>` Any existing channel number. If unspecified, value is set to 1
- `<port>` Source port number of the VNA. If unspecified, `<port>` is set to 1.
- `<num>` Number of test signal harmonics to reject.

While this argument can be used to make settings for ALL ports, it is designed to access ports such as an external source, true mode balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model such as "Port 1 Src2". Otherwise, the `<port>` argument performs the same function. If both arguments are specified, [srcPort] takes priority.

Examples

```
SOUR:MOD1:FILE:SIGN:OPT:HREJ 5
```

Query Syntax

SOURce<cnum>:MODulation<port>:FILE:SIGNal:OPTimize:HREJect?

Return Type
Numeric

Default
5

---

Applicable Models: All with Option S93070xB/9x070A/B, and/or All with Option S9x09xxA/B/S9x090A/B

(Read-Write) Sets and reads the tone spacing less than or equal to the value (Hz).

Parameters

- `<cnum>` Any existing channel number. If unspecified, value is set to 1
- `<port>` Source port number of the VNA. If unspecified, `<port>` is set to 1.
- `<num>` Distance between each tone.

While this argument can be used to make settings for ALL ports, it is designed
to access ports such as an external source, true mode balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model such as "Port 1 Src2". Otherwise, the <port> argument performs the same function. If both arguments are specified, [srcPort] takes priority.

Examples
SOUR:MOD1:FILE:SIGN:OPT:MAX:TONE:SPAC 100 kHz

Query Syntax

Return Type
Numeric

Default
100 kHz

Applicable Models: All with Option S93070xB/9x070A/B, and/or All with Option S9x09xxA/B/S9x090A/B

(Read-Write) Sets and reads the minimum number of tones.

Parameters
- <cnum> Any existing channel number. If unspecified, value is set to 1
- <port> Source port number of the VNA. If unspecified, <port> is set to 1.
- <num> Number of tones.

While this argument can be used to make settings for ALL ports, it is designed to access ports such as an external source, true mode balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model such as "Port 1 Src2". Otherwise, the <port> argument performs the same function. If both arguments are specified, [srcPort] takes priority.

Examples

Query Syntax

Return Type
Numeric

Default
1001

**Applicable Models:** All with Option S93070xB/9x070A/B, and/or All with Option S9x09xxA/B/S9x090A/B

*(Read-Write)* Sets and reads the minimum waveform period. This command minimizes the period of the waveform greater than or equal to the value (seconds).

**Parameters**

- `<cnum>` Any existing channel number. If unspecified, value is set to 1
- `<port>` Source port number of the VNA. If unspecified, `<port>` is set to 1.
- `<num>` Waveform period value.

While this argument can be used to make settings for ALL ports, it is designed to access ports such as an external source, true mode balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model such as "Port 1 Src2". Otherwise, the `<port>` argument performs the same function. If both arguments are specified, `[srcPort]` takes priority.

**Examples**

```
```

**Query Syntax**

```
```

**Return Type**

Numeric

**Default**

10 usec

---

**Applicable Models:** All with Option S93070xB/9x070A/B, and/or All with Option S9x09xxA/B/S9x090A/B

*(Read-Write)* Enables or disables the rejection of Nyquist frequencies. This ensures that Nyquist images of the signal tones in the IF bandwidth are not falling back on top of real signal frequencies.

**Parameters**

- `<cnum>` Any existing channel number. If unspecified, value is set to 1
- `<port>` Source port number of the VNA. If unspecified, `<port>` is set to 1.
<bool> Choose from:

0 - OFF - Disable Nyquist frequency rejection.

1 - ON - Enable Nyquist frequency rejection.

While this argument can be used to make settings for ALL ports, it is designed to access ports such as an external source, true mode balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model such as "Port 1 Src2". Otherwise, the <port> argument performs the same function. If both arguments are specified, [srcPort] takes priority.

Examples SOUR:MOD1:FILE:SIGN:OPT:NYQR:ENAB ON

Return Type Boolean

Default OFF

SOURce<cnum>:MODulation<port>:FILE:SIGNal:OPTimize:TYPE <enum>[,srcPort]

Applicable Models: All with Option S93070xB/9x070A/B, and/or All with Option S9x09xxA/B/S9x090A/B

(Write-only) Sets the optimize signal type.

Parameters

<enum> Any existing channel number. If unspecified, value is set to 1

<port> Source port number of the VNA. If unspecified, value is set to 1.

<enum> Choose from:

MIWPeriod - (Min Waveform Period) Minimizes the period of the waveform greater than or equal to the value (seconds).

MITNumber - (Min Number of Tones) Minimizes the number of tones greater than or equal to the value. This will ignore the Number of Tones selection.

MATSpacing - (Max Tone Spacing) Maximizes the tone spacing greater than or equal to the value (Hz). This will ignore the Tone Spacing selection.

FTOLerance - (Frequency Tolerance) Set frequency tolerance value (in percent).

While this argument can be used to make settings for ALL ports, it is designed to access ports such as an external source, true mode balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model such as "Port 1 Src2". Otherwise, the <port> argument performs the same function. If both arguments are specified, [srcPort] takes priority.

**Examples**

```
SOUR1:MOD1:FILE:SIGN:OPT:TYPE FTOL
```

**Query Syntax**

Not applicable

**Default**

FTOLerance

---

**Applicable Models:** All with Option S93070xB/9x070A/B, and/or All with Option S9x09xxA/B/S9x090A/B

*(Read-only)* Returns the calculated peak-to-average value.

**Parameters**

- `<cnum>`  Any existing channel number. If unspecified, value is set to 1
- `<port>`  Source port number of the VNA. If unspecified, value is set to 1.

While this argument can be used to make settings for ALL ports, it is designed to access ports such as an external source, true mode balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model such as "Port 1 Src2". Otherwise, the <port> argument performs the same function. If both arguments are specified, [srcPort] takes priority.

**Examples**

```
SOUR:MOD:FILE:SIGN:PAVG:CALC?
```

**Return Type**

Numeric

**Default**

Not applicable

---

SOURce<cnum>:MODulation<port>:FILE:SIGNal:PHASe:FIXed <num>[,srcPort]
Applicable Models: All with Option S93070xB/9x070A/B, and/or All with Option S9x09xxA/B/S9x090A/B

(Read-Write) Sets and reads the phase when Fixed phase is the Phase Type.

Parameters

- `<cnum>` Any existing channel number. If unspecified, value is set to 1
- `<port>` Source port number of the VNA. If unspecified, `<port>` is set to 1.
- `<num>` Phase setting.

While this argument can be used to make settings for ALL ports, it is designed to access ports such as an external source, true mode balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model such as "Port 1 Src2". Otherwise, the `<port>` argument performs the same function. If both arguments are specified, `[srcPort]` takes priority.

Examples

```
SOUR:MOD1:FILE:SIGN:PHAS:FIX 0
```

Query Syntax

SOURce<cnum>:MODulation<port>:FILE:SIGNal:PHAse:FIXed?

Return Type

Numeric

Default

0

---

SOURce<cnum>:MODulation<port>:FILE:SIGNal:PHAse:RANDom:SEED <num>[,srcPort]

Applicable Models: All with Option S93070xB/9x070A/B, and/or All with Option S9x09xxA/B/S9x090A/B

(Read-Write) Sets and reads the phase seed when Random phase is the Phase Type.

Parameters

- `<cnum>` Any existing channel number. If unspecified, value is set to 1
- `<port>` Source port number of the VNA. If unspecified, `<port>` is set to 1.
- `<num>` Phase setting.

While this argument can be used to make settings for ALL ports, it is designed to access ports such as an external source, true mode balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model such as "Port 1 Src2". Otherwise, the `<port>` argument performs the same function. If both arguments are specified, `[srcPort]` takes priority.

Examples

```
SOUR:MODE2:FILE:SIGN:PHAS:RAND 10

1001

---

Applicable Models: All with Option S93070xB/9x070A/B, and/or All with Option S9x09xxA/B/S9x090A/B

(Read-only) Returns the calculated number of tones.

**Parameters**

- `<cnum>`: Any existing channel number. If unspecified, value is set to 1.
- `<port>`: Source port number of the VNA. If unspecified, value is set to 1.

While this argument can be used to make settings for ALL ports, it is designed to access ports such as an external source, true mode balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model such as "Port 1
Src2". Otherwise, the <port> argument performs the same function. If both arguments are specified, [srcPort] takes priority.

**Examples**

**Return Type** Numeric

**Default** Not applicable

**Applicable Models:** All with Option S93070xB/9x070A/B, and/or All with Option S9x09xxA/B/S9x090A/B

(Read-only) Returns the calculated spacing between the tones.

**Parameters**

- `<cnum>` Any existing channel number. If unspecified, value is set to 1
- `<port>` Source port number of the VNA. If unspecified, value is set to 1.

While this argument can be used to make settings for ALL ports, it is designed to access ports such as an external source, true mode balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model such as "Port 1 Src2". Otherwise, the <port> argument performs the same function. If both arguments are specified, [srcPort] takes priority.

**Examples**

**Return Type** Numeric

**Default** Not applicable

**SOURce<cnum>:MODulation<port>:FILE:SiGNal:TONE:NUMBer:PRIority**

<bool>[,srcPort]
Applicable Models: All with Option S93070xB/9x070A/B, and/or All with Option S9x09xxA/B/S9x090A/B

(Read-Write) Sets and reads the tone number priority.

Parameters

- `<cnum>` Any existing channel number. If unspecified, value is set to 1
- `<port>` Source port number of the VNA. If unspecified, `<port>` is set to 1.
- `<bool>` Choose from:
  - **0 - OFF** - Disable priority for Compact modulation type.
  - **1 - ON** - Enable priority for NPR Notch and Flat Tone modulation types.

While this argument can be used to make settings for ALL ports, it is designed to access ports such as an external source, true mode balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model such as "Port 1 Src2". **Applicable Models:** All with Option S93070xB/9x070A/B, and/or All with Option S9x09xxA/B/S9x090A/B

*(Read-only)* Returns the tone frequency in Hz relative to the carrier.

**Parameters**

- `<cnum>` Any existing channel number. If unspecified, value is set to 1
- `<port>` Source port number of the VNA. If unspecified, value is set to 1.
- `<toneNum>` Tone number.

While this argument can be used to make settings for ALL ports, it is designed to access ports such as an external source, true mode balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model such as "Port 1 Src2". Otherwise, the `<port>` argument performs the same function. If both arguments are specified, `[srcPort]` takes priority.
the Source 2 outputs on the 2-port 2-source PNA-X model such as "Port 1 Src2". Otherwise, the <port> argument performs the same function. If both arguments are specified, [srcPort] takes priority.

Examples

SOUR:MOD:FILE:TONE:FREQ? 118

Return Type Numeric

Default 0

```
SOURce<cnum>:MODulation<port>:FILE:TONE:LOAD <fileName> [,srcPort]
```

**Applicable Models:** All with Option S93070xB/9x070A/B, and/or All with Option S9x09xxA/B/S9x090A/B

*(Write-only)* Loads the specified multitone file.

**Parameters**

- `<cnum>` Any existing channel number. If unspecified, value is set to 1.
- `<port>` Source port number of the VNA. If unspecified, value is set to 1.
- `<fileName>` **String**. Name of the file to be loaded (csv).

While this argument can be used to make settings for ALL ports, it is designed to access ports such as an external source, true mode balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model such as "Port 1 Src2". Otherwise, the <port> argument performs the same function. If both arguments are specified, [srcPort] takes priority.

Examples

SOUR1:MOD1:FILE:TONE:LOAD "C:/modulation/MyToneFile.csv"

Query Syntax Not applicable

Default Not applicable

```
SOURce<cnum>:MODulation<port>:FILE:TONE:PHASe <toneNum>,<phaseVal>[,srcPort]
```
**Applicable Models:** All with Option S93070xB/9x070A/B, and/or All with Option S9x09xxA/B/S9x090A/B

(Read-Write) Sets and reads the phase in degrees of the specified tone number.

**Parameters**

- `<cnum>` Any existing channel number. If unspecified, value is set to 1
- `<port>` Source port number of the VNA. If unspecified, `<port>` is set to 1.
- `<toneNum>` Tone number.
- `<phaseVal>` Phase value in degrees.

While this argument can be used to make settings for ALL ports, it is designed to access ports such as an external source, true mode balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model such as "Port 1 Src2". Otherwise, the `<port>` argument performs the same function. If both arguments are specified, `[srcPort]` takes priority.

**Examples**

```
SOUR:MOD1:FILE:TONE:PHAS 10,45
```

**Query Syntax**

SOURce<cnum>:MODulation<port>:FILE:TONE:PHASe? <toneNum>

**Return Type**

Numeric

**Default**

- 0 - toneNum
- 0 - phaseVal

**SOURce<cnum>:MODulation<port>:FILE:TONE:POWer**

```
SOURce<cnum>:MODulation<port>:FILE:TONE:POWer <toneNum>,<powerVal>[,srcPort]
```

4841
**Applicable Models:** All with Option S93070xB/9x070A/B, and/or All with Option S9x09xxA/B/S9x090A/B

*(Read-Write)* Sets and reads the power in dBm of the specified tone number.

**Parameters**

- `<cnum>` Any existing channel number. If unspecified, value is set to 1
- `<port>` Source port number of the VNA. If unspecified, `<port>` is set to 1.
- `<toneNum>` Tone number.
- `<powerVal>` Power value in dBm.

While this argument can be used to make settings for ALL ports, it is designed to access ports such as an external source, true mode balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model such as "Port 1 Src2". Otherwise, the `<port>` argument performs the same function. If both arguments are specified, `[srcPort]` takes priority.

**Examples**

```
SOUR:MOD1:FILE:TONE:POW 10,-30
```

**Query Syntax**

SOURce<cnum>:MODulation<port>:FILE:TONE:POWer? <toneNum>

**Return Type**

Numeric

**Default**

0 - toneNum
0 - powerVal

```
SOURce<cnum>:MODulation<port>:FILE:TONE:SAVE <fileName>[,srcPort]
```
(Write-only) Saves the specified multitone file.

**Parameters**

- `<cnum>` Any existing channel number. If unspecified, value is set to 1.
- `<port>` Source port number of the VNA. If unspecified, value is set to 1.
- `<fileName>` *String*. Name of the file to be saved (csv).

While this argument can be used to make settings for ALL ports, it is designed to access ports such as an external source, true mode balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model such as "Port 1 Src2". Otherwise, the `<port>` argument performs the same function. If both arguments are specified, `[srcPort]` takes priority.

**Examples**

```
SOUR1:MOD1:FILE:TONE:SAVE "C:/modulation/MyToneFile.csv"
```

**Query Syntax**

Not applicable

**Default**

Not applicable

---

(SOURce)<cnum>:MODulation<port>:FILE:TONE[:STATe] <toneNum>,<bool> [,srcPort]

(Read-Write) Set specified tone state to on or off.

**Parameters**

- `<cnum>` Any existing channel number. If unspecified, value is set to 1.
- `<port>` Source port number of the VNA. If unspecified, `<port>` is set to 1.
- `<bool>` Choose from:
  - 0 - OFF - Disable tone.
  - 1 - ON - Enable tone.
- `<toneNum>` Tone number.
While this argument can be used to make settings for ALL ports, it is designed to access ports such as an external source, true mode balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model such as "Port 1 Src2". Otherwise, the <port> argument performs the same function. If both arguments are specified, [srcPort] takes priority.

**Examples**

```
SOUR:MOD1:FILE:TONE:STAT 10,1
source:modulation:file:tone:state 10, on
```

**Query Syntax**

```
SOURce<cnum>:MODulation<port>:FILE:TONE[ :STATe]? <toneNum>
```

**Return Type**

Boolean

**Default**

0 - toneNum

1 - bool

---

**SOURce<cnum>:MODulation<port>:FILE:TYPE <enum> [,srcPort]**

**Applicable Models:** All with Option S93070xB/9x070A/B, and/or All with Option S9x09xxA/B/S9x090A/B

*(Write-only)* Sets the modulation type.

**Parameters**

- `<cnum>`  Any existing channel number. If unspecified, value is set to 1
- `<port>`  Source port number of the VNA. If unspecified, value is set to 1.
- `<enum>`  Choose from:
  - **COMPact** *(Compact)* Shortened version of any type of modulation. Compact signals cut a slice of the IQ data from an original waveform.
  - **FLATtones** *(Flat Tones)* This signal is a set of constant amplitude tones over a defined signal span.
  - **NPRNotch** *(NPR Notch)* This signal is a set of constant amplitude tones over a defined signal span where a subset of those tones are set to zero over a notch span.

While this argument can be used to make settings for ALL ports, it is designed
to access ports such as an external source, true mode balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model such as "Port 1 Src2". Otherwise, the <port> argument performs the same function. If both arguments are specified, [srcPort] takes priority.

**Examples**

SOUR1:MOD1:FILE:TYPE COMP

**Query Syntax**

Not applicable

**Default**

NPRNotch

---

### SOURce<cnum>\:MODulation<port>:LOAD <fileName> [,.srcPort]

**Applicable Models:** N522xB, N523xB, N524xB, All with S9x070A/B

*(Write-only)* Loads the specified modulation file.

**Parameters**

- `<cnum>` Any existing channel number. If unspecified, value is set to 1
- `<port>` Source port number of the VNA. If unspecified, value is set to 1.
- `<fileName>` **String**. Name of the file to be loaded.

While this argument can be used to make settings for ALL ports, it is designed to access ports such as an external source, true mode balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model such as "Port 1 Src2". Otherwise, the <port> argument performs the same function. If both arguments are specified, [srcPort] takes priority.

**Examples**

SOUR1:MOD1:LOAD "C:/modulation/MyModFile.mdx"

**Query Syntax**

Not applicable

**Default**

Not applicable

---

### SOURce<cnum>\:MODulation<port>:SAVE <file>[,.srcPort]

---

4845
Applicable Models: N522xB, N523xB, N524xB, All with S9x070A/B

(Write-only) Saves the specified modulation file.

**Parameters**

- `<cnum>` Any existing channel number. If unspecified, value is set to 1
- `<port>` Source port number of the VNA. If unspecified, value is set to 1.
- `<file>` *String*. Name of the file to be saved.

While this argument can be used to make settings for ALL ports, it is designed to access ports such as an external source, true mode balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model such as "Port 1 Src2". Otherwise, the `<port>` argument performs the same function. If both arguments are specified, `[srcPort]` takes priority.

**Examples**

```
SOUR1:MOD1:SAVE "C:/modulation/MyModFile.mdx"
```

**Query Syntax**

Not applicable

**Default**

Not applicable

---

SOURce<cnum>:MODulation<port>[:STATe] <bool> [,srcPort]

**Applicable Models:** N522xB, N523xB, N524xB, All with S9x070A/B

(Read-Write) Set and read the modulation state.

**Parameters**

- `<cnum>` Any existing channel number. If unspecified, value is set to 1.
- `<port>` Source port number of the VNA. If unspecified, `<port>` is set to 1.
- `<bool>` Choose from:
  - **0 - OFF** - Disable I/Q modulation.
  - **1 - ON** - Enable I/Q modulation.

While this argument can be used to make settings for ALL ports, it is designed to access ports such as an external source, true mode balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model such as "Port 1
Src2\". Otherwise, the \textless port\textgreater{} argument performs the same function. If both arguments are specified, [srcPort] takes priority.

- SCPI Command Tree

**Note:** The SOURce:POWer:CORRection:COLLect:ACQuire command, used to step the VNA and read a power meter, cannot be sent over the GPIB unless the power meter is connected to a different GPIB interface. See the alternative methods described in the command details.

---

**SOURce<ch>:POWer<port>:CORRection:COLLect:ABORt**

**Applicable Models:** N522xB, N523xB, N524xB, E5080, M980xA, P50xxA, M9485A

(Write-only) Aborts a source power calibration sweep that is in progress.

To use this ABORt command, you MUST use the ASYNchronous argument with SOUR:POW:CORR:COLL:ACQ

After aborting, this message appears in the error log: **+243,"Requested operation was canceled".**

**Parameters**

- `<ch>` Channel number of the source power cal. If unspecified, value is set to 1
- `<port>` Port number to correct for source power. If unspecified, value is set to 1.

**Examples**

```
SOUR:POW:CORR:COLL:ABOR
source1:power2:correction:collect:abort
```

**Query Syntax** Not Applicable

**Default** Not Applicable
SOURce<ch>:POWer<port>:CORRection:COLLect[:ACQuire] <char>,<id>[,[src][,[sync]]

**Applicable Models:** N522xB, N523xB, N524xB, E5080, M980xA, P50xxA, M9485A

*(Write-only)* Initiates a source power cal acquisition sweep using the power sensor attached to the specified channel (A or B) on the power meter, using a USB power sensor, or using the specified VNA receiver.

For source power cal, the power meter can NOT be controlled by the VNA using the GPIB Talker/Listener interface. Instead use one of the following methods:

- If present, use the GPIB dedicated controller port.
- Connect the power meter to the VNA using a USB / GPIB interface (Keysight 82357A).
- SCPI programming of the VNA using a LAN Client interface (see example).
- Send SCPI commands through the COM interface using the SCPI String Parser object.
- Directly control the Power Meter and VNA to step frequency; then acquire and store the Power reading. (see example).
- Configure the Power Meter/Sensor as a PMAR Device. Learn how. See SCPI commands.

**Parameters**

- `<ch>` Channel number of the source power cal. If unspecified, value is set to 1
- `<port>` Port number to correct for source power. If unspecified, value is set to 1.
- `<char>` Acquisition Choose from:
  - **PMETer** - Power Meter is used for all readings.
  - **PMReceiver** - Power meter for the first iteration; then use the reference receiver for remaining readings if necessary (same as "fast iteration" box checked on dialog box)
  - **RECeiver** - Use VNA measurement receiver for all readings.
- `<id>` String (Not case sensitive). The power sensor or VNA receiver to use for measuring power.

For **PMETer** or **PMRECeiver**, choose from:

- "ASENSOR" or "BSENSOR". For U series USB sensors, always specify "ASENSOR"

For **RECeiver**, choose from:
• Any VNA receiver to acquire readings using physical or logical receiver notation.
• Any configured PMAR device name. Learn more about PMAR Devices. See PMAR commands.

While this argument can be used to make settings for ALL ports, it is designed to access ports that are not simple numbers, such as "Port 1 Src2". Otherwise, the `<port>` argument performs the same function. If both arguments are specified, [src] takes priority.

[sync] If this argument is specified, must also specify [src].

Choose from:

• **SYNchronous** - Blocks SCPI commands during standard measurement (default behavior).
• **ASYNchronous** - Does NOT block SCPI commands during standard measurement.

Learn more about this argument

**Examples**
```
SYST:COMM:PSEN gpib, "13"

Not Applicable

**SOURce:POWer<port>:CORRRection:COLLect:AVERage[:COUNt] <num>**

**Applicable Models:** N522xB, N523xB, N524xB, E5080, M980xA, P50xxA, M9485A

(Read-Write) This command, along with SOUR:POW:CORR:COLL:AVER:NTOLerance, allows for settling of the power sensor READINGS.
Note: This command is global and does not depend on a specific channel number.

Sets the maximum number of acquisitions that will be used to acquire one settled reading from the power meter.

These settings affect every use of the power meter (PMAR and source power cal).

This setting and corresponding SOUR:POW:CORR:COLL:AVER:NTOLerance command only effect the settled reading of the currently selected legacy power meter.

Users may want to adjust this number if they know the signal is noisy as these settings set a threshold that determines when the power meter reading is done.

Each reading is averaged with the previous readings. When this average meets the Average:NTOLerance value or this number of readings has been made, the average is returned as the valid reading.

Learn more.

Parameters

<port> If provided, this argument is ignored by the VNA.

<num> Maximum number of readings to make to allow for settling. Choose any number between 3 and 1000.

Examples

// configure the power meter settling (up to 2 acquisitions to produce one settled meter reading)
SOUR:POW:CORR:COLL:AVER 2
SOUR:POW:CORR:COLL:AVER:NTOL .05

// configure the number of (settled) readings to acquire at each frequency point.

// 3 settled readings are averaged to produce one bucket of data per frequency
SOUR:POW:CORR:COLL:ITER 3
SOUR:POW:CORR:COLL:ITER:NTOL .005

Query Syntax SOURce:POWer:CORRection:COLLect:AVERage[:COUNt]?

Return Type Numeric

Default 3
**SOURce:POWer<port>:CORRection:COLLect:AVERage:NTOLerance <num>**

**Applicable Models:** N522xB, N523xB, N524xB, E5080, M980xA, P50xxA, M9485A

*(Read-Write)* This command, along with SOUR:POW:CORR:COLL:AVER:COUNT, allows for settling of the power sensor READINGS.

**Note:** This command is global and does not depend on a specific channel number.

This setting and corresponding SOUR:POW:CORR:COLL:AVER:COUNT command only effect the settled reading of the currently selected legacy power meter.

**Note:** To set the COUNT/NTOLerance of a specific PMAR, use the SYST:CONF:EDEV:PMAR:READ:COUNT and SYST:CONF:EDEV:PMAR:READ:NTOLerance commands.

Each power reading is averaged with the previous readings. When the average meets this nominal tolerance value or the max number of readings has been made, the average is returned as the valid reading.

Learn more.

**Parameters**

- `<port>` If provided, this argument is **ignored** by the VNA.
- `<num>` Power measurement settling tolerance value in dB. Choose any number between 0 and 5.

**Examples**

// configure the power meter settling (up to 2 acquisitions to produce one settled meter reading)

SOUR:POW:CORR:COLL:AVER 2
SOUR:POW:CORR:COLL:AVER:NTOL 0.05

// configure the number of (settled) readings to acquire at each frequency point.

// 3 settled readings are averaged to produce one bucket of data per frequency

SOUR:POW:CORR:COLL:ITER 3
SOUR:POW:CORR:COLL:ITER:NTOL 0.005

**Query Syntax** SOURce:POWer:CORRection:COLLect:AVERage:NTOLerance?

**Return Type** Numeric
SOURce<ch>:POWer<port>:CORRection:COLLect:DISPlay[:STATe] <ON | OFF>

**Applicable Models:** N522xB, N523xB, N524xB, E5080, M980xA, P50xxA, M9485A

*(Read-Write)* Enables and disables the display of power readings on the VNA screen. Send this command BEFORE you begin a source power cal acquisition. After the source power cal data is acquired, this setting is reset to ON.

**Parameters**
- `<ch>` Channel number of the source power cal. If unspecified, value is set to 1
- `<port>` If provided, this argument is ignored by the VNA.
- `<ON|OFF>` **ON (1)** Source power calibration dialog box is shown on the VNA screen. Power readings are plotted against the Tolerance value as limit lines.
  - **OFF (0)** - Source power calibration dialog box is NOT shown on the VNA screen.

**Examples**
```
SOUR:POW:CORR:COLL:DISP ON
source1:power2:correction:collect:display:state off
```

**Query Syntax** SOURce:POWer:CORRection:COLLect:DISPlay[:STATe]?

**Return Type** Boolean (1 = ON, 0 = OFF)

**Default** ON (1)

---

SOURce<ch>:POWer<port>:CORRection:COLLect:FCHeck[:STATe] <ON | OFF>

**Applicable Models:** N522xB, N523xB, N524xB, E5080, M980xA, P50xxA, M9485A

*(Read-Write)* Enables and disables frequency checking of source power cal acquisition sweeps. ONLY use when you have more than one power sensor.

**Parameters**
- `<ch>` Channel number of the source power cal. If unspecified, value is set to 1
- `<port>` If provided, this argument is ignored by the VNA.
- `<ON|OFF>` **ON (1)** turns source power cal frequency checking ON. A requested acquisition will only succeed for those frequency points which fall within a frequency range specified for the power sensor being used. An acquisition will pause in mid-sweep if the frequency is about to exceed the maximum frequency limit specified for that sensor. When the sweep is paused in this state...

**Examples**
```
SOUR:POW:CORR:COLL:FCHE ON
source1:power2:correction:collect:frequency:check:state off
```

**Query Syntax** SOURce:POWer:CORRection:COLLect:FCHeck[:STATe]?

**Return Type** Boolean (1 = ON, 0 = OFF)

**Default** OFF (0)
manner, a sensor connected to the other channel input of the power meter can be connected to the measurement port in place of the previous sensor, and used to complete the sweep. However, the maximum frequency specified for the second sensor would need to be sufficient for the sweep to complete. Frequency limits are specified using the SOUR:POW:CORR:COLL:SEN command.

**OFF (0)** - turns source power cal frequency checking OFF. An acquisition will use just one power sensor for the entire sweep, regardless of frequency.

**SOURce<ch>:POWer<port>:CORRection:COLLect:ITERation[:COUNt] <num>**

**Applicable Models:** N522xB, N523xB, N524xB, E5080, M980xA, P50xxA, M9485A

*(Read-Write)* This command, along with SOUR:POW:CORR:COLL:ITER:NTOL control the number of settled readings taken to produce a single power point during source power cal.

The source power cal reads the power (performed by SOUR:POW:CORR:COLL:AVER:COUNt and SOUR:POW:CORR:COLL:AVER:NTOLerance ) and makes internal adjustments to set the power to a desired level. These settings determine how many attempts (COUNt) the analyzer will make in an attempt to get close enough (NTOLerance ) to the target power level.

Learn more.

**Parameters**

- **<ch>** If provided, this argument is **ignored** by the VNA.
- **<port>** If provided, this argument is **ignored** by the VNA.
- **<num>** Maximum number of readings. Choose any number between 1 and 1000.

<table>
<thead>
<tr>

SOURce<ch>:POWer<port>:CORRection:COLLect:ITERation:NTOLerance <num>

**Applicable Models:**  N522xB, N523xB, N524xB, E5080, M980xA, P50xxA, M9485A

*(Read-Write)* This command, along with SOUR:POW:CORR:COLL:ITER:COUNT describes the number of adjustments to make to the source power.

Sets the maximum desired deviation from the sum of the test port power and the offset value. Power READINGS (performed by SOUR:POW:CORR:COLL:AVER:COUNT and SOUR:POW:CORR:COLL:AVER:NTOLerance ) will continue to be made, and source power adjusted, until a measurement is within this tolerance value or the max number of measurements has been met. The last value is the valid measurement for that data point.

Learn more.

**Parameters**

**SOURce<ch>:POWer<port>:CORRection:COLLect:METHod <char> Superseded**

**Applicable Models:** N522xB, N523xB, N524xB

This command is replaced with SOUR:POW:CORR:COLLect[:ACQuire] which now specifies the method and the device. The only parameter required by that command was either ASENsor or BSENsor which are still supported but not documented.

*(Read-Write)* Selects the calibration method to be used for the source power cal acquisition.

**Parameters**

- `<ch>`: Channel number of the source power cal. If unspecified, value is set to 1
- `<port>`: Port number to correct for source power. If unspecified, value is set to 1.
- `<char>`: Choose from:
  - **NONE**: No Cal method
  - **PMETer**: Power Meter is used for all readings. (same as "fast iteration" box not checked on dialog box)
  - **PMReceiver**: Power meter for the first iteration; then use the reference receiver for remaining readings if necessary (same as "fast iteration" box checked on dialog box)

**Examples**

```plaintext
SOUR:POW:CORR:COLL:METH PMET
SOURce1:power2:correction:collect:method pmreceiver
```

**Query Syntax**

SOURce<ch>:POWer<port>:CORRection:COLLect:METHod?

**Return Type**

Character

**Default**

NONE

**SOURce<ch>:POWer<port>:CORRection:COLLect:SAVE [<RREC>]**
**Applicable Models:** N522xB, N523xB, N524xB, E5080, M980xA, P50xxA, M9485A

*(Write-only)* Applies the array of correction values after a source power calibration sweep has completed. The source power correction will then be active on the specified source port for channel `<ch>`. This command does NOT save the correction values. To save correction values, save an instrument / calibration state (*.cst file) after performing a source power cal.

**Parameters**

- `<ch>`: If provided, this argument is **ignored** by the VNA.
- `<port>`: If provided, this argument is **ignored** by the VNA.
- `<RREC>`: Optional argument.

**RRECiever** In addition to a source Power Cal, perform a calibration of the reference receiver used in the measurement. ONLY the Reference Receiver calibration is then saved to a Cal Set or Cal Register as specified by the current setting of SENS:CORR:PREF:CSET:SAVE.

This argument only applies to standard S-parameter channels.

**Examples**

```
SOUR:POW:CORR:COLL:SAVE
source:power:correction:collect:save rreceiver
```

**Query Syntax** Not Applicable

**Default** Not Applicable

---

**SOURce<ch>:POWer<port>:CORRection:COLLect:<pmChan>SENsor[:FRANge] <num1>,<num2>**

*Applicable Models:* N522xB, N523xB, N524xB, E5080, M980xA, P50xxA, M9485A

*(Read-Write)* Specifies the frequency range over which the power sensors connected to the specified channels (A and B) of the power meter can be used (minimum frequency, maximum frequency). If the power meter has only a single channel, that channel is considered channel A.

**Parameters**

- `<ch>`: Channel number of the source power cal. If unspecified, value is set to 1
- `<port>`: If provided, this argument is **ignored** by the VNA. (It is required for query).
- `<pmChan>`: Power Meter channel. Choose from:
  - **A** - Channel A
  - **B** - Channel B
Minimum frequency for the sensor. If a frequency unit is not specified, Hz is assumed.

Maximum frequency for the sensor. If a frequency unit is not specified, Hz is assumed.

**Examples**

```
SOUR:POW:COR:COLL:ASEN 100E3, 3E9
source1:power:correction:collect:bsensor:frange 10 MHz, 18 GHz
```

**Query Syntax**

```
SOURce<ch>:POWer<port>:CORRection:COLLect:ASENsor[:FRANge]?
SOURce<ch>:POWer<port>:CORRection:COLLect:BSENsor[:FRANge]?
```

**Return Type**  
Numeric

**Default**  
0,0

---

**SOURce<ch>:POWer<port>:CORRection:COLLect:<pmChan>SENsor:RCFactor <num>**

**Applicable Models:** N522xB, N523xB, N524xB, E5080, M980xA, P50xxA, M9485A

*(Read-Write)*

Specifies the reference cal factor for the power sensor connected to channel A or B of the power meter. If the power meter has only a single channel, that channel is considered channel A.

**Note:** If the sensor connected to the specified channel of the power meter contains cal factors in EPROM (such as the Keysight E-series power sensors), those will be the cal factors used during the calibration sweep. The reference cal factor value associated with this command, and any cal factors entered into the VNA for that sensor channel, will not be used.

**Parameters**

- `<ch>` Channel number of the source power cal. If unspecified, value is set to 1
- `<port>` If provided, this argument is **ignore**d by the VNA.
- `<pmChan>` Power Meter channel. Choose from:
  
  **A** - Channel A
  
  **B** - Channel B

- `<num>` Reference cal factor in percent. Choose any number between 1 and 150.

**Examples**

```
SOUR:POW:COR:COLL:ASEN:RCF 98.7
source1:power2:correction:collect:bsensor:rcfactor 105
```

**Query Syntax**

```
SOURce:POWer:CORRection:COLLect:ASENsor:RCFactor?
SOURce:POWer:CORRection:COLLect:BSENsor:RCFactor?
```

**Return Type**  
Numeric
SOURce<ch>:POW<port>:CORRection:COLLect:<pmChan>SENsor:SELect

Applicable Models: N522xB, N523xB, N524xB, E5080, M980xA, P50xxA, M9485A

(Read-Write) Sets and returns the power sensor channel (A or B) to be used. This performs the same function as the Use this sensor only checkbox in the Power Sensor Settings dialog.

Notes:

- This command is NOT necessary when performing a Guided Power Cal using Multiple Sensors.
- This command can be used with Application channels.

Parameters

- `<ch>` Channel number of the source power cal. If unspecified, value is set to 1
- `<port>` If provided, this argument is ignored by the VNA.
- `<pmChan>` Power Meter channel. Choose from:
  - A - Channel A
  - B - Channel B

Examples

- SOUR:POW:CORR:COLL:<pmChan>SEN:SEL 'Write

-sourcem1:power2:correction:collect:bsensor:select? 1e9 'Read

Query Syntax

SOURce:POWer:CORRection:COLLect:ASENsor:SELect? <Frequency>

SOURce:POWer:CORRection:COLLect:BSENsor:SELect? <Frequency>

Returns a boolean 1 or 0 (ON or OFF) indicating whether the sensor is to be used at the specified frequency.

If frequency checking is OFF, then the <Frequency> parameter is ignored. The query returns if the sensor is selected for ALL frequencies.

Return Type

Numeric

Default
Not Applicable

SOURce<ch>:POW<port>:CORRection:COLLect:TABLE:DATA <data>
**Applicable Models:** N522xB, N523xB, N524xB, E5080, M980xA, P50xxA, M9485A

*(Read-Write)* Read or write data into the selected table. Use `SOUR:POW:CORR:COLL:TABL:SELeet` to select a table.

- When the power sensor table is selected, the data is interpreted as cal factors in *percent*.
- When the loss table is selected, POSITIVE values in dB are interpreted as LOSS. To compensate for gain, use negative values.
- Each table can contain up to 9999 segments. Values can be loaded using the Characterize Adapter macro.
- Learn more about Power Loss Compensation.

**Parameters**

- `<ch>` Channel number of the source power cal. If unspecified, value is set to 1
- `<port>` If provided, this argument is ignored by the VNA.
- `<data>` Data to write into the selected table.

**Examples**

```
SOURce:POWer:CORRection:COLLect:TABLE:DATA 0.12, 0.34, 0.56
```

**Query Syntax**

```
SOURce<ch>:POWer:CORRection:COLLect:TABLE:DATA?
```

If the selected table is currently empty, no data is returned.

**Return Type** Numeric - one number per table segment.

**Default** Not Applicable

---

**SOURce<ch>:POWer<port>:CORRection:COLLect:TABLE:FREQuency <data>**

**Applicable Models:** N522xB, N523xB, N524xB, E5080, M980xA, P50xxA, M9485A

*(Read-Write)* Read or write frequency values for the selected table (cal factor table for a power sensor, or the loss compensation table). Use `SOUR:POW:CORR:COLL:TABL:SELeet` to select a table.

**Parameters**

- `<ch>` Channel number of the source power cal. If unspecified, value is set to 1
- `<port>` If provided, this argument is ignored by the VNA.
- `<data>` Frequency data to write into the selected table.

**Examples**

```
SOURce:POWer:CORRection:COLLect:TABLE:FREQuency 10E6, 1.5E9, 9E9
```

**Query Syntax**

```
SOURce<ch>:POWer:CORRection:COLLect:TABLE:FREQuency?
```

If the selected table is currently empty, no data is returned.
**Return Type**  Numeric - one number per table segment

**Default**  Not Applicable

**SOURce<ch>:POWer<port>:CORRection:COLLect:TABLE:LOSS[:STATe] <ON | OFF>**

**Applicable Models:**  N522xB, N523xB, N524xB, E5080, M980xA, P50xxA, M9485A

*(Read-Write)* Indicates whether or not to adjust the power readings using the values in the loss table during a source power cal sweep. Learn more about Power Loss Compensation.

**Parameters**

- `<ch>`  Channel number of the source power cal. If unspecified, value is set to 1
- `<port>`  If provided, this argument is ignored by the VNA.
- `<ON|OFF>`  ON (or 1) - turns use of the loss table ON.
  
  OFF (or 0) - turns use of the loss table OFF.

**Examples**

```
SOUR:POW:CORR:COLL:LOSS ON
source1:power2:correction:collect:table:loss:state off
```

**Query Syntax**  SOURce:POWer:CORRection:COLLect:TABLE:LOSS[:STATe]?

**Return Type**  Boolean (1 = ON, 0 = OFF)

**Default**  OFF (0)

---

**SOURce<ch>:POWer<port>:CORRection:COLLect:TABLE:POINts?**

**Applicable Models:**  N522xB, N523xB, N524xB, E5080, M980xA, P50xxA, M9485A

*(Read-only)* Returns the number of segments that are currently in the selected table.

**Parameters**

- `<ch>`  Channel number of the source power cal. If unspecified, value is set to 1
- `<port>`  If provided, this argument is ignored by the VNA.

**Examples**

```
SOUR:POW:CORR:COLL:TABLE:POIN?
source1:power2:correction:collect:table:points?
```

**Return Type**  Numeric

**Default**  0

---

**SOURce<ch>:POWer<port>:CORRection:COLLect:TABLE[:SELect] <char>**
Applicable Models: N522xB, N523xB, N524xB, E5080, M980xA, P50xxA, M9485A

(Read-Write) Selects which table you want to write to or read from. Read or write using SOURce:POWer:CORRection:COLLect:TABLE:FREQuency and SOURce:POWer:CORRection:COLLect:TABLE:DATA

Parameters

<ch> Channel number of the source power cal. If unspecified, value is set to 1

<port> If provided, this argument is ignored by the VNA.

<char> Choose from:

NONE - No table selected

ASENsor - Cal Factor table for Power Sensor A

BSENSor - Cal Factor table for Power Sensor B

LOSS - Loss compensation table

Examples

SOUR:POW:CORR:COLL:TABLE ASEN
sourc1:power2:correction:collect:table:select bsensor

Query Syntax SOURce:POWer:CORRection:COLLect:TABLE[:SE lect]?

Return Type Character

Default NONE

SOURce<ch>:POWer<port>:CORRection:COLLect:WARN <bool>

Applicable Models: N522xB, N523xB, N524xB, E5080, M980xA, P50xxA, M9485A

(Read-Write) Enables/disables the use of error messages during a source calibration if the calibration fails to achieve the desired power level at the power sensor.

This property affects error reporting during the acquisition of a source power calibration.

When the power calibration sweep occurs, the tolerance set by “SOUR:POW:CORR:COLL:ITER:NTOL “ is indicated by a set of limit lines.

When those limits fail and SOUR:POW:CORR:COLL:WARN is set to OFF, the failure is not reported. This is the default.

When those limits fail and SOUR:POW:CORR:COLL:WARN is set to ON, the failure is reported to the SCPI error queue.
**Parameters**

- `<ch>` Channel number of the source power cal. If unspecified, value is set to 1.
- `<port>` Port number to correct for source power. If unspecified, value is set to 1.
- `<bool>`
  - **ON (or 1)** - enables SCPI error on source power calibration failure.
  - **OFF (or 0)** - disables SCPI error on source power calibration failure.

**Examples**

```
SOUR:POW:CORR:COLL:WARN ON
source1:power2:correction:collect:warn off
```

**Query Syntax**

```
SOURce:POWer:CORRection:COLLect:WARN?
```

**Return Type**

Boolean (1 = ON, 0 = OFF)

**Default**

OFF (0)

---

**SOURce<ch>:POWer<port>:CORRection:DATA <data>[,src]**

**Applicable Models:** All

(Read-Write) Writes and reads source power calibration data.

The effect from this command on the channel is immediate. Do NOT send
SOUR:POW:CORR:COLL:SAVE after this command as it may invalidate the uploaded data.

When querying source power calibration data, if no source power cal data exists for the specified
channel and source port, then no data is returned.

If a change in the instrument state causes interpolation and/or extrapolation of the source power cal,
the correction data associated with this command correspond to the new instrument state (interpolated
and/or extrapolated data).

If the channel is sweeping the source backwards, then the first data point is the highest frequency
value; the last data point is the lowest. Use the SENS:X:VALues? command to return the X-axis
values in the displayed order.

**Parameters**

- `<ch>` Channel number of the source power cal. If unspecified, value is set to 1.
- `<port>` Port number to correct for source power. If unspecified, value is set to 1.
- `<data>` Correction Data
While this argument can be used to make settings for ALL ports, it is designed to access ports that are not simple numbers, such as "Port 1 Src2". Otherwise, the <port> argument performs the same function. If both arguments are specified, [src] takes priority.

**Examples**

```
SOURce1:POWer2:CORRection:DATA 0.12, -0.34, 0.56
```

**Query Syntax**

```
SOURce<ch>:POWer<port>:CORRection:DATA? [src]
```

**Return Type**

Depends on FORMat:DATA command

**Default**

Not Applicable

---

**SOURce<ch>:POWer<port>:CORRection:DATA:PRIor <data>[,src]**

**Applicable Models:** N522xB, N523xB, N524xB, E5080, M980xA, P50xxA, M9485A

*(Read-Write)* Writes and reads power correction values from the previous iteration of the source power cal. Data for which the first power meter reading were within the tolerance limit, the prior correction value is 0.

In all other respects, this command is the same as SOUR:POW:CORR:DATA .

This command can be used to determine the final power reading at each point of the power cal, for a cal that did not pass tolerance limits. The formula for determining the power reading (in dB):

Power reading = Target power at the source port + specified power cal offset value + prior iteration corr value actual power corr value.

The "actual" value in this equation is returned with SOUR:POW:CORR:DATA?

**Parameters**

- `<ch>` Channel number of the source power cal. If unspecified, value is set to 1
- `<port>` Port number to correct for source power. If unspecified, value is set to 1.
- `<data>` Correction Data

While this argument can be used to make settings for ALL ports, it is designed to access ports that are not simple numbers, such as "Port 1 Src2". Otherwise, the <port> argument performs the same function. If both arguments are specified, [src] takes priority.

**Examples**

```
SOURce1:POWer2:CORRection:DATA:PRIor 0.12, -0.34, 0.56
```
Query Syntax  SOURce<ch>:POWer<port>:CORRection:DATA:PRIor? [src]
Return Type  Depends on FORMat:DATA command
Default  Not Applicable

SOURce<ch>:POWer<port>:CORRection:LEVel[:AMPLitude] <num>[,src]

Applicable Models:  N522xB, N523xB, N524xB, E5080, M980xA, P50xxA, M9485A

(Read-Write) Specifies the power level that is expected at the desired reference plane (DUT input or output). This is not used for segment sweep with independent power levels or power sweeps.

Note: Although this command still works, it is recommended that you specify cal power by setting the test port power and offset value.

Parameters

- `<ch>`  Channel number of the source power cal. If unspecified, value is set to 1
- `<port>`  Port number to correct for source power. If unspecified, value is set to 1.
- `<num>`  Cal power level in dBm. Because this could potentially be at the output of a device-under-test, no limits are placed on this value here. It is realistically limited by the specifications of the device (power sensor) that will be used for measuring the power. The power delivered to the VNA receiver must never exceed VNA specifications for the receiver!

While this argument can be used to make settings for ALL ports, it is designed to access ports that are not simple numbers, such as "Port 1 Src2". Otherwise, the `<port>` argument performs the same function. If both arguments are specified, [src] takes priority.

Examples

SOUR:POW:CORR:LEV 10
source1:power2:correction:level:amplitude 0 dbm

Query Syntax  SOURce:POWer:CORRection:LEVel[:AMPLitude]? [src]
Return Type  Numeric
Default  0 dBm

SOURce<ch>:POWer<port>:CORRection:OFFSet[:MAGNitude] <num>[,src]

4866
Applicable Models: N522xB, N523xB, N524xB, E5080, M980xA, P50xxA, M9485A

(Read-Write) Sets or returns a power level offset from the VNA test port power. This can be a gain or loss value (in dB) to account for components you connect between the source and the reference plane of your measurement. For example, specify 10 dB to account for a 10 dB amplifier at the input of your DUT.

Cal power is the sum of the test port power setting and this offset value. Following the calibration, the VNA power readouts are adjusted to the cal power.

Parameters

- `<ch>` Channel number of the source power cal. If unspecified, value is set to 1
- `<port>` Port number to correct for source power. If unspecified, value is set to 1.
- `<num>` Gain or loss value in dB. Choose a value between -200 and 200

While this argument can be used to make settings for ALL ports, it is designed to access ports that are not simple numbers, such as "Port 1 Src2". Otherwise, the `<port>` argument performs the same function. If both arguments are specified, `[src]` takes priority.

Examples

SOUR:POW:CORR:OFFS 10
source1:power2:correction:offset:magnitude -3

Query Syntax

SOURce:POWer:CORRection:OFFSet[:MAGNitude]? [src]

Return Type

Numeric

Default

0 dB

SOURce<ch>:POWer<port>:CORRection[:STATe] <bool>[,src]
**Applicable Models:** N522xB, N523xB, N524xB, E5080, M980xA, P50xxA, M9485A

*(Read-Write)* Enables and disables source power correction for the specified port on the specified channel.

**Parameters**

- `<ch>`  Channel number of the source power cal. If unspecified, value is set to 1
- `<port>` Port number to correct for source power. If unspecified, value is set to 1.
- `<bool>` ON (or 1) turns source power correction ON.
  
  OFF (or 0) - turns source power correction OFF.

While this argument can be used to make settings for ALL ports, it is designed to access ports that are not simple numbers, such as "Port 1 Src2". Otherwise, the `<port>` argument performs the same function. If both arguments are specified, `[src]` takes priority.

**Examples**

SOUR:POW:CORR ON
source1:power2:correction:state off, "MXG N5183A"

**Query Syntax**

SOURce:POWer:CORRection[:STATe]? "MXG N5183A"

**Return Type**  Boolean (1 = ON, 0 = OFF)

**Default**  OFF (0)
The status registers enable you to query the state of selected events that occur in the analyzer.

**Note:** This documentation requires familiarity with the "Standard Status Data Structure - Register Model" as defined in IEEE Std 488.2-1992. Also, first read [Learn about Status Registers](#).

STATus:OPERation:AVERaging<n> <keyword>

Applicable Models: All

Monitors and summarizes the status of Averaging on traces 1 to 580. When averaging for a trace is complete, the representative bit is set to 1.

Bit 0 is used to summarize the status in the registers that follow. For example, Average Register 3, bit 0, summarizes the status from registers 4 through 42.

All enable bits are set to 1 by default.

To find the measurement number, use Calc:Par:Mnum.

</tbody>
</table>

Averaging on this trace is complete.
To determine Register, Bit number, and Weight for trace numbers between 113 and 560 (not shown in the above table) use the following calculations.

The averaging status for trace numbers higher than 580 can NOT be tracked.

The following example calculates the Register, Bit number, and Bit Weight for trace # 400:

- To determine **Register** number, use \(((\text{Trace} \# - 1) / 14) + 1\).
- To determine **Bit Number**, use the remainder +1 of the above calculation.
- \(((\text{400}-1)/14) + 1 = \text{Register}# r+1\text{Bit}\)
  - \(399/14 = 28 \text{ r}7\)
  - \(28+1= \text{Register 29}\)
  - \(7+1= \text{Bit number 8}\)
- To determine **Bit Weight**: Use above table. For example: Bit 8 = **256**

STATus:QUEStionable:INTegrity:MEASurement<n> <keyword>

Applicable Models: All

Note: This register can be used ONLY with standard S-parameter measurements.

Monitors the lag between changing a channel setting and when the data is ready to query.

When you change the channel state (start/stop freq, bandwidth, and so forth), then the questionable bit for that channel is set. This indicates that your desired channel state does not yet match the data you would get if querying a data trace. When the next sweep is complete (without aborting in the middle), and the data trace matches the channel state that produced it, the bit is cleared for that channel.

<n> Measurement register number. Choose from 1 to 3

</tbody>
</table>

To determine Register, Bit number, and Weight for trace numbers between 113 and 560 (not shown in the above table) use the following calculations.

The limit status for trace numbers higher than 580 can NOT be tracked.

The following example calculates the Register, Bit number, and Bit Weight for trace # 400:

- To determine Limit **Register** number, use \(((\text{Trace} \# - 1) / 14) + 1\).
- To determine Limit **Bit Number**, use the remainder +1 of the above calculation.
- \(((400-1)/14) + 1 = \text{Register\# r+1Bit}\)
  - 399/14 = 28 r7
  - 28+1= **Register 29**
  - 7+1= **Bit number 8**
- To determine Limit **Bit Weight**: Use above table. For example: Bit 8 = **256**

**STATus:QUEStionable:LSUMmary:<keyword>**

**Applicable Models:** All

Summary register of limit test, ripple test and bandwidth test. bit 0: summary bit for the limit test. bit 1: summary bit for the ripple limit test. bit 2: summary bit for the bandwidth limit test.

```

</tr>
</tbody>
</table>
To determine Register, Bit number, and Weight for trace numbers between 113 and 560 (not shown in the above table) use the following calculations.

The limit status for trace numbers higher than 580 can NOT be tracked.

The following example calculates the Register, Bit number, and Bit Weight for trace # 400:

- To determine Limit Register number, use \(((\text{Trace} \# - 1) / 14) + 1\).
- To determine Limit Bit Number, use the remainder +1 of the above calculation.

\[
\text{calculation: } (400-1)/14 + 1 = \text{Register} + 1 \text{Bit}
\]

\[
399/14 = 28 \text{ r}7
\]

- \(28+1 = \text{Register} 29\)
- \(7+1 = \text{Bit number} 8\)

- To determine Limit Bit Weight: Use above table. For example: Bit 8 = 256

**STATus:QUEStionable:LSUMmary:RLIMit <cnum>:<keyword>**

**Applicable Models:** All

Monitors and summarizes the status of ripple limit line failures. When a trace fails, the representative bit is set to 1.

Bit 0 is used to summarize failures in the registers that follow. Refer the STATus:QUEStionable:LSUMmary:LIIMit for the trace number information.

All enable bits are set to 1 by default.

To find the measurement number, use **Calc:Par:Mnum**
Ripple limit channel status register. Choose from 1 to 42.

Standard Event Status Register

Applicable Models: All

Monitors "standard" events that occur in the analyzer. This register can only be cleared by:

- a Clear Command (*CLS).
- reading the Standard Enable Status Register (*ESE?).
- a power-on transition. The analyzer clears the register and then records any transitions that occur, including setting the Power On bit (7).

<table>
<thead>
<tr>
<th>Commands</th>

</tr>
</tbody>
</table>
Status Byte Register

**Applicable Models:** All

Summarizes the states of the other registers and monitors the VNA output queue. It also generates service requests. The Enable register is called the Service Request Enable Register.

### Commands

<table>
<thead>
<tr>
<th>Description</th>
<th>Commands</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>*CLS</td>
</tr>
<tr>
<td></td>
<td>*STB?</td>
</tr>
<tr>
<td></td>
<td>*SRE?</td>
</tr>
<tr>
<td></td>
<td>*SRE &lt;num&gt;</td>
</tr>
</tbody>
</table>

*CLS*  Clears ALL "event" registers and the SCPI Error / Event queue. The corresponding ENABLE registers are unaffected.

*STB?*  Reads the value of the analyzer's status byte. The byte remains after being read.

*SRE?*  Reads the current state of the Service Request **Enable** Register.

*SRE <num>*  Sets bits in the Service Request **Enable** register. The current setting of the SRE register is stored in non-volatile memory. Use *SRE 0 to clear the enable.

<num> Combined value of the weights for bits to be set.

See Also
SYSTem:ABORt:THReshold <value>

**Applicable Models:** All

(Read-Write) When a VNA setting is made while a sweep is in progress, the sweep is immediately aborted by default. This command allows you to change that behavior by specifying a time threshold. When a setting change is made during a sweep and if the total sweep time is less than the threshold time, then the sweep is allowed to finish instead of immediately aborting.

In general, VNA setting changes that could cause an aborted sweep are changes that affect how a measurement is made, such as changes in stimulus conditions.

For example, with a threshold setting of 60 seconds:

- Sweeps that require 60 seconds or less from start to finish will be allowed to complete if a VNA setting change is made at any time during the sweep.
- Sweeps that require MORE than 60 seconds from start to finish will be immediately aborted when a VNA setting change is made at any time during the sweep.

**Notes:**

- Preset clears this setting.
- Save state saves this setting.
- Sweep times are estimated.
- This setting affects ALL channels.

**Parameters**

<value> Threshold time in seconds. Set to 0 to immediately abort a sweep when a VNA setting is made.
When a setting is made during a sweep, if that sweep requires less than 10 seconds more to complete, it will be allowed to finish instead of aborting.

Example: SYST:ABOR:THR 10

Query Syntax: SYSTem:ABORt:THReshold?

Default: 0 - No threshold time; all sweeps are immediately aborted.

SYSTem:ACTive:CHANnel?

Applicable Models: All

(Read-only) Returns the number of the active channel. The active channel is the channel number that contains the active measurement. The active measurement is the trace that has a highlighted Tr# in the Trace Status area.

If there is no active channel, 0 is returned.

Example: SYST:PRES SYST:ACT:CHAN?

'Returns 1

Return Type: Integer

Default: Not Applicable

SYSTem:ACTive:MARKer <mkr>

Applicable Models: All

(Read-Write) Sets and reads the active marker

Parameters

<mkr> Active marker.

Example: SYST:ACT:MARK 1

Return Type: Integer

Query Syntax: SYSTem:ACTive:MARKer?

Default: 1

SYSTem:ACTive:MCLass <string>
Applicable Models: All

(Read-Write) Sets and reads the active measurement class.

**Parameters**

- `<string>`: Active measurement class.

**Examples**

```
SYST:ACT:MCL "Standard"
```

**Return Type**

String

**Query Syntax**

SYSTem:ACTive:MCLass?

**Default**

Standard

---

SYSTem:ACTive:MEASurement?

**Applicable Models:** All

(Read-only) Returns the name of the active measurement. While looking at the VNA display, the active measurement is the trace that has a highlighted `Tr#` in the Trace Status area. Only displayed measurements can be active.

If there is no active measurement, " " (empty string) is returned.

**Examples**

```
SYST:PRES
SYST:ACT:MEAS?

'Returns "CH1_S11_1"
```

**Return Type**

String

**Default**

Not Applicable

---

SYSTem:ACTive:MEASurement:NUMBer? <mnum>
**Applicable Models:** All

*(Read-only)* Returns the active measurement number.

**Parameters**

- `<mnum>` Measurement number for each measurement. There must be a selected measurement on the trace. If unspecified, `<mnum>` is set to 1.

**Examples**

```
SYST:PRES
SYST:ACT:MEAS:NUMB?
```

**Return Type** Integer

**Default** 1

---

**SYSTem:ACTive:PORT <num>**

**Applicable Models:** All

*(Read-Write)* Sets or gets the active port number.

**Parameters**

- `<num>` The active port number.

**Examples**

```
SYST:ACT:PORT 1
```

**Return Type** Integer

**Query Syntax** SYSTem:ACTive:PORT?

**Default** 1

---

**SYSTem:ACTive:PORT:SOURce?**

**Applicable Models:** All

*(Read-only)* Gets the active source port number.

**Parameters**

- `<num>` The active port number.

**Examples**

```
SYST:ACT:PORT:SOURce?
```

**Return Type** Integer

**Default** 1

---

**SYSTem:ACTive:PORT:TEST?**
### SYStem:ACTive:PORT:TEST?

**Applicable Models:** All

*(Read-only)* Gets the active test port number.

**Parameters**

**Examples** SYST:ACT:PORT:TEST?

**Return Type** Integer

**Default** 1

### SYStem:ACTive:SHEet?

**Applicable Models:** E5080A

*(Read-only)* Returns the active sheet number.

**Examples** SYST:ACT:SHE?

'Returns "1"

**Return Type** String

**Default** 1

### SYStem:ACTive:TRACe?

**Applicable Models:** All

*(Read-only)* Returns the active trace number.

**Examples** SYST:ACT:TRAC?

'Returns "1"

**Return Type** String

**Default** 1

### SYStem:ACTive:WINDow <wnum>

4897
Applicable Models: All

(Read-Write) Sets or gets the active window number.

Parameters

<wnum> The active window number.

Examples SYST:ACT:WIND 1

Return Type Integer

Query Syntax SYSTem:ACTive:WINDow?

Default 1

SYSTem:BEEPer:COMPLETE:IMMediate

Applicable Models: All

(Write-only) This command generates a beep for the notification of the completion of an operation.

Parameters None

Examples SYST:BEEP:COMP:IMM

Query Syntax Not Applicable

Default Not Applicable

SYSTem:BEEPer:STATe <num>

Applicable Models: All

(Read-Write) Sets the beeper on or off.

Parameters

<bool> ON (1) or OFF (0).

Examples SYST:BEEP:STAT 1

Query Syntax SYSTem:BEEPer:STAT?

Default 0

SYSTem:BEEPer:VOLUME <num>
**Applicable Models:** N522xB, N523xB, N524xB, M937xA, M9485A, P937xA

*(Read-Write)* Sets and reads the volume of the internal speaker.

**Parameters**

- `<num>` Relative volume of the internal speaker.
  - Choose a volume between 0 (off) and 100.

**Examples**

- `SYST:BEEP:VOL 5`
- `system:beeper:volume`

**Query Syntax**

- `SYSTem:BEEPer:VOLume?`

**Default**

- 0

---

**SYSTem:BEEPer:WARNing:IMMediate**

**Applicable Models:** All

*(Write-only)* This command generates a beep for the notification of warning/limit test results.

**Parameters**

- None

**Examples**

- `SYST:BEEP:WARN:IMM`

**Query Syntax**

- Not Applicable

**Default**

- Not Applicable

---

**SYSTem:CHANnels:CATalog?**

**Applicable Models:** All

*(Read-only)* Returns the channel numbers currently in use.

**Examples**

- `SYST:CHAN:CAT?`
- `system:channels:catalog?`
- `'Returns:
  "1,2,3"`

**Return Type**

- String of comma-separated numbers

**Default**

- Not Applicable
**SYSTem:CHANnels:COUPle[:STATe] <bool>**

**Applicable Models:** All

*(Read-Write)* Sets and reads the state of channel coupling. This causes the VNA to emulate Keysight 8720 channel coupling.

When set to ON, all existing S-parameter channels receive the stimulus settings of the active channel. Subsequent changes made to any coupled channel are changed on all coupled channels.

Channels with applications such as SMC, VMC, GCA, Noise, IMD are not affected.

Coupling is primarily aimed at stimulus settings (such as start, stop, points, power) but also applies to many trigger settings and to Cal Set pointers.

**Parameters**

- **<bool>**
  - ON (or 1) Channels are coupled
  - OFF (or 0) Channels are NOT coupled

**Examples**

- `SYST:CHAN:COUP 1`  
- `system:channels:couple:state OFF`

**Query Syntax**

SYSTem:CHANnels:COUPle[:STATe]?

**Default**

OFF

---

**SYSTem:CHANnels:COUPle:GROup <iarray>**

**Applicable Models:** N522xB, N523xB, N524xB, M937xA, M9485A, P937xA

*(Read-Write)* Sets and reads the group of channels for the mult-DUT parallel measurement.

**Parameters**

- **<array>**
  - `{<number of group>, <start channel No.>, <end channel No.>, ... }
  
  The first item means number or groups.
  
  Next pairs show start/end channel numbers of the group. 1 pair for 1 group.

  Example:

  - `{0}` Global coupling (default setting)
  - `{1, 1,4}` Couples channel 1-4
  - `{2, 1,3, 5,7}` Couples channel 1-3 and 5-7 independently
### SYSTem:CHANnels:COUPle:GROup? <value>

**Applicable Models:** M9485A, M980xA, P500xA, and E5080B

*(Read-Write)* Sets and reads the Multi DUT parallel measurement state. SYST:CHAN:COUP should be also turned on when Multi DUT parallel measurement is performed.

**Parameters**

- `<value>`
  - **ON** (or `1`) Multi DUT parallel measurement are enabled
  - **OFF** (or `0`) Multi DUT parallel measurement are NOT enabled

**Examples**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SYST:CHAN:COUP:GRO 1</td>
<td>Multi DUT parallel measurement enabled</td>
</tr>
<tr>
<td>system:channels:couple:group 1 1 4</td>
<td>Multi DUT parallel measurement off</td>
</tr>
</tbody>
</table>

**Query Syntax**

SYStem:CHANnels:COUPle:GROup?

**Default**

OFF

---

### SYSTem:CHANnels:COUPle:PARallel[:ENABle] <bool>

**Applicable Models:** M9485A, M980xA, P500xA, and E5080B

*(Read-Write)* Sets and reads the Multi DUT parallel measurement state. SYST:CHAN:COUP should be also turned on when Multi DUT parallel measurement is performed.

**Parameters**

- `<bool>`
  - **ON** (or `1`) Multi DUT parallel measurement are enabled
  - **OFF** (or `0`) Multi DUT parallel measurement are NOT enabled

**Examples**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SYST:CHAN:COUP:PAR 1</td>
<td>Multi DUT parallel measurement enabled</td>
</tr>
<tr>
<td>system:channels:couple:parallel OFF</td>
<td>Multi DUT parallel measurement off</td>
</tr>
</tbody>
</table>

**Query Syntax**

SYStem:CHANnels:COUPle:PARallel[:ENABle]?

**Default**

OFF

---

### SYSTem:CHANnels:NOISe:PARallel:STATe? <value>

**Applicable Models:** N522xB, N523xB, N524xB, M937xA, M9485A, P937xA

*(Read Only)* Gets the information if the parallel measurement is executed in the last sweep, for the targeted channel.

**Parameters**

- `<value>`
  - Channel number

**Examples**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SYST:CHAN:COUP:PAR:STAT? 1</td>
<td>Parallel measurement state enabled</td>
</tr>
<tr>
<td>system:channels:couple:parallel:state? 2</td>
<td>Parallel measurement state off</td>
</tr>
</tbody>
</table>

**Query Syntax**

SYStem:CHANnels:COUPle:PARallel:STATe?

**Default**

Not Applicable

---

### SYSTem:CHANnels:NOISe:PARallel[:ENABle] <bool>

Applicable Models: M9485A

(Read-Write) Sets and reads the Noise Figure Dual-band Parallel Measurement state. SYST:CHAN:Coup should be also turned on when Noise Figure Dual-band Parallel Measurement is performed. This function is supported only for M9385A which has options both 028 and 720.

Parameters
<bool> ON (or 1) Noise Figure Dual-band parallel measurement are enabled
OFF (or 0) Noise Figure Dual-band parallel measurement are NOT enabled

Examples
SYST:CHAN:NOIS:PAR 1
system:channels:noise:parallel OFF

Query Syntax
SYSTem:CHANnels:NOISe:PARallel[:ENABle]?

Default OFF

SYSTem:CHANnels:NOISe:PARallel:GROup <iarray>

Applicable Models: M9485A

(Read-Write) Sets and reads the group of channels for the Noise Figure Dual-band Parallel Measurement. This function is supported only for M9385A which has options both 028 and 720.

Parameters
<iarray> <num of groups>, <first channel of group #1>, <second channel of group #1>,<first channel of group #2>, <second channel of group #2>, … ,<first channel of group #n>, <second channel of group #n>

Two consecutive channels can be assigned into one group.

Example:

{1, 1,2} measures NF channels 1 and 2 in parallel.

{2, 3,4, 8,9} measures NF channels 3 and 4, then 8 and 9 in parallel.

Examples
SYST:CHAN:NOIS:PAR:GRO 1,1,2
system:channels:noise:parallel:group 1,1,2

Query Syntax
SYSTem:CHANnels:NOISe:PARallel:GROup?

Default 0
**SYSTem:CHANnels:NOISe:PARallel:GROup:LIST** <iarray>

**Applicable Models:** M9485A

*(Read-Write)* Sets and reads the group of channels for the Noise Figure Dual-band Parallel Measurement. This command allows you to setup any two channels in one group. This function is supported only for M9385A which has options both 028 and 720.

**Parameters**

| <iarray> |  <num of groups>,   |
|         |  <num of channels in group #1>, <channel>, <channel>,... |
|         |  <num of channels in group #2>, <channel>, <channel>,... |

Several channels can be assigned to one group

**Example:**

{1, 2, 1, 3} measures NF channels 1 and 3 in parallel.
{2, 2, 1, 3, 5, 7} measures NF channels 1 and 3, then 5 and 7 in parallel.

| Examples | **SYST:CHAN:NOIS:GRO:PAR:LIST** 2, 3, 1, 3, 2, 5, 7 |
|          | **system:channels:noise:parallel:group:list** 2, 2, 1, 3, 2, 5, 7 |

| Query Syntax | SYSTem:CHANnels:NOISe:PARallel:GROup:LIST? |
| Default | 0 |

**SYSTem:CHANnels:NOISe:PARallel:STATe?** <value>

**Applicable Models:** M9485A

*(Read Only)* Gets the information if the parallel measurement is executed in the last sweep, for the targeted channel. This function is supported only for M9385A which has options both 028 and 720.

**Parameters**

| <value> | Channel number |

| Examples | **SYST:CHAN:NOIS:PAR:STAT?** 1 |
|          | **system:channels:noise:parallel:state?** 2 |

| Query Syntax | SYSTem:CHANnels:NOISe:PARallel:STATe? |
| Default | Not Applicable |

**SYSTem:CHANnels:DELete** <value>
Applicable Models: All

(Write-only) Deletes the specified channel.

Parameters

<value> Channel number to delete

Examples

SYST:CHAN:DEL 2

Query Syntax Not Applicable

Default Not Applicable

SYSTem:CHANnels:HOLD

Applicable Models: All

(Write-only) Places all channels in hold mode. To place a single channel in hold mode, use SENS:SWE:MODE.

Examples

SYST:CHAN:HOLD

Query Syntax Not Applicable

Default Not Applicable

SYSTem:CHANnels:RESume

Applicable Models: All

(Write-only) Resumes the trigger mode of all channels that was in effect before sending SYSTem:CHANnels:HOLD (must be sent before SYST:CHAN:RESume).

Examples

SYST:CHAN:RES

Query Syntax Not Applicable

Default Not Applicable

SYSTem:CHANnels:SINGle <chanNums>
**Applicable Models:** N522xB, N523xB, N524xB, M937xA, P937xA

(Write-only) Sets up multiple channels for manual trigger and provides a method of triggering multiple channels using manual trigger. There are several prerequisites for using this command:

- Manual trigger mode must be used (INIT:CONT OFF)
- All channels in HOLD (SENS:SWE:MODE HOLD), not just the channels being triggered
- No acquisitions currently running (instrument is NOT sweeping - see ABORt:THReshold )
- All specified channels must exist

If the above conditions are not met, then the command will generate an error which describes what is at fault. If the above conditions are met, then the trigger count for the specified channels is set to 1. Issuing an *OPC? query will indicate when the first channel is armed (ready for manual trigger). It is not necessary to wait for *OPC? before sending INIT:IMM to trigger the first channel. After the first channel is triggered, *OPC? will indicate when all armed channels have finished acquiring data.

Channels will be sorted by channel number, and acquire in order from lowest channel number first to highest channel number last.

**Parameters**

<chanNums> Existing comma separated list of channel numbers.

**Examples**

```
SYST:CHAN:SING 1,3,4
System:channels:single 1,3,4
```

**Query Syntax** Not Applicable

**Default** Not Applicable

---

**SYSTem:CHANnels:SINGle:COMBine <chanNums>**

**Applicable Models:** M937xA, P937xA

(Write-only) Sets the trigger count on the list of channels to ONE, and then combines the channels into a single efficient acquisition. The index line stays high during the entire acquisition.

**Parameters**

<chanNums> Existing comma separated list of channel numbers to combine.

**Examples**

```
SYST:CHAN:SING:COMB 1,3,4
System:channels:combination 1,3,4
```

**Query Syntax** Not Applicable

**Default** Not Applicable
SYSTem:CLOCk[:STATe] <bool>

Applicable Models: All

(Read-Write) Sets and reads the clock visibility state in the VNA status bar.

Parameters

<bool>  ON (or 1)  Clock is visible in the VNA status bar.

OFF (or 0)  Clock is NOT visible in the VNA status bar.

Examples

SYST:CLOC 1
system:clock:state OFF

Query Syntax  SYSTem:CLOCk[:STATe]?

Default  ON

SYSTem:CONFigure <model>,<address>

Applicable Models: N522xB, N523xB, N524xB, M937xA, P937xA

(Write-only) Restarts as an "N-port" VNA using the specified multiport test set.

Learn more about VNA Multiport capability.

See other commands to configure multiport test sets.

Parameters

<model>  String - Model of the test set with which to restart.

Use "Native" to restart without a test set.

To see a list of supported test sets, use SENS:MULT:CAT?

<address>  Numeric - GPIB Address of the test set. Ignored when model = "Native".

Examples

SYST:CONF "NATIVE",0
system:configure "N44xx",18

Query Syntax  Not Applicable

Default  Not Applicable

SYSTem:CONFigure:BIT?
**Applicable Models:** All

*(Read-only)* Returns whether VNA FW is 32 bit application or 64 bit application. Returns the word size (32 or 64).

- **Parameters** None
- **Examples** `SYST:CONF:BIT?`
- **Return Type** String
- **Default** Not Applicable

---

**SYSTem:CONFigure:DIRectory? <char>**

**Applicable Models:** All

*(Read-only)* Returns the directory path location for the specified file type.

- **Parameters** None
- `<char>` Type of file. Choose from:
  - **STATe** - This is the location for the storage of state files.
  - **APPLication** - This is the location of the VNA firmware executable files.
  - **SUPPort** - This is the location of private support files for the VNA firmware.

  See these file locations.
- **Example** `SYST:CONF:DIR? SUPP`
- **Return Type** String
- **Default** Not applicable

---

**SYSTem:CONFigure:REVision:CPU?**
Applicable Models: N522xB, N523xB, N524xB, M937xA, E5080A, P937xA

(Read-only) Returns a number that corresponds to the VNA CPU speed that is visible in the Help, About Network Analyzer dialog box. Learn more.

Use the following table to learn the clock speed using the returned value.

<table>
<thead>
<tr>
<th>Reported CPU version</th>
<th>Clock speed</th>
</tr>
</thead>
<tbody>
<tr>
<td>1.0</td>
<td>266 MHz (PNA), 2.53 GHz dual core (E5080A)</td>
</tr>
<tr>
<td>2.0</td>
<td>500 MHz</td>
</tr>
<tr>
<td>3.0</td>
<td>1100 MHz</td>

<tr>
<td>8.0</td>
<td>1600 MHz quad core (Max Turbo Frequency 2.90 GHz)</td>
</tr>
</tbody>
</table>

**Parameters**  None

**Example**  SYST:CONF:REV:CPU?

**Return Type**  String

**Default**  Not applicable

---

SYSTem:CONFigure:REVision:DSP?

Applicable Models: N522xB, N523xB, N524xB, M937xA, P937xA

(Read-only) Returns the DSP Revision number that is visible in the Help, About Network Analyzer dialog box. Learn more.

**Parameters**  None

**Example**  SYST:CONF:REV:DSP?

**Return Type**  String

**Default**  Not applicable
SYSTem:CONFigure:REVision:DSPFpga?

Applicable Models: N522xB, N523xB, N524xB, M937xA, P937xA

(Read-only) Returns the DSP FPGA Revision number that is visible in the Help, About Network Analyzer dialog box. Learn more.

<table>

</tbody>
</table>

SYSTem:CONFigure:REVision:PNA:SYNThesizer[0,1,2,3]:VERSion?

Applicable Models: N522xB, N524xB

(Read-only) Returns the Synthesizer Revision number.

Synthesizer Versions

5.0 - Direct Digital Synthesizer to generate frequencies from 10 to 250 MHz, one synthesizer per assembly.

6.0 - Improved filtering and reliability improvements, one synthesizer per assembly.

7.0 - Direct Digital Synthesizer to generate frequencies from 10 MHz to 6 GHz, two or four synthesizers per assembly.

Index Definitions for Synthesizer Versions

0 - LO synthesizer

1 - Src1 synthesizer

2 - Src 2 synthesizer

3 - Src 3 synthesizer

</thead>
<tbody>
<tr>
<td>Example</td>
<td>SYST:CONF:REV:PNA:SYNT:VERS?</td>
</tr>
<tr>
<td></td>
<td>&quot;6.0&quot;</td>
</tr>
</tbody>
</table>
Return Type: String
Default: Not applicable

SYSTem:CORRection:WiZard[:IMMediate] <char>

Applicable Models: All

(Write-only) Launches either the Calibration Wizard or the Version 2 Calibration Kit File Manager dialog box.

Remote operation returns immediately after the dialog is launched. This is done to avoid timeout issues with I/O protocols such as VISA. Although it is possible to send commands to the VNA while the dialog is open, this is not encouraged. Application programs should wait until the dialog is closed before resuming remote operations.

Parameters

<char> Choose from:

- **MAIN** - Launches the Calibration Wizard which matches the current channel, such as standard S-params, NoiseFigure, GCA, and so forth.
- **CKIT** - Launches the Version 2 Calibration Kit File Manager dialog box.
- **RESP** - Launches the Response Cal Type Selection.
- **BASic** - Launches the Basic Cal dialog.
- **CALL** - Launches the Calibrate All Selected Channels dialog.

These display on the VNA screen.

Examples

SYST:CORR:WIZ MAIN
system:correction:wizard:immediate ckit

Query Syntax: Not Applicable

Default: MAIN

SYSTem:DATA:MEMory:ADD <string>

Applicable Models: All

(Write only) Add a request to copy the contents of the specified measurement into shared memory. Call this command once for each measurement definition. Once the shared memory is setup, there is no need to send more SCPI commands. The shared memory is filled automatically on every sweep.
Parameters

<string> The following elements separated with colons (:).

<Ch>:<MeasNum>:<dataFormat>:<numPoints>:[<repeatCount>]

where:

- <Ch> - Channel number of the measurement to share memory. Use SYST:ACTive:CHAN to return the active channel number. Use SYST:CHAN:CAT? to return the channel numbers in use.
- <MeasNum> - Measurement (Tr) number to share memory. Use CALC<ch>:PAR:MNUM ? just after the trace is created to read the measurement number. See also: Referring to Traces, Measurements, Channels, and Windows Using SCPI.
- <dataFormat> - Choose from:
  - SDATA - Complex measurement data.
    - Reads data from Apply Error Terms (access point 1). Returns TWO numbers per data point. Corrected data is returned when correction is ON. Uncorrected data is returned when correction is OFF.
  - FDATA - Formatted measurement data to or from Data Access Map location Display (access point 2).
    - Corrected data is returned when correction is ON.
    - Uncorrected data is returned when correction is OFF.
    - Returns one number per data point for all other formats.
    - Format of the read data is same as the displayed format.
  - CAL - Access the entire set of calibrated SParameter measurements.
    - Only functional if an SParameter calibration is applied to the channel.
    - Always returns all the SParameters.
    - SParameters are in the following order for a 3 port cal:
      - \{S11, S21, S31, S12, S22, S32, S13, S23, S33\}
- <numPoints> - Number of data points in the measurement trace.
- [<repeatCount>] - This argument is optional. When specified, the buffer will include multiple sweeps of information into the buffer. Each sweep is stored consecutively into the shared data buffer.
### System:Data:Memory:ADD String "2:3:SDATA:201"

Copies the data for channel #2, measurement #3, complex data, 201 points into the shared memory buffer.

### Query Syntax
Not Applicable

### Default
Not Applicable

---

**System:Data:Memory:Catalog?**

**Applicable Models:** All

(Read only) Returns a list of all the allocated shared memory buffers

**Parameters** None

**Examples** System:Data:Mem:Cat?

**Return Type** String

**Default** Not Applicable

---

**System:Data:Memory:Close <memName>**

**Applicable Models:** All

(Write-only) Closes the specified memory mapped buffer.

**Parameters**

<memName> String. Name of the memory mapped buffer.

**Examples** System:Data:Mem:Clos "VNA_MemoryMap"

**Query Syntax** Not Applicable

**Default** Not Applicable

---

**System:Data:Memory:Close:File <fileName>**
Applicable Models: All

(Write-only) Closes the specified memory file.

Parameters
<fileName> Memory file name.

Examples
SYST:DATA:MEM:CLOS "c:\temp\myfile.dat"

Query Syntax
Not Applicable
Default
Not Applicable

SYSTem:DATA:MEMory:COMMit <memName>

Applicable Models: All

(Write only) Allocates the memory mapped buffer.

Parameters
<memName> String. Name of the memory mapped buffer. This must be a unique name, and cannot conflict with other shared memory buffer names. Use this command in your program when connecting to the shared memory.

Examples
SYST:DATA:MEM:COMM "VNA_MemoryMap"

Query Syntax
Not Applicable
Default
Not Applicable

SYSTem:DATA:MEMory:COMMit:FILE <fileName>
Applicable Models: All

(Write only) This command creates the memory buffer and saves the buffer to a file. This command is an alternative to using the SYST:DATA:MEM:COMMIT command.

Parameters
<fileName> String. Name of the memory mapped buffer file. This must be a unique name, and cannot conflict with other shared memory buffer file names. Use this command in your program when connecting to the shared memory.

Examples
SYST:DATA:MEM:COM:FILE "c:\temp\myfile.dat"

Query Syntax Not Applicable
Default Not Applicable

SYSTem:DATA:MEMory:DELete <memName> - Obsolete

Applicable Models: All

(Write only) Deletes the specified memory mapped buffer.

Parameters
<memName> String. Name of the memory mapped buffer. This is the unique name that is used in the COMMit command.

Examples
SYST:DATA:MEM:DEL "VNA_MemoryMap"

Query Syntax Not Applicable
Default Not Applicable

SYSTem:DATA:MEMory:INITialize

Applicable Models: All

(Write only) Initializes the shared memory setup buffers.

Parameters None

Examples SYST:DATA:MEM:INIT

Query Syntax Not Applicable
Default Not Applicable
SYSTem:DATA:MEMory:NAME?

Applicable Models: All

(Read only) Returns a unique, auto-generated name that can be used in the COMMIt command. By using this generated name, a client can be sure not to conflict with any other used shared memory regions.

| Parameters | None |
| Return Type | String |
| Default | Not Applicable |

SYSTem:DATA:MEMory:OFFSet?

Applicable Models: All

(Read only) The shared memory is a contiguous block of memory. Each measurement takes up a subset of this contiguous block. This command returns the offset (in bytes) into the shared memory for the most recently added parameter. The offset is a number that specifies the starting index (in bytes) of the data.

This query can be sent after sending SYST:DATA:MEM:ADD.

| Parameters | None |
| Return Type | Numeric |
| Default | Not Applicable |

SYSTem:DATA:MEMory:REPeat:RESet

Applicable Models: All

(Write only) This command resets the current repeat index to 0.

| Parameters | None |
| Default | Not Applicable |
SYSTem:DATA:MEMory:RESet

Applicable Models: All

(Write only) Deletes all allocated shared memory buffers.

Parameters
None

Examples
SYS:DATA:MEM:RES

Query Syntax
Not Applicable

Default
Not Applicable

SYSTem:DATA:MEMory:SIZE?

Applicable Models: All

(Read only) Returns the size of the memory mapped region. Send this immediately after SYST:DATA:MEM:COMMit. The result is the total size (in bytes) of all the measurements in the shared memory region.

Parameters
None

Examples
SYS:DATA:MEM:SIZE?

ReturnType
Numeric

Default
Not Applicable

SYSTem:DATE?

Applicable Models: All

(Read-only) Returns the system date.

Parameters
None

Example
SYS:DATE?

ReturnType
Comma separated numbers representing year, month, day.

Default
Not applicable

SYSTem:DISK:REVision?
Applicable Models: N522xB, N523xB, N524xB, P937xA, E5080A

(Read-only) Returns the disk drive version. The format is S.XX.YY.ZZ.

<table>
<thead>
<tr>
<th>Parameters</th>
<th>None</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example</td>
<td>SYST:DISK:REV?</td>
</tr>
<tr>
<td>Return Type</td>
<td>Comma separated numbers representing year, month, day.</td>
</tr>
<tr>
<td>Default</td>
<td>Not applicable</td>
</tr>
</tbody>
</table>

SYSTem:ERRor?

Applicable Models: All

(Read-only) Returns the next error in the error queue. Each time the analyzer detects an error, it places a message in the error queue. When the SYSTEM:ERROR? query is sent, one message is moved from the error queue to the output queue so it can be read by the controller. Error messages are delivered to the output queue in the order they were received. The error queue is cleared when any of the following conditions occur:

- When the analyzer is switched ON.
- When the *CLS command is sent to the analyzer.
- When all of the errors are read.

If the error queue overflows, the last error is replaced with a "Queue Overflow" error. The oldest errors remain in the queue and the most recent error is discarded.

See list of all SCPI Errors.

<table>
<thead>
<tr>
<th>Examples</th>
<th>SYST:ERR? system:err?</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default</td>
<td>Not Applicable</td>
</tr>
</tbody>
</table>

SYSTem:ERRor:COUNt?
Applicable Models: All

(Read-only) Returns the number of errors in the error queue. Use SYST:ERR? to read an error.

See list of all SCPI Errors.

Examples

- SYST:ERR:COUN?
- system:err:count?

Default Not Applicable

SYSTem:ERRor:REPort:SUNLeveled <bool>

Applicable Models: All

(Read-Write) Specifies whether or not to report Source Unleveled errors to the SCPI system error buffer.

This setting will NOT revert to the default (OFF) setting on Instrument Preset. Use the SYSTem:PREFerences:DEFault command to reset the preferences to their default settings.

Parameters

- <bool> ON (or 1) Report Source Unleveled Errors. Read errors from the system error buffer using SYST:ERR?
- OFF (or 0) Do NOT report Source Unleveled Errors.

Examples

- SYST:ERR:REP:SUNL 1
- system:err:report:sunleveled ON

Query Syntax

SYSTem:ERRor:REPort:UNLeveled?

Default OFF

SYSTem:FCORrection:CHANnel<cnum>:COUPler[:STATe] <char>
Applicable Models: M937xA, P937xA, E5080B, M980xA, P50xxA, M9485A

(Read-Write) (M937xA/P937xA) Sets and returns the coupler state. This command is not effective for SMC class. (E5080B, M980xA, P50xxA, M9485A) Turn off the system calibration.

Parameters

<char> Choose from:

OFF

AUTO

Examples

SYST:FCOR:CHAN:COUP AUTO
system:fcorrection:channel1:coupler OFF

Query Syntax

SYSTem:FCORrection:CHANnel<cnum>:COUPler[:STATe]?

Return Type

Character

Default

AUTO (for ENA/PXI)

OFF (for PNA)

SYSTem:FPReset

Applicable Models: All

(Write-only) Performs a standard Preset, then deletes the default trace, measurement, and window. The VNA screen becomes blank.

Examples

SYST:FPR
system:fpreset

Default

Not applicable

SYSTem:ISPContol[:STATe] <bool>
**Applicable Models:** E5080A/B, M9485A, M980xA, P50xxA

*(Read-Write)* Sets and reads the status of the Initial Source Port Control feature (to switch the stimulus output in the trigger hold state to a test port).

**Parameters**

- `<bool>`
  - **ON** (or 1) Source is outputted only when measurement is done. Source is not outputted during hold state.
  - **OFF** (or 0) Source is always outputted.

**Examples**

```
SYST:ISPC 1
system:ispcontrol OFF
```

**Query Syntax**

SYSTem:ISPControl[:STATe]?

**Default**

ON (E5080A), OFF (P50xxA, M980xA, M9485A, E5080B)

---

**SYSTem:LOCal**

**Applicable Models:** All

*(Write-only)* Sets the local/remote state to local.

**Examples**

```
SYST:LOC
system:local
```

**Default**

Not applicable

---

**SYSTem:MACRo:COPY:CHANnel<cnum>[:TO] <num>**

**Applicable Models:** All

*(Write-only)* Copies ALL settings from `<cnum>` channel to `<num>` channel. Learn more about copy channels.

Use SENS:PATH:CONF:COPY to copy ONLY mechanical switch and attenuator settings.

**Parameters**

- `<cnum>` Channel number to copy settings from. If unspecified, value is set to 1.
- `<num>` Channel number to copy settings to.

**Examples**

```
SYST:MACR:COPY:CHAN1 2
system:macro:copy:channel2:to 3
```

**Query Syntax**

Not Applicable
SYSTem:MACRo:COPIy:CHANnel<fromChannel>:STATe <toChannel>,<toWindow>,[<copyScope>]

**Applicable Models:** All

*(Write-only)* Copies settings only, or settings and measurements, traces, markers, and limit lines from an existing channel, `<fromChannel>`, to a new channel, `<toChannel>`. Traces can be copied into the Active Window, a user specified window, or a new (next available) window.

**Parameters**
- `<fromChannel>`: Channel number to copy settings from. If unspecified, value is 1.
- `<toChannel>`: 0 for next available channel, or N for channel number to copy settings to.
- `<toWindow>`: -1 will create a new window, 0 will use the active window, and N will use the specified window N. `<toWindow>` is ignored when `<copyScope>` is "stimulus"
- `<copyScope>`: must be "stimulus" which copies only settings, or "state" which copies settings, measurements, traces, markers, and limit lines.

**Examples**

```
SYST:MACR:COPY:CHAN1:STAT 2,0,"stimulus"
```

Copies only settings from channel #1 to channel #2. This is equivalent to `SYST:MACR:COPY:CHAN1 2`

```
SYST:MACR:COPY:CHAN1:STAT 2,-1,"state"
```

Copies settings, measurements, traces, etc. from channel #1 to channel #2. Traces are placed into a new window (next available window), and additional windows will be created as necessary so that all traces are copied.

```
SYST:MACR:COPY:CHAN1:STAT 0,-1
```

Copies settings, measurements, etc. from channel #1 to the next available channel and places traces into the next available new window.

**Query Syntax** Not Applicable

**Default** Not Applicable
SYSTem:MACR: COPY:CHAN<fromChan>:SOUR <fromPort>,<toChan>,<toPort>

**Applicable Models:** N522xB, N523xB, N524xB, E5080A, M9485A, P937xA

*(Write-only)* Copies and applies an existing Source Power Calibration to another channel. Learn more about source power calibration.

**Parameters**
- `<fromChan>` Channel number of the existing source power correction.
- `<fromPort>` Port number of the existing source power correction.
- `<toChan>` Channel number to which the source power correction will be copied.
- `<toPort>` Port number to which the source power correction will be applied.

**Examples**
- `SYST:MACR: COPY:CHAN1:SOUR 1,2,1`
- `system:macro:copy:channel2:source 2,1,2`

**Query Syntax** Not Applicable

**Default** Not Applicable

---

SYSTem:MClass:CATalog?

**Applicable Models:** All

*(Read-only)* Returns measurement classes available on the VNA. Learn more about Measurement Classes.

**Parameters** None

**Examples**
- `SYST:MCClass:CAT?`

**Return Type** String of comma-separated measurement class names. See the complete list of measurement class names.

**Default** Not Applicable

---

SYSTem:MCClass:PARameter:CATalog? <name>
### SYSTem:MEASure:CATalog? [chan]

**Applicable Models:** All

(Read-only) Returns ALL measurement numbers, or measurement numbers from a specified channel.

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>[chan]</td>
<td>Optional. Channel number to catalog. If not specified, all measurement numbers are returned.</td>
</tr>
</tbody>
</table>

#### Examples

- Returns all measurement numbers
  
  ```
  SYST:MEAS:CAT? 
  ```

- Returns the measurement numbers on channel 2
  
  ```
  system:measurement:catalog? 2 
  ```

<table>
<thead>
<tr>
<th>Return Type</th>
<th>String of comma-separated numbers</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default</td>
<td>Not Applicable</td>
</tr>
</tbody>
</table>

---

### SYSTem:MEASure<n>:NAME?

**Applicable Models:** All

(Read-only) Returns ALL parameters that are supported by the specified measurement class.

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;name&gt;</td>
<td>String. Measurement Class name. See the complete list of measurement class names.</td>
</tr>
</tbody>
</table>

#### Examples

- Returns all parameters for Gain Compression.
  
  ```
  SYST:MCL:PAR:CAT? "Gain Compression"
  ```

<table>
<thead>
<tr>
<th>Return Type</th>
<th>String of comma-separated parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default</td>
<td>Not Applicable</td>
</tr>
</tbody>
</table>
Applicable Models: All

(Read-only) Returns the name of the specified measurement.

Parameters

<n> Measurement number for which to return the measurement name. If unspecified, value is set to 1.

Examples
'SReturns the name of measurement 2
SYST:MEAS2:NAME?

Return Type String
Default Not Applicable

SYSTem:MEASure<n>:TRACe?

Applicable Models: All

(Read-only) Returns the trace number of the specified measurement number. Trace numbers restart for each window while measurement numbers are always unique.

Parameters

<n> Measurement number for which to return the trace number. If unspecified, value is set to 1.

Examples
'SReturns the trace number of measurement 1
SYST:MEAS1:TRAC?

Return Type Numeric
Default Not Applicable

SYSTem:MEASure<n>:WINDow?
Applicable Models: All

(Read-only) Returns the window number of the specified measurement number.

Parameters

<n> Measurement number for which to return the window number. If unspecified, value is set to 1.

Examples

'SReturns the window number of measurement 2
SYST:MEAS2:WIND?

Default Numeric

Return Type Numeric

Default Not Applicable

SYSTem:PERSona:MANufacturer <string>

Applicable Models: All

(Read-Write) This command allows you to modify the manufacturer name returned by the instrument’s *IDN query response. This is intended to be used for Agilent backward identity compatibility. For example, "Agilent Technologies” or “Agilent”. However, it could be used for other purposes such as emulation of another vendor’s instrument.

The change to the manufacturer string will not take effect until after an instrument reboot.

The manufacturer string does not allow commas in the name. If a comma is detected an error is returned. Also, if an invalid manufacturer is detected, an error is returned.

The manufacturer string used for Keysight is “Keysight Technologies”.

Parameters

<string> Name of the manufacturer.

Examples SYST:PERS:MAN "Keysight Technologies"

Query Syntax SYSTem:PERSona:MANufacturer?

Return Type String

Default Not Applicable

SYSTem:PERSona:MANufacturer:DEFault
**Applicable Models:** All

(Read-Write) Sets and returns the instrument's original manufacturer identification state following the next instrument reboot.

| Parameters | None |
| Parameters | None |

**Examples**

| SYST: PERS: MAN: DEF |
| SYST: PERS: MAN: DEF |

**Query Syntax**

SYSTem:PERSona:MANufacturer:DEFault?
SYSTem:PERSona:MANufacturer?

**Return Type**

String

**Default**

Not Applicable

---

**SYSTem:PERSona:MODel <string>**

**Applicable Models:** All

(Read-Write) This command allows you to modify the product model returned by the instrument’s *IDN query response. This is intended to be used for model compatibility. If not specified, the default model of the instrument is used.

The change to the model string will not take effect until after an instrument reboot.

The model string does not allow commas in the name. If a comma is detected an error is returned. Also, if an invalid model is detected, an error is returned.

**Parameters**

<string> Product model name.

**Examples**

| SYST: PERS: MOD "33220A" |
| SYST: PERS: MOD "33220A" |

**Query Syntax**

SYSTem:PERSona:MANufacturer?

**Return Type**

String

**Default**

Not Applicable

---

**SYSTem:PERSona:MODel:DEFault**
Applicable Models: All

(Read-Write) Sets and returns the instrument's original product model name following the next instrument reboot.

**Parameters** None

**Examples** `SYST: PERS: MOD: DEF`

**Query Syntax** SYSTem:PERSona:MODel:DEFault?

**Return Type** String

**Default** Not Applicable

---

SYSTem:POFF

Applicable Models: All

(Write-only) Shuts down the system.

**Parameters**

<n> Shutdown or restart. Choose from:

1 - Restart.

0 - Shutdown.

**Examples** 'Shuts down the system

`SYST: POFF`

**Default** 0 (Shutdown)

---

SYSTem:POWer<pnum>:LIIMit <value>
**Applicable Models:** All

*(Read-Write)* Sets and returns the power limit for the specified port. Learn more about Power Limit.

**Parameters**

- `<pnum>`  Port number. Choose any VNA port.
- `<value>`  Power limit in dBm

**Examples**

```
SYST:POW1:LIM 5
system:power2:limit 0
```

**Query Syntax**  SYSTem:POWer<pnum>:LIMit?

**Return Type**  Numeric

**Default**  100 dBm

---

**SYSTem:POWer:LIMit:LOCK <bool>**

**Applicable Models:** All

*(Read-Write)* Enables or disables the ability to change the power limit values through the user interface. Learn more about Power Limit.

**Parameters**

- `<bool>`  Power limit lock. Choose from:

  - **ON** or **1** - Disables the ability to change the power limit values from the user interface.
  - **OFF** or **0** - Enables the ability to change the power limit values from the user interface.

**Examples**

```
SYST:POW:LIM:LOCK 1
system:power:limit:lock OFF
```

**Query Syntax**  SYSTem:POWer:LIMit:LOCK?

**Return Type**  Boolean

**Default**  OFF

---

**SYSTem:POWer<pnum>:LIMit:STATe <bool>**
**Applicable Models:** All

**Read-Write** Enables or disables the power limit for the specified port. Learn more about Power Limit.

### Parameters

- `<pnum>` Port number. Choose any VNA port.
- `<value>` Power limit state. Choose from:
  - **ON** or **1** Enables the power limit for the port<pnum>.
  - **OFF** or **0** Disables the power limit for the port<pnum>.

### Examples

```
SYST:POW1:LIM:STAT ON
system:power2:limit:state 0
```

### Query Syntax

```
SYSTem:POWer<pnum>:LIMit:STATe?
```

### Return Type

Boolean

### Default

OFF

---

**SYSTem:PRESet**

**Applicable Models:** All

**(Write-only)** Deletes all traces, measurements, and windows. In addition, resets the analyzer to factory defined default settings and creates a S11 measurement named "CH1_S11_1". For a list of default settings, see Preset.

Regardless of the state of the User Preset Enable checkbox, the SYST:PRESet command will always preset the VNA to the factory preset settings, and SYST:UPReset will always perform a User Preset.

If the VNA display is disabled with DISP:ENAB OFF then SYST:PRES will NOT enable the display.

This command performs the same function as *RST with one exception: Syst:Preset does NOT reset Calc:FORMAT to ASCII as does *RST.

### Examples

```
SYST:PRES
system:preset
```

### Default

Not applicable

---

**SYSTem:SECurity[:LEVe]l <char>**
Applicable Models: All

(Read-Write) Sets and returns the display of frequency information on the VNA screen and printouts.

Learn more about security level.

Parameters

<char> Choose from:

NONE - ALL frequency information is displayed.

LOW - NO frequency information is displayed. Frequency information can be redisplayed using the Security Setting dialog box or this command.

HIGH - LOW setting plus GPIB console is disabled. Frequency information can be redisplayed ONLY by performing a Preset, recalling an instrument state with None or Low security settings, or using this command.

EXTRA - HIGH setting plus:

- ASCII data saving is disabled. Same method to redisplay frequency information as HIGH setting.
- Mixer setup files (*.mxr) can NOT be saved.

Examples

SYST:SEC LOW
system:security:level high

Query Syntax

SYSTem:SECurity[:LEVel]?

Return Type

Character

Default

None

SYSTem:SET <block>
Applicable Models: All

(Read-Write) Sends a definite-length binary block Instrument state and sets the VNA with those settings. This command does the same as saving a *.sta file to the VNA (MMEM:STOR STATE ) and then MMEM:TRAN to transfer the file to the computer.

Parameters

- `<block>` The Instrument state file as definite-length arbitrary binary block.

Examples

```
SYST:SET <block>
```

Query Syntax

SYSTem:SET? (This saves the instrument state file to the remote computer.)

Return Type

Definite-length arbitrary binary block.

Default

Not Applicable

SYSTem:SHEets:CATalog?

Applicable Models: N522xB, N523xB, N524xB, E5080A, M937xA, P937xA

(Read-only) Returns comma separated list of visible sheets.

Parameters

Examples

```
SYST:SHE:CAT?

'Returns:

"1,2,3"
```

Return Type

String of comma-separated numbers

Default

1

SYSTem:SHORtcut<n>:ARGuments<string>
Applicable Models: All

(Read-Write) Reads and writes the arguments for the specified macro. On the Edit Macro Dialog, this is called the "Macro run string parameters".

**Parameters**

- `<n>` Numeric. Number of the macro that is stored in the VNA.
  
  To find the number of a macro, either open the Macro Setup dialog and count the line number of the desired macro, or query the titles of all of the macros for the desired macro title.

- `<string>` Arguments for the specified macro.

**Examples**

- SYST:SHOR1:ARG

**Query Syntax**

SYSTem:SHORtcut<n>:ARGuments?

**Default** Not Applicable

---

SYSTem:SHORtcut<n>:DELe

Applicable Models: All

(Write-only) Removes the specified macro from the list of macros in the VNA. Does not delete the macro executable file.

**Parameters**

- `<n>` Numeric. Number of the macro that is stored in the VNA.
  
  To find the number of a macro, either open the Macro Setup dialog and count the line number of the desired macro, or query the titles of all of the macros for the desired macro title.

**Examples**

- SYST:SHOR1:DEL

**Query Syntax** Not Applicable

**Default** Not Applicable

---

SYSTem:SHORtcut<n>:EXECute
**Applicable Models:** All

*(Write-only)* Executes (runs) the specified Macro (shortcut) that is stored in the VNA.

**Note:** If Enable Remote Drive Access is unchecked in the Remote Interface dialog, this command will return an error.

**Parameters**

<n> Numeric. Number of the macro that is stored in the VNA.

To find the number of a macro, either open the Macro Setup dialog and count the line number of the desired macro, or query the titles of all of the macros for the desired macro title.

**Examples**

SYST:SHOR1:EXEC

**Query Syntax**

Not Applicable

**Default**

Not Applicable

**SYSTem:SHORtcut<n>:PATH <string>**

**Applicable Models:** All

*(Read-Write)* Defines a Macro (shortcut) by linking a path and file name to the Macro number. To be executed, the executable file must be put in the VNA at the location indicated by this command.

**Parameters**

<n> Numeric. Number of the macro to be stored in the analyzer. If the index number already exists, the existing macro is replaced with the new macro.

<string> Full path, file name, and extension, of the existing macro "executable" file.

To find the number of a macro, either open the Macro Setup dialog and count the line number of the desired macro, or query the titles of all of the macros for the desired macro title.

**Examples**

SYST:SHOR1:PATH "C:\Program Files(x86)\Keysight\Network Analyzer\Documents\unguideMultiple.vbs"

**Query Syntax**

SYSTem:SHORtcut<n>:PATH?

**Default**

Not Applicable

**SYSTem:SHORtcut<n>:TITLe<string>**
Applicable Models: All

(Read-Write) Reads and writes the name of the specified macro.

**Parameters**

- `<n>` Numeric. Number of the macro that is stored in the VNA.
  
  To find the number of a macro, either open the Macro Setup dialog and count the line number of the desired macro, or query the titles of all of the macros for the desired macro title.

- `<string>` The name to be assigned to the macro.

**Examples**

```
SYST:SHOR1:TITL "Guided 4-Port Cal"
```

**Query Syntax**

```
SYSTem:SHORcut<n>:TITLe?
```

**Default** Not Applicable

---

**SYSTem:TDR:PRESet**

Applicable Models: All with TDR Options (S9x011A/B)

(Write-only) Launches TDR application without VNA-TDR GUI.

**Parameters** None

**Example**

```
SYST:TDR:PRES
```

**Return Type** Not applicable

**Default** Not applicable

---

**SYSTem:TIME?**

Applicable Models: All

(Read-only) Returns the system time.

**Parameters** None

**Example**

```
SYST:TIME?
```

**Return Type** Comma separated numbers representing hours, minutes, seconds.

**Default** Not applicable

---

**SYSTem:TOUCHscreen[:STATe] <bool>**
**Applicable Models:** N522xB, N523xB, N524xB, E5080A/B

*(Read-Write)* Enables and disables the touchscreen.

This setting remains until changed again from the front-panel or remotely, or until the hard drive is changed or reformatted.

**Parameters**

<bool> Choose from:

**ON (1)** Enables the touchscreen.

**OFF (0)** Disables the touchscreen.

**Examples**

```
SYST:TOUC 1
system:touchscreen:state OFF
```

**Query Syntax**

SYSTem:TOUChscreen[:STATe]?

**Return Type**

Boolean

**Default**

ON when shipped from factory.

---

**SYSTem:UPReset**

**Applicable Models:** N522xB, N523xB, N524xB, E5080A, M9485A, P937xA

*(Write-only)* Performs a User Preset. There must be an active User Preset state file (see Load and Save) or an error will be returned. Learn more about User Preset.

Regardless of the state of the User Preset Enable checkbox, the SYST:PRESet command will always preset the VNA to the factory preset settings, and SYST:UPReset will always perform a User Preset.

**Examples**

```
SYST:UPReset
system:upreset
```

**Query Syntax**

Not Applicable

**Default**

Not Applicable

---

**SYSTem:UPReset:FPANel[:STATe] <bool>**
**Applicable Models:** N522xB, N523xB, N524xB, E5080A, M9485A, P937xA

(Read-Write) 'Checks' and 'clears' the enable box on the User Preset dialog box. This only affects subsequent Presets from the front panel user interface.

Regardless of the state of the User Preset Enable checkbox, the SYST:PRESet command will always preset the VNA to the factory preset settings, and SYST:UPReset will always perform a User Preset.

**Parameters**

<bool> Front Panel User Preset State. Choose from:

0 User Preset OFF

1 User Preset ON

**Examples**

```
SYST:UPR:FPAN 1
system:upreset:fpanel:state 0
```

**Query Syntax**

SYSTem:UPREset:FPANel[:STATe]?

**Return Type**

Boolean

**Default**

0

---

**SYSTem:UPReset:LOAD[:FILE] <file>**

**Applicable Models:** N522xB, N523xB, N524xB, E5080A, M9485A, P937xA

(Write-only) Loads an existing instrument state file (.sta or .cst) to be used for User Preset. Subsequent execution of SYSTem:UPReset will cause the VNA to assume this instrument state.

Regardless of the state of the User Preset Enable checkbox, the SYST:PRESet command will always preset the VNA to the factory preset settings, and SYST:UPReset will always perform a User Preset.

Learn more about User Preset.

**Parameters**

<file> String - Name of the file to be loaded. Change the default folder name using MMEMory:CDIRectory.

**Examples**

```
SYST:UPR:LOAD '1MHzto20GHzUserPreset.cst'
system:upreset:load:file 'C:\Documents and Settings\Administrator\My Documents\NewUserPreset.cst'
```

**Query Syntax**

Not Applicable

**Default**

Not Applicable
SYStem:UPReset:SAVE[:STATE]

Applicable Models: N522xB, N523xB, N524xB, E5080A, M9485A, P937xA

(Write-only) Saves the current instrument settings as UserPreset.sta. Subsequent execution of SYStem:UPReset will cause the VNA to assume this instrument state.

Regardless of the state of the User Preset Enable checkbox, the SYST:PRESet command will always preset the VNA to the factory preset settings, and SYST:UPReset will always perform a User Preset.

Learn more about User Preset.

Examples

SYST:UPR:SAVE
system:upreset:save:state

Query Syntax

Not Applicable

Default

Not Applicable

SYStem:WINDows:CATalog?

Applicable Models: All

(Read-only) Returns the window numbers that are currently being used.

Examples

SYST:WIND:CAT?

system:windows:catalog?

Return Type

String of comma-separated numbers.

For example: "1,2"

Default

Not Applicable
**SYSTEM:CALibrate:ALL Commands**

Contains the settings to configure a "Cal All" Calibration.

Use the Guided Cal interface to perform the calibration.

**SYSTem:CALibrate:ALL[1-250]:CHANnel<ch>:PORTs[:SELect] <value>**

**Applicable Models:** All

*(Write-Read)* For each channel to be calibrated, sets and returns the ports to be calibrated. Specify port numbers ONLY for standard channels.

**Parameters**

- *[1-250]* Calibration number. The default is 1.
- *<ch>* Channel number to be calibrated.
- *<value>* Ports to be calibrated for the specified channel. Select any of the native VNA ports (1,2,3,4).

**Examples**

```
SYST:CAL:ALL:CHAN2:PORT 1,2,3
```

**Query Syntax**

SYSTem:CALibrate:ALL:CHANnel<ch>:PORTs[:SELect]?

**Return Type**

Comma-separated port numbers.
SYSTem:CALibrate:ALL[1-250]:CSET:CATalog?

Applicable Models: All

(Read-only) Returns the User Cal Set or cal register names that were produced by the cal all session.

Parameters

[1-250] Calibration number. The default is 1.

Examples

SYST:CAL:ALL:CSET:CATalog?

'returns this format:

"MyCalAll_STD_001, MyCalAll_SMC_002"

See example program

Return Type String of comma-separated Cal Set or cal register names

Default Not Applicable

SYSTem:CALibrate:ALL[1-250]:CSET:PREFix<value>

Applicable Models: All

(Write-Read) Sets and returns the prefix to be used when saving User Cal Sets that result from the Cal All session. The Meas Class and channel number are appended to this prefix for each calibrated channel. Use SYST:CAL:ALL:CSET:CATalog? to read the saved cal set names.

- SENS:CORR:COLL:GUID:SAVE:CSET can also be used to set the Cal Set prefix.
- If a Cal Set prefix is NOT set using either command, the cal data for each channel will be saved only to cal registers. Learn about cal registers.

Parameters

[1-250] Calibration number. The default is 1.

<value> (String) User Cal Set prefix.

Examples

SYST:CAL:ALL:CSET:PREFix "MyCalAll"

Query Syntax SYSTem:CALibrate:ALL:CSET:PREFix?

Return Type String

Default " " (Empty string)
**SYSTem:CALibrate:ALL[1-250]:GUIDed:CHANnel:LIST?**

**Applicable Models:** All

(Read-only) Returns all cal all guided calibration channels.

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>[1-250]</td>
<td>Calibration number. The default is 1.</td>
</tr>
</tbody>
</table>

**Examples**

```
chan = SYST:CAL:ALL:GUID:CHAN:LIST?
```

**Return Type**

Numeric of comma-separated channel numbers

**Default**

Not applicable

---

**SYSTem:CALibrate:ALL[1-250]:GUIDed:CHANnel[:VALue]?**

**Applicable Models:** All

(Read-only) Returns the primary guided calibration channel number if more than one channel exists; otherwise, this command returns the one value. Use this value as the <ch> argument for the subsequent Guided:Cal commands.

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>[1-250]</td>
<td>Calibration number. The default is 1.</td>
</tr>
</tbody>
</table>

**Examples**

```
chan = SYST:CAL:ALL:GUID:CHAN:VAL?
```

**Return Type**

Numeric

**Default**

Not applicable

---

**SYSTem:CALibrate:ALL[1-250]:GUIDed:PORTs?**
Applicable Models: All

(Read-only) Returns the ports to be calibrated during the Cal All Channels calibration. Specify connectors and cal kits for these ports using the Guided:Cal commands.

Specify the ports to be calibrated for each channel using SYST:CAL:ALL:CHAN<ch>:PORT.

Parameters

<table>
<thead>
<tr>
<th>[1-250]</th>
<th>Calibration number. The default is 1.</th>
</tr>
</thead>
</table>

Examples

```
ports = SYST:CAL:ALL:GUID:PORT?
```

Return Type
Comma-separated list of port numbers

Default
Not applicable

SYSTem:CALibrate:ALL[1-250]:IFBW <value>

Applicable Models: All

(Write-Read) Sets and returns the IFBW for a Cal All calibration. Learn more about this setting.

Parameters

<table>
<thead>
<tr>
<th>[1-250]</th>
<th>Calibration number. The default is 1.</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;value&gt;</td>
<td>IF Bandwidth in Hz. The list of valid IF Bandwidths is different depending on the VNA model. See the list of valid settings. If an invalid number is specified, the VNA will round up to the closest valid setting.</td>
</tr>
</tbody>
</table>

Examples

```
SYST:CAL:ALL:IFBW 10e3
```

Query Syntax
SYSTem:CALibrate:ALL:IFBW?

Return Type
Numeric

Default
1 kHz

SYSTem:CALibrate:ALL[1-250]:INDependent:SOURce:CALibrate:CATalog?
Applicable Models: All

(Read-only) Returns available ports for independent power calibration.

**Parameters**

[1-250] Calibration number. The default is 1.

**Examples**

```
SYST:CAL:ALL:IND:SOUR:CAL:CAT?
```

**Return Type** String

**Default** Not applicable

---

Applicable Models: All

(Write-only) This command adds a power cal range for a specific port <n>. Note that external sources are valid and specifying a source port is the same as other remote commands. By default this will create a range with the preset start/stop frequency and 201 points. The maximum number of ranges that can be added is 100 (same as the maximum number of segments).

**Parameters**

[1-250] Calibration number. The default is 1.

<n> Port number

**Examples**

```
```

**Default** Not applicable

---

SYSTem:CALibrate:ALL[1-250]:INDependent:SOURce<n>:CALibrate:RANGe:CLEar

Applicable Models: All

(Write-only) This command resets all ranges for the given source port <n>.

**Parameters**

[1-250] Calibration number. The default is 1.

<n> Port number

**Examples**

```
```

**Default** Not applicable
SYSTem:CALibrate:ALL[1-250]:INDependent:SOURce<n>:CALibrate:RANGe:COUNt?

Applicable Models: All

(Read-only) This command queries how many ranges are included in the calibration for source port <n>.

Parameters

[1-250] Calibration number. The default is 1.
<n> Port number

Examples

Return Type Numeric
Default Not applicable

SYSTem:CALibrate:ALL[1-250]:INDependent:SOURce<n>:CALibrate:RANGe<m>:POINts <value>

Applicable Models: All

(Write-Read) This command sets and gets the number of points for range <m> for source port <n>.

Parameters

[1-250] Calibration number. The default is 1.
<n> Port number
<m> Range number
<value> Number of points

Examples

Query Syntax
SYSTem:CALibrate:ALL:INDependent:SOURce<n>:CALibrate:RANGe<m>:POINts?

Return Type Numeric
Default Not applicable

SYSTem:CALibrate:ALL[1-250]:INDependent:SOURce<n>:CALibrate:RANGe<m>:STARt <value>
Applicable Models: All

(Write-Read) This command sets and gets the start frequency for range <m> for source port<n>.

Parameters

[1-250] Calibration number. The default is 1.

<n> Port number

<m> Range number

<value> Start frequency for range <m>

Examples

Query Syntax

SYSTem:CALibrate:ALL:INDependent:SOURce<n>:CALibrate:RANGe<m>:START?

Return Type

Numeric

Default Not applicable

SYSTem:CALibrate:ALL[1-250]:INDependent:SOURce<n>:CALibrate:RANGe<m>:STOP

<value>

Applicable Models: All

(Write-Read) This command sets and gets the stop frequency for range <m> for source port<n>.

Parameters

[1-250] Calibration number. The default is 1.

<n> Port number

<m> Range number

<value> Stop frequency for range <m>

Examples

Query Syntax

SYSTem:CALibrate:ALL:INDependent:SOURce<n>:CALibrate:RANGe<m>:STOP?

Return Type

Numeric

Default Not applicable

Applicable Models: All

(Read-only) Returns the unique, settable properties for the current cal all session.

See a list of valid properties and values for each measurement class.

**Parameters**

- **[1-250]** Calibration number. The default is 1.
- **[mclass]** Optional argument. String name of the measurement class for which properties are to be returned. See a list of valid measurement class Application names. The measurement class must be included in the current Cal All calibration.

**Examples**

'with NFX app, returns:

"Noise Cal Method, Noise Tuner, AutoOrient Tuner, Tuner In, Tuner Out, Receiver Characterization Method, ENR File, Noise Source Connector, Noise Source CalKit"

**Return Type**

String of comma-separated properties.

**Default**

Not applicable

Applicable Models: All

(Read-only) Returns the valid property values for a specific property name.

See a list of valid properties and values for each measurement class.

**Parameters**

- **[1-250]** Calibration number. The default is 1.
- **<prop>** (String) Property name for which valid values are to be returned.

**Examples**

'with NFX app, returns:

"Scalar, Vector"

**Return Type**

String of comma-separated values

**Default**

Not applicable
SYSTem:CALibrate:ALL[1-250]:MClass:PROPerty:VALue[:STATe] <prop>,<value>

Applicable Models: All

(Write-Read) Sets and returns the property value for a specific property name.

See a list of valid properties and values for each measurement class.

**Parameters**

- **[1-250]** Calibration number. The default is 1.
- **<prop>** (String) Property name for which value is to be set or returned.
- **<value>** Property value. To read a list of valid values, use SYST:CAL:ALL:MCL:PROP:VAL:CAT?

**Examples**

- **Example 1:**

- **Example 2:**
  SYST:CAL:ALL:MCL:PROP:VAL "Enable Extra Power Cals","Port 1 Src2,Port3"

- **Example 3:**
  SYST:CAL:ALL:MCL:PROP:VAL "Port 1 Src2 Cal Power","-20"

**Query Syntax**

SYSTem:CALibrate:ALL:MClass:PROPerty:VALue[:STATe]? <prop>

**Return Type**

String

**Default**

Varies with the property name.

---

SYSTem:CALibrate:ALL[1-250]:PATH:CONFigure:ELEMENT[:STATe] <element>,<setting>
**Applicable Models:** N522xB, N523xB, N524xB

(Write-Read) Sets and returns the Path Configuration settings for a Cal All calibration.

**Parameters**

- **[1-250]** Calibration number. The default is 1.
- **<element>** (String) Path configuration element to be set. See a list of configurable RF Path elements and settings.
- **<setting>** (String) Path configuration element setting.

**Examples**

```plaintext
SYST:CAL:ALL:PATH:CONFigure:ELEMent "Port1NoiseTuner","Internal"
```

**Query Syntax**

```plaintext
SYSTem:CALibrate:ALL:PATH:CONFigure:ELEMent[:STATe]? <element>
```

**Return Type**

String

**Default**

Not Applicable

---

**Applicable Models:** All

(Write-Read) Sets and returns the Receiver Attenuator setting for a Cal All calibration.

**Parameters**

- **[1-250]** Calibration number. The default is 1.
- **<n>** Receiver port number.
- **<value>** Attenuation value in dB for a Cal All calibration. Choose a valid value for the VNA model. See valid settings.

While this argument can be used to make settings for ALL ports, it is designed to access ports such as an external source, true mode balanced port, or one of the Source outputs on the 2-port PNA-X model with multiple sources such as "Port 1 Src2". Otherwise, the <port> argument performs the same function. If both arguments are specified, [src] takes priority.

**Examples**

```plaintext
SYST:CAL:ALL:PORT2:REC:ATT 10
```

**Query Syntax**

```plaintext
SYSTem:CALibrate:ALL:PORT<n>:RECeiver:ATTen<value>[,src]
```

**Return Type**

Numeric

**Default**

0
SYSTem:CALibrate:ALL[1-250]:PORT<n>:RECeiver:ATTen:REFerence<num>

**Applicable Models:** N522xB, N523xB, N524xB, M9485A

**Parameters**

- **[1-250]** Calibration number. The default is 1.
- **<n>** Receiver port number.
- **<num>** Attenuation value in dB for a Cal All calibration. 0dB or 35dB.

If a number other than these is entered, the analyzer will select the next lower valid value. For example, if 19dB is entered, then 0dB attenuation will be selected.

<table>
<thead>
<tr>
<th>Examples</th>
<th>SYST:CAL:ALL:PORT2:REC:ATT:REF 0</th>
</tr>
</thead>
</table>

**Query Syntax**

SYSTem:CALibrate:ALL:PORT<n>:RECeiver:ATTen:REFerence?

**Return Type** Numeric. If querying for the standard port, the return value is 0

**Default** 35

---

SYSTem:CALibrate:ALL[1-250]:PORT<n>:RECeiver:ATTen:TEST<num>

**Applicable Models:** N522xB, N523xB, N524xB, M9485A

**Parameters**

- **[1-250]** Calibration number. The default is 1.
- **<n>** Receiver port number.
- **<num>** Attenuation value in dB for a Cal All calibration. 0dB or 35dB.

If a number other than these is entered, the analyzer will select the next lower valid value. For example, if 19dB is entered, then 0dB attenuation will be selected.

<table>
<thead>
<tr>
<th>Examples</th>
<th>SYST:CAL:ALL:PORT2:REC:ATT:TEST 0</th>
</tr>
</thead>
</table>

**Query Syntax**

SYSTem:CALibrate:ALL:PORT<n>:RECeiver:ATTen:TEST?

**Return Type** Numeric. If querying for the standard (M9376A) port, the return value is 0.
System:CALibrate:ALL[1-250]:PORT<n>:SOURce:POWer:ATTen<value>[,src]

Applicable Models: N522xB, N523xB, N524xB, M937xA, P937xA

(Write-Read) Sets and returns the Source Attenuator setting for the Cal All calibration.

Parameters

[1-250] Calibration number. The default is 1.
<n> Source port number.
<value> Attenuation value in dB for the Cal All calibration. Choose a valid value for the VNA model. See valid settings.

While this argument can be used to make settings for ALL ports, it is designed to access ports such as an external source, true mode balanced port, or one of the Source outputs on the 2-port PNA-X model with multiple sources such as "Port 1 Src2". Otherwise, the <port> argument performs the same function. If both arguments are specified, [src] takes priority.

Examples

Query Syntax
SYSTem:CALibrate:ALL:PORT<n>:SOURce:POWer:ATTen?

Return Type Numeric

Default 0

System:CALibrate:ALL[1-250]:PORT<n>:SOURce:POWer:OFFSet <value>[,src]
**Applicable Models:** All

*(Write-Read)* Sets and returns the power offset value for a Cal All calibration.

Power Offset provides a method of compensating port power for added attenuation or amplification in the source path. The result is that power at the specified port reflects the added components.

**Parameters**

- **[1-250]** Calibration number. The default is 1.
- **<n>** Source port number.
- **<value>** Power offset value in dB for a Cal All calibration.

- For amplification, use positive offset.
- For attenuation, use negative offset.

While this argument can be used to make settings for ALL ports, it is designed to access ports such as an external source, true mode balanced port , or one of the Source outputs on the 2-port PNA-X model with multiple sources such as "Port 1 Src2". Otherwise, the <port> argument performs the same function. If both arguments are specified, [src] takes priority.

**Examples**

```
```

**Query Syntax**

`SYSTem:CALibrate:ALL:PORT<n>:SOURce:POWer:OFFSet?`

**Return Type**

Numeric

**Default**

0

```
SYSTem:CALibrate:ALL[1-250]:PORT<n>:SOURce:POWer[:VALue] <value>[,src]
```
Applicable Models: All

(Write-Read) Sets and returns the power level at which a Cal All calibration is to be performed.

Parameters

- [1-250] Calibration number. The default is 1.
- <n> Source port number.
- <value> Power level at which the calibration is to be performed.

While this argument can be used to make settings for ALL ports, it is designed to access ports such as an external source, true mode balanced port, or one of the Source outputs on the 2-port PNA-X model with multiple sources such as "Port 1 Src2". Otherwise, the <port> argument performs the same function. If both arguments are specified, [src] takes priority.

<td>Numeric</td>
<td>Preset power of the VNA model.</td>
</tr>
<tr>
<td>SYST:CAL:ALL:PORT&lt;n&gt;:SOUR:POW[:VALue]?</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

See the data sheet for the power level for each model.

---

SYSTem:CALibrate:ALL[1-250]:RESet

Applicable Models: All

(Write-only) Resets all properties associated with the Cal All session to their default values.

Parameters

- [1-250] Calibration number. The default is 1.

Examples

<table>
<thead>
<tr>
<th>Query Syntax</th>
<th>Return Type</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>SYST:CAL:ALL:RES</td>
<td></td>
<td>Not Applicable</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

SYSTem:CALibrate:ALL[1-250]:SELect <value>
Applicable Models: All

(Write-Read) Sets and returns the list of channels to be calibrated during the Cal All session.

**Parameters**

| [1-250] | Calibration number. The default is 1. |
| <value> | Channel numbers to be calibrated. These channels must already exist. |

**Examples**

```
SYST:CAL:ALL:SEL 1, 2, 3
```

**Query Syntax**

SYSTem:CALibrate:ALL:SELect?

**Return Type**

Comma-separated channel numbers.

**Default**

Existing channels
System:Calibrate:Phase

Contains the settings to perform an SMC Phase Reference Calibration.

```
SYSTem:CALibrate:PHASe
   CKit
   CONNector
   DEEMbed
   FREQuency:
   | START
   | STOP
   GUIDed:
   | CHANnel?
   PORT
   POWer:ATTenuator
   REFerence:
   | CATalog?
   RESet
   UNKNown:
   | INCLude
   | INPUT:POWer
   | LO
   | FREQuency
   | POWer
```

Click on a red keyword to view the command details.

**Important Notes**

- It is **NOT** necessary to create an SMC measurement before performing a remote Phase Reference Cal. It is necessary when performed from the user interface.

- Before A..09.90, port selection was made remotely by selecting connectors and Cal Kits for the ports to be included in the SOLT calibration. With A.09.90, port selection is made explicitly with the commands in this node.

**See Also**
SYSTem:CALibrate:PHASe:CKIT <string>

**Applicable Models:** N522xB, N523xB, N524xB

*(Write-Read)* Sets and returns the Cal Kit that will be used to perform the S-parameter Cal.

To read a list of valid Cal Kits, use **SENS:e:CORR:COLL:GUID:CKIT:CAT?**

**Parameters**

- **<string>** Cal Kit.

**Examples**

```text
SYST:CAL:PHAS:CKIT "85052D"
```

**Query Syntax**

SYSTem:CALibrate:PHASE:CKIT?

**Return Type**

String

**Default**

" "

---

SYSTem:CALibrate:PHASe:CONNector <string>

**Applicable Models:** N522xB, N523xB, N524xB

*(Write-Read)* Sets and returns the connector type and gender of your Cal Kit.

To read a list of valid connector types, use **SENS:e:CORR:COLL:GUID:CONN:CAT?**

**Parameters**

- **<string>** Connector type.

**Examples**

```text
SYST:CAL:PHAS:CONN "APC 3.5 female"
```

**Query Syntax**

SYSTem:CALibrate:PHASE:CONNector?

**Return Type**

String

**Default**

" "

---

4955
SYSTem:CALibrate:PHASe:DEEMbed <bool>

Applicable Models: N522xB, N523xB, N524xB

(Write-Read) Sets and returns the state of de-embedding (reversing) the port 2 coupler.

Parameters

<bool> Port 2 coupler de-embed state. Choose from:

ON (or 1) - Configures the calibration to include additional measurements to de-embed the effects of reversing the coupler. (This is the same as clearing the “Omit Coupler” checkbox.)

OFF (or 0) - Excludes additional measurements for de-embedding the effects of reversing the coupler.

Examples SYST:CAL:PHAS:DEEM 1

Query Syntax SYSTem:CALibrate:PHASE:DEEMbed?

Return Type Boolean

Default ON or 1

SYSTem:CALibrate:PHASE:FREQuency:STARt <value>

Applicable Models: N522xB, N523xB, N524xB

(Write-Read) Sets and returns the phase reference cal start frequency.

Parameters

<value> Start frequency. Choose any frequency from 10 MHz to the stop frequency of the VNA.

Examples SYST:CAL:PHAS:FREQ:STAR 17.5e6

Query Syntax SYSTem:CALibrate:PHASE:FREQuency:STARt?

Return Type Numeric

Default Start frequency of the VNA

SYSTem:CALibrate:PHASE:FREQuency:STOP <value>
Applicable Models: N522xB, N523xB, N524xB

(Write-Read) Sets and returns the phase reference cal stop frequency.

Parameters
<value>  Stop frequency. Choose any frequency within the range of the VNA.
Examples  SYST:CAL:PHAS:FREQ:STOP 26.5e9

Query Syntax  SYSTem:CALibrate:PHAs:FRequency:STOP?
Return Type  Numeric
Default  Stop frequency of the VNA

SYSTem:CALibrate:PHAs:GUIDed:CHANnel?

Applicable Models: N522xB, N523xB, N524xB

(Read-only) Reads the channel number of the Phase Reference Calibration. Use this value as the <ch> argument for the subsequent Guided:Cal commands.

Parameters  None
Examples  chan = SYST:CAL:PHAS:GUID:CHAN?
Return Type  Numeric
Default  Not applicable

SYSTem:CALibrate:PHAs:PORT<n> <bool>

Applicable Models: N522xB, N523xB, N524xB

(Write-Read) Sets and returns the enable state for the specified port.

Parameters
<n>  Port number to enable or disable.
<bool>  Port enable state. Choose from:
ON (or 1) - Enable port <n>
OFF (or 0) - Disable port <n>
Examples  SYST:CAL:PHAS:PORT2 1
Query Syntax  SYSTem:CALibrate:PHAs:PORT<n>?
**Return Type**  Boolean

**Default**  Ports 1 and 2 are enabled.

Ports 3 and 4 (if present) are disabled

---

SYSTem:CALibrate:PHASe:POWer:ATTenuator <value>

**Applicable Models:** N522xB, N523xB, N524xB

*(Write-Read)* Sets and returns the Source Attenuator setting for the Phase Reference calibration.

**Note:** This setting MUST match the source attenuator setting at the mixer input port for subsequent SMC+Phase measurements.

**Parameters**

<value>  Attenuation value in dB. Choose a valid value for the VNA model. See valid settings.

**Examples**  SYST:CAL:PHAS:POW:ATT 10

**Query Syntax**  SYSTem:CALibrate:PHASe:POWer:ATTenuator?

**Return Type**  Numeric

**Default**  10 dB

---

SYSTem:CALibrate:PHASe:REFerence <string>

**Applicable Models:** N522xB, N523xB, N524xB

*(Write-Read)* Sets and returns the Phase Reference ID to be used for the Phase Reference calibration. Use SYST:CAL:PHAS:REF:CAT? to read the phase references currently connected to the VNA USB.

**Parameters**

<string>  Phase reference ID string.

**Examples**  SYST:CAL:PHAS:REF "MYPRT0001"

**Query Syntax**  SYSTem:CALibrate:PHASe:REFerence?

**Return Type**  String

**Default**  Not Applicable
SYSTem:CALibrate:PHASe:REFerence:CATalog?

Applicable Models: N522xB, N523xB, N524xB

(Read-only) Reads the ID strings of the phase references that are currently connected to the VNA USB.

Parameters

None

Examples

pRef = SYST:CAL:PHAS:REF:CAT?

Return Type

Comma-separated string

Default

Not Applicable

SYSTem:CALibrate:PHASe:RESet

Applicable Models: N522xB, N523xB, N524xB

(Write-only) Resets all properties associated with the Phase Reference Cal to their default values.

Parameters

None

Examples

SYST:CAL:ALL:PHAS:RES

Query Syntax

Not Applicable

Default

Not Applicable

SYSTem:CALibrate:PHASe:UNKNown:INCLude <bool>

Applicable Models: N522xB, N523xB, N524xB

(Write-Read) Sets and returns the state of Unknown Mixer calibration.

Parameters

<bool> Unknown Mixer cal state. Choose from:

ON (or 1) - Enable Unknown Mixer cal. The start frequency becomes 10 MHz and can NOT be changed.

OFF (or 0) - Disable Unknown Mixer cal.

Examples

SYST:CAL:PHAS:UNKN:INCL 1

Query Syntax

SYSTem:CALibrate:PHASe:UNKNown:INCLude?

Return Type

Boolean

Default

OFF or 0
SYSTem:CALibrate:PHASe:UNKown:INPut:POWer <value>

Applicable Models: N522xB, N523xB, N524xB

(Write-Read) Sets and returns the input power level to the unknown mixer.

Parameters

<value>  Input power level in dBm.

Examples

Query Syntax

SYSTem:CALibrate:PHASe:UNKown:INPut:POWer?

Return Type  Numeric

Default  -15 dBm

---

SYSTem:CALibrate:PHASe:UNKown:LO:FREQuency <value>

Applicable Models: N522xB, N523xB, N524xB

(Write-Read) Sets and returns the LO frequency to the unknown mixer.

Parameters

<value>  LO frequency in Hz. Choose a value between 3 GHz and (Max Frequency minus 1GHz).

For a 26.5 GHz VNA, the range is 3 GHz to 25.5 GHz.

For best results, use the default LO frequency. 3.351Ghz. This frequency produces no spurs from the input/LO frequency. And also the Input frequency will have no band breaks.

Examples

SYST:CAL:PHAS:UNK:LO:FREQ 3.351e9

Query Syntax

SYSTem:CALibrate:PHASe:UNKown:LO:FREQuency?

Return Type  Numeric

Default  3.351 GHz

---

SYSTem:CALibrate:PHASe:UNKown:LO:POWer <value>
Applicable Models: N522xB, N523xB, N524xB

(Write-Read) Sets and returns the LO power level to the unknown mixer.

Parameters

<value>  LO power level in dBm.

Examples

SYSTem:CALibrate:PHASe:UNKown:LO:POWer 10

Query Syntax

SYSTem:CALibrate:PHASe:UNKown:LO:POWer?

Return Type

Numeric

Default

10 dBm
SYSTem:CAPability Commands

Reads various capabilities of the analyzer.

    | INTernal:COUNt?
   | IF
    | MAXimum?
    | MINimum?
```
SYSTem:CAPability:HARDware:POWer Commands

These commands provide access to data sheet specified and typical, max and min power levels (in dBm). Max power refers to the maximum leveled source power at the specified port. Min power is calculated by subtracting the power sweep range from the max leveled power. This information is stored by frequency band in a power specification file. These commands provide access to the file’s contents and provide an interface to configure the port number and RF signal path of interest.

No measurement of instrument-specific dynamic range is performed; all power levels are equivalent to power data published in device data sheets. Power levels are valid only for measurement configurations where the front panel jumpers are in their standard positions, as originally shipped. Internal source attenuation and any calibrated external path loss/gain due to cables, fixtures, switches or booster amplifiers are not included in the reported min/max leveled power values. It remains the users’ responsibility to transform the reported factory power range data to a value corresponding to the specific calibration plane of their setups.

The power range data files contain both specified min/max leveled power values and the corresponding “typical” values. Some paths, that are not part of the specifications of the instrument may only have typical data. Only the “Specified” power range data is guaranteed for an instrument with an up-to-date calibration certificate.

Setting Up Power Range

The following describes the command sequence for setting up power range to query the right information.

Setup Power Range to correct path and path settings:

1. Set to the port that you would like to query leveled output power
   SYST:CAP:HARD:POW:PORT <portNum>

2. Find path elements available for the port specified (Optional)

3. Find settings for a path element name given by the above command (Optional)

4. Specify the path element and the value to query power data from

Query power limits for the port using a specific path and path settings:

Discrete frequencies: (CW)

1. Input discrete frequencies of interest

2. Query maximum power limit of each frequency in the list

3. Query minimum power limit of each frequency in the list

4. Query most restrictive maximum of all frequencies in the list
SYST:CAP:HARD:POW:DISC:MAX?

5. Query most restrictive minimum of all frequencies in the list
SYST:CAP:HARD:POW:DISC:MIN?

Frequency range: (Freq sweep)

1. Input start frequency

2. Input stop frequency

3. Query the most restrictive maximum within the specified range
SYST:CAP:HARD:POW:RANG:MAX?

4. Query the most restrictive minimum within the specified range
SYST:CAP:HARD:POW:RANG:MIN?

**SYSTEM:CAPability:FREQuency:MAXimum??**
**SYStem:CAPability:FREQuency:MAXimum?**

**Applicable Models:** All

*(Read-only)* Returns the maximum frequency of the analyzer, including any over-sweep. Over-sweep frequencies can be set but are not specified.

- **Parameters** None
- **Examples** SYST:CAP:FREQ:MAX?
- **Return Type** Numeric
- **Default** Not Applicable

**SYStem:CAPability:FREQuency:MINimum?**

**Applicable Models:** All

*(Read-only)* Returns the minimum frequency of the analyzer, including any under-sweep. Under-sweep frequencies can be set but are not specified.

- **Parameters** None
- **Examples** SYST:CAP:FREQ:MIN?
- **Return Type** Numeric
- **Default** Not Applicable

**Applicable Models:** N522xB, N523xB, N524xB, M937xA, E5080A, P937xA

*(Read-only)* Returns whether or not there is a receiver attenuator on the specified port.

- **Parameters**
  - `<portNum>` Port number. Choose from the number of test ports on the analyzer.
- **Return Type** Boolean
  - 1 - Yes, the test port has a receiver attenuator.
  - 0 - No, the test port does NOT have a receiver attenuator.
- **Default** Not Applicable

Applicable Models: N522xB, N523xB, N524xB, M937xA, E5080A, P937xA

(Read-only) Returns the maximum amount of receiver attenuation on the specified port.

Parameters
<portNum> Port number. Choose from the number of test ports on the analyzer.

Examples

Return Type Numeric
Default Not Applicable

SYSTem:CAPability:HARDware:ATTenuator:RECeiver:STEP[:SIZE]? <portNum>

Applicable Models: N522xB, N523xB, N524xB, M937xA, E5080A, P937xA

(Read-only) Returns the step size of the receiver attenuator on the specified port.

Parameters
<portNum> Port number. Choose from the number of test ports on the analyzer.

Examples

Return Type Numeric
Default Not Applicable

Applicable Models: N522xB, N523xB, N524xB, M937xA, E5080A, P937xA

(Read-only) Returns the maximum amount of source attenuation on the specified port.

Parameters
<portNum> Port number. Choose from the number of test ports on the analyzer.

Examples

Return Type Numeric
Default Not Applicable

SYSTem:CAPability:HARDware:ATTenuator:SOURce:STEP[:SIZE]? <portNum>

4970
Applicable Models: N522xB, N523xB, N524xB, M937xA, E5080A, P937xA

(Read-only) Returns the step size of the source attenuator on the specified port.

**Parameters**

- `<portNum>` Port number. Choose from the number of test ports on the analyzer.

**Examples**

```
```

**Return Type** Numeric

**Default** Not Applicable

---

Applicable Models: N522xB, N523xB, N524xB, M937xA, E5080A/B, P937xA

(Read-only) Returns a list of names of the internal DC receivers.

**Parameters** None

**Examples**

```
```

**Return Type** String of internal DC receivers separated by commas.

For example, "AI1, AI2, AIG, AOS1, AOS2"

**Default** Not Applicable

---

**SYSTem:CAPability:Hardware:DC:RECeiver:INTernal:COUNt?**

Applicable Models: N522xB, N523xB, N524xB, M937xA, E5080A/B, P937xA

(Read-only) Returns the number of internal DC receivers in the analyzer.

**Parameters** None

**Examples**

```
```

**Return Type** Numeric

**Default** Not Applicable

---

**SYSTem:CAPability:Hardware:DC:SOURce:INTernal:CATalog?**

### SYStem:CAPability:HARDware:PORTs:COUNt?

4973
Applicable Models: All

(Read-only) Returns the number of test ports including external testset ports.

Parameters: None

Examples: SYST:CAP:PORT:COUN?

Return Type: Numeric

Default: Not Applicable

SYSTem:CAPability:HARDware:PORTs:INTernal:CATalog?

Applicable Models: All

(Read-only) Returns a list of internal test port names.

Parameters: None

Examples: SYST:CAP:PORT:INT:CAT?

Return Type: String of port names separated by commas.
For example, "Port 1,Port 2,Port 3,Port 4".

Default: Not Applicable

SYSTem:CAPability:HARDware:PORTs:INTernal:COUNt?

Applicable Models: All

(Read-only) Returns the number of internal test ports.

Parameters: None

Examples: SYST:CAP:PORT:INT:COUN?

Return Type: Numeric

Default: Not Applicable

SYSTem:CAPability:HARDware:PORTs:PNUMber? <portName>
**Applicable Models:** All

(Read-only) Returns the port number associated with the specified port name.

<table>
<thead>
<tr>
<th>Parameters</th>
<th>None</th>
</tr>
</thead>
</table>

**Examples**

```plaintext
SYST:CAP:HARD:PORT:PNUM? "Port 1"
```

**Return Type** Numeric

**Default** Not Applicable

**SYSTem:CAPability:HARDware:PORTs:SOURce:CATalog?**

**Applicable Models:** All

(Read-only) Returns a list of source port names, including any configured external sources.

<table>
<thead>
<tr>
<th>Parameters</th>
<th>None</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>String of source port names separated by commas.</td>

</tbody>
</table>

**Default** Not Applicable

**SYSTem:CAPability:HARDware:PORTs:SOURce:INTernal:CATalog?**
Applicable Models: All

(Read-only) Returns a list of internal source port names.

**Parameters** None

**Return Type** String of internal source port names separated by commas.

For example, "Port 1,Port 2,Port 3,Port 4, Port 1 Src 2,Source3"

**Default** Not Applicable

---

`SYSTem:CAPability:HARDware:PORTs:SOURce:INTernal:COUNt?`

Applicable Models: All

(Read-only) Returns the number of internal source ports.

**Parameters** None

**Examples** `SYST:CAP:HARD:PORT:SOUR:INT:COUN?`

**Return Type** Numeric

**Default** Not Applicable

---

Applicable Models: N522xB, N523xB, N524xB

(Read-Write) Sets or returns the list of discrete frequencies corresponding to the powers returned by the discrete min and max power list functions.

**Parameters**

- `<freqList>` List of frequencies for which power is returned.

**Examples** `SYST:CAP:HARD:POW:DISC:FREQ:LIST 1e9,2e9,3e9,4e9`

`system:capability:hardware:power:discrete:frequency:list 10e6,100e6,1e9,10e9`

**Query Syntax** `SYSTem:CAPability:HARDware:POWer:DISCrete:FREQuency:LIST?`

**Return Type** Array

**Default** Not Applicable
SYSTem:CAPability:HARDware:POWer:DISCrete:MAXimum?

**Applicable Models:** N522xB, N523xB, N524xB

*(Read-only)* Returns a single max leveled power value (in dBm) indicating the most restrictive maximum for all discrete maximum powers (the minimum of all max leveled powers).

<table>
<thead>
<tr>
<th>Parameters</th>
<th>None</th>
</tr>
</thead>
</table>
| Examples   | SYST:CAP:HARD:POW:DISC:MAX?  
System:capability:hardware:power:discrete:maximum? |
| Return Type| Double |
| Default    | Not Applicable |

SYSTem:CAPability:HARDware:POWer:DISCrete:MAXimum:LIST?

**Applicable Models:** N522xB, N523xB, N524xB

*(Read-only)* Returns an array of max leveled power values (in dBm), where each element corresponds to the maximum leveled power possible for CW stimulus at the corresponding frequency set by the SYSTem:CAPability:HARDware:POWer:DISCrete:FREQuency:LIST command.

<table>
<thead>
<tr>

System:capability:hardware:power:discrete:maximum:list? |
| Return Type| Array |
| Default    | Not Applicable |

SYSTem:CAPability:HARDware:POWer:DISCrete:MINimum?
**Applicable Models:** N522xB, N523xB, N524xB

*(Read-only)* Returns a single minimum power value (in dBm) indicating the most restrictive minimum for all discrete minimum powers (the maximum of all minimum powers).

**Parameters** None

**Examples**

```
SYST:CAP:HARD:POW:DISC:MIN?

system:capability:hardware:power:discrete:minimum?
```

**Return Type** Double

**Default** Not Applicable

---

**SYSTem:CAPability:HARDware:POWer:DISCrete:MINimum:LIST?**

**Applicable Models:** N522xB, N523xB, N524xB

*(Read-only)* Returns an array of minimum power values (in dBm), where each element corresponds to the minimum power possible for CW stimulus at the corresponding frequency set by the SYSTem:CAPability:HARDware:POWer:DISCrete:FREQuency:LIST command.

**Parameters** None

**Examples**

```

System:capability:hardware:power:discrete:minimum:list?
```

**Return Type** Array

**Default** Not Applicable

---

**SYSTem:CAPability:HARDware:POWer:PATH:CONFig:ELEMent:CATalog?**

**Applicable Models:** N522xB, N523xB, N524xB

*(Read-only)* Returns a string with the names of all valid RF path configuration elements.

**Parameters** None

**Examples**

```

```

**Return Type** String

**Default** Not Applicable
SYSTem:CAPability:HARDware:POWer:PATH:CONFig:ELEMent[:STATe]
<element>,<setting>

Applicable Models: N522xB, N523xB, N524xB

(Read-Write) Returns the name of the value for the given path element name or sets the value of a path element.

Parameters
<element>  String - Choose from all path elements listed with SYST:CAP:_HARD:POW:PATH:CONF:ELEM:CAT?.

Examples
SYST:CAP:_HARD:POW:PATH:CONF:ELEM "Src1Out1LowBand","HiPwr"
SYST:CAP:_HARD:POW:PATH:CONF:ELEM:STAT "Port1Bypass","Thru"

Query Syntax
SYSTem:CAPability:HARDware:POWer:PATH:CONFig:ELEMent:STATe?
“Src2Out1LowBand”

Returns the setting for the specified element.

Return Type
String
Default  Not Applicable

Applicable Models: N522xB, N523xB, N524xB

(Read-only) Returns all valid values for the given path configuration element.

Parameters
<PathElementName>  (String) Chose from all path elements (see PATH:CONF:ELEM:CAT?)

Examples

Return Type
String
Default  Not Applicable

SYSTem:CAPability:HARDware:POWer:PORT <portNum>
**Applicable Models:** N522xB, N523xB, N524xB

*(Read-Write)* Sets and reads the port number for power range data. When two sources are available in combiner mode, refer to the portNum selections below.

### Parameters

<portNum> Port number. Choose from:

1 - Port 1.
2 - Port 2.
3 - Port 3 (4-port instrument) or Src2-Out1 (2-port instrument with option 224).
4 - Port 4 (4-port instrument) or Src2-Out2 (2-port instrument with option 423).
5 - Src2Out1LowBand (2-port with option 224 or 4-port with option 423).
6 - Source 3

### Examples

SYST:CAP:HW:POW:PORT 1

### Query Syntax

SYSTem:CAPability:HW:POW:PORT?

### Return Type

Integer

### Default

Not Applicable

SYSTem:CAPability:HW:POW:RANGe:FREQuency:STARt <num>
**Applicable Models:** N522xB, N523xB, N524xB

*(Read-Write)* Sets or returns the lower bound of the frequency range used for range based power min and max.

**Parameters**

| <num> | Start frequency. Choose a number within the frequency limits of the analyzer. Units are Hz. |

**Examples**

| system:capability:hardware:power:range:frequency:start 1e9 |

**Query Syntax**

SYSTem:CAPability:HARDware:POWer:RANGe:FREQuency:STARt?

**Return Type**

Double

**Default**

Not Applicable

---

**SYSTem:CAPability:HARDware:POWer:RANGe:FREQuency:STOP <num>**

**Applicable Models:** N522xB, N523xB, N524xB

*(Read-Write)* Sets or returns the upper bound of the frequency range used for range based power min and max.

**Parameters**

| <num> | Stop frequency. Choose a number within the frequency limits of the analyzer. Units are Hz. |

**Examples**

**Query Syntax**

SYST:CAP:HW:POW:RANG:FREQ:STOP?

**Return Type**

Double

**Default**

Not Applicable

---

**SYSTem:CAPability:HARDware:POWer:RANGe:MAXimum?**
Applicable Models: N522xB, N523xB, N524xB

(Read-only) Returns the minimum of all max leveled power values (in dBm) from range start frequency to stop frequency (inclusive).

Parameters
None

Examples
SYST: CAP: HARD: POW: RANG: MAX?

Return Type
Double
Default
Not Applicable

System: Capability: Hardware: Power: Range: Minimum?

Applicable Models: N522xB, N523xB, N524xB

(Read-only) The maximum of all min power values (in dBm) from range start frequency to stop frequency (inclusive).

Parameters

Examples
SYST: CAP: HARD: POW: RANG: MIN?

Return Type
Double
Default
Not Applicable

System: Capability: Hardware: Power: Reset

Applicable Models: N522xB, N523xB, N524xB

(Write-only) Resets all power range properties to default values, as if the instrument had been preset. Power range type is set to SPECified, port number is set to 1 with all path configuration elements in their default states.

Parameters
None

Examples
SYST: CAP: HARD: POW: RES
system: capability: hardware: power: reset

Default
Not Applicable

System: Capability: Hardware: Power: Type <enum>
Applicable Models: N522xB, N523xB, N524xB

(Read-Write) Sets and reads the type of power range data (specified or typical) to be returned.

Parameters
<enum> Choose from:

**SPECified** - Warranted performance.

**TYPical** - Typical performance.

Examples

<table>
<thead>
<tr>
<th>SYST:CAP:HARD:POW:TYPE SPEC</th>
</tr>
</thead>
<tbody>
<tr>
<td>system:capability:hardware:power:type typical</td>
</tr>
</tbody>
</table>

Query Syntax
SYSTem:CAPability:HARDware:POWer:TYPE?

Return Type
Enumeration

**Default** SPECified

---

Applicable Models: All

(Read-only) Returns whether or not the specified port number has a reference bypass switch.

Parameters

<portNum> Port number. Choose from the number of test ports on the analyzer.

Examples

Return Type

Boolean

1 - Yes, the test port has a reference bypass switch.

0 - No, the test port does NOT have a reference bypass switch.

**Default** Not Applicable

---

SYSTem:CAPability:HARDware:RECeiver:INTernal:COUNt?

</table>
Applicable Models: All

*(Read-only)* Returns the list of licenses. See a list of common licenses.

**Parameters**

Choose from:

**VALID** - Return a list of licenses which have enabled VNA features. For PXI/USB VNA, only software licenses are returned. For PNA/ENA, all options including hardware are returned.

**ALL** - Return a list of all installed licenses/options in the Keysight License Manager including the ones not related to the VNA software.

**IGNORED** - Return a list of VNA software licenses which are either invalid or ignored. This can occur when a transportable license is transported to an instrument that does not support the license feature. In addition, this can occur when multiple licenses for the same base feature are installed and only the least restrictive license is used (the more restrictive licenses are ignored). For example, when transporting multiple Spectrum Analyzer licenses to the same instrument, the license with the greatest frequency range is used and the other licenses are ignored.

**Note:** Licenses not related to the VNA software but installed on the instrument are not reported as ignored when using **IGNORED**.

**Examples**

```
SYST:CAP: LIC: CAT? ALL
"N5242B-423, N5242B-020, N5242B-021, N5242B-022, S93029A/B-1FP"
```

**Return Type**

Variant array of string values

**Default**

Not Applicable

```
SYSTem:CAPability:NBW:NOISe:CATalog?
```
Applicable Models: N522xB, N523xB, N524xB, M937xA, P937xA, M980xA, P50xxA

(Read-only) Returns the list of supported Noise Bandwidth values when using a noise receiver (option 029). Learn more about Opt. 029.

Parameters  None
Examples  SYST:CAP:NBW:NOIS:CAT?
Return Type  Variant array of string values
Default  Not Applicable

SYSTem:CAPability:NBW:STD:CATalog?

Applicable Models: N522xB, N523xB, N524xB, M937xA, P937xA

(Read-only) Returns the list of supported Noise Bandwidth values when using the NA receiver for noise measurements (option 028). Learn more about Opt 028.

Parameters  None
Examples  SYST:CAP:NBW:STD:CAT?
Return Type  Variant array of string values
Default  Not Applicable

SYSTem:CAPability:POINts:MAXimum?

Applicable Models: All

(Read-only) Returns the maximum number of points.

Parameters  None
Examples  SYST:CAP:POIN:MAX?
Return Type  Numeric
Default  Not Applicable

SYSTem:CAPability:POINts:MINimum?
Applicable Models: All

(Read-only) Returns the minimum number of points.

<table>

SYSTem:CAPability:RBW:IMS:CATalog?
Applicable Models: N522xB, N523xB, N524xB, M937xA, P937xA

(Read-only) Returns the list of supported Resolution BW values for the IMSpectrum channel. Learn more about IMSpectrum.

Parameters

None

Examples

SYST:CAP:RBW:IMS:CAT?

Return Type

Variant array of string values

Default

Not Applicable

SYSTem:CAPability:RBW:SA:CATalog?

Applicable Models: All with Spectrum Analysis Options (S9x09xA/B, S9x090A/B)

(Read-only) Returns the list of supported Resolution BW values for the SA channel. Learn more about the SA application.

Parameters

None

Examples

SYST:CAP:RBW:SA:CAT?

Return Type

Variant array of string values

Default

Not Applicable

SYSTem:CAPability:SUPPort:DWELl? <ifBandwidth>

Applicable Models: VNAs with S93070xA/B or S95070A/B

(Read-only) Returns whether a given IF Bandwidth value supports dwell time (dwell time between each sweep point). Dwell time can be used for all IF Bandwidth values.

Parameters

<ifBandwidth> IF Bandwidth value.

Examples

SYST:CAP:SUPP:DWEL? 1E3

Return Type

Boolean

0 = False

1 = True

Default

Not Applicable
SYSTem:CAPability:SUPPort:RIFBw?

Applicable Models: VNAs with S93070xA/B or S95070A/B

(Read-only) Returns whether the VNA supports the Reduce IF BW at Low Frequencies feature. The noise floor increases at low frequencies. By reducing the IFBW automatically, the noise floor is kept constant. Otherwise, measurements get noisier at low frequencies. When a constant bandwidth is required (for pulse measurement for instance), then the Reduce IF BW at Low Frequencies is turned off.

Parameters None

Examples SYST:CAP:SUPP:RIFB?

Return Type Boolean

0 = False

1 = True

Default Not Applicable

SYSTem:CAPability:WINDows:MAXimum[:COUNt]?

Applicable Models: All

(Read-only) Returns the maximum number of windows. Learn more.

Parameters None

Examples SYST:CAP:WIND:MAX?

Return Type Numeric

Default Not Applicable

SYSTem:CAPability:WINDows:TRACes:MAXimum[:COUNt]?

Applicable Models: All

(Read-only) Returns the maximum number of traces per window. Learn more.

Parameters None

Examples SYST:CAP:WIND:TRAC:MAX?

Return Type Numeric

Default Not Applicable

SYSTem:COMMunicate:ECAL<mod>:CLIS?
**SyStem:ComMuNicate:ECAL:CLiST?**

**Applicable Models:** All

*(Read-only)* Returns a list of characterizations stored in the specified ECal module.

**Parameters**

<mod> ECal module from which to read user characterization numbers. Choose from 1 to 50. If unspecified, value is set to 1.

**Examples**

```
Module 1 contains User Characterizations 1 and 3.
SYST:COMM:ECAL:CLIST?
'REturns the following (0 always indicates the factory characterization):
0,1,3
```

**Return Type** Numeric list, separated by commas.

**Default** Not Applicable

**SyStem:ComMuNicate:ECAL:COUNt?**

**Applicable Models:** All

*(Read-only)* Returns the number of installed cal kits.

**Examples**

```
SYST:COMM:ECAL:COUNt?
```

**Query Syntax**

SYST:COMM:ECAL:COUNt?

**Return Type** Numeric

**Default** Not Applicable

**SyStem:ComMuNicate:ECAL:DMEMory:CLEar <kitName>**
Applicable Models: All

(Write-only) Deletes user characterizations from VNA disk memory.

Parameters

<kitName>  Optional String argument. ECal Model, User Characterization name + " ECal", and serial number of the ECal module, separated by spaces. See examples below.

If unspecified, ALL User Characterizations that are stored in VNA disk memory are deleted.

Examples

'SThese examples all use "MyUserChar" as the User characterization name.

'The "My User Char" characterization is deleted from disk memory.

SYST:COMM:ECAL:DMEM:CLE "N4433A MyUserChar ECal 00001"

'All User characterizations are deleted from disk memory.

SYST:COMM:ECAL:DMEM:CLE

Query Syntax

Not Applicable

Default

Not Applicable

SYSTem:COMMunicate:ECAL:DMEMory:IMPort <file>

Applicable Models: All

(Write-only) After the VNA disk memory is Exported to a file, use this command to Import the file into VNA disk memory, which allows the User Characterization to be used with the VNA and ECal module.

Note: An ECal confidence check can NOT be performed remotely from User Characterizations that are stored on the VNA disk.

Parameters

<file>  String. Full path and file name of file that was exported.

Examples

SYST:COMM:ECAL:DMEM:IMP "c:\users\public\network analyzer\ECal User Characterizations/myDiskUserChar.euc"

Query Syntax

Not Applicable

Default

Not Applicable
SYSTem:COMMunicate:ECAL:EXP ort <kit>,[<file>],[<NewName>]]

Applicable Models: All

(Write-only) Saves an existing ECal characterization to a file. Use this command to archive the user characterization or to move the characterization to a different VNA for use with the specified ECal module. After exporting the user characterization, use SYST:COMM:ECAL:DMEM:IMPort to make the user characterization available for use.

Parameters

- **<kit>** String. Not case sensitive. ECal Model, User char name + " ECal", and serial number of the ECal module used for the characterization, separated by spaces. See examples below.

  If the model and serial number of the module is not found, an error is returned.

- **[<file>]** Optional String argument. Path and filename of the user characterization. If not specified, the file is saved using characterization name + ".euc". If the path is not specified, it is stored in C:\Program Files(x86)\Keysight\Network Analyzer\E Cal User Characterizations\ The extension ".euc" is appended if one is not specified.

- **[<NewName>]** Optional String argument. This allows you to change the name for the User Characterization. When specified, the new name is saved in the file with the characterization. If unspecified, the existing user characterization name is saved.

  **Note:** If this argument is specified, the second argument (<file>) must also be specified.

Examples

- These examples all use "MyUserChar" as the User characterization name.

  - All parameters specified

    SYST:COMM:ECAL:EXP "N4433A MyUserChar ECal 00001","myUserChar.euc","NewUserChar"

  - First two parameters are specified

    system:communicate:ecal:export "N4691B MyUserChar ECal 00500","myUserChar.euc"

  - Only first parameter is specified

    SYST:COMM:ECAL:EXP "N4433A MyUserChar ECal 00001"

Query Syntax

Not Applicable
SYSTem:COMMunicate:ECAL:EXPort:SNP <kit>,<ecalState>,<snpFileName>

**Applicable Models:** All

(Write-only) Read S parameter of ECal Thru from the ECal memory and save it as s2p file.

**Parameters**

- **<kit>**  String. Not case sensitive. ECal Model, User char name + " ECal", and serial number of the ECal module used for the characterization, separated by spaces. See examples below.
  
  If the model and serial number of the module is not found, an error is returned.

- **<ecalState>**  ECal transmission path. Choose from AB, AC, AD, BA, BC, BD, CA, CB, CD, DA, DB or DC. Not case sensitive.

- **<snpFileName>**  Path and filename of the output s2p file name.

**Examples**  

```
SYST:COMM:ECAL:EXP "N4433A ECal 00001","BC","D:\ecal thru.s2p"
```

**Query Syntax**  

Not Applicable

**Default**  

Not Applicable

---

SYSTem:COMMunicate:ECAL<mod>:INFormation? [<char>]

---

4997
Applicable Models: All

(Read-only) Reads the identification and characterization information from the specified ECal module.

Note: To read user-characterization information that is stored in VNA disk memory, then use SYST:COMM:ECAL:KNAM:INF?

Parameters

<mod> ECal module from which to read characterizations. Choose from 1 through 50. If unspecified, value is set to 1.

Do NOT assume the <mod> number is the order in which ECal modules were connected.

Use SYST:COMM:ECAL:LIST? to read a list of <mod> numbers of currently-attached ECal modules.

<char> Optional argument. Specifies which characterization to read information from. If not specified, value is set to CHAR0.

Choose from:

- CHAR0 Factory characterization (data that was stored in the ECal module by Keysight)
- CHAR1 User characterization #1
- CHAR2 User characterization #2
- ... through ...
- CHAR12 User characterization #12

Examples

SYST:COMM:ECAL2:INFormation? char5

'Example return string:

"ModelNumber: 85092-60007, SerialNumber: 01386, ConnectorType: N5FN5F, PortAConnector: Type N (50) female, PortBConnector: Type N (50) female, MinFreq: 30000, MaxFreq: 9100000000, NumberOfPoints: 250, Calibrated: July 4 2002"

Return Type Character

Default Not Applicable

SYSTem:COMMunicate:ECAL:KNAMe:INFormation? <kitName>
Applicable Models: All

(Read-only) Reads the identification and characterization information from the specified ECal module or VNA disk memory.

Learn more about User Characterization in VNA Disk Memory.

Parameters

<kitName> String. ECal model and characterization to read information from, enclosed in quotes, in the following format:

<model> <name> ECal <serial number>

Where:

<model>: Always required

<name>:

- For the factory characterization, do not specify.
- For a user-characterization stored in the module, use User <n> in the string, where <n> is the user-characterization number. Not case sensitive. Separate User and <n> with a space.
- For a user-characterization stored in VNA disk memory, use <charName> from SENS:CORR:CKIT:ECAL:CHAR:DMEM:SAVE <charName>

ECal - not case sensitive

<serial number>: Optional. Include when two or more ECal modules with same model number are attached to the VNA,

Each item is separated with a space.

Examples

'For a factory characterization in module memory:

'For user characterization in module memory with optional serial number:
SYST:COMM:ECAL:KNAM:INF? "N4433A User 1 ECal 00028"

'For user characterization "foo" in disk memory:
SYST:COMM:ECAL:KNAM:INF? "N4433A foo ECal 00028"

'Example return string:

"ModelNumber: N4433A, SerialNumber: 00028, ConnectorType: N5FN5F, PortAConnector: Type N (50) female, PortBConnector: Type N (50) female, MinFreq: 30000, MaxFreq: 9100000000,"
**SYSTem:COMMunicate:ECAL:LIST?**

**Applicable Models:** All

(Read-only) Returns a list of index numbers for ECal modules that are currently attached to the VNA. Use these numbers (called <mod> in VNAHelp) to refer to the ECal module using SCPI commands.

**Examples**

```
SYST:COMM:ECAL:LIST?

'If 2 modules are attached to the VNA
'then the returned list will be:
+1,+2

'If NO modules are attached to the VNA
'then the returned list will be:
+0
```

**Return Type** Numeric list, separated by commas.

**Default** Not Applicable

---

**SYSTem:COMMunicate:ECAL<n>:PATH:COUNt? <path>**

**Applicable Models:** All

(Read-only) Returns the number of unique states that exist for the specified path name on the selected ECal module.

This command performs exactly the same function as `CONT:ECAL:MOD:PATH:COUNt?`

Use the `CONT:ECAL:MOD:PATH:STAT` command to set the module into one of those states.

Use `SENS:CORR:CKIT:ECAL:PATH:DATA?` to read the data for a state.

**Parameters**

- `<n>` USB number of the ECal module. Choose from 1 to 50.

  If unspecified (only one ECal module is connected to the USB), `<n>` is set to 1. If two or more modules are connected, use `SYST:COMM:ECAL:LIST?` to determine how many, and `SYST:COMM:ECAL:INF?` to verify their identities.
<path> Name of the path for which to read number of states. Choose from:

Reflection paths

- A
- B
- C (4-port modules)
- D (4-port modules)

Transmission paths

- AB
- AC (4-port modules)
- AD (4-port modules)
- BC (4-port modules)
- BD (4-port modules)
- CD (4-port modules)

Examples

SYST:COMM:ECAL:PATH:COUNt?
system:communicate:ecal:path:count?

Return Type

- Integer

Default

- Not Applicable

SYSTem:COMMunicate:GPIB:PMETer[:ADDRESS] <num> Superseded
**Applicable Models:** N522xB, N523xB, N524xB, M937xA, P937xA

**Note:** This command is replaced with `SYST:COMM:PSEnson`.

*(Read-Write)* Specifies the GPIB address of the power meter to be used in a source power calibration. When performing a source power cal, the VNA will search VISA interfaces that are configured in the Keysight IO Libraries on the VNA.

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;num&gt;</td>
<td>GPIB address of the power meter. Choose any integer between 0 and 30.</td>
</tr>
</tbody>
</table>

**Examples**

```plaintext
SYST:COMM:GPIB:PMET 13
```

```
system:communicate:gpi:pmeter:address 14
```

**Query Syntax**

```
SYSTem:COMMunicate:GPIB:PMETer[:ADDRess]?
```

**Return Type**

Numeric

**Default**

13

**Applicable Models:** All

*(Read-only)* Returns the ID string of power meters / sensors that are connected to the VNA via GPIB. Optionally, the visa address is returned. Use the list to select a power sensor for a *source power cal*.

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;optional bool&gt;</td>
<td>Choose from:</td>
</tr>
</tbody>
</table>

| ON or 1               | Returns the visa address.                                                     |
| OFF or 0              | Does not return the visa address.                                             |

**Examples**

```plaintext
SYST:COMM:USB:PMET:CAT? ON
```

```
system:communicate:usb:pmeter:catalog?
```

**Return Type**

Comma-delimited strings. Two power sensor strings are separate by a semicolon.

**Default**

OFF

**SYSTem:COMMunicate:GPIB:RDEVice:CLOSE <ID>**

5002
Applicable Models: N522xB, N523xB, N524xB, M937xA, P937xA

(Write only) Closes the remote GPIB session. This command should be sent when ending every successful OPEN session.

Parameters

- `<ID>` Session identification number that was returned with the OPEN? command.

Examples

See an example program

Query Syntax

Not Applicable

Default

Not Applicable

SYSTem:COMMunicate:GPIB:RDEVice:OPEN <bus>, <addr>, <timeout>

Applicable Models: N522xB, N523xB, N524xB, M937xA, P937xA

(Read-Write) Initiates a GPIB pass-through session. First send this OPEN command, then send the OPEN query to read the session ID number. An existing GPIB pass-through session remains open after an instrument preset.

To learn more about GPIB pass-through capability, see the example program.

Parameters

- `<bus>` Bus ID number.

You can find the USB-GPIB adapter bus number by looking at the dialog that appears when the USB-GPIB device is connected. Error 1073 indicates the bus or address number is incorrect.

Use 0 (zero) when connected using a GPIB cable to the VNA controller port.

- `<addr>` GPIB Address of the device to be controlled

- `<timeout>` The amount of time (in milliseconds) to wait for a response from the remote device after sending a command. A "timeout" error is displayed after this time has passed without a response.

Examples

See an example program

Query Syntax

SYSTem:COMMunicate:GPIB:RDEVice:OPEN?

Returns the session identification number that is used when communicating with this device.

Return Type

Numeric
SYSTem:COMMunicate:GPIB:RDEVice:READ? <ID>

Applicable Models: N522xB, N523xB, N524xB, M937xA, P937xA

(Read-only) Returns data from the GPIB pass-through device.

Parameters

- **<ID>** Session identification number that was returned with the OPEN? command.

Examples

- See an example program

Return Type String

- **Default** Not Applicable

SYSTem:COMMunicate:GPIB:RDEVice:RESet

Applicable Models: N522xB, N523xB, N524xB, M937xA, P937xA

(Write-only) Performs the same function as SYST:COMM:GPIB:RDEV:CLOS except that ALL pass-through sessions are closed.

Examples

- SYST:COMM:GPIB:RDEV:RES

- **Default** Not Applicable

SYSTem:COMMunicate:GPIB:RDEVice:WBINary <ID>,<data>
(Write-only) Sends data to a GPIB pass-through device. This command requires a header that specifies the size of the data to be written. The header (described below) is not passed along to the device.

Use this command if too many embedded quotes prevent you from using `SYST:COMM:GPIB:RDEV:WRIT`.

Use `SYST:COMM:GPIB:RDEV:OPEN` to open the pass through session.

**Parameters**

- `<ID>`: Session identification number that was returned with the `OPEN?` command.
- `<data>`: Data to be sent to the GPIB pass-through device. Use the following syntax:
  
  #<num digits><byte count><data bytes><NL><END>

  * `<num_digits>` specifies how many digits are contained in `<byte_count>`
  
  * `<byte_count>` specifies how many data bytes will follow in `<data bytes>`

**Examples**

```
SYSTem:COMMunicate:GPIB:RDEVice:WBINary 101,#17ABC+XYZ<nl><end>
```

# - always sent before data.

1 - specifies that the byte count is one digit (7).

7 - specifies the number of data bytes that will follow, not counting `<NL><END>`.

`ABC+XYZ` - Data block

`<nl><end>` - always sent at the end of block data.

The following example sends a line feed at the end.

```
SYST:COMM:GPIB:RDEV:WBIN 1,#210SYST:PRES<EOL>
```

The `<EOL>` represents your linefeed character.

**Query Syntax**

Not Applicable

**Default**

Not Applicable

```
SYSTem:COMMunicate:GPIB:RDEVice:WBLock <ID>,<data>
```
**Applicable Models:** N522xB, N523xB, N524xB, M937xA, P937xA

*(Write-only)* Same as `SYSTem:COMM:GPIB:RDEV:WBIN` (above) but the header IS passed along to the device.

Use this command if too many embedded quotes prevent you from using `SYST:COMM:GPIB:RDEV:WRIT`.

**Parameters**

- `<ID>` Session identification number that was returned with the `OPEN?` command.
- `<data>` Data to be sent to the GPIB pass-through device. See previous command.

**Examples**

See previous example.

**Query Syntax**

Not Applicable

**Default**

Not Applicable

---

`SYSTem:COMMunicate:GPIB:RDEVice:WRITe <ID>,<string>`

**Applicable Models:** N522xB, N523xB, N524xB, M937xA, P937xA

*(Write-only)* Sends ASCII string data to the GPIB pass-through device.

A line feed is NOT appended to the string data. To send a line feed, see the example in `SYST:COMM:GPIB:RDEV:WBIN`.

**Parameters**

- `<ID>` Session identification number that was returned with the `OPEN?` command.
- `<string>` Commands to be sent to the GPIB pass-through device.

**Examples**

See an example program

**Query Syntax**

**Default**

Not Applicable

---

`SYSTem:COMMunicate:LAN:HOSTname?`
Applicable Models: All

(Read-only) Returns the LAN hostname that is visible in the Help, About Network Analyzer dialog box. Learn more. This is the same information that is visible on the LXI compliance dialog.

Parameters
None

Example
SYST:COMM:LAN:HOSTname?

Return Type
String

Default
Not applicable

SYSTem:COMMunicate:PSENsor <char>, <string>

Applicable Models: All

This command replaces SYST:COMM:GPIB:PMET:ADDR.

(Read-Write) Specifies the type and location of the power meter to be used in a source power calibration.

Parameters

<char> Type of power meter/ sensor. Choose from:

- GPIB  GPIB power meter
- USB  USB power sensor or USB power sensor
- LAN  LAN enabled power meter
- ANY  Any VISA resource string or a visa alias

<string> For GPIB, address of the power meter. Choose any integer between 0 and 30.

For USB, the ID string of the power meter or power sensor. Use SYST:COMM:USB:PMET:CAT? to see a list of ID strings of connected power meters and sensors.

For LAN, the hostname or IP address of the power meter.

For ANY, any VISA resource string or a visa alias.

Examples
SYST:COMM:PSEN gpib, "14"
system:communicate:psensor usb, "Keysight Technologies,U2000A,MY12345678"
syst:comm:psen lan, "mymeter.Keysight.com"

**Applicable Models:** All

*(Read-only)* Returns the ID string of power meters / sensors that are connected to the VNA USB. Optionally, the visa address is returned. Use the list to select a power sensor for a source power cal.

These meter/sensor ID strings can NOT be used as the resource string for configuring a USB-based PMAR (*SYST:CONF:EDEV:IOConfig)*.

**Parameters**

Choose from:

- **ON** or **1** - Returns the visa address.
- **OFF** or **0** - Does not return the visa address.

**Examples**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
</table>

**Return Type**

Comma-delimited strings. Two power sensor strings are separate by a semicolon.

**Default**

OFF

---

SYSTem:COMMunicate:TCPip:CONTrol?
Applicable Models: All

(Read-only) Queries the TCP/IP port number to use for opening a TCP/IP socket control connection to the VNA. The control connection is used for two purposes:

1. To perform a Device Clear operation on the VNA
2. To detect when a Service Request (SRQ) event occurs on the VNA.

The port number can range from 5000 to 5099. The VNA will skip over 5025 as it is being used for the primary socket connection.

To detect an SRQ, your program sends the appropriate commands via the regular socket connection to set up for an SRQ event to occur the same sequence of commands as if you were sending them via GPIB. You write your program so that while your program is doing SCPI transactions on the standard socket connection, a second thread of execution in your program detects the SRQ on the control connection and responds to the event. When the SRQ event occurs, the VNA sends a SRQ +xxx/n message on the control connection (where /n is linefeed character, ASCII value 10 decimal). The xxx value in the SRQ +xxx/n string is the IEEE 488.2 status byte at the time the SRQ was generated. So listening for that on the control connection is how your program detects the event. If for your socket communication you're using a software API that provides for asynchronous communication via a callback mechanism (for example, if you're using Microsoft's winsock API, or their .NET Socket class as in the example program below), in that case your listener execution thread is created implicitly for you so your program doesn't have to create one explicitly.

Note: If this SCPI query is sent to the VNA via a SCPI parser other than a TCP/IP socket connection (for example, if sent via GPIB), the query is not applicable in that case and will return value of 0.

<table>
<thead>
<tr>
<th>Parameters</th>
<th>None</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example</td>
<td>See example program</td>

<td>Not applicable</td>
</tr>
</tbody>
</table>

SYSTem:COMMunicate:VISA:RDEVice:CLOSE <ID>
**Applicable Models:** N522xB, N523xB, N524xB, E5080A

(Write only) Closes the specified remote VISA session. VISA sessions should always be closed when you are finished communicating with the remote device. Use this command to close (end) each VISA session that was opened successfully using the OPEN command. If you have more than one open session, and need to close them all at the same time, it may be faster and easier to use the RESet command.

**Parameters**

- `<ID>` VISA session number (see SYST:COMM:VISA:RDEV:OPEN[?]).

**Examples**

```
SYST:COMM:VISA:RDEV:CLOS 1
system:communicate:visa:rdevice:close 2
```

**Query Syntax**

Not Applicable

**Default**

Not Applicable

---

**SYSTem:COMMunicate:VISA:RDEVice:FIND? <VISA regex> [,<ADDRess|ALIas>]**

**Applicable Models:** All

(Read-only) Returns a comma separated list of either VISA address strings or aliases.

**Parameters**

- `<VISA regex>` (String) VISA regular expressions are expressions defined by the user to find devices that have been set up on the VISA interface. The following are examples of VISA regular expressions:

<table>
<thead>
<tr>
<th>Interface</th>
<th>Expression</th>
</tr>
</thead>
<tbody>
<tr>
<td>GPIB</td>
<td>GPIB[0-9]*::?*INSTR</td>
</tr>
<tr>
<td>PXI</td>
<td>PXI?*INSTR</td>
</tr>
<tr>
<td>VXI</td>
<td>VXI?*INSTR</td>
</tr>
<tr>
<td>GPIB-VXI</td>
<td>GPIB-VXI!?*INSTR</td>
</tr>
<tr>
<td>GPIB and GPIB-VXI</td>
<td>GPIB?*INSTR</td>
</tr>
<tr>
<td>All VXI</td>
<td>?<em>VXI[0-9]</em>::?*INSTR</td>
</tr>
<tr>
<td>ASRL</td>
<td>ASRL[0-9]*::?*INSTR</td>
</tr>
<tr>
<td>All</td>
<td>?<em>INSTR or ?</em></td>
</tr>
</tbody>
</table>

Note that using "INSTR" in the VISA regular expression finds "instruments." To search all interfaces, use "?*".
<ADDRess|ALIas>  Optional. Determines whether addresses or aliases are returned.

**Note:** The list of aliases may have less or more entries than the list of addresses because not all addresses will have aliases, and one address can have more than one alias.

### Examples

```
SYST:COMM:VISA:RDEV:FIND? "?*", ADDR
system:communicate:visa:rdevice:find? '??*INSTR', alias
```

### Return Type

**Default** Addresses returned if no return-type specified

---

**SYSTem:COMMunicate:VISA:RDEVice:OPEN <addr>, <timeout>**

**Applicable Models:** N522xB, N523xB, N524xB, E5080A

*Read-Write* Initiates a VISA pass-through session for a device. Immediately after successfully sending this command, send an OPEN? query to retrieve the unique session ID that is to be used whenever communicating with the device. Pass-through sessions can be closed by using the CLOSE command, the RESet command, or by properly shutting down the instrument or the analyzer application. Presetting the instrument will not close existing pass-through sessions.

**Note:** When opening a socket session (addresses of type: “TCP/IP[board]:host address::port::SOCKET”), you must use the appropriate VISA Address for the identifier argument. Using an alias to open a socket session is not currently supported. Aliases are allowed for all other types of supported sessions.

### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;addr&gt;</td>
<td>VISA Address or alias name of the device to be controlled</td>
</tr>
<tr>
<td>&lt;timeout&gt;</td>
<td>The amount of time (in milliseconds) to wait for a response from the remote device after sending a command. A &quot;timeout&quot; error is displayed after this time has passed without a response.</td>
</tr>
</tbody>
</table>

### Examples

```
SYST:COMM:VISA:RDEV:OPEN 'TCPIP0::A-N5242A-10096::hislip1::INSTR', 1000
system:communicate:visa:rdevice:open 'MyAliasName', 7000
```

### Query Syntax

**SYSTem:COMMunicate:VISA:RDEVice:OPEN?**

Returns the VISA session identification number to be used when communicating with this device.

### Return Type

**Default** Numeric

**Not Applicable**
SYStem:COMMunicate:VISA:RDEVice:READ? <ID>

**Applicable Models:** N522xB, N523xB, N524xB, E5080A

(Read-only) Returns data from the VISA pass-through device.

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;ID&gt;</td>
<td>VISA session number (see SYST:COMM:VISA:RDEV:OPEN[?]).</td>

**Return Type** String

**Default** Not Applicable

---

SYStem:COMMunicate:VISA:RDEVice:RESet

**Applicable Models:** N522xB, N523xB, N524xB, E5080A

(Write-only) Closes all currently open VISA pass-through sessions. See also CLOSe to close only one session at a time.

**Examples**

<table>
<thead>
<tr>
<th>Command</th>
</tr>
</thead>
<tbody>
<tr>
<td>SYST:COMM:VISA:RDEV:RES</td>
</tr>
</tbody>
</table>

**Query Syntax** Not Applicable

**Default** Not Applicable

---

SYStem:COMMunicate:VISA:RDEVice:TIMeout <ID>, <timeout>

**Applicable Models:** All

(Read-Write) Sets or returns the timeout value (in milliseconds) for VISA pass-through commands for the specified VISA session ID.

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;ID&gt;</td>
<td>VISA session number that was returned with the OPEN? command.</td>
</tr>
<tr>
<td>&lt;timeout&gt;</td>
<td>The amount of time (in milliseconds) to wait for a response from the remote device after sending a command. A &quot;timeout&quot; error is displayed after this time has passed without a response.</td>
</tr>
</tbody>
</table>

**Examples**

<table>
<thead>
<tr>
<th>Command</th>
</tr>
</thead>
<tbody>
<tr>
<td>SYST:COMM:VISA:RDEV:TIM 1,6000</td>
</tr>
<tr>
<td>system:communicate:visa:rdevice:timeout 3,6000</td>
</tr>
</tbody>
</table>
### Query Syntax

SYSTem:COMMunicate:VISA:RDEVice:TIMeout? <ID>

Returns the timeout value for the specified session ID.

**Return Type**

*Numeric*

**Default**

2000

### SYSTem:COMMunicate:VISA:RDEVice:WBINary <ID>,<data>

**Applicable Models:** N522xB, N523xB, N524xB, E5080A

*(Write-only)* Sends data to a VISA pass-through device. This command requires a header that specifies the size of the data to be written. The header (described below) is not passed along to the device.

**Parameters**

- **<ID>** VISA session number (see `SYST:COMM:VISA:RDEV:OPEN[?]`).
- **<data>** Data to be sent to the VISA pass-through device. Use the following syntax:

  ```
  #<num_digits><byte_count><data_bytes><NL><END>
  ```

  - `<num_digits>` specifies how many digits are contained in `<byte_count>`.
  - `<byte_count>` specifies how many data bytes will follow in `<data_bytes>`.

**Examples**

SYSTem:COMMunicate:VISA:RDEVice:WBINary 1,#17ABC+XYZ<nl><end>

- # - always sent before data.
- 1 - specifies that the byte count is one digit (7).
- 7 - specifies the number of data bytes that will follow, not counting `<NL><END>`.
- ABC+XYZ - Data block
- `<nl><end>` - always sent at the end of block data.

The following example sends a line feed at the end.

SYST:COMM:VISA:RDEV:WBIN 1,#210SYST:PRES<EOL>

The `<EOL>` represents your linefeed character.

**Query Syntax**

Not Applicable
**SYSTem:COMMunicate:VISA:RDEVice:WRIte <ID>,<string>**

**Applicable Models:** N522xB, N523xB, N524xB, E5080A

*(Write-only)* Sends ASCII string data to the VISA pass-through device. If sending a command that returns data, follow with the `READ?` query.

**Parameters**

- **<ID>** VISA session number (see `SYST:COMM:VISA:RDEV:OPEN[?]`).
- **<string>** Commands to be sent to the VISA pass-through device.

**Examples**

```
SYST:COMM:VISA:RDEV:WRIT 1,'*IDN?'
```

```
SYSTEM:COMMunicate:visa:rdevice:write 2,'SYST:PRES'
```

**Query Syntax** Not Applicable

**Default** Not Applicable
SYSTem:CONFigure:MWAVe Commands

Controls and queries settings that affect Millimeter Wave measurements.

Millimeter Module Configuration
Banded Configuration Dialog

Broadband Configuration Dialog
SYSTem:CONFigure:MWAVe:CONF:ACTive <string>

**Applicable Models:** N5261A, N5262A, N5252A, N5292A

*(Read-Write)* Set and return the active configuration.

**Note:** Any changes to configuration settings are not active until the SYSTem:CONFigure:MWAVe:CONF:ACTive command is executed.

**Parameters**

<string> The name of the mmWave configuration to activate.

**Examples**

```
SYST:CONF:MWAV:CONF:ACT "N5291A Broadband"  'Set to broadband configuration
SYST:CONF:MWAV:CONF:ACT "WR10"  'Set to banded configuration
```

**Return Type**
String

**Default**
Not applicable

**SYSTem:CONFigure:MWAve:CONF:ACTive:CALibration:DATE?**

**Applicable Models:** N5293A, N5295A

*(Read-only)* Return the calibration date of the active configuration's test set. Three integers are returned (year, month, day). All three integers will be 0 if there is no calibration data for the active test set.

**Parameters**
None

**Examples**
system:configure:mwave:conf:active:calibration:date?

**Return Type**
Integer

**Default**
Not applicable

**SYSTem:CONFigure:MWAve:CONF:ACTive:CALibration:TIME?**

**Applicable Models:** N5293A, N5295A

*(Read-only)* Return the calibration time of the active configuration's test set. Three integers are returned (hour, minute, second). All three integers will be 0 if there is no calibration data for the active test set.

**Parameters**
None

**Examples**
system:configure:mwave:conf:active:calibration:time?

**Return Type**
Integer

**Default**
Not applicable

**SYSTem:CONFigure:MWAve:CONF:ACTive:MODE?**
Applicable Models: N5293A, N5295A

(Read-only) Return the model number of the active test set.

Parameters None
Examples
SYST:CONF:MWAV:CONF:ACT:MOD?
system:onfigure:mwave:conf:active:model?

Return Type String
Default Not applicable

SYSTem:CONFigure:MWAVe:CONF:ACTive:OPTion?

Applicable Models: N5293A, N5295A

(Read-only) Return the option number of the active test set.

Parameters None
Examples
SYST:CONF:MWAV:CONF:ACT:OPT?
system:onfigure:mwave:conf:active:option?

Return Type String
Default Not applicable

SYSTem:CONFigure:MWAVe:CONF:ACTive:PORT{1:4}:CALibration:DATE?

Applicable Models: N5293A, N5295A

(Read-only) Return the calibration date of the active configuration's port. Three integers are returned (year,month,day). All three integers will be 0 if there is no calibration data for the active port.

Parameters None
Examples
system:onfigure:mwave:conf:active:port1:calibration:date?

Return Type Integer
Default Not applicable

SYSTem:CONFigure:MWAVe:CONF:ACTive:PORT{1:4}:CALibration:TIME?
### Applicable Models: N5293A, N5295A

(Read-only) Return the calibration time of the active configuration's port. Three integers are returned (hour, minute, second). All three integers will be 0 if there is no calibration data for the active port.

**Parameters** None

**Examples**

<table>
<thead>
<tr>
<th>Command</th>
</tr>
</thead>
<tbody>
<tr>
<td>system:onfigure:mwave:conf:active:port1:calibration:time?</td>
</tr>
</tbody>
</table>

**Return Type** Integer

**Default** Not applicable

---

### SYSTem:CONFigure:MWAve:CONF:ACTive:PORT{1:4}:MODei?

**Applicable Models: N5293A, N5295A**

(Read-only) Return the model number of the frequency extender module connected to the specified port number.

**Parameters** None

**Examples**

<table>
<thead>
<tr>
<th>Command</th>
</tr>
</thead>
<tbody>
<tr>
<td>system:onfigure:mwave:conf:active:port1:model?</td>
</tr>
</tbody>
</table>

**Return Type** String

**Default** Not applicable

---

### SYSTem:CONFigure:MWAve:CONF:ACTive:PORT{1:4}:OPTiOn?

**Applicable Models: N5293A, N5295A**

(Read-only) Return the option number of the frequency extender module connected to the specified port number.

**Parameters** None

**Examples**

<table>
<thead>
<tr>
<th>Command</th>
</tr>
</thead>
<tbody>
<tr>
<td>system:onfigure:mwave:conf:active:port1:option?</td>
</tr>
</tbody>
</table>

**Return Type** String

**Default** Not applicable
SYSTem:CONFigure:MWAVe:CONF:ACTive:PORT{1:4}:SERial?

Applicable Models: N5293A, N5295A

(Read-only) Return the serial number of the frequency extender module connected to the specified port number.

Parameters
None

Examples
system:configure:mwave:conf:active:port1:serial?

Return Type
String
Default Not applicable

SYSTem:CONFigure:MWAVe:CONF:ACTive:SERial?

Applicable Models: N5292A

(Read-only) Return the serial number of the test set.

Parameters
None

Examples
SYST:CONF:MWAV:CONF:ACT:SER?
system:configure:mwave:conf:active:serial?

Return Type
String
Default Not applicable

SYSTem:CONFigure:MWAVe:CONF:ADD <string>

Applicable Models: N5261A, N5262A, N5252A, N5292A

(Read-Write) Add a banded mmWave configuration.

Parameters
<string> The name of the mmWave configuration to add.

Examples
SYST:CONF:MWAV:CONF:ADD "WR10"
system:configure:mwave:conf:add "wr10"

Query Syntax
SYSTem:CONFigure:MWAVe:CONF:ADD?

Return Type
String
Default Not applicable
SYSTem:CONFigure:MWAVe:CONF:CATalog?

Applicable Models: N5261A, N5262A, N5252A, N5292A

(Read-only) Returns the list of mmWave configurations.

Parameters

Examples

SYST:CONF:MWA:CONF:CAT?

system:configure:mwave:config:catalog?

Return Type  Comma-delimited string.

Default  Not applicable

---

SYSTem:CONFigure:MWAVe:CONF:REMove <string>

Applicable Models: N5261A, N5262A, N5252A, N5292A

(Write-only) Remove a mmWave configuration.

Parameters

<string>  The name of the mmWave configuration to remove.

Examples

SYST:CONF:MWA:CONF:REM "WR10"

system:configure:mwave:conf:remove "wr10"

Return Type  Not applicable

Default  Not applicable

---

SYSTem:CONFigure:MWAVE:FREQuency:LO:MULTiplier <string>,<value>
**Applicable Models:** N5261A, N5262A, N5252A, N5292A

*(Read-Write)* Set and read the LO multiplier value for the specified configuration. The LO Frequency Range multiplied by this value equals the test port frequency. Learn more about frequency settings.

**Note:** Any changes to configuration settings are not active until the SYSTem:CONFigure:MWAVe:CONF:ACTive command is executed.

### Parameters
- **<string>** The name of the mmWave configuration.
- **<value>** Choose a value within the range of the analyzer.

### Examples
- `system:configure:mwave:frequency:lo:multiplier "WR10",8`

### Query Syntax
- `SYSTem:CONFigure:MWAVe:FREQuency:LO:MULTiplier? "WR10"`

### Return Type
- **Integer**
- **Default** 1

**SYSTem:CONFigure:MWAVe:FREQuency:LO:SOURce <string>,<source>**

**Applicable Models:** N5261A, N5262A, N5292A

*(Read-Write)* Set and read the LO source for the specified configuration. Learn more.

**Note:** Any changes to configuration settings are not active until the SYSTem:CONFigure:MWAVe:CONF:ACTive command is executed.

### Parameters
- **<string>** The name of the mmWave configuration.
- **<source>** The name of the LO source.

### Examples
- `SYST:CONF:MWAV:FREQ:LO:SOUR "WR10","LO_Source"
- `system:configure:mwave:frequency:lo:source "WR10","LO_Source"

### Query Syntax
- `SYSTem:CONFigure:MWAVe:FREQuency:LO:SOURce? "WR10"

### Return Type
- **String**
- **Default** Internal LO source

**SYSTem:CONFigure:MWAVe:FREQuency:LO:STARt? <string>**
(Read-only) Return the calculated LO start frequency using the LO multiplier for the specified configuration. Learn more about frequency settings.

**Parameters**

- `<string>`: The name of the mmWave configuration.

**Examples**

```

system:configure:mwave:frequency:lo:start? "WR10"
```

**Return Type**

- Double

**Default**

Dependent on the range of the analyzer

---

(Read-only) Return the calculated LO stop frequency using the LO multiplier for the specified configuration. Learn more about frequency settings.

**Parameters**

- `<string>`: The name of the mmWave configuration.

**Examples**

```

system:configure:mwave:frequency:lo:stop? "WR10"
```

**Return Type**

- Double

**Default**

Dependent on the range of the analyzer

---

SYSTem:CONFigure:MWAVe:FREQuency:RF:MULTiplier <string>,<value>
Applicable Models: N5261A, N5262A, N5252A, N5292A

(Read-Write) Set and read the RF multiplier value for the specified configuration. The RF Frequency Range multiplied by this value equals the test port frequency range. Learn more about frequency settings.

Note: Any changes to configuration settings are not active until the SYSTem:CONFigure:MWAVe:CONF:ACTive command is executed.

Parameters
- <string> The name of the mmWave configuration.
- <value> Choose a value within the range of the analyzer.

Examples
- system:configure:mwave:frequency:rf:multiplier "WR10", 6

Query Syntax
SYSTem:CONFigure:MWAVe:FREQuency:RF:MULTiplier? "WR10"

Return Type
Integer
Default 1

System:CONFigure:MWAVe:FREQuency:RF:SOURce <string>,<source>

Applicable Models: N5261A, N5262A, N5292A

(Read-Write) Set and read the RF source for the specified configuration. Learn more.

Note: Any changes to configuration settings are not active until the SYSTem:CONFigure:MWAVe:CONF:ACTive command is executed.

Parameters
- <string> The name of the mmWave configuration.
- <source> The name of the RF source.

Examples
- SYST:CONF:MWAV:FREQ:RF:SOUR "WR10", "RF_Source"
- system:configure:mwave:frequency:rf:source "WR10", "RF_Source"

Query Syntax
SYSTem:CONFigure:MWAVe:FREQuency:RF:SOURce? "WR10"

Return Type
String
Default Internal RF source

System:CONFigure:MWAVe:FREQuency:RF:STARt? <string>
Applicable Models: N5261A, N5262A, N5252A, N5292A

(Read-only) Return the calculated RF start frequency using the RF multiplier for the specified configuration. Learn more about frequency settings.

Parameters

<string> The name of the mmWave configuration.

Examples

system:conffigure:mwave:frequency:rf:start? "WR10"

Return Type Double

Default Dependent on the range of the analyzer

SYSTem:CONFigure:MWAVe:FREQuency:RF:STOP? <string>

Applicable Models: N5261A, N5262A, N5252A, N5292A

(Read-only) Return the calculated RF stop frequency using the RF multiplier for the specified configuration. Learn more about frequency settings.

Parameters

<string> The name of the mmWave configuration.

Examples

system:conffigure:mwave:frequency:rf:stop? "WR10"

Return Type Double

Default Dependent on the range of the analyzer

SYSTem:CONFigure:MWAVe:FREQuency:STARt <string>,<value>
Applicable Models: N5261A, N5262A, N5252A, N5292A

(Read-Write) Set and read the start frequency for the specified configuration. Learn more about frequency settings.

Note: Any changes to configuration settings are not active until the SYStem:CONFigure:MWAVe:CONF:ACTive command is executed.

Parameters
- <string> The name of the mmWave configuration.
- <value> The start frequency.

Examples
- SYST:CONF:MWAV:FREQ:STAR "WR10",75e9
- system:configure:mwave:frequency:start "WR10",75e9

Query Syntax
- SYSTem:CONFigure:MWAVe:FREQuency:STAR? "WR10"

Return Type
- Double
- Default Dependent on the range of the analyzer

SYSTem:CONFigure:MWAVe:FREQuency:STOP <string>,<value>

Applicable Models: N5261A, N5262A, N5252A, N5292A

(Read-Write) Set and read the stop frequency for the specified configuration. Learn more about frequency settings.

Note: Any changes to configuration settings are not active until the SYStem:CONFigure:MWAVe:CONF:ACTive command is executed.

Parameters
- <string> The name of the mmWave configuration.
- <value> The stop frequency.

Examples
- SYST:CONF:MWAV:FREQ:STOP "WR10",110e9
- system:configure:mwave:frequency:stop "WR10",110e9

Query Syntax
- SYSTem:CONFigure:MWAVe:FREQuency:STOP? "WR10"

Return Type
- Double
- Default Dependent on the range of the analyzer

SYSTem:CONFigure:MWAVe:SERial?
**Applicable Models:** N5290A, N5291A

*(Read-only)* Return the serial number of the mmWave system.

**Parameters** None

**Parameters** None

**Examples**

```
SYST:CONF:MWAV:SER?
```

```
System:configure:mwave:serial?
```

```
"M42147691962"
```

**Return Type** String

**Default** Not applicable

**SYSTem:CONFigure:MWAVe:TSET:ALC** `<string>,<bool>`

**Applicable Models:** N5261A, N5262A

*(Read-Write)* Enable or disable automatic power leveling for the specified configuration. Learn more about test set properties.

**Note:** Any changes to configuration settings are not active until the SYSTem:CONFigure:MWAVe:CONF:ACTive command is executed.

**Parameters**

- `<string>` The name of the mmWave configuration.
- `<bool>` Choose from:
  - 0 - **OFF** - Disable automatic power leveling control.
  - 1 - **ON** - Enable automatic power leveling control.

**Examples**

```
SYST:CONF:MWAV:TSET:ALC "WR10",1
```

```
System:configure:mwave:tset:alc "WR10",1
```

**Query Syntax** SYSTem:CONFigure:MWAVe:TSET:ALC? "WR10"

**Return Type** Boolean

**Default** 1

**SYSTem:CONFigure:MWAVe:TSET:CATalog?**
Applicable Models: N5261A, N5262A, N5292A

(Read-only) Returns the list of available test set names.

Parameters

Examples

```
SYST:CONF:MWAV:TSET:CAT?

system:configure:mwave:tset:catalog?
```

Return Type  Comma-delimited string.
Default    Not applicable

SYSTem:CONFigure:MWAVe:TSET:MIXer <string>,<bool>

Applicable Models: N5261A, N5262A, N5292A

(Read-Write) Enable or disable mmWave mixer mode to allow mixer testing using the specified configuration. Learn more about test set properties.

Note: Any changes to configuration settings are not active until the SYSTem:CONFigure:MWAVe:CONF:ACTive command is executed.

Parameters

```
<string>   The name of the mmWave configuration.
<bool>     Choose from:

0 - OFF - Disable mmWave mixer mode.
1 - ON  - Enable mmWave mixer mode.
```

Examples

```
SYST:CONF:MWAV:TSET:MIXer "WR10",0

system:configure:mwave:tset:mixer "WR10",0
```

Query Syntax

SYSTem:CONFigure:MWAVe:TSET:MIXer? "WR10"

Return Type  Boolean
Default    0

SYSTem:CONFigure:MWAVe:TSET:NAME <string>,<name>
Applicable Models: N5261A, N5262A, N5292A

(Read-Write) Set and read the test set name for the specified configuration.

Note: Any changes to configuration settings are not active until the SYStem:CONFigure:MWAVe:CONF:ACTive command is executed.

Setting the test set name may reset the test set properties to default values, which includes the following:

- Enabled Modules
- Mixer Mode
- IF Gain
- Route to Rear Panel
- ALC Enabled
- Power Limit
- Power Offset
- Power Slope

**Parameters**

- `<string>` The name of the mmWave configuration.
- `<name>` The name of the test set.

**Examples**

```
SYST:CONF:MWAV:TSET:NAME "WR10","N5262A"
```

**Query Syntax**

```
SYSTem:CONFigure:MWAVe:TSET:NAME? "WR10"
```

**Return Type** String

**Default** Not applicable

```
SYSTem:CONFigure:MWAVe:TSET:PORT<port> <configuration>,<val>
```
**Applicable Models:** N5261A, N5262A, N5292A

*(Read-Write)* This command enables or disables modules for individual ports on a particular configuration. If an N5292A test set is attached it will detect if a module is physically present and only allow this command on those ports.

**Note:** Any changes to configuration settings are not active until the SYStem:CONFigure:MWAVe:CONF:ACTive command is executed.

**Parameters**

- `<port>` Test set port number.
- `<configuration>` The name of the mmWave configuration. Use SYStem:CONFigure:MWAVe:CONF:CATalog? for a list of configuration names.
- `<val>` Enable/disable test set port. Choose from:
  - **0 - OFF** - Disable test set port.
  - **1 - ON** - Enable test set port.

**Examples**

```
SYST:CONF:MWAV:TSET:PORT1 "WR10",1
system:configure:mwave:tset:port1 "WR10",1
```

**Query Syntax**

SYStem:CONFigure:MWAVe:TSET:PORT:COUNT? <string>

**Applicable Models:** N5261A, N5262A, N5292A

*(Read-only)* Return the number of ports on a test set. Only the test set ports having frequency extenders attached are detected.

**Parameters**

- `<string>` The name of the mmWave configuration.

**Examples**

```
```

**Return Type**

- **Boolean**
- **Default** 0
SYSTem:CONFigure:MWAVe:TSET:POWer:LIMit <string>,<value>

Applicable Models: N5261A, N5262A, N5252A, N5292A

(Read-Write) Set and read the test set power limit for the specified configuration. Learn more about test set properties.

Note: Any changes to configuration settings are not active until the SYSTem:CONFigure:MWAVe:CONF:ACTive command is executed.

Parameters

<string> The name of the mmWave configuration.

<value> The power limit. Choose a value between -90 and +13 dBm.

Examples

Query Syntax

SYSTem:CONFigure:MWAVe:TSET:POWer:LIMit? "WR10"

Return Type Double

Default 11 dBm

---

SYSTem:CONFigure:MWAVe:TSET:POWer:OFFSet <string>,<value>

Applicable Models: N5261A, N5262A, N5252A, N5292A

(Read-Write) Set and read the test set power offset for the specified configuration. Learn more about test set properties.

Note: Any changes to configuration settings are not active until the SYSTem:CONFigure:MWAVe:CONF:ACTive command is executed.

Parameters

<string> The name of the mmWave configuration.

<value> The power offset. Choose a value between -30 and +30 dB.

Examples

SYST:CONF:MWAV:TSET:POW:OFFS "WR10",0
system:configure:mwave:tset:power:offset "WR10",0

Query Syntax

SYSTem:CONFigure:MWAVe:TSET:POWer:OFFSet? "WR10"

Return Type Double

Default 0 dB
SYSTem:CONFigure:MWAVe:TSET:POWer:SLOPe <string>,<value>

**Applicable Models:** N5261A, N5262A, N5252A, N5292A

*(Read-Write)* Set and read the test set power slope for the specified configuration. Learn more about test set properties.

**Note:** Any changes to configuration settings are not active until the SYSTem:CONFigure:MWAVe:CONF:ACTive command is executed.

**Parameters**
- `<string>` The name of the mmWave configuration.
- `<value>` The power slope. Choose a value between -2 dB/GHz and +2 dB/GHz.

**Examples**
- `SYST:CONF:MWAV:TSET:POW:SLOP "WR10",.113`
- `system:onfigure:mwave:tset:power:slope "WR10",.113`

**Query Syntax**
- `SYSTem:CONFigure:MWAVe:TSET:POWer:SLOpe? "WR10"`

**Return Type**
- Double
- **Default** 0.113 dB/GHz

---

SYSTem:CONFigure:MWAVe:TSET:RPANel <string>,<bool>

**Applicable Models:** N5261A, N5262A

*(Read-Write)* Set and read the status of the RF power routing to the rear panel "SW SRC OUT" connector for the specified configuration.

**Note:** Any changes to configuration settings are not active until the SYSTem:CONFigure:MWAVe:CONF:ACTive command is executed.

**Parameters**
- `<string>` The name of the mmWave configuration.
- `<bool>` Choose from:
  - **0 - OFF** - Disable RF power routing to rear panel.
  - **1 - ON** - Enable RF power routing to rear panel "SW SRC OUT" connector.

**Examples**
- `SYST:CONF:MWAV:TSET:RPAN "WR10",1`
- `system:onfigure:mwave:tset:rpanel "WR10",1`

**Query Syntax**
- `SYSTem:CONFigure:MWAVe:TSET:RPANel? "WR10"`
Return Type  Boolean
Default  1
External Device Commands

Configures and makes settings for an external device.

Configure an External Source

Configure a PMAR Device

SYST:PREF:ITEM:EDEV:DPOL - Determines whether external devices remain activated or are de-activated when the VNA is Preset or when a Instrument State is recalled.

Synchronizing the Analyzer and Controller

SCPI Command Tree

**SYSTem:CONFigure:EDEVice:ADD <name>**

**Applicable Models:** All

*(Write-only)* Adds an external device to the list of configured devices. This is the same as pressing New on the Select an external device dialog.

Upon creation, all settings on the new device are set to the defaults. The device is not active until set using **SYST:CON:EDev:STAT**

**Parameters**

- `<name>` String - Model and type of the external device.

To see a list of configured external devices, use **SYST:CONF:EDEV:CAT?**

**Examples**

- **SYST:CONF:EDEV:ADD "myDevice"**
- `system:configure:edevice:add "myDevice"`

**Query Syntax**

- Not Applicable

**Default**

- Not Applicable

**SYSTem:CONFigure:EDEVice:CAT?**
Applicable Models: All

(Read-only) Returns a list of names of all configured devices. These are devices that appear in the external devices dialog.

Use SENS:FOM:CAT? to report all active devices.

Use Source:CAT? to report all active sources.

SYStem:CONFigure:EDEVice:DTYPe <name>,<type>

Applicable Models: All

(Read-Write) Sets and returns the Device Type for the external device.

Parameters

- `<name>` String - Name of the device to modify.
- `<type>` String - Device type - not case sensitive. Choose from:
  - "None"
  - "Source" - external source
  - "Power Meter" - power meter
  - "DC Meter" - DC voltmeter
  - "DC Source" - DC power supply
  - "Pulse Generator" - external pulse generator
  - "SMU" - Source Measure Unit

Examples

SYST:CONF:EDEV:DTYP "myDevice","Power Meter"

System:configure:edevice:dtype "myDevice","Source"

Query Syntax

SYSTem:CONFigure:EDEVice:DTYPE? <name>

Return Type

- String

  Default

  Source

SYSTem:CONFigure:EDEVice:EXISts? <string>
### Applicable Models:

All

(Read-only) Returns whether the named device is present on the bus for which it is configured.

#### Parameters

- `<string>`: Name of the external device.

#### Example

```
SYST:CONF:EDEV:EXIS? "MyPowerMeter"
```

#### Return Type

Boolean

- **0**: The device is not in the collection or the device fails to respond and times out when communication is attempted.
- **1**: The device responds when communication is attempted.

**Default**: Not applicable

---

### SYStem:CONFigure:EDEVice:IOConfig <name>,<value>

**Applicable Models**: All

(Read-Write) Sets and return the configuration path for the specified external device.

#### Parameters

- `<name>`: String - Name of the device.
- `<value>`: String - Configuration path. Any valid VISA resource shown in the IO Configuration field of the external devices dialog, enclosed in quotes.

Use the `SYST:COMM:VISA:RDEV:FIND?` command to return IO devices that the visa subsystem can identify. This command will return addresses for devices found on GPIB, USB, or LAN.

#### Examples

```
SYST:CONF:EDEV:IOC "myDevice","GPIB0::13::INSTR"

SYST:CONF:EDEV:IOC "myDevice","TCPIP0::141.121.148.119::inst0::INSTR"

system:configure:edevice:ioconfig
"myDevice","USB0::10893::19457::MZ00703073::0::INSTR"
```

#### Query Syntax

```
SYSTem:CONFigure:EDEVice:IOConfig? <name>
```

#### Return Type

String

**Default**

"" Empty String
SYSTem:CONFigure:EDEVice:IOENable <name>,<value>

Applicable Models: All

(Read-Write) Enable or disable communication with an external device.

When disabled (OFF), the VNA will NOT attempt to connect to the external device regardless of the instrument state command (SYST:CONF:EDEV:STATe). Therefore, no errors will be produced if the device is not connected.

This command is useful for debugging and testing states when the external device is not connected. This command is unnecessary in ordinary operation (when the device is connected).

Parameters

- <name> String - Name of the device.
- <value> Boolean - Choose from:
  - OFF or 0 - Device communication disabled
  - ON or 1 - Device communication enabled

Examples

SYST:CONF:EDEV:IOEN "myDevice", ON
system:configure:edev:ioenable "myDevice", 0

Query Syntax

SYSTem:CONFigure:EDEVice:IOENable? <name>

Return Type

Boolean

Default

ON

SYSTem:CONFigure:EDEVice:LOAD <file>,<name>

Applicable Models: All

(Write-only) Recalls an external device configuration file from the VNA hard drive.

Currently, only DC Supply and DC Meter configuration files are supported. See more DC Device commands.

Parameters

- <file> String - Filename of the external device configuration file.

1. If <file> is not a full path, it is assumed to be a relative path based at "D:\Drivers".
2. The file specified using <file> cannot be the same file as "D:\Drivers\<name>.xml".
### SYStem:CONFigure:EDEVice:REMove <name>

**Applicable Models:** All  

(Write-only) Removes the specified device from the list of configured devices. If the device is a Source and both Active and I/O Enabled is checked (ON), then the RF power state is set to OFF. Learn more.

**Parameters**

- `<name>`  

**Examples**

```
SYST:CONF:EDEV:REM "myDevice"
```

**Query Syntax**  
Not Applicable

**Default**  
Not Applicable

### SYStem:CONFigure:EDEVice:SAVE <file>,<name>

**Applicable Models:** All

(Write-only) Saves an external device configuration file to the VNA hard drive.

Currently, only DC Supply and DC Meter configuration files are supported. See more DC Device commands.

Use `SYST:CONF:EDEV:LOAD` to recall a configuration file.

**Parameters**

- `<file>`  
  String - Filename of the external device configuration file.

- `<name>`  
  String - Name of the external device. Currently, only DC Supply and DC Meter configuration files are supported.

**Examples**

```
SYST:CONF:EDEV:SAVE "myDevice.xml","MyDCSupply"
```
SYSTem:CONFigure:EDEVice:SMU:CHANnel[1-4]:STATe <name>,<state>

**Applicable Models:** All

*(Read-Write)* Set and return the state of activation of the SMU device channel. Learn more about configuring an external SMU.

When `SYST:CONF:EDEV:IOEN` = ON, and this command is set to ON, the VNA will attempt communication with the external device.

Send this command AFTER sending other external device settings (especially `SYST:CONF:EDEV:DTYP`) to avoid communicating with the device before it has been fully configured.

See Also: `SYST:PREF:ITEM:EDEV:DPOL` - Determines whether external devices remain activated or are de-activated when the VNA is Preset or when a Instrument State is recalled.

**Parameters**

- `<name>`  String - Name of the SMU device.
- `<state>`  Boolean - Choose from:

  - **OFF** or **0** - SMU Device channel is NOT activated
  - **ON** or **1** - SMU Device channel is activated.

**Examples**

```
SYST:CONF:EDEV:SMU:CHAN2:STAT "myDevice", ON
system:configure:edevice:smu:channel2:state "myDevice", 0
```

**SYSTem:CONFigure:EDEVice:STATe <name>,<state>**

**Query Syntax**

Not Applicable

**Default**

Not Applicable

**Return Type**

Boolean

**Default**

OFF
**Applicable Models:** All

*(Read-Write)* Set and return the state of activation of the device. When `SYST:CONF:EDEV:IOEN = ON`, and this command is set to ON, the VNA will attempt communication with the external device.

Send this command AFTER sending other external device settings (especially `SYST:CONF:EDEV:DTYP`) to avoid communicating with the device before it has been fully configured.

See Also: `SYST:PREF:ITEM:EDEV:DPOL` - Determines whether external devices remain activated or are deactivated when the VNA is Preset or when a Instrument State is recalled.

**Parameters**

- `<name>` String - Name of the device.
- `<state>` Boolean - Choose from:
  - **OFF** or 0 - Device is NOT activated
  - **ON** or 1 - Device is activated.

**Examples**

```plaintext
SYST:CONF:EDEV:STAT "myDevice", ON
system:configure:edevice:state "myDevice", 0
```

**Query Syntax**

SYSTem:CONFigure:EDEVice:STATe? `<name>`

**Return Type**

Boolean

**Default**

OFF - When configured using the front panel user interface, the device is ON (activated) by default.

---

**SYSTem:CONFigure:EDEVice:TOUT `<name>`,<value>**

**Applicable Models:** All

*(Read-Write)* Set and return the time out value for the specified external device. This is the time allowed for communication with the device before an error is generated.

**Parameters**

- `<name>` String - Name of the device.
- `<value>` Time out value in seconds.

**Examples**

```plaintext
SYST:CONF:EDEV:TOUT "myDevice",2
system:configure:edevice:tout "myDevice",5
```

**Query Syntax**

SYSTem:CONFigure:EDEVice:TOUT? `<name>`

**Return Type**

Numeric

5042
SYSTem:CONFigure:EDEVice:SOURce:DPP <name>,<value>

**Applicable Models:** All

(Read-Write) Sets and returns the amount of time the VNA should wait after for an external source to settle before making a measurement at each data point. This setting applies to all channels that use this external source.

**Parameters**
- **<name>** String - Name of the device.
- **<value>** Dwell time in seconds.

**Examples**

```
SYST:CONF:EDEV:SOUR:DPP "myDevice",2
system:configure:edevice:source:dpp "myDevice",1
```

**Query Syntax**

SYSTem:CONFigure:EDEVice:SOURce:DPP? <name>

**Return Type** Numeric

**Default** 3.114 e-3

---

SYSTem:CONFigure:EDEVice:SOURce:MODulation:CONTrol:STATe <name>,<state>

**Applicable Models:** N522xB, N523xB, N524xB, M937xA, E5080A

(Read-Write) Sets and reads the state of the modulation control. Modulation control must be ON to control the modulation of an external source.

**Parameters**
- **<name>** String - Name of the device.
- **<state>** ON (or 1) Enable control of external modulation.
- **OFF** (or 0) Disable control of external modulation.

**Examples**

```
SYST:CONF:EDEV:SOUR:MOD:CONT:STAT "qasmxg",1
```

**Query Syntax**

SYSTem:CONFigure:EDEVice:SOURce:MODulation:CONTrol:STATe? "qasmxg"

---

5043
SYS TEM:CONFigure:EDEVice:SOURce:TMODe <name>,<value>

Applicable Models: All

(Read-Write) Sets and returns the trigger mode for an external source. Learn more.

Parameters
- <name> String - Name of the device.
- <value> Trigger Mode. Choose from:
  - CW - Software CW mode
  - HW - Hardware list mode

Examples
SYST:CONF:EDEV:SOUR:TMOD "myDevice",CW
system:configure:edevice:source:tmode "myDevice",hw

Query Syntax
SYSTem:CONFigure:EDEVice:SOURce:TMODe? "myDevice"

Return Type Character
Default Depends on Source and VNA Model

SYS TEM:CONFigure:EDEVice:SOURce:TPORt <name>,<value>

Applicable Models: N522xB, N523xB, N524xB, M937xA, M9485A, E5080A

(Read-Write) Sets and returns the VNA port through which an external source is to be triggered.

Parameters
- <name> String - Name of the device.
- <value> Trigger Port. Choose from aux1 or aux2

Examples
system:configure:edevice:source:tport "myDevice",aux1

Query Syntax
SYSTem:CONFigure:EDEVice:SOURce:TPORt? <name>

Return Type Character
Default aux1
SYSTem:CONF:EDEVice:DC Commands

Configures external SMU, DC Meter, and DC Source properties.

```plaintext

**SYSTem:CONFigure:EDEVice:DC:COMMand:EXIT <name>,<value>**

**Applicable Models:** N522xB, N523xB, N524xB, M937xA, P937xA

*(Read-Write)* Sets and returns the Disable I/O command for an external DC Source and an external DC Meter.

**Parameters**

- `<name>`  
  String - Name of the device.
- `<value>`  
  String - The SCPI command used to disable the DC Source and DC Meter.

**Examples**

```
SYST:CONF:EDEV:DC:COMM:EXIT "myDCDevice","OUTP OFF"

system:configure:edevice:dc:command:exit "myDCDevice","OUTP OFF"
```

**Query Syntax**  
SYSTem:CONFigure:EDEVice:DC:COMMan:EXIT? <name>

**Return Type**  
String

**Default**  
"" Empty String

**SYSTem:CONFigure:EDEVice:DC:COMMan:INIT <name>,<value>**
Applicable Models: N522xB, N523xB, N524xB, M937xA, P937xA

*(Read-Write)* Sets and returns the **Enable I/O command** for an external DC Source and an external DC Meter.

**Parameters**

- `<name>` String - Name of the device.
- `<value>` String - The SCPI command used to enable the DC Source and DC Meter.

**Examples**

```
SYST:CONF:EDEV:DC:COMM:INIT "myDCDevice","OUTP ON"
system:configure:edevice:dc:command:init "myDCDevice","OUTP ON"
```

**Query Syntax**

`SYSTem:CONFigure:EDEVice:DC:COMMand:INIT? <name>`

**Return Type**

String

**Default**

" " Empty String

---

SYSTem:CONFigure:EDEVice:DC:COMMand:LIMit <name>, <cmd>

Applicable Models: N522xB, N523xB, N524xB, M937xA, P937xA

*(Read-Write)* Sets and returns a user-defined command string that is used to set the DC limit of the external DC source. The actual limit value is set using either the `SYST:CONF:EDEV:DC:LIM:VOLT` (voltage) or `SYST:CONF:EDEV:DC:LIM:CURR` (current). The limit command is sent to the external DC source at the beginning of a sweep for each channel. The firmware automatically selects the current or voltage limit value depending on the external DC source type.

**Parameters**

- `<name>` String - Name of the device.
- `<cmd>` String - User-defined command name: Include `{%f}` in the command string which will be substituted by the actual limit value.

**Examples**

```
system:configure:edevice:dc:command:limit "myDCDevice","Limit Command {%f}"
```

**Query Syntax**

`SYSTem:CONFigure:EDEVice:DC:COMMand:LIMit? <name>`

**Return Type**

String

**Default**

Not Applicable

---

SYSTem:CONFigure:EDEVice:DC:COMMand:POINt:SET <name>,<value>
Applicable Models: N522xB, N523xB, N524xB, M937xA, P937xA

(Read-Write) Sets and returns the Point Read Commands for an external DC Meter or Point Set Commands for an external DC Source.

Parameters
  <name>  String - Name of the device.
  <value> String -

For DC Source, sets the Point Set Commands. Use {%f} to specify a double value and {%d} to specify an integer.

For DC Meter, sets the Point Read Commands (for example, meas:volt?).

Examples
SYST:CONF:EDEV:DC:COMM:POIN:SET "myDCDevice","sour1:volt {%f}"

Query Syntax
SYSTem:CONFigure:EDEVice:DC:COMManD:POINt:SET? <name>

Return Type  String
  Default  " " Empty String

SYSTem:CONFigure:EDEVice:DC:COMManD:SWEep:ABORt <name>,<value>

Applicable Models: N522xB, N523xB, N524xB, M937xA, P937xA

(Read-Write) Sets and returns the Abort Sweep command for an external DC Source and an external DC Meter.

Parameters
  <name>  String - Name of the device.
  <value> String - The SCPI command used to abort or reset the DC Source or DC Meter.

Examples
SYST:CONF:EDEV:DC:COMM:SWE:ABOR "myDCDevice","ABORt"

system:configure:edevice:dc:command:sweep:abort "myDCDevice","ABORt"

Query Syntax
SYSTem:CONFigure:EDEVice:DC:COMManD:SWEep:ABORt? <name>

Return Type  String
  Default  " " Empty String

5048
SYSTem:CONFigure:EDEVice:DC:COMManD:SWEep:AFTer <name>,<value>

Applicable Models: N522xB, N523xB, N524xB, M937xA, P937xA

(Read-Write) Sets and returns the After Sweep command for an external DC Source and an external DC Meter.

Parameters
- <name> String - Name of the device.
- <value> String - The SCPI command to be sent at the end of a sweep.

Examples

"myDCDevice","OUTP OFF"

Query Syntax
SYSTem:CONFigure:EDEVice:DC:COMManD:SWEep:AFTer? <name>

Return Type String
Default " " Empty String

SYSTem:CONFigure:EDEVice:DC:COMManD:SWEep:BEFore <name>,<value>

Applicable Models: N522xB, N523xB, N524xB, M937xA, P937xA

(Read-Write) Sets and returns the Before Sweep command for an external DC Source and an external DC Meter.

Parameters
- <name> String - Name of the device.
- <value> String - The SCPI command to be sent at the beginning of a sweep.

Examples

"myDCDevice","OUTP ON"

Query Syntax
SYSTem:CONFigure:EDEVice:DC:COMManD:SWEep:BEFore? <name>

Return Type String
Default " " Empty String

SYSTem:CONFigure:EDEVice:DC:CORRection <name>,<value>
Applicable Models: N522xB, N523xB, N524xB, M937xA, P937xA

(Read-Write) Sets and returns the correction ON/OFF state for a DC Meter and a DC Source.

Parameters
- `<name>`  String - Name of the device.
- `<value>` Correction ON/OFF state. Choose from:
  - **ON or 1** - Turn Correction ON
  - **OFF or 0** - Turn Correction OFF

Examples

```
SYST:CONF:EDEV:DC:CORR "myDCDevice",1
system:configure:edevice:dc:correction "myDCDevice",OFF
```

Query Syntax
SYSTem:CONFigure:EDEVice:DC:CORRection? <name>

Return Type
Boolean
Default OFF

SYSTem:CONFigure:EDEVice:DC:DPOint <name>,<value>

Applicable Models: N522xB, N523xB, N524xB, M937xA, P937xA

(Read-Write) Sets and returns the "Dwell Before/After Point" value for an external DC Device which can be configured as either a DC Meter or a DC Source.

Parameters
- `<name>`  String - Name of the device.
- `<value>` For DC Meter, the dwell time (in seconds) before making a data point measurement.
  For DC Source, the dwell time (in seconds) after making a data point setting.

Examples

```
SYST:CONF:EDEV:DC:DPO "myDCDevice",10e-3
system:configure:edevice:dc:dpoint "myDCDevice",.01
```

Query Syntax
SYSTem:CONFigure:EDEVice:DC:DPOint? <name>

Return Type
Numeric
Default 3 milliseconds

SYSTem:CONFigure:EDEVice:DC:DSWeep <name>,<value>
Applicable Models: N522xB, N523xB, N524xB, M937xA, P937xA

(Read-Write) Sets and returns the "Dwell Before Sweep" value for an external DC Device which can be configured as either a DC Meter or a DC Source.

Parameters
- <name> String - Name of the device.
- <value> The dwell time (in seconds) before making a new sweep.

Examples

```
SYST:CONF:EDEV:DC:DSW "myDCDevice",10e-3
system:configure:edevice:dc:dsweep "myDCDevice",.01
```

Query Syntax
SYSTem:CONFigure:EDEVice:DC:DSWeep? <name>

Return Type
Numeric
Default 1 millisecond

---

SYSTem:CONFigure:EDEVice:DC:LIMit:CURRent <name>, <value>

Applicable Models: N522xB, N523xB, N524xB, M937xA, P937xA

(Read-Write) Sets and returns the maximum output current value of the external DC Source. This command supports Keysight B2900A and N6700 series devices only.

Parameters
- <name> String - Name of the device.
- <value> Current limit value.

Examples

```
SYST:CONF:EDEV:DC:LIM:CURR "myDCDevice",4
```

Query Syntax
SYSTem:CONFigure:EDEVice:DC:LIMit:CURRent? <name>

Return Type
Double
Default 0

---

SYSTem:CONFigure:EDEVice:DC:LIMit:VOLTage <name>, <value>
Applicable Models: N522xB, N523xB, N524xB, M937xA, P937xA

(Read-Write) Sets and returns the maximum output voltage value of the external DC Source. This command supports Keysight B2900A and N6700 series devices only.

Parameters
- `<name>`: String - Name of the device.
- `<value>`: Voltage limit value.

Examples

Query Syntax
- `SYSTem:CONFigure:EDEVice:DC:LIMit:VOLTage? <name>`

Return Type: Double
- Default: 0

SYSTem:CONFigure:EDEVice:DC:MAX[:STATe] <name>,<value>

Applicable Models: N522xB, N523xB, N524xB, M937xA, P937xA

(Read-Write) Sets and returns the "Define Max As" ON/OFF state for an external DC Source.

Parameters
- `<name>`: String - Name of the device.
- `<value>`: "Define Max As" ON/OFF state. Choose from:
  - **ON or 1** - Turn "Define Max As" ON
  - **OFF or 0** - Turn "Define Max As" OFF

Examples
- `SYST:CONF:EDEV:DC:MAX "myDCDevice",1`
- `system:configure:edevice:dc:max:state "myDCDevice",OFF`

Query Syntax
- `SYSTem:CONFigure:EDEVice:DC:MAX:STATe? <name>`

Return Type: Boolean
- Default: ON

SYSTem:CONFigure:EDEVice:DC:MAX:VALue name, value
Applicable Models: N522xB, N523xB, N524xB, M937xA, P937xA

(Read-Write) Sets and returns the "Define Max As" value for an external DC Source.

Parameters

- `<name>` String - Name of the device.
- `<value>` Maximum value for the external DC Source (in volts).

Examples

```
system:configure:edevice:dc:max:value "myDCDevice",10
```

Query Syntax

```
SYSTem:CONFigure:EDEVice:DC:MAX:VALue? <name>
```

Return Type: Double

Default: 10

Applicable Models: N522xB, N523xB, N524xB, M937xA, P937xA

(Read-Write) Sets and returns the "Define Min As" ON/OFF state for an external DC Source.

Parameters

- `<name>` String - Name of the device.
- `<value>` "Define Min As" ON/OFF state. Choose from:
  - **ON or 1** - Turn "Define Min As" ON
  - **OFF or 0** - Turn "Define Min As" OFF

Examples

```
SYST:CONF:EDEV:DC:MIN "myDCDevice",1
system:configure:edevice:dc:min:state "myDCDevice",OFF
```

Query Syntax

```
SYSTem:CONFigure:EDEVice:DC:MIN:STATe? <name>
```

Return Type: Boolean

Default: ON

Applicable Models: N522xB, N523xB, N524xB, M937xA, P937xA

(Read-Write) Sets and returns the "Define Min As" value for an external DC Source.

Parameters

- `<name>` String - Name of the device.
- `<value>` Maximum value for the external DC Source (in volts).

Examples

```
SYST:CONF:EDEV:DC:MIN:VALue <name>, <value>
```

5053
Applicable Models: N522xB, N523xB, N524xB, M937xA, P937xA

(Read-Write) Sets and returns the "Define Min As" value for an external DC Source.

**Parameters**
- `<name>` String - Name of the device.
- `<value>` Minimum value for the external DC Source (in volts).

**Examples**
```
SYST:CONF:EDEV:DC:MIN:VAL "myDCDevice",-10
system:configure:edevice:dc:min:value "myDCDevice",-10
```

**Query Syntax**
```
SYSTem:CONFigure:EDEVice:DC:MIN:VALue? <name>
```

**Return Type** Double

**Default** -10

---

**SYSTem:CONFigure:EDEVice:DC:OFFSet <name>,<value>**

Applicable Models: N522xB, N523xB, N524xB, M937xA, P937xA

(Read-Write) Sets and returns the offset correction value for an external DC Device which can be configured as either a DC Meter or a DC Source.

**Parameters**
- `<name>` String - Name of the device.
- `<value>` DC offset value.

The VNA will display readings from a DC Meter as:
```
Display = (Meas'd value - Offset) * Scale
```

The VNA will adjust the output from a DC Source as:
```
Output = (Set value - Offset) * Scale
```

**Examples**
```
SYST:CONF:EDEV:DC:OFFS "myDCDevice",4
system:configure:edevice:dc:offset "myDCDevice",1.25
```

**Query Syntax**
```
SYSTem:CONFigure:EDEVice:DC:OFFSet? <name>
```

**Return Type** Numeric

**Default** 0

---

**SYSTem:CONFigure:EDEVice:DC:QUERy:ERRor <name>,<value>**
Applicable Models: N522xB, N523xB, N524xB, M937xA, P937xA

(Read-Write) Sets and returns the Error Query command for an external DC Source and an external DC Meter.

Parameters
- `<name>` String - Name of the device.
- `<value>` String - The SCPI command for returning DC Source and DC Meter errors.

Examples

Query Syntax
- `SYSTem:CONFigure:EDEVice:DC:QUERy:ERRor? <name>`

Return Type
- String
- Default "SYST:ERR?"

---

Applicable Models: N522xB, N523xB, N524xB, M937xA, P937xA

(Read-Write) Sets and returns the ID Query command for an external DC Source and an external DC Meter.

Parameters
- `<name>` String - Name of the device.
- `<value>` String - The SCPI command for returning DC Source and DC Meter ID string.

Examples
- `SYST:CONF:EDEV:DC:QUER:ID "myDCDevice","*IDN?"
- `system:configure:edevice:dc:query:error "myDCDevice","*IDN?"`

Query Syntax
- `SYSTem:CONFigure:EDEVice:DC:QUERy:ID? <name>`

Return Type
- String
- Default "*IDN?"

---

Applicable Models: N522xB, N523xB, N524xB, M937xA, P937xA

SYSTem:CONFigure:EDEVice:DC:SCALe <name>,<value>
Applicable Models: N522xB, N523xB, N524xB, M937xA, P937xA

(Read-Write) Sets and returns the scale correction value for an external DC Device which can be configured as either a DC Meter or a DC Source.

Parameters

- `<name>`: String - Name of the device.
- `<value>`: DC Scale value.

The VNA will display readings from a DC Meter as:

\[ \text{Display} = (\text{Meas'd value} - \text{Offset}) \times \text{Scale} \]

The VNA will adjust the output from a DC Source as:

\[ \text{Output} = (\text{Set value} - \text{Offset}) \times \text{Scale} \]

Examples

- `SYST:CONFigure:EDEVice:DC:SCALe "myDCDevice",1.2`
- `system:configure:edevice:dc:scale "myDCDevice",.5`

Query Syntax

`SYSTem:CONFigure:EDEVice:DC:SCALe? <name>`

Return Type

- Numeric
- Default: 1

---

`SYSTem:CONFigure:EDEVice:DC:TYPE <name>,<value>`

Applicable Models: N522xB, N523xB, N524xB, M937xA, P937xA

(Read-Write) Sets and returns the DC Type for an external DC Device which can be configured as either a DC Meter or a DC Source. This setting is used as the units for display on the VNA X-axis.

Parameters

- `<name>`: String - Name of the device.
- `<value>`: DC type. Choose from:

  "dBm", "A", "V", "W", "K", "F", "C"

Examples

- `SYST:CONFigure:EDEVice:DC:TYPE "myDCDevice","A"
- `system:configure:edevice:dc:type "myDCDevice","W"

Query Syntax

`SYSTem:CONFigure:EDEVice:DC:TYPE? <name>`

Return Type

- String
- Default: "V"
SYST:CONF:EDEVice:PMAR Commands

Configures and makes settings for an external Power Meter as Receiver.

SYST:PREF:ITEM:EDEV:DPOL - Determines whether External Devices remain activated or are de-activated when the VNA is Preset or when a Instrument State is recalled.

Synchronizing the Analyzer and Controller

SCPI Command Tree

SYSTem:CONFigure:EDEVice:PMAR:CALibrate <name>

Applicable Models: All

(Write-only) Performs a calibration of the power sensor. Calibration usually involves connecting the power sensor to the meter's 1 mW reference.

- Keysight P-Series sensors have an internal reference so you can calibrate them using this command without connecting to the meters reference port.
- Keysight USB power sensors do not require calibrating.
- For other sensors, refer to the documentation to determine if it has calibration capability.

This command is always synchronous, so *OPC? is the only way to determine that the operation is complete. Set an I/O timeout of at least 20 seconds.

Parameters

- <name> String - Name of the power meter.

Examples

SYST:CONF:EDEV:PMAR:CAL "myDevice"

system:configure:edevice:pmar:calibrate "myDevice"

Query Syntax Not Applicable

Default Not Applicable

SYSTem:CONFigure:EDEVice:PMAR:FLIMit <name>,<value>
Applicable Models: All

(Read-Write) Enable or disable the power meter min and max frequencies.

Parameters

- `<name>` String - Name of the power meter.
- `<value>` Boolean. State of min and max frequency. Choose from:
  - **OFF** or 0 - Min and max frequencies disabled.
  - **ON** or 1 - Min and max frequencies enabled.

Examples

```
SYST:CONF:EDEV:PMAR:FLIM "myDevice", 0
system:configure:edevice:pmar:flimit "myDevice", ON
```

See example program

Query Syntax

SYSTem:CONFigure:EDEVice:PMAR:FLIMit? <name>

Return Type

Boolean

Default

OFF

SYSTem:CONFigure:EDEVice:PMAR:FMAXimum <name>,<value>

Applicable Models: All

(Read-Write) Set and return the maximum frequency of the power meter.

Parameters

- `<name>` String - Name of the power meter.
- `<value>` Numeric - Max frequency in Hz.

Examples

```
SYST:CONF:EDEV:PMAR:FMAX "myDevice", 1e10
system:configure:edevice:pmar:fmaximum "myDevice", 3e9
```

See example program

Query Syntax

SYSTem:CONFigure:EDEVice:PMAR:FMAXimum? <name>

Return Type

Numeric

Default

Not Applicable

SYSTem:CONFigure:EDEVice:PMAR:FMINimum <name>,<value>
Applicable Models: All

(Read-Write) Set and return the minimum frequency of the power meter.

**Parameters**
- `<name>` String - Name of the power meter.
- `<value>` Numeric - Min frequency in Hz.

**Examples**
```
SYST:CONF:EDEV:PMAR:FMIN "myDevice", 1e10

system:configure:edevice:pmar:fminimum "myDevice", 3e9
```

See example program

**Query Syntax**
```
SYSTem:CONFigure:EDEVice:PMAR:FMAXimum? <name>
```

**Return Type** Numeric

**Default** Not Applicable

---

SYSTem:CONFigure:EDEVice:PMAR:CFACtors:STATe <name> <bool>

Applicable Models: All

(Read-Write) Enables/disables use of internal calibration factors for power sensors with built-in calibration factors and reads the current state.

**Parameters**
- `<name>` String - Name of the power meter.
- `<bool>` Choose from:
  - 0 - OFF - Disables the use of internal calibration factors.
  - 1 - ON - Enables the use of internal calibration factors.

Learn about these settings.

**Examples**
```
' This example script demonstrates the SCPI set/get of the "Use Internal Cal Factors" property
' for an existing PMAR named 'MyPMAR'.

Option Explicit

dim app

Query Syntax  SYSTem:CONFigure:EDEVice:PMAR:CFACtors:STATe?
SYSTem:CONFigure:EDEVice:PMAR:READing:COUNt <name>,<value>

**Applicable Models:** All

*(Read-Write)* This command, along with SYST:CONF:EDEV:PMAR:READ:NTOL, allows for settling of the power sensor READINGS.

Set and return the maximum number of power readings that are taken at each stimulus point to allow for measurement settling. Each reading is averaged with the previous readings at that stimulus point.

When this average meets the Average:NTOLerance value or this number of readings has been made, the average is returned as the valid reading.

**Parameters**

- `<name>`: String - Name of the power meter.
- `<value>`: Number of readings. Choose a value between 1 and 1000

**Examples**

```
```

See example program

**Query Syntax**

SYSTem:CONFigure:EDEVice:PMAR:READing:COUNt? <name>

**Return Type** Numeric

**Default** 3

SYSTem:CONFigure:EDEVice:PMAR:READing:NTOLerance <name>,<value>
Applicable Models: All

(Read-Write) This command, along with SYST:CONF:EDEV:PMAR:READ:COUN, allows for settling of the power sensor READINGS.

Each power reading is averaged with the previous readings at each stimulus point. When the average meets this nominal tolerance value, or the max number of readings has been made, the average is returned as the valid reading.

Parameters

- `<name>` String - Name of the power meter.
- `<value>` Power measurement settling tolerance value in dB. Choose any number between 0 and 5.

Examples

```plaintext
system:configure:edevice:pmar:reading:ntolerance "myDevice",.01
```

See example program

Query Syntax

SYSTem:CONFigure:EDEVice:PMAR:READing:NTOLerance? <name>

Return Type

Numeric

Default

.05

SYSTem:CONFigure:EDEVice:PMAR:SENSor <name>,<value>

Applicable Models: All

(Read-Write) Sets and returns the power sensor channel (1 or 2) to be used. This performs the same function as the **Use this sensor only** checkbox.

Parameters

- `<name>` String - Name of the power meter.
- `<value>` Power Meter channel.

Examples

```plaintext
SYST:CONF:EDEV:PMAR:SENS "myDevice",2
system:configure:edevice:pmar:sensor "myDevice",1
```

See example program

Query Syntax

SYSTem:CONFigure:EDEVice:PMAR:SENSor? <name>
SYStem:CONFigure:EDEVice:PMAR:SENSor:CATalog? <name>

Applicable Models: All

(Read-only) Returns the power sensor channel assignment of the specified power meter.

Parameters

=name> String - Name of the power meter.

Examples

Return Type Numeric

Default 1

---

SYSTem:CONFigure:EDEVice:PMAR:TABLE:CFAC:DATA <name>,<value>[,value]

Applicable Models: All

(Read-Write) Sets and returns the cal factor data for the power sensor.

Parameters

=<name> String - Name of the power meter.

<value>[,value] Cal factor data in percent. For each frequency used with
SYST:CONF:EDEV:PMAR:TABLE:CFAC:FREQ, enter a cal factor number
between 1 and 100.

Examples

97,97,97

See example program

Query Syntax

SYSTem:CONFigure:EDEVice:PMAR:TABLE:CFAC:DATA? <name>

Return Type Numeric - one number per table segment.

Default Not Applicable

---

SYSTem:CONFigure:EDEVice:PMAR:TABLE:CFAC:FREQuency <name>,<value>[,value]
Applicable Models: All

(Read-Write) Sets and returns the cal factor frequencies for the power sensor.

**Parameters**

- `<name>` String - Name of the power meter.
- `<value>[,value]` Cal factor frequencies in Hz.

**Examples**

```plaintext
SYST:CONF:EDEV:PMAR:TABL:CFAC:FREQ "myDevice", 1e7,1e8,1e9
system:configure:edevice:pmar:table:cfac:frequency "myDevice", 5e7,5e8,5e9
```

See example program

**Query Syntax**

SYSTem:CONFigure:EDEVice:PMAR:TABLe:CFAC:FREQuency?<name>

**Return Type**

Numeric - one number per table segment.

**Default**

Not Applicable

---

SYSTem:CONFigure:EDEVice:PMAR:TABLe:LOSS:DATA <name>,<value>[,value]

Applicable Models: All

(Read-Write) Sets and returns the power loss data for the power sensor.

Each table can contain up to 9999 segments. Values can also be loaded using the Characterize Adapter macro.

**Parameters**

- `<name>` String - Name of the power meter.
- `<value>[,value]` Loss data in dB. POSITIVE values in dB are interpreted as LOSS. To compensate for gain, use negative values.

For each frequency used with SYST:CONF:EDEV:PMAR:TABL:LOSS:FREQ, enter a cal factor number between 1 and 100.

**Examples**

```plaintext
SYST:CONF:EDEV:PMAR:TABL:LOSS:DATA "myDevice",.01,.02,.03
system:configure:edevice:pmar:table:loss:data "myDevice",.04,.05,.06
```

See example program

**Query Syntax**

SYSTem:CONFigure:EDEVice:PMAR:TABLe:CFAC:DATA? <name>
**SYStem:CONFigure:EDEVice:PMAR:TABLe:LOSS:FREQuency** <name>,<value>[,value]

**Applicable Models:** All

*(Read-Write)* Sets and returns frequencies for the power loss data.

**Parameters**

- `<name>`: String - Name of the power meter.
- `<value>[,value]`: Power Loss frequencies in Hz.

**Examples**

```language
SYST:CONF:EDEV:PMAR:TABLE:LOSS:FREQ "myDevice",1e7,1e8,1e9

"myDevice",5e7,5e8,5e9
```

See example program

**Query Syntax**

SYSTem:CONFigure:EDEVice:PMAR:TABLe:LOSS:FREQuency? <name>

**Return Type** Numeric - one number per table segment.

**Default** Not Applicable

---

**SYStem:CONFigure:EDEVice:PMAR:TABLe:LOSS:STATe** <name>,<value>

**Applicable Models:** All

*(Read-Write)* Sets and returns whether to use the power loss table.

**Parameters**

- `<name>`: String - Name of the power meter.
- `<value>`: Boolean. State of the power loss table. Choose from:
  - OFF or 0 - Power loss table not used.
  - ON or 1 - Power loss table used.

**Examples**

```language

```

See example program

**Query Syntax**

SYSTem:CONFigure:EDEVice:PMAR:TABLe:LOSS:STATe? <name>
**SYSTem:CONFigure:EDEVice:PMAR:TABLE:RFACtor** <name>,<value>

**Applicable Models:** All

*(Read-Write)* Sets and returns the reference cal factor for the power sensor.

Note: If the sensor connected to the power meter contains cal factors in EPROM (such as the Keysight E-series power sensors), those will be the cal factors used. The reference cal factor value associated with this command, and any cal factors entered into the VNA for that sensor channel, will not be used.

**Parameters**

- **<name>** String - Name of the power meter.
- **<value>** Reference cal factor in percent. Choose any number between 1 and 150.

**Examples**

```
SYST:CONF:EDEV:PMAR:TABL:RFAC "myDevice", 1
system:configure:edevice:pmar:table:rfactor "myDevice", 1
```

[See example program]

**Query Syntax**

```
SYSTem:CONFigure:EDEVice:PMAR:TABLE:RFACtor? <name>
```

**Return Type** Numeric

**Default** 100

---

**SYSTem:CONFigure:EDEVice:PMAR:UNCertainty:CATalog?**

**Applicable Models:** N522xB, N523xB, N524xB (requires Option S93015A)

*(Read-only)* Returns a list of available power meters that have power uncertainty.

**Parameters**

- **<name>** String - Name of the device used as power meter which has uncertainty data available from the external device list.

**Examples**

```
SYST:CONF:EDEV:PMAR:UNC:CAT?
system:configure:edevice:pmar:uncertainty:catalog?
```

**Return Type** Comma separated string

**Default** Not Applicable
SYSTem:CONFigure:EDEVice:PMAR:UNCertainty:FILE <name>,<FilePath>

**Applicable Models:** N522xB, N523xB, N524xB (requires Option S93015A)

*(Read-Write)* Sets and returns a custom model uncertainty file containing all of the power meter uncertainty properties. When this command is executed, the model name is automatically set to "CustomFile".

**Parameters**
- `<name>`: String - Name of the device used as the power meter.
- `<FilePath>`: Full path to the custom file.

**Examples**
```
SYST:CONF:EDEV:PMAR:UNC:FILE
"myDevice","C:\U8485A_MY55140018.dat"
```
```
system:configure:edevice:pmar:uncertainty:file
"myDevice","C:\U8485A_MY55140018.dat"
```

**Query Syntax**
SYSTem:CONFigure:EDEVice:PMAR:UNCertainty:FILE? <name>

**Return Type**
String

**Default**
Not Applicable

---

SYSTem:CONFigure:EDEVice:PMAR:UNCertainty:MODel <name>,<PwrMtrModel>

**Applicable Models:** N522xB, N523xB, N524xB (requires Option S93015A)

*(Read-Write)* Sets and returns the name assigned to a specific power meter model among those available for uncertainty (see SYSTem:CONFigure:EDEVice:PMAR:UNC:CAT?).

**Parameters**
- `<name>`: String - Name of the device used as the power meter.
- `<PwrMtrModel>`: String - Specific power meter model.

**Examples**
```
SYST:CONF:EDEV:PMAR:UNC:MOD "myPowerMeter","N8488A"
```
```
"myPowerMeter","N8488A"
```

**Query Syntax**
SYSTem:CONFigure:EDEVice:PMAR:UNCertainty:MODel? <name>

**Return Type**
String

**Default**
Not Applicable

---

SYSTem:CONFigure:EDEVice:PMAR:UNCertainty:PLEVel? <name>
**Applicable Models:** N522xB, N523xB, N524xB (requires Option S93015A)

*(Read-only)* Returns the power level associated with the best accuracy for a specific power meter.

**Note:** This is typically the level where the calfactor was obtained.

**Parameters**

- `<name>` String - Name of the device used as the power meter.

**Examples**

```
```

**Return Type**

- Double (dBm)

**Default**

Not Applicable

---

**SYSTem:CONFigure:EDEVice:PMAR:UNCertainty:READing? <name>,<frequency>,<power>**

**Applicable Models:** N522xB, N523xB, N524xB (requires Option S93015A)

*(Read-only)* Returns the power uncertainty associated with the specific power meter at the specified frequency and power. The returned value is the variance of the power expressed in [mW]^2.

**Parameters**

- `<name>` String - Name of the device used as the power meter.
- `<frequency>` Frequency (Hz).
- `<power>` Power (dBm).

**Examples**

```
SYST:CONF:EDEV:PMAR:UNC:READ? "myDevice",10e9,0.0
system:configure:edevice:pmar:uncertainty:read? "myDevice",10e9,0.0
```

**Return Type**

- Double (W^2)

**Default**

Not Applicable

---

**SYSTem:CONFigure:EDEVice:PMAR:ZERO <name>[,SYNC,<value>]**
**Applicable Models:** All

*(Write-only)* Performs a zeroing of the PMAR device.

This command is always synchronous, so *OPC?* is the only way to determine that the operation is complete. Set an I/O timeout of at least 20 seconds.

Keysight P-Series sensors do ONLY Internal zeroing. These, and Keysight USB power sensors when Internal is selected, do NOT require disconnecting from the measurement path before zeroing.

All other Keysight sensors do ONLY External zeroing.

**Parameters**

- `<name>` String - Name of the power meter.

- `[SYNC,<value>]` Optional argument for use with power sensors that support both internal and external types of zeroing such as Keysight USB power sensors.

  Choose from:

  - **SYNC,Internal** - Internal zeroing. Power is automatically removed from the sensor input before zeroing occurs (Default setting).

  - **SYNC,External** - External zeroing. First remove the sensor input, then send this command. External zeroing is recommended for powers below -30 dBm with the U2000-Series sensors (-20 dBm for the H models).

**Examples**

```
SYST:CONF:EDEV:PMAR:ZERO "myDevice"
```

```
SYSTEM:configure:edevice:pmar:zero "myDevice",sync,internal
```

**Query Syntax** Not Applicable

**Default** Not Applicable
SYSTem:CONF:EDEVice:PULSe Commands

Configures and makes settings for an external Keysight 81110A Pulse Generator.

```
SYST:CONF:EDEVice:PULSe
  | CHAN
  | HAMP
  | LAMP
  | LIMP
  | PMODE
  | SIMP
```

**SYSTem:CONFigure:EDEVice:PULSe:CHAN <name>,<value>**
**Applicable Models:** All

(Read-Write) Sets and returns the output channel of the pulse generator.

**Parameters**

- `<name>`: String - Name of the external pulse generator.
- `<value>`: Pulse Generator output port. Choose from 1 or 2.

**Examples**

```
SYST:CONF:EDEV:PULS:CHAN "81110",1
system:configure:edevice:pulse:chan "myPG",2
```

**Query Syntax**

```
SYSTem:CONFigure:EDEVice:DC:PULSe:CHAN? <name>
```

**Return Type**

Numeric

**Default**

1

---

**SYSTem:CONFigure:EDEVice:PULSe:HAMP <name>,<value>**

(Read-Write) Sets and returns the High amplitude (voltage) of the pulse generator.

**Parameters**

- `<name>`: String - Name of the external pulse generator.
- `<value>`: Pulse Generator high amplitude voltage.

**Examples**

```
SYST:CONF:EDEV:PULS:HAMP "81110",3
system:configure:edevice:pulse:HAMP "myPG",4
```

**Query Syntax**

```
SYSTem:CONFigure:EDEVice:DC:PULSe:HAMP? <name>
```

**Return Type**

Numeric

**Default**

5

---

**SYSTem:CONFigure:EDEVice:PULSe:LAMP <name>,<value>**
Applicable Models: All

(Read-Write) Pulse Generator low amplitude voltage.

Parameters

- `<name>` String - Name of the external pulse generator.
- `<value>` Pulse Generator low amplitude voltage.

Examples

```
SYST:CONF:EDEV:PULS:LAMP "81110",.2
```
```
system:configure:edevice:pulse:lamp "myPG",1
```

Query Syntax

```
SYSTem:CONFigure:EDEVice:DC:PULSe:LAMP? <name>
```

Return Type Numeric

Default 0

---

SYSTem:CONFigure:EDEVice:PULSe:LIMP <name>,<value>

Applicable Models: All

(Read-Write) Sets and returns the load impedance of the pulse generator.

Parameters

- `<name>` String - Name of the external pulse generator.
- `<value>` Pulse generator load impedance.

Examples

```
SYST:CONF:EDEV:PULS:LIMP "81110",52
```
```
system:configure:edevice:pulse:limp "myPG",49
```

Query Syntax

```
SYSTem:CONFigure:EDEVice:DC:PULSe:LIMP? <name>
```

Return Type Numeric

Default 50

---

SYSTem:CONFigure:EDEVice:PULSe:PMODE <name>,<bool>
Applicable Models: All

(Read-Write) Sets and returns the primary (On/Off) setting of the external pulse generator. The ON setting allows the external pulse generator to set the primary clock frequency for the other pulse generators.

Parameters

- `<name>` String - Name of the external pulse generator.
- `<bool>` Primary setting. Choose from:
  - **ON** or 1 - Use the external pulse generator becomes the primary clock frequency.
  - **OFF** or 0 - Use the internal pulse generator as the primary clock frequency.

Examples

```
SYST:CONF:EDEV:PULS:PMOD "81110",OFF
system:configure:edevice:pulse:pmode "myPG",1
```

Query Syntax

```
SYSTem:CONFigure:EDEVice:DC:PULSe:PMODe? <name>
```

Return Type

Boolean

Default

OFF or 0

---

SYSTem:CONFigure:EDEVice:PULS:SIMP <name>,<value>

Applicable Models: All

(Read-Write) Sets and returns the source impedance of the pulse generator.

Parameters

- `<name>` String - Name of the external pulse generator.
- `<value>` Pulse generator source impedance.

Examples

```
SYST:CONF:EDEV:PULS:SIMP "81110",52
system:configure:edevice:pulse:simp "myPG",49
```

Query Syntax

```
SYSTem:CONFigure:EDEVice:DC:PULSe:SIMP? <name>
```

Return Type

Numeric

Default

50
The five SYSTem:CORRection:INTerpolate:LINear commands are used as a sequence. They are not meant to be used independent of the others. The commands perform linear interpolation on a scalar data of (x,y) pairs based on a primary set of x and y values to a new mapping based on a desired set of x values. The desired set of x values (or range) must fall within the primary set of x values (or range) and can have a different number of points than the primary data set.

Definition:

Linear interpolation operates by drawing a straight line between each two adjacent data points on the primary (x,y) pairs that fall on either side of the new desired data point represented by (x’,y’). In other words if

\[(xi, yi)\] represents data pairs on the primary data set and \[(xj’,yj’)\] represents a data point on the interpolated result data set then:

\[X_i < X_j' < X_{i+1} \quad \text{and} \quad Y_j' = Y_i + \frac{(Y_{i+1} - Y_i)}{(X_{i+1} - X_i)}(X_j' - X_i)\]

Note: The primary data set must represent a function on the Cartesian coordinate system. In other words, for each x value in the primary data set, there can be only one corresponding Y value.

There are five steps in the sequence:

1. SYSTem:CORRection:INTerpolate:LINear:INPut:X - loads in the primary X values
2. SYSTem:CORRection:INTerpolate: LINear:INPut:Y - loads in the primary Y values
3. SYSTem:CORRection:INTerpolate: LINear:OUTPut:X - loads in the desired interpolated X values
4. SYSTem:CORRection:INTerpolate: LINear:CALCulate - calculates the interpolated Y values

Example

The following function uses the SYSTem:CORRection:INTerpolate: LINear commands:

```vbnet
Function InterpolateData_Single(inputX() As Double, inputY() As Single, outputX() As Double, ByVal interpData() As Single)
    x = visa_io.ag_send_binBlock64("SYST:CORR:INT:LIN:INP:X ", inputX)
    x = visa_io.ag_send_binBlock("SYST:CORR:INT:LIN:INP:Y ", inputY)
    x = visa_io.ag_send_binBlock64("SYST:CORR:INT:LIN:OUTP:X ", outputX)
End Function
```
 Dim BResp_freqList() As Double
 Dim BResp_Re() As Single
 Dim BResp_Im() As Single

 GetErrorTerm_noChan BResp_Calset, "ResponseTracking(B)", BResp_freqList, BResp_Re, BResp_Im

 Dim Noise_freqList() As Double

 GetCalsetStimulus calsetName, Noise_freqList, 1, "Noise Figure Cold Source"
' Response Stimulus Range

 Dim BResp_Re_interp() As Single
 Dim BResp_Im_interp() As Single

 InterpolateData_Single BResp_freqList, BResp_Re, Noise_freqList, BResp_Re_interp
 InterpolateData_Single BResp_freqList, BResp_Im, Noise_freqList,
BResp_Im_interp

PutErrorTerm channel, calsetName, "ResponseTracking(B)", BResp_Re_interp,
BResp_Im_interp
The 4 GB FIFO data buffer is available with Option S93118A/B or Option S930900A/B on the VNA and N5264B. These commands control data in and out of FIFO data buffer. The FIFO can be emptied as it is being filled, which means that the VNA can be used to acquire an infinite amount of data.

The data placed into the FIFO is the raw data after averaging and ratioing has been applied, but prior to any calibration, formatting, or data analysis functions.

Click on a red keyword to view the command details.

SYSTem:FIFO:DATA? <dpoints>
**Applicable Models:** N522xB, N524xB

(Read-only) Reads the next specified number of data points from the FIFO buffer. Each data point is returned as a real/imaginary pair. Data is cleared as it is read.

### Parameters

- **<dPoints>** Number of data points to read. An error is returned if the amount of requested data is larger than the available data.

### Examples

```
SYST:FIFO:DATA? 1e6

system:fifo:data? 1e3
```

### Return Type

Use `FORMat:DATA` to change the data type (<REAL,32>, <REAL,64> or <ASCii,0>). For best results, use REAL,32.

Use `FORMat:BORDer` to change the byte order. Use “NORMal” when transferring a binary block from LabView or Vee. For other programming languages, you may need to "SWAP" the byte order.

Each data point is returned as a real/imaginary pair.

**Default** Not applicable

---

**SYSTem:FIFO:DATA:BYTe? <X>**

**Applicable Models:** N522xB, N524xB

(Read-only) Returns a specific number of bytes to read.

### Parameters

- **<X>** Number of bytes to read.

### Examples

```
SYST:FIFO:DATA:BYTe? 4096

system:fifo:byte? 4096
```

### Return Type

IEEE binary block

**Default** Not applicable

---

**SYSTem:FIFO:DATA:BYTe:COUNt?**
Applicable Models: N522xB, N524xB

(Read-only) Returns a specific number of bytes to read.

Parameters

Examples

Return Type  Integer

Default  Not applicable

SYS: FIFO: DATA: BYTe: COUNT?

SYST: FIFO: DATA: CLEar

Applicable Models: N522xB, N524xB

(Write-only) Clears the data from the FIFO buffer.

Parameters  None

Examples

Return Type  None

Default  Not applicable

SYS: FIFO: DATA: COUNT?

(Read-only) Returns the total number of data points in the FIFO buffer.

Parameters  None

Examples

Return Type  Numeric

Default  Not applicable

SYS: FIFO[:STATe] <bool>
Applicable Models: N522xB, N524xB

(Write-Read) Sets and returns the state of data storage to the FIFO buffer. Syst:Preset or an instrument state recall also ends storage to the FIFO buffer. The FIFO buffer is cleared when set to OFF.

Parameters

<bool> FIFO buffer state. Choose from:

**ON or 1** Data is stored in the FIFO buffer.

**OFF or 0** Data is NOT stored in the FIFO buffer.

Examples

```plaintext
SYST:FIFO 1
system:fifo:state off
```

Query Syntax

SYSTem:FIFO[:STATE]?

Return Type

Boolean

Default

0 OFF
Sets and reads the VNA Preferences settings.

- SENS:CORRection:PREFerences
SYSTem:PREFERENCEs:ITEM:ASMRamp <bool>

**Applicable Models:** N522xB, N523xB, N524xB, E5080A/B

*(Read-Write)* Set and return whether ramp sweep is used whenever possible when sweep mode is in Auto.

**Parameters**

<bool> Choose from:

- **ON (1)** Enable ramp sweep.
- **OFF (0)** Disable ramp sweep.

**Examples**

<table>
<thead>
<tr>
<th>Syntax</th>
</tr>
</thead>
<tbody>
<tr>
<td>SYST:PREF:ITEM:ASMR 1</td>
</tr>
<tr>
<td>system:preferences:item:asmramp OFF</td>

**Default**

Not Applicable

---

SYSTem:PREFERENCEs:ITEM:CORRection:PARallel:PROCess <bool>
Applicable Models: All

(Read-Write) Enable or disable parallel processing in the CPU which provides higher calculation speeds.

**Parameters**
- `<bool>` Choose from:
  - **OFF (0)** Disable parallel processing.
  - **ON (1)** Enable parallel processing.

**Examples**
- `SYST:PREF:ITEM:CORR:PAR:PROC 1`
- `system:preferences:item:correction:parallel:process OFF`

**Query Syntax**
- `SYSTem:PREFerences:ITEM:CORRection:PARallel:PROCess?`

**Return Type**
- Boolean

**Default**
- ON or 1

---

SYSTem:PREFerences:ITEM:EDEV:DPOLicy `<bool>`

Applicable Models: All

(Read-Write) Set and return whether External Devices remain activated or are de-activated when the VNA is Preset or when a Instrument State is recalled.

This setting remains until changed again using this command, or until the hard drive is changed or reformatted.

**Parameters**
- `<bool>` Choose from:
  - **OFF (0)** External devices remain active when the VNA is Preset or when a Instrument State is recalled.
  - **ON (1)** External devices are de-activated (`SYST:CONF:EDEV:STAT` to OFF) when the VNA is Preset or when a Instrument State is recalled.

**Examples**
- `SYST:PREF:ITEM:EDEV:DPOL 1`
- `system:preferences:item:edev:dpolicy OFF`

**Query Syntax**
- `SYSTem:PREFerences:ITEM:EDEV:DPOLicy?`

**Return Type**
- Boolean

**Default**
- ON or 1
SYSTem:PREFerences:ITEM:CSET:COMPact <bool>

Applicable Models: All

(Read-Write) Enables/disables the creation of compact calsets.

Parameters
  <bool> Choose from:

  ON (1) Enable creation of compact calsets.

  OFF (0) Disable creation of compact calsets.

Examples
SYST:PREF:ITEM:CSET:COMP 1

system:preferences:item:cset:compact OFF

Query Syntax
SYSTem:PREFerences:ITEM:CSET:COMPact?

Return Type
Boolean

Default
OFF

SYSTem:PREFerences:ITEM:DIALog:SHOW:LICense <bool>

Applicable Models: All

(Read-Write) Enables/disables showing the licensed features dialog on startup.

Parameters
  <bool> Choose from:

  ON (1) Enable showing licensed features on startup.

  OFF (0) Disable showing licensed features on startup.

Examples
SYST:PREF:ITEM:DIAL:SHOW:LIC 1

system:preferences:item:dialog:show:license OFF

Query Syntax
SYSTem:PREFerences:ITEM:DIALog:SHOW:LICense?

Return Type
Boolean

Default
OFF

SYSTem:PREFerences:ITEM:EEXTrapolate <bool>
Applicable Models: All

(Read-Write) Sets whether a Swept IMD or IMDx calibration can exceed the stop frequency limit of an ECal module. Learn more.

Parameters

<bool> Choose from:

ON (1) Allow extrapolation.

OFF (0) Do NOT allow extrapolation.

Examples

```
SYST:PREF:ITEM:EEXT 1
```

```
system:preferences:item:eextrapolate OFF
```

Query Syntax

SYSTem:PREFerences:ITEM:EEXTrapolate?

Return Type

Boolean

Default

OFF

SYSTem:PREFerences:ITEM:FIXTure:CIRCuit:DEFAults <char>

Applicable Models: All

(Read-Write) Sets the Series-C and Shunt-L components to legacy or theoretical behavior when set to zero.

Note: This command is only applicable in Firmware versions A.14.00.00 and later.

Parameters

<char> Choose from:

THEoretical - When "R" or "L" is set to 0, the component is defined as "Short"; when "C" or "G" is set to 0, the component is defined as "Open".

LEGacy - Legacy operation provided as a user-convenience for backward compatibility. When either of the two components of Series-C, "C", and "G", is set to 0, the component is defined as "Open"; when both components are set to 0, they are defined as "Short". When either of the two components of Shunt-L, "L", and "R", is set to 0, the component is defined as "Short"; when both components are set to 0, they are defined as "Open".

Examples

```
SYST:PREF:ITEM:FIXT:CIRC:DEFA THE
```

```
system:preferences:item:fixture:circuit:defaults legacy
```

Query Syntax

SYSTem:PREFerences:ITEM:FIXTure:CIRCuit:DEFAults?
SYSTem:PREFerences:ITEM:GDELay:LEGacy <bool>

**Applicable Models:** All

*(Read-Write)* Sets the group delay aperture to use the legacy computation method. [Learn more about group delay aperture.](#)

**Parameters**

<bool> Choose from:

- **ON (1)** Use legacy computation method.
- **OFF (0)** Do not use legacy computation method.

**Examples**

```
SYST:PREF:ITEM:GDEL:LEG 1
system:preferences:item:gdelay:legacy OFF
```

**Query Syntax**

SYSTem:PREFerences:ITEM:GDELay:LEGacy?

**Return Type** Boolean

**Default** OFF

SYSTem:PREFerences:ITEM:GDELay:TWOPoint <bool>

**Applicable Models:** All

*(Read-Write)* Sets the default group delay aperture setting. [Learn more about group delay aperture.](#)

**Parameters**

<bool> Choose from:

- **ON (1)** Sets default group delay aperture to 2 points.
- **OFF (0)** Sets default group delay aperture to 11 points.

**Examples**

```
SYST:PREF:ITEM:GDEL:TWOP 1
system:preferences:item:gdelay:twopoint OFF
```

**Query Syntax**

SYSTem:PREFerences:ITEM:GDELay:TWOPoint?

**Return Type** Boolean

**Default** OFF
SYSTem:PREferences:ITEM:KEYS <bool>

Applicable Models: N522xB, N523xB, N524xB, M937xA, P937xA

(Read-Write) Set and return whether the keys are displayed or not.

Parameters

<bool> Choose from:

**ON (1)** – Turn keys on.

**OFF (0)** – Turn keys off.

Examples

SYST:PREF:ITEM:KEYS 1

system:preferences:item:keys OFF

Query Syntax

SYSTem:PREferences:ITEM:KEYS?

Return Type

Boolean

Default

OFF (0)

---

SYSTem:PREferences:ITEM:MARKer:BANDwidth:SEARch <char>

Applicable Models: All

(Read-Write) Sets the bandwidth search preference to start a bandwidth or notch search in either peak or marker mode.

Parameters

<char> Choose from:

**MARKer** - BW/Notch marker search reference is set to current marker position after Preset.

**PEAK** - BW/Notch marker search reference is set to peak after Preset.

Examples

SYST:PREF:ITEM:MARK:BAND:SEAR MARK

system:preferences:item:marker:bandwidth:search PEAK

Query Syntax

SYSTem:PREferences:ITEM:MARKer:BANDwidth:SEARch?

Return Type

Character

Default

MARK (E5080A/B), PEAK (Others)

---

SYSTem:PREferences:ITEM:MARKer:SINGle <bool>
Applicable Models: All

(Read-Write) Set and return whether to use one marker for marker search.

Enabled behavior:

- Only one marker is used for bandwidth, notch, PNOP, and PSAT marker searches. The points of interest are marked with a notational UI element, i.e. a small triangle.
- Bandwidth, notch, PNOP, and PSAT marker searches are always tracking. Tracking cannot be disabled.
- One basic search and one advanced search may be set per marker.
- The advanced search is enabled until the user disables the search or a multi-peak or multi-target search is executed.

Disabled behavior:

- Bandwidth, notch, PSAT, and PNOP marker searches use multiple markers.
- One advanced marker search is allowed per trace.
- A marker may only perform a basic search or be part of an advanced search. Not both.
- If an advanced marker search is enabled on a trace and then the user performs a basic search, the advanced search is automatically disabled.
- Advanced searches may enable or disable tracking. Only one search may be tracked.

Parameters

<bool> Choose from:

ON (1) Enable single marker search.

OFF (0) Disable single marker search.

Examples

SYSTM:PREF:ITEM:MARK:SING 1
system:preferences:item:marker:single OFF

Query Syntax

SYSTem:PREFerences:ITEM:MARKer:SINGle?

Return Type

Boolean

Default

ON

SYSTem:PREFerences:ITEM:MCControl <bool>
Applicable Models: All

(Read-Write) Set and return whether the Coupled Markers setting controls the ON|OFF state of markers that are coupled. Learn more about Coupled Markers. Refer also to CALC:MEAS:MARK:COUP:STATE ON.

Parameters

\(<\text{bool}>\) Choose from:

ON (1) – With Coupled Markers ON, when a marker is turned on, the same-numbered marker on all coupled traces will also be turned on. Likewise, turning off a marker will turn it off on all coupled traces.

OFF (0) – Turning a marker on or off will have no effect on the markers on other traces.

Examples

```
SYST:PREF:ITEM:MCC 1
```
```
system:preferences:ITEM:mccontrol OFF
```

Query Syntax

SYSTem:PREFerences:ITEM:MCControl?

Return Type

Boolean

Default

OFF (0)

---

SYSTem:PREFerences:ITEM:MCMethod <\text{bool}>

Applicable Models: All

(Read-Write) Set and return whether Coupled Markers is set to Channel or All after Preset. Learn more about Coupled Markers. Refer also to CALC:MEAS:MARK:COUP:STATE ON and SYST:PREF:ITEM:MCPR ON.

Parameters

\(<\text{bool}>\) Choose from:

ON (1) – Marker Coupling Method is set to Channel after Preset.

OFF (0) – Marker Coupling Method is set to ALL after Preset.

Examples

```
SYST:PREF:ITEM:MCM 1
```
```
system:preferences:ITEM:mcmcontrol OFF
```

Query Syntax

SYSTem:PREFerences:ITEM:MCMethod?

Return Type

Boolean
**SYSTem:PREFerences:ITEM:MCPRest <bool>**

**Applicable Models:** All

(Read-Write) Set and return whether Coupled Markers is set to ON or OFF after Preset. Learn more about Coupled Markers.

**Parameters**

<bool> Choose from:

- **OFF (0)** – Coupled Markers is OFF after Preset.
- **ON (1)** – Coupled Markers is ON after Preset.

**Examples**

```
SYST:PRE:F:ITEM:MCPR 1
system:preferences:item:mcpreset OFF
```

**Query Syntax**

SYSTem:PREFerences:ITEM:MCPReset?

**Return Type**

Boolean

**Default**

OFF (0)

---

**SYSTem:PREFerences:ITEM:MIInterpolate <bool>**

Applicable Models: N522xB, N523xB, N524xB

(Read-Write) Sets and reads the state of the memory data interpolation default preference. The PNA will return to the default interpolation state after a Preset, creating a new trace, or closing the PNA application. Learn more.

**Parameters**

<bool> Choose from:

- **0 - OFF** - Set memory interpolation to OFF as the default.
- **1 - ON** - Set memory interpolation to ON as the default.

**Examples**

```
SYST:PRE:F:ITEM:MINT 1
```

**Query Syntax**

SYSTem:PREFerences:ITEM:MIInterpolate?

**Return Type**

Boolean

**Default**

0
SYSTem:PREFerences:ITEM:MRU <bool>

Applicable Models: All

(Read-Write) Set and return whether to list files for recall on softkeys by most-recently used or alphabetically.

Parameters

<bool> Choose from:

ON (1) – Recall softkeys show most recently-used files.

OFF (0) – Recall softkeys show alphabetically-ordered files.

Examples

SYST:PREF:ITEM:MRU 1
system:preferences:item:mru OFF

Query Syntax

SYSTem:PREFerences:ITEM:MRU?

Return Type

Boolean

Default

OFF (0)

SYSTem:PREFerences:ITEM:OFFSet:RCV <bool>

Applicable Models: All

(Read-Write) Set and return whether to offset the test port receivers by the amount of receiver attenuation. Learn more.

To send this command using the VNA front panel, open the GPIB Command Processor Console, then type either of the following examples at the command prompt. Then type the Query Syntax and press enter to be sure the VNA took the command.

This setting remains until changed again using this command, or until the hard drive is changed or reformatted.

Parameters

<bool> Choose from:

ON (1) Offset the test port receivers

OFF (0) Do NOT offset the test port receivers

Examples

SYST:PREF:ITEM:OFFS:RCV 1
system:preferences:item:offset:rcv OFF
**Query Syntax**  SYSTem:PREFerences:ITEM:OFFSet:RCV?

**Return Type**  Boolean

**Default**  PNA-L and E836xB: **OFF** (does NOT offset the display).

PNA-X: **ON** (offsets the display).

SYSTem:PREFerences:ITEM:OFFSet:SRC <bool>

**Applicable Models:** All

*(Read-Write)* Set and return whether to offset the reference receiver by the amount of source attenuation. Learn more.

To send this command using the VNA front panel, open the GPIB Command Processor Console, then type either of the following examples at the command prompt. Then type the Query Syntax and press enter to be sure the VNA took the command.

This setting remains until changed again using this command, or until the hard drive is changed or reformatted.

**Parameters**

<bool>  Choose from:

**ON (1)** Offset the reference receivers.

**OFF (0)** Do NOT Offset the reference receivers.

**Examples**

<table>
<thead>
<tr>
<th>Command</th>
</tr>
</thead>
<tbody>
<tr>
<td>SYST:PREF:ITEM:OFFS:SRC 1</td>
</tr>
<tr>
<td>system:preferences:item:offset:src OFF</td>
</tr>
</tbody>
</table>

**Query Syntax**  SYSTem:PREFerences:ITEM:OFFSet:SRC?

**Return Type**  Boolean

**Default**  All models: **ON** (offset the display).

SYSTem:PREFerences:ITEM:OPTimize:MEMory <bool>
**Applicable Models:** M9485A

*(Read-Write)* Set and return the memory optimization function status. This extends the maximum number of channel. However, this causes slow measurement.

**Parameters**

<bool> Choose from:

**ON (1)** Memory optimization on (more channels, but slower speed)

**OFF (0)** Memory optimization off

**Examples**

SYST:PREF:ITEM:OPT:MEM 1

system:preferences:item:optimize:memory OFF

**Query Syntax**

SYSTem:PREFerences:ITEM:OPTimize:MEMory?

**Return Type** Boolean

**Default** OFF

**SYSTem:PREFerences:ITEM:PRES:CONFirm <bool>**

**Applicable Models:** All

*(Read-Write)* Set and return preset confirmation. If preset confirmation is OFF, pressing the green PRESET key presets the instrument and opens the Preset softkey menu. If preset confirmation is ON, pressing the green PRESET causes the Preset menu to appear.

**Parameters**

<bool> Choose from:

**ON (1)** Enable preset confirmation.

**OFF (0)** Disable preset confirmation.

**Examples**

SYST:PREF:ITEM:PRES:CONF 1

system:preferences:item:preset:confirm OFF

**Query Syntax**

SYSTem:PREFerences:ITEM:PRESet:CONFirm?

**Return Type** Boolean

**Default** ON

**SYSTem:PREFerences:ITEM:PRESet:POWer[:STATe] <char>**
Applicable Models: All

(Read-Write) Set and return the Preset Power ON/OFF state. Learn more.

This setting remains until changed again using this command, or until the hard drive is changed or reformatted.

Parameters

<char> Choose from:

ON - Instrument Preset always turns RF power ON.

AUTO - When the current power setting is OFF, leave power OFF after Preset. When the current power setting is ON, turn power ON after Preset.

Examples

SYST:PREF:ITEM:PRE:POW ON
system:preferences:item:preset:power:state auto

Query Syntax

SYSTem:PREFerences:ITEM:PREset:POWer[:STATe]?

Return Type

Character

Default

ON

SYSTem:PREFerences:ITEM:PSRTrace <char>

Applicable Models: All

(Read-Write) At the end of a power sweep, while waiting to trigger the next sweep, maintain source power at either the start power level or at the stop power level.

To send this command using the VNA front panel, open the GPIB Command Processor Console, then type either of the following examples at the command prompt. Then type the Query Syntax and press enter to be sure the VNA took the command.

This setting remains until changed again using this command, or until the hard drive is changed or reformatted.

Parameters

<char> Choose from:

START - Maintain source power at the start power level.

STOP - Maintain source power at the stop power level.

Examples

SYST:PREF:ITEM:PSRT STOP
system:preferences:item:psrtrace start
**Query Syntax**
SYSTem:PREFerences:ITEM:PSRTrace?

**Return Type**
Character

**Default**
STARt

**SYSTem:PREFerences:ITEM:QSTart <bool>**

**Applicable Models:** All

*(Read-Write)* This command controls the on/off state of the preference, "On PRESET show Quick Start dialog".

**Parameters**

<bool> Choose from:

**ON (1)** Display the Quick Start dialog on PRESET.

**OFF (0)** Do not display the Quick Start dialog on PRESET.

**Examples**

SYST:PREF:ITEM:QST 1
system:preferences:item:qstart OFF

**Query Syntax**
SYSTem:PREFerences:ITEM:QST?

**Return Type**
Boolean

**Default**
OFF

**SYSTem:PREFerences:ITEM:RECeivers:CERRor[:STATe] <bool>**

**Applicable Models:** All

*(Read-Write)* Set and return whether to display receiver overload warnings. Learn more.

**Parameters**

<bool> Choose from:

**ON (1)** Display overload warnings,

**OFF (0)** Do NOT display overload warnings.

**Examples**

SYST:PREF:ITEM:REC:CERR 1
system:preferences:item:receivers:cerror:state OFF

**Query Syntax**
SYSTem:PREFerences:ITEM:RECeivers:CERRor[:STATe]?

**Return Type**
Boolean
SYSTem:PREFerences:ITEM:RECeivers:OVERload:POWer[:STATe] <bool>

Applicable Models: All

(Read-Write) Set and return whether to turn source power OFF when a receiver is overloaded. Learn more.

Parameters

 BOOL Choose from:

ON (1) Turn OFF source power to ALL ports when a receiver is overloaded.

OFF (0) Power remains ON when a receiver is overloaded.

Examples

SYST:PREF:ITEM:REC:OVER:POW 1
system:preferences:item:receivers:overload:power:state OFF

Query Syntax

SYSTem:PREFerences:ITEM:RECeivers:OVERload:POWer[:STATe]?

Return Type

Boolean

Default

OFF (0)

SYSTem:PREFerences:ITEM:REDLimits <bool>

Applicable Models: N522xB, N523xB, N524xB, M937xA, P937xA

(Read-Write) Set and return whether to draw limits lines in Red or the trace color.

Parameters

 BOOL Choose from:

ON (1) All Limit lines are drawn in Red.

OFF (0) Limit lines are drawn the same color as the trace.

Examples

SYST:PREF:ITEM:REDL 1
system:preferences:item:redlimits OFF

Query Syntax

SYSTem:PREFerences:ITEM:REDLimits?

Return Type

Boolean

Default

OFF
**SYSTem:PREFerences:ITEM:REFMarker <bool>**

**Applicable Models:** N522xB, N523xB, N524xB, M937xA, P937xA

*(Read-Write)* Set and return whether to treat marker 10 as a reference marker. [Learn more.]

**Parameters**

- *<bool>* Choose from:
  
  **ON (1)** Marker 10 is always a reference marker (Pre A.10.40 behavior).
  
  **OFF (0)** Marker 10 is just another marker. See Reference Marker commands

**Examples**

- `SYST:PREF:ITEM:REFM 1`
- `system:preferences:item:refmarker OFF`

**Query Syntax**

- `SYSTem:PREFerences:ITEM:REFMarker?`

**Return Type**

- Boolean

**Default**

- OFF

---

**SYSTem:PREFerences:ITEM:REMote:AUTO[:STATe] <bool>**

**Applicable Models:** All

*(Read-Write)* Enables/disables changing from local to remote status when a SCPI command is received.

**Parameters**

- *<bool>* Choose from:
  
  **OFF (0)** Turn OFF local/remote behavior.
  
  **ON (1)** Turn ON local/remote behavior.

**Examples**

- `SYST:PREF:ITEM:REM:AUTO 0`
- `system:preferences:item:remote:auto:state OFF`

**Query Syntax**

- `SYSTem:PREFerences:ITEM:REMote:AUTO[:STATe]?`

**Return Type**

- Boolean

**Default**

- ON

---

**SYSTem:PREFerences:ITEM:RETRace:POWer <char>**
Applicable Models: N522xB, N523xB, N524xB, E5080B

(Read-Write) For single-band frequency or segment sweeps ONLY, specify whether to turn RF power ON or OFF during a retrace. Learn more about RF power during sweep retrace.

To send this command using the VNA front panel, open the GPIB Command Processor Console, then type either of the following examples at the command prompt. Then type the Query Syntax and press enter to be sure the VNA took the command.

This setting remains until changed using this command, or until the hard drive is changed or reformatted.

**Parameters**

<char> Choose from:

**AUTO**: Power is left ON during retrace of single-band frequency or segment sweeps ONLY.

**OFF**: Power is turned OFF during retrace of single-band frequency or segment sweeps ONLY.

**Examples**

```
SYST:PREF:ITEM:RETR:POW OFF
system:preferences:item:retrace:power auto
```

**Query Syntax** SYSTem:PREFerences:ITEM:RETRace:POWer?

**Return Type** Character

**Default** AUTO

```
SYSTem:PREFerences:ITEM:ROSCillator:RECall <bool>
```
**Applicable Models:** All

*(Read-Write)* Enables/disables External Reference settings being affected by Recall/Preset.

**Parameters**

- `<bool>` Choose from:
  - **OFF (0)** External Reference settings will be maintained until changed.
  - **ON (1)** External Reference settings will be affected by Recall/Preset.

**Examples**

```
SYST:PREF:ITEM:ROSC:REC 0
system:preferences:item:roscillator:recall OFF
```

*Query Syntax*  
SYSTem:PREFerences:ITEM:ROSCillator:RECall?

*Return Type*  
Boolean

*Default*  
ON

**SYSTem:PREFerences:ITEM:RTOF <bool>**

**Applicable Models:** All

*(Read-Write)* Set and return whether to display limit line failures as red trace segments or red data points (dots). Learn more.

**Parameters**

- `<bool>` Choose from:
  - **ON (1)** Display failures as red trace segments. (Red Trace On Fail).
  - **OFF (0)** Display failures as red data points (dots).

**Examples**

```
SYST:PREF:ITEM:RTOF 1
system:preferences:item:rtof OFF
```

*Query Syntax*  
SYSTem:PREFerences:ITEM:RTOF?

*Return Type*  
Boolean

*Default*  
OFF

**SYSTem:PREFerences:ITEM:SOFTkeys:NAVigation <bool>**
Applicable Models: N522xB, N523xB, N524xB, M937xA, P937xA

(Read-Write) This command controls the on/off state of the preference, "Use keyboard to navigate softkeys".

Parameters

<bool> Choose from:

ON (1) Enable softkey navigation with keyboard.

OFF (0) Disable softkey navigation with keyboard.

Examples

SYST:PREF:ITEM:SOFT:NAV 1
system:preferences:item:softkeys:navigation OFF

Query Syntax

SYSTem:PREFerences:ITEM:SOFTkeys:NAVigation?

Return Type

Boolean

Default

OFF

---

SYSTem:PREFerences:ITEM:SWITch:DEF <string>, <int>

Applicable Models: All

(Read-Write) Sets the default setting for the Noise Tuner switch. This is the setting that occurs when a new channel is created. Learn more.

This command will return an error on VNA models with a built-in Noise tuner.

To send this command using the VNA front panel, open the GPIB Command Processor Console, then type either of the following examples at the command prompt. Then type the Query Syntax and press enter to be sure the VNA took the command.

This setting remains until changed using this command, or until the hard drive is changed or reformatted.

Parameters

<string> Name of the switch to set. Choose from:

- "Port1NoiseTuner"

<int> Value to set. Choose from:

0 Sets the default (preset) to INTERNAL

1 Sets the default (preset) to EXTERNAL
### Examples

<table>
<thead>
<tr>
<th>Query Syntax</th>
<th>Return Type</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>SYST:PREF:ITEM:SWIT:DEF &quot;Port1NoiseTuner&quot; 1 'Write</td>
<td>System:preferences:item:switch:def? &quot;Port1NoiseTuner&quot; 'Read</td>
<td>1 (External)</td>
</tr>
</tbody>
</table>

### SYStem:PREferenceS:SOURce<port>:GLOBAL:FRQuency <num>

**Applicable Models:** All

*(Read-Write)* Set and return the frequency of the specified global source. **Learn more.**

**Parameters**

- **<port>** Source port number of the VNA.
- **<num>** Global source frequency. Choose any number between the **minimum** and **maximum** frequency limits of the analyzer. Units are Hz.

**Examples**

<table>
<thead>
<tr>
<th>Query Syntax</th>
<th>Return Type</th>
<th>Default</th>
</tr>
</thead>
</table>

### Query Syntax

SYSTem:PREFerences:SOURce<port>:GLOBAL:FRQuency?

**Return Type** Numeric

**Default** Not Applicable

### SYSTem:PREferences:SOURce<port>:GLOBAL:OUTPut[:STATe] <bool>
Applicable Models: All

(Read-Write) Set and return the output state of the specified global source. Learn more.

Parameters

<port> Source port number of the VNA.
<br> Choose from:

**OFF (0)** Turn global source output OFF.

**ON (1)** Turn global source output ON.

Examples

```
SYST:PREF:SOUR2:GLOB:OUTP 1
```

```
 system:preferences:source3:global:output:state OFF
```

Query Syntax

SYSTem:PREFerences:SOURce<port>:GLOBal:OUTPut[:STATe]?

Return Type

Boolean

Default OFF

---

Applicable Models: All

(Read-Write) Set and return the global sources that ignore the power off setting. Learn more.

Parameters

<port> Source port number of the VNA.
<br> Choose from:

**OFF (0)** Do not ignore power off settings for specified global sources.

**ON (1)** Ignore power off settings for specified global sources.

Examples

```
SYST:PREF:SOUR2:GLOB:POFF:IGN 1
```

```
```

Query Syntax

SYSTem:PREFerences:SOURce<port>:GLOBal:POFF:IGNore[:STATe]?

Return Type

Boolean

Default OFF

---

SYSTem:PREFerences:SOURce<port>:GLOBal:POWer <num>
Applicable Models: All

(Read-Write) Set and return the power of the specified global source. Learn more.

**Parameters**

- `<port>` Source port number of the VNA.
- `<num>` Global source frequency. Choose any number between the `minimum` and `maximum` frequency limits of the analyzer. Units are Hz.

**Examples**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
</table>

**Query Syntax**

SYSTem:PREferences:SOURce<port>:GLOBal[:STATe] <bool>

**Applicable Models: All**

(Read-Write) Set and return the global state of the specified global source. Learn more.

**Parameters**

- `<port>` Source port number of the VNA.
- `<bool>` Choose from:
  - **OFF (0)** Turn global state of the specified source OFF.
  - **ON (1)** Turn global state of the specified source ON.

**Examples**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
</table>

**Query Syntax**

SYSTem:PREferences:SOURce<port>:GLOBal[:STATe]

**Return Type**

- **Numeric**
- **Boolean**

**Default**

- OFF

SYS Te m:TDR:CAPability:FREQuency:MAXimum <freq>

**Applicable Models:** All with TDR Options (S9x011A/B)

*(Read-Write)* Set/Get stop limit frequency in TDR app. The value change gets effective after TDR preset.

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;freq&gt;</td>
<td>Stop limit frequency</td>
</tr>
</tbody>
</table>

**Examples**

```
SYST:TDR:CAP:FREQ:MAX 9E6
system:tdr:capability:frequency:maximum?
```

**Query Syntax**

```
SYSTem:TDR:CAPability:FREQuency:MAXimum ]?
```

**Return Type**

Numeric

**Default**

Same as the product default stop frequency

SYS Te m:TDR:CAPability:FREQuency:MINimum <freq>
Applicable Models: All with TDR Options (S9x011A/B)

(Read-Write) Set/Get start limit frequency in TDR app. The value change gets effective after TDR preset.

Parameters

<freq> Start limit frequency

Examples

```
SYST:TDR:CAP:FREQ:MIN 9E3
system:tdr:capability:frequency:minimum?
```

Query Syntax

```
SYSTem:TDR:CAPability:FREQuency:MINimum ]?
```

Return Type

Numeric

Default

Same as the product default start frequency

SYSTem:TDR:PRESet

Applicable Models: All with TDR Options (S9x011A/B)

(Write-only) This command executes a TDR preset.

Examples

```
SYST:TDR:PRES
system:tdr:preset
```

Default

Not Applicable
**SYSTem:UNCertainty**

Contains the settings to create and control Dynamic Uncertainty for S-Parameters (Opt. S93015A/B).

SYSTem:UNCertainty:CABLE:CATalog?
Applicable Models: N522xB, N523xB, N524xB

(Read-only) Returns a comma-delimited list of names of cables that are defined in the Uncertainty Manager application.

<table>
<thead>
<tr>
<th>Parameters</th>
<th>None</th>
</tr>
</thead>
<tbody>
<tr>
<td>Examples</td>
<td>SYST:UNC:CABL:CAT?</td>

</tr>
</tbody>
</table>

SYSTem:UNCertainty:CABLE:REPeat:RESet <cableName>

Applicable Models: N522xB, N523xB, N524xB

(Write-only) Resets (clears) the characterized repeatability data associated with the specified cable.

Parameters
<\cableName> String. Name of the cable for which data is to be reset.

| Examples     | SYST:UNC:CABL:REP:RES "MyCable" |
| Query Syntax | Not Applicable |
| Default      | Not Applicable |

SYSTem:UNCertainty:PORT:CABLE:ALL[:SELect] <cableName>

Applicable Models: N522xB, N523xB, N524xB

(Write-only) Sets the name of the cable to be associated with all the ports currently enabled on the VNA.

Parameters
<\cableName> String. Name of the cable.

| Examples     | SYST:UNC:PORT:CABL:ALL "MyCable" |
| Query Syntax | Not Applicable |
| Default      | Not Applicable |

SYSTem:UNCertainty:PORT<pNum>:CABLe[:SELect] <cableName>
Applicable Models: N522xB, N523xB, N524xB

(Write-Read) Sets and returns the name of the cable to be associated with the specified port number on the VNA

Parameters

- `<pNum>` VNA port number.
- `<cableName>` String. Name of the cable.

Examples

```
SYST:UNC:PORT3:CABL "MyCable"
```

Query Syntax

```
SYSTem:UNCertainty:PORT<pNum>:CABLe[:SELect]?
```

Return Type

String

Default

Not Applicable

---

**SYSTem:UNCertainty:PORT:NOISe:ALL:COPY <pNum>**

Applicable Models: N522xB, N523xB, N524xB

(Write-only) Copies the characterized noise data associated with the specified port, to all the other ports

Parameters

- `<pNum>` VNA port number for which noise data will be copied.

Examples

```
SYST:UNC:PORT:NOIS:ALL:COPY 2
```

Query Syntax

Not Applicable

Default

Not Applicable

---

**SYSTem:UNCertainty:PORT:NOISe:ALL:RESet**

Applicable Models: N522xB, N523xB, N524xB

(Write-only) Resets (clears) the characterized noise data for all currently enabled VNA ports.

Parameters

None

Examples

```
SYST:UNC:PORT:NOIS:ALL:RESet
```

Query Syntax

Not Applicable

Default

Not Applicable
SYSTem:UNCertainty:PORT<pNum>:NOISe:RESet

Applicable Models: N522xB, N523xB, N524xB

(Write-only) Resets (clears) the characterized noise data for the specified VNA port.

Parameters
None

<pNum> VNA port number for which noise data will be reset.

Examples
SYST:UNC:PORT2:NOIS:RESet

Query Syntax Not Applicable

Default Not Applicable

SYSTem:UNCertainty:LOAD <filename>

Applicable Models: N522xB, N523xB, N524xB

(Write-only) Loads an uncertainty ‘workspace’ (*.ml4) file into the Uncertainty Manager.

Parameters
None

<filename> String. Full path, filename, and extension of the uncertainty workspace file, enclosed in quotes.

Examples
SYST:UNC:LOAD "C:\MyUncert.ml4"

Query Syntax Not Applicable

Default Not Applicable

SYSTem:UNCertainty:STORe [filename]
**Applicable Models:** N522xB, N523xB, N524xB

(Write-only) Saves the current uncertainty ‘workspace’ of the Uncertainty Manager to a (‘.ml4’) file.

**Parameters**
- None

  If filename is not specified, the current workspace is saved to the default workspace (*.ml4) file.

**Examples**

```
SYST:UNC:STORe "C:\MyUncert.ml4"
```

**Query Syntax**
- Not Applicable
- **Default**

---

**SYSTM:UNCertainty:POINts:MAXimum <num>**

**Applicable Models:** N522xB, N523xB, N524xB

(Write-Read) Sets and returns the maximum number of points (“decimation value”) for which uncertainties are to be computed for subsequent calibrations that are performed using Dynamic Uncertainty for S-Parameters.

**Parameters**
- <num> Max number of points. Specify an integer between 0 and 501.

**Examples**

```
SYST:UNC:POIN:MAX 201
```

**Query Syntax**
- SYSTM:UNCertainty:POINts:MAXimum?
- **Return Type**
- Numeric
- **Default**

---

**SYSTM:UNCertainty:ETERm:NOISe:ENABle <bool>**
**Applicable Models:** N522xB, N523xB, N524xB

*(Write-Read)* Sets and returns the ON/OFF state of allowing noise data to contribute to the uncertainty of a calibration performed using Dynamic Uncertainty for S-Parameters. Noise data must also be present for the ports at the time the calibration is performed.

**Parameters**

<bool> Enable ON/OFF state. Choose from:

- **ON** or 1 - Noise uncertainty ON.
- **OFF** or 0 - Noise uncertainty OFF.

**Examples**

```
SYST:UNC:ETER:NOIS:ENAB ON
```

**Query Syntax**

SYSTem:UNCertainty:ETERm:NOISe:ENABle?

**Return Type**

Boolean

**Default**

ON

---

**SYSTem:UNCertainty:ETERm:CABLe:REPeat[:ENABle] <bool>**

**Applicable Models:** N522xB, N523xB, N524xB

*(Write-Read)* Sets and returns the ON/OFF state of allowing cable repeatability data to contribute to the uncertainty of a calibration performed using Dynamic Uncertainty for S-Parameters. Repeatability data must also be present for the ports at the time the calibration is performed.

**Parameters**

<bool> Enable ON/OFF state. Choose from:

- **ON** or 1 - Cable repeatability uncertainty ON.
- **OFF** or 0 - Cable repeatability uncertainty OFF.

**Examples**

```
SYST:UNC:ETER:CABL:REP ON
```

**Query Syntax**

SYSTem:UNCertainty:ETERm:CABLe:REPeat[:ENABle]?

**Return Type**

Boolean

**Default**

ON

---

**SYSTem:UNCertainty:ETERm:SDEFinitions[:ENABle] <bool>**
**Applicable Models:** N522xB, N523xB, N524xB

*(Write-Read)* Sets and returns the ON/OFF state of allowing the uncertainty associated with the standard definitions in the cal kits to contribute to the uncertainty of a calibration performed using Dynamic Uncertainty for S-Parameters. The uncertainty data for the Cal standards must also be present at the time the calibration is performed.

**Parameters**

<`bool>` Enable ON/OFF state. Choose from:

- **ON** or **1** - Standard definition uncertainty ON.
- **OFF** or **0** - Standard definition uncertainty OFF.

**Examples**

```
SYST:UNC:ETER:SDEF ON
```

**Query Syntax**

SYSTem:UNCertainty:ETERm:SDEFinitions[:ENABle]?

**Return Type**

Boolean

**Default**

ON
Trigger Commands

TRIGger:AUXiliary:COUNt?
Applicable Models: N522xB, N523xB, N524xB, E5080A, M937xA, M9485A, P937xA

(Read-only) Returns the number of AUX trigger input / output connector pairs in the instrument.

Parameters

Examples

TRIG:AUX:COUN?
trigger:auxiliary:count?

Return Type
Numeric

Default
Not Applicable

TRIGger:CHANnel<ch>:AUXiliary<n>:DURation <num> Superseded

Applicable Models: N522xB, N523xB, N524xB, M937xA

This command is replaced with TRIG:CHAN:AUX:INP:DEL.

(Read-Write) Specifies the delay that should be applied by the VNA after the Aux trigger input is received and before the acquisition is made.

Parameters

<ch> Any existing channel number. If unspecified, value is set to 1.

<n> AUX Trigger connector used to send or receive signals.

Choose from 1 (AUX TRIG 1) or 2 (AUX TRIG 2)

If unspecified, value is set to 1.

<num> Delay value in seconds. Choose a value between 0 and 3.0 seconds.

Examples

TRIG:CHAN:AUX:DEL 0.5
trigger:channel2:aux2:delay 1.5

Query Syntax
TRIGger:CHANnel<ch>:AUXiliary<n>:DURation<num>?

Return Type
Numeric

Default
0

TRIGger:CHANnel<ch>:AUXiliary<n>:DURation <num> Superseded
**Applicable Models:** N522xB, N523xB, N524xB, E5080A, M937xA, M9485A

This command is replaced with `TRIG:CHAN:AUX:OUTP:DUR`.

(Read-Write) Specifies the width of the output pulse, which is the time that the Aux trigger output will be asserted.

**Parameters**

- `<ch>`: Any existing channel number. If unspecified, value is set to 1.
- `<n>`: AUX Trigger connector used to send or receive signals.

Choose from 1 (AUX TRIG 1) or 2 (AUX TRIG 2)

If unspecified, value is set to 1.

- `<num>`: Duration value in seconds. Choose a value between 1us (1E-6) and 1

**Examples**

```
TRIG:CHAN:AUX:DUR .1
trigger:channel2:aux2:duration .01
```

**Query Syntax**

`TRIGger:CHANnel<ch>:AUXiliary<n>:DURation?`

**Return Type**

Numeric

**Default**

1E-6

---

`TRIGger:CHANnel<ch>:AUXiliary<n>[:ENABle] <bool>`

**Applicable Models:** N522xB, N523xB, N524xB, M937xA, E5080A, M9485A

(Read-Write) Turns ON / OFF the trigger output.

**Parameters**

- `<ch>`: Any existing channel number. If unspecified, value is set to 1.
- `<n>`: AUX Trigger connector used to send or receive signals.

Choose from 1 (AUX TRIG 1) or 2 (AUX TRIG 2)

If unspecified, value is set to 1.

- `<bool>`: ON (or 1) - turns trigger output ON.

**Examples**

```
TRIG:CHAN:AUX 1
trigger:channel2:aux2:enable off
```
TRIGger:CHANnel<ch>:AUXiliary<n>:HANDshake <bool> Superseded

**Applicable Models:** N522xB, N523xB, N524xB

This command is replaced with TRIG:CHAN:AUX:INP:HAND.

*(Read-Write)* Turns handshake ON / OFF.

To enable handshake, the main trigger enable must also be set using TRIG:CHAN:AUX:ENAB.

When ON, VNA waits indefinitely for the input line to be asserted before continuing with the acquisition. When OFF, the VNA acquires data without waiting.

**Parameters**

- `<ch>` Any existing channel number. If unspecified, value is set to 1.
- `<n>` AUX Trigger connector used to send or receive signals.
  - Choose from 1 *(AUX TRIG 1)* or 2 *(AUX TRIG 2)*
  - If unspecified, value is set to 1.
- `<bool>`
  - **ON** (or 1) - turns handshaking ON.
  - **OFF** (or 0) - turns handshaking OFF.

**Examples**

```
TRIG:CHAN:AUX:HAND 1
trigger:channel2:aux2:handshake off
```

**Query Syntax**

TRIGger:CHANnel<ch>:AUXiliary<n>:HANDshake?

**Return Type** Boolean

**Default** OFF
Applicable Models: N522xB, N523xB, N524xB

(Read-Write) Specifies the delay that should be applied by the VNA after the Aux trigger input is received and before the acquisition is made.

Parameters

- `<ch>` Any existing channel number. If unspecified, value is set to 1.
- `<n>` AUX Trigger connector used to send or receive signals. Choose from 1 (AUX TRIG 1) or 2 (AUX TRIG 2)
  - If unspecified, value is set to 1
- `<num>` Delay value in seconds. Choose a value between 0 and 3.0 seconds.

Examples

```
TRIG:CHAN:AUX:INP:DEL .5
```
```
trigger:channel2:aux:input:delay 1.5
```

Query Syntax

TRIGger:CHANnel<ch>:AUXiliary<n>:INPut:DELay?

Return Type

Numeric

Default

0

Applicable Models: N522xB, N523xB, N524xB

(Read-Write) Turns handshake ON / OFF.

To enable handshake, the main trigger enable must also be set using TRIG:CHAN:AUX:ENAB.

When ON, VNA waits indefinitely for the input line to be asserted before continuing with the acquisition. When OFF, the VNA acquires data without waiting.

Parameters

- `<ch>` Any existing channel number. If unspecified, value is set to 1.
- `<n>` AUX Trigger connector used to send or receive signals.
  - Choose from 1 (AUX TRIG 1) or 2 (AUX TRIG 2)
  - If unspecified, value is set to 1
- `<bool>`
  - ON (or 1) - turns handshaking ON.
  - OFF (or 0) - turns handshaking OFF.
Examples

```
TRIG:CHAN:AUX:INP:HAND 1
trigger:channel2:aux:input:handshake off
```

Query Syntax

TRIGger:CHANnel<ch>:AUXiliary<n>:INPut:HANDshake?

Return Type

Boolean

Default

OFF

TRIGger:CHANnel<ch>:AUXiliary<n>:INPut:POLarity <char>

Applicable Models: N522xB, N523xB, N524xB

(Read-Write) Specifies the polarity of the trigger IN signal to which the VNA will respond.

Parameters

<ch> Any existing channel number. If unspecified, value is set to 1.

<n> AUX Trigger connector used to send or receive signals.

Choose from 1 (AUX TRIG 1) or 2 (AUX TRIG 2)

If unspecified, value is set to 1.

<char> Choose from:

- POSitive VNA responds to leading edge or HIGH level
- NEGative VNA responds to trailing edge or LOW level.

Set Edge or Level triggering using TRIG:CHAN:AUX:TYPE

Examples

```
TRIG:CHAN:AUX:INP:POL POS
trigger:channel2:aux2:input:polarity negative
```

Query Syntax

TRIGger:CHANnel<ch>:AUXiliary<n>:INPut:POLarity?

Return Type

Character

Default

NEGative

TRIGger:CHANnel<ch>:AUXiliary<n>:INPut:TYPE <char>
**Applicable Models:** N522xB, N523xB, N524xB

*(Read-Write)* Specifies the type of Aux input detection that the VNA will employ.

**Parameters**

- `<ch>` Any existing channel number. If unspecified, value is set to 1.
- `<n>` AUX Trigger connector used to send or receive signals.
  
  Choose from 1 (AUX TRIG 1) or 2 (AUX TRIG 2)

  If unspecified, value is set to 1.
- `<char>` Choose from:
  
  - **EDGE** VNA responds to the leading edge of a signal
  - **LEVEL** VNA responds to the level (HIGH or LOW) of a signal

**Examples**

```
TRIG:CHAN:AUX:INP:TYPE EDGE
```

```
trigger:channel2:aux:input:type level
```

**Query Syntax**

TRIGger:CHANnel<ch>:AUXiliary<n>:INPut:TYPE?

**Return Type**

Character

**Default**

EDGE

---

**TRIGger:CHANnel<ch>:AUXiliary<n>:INTerval <char> Superseded**

*Applicable Models:* N522xB, N523xB, N524xB, M937xA, E5080A/B, M9485A, M98xxA, P50xxA

This command is replaced with `TRIG:CHAN:AUX::OUTP:INT`.

*(Read-Write)* Specifies how often a trigger output signal is sent.

**Parameters**

- `<ch>` Any existing channel number. If unspecified, value is set to 1.
- `<n>` AUX Trigger connector used to send or receive signals.

  Choose from 1 (AUX TRIG 1) or 2 (AUX TRIG 2)

  If unspecified, value is set to 1.
- `<char>` Choose from:
- **POINT** Trigger signal is sent every data point. (effectively the same as Point sweep)

- **SWEep** Trigger signal is sent once every sweep.

**Examples**

```
TRIG:CHAN:AUX:INT POI
```

```
trigger:channel2:aux2:interval sweep
```

**Query Syntax**  
TRIGger:CHANnel<ch>:AUXiliary<n>:INTerval?

**Return Type**  
Character

**Default**  
SWEep

TRIGger:CHANnel<ch>:AUXiliary<n>:IPOLarity <char> **Superseded**

**Applicable Models:** N522xB, N523xB, N524xB

This command is replaced with **TRIG:CHAN:AUX::INP:POL**.

**Parameters**

- **<ch>** Any existing channel number. If unspecified, value is set to 1.
- **<n>** AUX Trigger connector used to send or receive signals.
  - Choose from 1 (AUX TRIG 1) or 2 (AUX TRIG 2)
  - If unspecified, value is set to 1.
- **<char>** Choose from:
  - **POSitive** VNA responds to leading edge or HIGH level
  - **NEGative** VNA responds to trailing edge or LOW level.

**Examples**

```
TRIG:CHAN:AUX:IPOL POS
```

```
trigger:channel2:aux2:ipolarity negative
```

**Query Syntax**  
TRIGger:CHANnel<ch>:AUXiliary<n>:IPOLarity?

**Return Type**  
Character

**Default**  
NEGative
TRIGger:CHANnel<ch>:AUXiliary<n>:OPOLarity <char> Superseded

Applicable Models: N522xB, N523xB, N524xB, M937xA, E5080A/B, M9485A, M98xxA, P50xxA

This command is replaced with TRIG:CHAN:AUX::OUTP::POL.

(Read-Write) Specifies the polarity of the Aux Output signal being supplied by the VNA.

Parameters

<ch> Any existing channel number. If unspecified, value is set to 1.

<n> AUX Trigger connector used to send or receive signals.

Choose from 1 (AUX TRIG 1) or 2 (AUX TRIG 2)

If unspecified, value is set to 1.

<char> Choose from:

- POSitive VNA sends positive going pulse.
- NEGative VNA sends negative going pulse.

Examples

<table>
<thead>
<tr>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>TRIG:CHAN:AUX::OPOL NEG</td>
</tr>
<tr>
<td>trigger:channel2:aux2:opolarity positive</td>

Query Syntax TRIGger:CHANnel<ch>:AUXiliary<n>:OPOLarity?

Return Type Character

Default NEGative

TRIGger:CHANnel<ch>:AUXiliary<n>:OUTPut:DELay <num>
**Applicable Models:** N522xB, N523xB, N524xB, M937xA, E5080A/B, M9485A, M98xxA, P50xxA

(Read-Write) Specifies the delay that should be applied by the VNA after the Aux trigger output is output and before the acquisition is made.

**Parameters**

- `<ch>` Any existing channel number. If unspecified, value is set to 1.
- `<n>` AUX Trigger connector used to send or receive signals.
  
  Choose from **1** (AUX TRIG 1) or **2** (AUX TRIG 2)
  
  If unspecified, value is set to 1.

- `<num>` Delay value in seconds. Choose a value between 0 and 1 seconds.

**Examples**

```
TRIG:CHAN:AUX:OUTP:DEL .5
trigger:channel2:aux:output:delay 1.5
```

**Query Syntax**

TRIGger:CHANnel<ch>:AUXiliary<n>:OUTPut::DELay?

**Return Type** Numeric

**Default** 0

---

**TRIGger:CHANnel[ch]:AUXiliary[n]:OUTPut:DURation <num>**

(Read-Write) Specifies the width of the output pulse, which is the time that the Aux trigger output will be asserted.

**Parameters**

- `<ch>` Any existing channel number. If unspecified, value is set to 1.
- `<n>` AUX Trigger connector used to send or receive signals.
  
  Choose from **1** (AUX TRIG 1) or **2** (AUX TRIG 2)
  
  If unspecified, value is set to 1.

- `<num>` Duration value in seconds. Choose a value between 1us (1E-6) and 1

**Examples**

```
TRIG:CHAN:AUX:OUTP:DUR .1
trigger:channel2:aux:output:duration .01
```

**Query Syntax**

TRIGger:CHANnel<ch>:AUXiliary<n>:OUTPut:DURation?

**Return Type** Numeric
TRIGger:CHANnel<ch>:AUXiliary<n>:OUTPut:INTerval <char>

Applicable Models: N522xB, N523xB, N524xB, M937xA, E5080A/B, M9485A, M98xxA, P50xxA

(Read-Write) Specifies how often a trigger output signal is sent.

Parameters

<ch> Any existing channel number. If unspecified, value is set to 1.

<n> AUX Trigger connector used to send or receive signals.

Choose from 1 (AUX TRIG 1) or 2 (AUX TRIG 2)

<char> Choose from:

- **POINT** Trigger signal is sent every data point. (effectively the same as Point sweep)
- **SWEep** Trigger signal is sent once every sweep.

Examples

```
TRIG:CHAN:AUX:OUTP:INT POI
trigger:channel2:aux:output:interval sweep
```

Query Syntax TRIGger:CHANnel<ch>:AUXiliary<n>:OUTPut:INTerval?

Return Type Character

Default SWEep

---

TRIGger:CHANnel<ch>:AUXiliary<n>:OUTPut:POLarity <char>
**Applicable Models:** N522xB, N523xB, N524xB, M937xA, E5080A/B, M9485A, M98xxA, P50xxA

*(Read-Write)* Specifies the polarity of the Aux Output signal being supplied by the VNA.

**Parameters**

- `<ch>` Any existing channel number. If unspecified, value is set to 1.
- `<n>` AUX Trigger connector used to send or receive signals.
  
  Choose from 1 (AUX TRIG 1) or 2 (AUX TRIG 2)

  If unspecified, value is set to 1.
- `<char>` Choose from:
  
  - **POSitive** VNA sends positive going pulse.
  - **NEGative** VNA sends negative going pulse.

**Examples**

```
TRIG:CHAN:AUX:OUTP:POL NEG
trigger:channel2:aux:output:polarity positive
```

**Query Syntax**

TRIGger:CHANnel<ch>:AUXiliary<n>:OUTPut:POLarity?

**Return Type**

Character

**Default** NEGative

---

**Applicable Models:** N522xB, N523xB, N524xB, M937xA, E5080A/B, M9485A, M98xxA, P50xxA

*(Read-Write)* Specifies whether the aux trigger out signal is sent BEFore or AFTer the acquisition.

**Parameters**

- `<ch>` Any existing channel number. If unspecified, value is set to 1.
- `<n>` AUX Trigger connector used to send or receive signals.
  
  Choose from 1 (AUX TRIG 1) or 2 (AUX TRIG 2)

  If unspecified, value is set to 1.
- `<char>` Choose from:
  
  - **BEFore** Use if the external device needs to be triggered before the data is acquired, such as a power meter.
- **AFTer** Use if the external device needs to be triggered just after data has been acquired, such as an external source. This could be more efficient since it allows the external device to get ready for the next acquisition at the same time as the VNA.

**Examples**

```
TRIG:CHAN:AUX:OUTP:POS BEF
```

```
trigger:channel2:aux:output:position after
```

**Query Syntax**

```
TRIGger:CHANnel<ch>:AUXiliary<n>:OUTPut:POSition?
```

**Return Type**

Character

**Default** AFTer

---

**TRIGger:CHANnel<ch>:AUXiliary<n>:POSition <char> Superseded**

**Applicable Models:** N522xB, N523xB, N524xB, M937xA, E5080A/B, M9485A, M98xxA, P50xxA

This command is replaced with `TRIG:CHAN:AUX::OUTP:POS`.

**Parameters**

- `<ch>` Any existing channel number. If unspecified, value is set to 1.
- `<n>` AUX Trigger connector used to send or receive signals.
  
  Choose from 1 (AUX TRIG 1) or 2 (AUX TRIG 2)

  If unspecified, value is set to 1.
- `<char>` Choose from:
  
  - **BEF**ore Use if the external device needs to be triggered before the data is acquired, such as a power meter.
  
  - **AFT**er Use if the external device needs to be triggered just after data has been acquired, such as an external source. This could be more efficient since it allows the external device to get ready for the next acquisition at the same time as the VNA.

**Examples**

```
TRIG:CHAN:AUX:POS BEF
```

```
trigger:channel2:aux2:position after
```

**Query Syntax**

```
TRIGger:CHANnel<ch>:AUXiliary<n>:POSition?
```

**Return Type**

Character
TRIGger:CHANnel<ch>:AUXiliary<n>:TYPE  <char> Superseded

Appllicable Models: N522xB, N523xB, N524xB

This command is replaced with TRIG:CHAN:AUX::INP:TYPE.

(Read-Write) Specifies the type of Aux input detection that the VNA will employ.

Parameters

<ch> Any existing channel number. If unspecified, value is set to 1.

<n> AUX Trigger connector used to send or receive signals.

Choose from 1 (AUX TRIG 1) or 2 (AUX TRIG 2)

If unspecified, value is set to 1.

<char> Choose from:

- **EDGE** VNA responds to the leading edge of a signal
- **LEVel** VNA responds to the level (HIGH or LOW) of a signal

Examples

- TRIG:CHAN:AUX:TYPE EDGE
- trigger:channel2:aux2:type level

Query Syntax

TRIGger:CHANnel<ch>:AUXiliary<n>:TYPE?

Return Type

Character

Default

EDGE
Applicable Models: All

(Read-Write) Sets and reads the trigger delay for ALL channels (globally). This delay is only applied while TRIG:SOURce = EXTernal and TRIG:SCOP = ALL. After an external trigger is applied, the start of the sweep is held off for an amount of time equal to the delay setting plus any inherent latency.

To apply a trigger delay for the specified channel ONLY, use SENS:SWE:TRIG:DELay

**Parameters**

- `<num>` Delay value in seconds. Choose from 0 to 3.

**Examples**

TRIG:DEL .0003

Sets the trigger delay to 300 microseconds. The sweep will not start until approximately 300 microseconds after an external trigger is applied.

**Query Syntax** TRIGger:DELay?

**Return Type** Numeric

**Default** 0

---

TRIGger:PREFerence:ALGロbal <bool>

**Applicable Models:** N522xB, N523xB, N524xB, E5080A, M937xA, M9485A, P937xA

(Read-Write) Sets the Trigger OUT behavior to either Global or Channel. Learn more about this setting.

This command will cause the VNA to Preset.

This setting remains until changed again using this command, or until the hard drive is changed or reformatted.

To send this command using the VNA GUI, open the GPIB Command Processor Console, then type either of the following examples at the command prompt. Then type the Query Syntax and press enter to be sure the VNA took the command.

**Parameters**

- `<bool>` Choose from:

  - **ON** (or 1) - Trigger properties apply to ALL channels (Global).
    - Allows use of CONT:SIGNal command to configure the external trigger properties.
    - "Per Point" trigger property is not settable. Use the channel's Point trigger setting.
- **OFF** (or 0) - External Trigger properties apply to each channel independently.
- Must use TRIG:CHAN:AUX commands to configure the external trigger properties. CONT:SIGNal will NOT work.
- "Per Point" trigger output property is set using the channel's Point trigger setting AND TRIG:CHAN:AUX:INTerval.

### Examples

```
TRIG:PREF:AIGL 1
trigger.preference:aiglobal 0
```

### Query Syntax

TRIGger:PREFerence:AIGLobal?

### Return Type

Boolean

### Default

0

---

**TRIGger:READy:POLarity <char>**

**Applicable Models:** N522xB, N523xB, N524xB, E5080A/B, M937xA, P937xA, M98xxA, P50xxA

(Read-Write) Specifies the polarity of Ready for Trigger output.

All existing Ready for Trigger outputs are configured simultaneously with this command.

### Parameters

- **<char>**
  - LOW - Outputs a TTL low when the VNA is ready for trigger.
  - HIGH - Outputs a TTL high when the VNA is ready for trigger.

### Examples

```
TRIG:READ:POL HIGH
trigger:ready:polarity low
```

### Query Syntax

TRIGger:READy:POLarity?

### Return Type

Character

### Default

Low

---

**TRIGger:READy:SOURce:MANual:ENABle <bool>**
Applicable Models: M980xA, P50xxA, E5080B

(Read-Write)  Sets the mode of Ready for Trigger output. This allows you to have a same operation with M937xA and P937xA. This setting is not saved/recalled in the status file.

Parameters
<bool>  Choose from:

- **ON** (or 1) - Outputs ready for trigger when trigger source is external or manual. Same operation with M937xA and P937xA.
- **OFF** (or 0) - Outputs ready for trigger when trigger source is external.

Examples

```
TRIG:READ:SOUR:MAN:ENAB 1
trigger:ready:source:manual:enable 0
```

Query Syntax  TRIGger:READy:SOURce:MANual:ENABle?
Return Type  Boolean
Default  0 (Preset will not reset the setting.)

---

TRIGger[:SEQUence]:LEVEL <char> - Superseded

This command is replaced with CONTrol:SIGNal

(Read-Write)  Triggers either on a **High** or **Low** level trigger signal. This setting only has an effect when TRIG:SOURce EXTERNAL is selected.

Parameters
<char>  Choose from:

- **HIGH** - analyzer triggers on TTL High
- **LOW** - analyzer triggers on TTL Low

Examples

```
TRIG:LEV HIGH
trigger:sequence:level low
```

Query Syntax  TRIGger[:SEQUence]:LEVEL?
Return Type  Character
Default  HIGH
TRIGger[:SEQunce]:ROUTE:INPut <char>

Applicable Models: All

(Read-Write) Specifies the connector to use for the external trigger input.

Parameters

<char> Choose from:

- MAIN - Meas Trig In BNC
- MATH - handler I/O Pin 18
- PULSE3 - Internal routing of pulse 3 output to the MEAS TRIG IN on the rear pane

PXI/USB VNA

- SMB – Meas Trig In SMB

(The M9370A/71A/72A/73A/74A/75A support the following parameters for backplane trigger.)

- DSTARB – Backplane Trigger Lines (PXIe DSTARB)
- STAR – Backplane Trigger Lines (PXI STAR)
- TRIG0 – Backplane Trigger Lines (PXI TRIG0)
- TRIG1 – Backplane Trigger Lines (PXI TRIG1)
- TRIG2 – Backplane Trigger Lines (PXI TRIG2)
- TRIG3 – Backplane Trigger Lines (PXI TRIG3)
- TRIG4 – Backplane Trigger Lines (PXI TRIG4)
- TRIG5 – Backplane Trigger Lines (PXI TRIG5)
- TRIG6 – Backplane Trigger Lines (PXI TRIG6)
- TRIG7 – Backplane Trigger Lines (PXI TRIG7)

(The P50xxA support the following parameters for streamline Rear Trig
1/2 SMB port.)

NONE – Streamline Rear SMB Not connected (NONE)

REAR1 – Streamline Rear SMB (TRIG1)

REAR2 – Streamline Rear SMB (TRIG2)

Examples

TRIG:ROUTE:INP MAIN

trigger:sequence:route:input main

Query Syntax
TRIGger[:SEQuence]:ROUTE:INPut?

Return Type Character
Default MAIN

TRIGger[:SEQuence]:ROUTE:READy <char>

Applicable Models: N522xB, N523xB, N524xB, M937xA, P937xA

(Read-Write) Specifies the connector to use for the trigger OUT ready line.

Parameters

<char> Choose from:

MAIN - Meas trig ready

MATH - handler pin 21

Examples

TRIG:ROUTE:READ MATH

trigger:sequence:route:ready math

Query Syntax
TRIGger[:SEQuence]:ROUTE:READy?

Return Type Character
Default MAIN

TRIGger[:SEQuence]:SCOpe <char>
Applicable Models: All

(Read-Write) Specifies whether a trigger signal is sent to all channels or only the current channel.

See Triggering the VNA using SCPI.

Parameters

<char> Choose from:

- **ALL** - trigger signal is sent to all channels. Also sets SENS:SWEep:TRIG:POINT OFF on ALL channels.
- **CURRENT** - trigger signal is sent to only one channel at a time. With each trigger signal, the channel is incremented to the next triggerable channel.
- **ACTIVE** - trigger signal is sent to active channel only.

Examples

```
TRIG:SCOP ALL
trigger:sequence:scope current
```

Query Syntax

TRIGger[:SEQuence]:SCOPe?

Return Type

Character

Default

ALL

---

TRIGger[:SEQuence]:SLOPe <char>

Applicable Models: All

(Read-Write) Specifies the polarity expected by the external trigger input circuitry. Also specify TRIG:TYPE (Level |Edge).

See Triggering the VNA using SCPI.

Parameters

<char> Choose from:

- **POSitive** (rising Edge) or High Level
- **NEGative** (falling Edge) or Low Level

Examples

```
TRIG:SLOP NEG
trigger:sequence:slope positive
```

Query Syntax

TRIGger[:SEQuence]:SLOPe?

Return Type

Character
TRIGger[:SEQuence]:SOURce <char>

Applicable Models: All

(Read-Write) Sets the source of the sweep trigger signal. This command is a super-set of INITiate:CONTinuous which can NOT set the source to External.

See Triggering the VNA using SCPI.

Parameters

<char> Choose from:

- **EXTERNAL** - external (rear panel) source.
- **IMMediate** - internal source sends continuous trigger signals
- **MANual** - sends one trigger signal when manually triggered from the front panel or INIT:IMM is sent.

Examples

```
TRIG:SOUR EXT
TRIGGER:SEQUENCE:SOURCE IMMEDIATE
```

Query Syntax

TRIGger[:SEQuence]:SOURce?

Return Type

Character

Default

IMMediate

---

TRIGger[:SEQuence]:TYPE <char>
Applicable Models: All

(Read-Write) Specifies the type of EXTERNAL trigger input detection used to listen for signals on the Meas Trig IN connectors. Edge triggers are most commonly used.

Parameters

<char> Choose from:

**EDGE** VNA responds to the rising and falling edge of a signal.

**LEVel** VNA responds to a level (HIGH or LOW).

Use TRIG:SLOPe to specify Rising or falling - High or Low.

Examples

```
TRIG:TYPE EDGE
trigger:sequence:type level
```

Query Syntax

TRIGger[:SEQuence]:TYPE?

Return Type

Character

Default

LEVel

---

TRIGger:STATus:READy? <char>

Applicable Models: N522xB, N523xB, N524xB, M9485A, E5080A

(Read-only) Checks if the VNA is ready for a hardware trigger.

This command is not intended to be used in a dynamic triggering situation where the ready status is constantly changing. Instead, the expected use is a more static situation where you are expecting the VNA to transition from not ready to ready, and then wait for a trigger. The VNA is polled until it becomes ready and then an operation that triggers the VNA is performed.

Note: This command is only supported on the PNA-L, PNA, and PNA-X with DSP5 installed. Any other model will return an error.

Parameters

<char> ANY - Check if the VNA is ready for any of the following hardware triggers.

**MEAS** - Check if the VNA is ready for an External trigger from the Meas Trig In BNC, Handler IO Pin 18, or Pulse 3 line.

**AUX1** - Check if the VNA is ready for a trigger from the AUX TRIG 1 IN on the rear panel. (PNA, ENA)
**AUX2** - Check if the VNA is ready for a trigger from the AUX TRIG 2 IN on the rear panel. (PNA, ENA)

**MANual** - Check if the VNA is ready for manual trigger.

**Examples**

```
TRIG:STAT:READ? MEAS
trigger:status:ready? aux1
```

**Return Type**  
Boolean

**Default**  
ANY

AFR Using One Differential 2X THRU

This VBScript program performs AFR using one differential 2X THRU, saves the fixture data to a file, then performs deembedding.

Each VBScript (*.vbs) program can be run as a macro in the PNA. To do this, copy the code into a text editor file, such as Notepad, and save it on the PNA hard drive as *.vbs.

Learn how to setup and run the macro.

See Other SCPI Example Programs

Dim app
Dim scpi
Set app = CreateObject("AgilentPNA835x.Application")
Set scpi = app.ScpiStringParser

'The 2X THRU data file should already exist

Perform a Cal All Channels Calibration

There are two sets of commands used to automate a Cal All Channels Calibration: `SYST:CAL:ALL <commands>` and `SENS<chan>:CORR:COLL:GUIDed <commands>`.

**SYST:CAL:ALL <commands>**

The general sequence for setting up the Cal All session is as follows:

1. Select the channels to calibrate using the `SYST:CAL:ALL:SEL` command.
2. Select the ports to calibrate using the `SYST:CAL:ALL:CHAN:PORTs` command.
3. Set the properties that are available in Cal All that are relevant to the channels you are calibrating using the `SYST:CAL:ALL:MCLass:PROP:VAL <name>,<val>` command. For example, setting `<name>` to "Include Power Calibration" and `<val>` to "true" will include a source and receiver power calibration in the Cal All calibration.
4. Query the channel number to use for the remaining cal commands. This channel is used for the sole purpose of acquiring cal data and finds the highest available channel number.

   **Note:** You must query this number – do not assume that it will always be a particular value. For example: `a.chan = SYST:CAL:ALL:GUIDed:CHAN?`

**SENS<chan>:CORR:COLL:GUIDed <commands>**

These commands are identical to the command used for a single channel calibration. However, the number used for the SENSe header is determined by the `SYST:CAL:ALL:GUIDed:CHAN?` command. The general sequence is as follows:

1. Set up the power sensor using the `SENS:CORR:COLL:GUID:PSENso` commands if you will be performing a power calibration (source and receiver power cal).
2. Set up the connector family and gender per port using the `SENS:CORR:COLL:GUID:CONN:PORT` command.
5. Query the number of steps using the `SENS:CORR:COLL:GUID:STEPs?` command.
7. Save the calset using the `SENS:CORR:COLL:GUID:SAVE` command.

Catalog Measurements using SCPI

This Visual Basic Program does the following:

- Catalogs the currently defined measurements, windows, and traces
- Selects a measurement for further definition
- Adds a Title to the window

To run this program, you need:

- An established GPIB interface connection

See Other SCPI Example Programs

Dim Meas as String
Dim Win as String
Dim Trace as String

' Read the current measurements in Channel 1
GPIB.Write "CALCulate1:PARameter:CATalog?"
Meas = GPIB.Read
MsgBox("Ch1 Measurements: " & Meas)

' Read the current windows
GPIB.Write "DISPlay:CATalog?"
Win = GPIB.Read
MsgBox("Windows: " & Win)

' Read current traces in window 1
GPIB.Write "DISPlay:WINDow1:CATalog?"
Trace = GPIB.Read
MsgBox("Traces in Window1: " & Trace)
This VBScript program does the following:

- Presets the analyzer, deleting the default trace
- Create 2 windows
- Create 2 Measurements
- Feed the measurements to windows / traces
- Change frequency ranges for channels
- Select both measurements
- Turn marker 1 ON for each measurement

The following notes explain the basic structure of the SCPI tree on the analyzer:

- **SOURce**: and most **SENSe**: commands act on the **channel** that is specified in the command. Channel 1 is default if not specified.

- Most **DISPlay**: commands act on the **window and trace** specified in the command. Window1 and Trace1 are default if not specified.

- **CALCulate**: commands act on the **selected measurement** in the specified channel. Select the measurement for each channel using **CALCulate<channel number>:PARameter:SELect <meas name>**. You can select one measurement in each channel.

See [Traces, Channels, and Windows on the Analyzer](#)

**How to run this program:**

The SCPI commands in this example are sent over a COM interface using the **SCPIStringParser** object. You do NOT need a GPIB connection to run this example.

This VBScript (*.vbs) program can be run as a macro in the analyzer. To do this, copy the following code into a text editor file such as Notepad and save it on the analyzer hard drive as NewMeas.vbs. **Learn how to setup and run the macro.**

GPIB.Write "::CALCulate2:MEASure2:MARKer:STATe ON"
VNA as Controller and Talker / Listener

This Visual Basic Program uses VISA to do the following:

- Control the VNA using a VISA LAN Client interface on the VNA.
- Control another instrument using the VNA as GPIB controller.
- Queries both the analyzer and other instrument to identify themselves with *IDN?

**Note:** This program can be modified to work from a remote PC to control both instruments. In that case, set up the VNA to be a talker/listener.

To run this program, you need to do the following:

- Add module **visa32.bas** to the VB project.
- Configure the VNA for VISA / SICL
- Set up the VNA to be GPIB system controller.
- Connect another instrument to the analyzer through a GPIB cable with Primary address of 13 on GPIB0 interface

**See Other SCPI Example Programs**

Sub main()

' This application run from onboard the VNA 
' can control both the VNA and another GPIB instrument.
'
' To run this program the module visa32.bas must be added
' to the project.

'VISA function status return code
Dim status As Long
'Session to Default Resource Manager
Dim defRM As Long
'Session to instrument
Dim viPNA As Long
'Session to other GPIB instrument
Dim viInstrument As Long
' String to hold results
Dim strRes As String * 200
On Error GoTo ErrorHandler

status = viOpenDefaultRM(defRM)
If (status < VI_SUCCESS) Then GoTo VisaErrorHandler

If (status < VI_SUCCESS) Then GoTo VisaErrorHandler

'Read the ID as a string.
status = viVScanf(viPNA, "%t", strRes)
If (status < VI_SUCCESS) Then GoTo VisaErrorHandler
'Display the results
MsgBox "Other instrument is: " + strRes
' Close the resource manager session (which closes everything)
Call viClose(defRM)
End

ErrorHandler:
'Display the error message
MsgBox "*** Error : " + Error$, MB_ICONEXCLAMATION
End

VisaErrorHandler:
Dim strVisaErr As String * 200
Call viStatusDesc(defRM, status, strVisaErr)
MsgBox "*** Error : " + strVisaErr
End
End Sub
This example program does the following:

- creates several Balanced measurements in separate windows
- generates markers
- calculates statistics
- sets limit lines and queries results
- queries a measurement to determine if we have a balanced parameter and what type it is.

**Note:** By their nature, balanced measurements are extremely sensitive to phase differences between the two RF paths that make up the balanced port, especially at higher frequencies. A good calibration (not performed in this example) is critical to achieving good balanced measurement results.

The SCPI commands in this example are sent over a COM interface using the `SCPIStringParser` object. You do NOT need a GPIB connection to run this example.

This VBScript (*.vbs) program can be run as a macro in the VNA. To do this, copy the following code into a text editor file such as Notepad and save it on the VNA hard drive as Balanced.vbs. Learn how to setup and run the macro.

Create a Measurement using SCPI

This VBScript program creates a new S21 measurement and displays it on the VNA screen.

The SCPI commands in this example are sent over a COM interface using the SCPIStringParser object. You do NOT need a GPIB connection to run this example.

This VBScript (*.vbs) program can be run as a macro in the VNA. To do this, copy the following code into a text editor file such as Notepad and save it on the VNA hard drive as NewMeas.vbs. Learn how to setup and run the macro.

See Other SCPI Example Programs

```vbs
Dim app
Dim scpi
    ' Create / Get the VNA application.
Set app = CreateObject("AgilentPNA835x.Application")
Set scpi = app.ScpiStringParser
    ' A comment
    'Preset the analyzer
scpi.Execute ("SYST:PREset")
    ' Create and turn on window 1
scpi.Execute ("DISPlay:WINDow1:STATE ON")
    'Define a measurement name, parameter
scpi.Execute ("CALCulate:PARameter:DEFine:EXT 'MyMeas',S21")
    'Associate ("FEED") the measurement name ("MyMeas") to WINDow (1), and give the new
    TRACe a number (1).
scpi.Execute ("DISPlay:WINDow1:TRACe1:FEED 'MyMeas'")
```

Example

```vbs
Dim app
Dim scpi
    ' Create / Get the VNA application.
Set app = CreateObject("AgilentPNA835x.Application")
Set scpi = app.ScpiStringParser
    ' A comment
    'Preset the analyzer
scpi.Execute ("SYST:PREset")
    'Define a measurement parameter
scpi.Execute ("CALCulate:MEASure1:PARameter 'S21'")
```
Create a Multi-Dimensional Sweep

Create a Narrowband Point-in-Pulse Measurement using the PNA-X

The following SCPI example demonstrates how to create a Narrowband Point-in-Pulse measurement using the Pulsed Application DLL on the PNA-X.

It first gets valid configuration settings and then uses those settings to configure the VNA and internal pulsed generators.

To run this program, you need:

- PNA-X
- Pulsed Application (Option H08)

This VBScript (*.vbs) program can be run as a macro in the VNA. To do this, copy the following code into a text editor file such as Notepad and save it on the VNA hard drive as PulseProfile.vbs. Learn how to setup and run the macro.

Note: Because of the long length of some commands in this example, word wrapping may occur when copying. These lines require modification after pasting.

Create a Swept IMDX Measurement

This program configures several Swept IMDx parameters using power sweep. In this configuration, tone power is swept from -20 dBm to -5 dBm while the Input, LO, and Output frequencies are fixed as follows:

- Input center freq = 2.50 GHz
- Tone Delta freq = 10 MHz (f1 = 2.495 GHz and f2 = 2.505 GHz).
- LO freq = 2.00 GHz
- Output freq = 4.50 GHz

This program also allows you to optionally load a .mxr file to perform mixer setup.

To run this program without error, an external source named 'PSG' must be connected to drive the LO.

This program can be run as a macro in the VNA. To do this, copy the code into a text editor file such as Notepad and save on the VNA hard drive as IMDX.vbs. Learn how to setup and run the macro.

See all Swept IMD commands.

See all Mixer Setup commands.

'Set Pulse0 delay to 400 ns

scpi.Execute("sens:puls0:delay 0.000004")

'Set trigger scope to Channel

scpi.Execute("TRIG:SCOP CURRENT")

End Sub
Create an FOM Measurement

All three VBScript examples in this topic create a FOM measurement with the following attributes:

- Sweep the Source (input) from 1 GHz to 2 GHz
- Sweep the Receivers (output) from 2 GHz to 3 GHz
- You provide an LO at 1 GHz

Learn more about Frequency Offset Mode

These programs can be run as a macro in the VNA. To do this, copy the code into a text editor file such as Notepad and save on the VNA hard drive as FOM.vbs. Learn how to setup and run the macro.

See Other SCPI Example Programs

The following example will run on any VNA model with FOM (opt S93080A). However, these commands have no provisions for internal second source. It uses Sens:Offset commands.

```vbs
' This section gets the VNA application
' starts the scpi parser, and presets the VNA
Set app = CreateObject("AgilentPNA835x.Application")
Set scpi = app.ScpiStringParser
scpi.Execute("SYST:FPRESET")
' Create and turn on window 1
scpi.Execute ("DISPlay:WINDow1:STATE ON")
' Define a measurement name, parameter
scpi.Execute ("CALCulate:PARameter:DEFine:EXT 'MyMeas',S21")
' Associate ("FEED") the measurement name ('MyMeas') to WINDow (1)
' and give the new TRACe a number (1).
scpi.Execute ("DISPlay:WINDow1:TRACe1:FEED 'MyMeas'")
```
The following example can be run ONLY on a VNA with FOM (opt S93080A). It uses new Sens:FOM commands.

' This section gets the VNA application
' starts the scpi parser, and presets the VNA
Set app = CreateObject("AgilentPNA835x.Application")
Set scpi = app.ScpiStringParser
scpi.Execute("SYST:FPRESET")
' Create and turn on window 1
scpi.Execute("DISPlay:WINDow1:STATE ON")
'Define a measurement name, parameter
scpi.Execute("CALCulate:PARameter:DEFine 'MyMeas',S21")
'Associate ("FEED") the measurement name ('MyMeas') to WINDow (1),
and give the new TRACe a number (1).
scpi.Execute("DISPlay:WINDow1:TRACe1:FEED 'MyMeas'")

scpi.Execute("SENS:FREQ:START 1e9")
scpi.Execute("SENS:FREQ:STOP 2e9")
' set the receivers to be 2e9 -> 3e9
scpi.Execute("SENS:OFFS:OFFS 1e9")
scpi.Execute("SENS:OFFS ON")
The following example can be run ONLY on a VNA with FOM (opt S93080A). It uses the internal 2nd source for the fixed LO frequency.

```vna
' This section gets the VNA application
' starts the scpi parser, and presets the VNA
Set app = CreateObject("AgilentPNA835x.Application")
Set scpi = app.ScpiStringParser
scpi.Execute("SYST:FPRESET")

' Create and turn on window 1
scpi.Execute("DISPlay:WINDow1:STATE ON")

'Define a measurement name, parameter
scpi.Execute("CALCulate:PARameter:DEFine 'MyMeas',S21")

'Associate ("FEED") the measurement name ("MyMeas") to WINDow (1)
'and give the new TRACe a number (1).
scpi.Execute("DISPlay:WINDow1:TRACe1:FEED 'MyMeas'")

scpi.Execute("SENS:FREQ:START 1e9")
scpi.Execute("SENS:FREQ:STOP 2e9")

'set the receivers to be 2e9 -> 3e9
scpi.Execute("SENS:FOM:RANG3:FREQ:OFFS 1e9")

'setup the 2nd source frequencies
scpi.Execute("SENS:FOM:RANG4:COUP 0")
scpi.Execute("SENS:FOM:RANG4:FREQ:START 1e9")
scpi.Execute("SENS:FOM:RANG4:FREQ:STOP 1e9")

'turn off coupling
scpi.Execute("SOUR:POW:COUP 0")

'set LO power to 10dBm
scpi.Execute("SOUR:POW3 10")
```
'turn ON port 3, our LO signal

scpi.Execute("SOUR:POW3:MODE ON")

scpi.Execute("SENS:FOM:STAT ON")
Create an iTMSA Measurement

This example program does the following:

- Create an iTMSA Balanced Sdd21 measurement
- Set sweep type = power
- Set phase offset on balanced port 1 = 180 degrees

The SCPI commands in this example are sent over a COM interface using the `SCPIStringParser` object. You do NOT need a GPIB connection to run this example.

This VBScript (*.vbs) program can be run as a macro in the VNA. To do this, copy the following code into a text editor file such as Notepad and save it on the VNA hard drive as Balanced.vbs. Learn how to setup and run the macro.

```vbs
Dim app
Dim scpi

' Create / Get the VNA application.
Set app = CreateObject("AgilentPNA835x.Application")
Set scpi = app.ScpiStringParser

' Reset the system
scpi.Parse("SYST:FPRESET")

' This example uses DUT topology Bal-Bal -
' a DUT with a True-mode balanced input and balanced output.
'
' Port mapping for our DUT:
' logical port 1 = physical ports 1 and 3
' logical port 2 = physical ports 2 and 4
'
' logical 1          logical 2
' |------------------|------------------|
' 1 -------|------ DUT ------- 2 +
```

See Other SCPI Example Programs
' Turn on a window
scpi.Parse("DISP:WIND1:STATE ON")

' Create a trace called "sdd21", and for that trace turn on the balanced
transformation and set the balanced transformation to BBAL SDD21.
scpi.Parse("CALC:PAR:DEF:EXT ""sdd21"",S11")

' Feed the sdd21 trace to window 1, trace 1
scpi.Parse("DISP:WIND1:TRAC1:FEED ""sdd21"")
scpi.Parse("CALC:PAR:SEL ""sdd21"")

' Set the topology of measurement
scpi.Parse("CALC:FSIM:BAL:DEVice BBALanced")
scpi.Parse("CALC:FSIM:BAL:TOPology:BBAL:PPORts 1,3,2,4")

' Set up stimulus
scpi.Parse("SENS:SWE:POINTs 801")
scpi.Parse("SENS:FREQ:START 10e6")
scpi.Parse("SENS:FREQ:STOP 1e9")
scpi.Parse("CALC:FSIM:BAL:PAR:STATE ON")

' Recall a 4-port Cal Set or perform a 4-port Cal here

' Set the sweep type to power sweep
scpi.Parse("SENS:SWE:TYPE POWER")

' Set iTMSA parameters
Create an SMC Fixed Output Measurement

This VB Script example creates a calibrated SMC fixed output measurement using an external, controlled LO. Then a single sweep is taken and data is retrieved. The external LO is NOT required when using the internal second VNA source for the LO.

Requirements:

- The external LO should be configured to match the SENS:MIX:LO:NAME command below.

Fixed output measurements require that an external LO source be swept and synchronized with the VNA source. FCA performs this synchronization using the external source configuration settings. See Configure an External Source using SCPI.

The fastest, and recommended, method of controlling the LO source is Hardware List (BNC) triggering mode. However, in this mode, FCA channels will not respond to manual triggers. Therefore, the example uses the following mechanism to trigger a sweep:

Write "SENS:SWE:MODE HOLD" 'place channel 1 in HOLD mode
Write "INIT:CONT ON" 'place VNA in internal trigger mode
Write "SENS:SWE:MODE SINGLE
Write "*OPC?" 'wait until the sweep is complete
Read

The SCPI commands in this example are sent over a COM interface using the SCPIStringParser object. You can run a VBScript (*.vbs) program from the VNA using Macros. To run this program, copy the following code into a text editor and save it as a *.vbs file.

```vbs
option explicit
'
' Setup infrastructure to use the SCPI over COM

dim app
set app = createobject("Agilentpna835x.application")
dim p
set p = app.scpistringparser
dim returnStr
sub Write (command)
  if len(returnStr) <> 0 then
    err.Raise 55,"Write","Query Unterminated"
end if
end sub
```
end if
returnStr = p.parse(command)
end sub

sub WriteIgnoreError(command)
returnStr = p.Execute(command)
p.Parse("SYST:ERR?") ' clear error queue
end sub

function Read
if len(returnStr) = 0 then
    err.Raise 55,"Read","Bad read"
end if
Read = returnStr
returnStr = ""
end function

Write "SYST:PRES"
' When programming in remote mode, hold mode is recommended
Write "SENS:SWE:MODE HOLD"
' Delete the standard measurement
Write "CALC:PAR:DEL:ALL"
' Create an SC21 measurement
Write "CALC:CUST:DEF 'MySC21', 'Scalar Mixer/Converter', 'SC21'
Write "DISP:WIND:TRACE:FEED 'MySC21'
Write "CALC:PAR:SEL 'MySC21'
' Set number of points to 11
Write "SENS:SWE:POIN 11"
' Setup the mixer parameters for a swept LO, fixed output measurement
Write "SENS:MIX:INP:FREQ:START 200e6"
Write "SENS:MIX:INP:FREQ:STOP 700e6"

Create and Cal a GCX Measurement

This VBS program does the following:

- creates and configures GCX
- performs a calibration using an ECal with 3.5 mm Female on Port A and 3.5 mm Male connectors on Port B

To run this example without modification you need the following:

- An ECal module that covers the frequency range of the measurement. You may need to change the ECal model number in the program.
- A power meter must be available to the VNA. This can be accomplished either by attaching the meter to the VNA via a GPIB cable, or by using SCPI over LAN.

By removing the comments (') at the start of the BLUE code, it can also do the following:

- Use ECal characterizations
- Specify Mechanical Cal Kits
- Perform manual ECal orientation.
- Specify the thru measurement method.
- Omit the isolation part of the 2-port cal.
- Perform an LO Power Cal.
- Set LO power level on External Source (MUST be pre-configured either remotely or using the GUI. See example program.)

The SCPI commands in this example are sent over a COM interface using the SCPIStringParser object. You do NOT need a GPIB connection to run this example. However, some modification is necessary to make the program run on a traditional GPIB Interface. For example, during the power meter portion of this calibration, scpi.Parse will not process a command until the power meter routine has completed. Traditional GPIB would require a serial polling technique to ensure the routine has completed before proceeding.

This program can be run as a macro in the VNA. To do this, copy the code into a text editor file such as Notepad and save on the VNA hard drive as GCX.vbs. Learn how to setup and run the macro.

Create and Cal a Noise Figure Measurement

This example program creates a Noise Figure measurement, then calibrates the measurement.

You MUST change the ECal Identification strings (in **Blue** font).

Optional: Uncomment the following lines (in **Blue** font) to change these settings:

- Noise Receiver = Noise Receiver to Std (VNA) Receiver
- Cal Method = "Vector" to "Scalar"
- Receiver Characterization Method = "NoiseSource" to "PowerMeter"

This VBScript program can be run as a macro in the VNA. To do this, copy the code into a text editor file such as Notepad and save on the VNA hard drive as NF.vbs. **Learn how to setup and run the macro.**

See the Noise figure commands.

Create and Cal a VMC Measurement

The following example program sets up a 1-stage mixer, then performs a full VMC calibration. By removing the comments (' ) at the start of the BLU3E code, it can also do the following:

- Load a mixer setup file
- Use an ECal Module
- Perform manual ECal orientation
- Load a Mixer Characterization

See Also

Setup Converter commands
VMC Cal commands
All Guided Cal commands

Example - Perform a Mixer Characterization ONLY

This VBScript (*.vbs) program can be run as a macro in the VNA. To do this, copy the following code into a text editor file such as Notepad and save it on the VNA hard drive as VMC.vbs. Learn how to setup and run the macro.

```vbnet
Dim app
Dim scpi

' Create / Get the VNA application.
Set app = CreateObject("AgilentPNA835x.Application")
Set scpi = app.ScpiStringParser
scpi.Parse "SYSTem:PRESet"

' Create a Vector Mixer Measurement
' First, delete all measurements on the channel
```
Create a forward scalar mixer measurement and configure it in channel 1.
The first parameter is a unique identifying string to allow subsequent
commands to be directed at this specific measurement.

`scpi.Parse "CALC:CUST:DEF 'My VC21', 'Vector Mixer/Converter', 'VC21'"`

Setup the new measurement as the 2nd trace in the active window

`scpi.Parse "DISP:WIND:TRAC2:FEED 'My VC21'"`

Make the new trace the active measurement

`scpi.Parse "CALC:PAR:SEL 'My VC21'"`

The parameters of the mixer measurement can now be configured.
This can be done by either using the SENS:MIX commands
for each of the parameters or by loading a mixer setup file.

Uncomment the following line to load a mixer setup file. The path
name for the mixer file may be loaded from other mapped drives.

`scpi.Parse "SENS:MIXer:Load 'c:\users\public\network analyzer\documents/Mixer/MyMixer.mxr'"`

Setup Stimulus
Points and IFBW are channel settings

`scpi.Parse "SENS:SWEep:POINts 21"
scpi.Parse "SENS:BANDwidth 1e3"

The rest are mixer settings

Create and Cal an SMC Measurement

This VB Script example creates and calibrates a scalar mixer measurement.

To run this example **without modification** you need the following:

- An ECal module that covers the frequency range of the measurement.
- A power meter must be available to the VNA. This can be accomplished either by attaching the meter to the VNA via a GPIB cable, or by using SCPI over LAN.

By removing the comments (' ') at the start of the **BLUE code**, it can also do the following:

- Load a mixer setup file
- Use ECal characterizations
- Specify Mechanical Cal Kits
- Perform manual ECal orientation.
- Specify the thru measurement method.
- Omit the isolation part of the 2-port cal.
- Perform an LO Power Cal.
- Set LO power level on External Source (MUST be pre-configured either remotely or using the GUI. See example program.)
- Enable and configure phase measurements

The SCPI commands in this example are sent over a COM interface using the SCPIStringParser object. You do NOT need a GPIB connection to run this example. However, some modification is necessary to make the program run on a traditional GPIB Interface. For example, during the power meter portion of this calibration, sepi.Parse will not process a command until the power meter routine has completed. Traditional GPIB would require a **serial polling technique** to ensure the routine has completed before proceeding.

This VBScript (*.vbs) program can be run as a macro in the VNA. To do this, copy the following code into a text editor file such as Notepad and save it on the VNA hard drive as SMC.vbs. **Learn how to setup and run the macro.**

```
Dim app
```
Dim scpi

' Create / Get the VNA application.
Set app = CreateObject("AgilentPNA835x.Application")
Set scpi = app.ScpiStringParser

' Create a Scalar Mixer Forward Measurement
' First, delete all measurements on the channel
scpi.Parse "CALC:PAR:DEL:ALL"

' Create a forward scalar mixer measurement and configure it in
' channel 1. The first parameter is a unique
' identifying string (specified by the user) to allow subsequent
' commands to be directed at this specific measurement.
scpi.Parse "CALC:CUST:DEF 'My SC21', 'Scalar Mixer/Converter', 'SC21'"

' Setup the new measurement in the active window
scpi.Parse "DISP:WIND:TRAC:FEED 'My SC21'"

' Make the new trace the active measurement
scpi.Parse "CALC:PAR:SEL 'My SC21'"

' The parameters of the mixer measurement can now be configured.
' This can be done by either using the SENS:MIX commands
' for each of the parameters or by loading a mixer setup file.
' Uncomment the following line to load a mixer setup file. The path name
' for the mixer file may be loaded from other mapped drives.
' scpi.Parse "SENS:MIXer:Load 'c:\users\public\network

Dim steps
Dim desc

'Determine the number of steps required to complete the calibration.
steps = scpi.Parse("SENS:CORR:COLL:GUID:STEP?")
For i = 1 To steps

'Display the prompt for each step
MsgBox(desc)

'Perform the measurement for each step
scpi.Parse("SENS:CORR:COLL:GUID:ACQ STAN" & CStr(i))
Next

'Finish the cal and save the calset
scpi.Parse("SENS:CORR:COLL:GUID:SAVE ON")
Msgbox("SMC cal saved to CH1_CALREG")
Calibrate Multiple SMC Channels

This example allows you to calibrate multiple SMC channels while connecting the power meter and required standards or ECal module only once.

In the example program:

- Modify `chans = 2` to indicate the number of channels to calibrate.
- You can also change the connector type and cal kit for each port.

The SCPI commands in this example are sent over a COM interface using the SCPIStringParser object. You do NOT need a GPIB connection to run this example.

This VBScript (*.vbs) program can be run as a macro in the VNA. To do this, copy the following code into a text editor file such as Notepad and save it on the VNA hard drive as MultChanCal.vbs. Learn how to setup and run the macro.

```vbs
Dim app
Dim scpi
Dim chans
Dim i
Dim steps
Dim desc

' Create / Get the VNA application.
Set app = CreateObject("AgilentPNA835x.Application")
Set scpi = app.ScpiStringParser
app.Preset

' Set number of channels to create
chans = 2
ReDim calset(chans - 1)

For i = 1 To chans
    chanStr = CStr(i+1)  ' calibrate on channels 2 and 3
    Dim parm, measName, sens, calc
```
parm = "S" & CStr(i) & CStr(i)
measName = "My" & parm
sens = "SENS" & chanStr
calc = "CALC" & chanStr

scpi.Parse calc & ":CUST:DEF ' & measName & ' , 'Scalar Mixer/Converter', ' & parm & ''

' Setup the new measurement as the 2nd trace in the active window
scpi.Parse "DISP:WIND:TRAC" & chanStr & ":FEED ' & measName & ''

'Make the new trace the active measurement
scpi.Parse calc & ":PAR:SEL ' & measName & ''

'-------------------Perform A FCA Mixer Calibration-------------------

'Set ports and cal kits for 2 port calibration portion
scpi.Parse sens & ":CORR:COLL:GUID:CONN:PORT1:SEL "APC 3.5 male"
scpi.Parse sens & ":CORR:COLL:GUID:CONN:PORT2:SEL "APC 3.5 female"

'ECal modules are specified with the same command

'Specify the thru measurement method.
scpi.Parse sens & ":CORR:COLL:GUID:PATH:TMET 1,2,""DEFINED THRU"

'Omit the isolation part of the 2-port cal
scpi.Parse sens & ":CORR:COLL:GUID:ISOL NONE"
'Initialize an SMC guided calibration.
scpi.Parse sens & "(:CORR:COLL:GUID:INIT"

'Determine the number of steps required to complete the calibration.
steps = scpi.Parse (sens & "(:CORR:COLL:GUID:STEP?"

Next
For j = 1 To CInt(steps)

'Display the prompt for each step
MsgBox (desc)

'Measure the same standard for each channel
For i = 1 To chans

    chanStr = CStr(i+1) ' channel number as string
    scpi.Parse "SENS" & chanStr & "(:CORR:COLL:GUID:ACQ STAN" & CStr(j)
    opc_comp = scpi.Parse("*OPC?"

    Next
Next

'Finish the cal and save the calsets
For i = 1 To chans

    calset(i - 1) = scpi.Parse("SENS" & CStr(i+1) & "(:CORR:COLL:GUID:SAVE ON")

    Next

MsgBox ("SMC Cals Complete!")
Create a Mixing Plan for a Dual-Stage, Fixed-Output Converter

This VB Script example creates a dual-stage mixer with a fixed output. While all the frequency ranges are explicitly programmed, the analyzer needs the calculate command at the end to satisfy the setup.

The SCPI commands in this example are sent over a COM interface using the SCPIStringParser object. You do NOT need a GPIB connection to run this example. However, some modification is necessary to make the program run on a traditional GPIB Interface. For example, during the power meter portion of this calibration, scpi.Parse will not process a command until the power meter routine has completed. Traditional GPIB would require a serial polling technique to ensure the routine has completed before proceeding.

This VBScript (*.vbs) program can be run as a macro in the VNA. To do this, copy the following code into a text editor file such as Notepad and save it on the VNA hard drive as SMC.vbs. Learn how to setup and run the macro.

```vbs
Dim app
Dim scpi

' Create / Get the VNA application.
Set app = CreateObject("AgilentPNA835x.Application")
Set scpi = app.ScpiStringParser
scpi.Parse "SYSTem:PRESet"

' Create a Scalar Mixer Measurement

' First, delete all measurements on the channel
scpi.Parse "CALC:PAR:DEL:ALL"

' Create a forward scalar mixer measurement and configure it in channel 1. The first parameter is a unique identifying string (specified by the user) to allow subsequent commands to be directed at this specific measurement.
scpi.Parse "CALC:CUST:DEF 'My SC21', 'Scalar Mixer/Converter', 'SC21'"

' Setup the new measurement as the 2nd trace in the active window
scpi.Parse "DISP:WIND:TRAC2:FEED 'My SC21'"
```
' Setup Stimulus

' Points and IFBW are channel settings
scpi.Parse "SENS:SWEep:POINts 21"
scpi.Parse "SENS:BANDwidth 1e3"

' Mixer settings
scpi.parse "SENS:MIX:STAG 2"
scpi.parse "SENS:MIX:INP:FREQ:MODE SWEPT"
scpi.parse "SENS:MIX:INP:FREQ:STAR 170e6"
scpi.parse "SENS:MIX:INP:FREQ:STOP 210e6"
scpi.parse "SENS:MIX:LO:FREQ:MODE SWEPT"
scpi.parse "SENS:MIX:LO:FREQ:STAR 3.89e9"
scpi.parse "SENS:MIX:LO:FREQ:STOP 3.93e9"
scpi.parse "SENS:MIX:LO:FREQ:ILTI 0"
scpi.parse "SENS:MIX:IF:FREQ:SID LOW"
scpi.parse "SENS:MIX:LO2:FREQ:MODE FIXED"
scpi.parse "SENS:MIX:LO2:FREQ:FIX 3.56e9"
scpi.parse "SENS:MIX:LO2:FREQ:ILTI 1"
scpi.Parse "SENS:MIX:OUTP:FREQ:SID LOW"
scpi.parse "SENS:MIX:OUTP:FREQ:MODE FIXED"
scpi.parse "SENS:MIX:OUTP:FREQ:FIX 160e6"
scpi.Parse "SENS:MIX:CALC Input"
Create New Cal Kit using SCPI

When creating new cal kits programmatically, the order in which cal kit commands are sent can be important. For example to create a kit with opens, shorts, loads, and thurs. Be sure to use the following sequence for each newly defined standard.

1. Programmatically select the standard number
2. Programmatically select the standard type.
3. Program the cal standard's values.
4. Repeat steps 1, 2, 3 for additional new standards being defined.

```
10 !
20 !
30 ! This example program demonstrates how to create
40 ! new PNA calibration kits.
50 !
60 ! 1) Select a kit not previously defined
70 ! 2) Define open, short, load, and thru cal standards
80 ! Note: Each of the newly defined standards is assigned
90 ! a default connector name. These default connector names
100 ! will be replaced in subsequent steps.
110 ! 3) Use the delete connector command to remove default
120 ! connector names.
130 ! 4) Add connectors. Specify:
140 ! Start and Stop Freq
150 ! Z - Impedance
160 ! sex - MALE, FEMALE, NONE
170 ! media - COAX, WAVE
180 ! cutoff - Frequency for waveguide
190 ! 5) Assign the appropriate connector to each standard
200 ! 6) Modify the class assignments for the standards defined
210 ! 7) Verify the kit values
220 !
230 ! Additional Note: After setting each new cal kit value, it is
240 ! recommended that the program periodically perform queries to
250 ! verify the new values.
260 !
270 ! This will prevent program synchronization issues that can
```
280  ! final values stored within new cal kits.
290  !

This topic requires that you have a working knowledge of Visual Basic.

This topic will help you create your own power meter driver for use with Source Power Calibration on the VNA. If you are using an Keysight Power Meter to perform a Source Power Calibration, you do NOT need to create your own driver.

Your Power Meter driver will be created from a template written in Visual Basic using VISA over the GPIB bus.

**Note:** This procedure applies to Visual Basic 6.0. Applicability to Visual Basic .NET has not yet been investigated.

- **Prepare Template Files**
- **Modify Template Files**
- **Compile, Copy, and Register, Your New Driver**
- **Test Your new Driver**

### Other SCPI Example Programs

#### Prepare Template Files

1. Copy all the files from the VNA hard drive C:\Program Files(x86)\Keysight\Network Analyzer\Automation\Power Meter Driver Templates folder, to a folder on your development PC.

2. In Visual Basic click *File*, then *Open Project...*, find `MyPowerMeter.vbp` (a file you copied from the VNA). Click *Open*. This is a VB ActiveX EXE template, which you will fill in to become your driver.

3. Click *Project*, then *MyPowerMeter Properties*. Click the *General* tab.

4. Overwrite the Project Name with a name of your own choosing. This will be the name of your driver’s type library (also the default name of your exe).

   **Note** If the name of your exe does not match the VB Project Name with which it was compiled, registration of the exe on the VNA will not succeed.

5. Set the Project Description. After building your driver if you wish to test it using VB, this is the string that will show up in the VB References list of your test project, and also in the lower pane of the VB Object Browser.
6. Set the Thread Pool size to 1 thread.

7. Click OK to close the project properties dialog.

8. From the VB Project menu, click References… Ensure that Keysight PNA Power Meter 1.0 Type Library and VISA Library are checked. Click OK.

**Note:** Keysight's implementation of VISA is installed as part of the Keysight I/O Libraries on the VNA. For help on VISA, go to the Windows Start button on your VNA, select Programs, Keysight IO Libraries, VISA Help.

---

### Modify Template Files

From Visual Basic View menu click Project Explorer. Expand the Modules and Class Modules folders. Ensure there is one module (WinAPI) and one class module (PowerMeter).

Let's look at the WinAPI module first.

1. In the Project Explorer window, click WinAPI.

2. From the View menu click Code.

There is only one line of code you should need to modify in this module: the value of the string constant named sIDSEARCH. The comments preceding the declaration of that string describe how to change it. The rest of this module contains functions which will use the Microsoft Windows API to insure proper registration of your driver on the VNA. If you know of other Windows API functions you feel might be helpful to call from within your PowerMeter class module (to help in formatting data, for example), this module would be the place to declare them.

Now let's look at the class module.

1. In the Project Explorer window, click PowerMeter.

2. From the View menu click Properties Window. The Instancing property must be set to MultiUse. This allows other applications to create objects from this class, such that one instance of your driver EXE can supply more than one such object at a time.

3. From the View menu click Code.

Do NOT modify the Interfaces to IPowerMeter subroutines and functions. VNA source power cal expects to find these interfaces as they are currently defined.

The only members that you need to supply code to are those containing “Your code here” comments.
In addition, comments have been provided at the beginning of each member to describe the information that member needs to be read from or written to the power meter.

To get an idea of how communicate with the power meter using the VISA functions `viWrite` and `viRead`, examine the code which has been implemented for you in `IPowerMeter_Connect`, `IPowerMeter_QueryMeter`, and `IPowerMeter_WriteMeter`.

### Compile, Copy, and Register Your New Driver

When your driver is ready to run, you will first need to compile it into an EXE.

From the File menu select **Make exe**.

After compiling, the following will instruct VB to use the same ID (GUID) every time you re-compile your project.

1. From the **Project** menu, click **PowerMeter Properties**.
2. On the **Component** tab, select **Binary Compatibility** and click **...**
3. Browse to and select your project EXE. Click **Open**.
4. Click **OK** to close **Project Properties**.
5. Save your project.
6. Copy your driver EXE file to a folder on your VNA (do NOT use C:\Program Files(x86)\Keysight\Network Analyzer\Automation\Power Meter Driver Templates folder).
7. Run the EXE file. A message box will pop up reporting whether or not registration was successful. If not successful, it will make a suggestion on what to fix.

When your driver is properly registered, VNA Source Power Cal should be able to associate it with the ID string of your power meter.

### Test Your Power Meter Driver

We have also provided a Visual Basic project to test your new Power Meter driver. This project individually calls every `IPowerMeter` method and property in your driver to verify that it performs correctly. Before running the test your PC and VNA must be configured to communicate using DCOM.

1. Connect your PC and the VNA to LAN.
2. Add your PC logon to the VNA. Both logons and password must match to communicate using DCOM. See Additional VNA users.

3. Configure your driver using DCOM Config on the VNA. This will give you permission to launch and access the driver. See Configure for COM-DCOM Programming.

Modify the Test Project

1. In Visual Basic click File, then Open Project..., find MyPowerMeterTest.vbp (a file you copied from the VNA). Click Open.

2. From the Project menu, click References... From the list, find and check your new Power Meter Driver. (It should have been registered on your PC when you successfully made your driver EXE.) Click OK.

3. From the View menu click Code.

4. Modify the CreateObject line as follows:
   Replace MyPowerMeter with the Project Name that you chose for your driver
   Replace MyPNA with the Computer Name of your VNA.
   For example:

   ```vba
   Set PowerMeterObj = CreateObject("AcmeBrand.PowerMeter", "AGILENT-PNA123")
   ```

   (This assumes that you kept PowerMeter as class module name in your driver.)

Run the Test Project

Ensure your power meter is connected to the VNA with a GPIB cable.

Put the VNA in system controller mode:

1. From the VNA System menu point to Configure then click SICL/GPIB.

2. In the GPIB box click System Controller.

Run the test project. If there are no errors, the driver is created successfully. If there are errors, try to figure out what went wrong and fix it. Then re-compile, re-copy the .exe to the VNA, and re-run the test. You should not need to re-register the driver or re-modify the test program.
ECAL Confidence Check using SCPI

This Visual Basic program performs a complete ECAL confidence check.

To run this program, you need:

- An established GPIB interface connection
- Keysight's VISA or National Instrument's VISA installed on your PC
- The module visa32.bas added to your VB project.
- A form with two buttons: cmdRun and cmdQuit
- A calibrated S11 1-port or N-port measurement active on Channel 1
- Window 1 is visible

**Note:** A confidence check can NOT be performed remotely from User Characterizations that are stored on the VNA disk.

---

Establish a VISA Session

This Visual Basic program demonstrates how to send a SCPI command using VISA and the Keysight IO libraries. To run this program, you need:

- Your PC and VNA both connected to a LAN (for communicating with each other).
- The SICL and VISA components of Keysight’s I/O Libraries software installed on your PC. Both are included when you install the software, unless you already have another vendor’s VISA installed. Then specify Full SICL and VISA installation to overwrite the other vendor’s VISA.
- The module visa32.bas added to your VB project. After you install VISA, the module will be located at C:/VXIPNP/WINNT (or equivalent)/INCLUDE/Visa32.bas
- A form with two buttons: cmdRun and cmdQuit.
- Your PC configured to be a VISA LAN Client, and the SICL Server capability enabled on the analyzer. See Configure for VISA and SICL

See Other SCPI Example Programs

**Note:** This example is a piece of a larger VISA program that performs a source power calibration.

```vbnet
' Session to VISA Default Resource Manager
Private defRM As Long
' Session to VNA
Private viPNA As Long
' VISA function status return code
Private status As Long

Private Sub Form_Load()
    defRM = 0
End Sub

Private Sub cmdRun_Click()
    ' String to receive data from the VNA.
    ' Dimensioned large enough to receive scalar comma-delimited values
    ' for 21 frequency points (20 ASCII characters per point)
    Dim strReply As String * 420

    ' Open the VISA default resource manager
    status = viOpenDefaultRM(defRM)
    If (status < VI_SUCCESS) Then HandleVISAError

    ' Open a VISA session (viPNA) to the SICL LAN server
    ' at “address 16” on the VNA pointed to by the “GPIB0”
    ' VISA LAN Client on this PC.
    ' CHANGE GPIB0 TO WHATEVER YOU VNA IS SET TO
```
status = viOpen(defRM, "GPIB0::16::INSTR", 0, 0, viPNA)
If (status < VI_SUCCESS) Then HandleVISAError

' Need to set the VISA timeout value to give all our calls to
' myGPIBRead sufficient time to complete before a timeout
' error occurs.
' For this example, let's try setting the limit to
' 30000 milliseconds (30 seconds).
status = viSetAttribute(viPNA, VI_ATTR_TMO_VALUE, 30000)
If (status < VI_SUCCESS) Then HandleVISAError

' Preset the VNA
status = myGPIBWrite(viPNA, "SYST:PRES")
If (status < VI_SUCCESS) Then HandleVISAError

' Print the data using a message box
MsgBox strReply
End Sub

Private Sub cmdQuit_Click()
' Close the resource manager session (which also closes
' the session to the VNA).
If defRM <> 0 Then Call viClose(defRM)

' End the program
End End Sub

Private Function myGPIBWrite(ByVal viHandle As Long, ByVal strOut As String) As Long
' The "+ Chr$(10)" appends an ASCII linefeed character to the
' output, for terminating the write transaction.
myGPIBWrite = viVPrintf(viHandle, strOut + Chr$(10), 0)
End Function

Private Function myGPIBRead(ByVal viHandle As Long, strIn As String) As Long
myGPIBRead = viVScanf(viHandle, "%t", strIn)
End Function

Sub HandleVISAError()
Dim strVisaErr As String * 200
Call viStatusDesc(defRM, status, strVisaErr)
MsgBox "*** Error : " + strVisaErr, vbExclamation
End
End Sub
This program demonstrates the use of several External Test Set Control commands.

The SCPI commands in this example are sent over a COM interface using the SCPIStringParser object. You do NOT need a GPIB connection to run this example.

This VBScript (*.vbs) program can be run as a macro in the VNA. To do this, copy the following code into a text editor file such as Notepad and save it on the VNA hard drive as ExtTS.vbs. Learn how to setup and run the macro.

```vbs
' Demonstrate some SCPI commands for external testsets.
Dim pna
Set pna = CreateObject("AgilentPNA835x.Application")
Set scpi = pna.ScpiStringParser
' The K64 testset is only usable on a 4-port VNA
If (pna.NumberOfPorts <> 4) Then
    MsgBox("This program only runs on 4-port analyzers.")
Else
    ' If Help is active, show the measurement window and help
    scpi.Execute("DISP:ARR TILE")
    ' Return the list of supported test sets
    list=scpi.Execute("SENS:MULT:CATalog?")
    MsgBox(list)
    '************* K64 *****************
    ' The K64 is connected using the Testset I/O
    ' connector. There is no handshake information.
    ' Therefore, a testset need not be connected.
    ' Load a configuration file.
    scpi.Execute("SENS:MULT1:TYPE 'Z5623AK64'")
    scpi.Execute("SENS:MULT1:ADDR 0")
```

5272
'return stuff about the test set

' Returns number of input ports
Inports = scpi.Execute("SENS:MULT1:INCount?")
MsgBox("Input Ports: " & CStr(Inports))

' Returns number of output ports
ports = scpi.Execute("SENS:MULT1:COUNt?")
MsgBox("Output Ports: " & CStr(ports))

' Returns valid output ports for each input port
For portNum = 1 To Inports
    ports = scpi.Execute("SENS:MULT1:PORT" & CStr(portNum) & ":CAT?"")
    MsgBox("Port " & CStr(portNum) & " catalog: " & (ports))
Next

MsgBox("Ports will be mapped to " & CStr(portMap))

' Enable external testset control and execute port mapping. This automatically enables status bar display as well.
scpi.Execute("SENS:MULT1:STATe 1")
MsgBox("Z5623A K64 Enabled")
End If
Create fixture function (impedance conversion and port matching)

This example programs below create single-ended port impedance conversion function and add network circuit by loading/recall the file from C drive.

The first program uses Fsimulator Draft and Fsimulator Active SCPI commands while the second program uses legacy SCPI commands. Learn about Using Fixture Simulator.

See Other SCPI Example Programs

Create fixturing function (port impedance conversion and port extension)

This example programs below create port extension and port impedance conversion function.

The first program uses Fsimulator Draft and Fsimulator Active SCPI commands while the second program uses legacy SCPI commands. Learn about Using Fixture Simulator.

See Other SCPI Example Programs

Example program with Fsimulator Draft and Fsimulator Active SCPI commands

```
SYST:PRES
*OPC?
#calc1:fsim:send:oord 3,2,1,0
#The command above indicates that we need to create the blocks in this order:
#Arb Impendance, Port Matching, 2-Port Deembed, Port Extensions
#Special note: It turns out that the arb impedance doesn't matter where it's at in the chain, the new fixture generator
#takes care of it appropriately, so it doesn't matter (and no need to have a command to move it) (it is in a different processing chain)
#for as an example, we'll show you how to move it:
calc1:fsim:stat ON
calc1:fsim:stat?
calc:fsim:draft:discard
CALC:FSIM:DRAFT:SECTION:ZCONversion:ENABLE on
calc1:fsim:draft:zcon:send:port1:state on
calc1:fsim:draft:zcon:send:port1:state?
calc1:fsim:draft:zcon:send:port1:scal 75
calc1:fsim:draft:zcon:send:port1:scal?
CALC:FSIM:DRAFT:EXTension:PORT1:DELay 1E-10
CALC:FSIM:DRAFT:EXTension:PORT1:DELay?
```
Example program with legacy SCPI commands

```
SYST:PRES
*OPC?
calc1:fsim:send:oord?
calc1:fsim:send:oord 3,2,1,0
calc1:fsim:stat ON
calc1:fsim:stat?
sens1:corr:ext:port1:time 1E-10
sens1:corr:ext:port1:time?
sens1:corr:ext ON
sens1:corr:ext?
sens1:corr:ext

calc1:fsim:send:zcon:stat on
calc1:fsim:send:zcon:stat?
calc1:fsim:send:zcon:port1:z0 75
```
Getting and Putting Data using SCPI

This Visual Basic Program does the following:

- Reads data from the analyzer
- Puts the data back into memory
- To see the data on the analyzer after running the program, from the front panel click:
  \[ \text{Trace - Math/Memory - Memory Trace} \]

To run this program, you need:

- An established GPIB interface connection

See Other SCPI Example Programs

**Note:** To change the read and write location of data, removing the comment from the beginning of ONE of the lines, and replace the comment in the beginning of the SDATA and SMEM lines.

```vbnet
Private Sub ReadWrite_Click()
    Dim i As Integer
    Dim t As Integer
    Dim q As Integer
    Dim dat As String
    Dim cmd As String
    Dim datum() As Double

    GPIB.Configure
    GPIB.Write "SYSTem:PRESet;*wai"

    'Select the measurement
    GPIB.Write "CALCulate:PARameter:SELect 'CH1_S11_1'"

    'Read the number of data points
    GPIB.Write "SENSe1:SWEep:POIN?"
    numpts = GPIB.Read

    'Turn continuous sweep off
    GPIB.Write "INITiate:CONTinuous OFF"

    'Take a sweep
    GPIB.Write "INITiate:IMMediate;*wai"

    'Ask for the Data

    'PICK ONE OF THESE LOCATIONS TO READ
    'GPIB.Write "CALCulate:DATA? FDATA" 'Formatted Meas
    'GPIB.Write "CALCulate:DATA? FMEM" 'Formatted Memory
    GPIB.Write "CALCulate:DATA? SDATA" 'Corrected, Complex Meas
```
This Excel VBA Program with VISA-COM does the following:

- Reads data from the analyzer
- Puts the data back into memory

**Note:** To change the read and write location of data, removing the comment from the beginning of ONE of the lines, and replace the comment in the beginning of the FDATA lines.
Sub SampleGetPutData()
    '*** The variables of the resource manager and the instrument I/O are declared.
    Dim ioMgr As VisaComLib.ResourceManager
    Dim GPIB As VisaComLib.FormattedIO488
    '*** The memory area of the resource manager and the instrument I/O are acquired.
    Set ioMgr = New VisaComLib.ResourceManager
    Set GPIB = New VisaComLib.FormattedIO488
    '*** Open the instrument.
    Set GPIB.IO = ioMgr.Open("GPIB0::16::INSTR")
    GPIB.IO.timeout = 10000

    Dim Numpts As Long
    Dim Datam As Variant

    'Select the measurement
    GPIB.WriteString "CALCulate1:MEASure1:PARameter 'S21'", True
    'Read the number of data points
    GPIB.WriteString "SENSe1:SWEep:POINts?", True
    Numpts = GPIB.ReadNumber
    'Turn continuous sweep off
    GPIB.WriteString "INITiate:CONTinuous OFF", True
    'Take a sweep
    GPIB.WriteString "INITiate1:IMMediate;*WAI", True

        ' Corrected, Complex Memory
    GPIB.WriteString "SENSe1:CORRection:CSET:ETERm:DATA 'Directivity(1,1)',", False
        ' Error-Term Directivity
GPIB.WriteList Datam, ASCIIType_R8, ",", True

'*** End procedure
GPIB.IO.Close
End Sub
GPIB Pass-Through Example

The SCPI SYSTem commands used in this example allow you to send GPIB commands to another GPIB device through the VNA. The other device would typically be connected to the VNA through the System Controller GPIB port on the VNA rear-panel or alternatively be connected using a USB/GPIB interface. Uncomment the line in Blue text in the example to open a session for a USB/GPIB interface.

This VB Script example uses the COM SCPIStringParser object. However, this is not critical to the use of these commands; they can be sent using the normal syntax of your programming environment. Using the SCPIStringParser over LAN allows you to communicate with GPIB devices without requiring your remote PC to have a GPIB interface card installed.

Although this method of pass-through works for most applications, there are a couple of limitations:

- All data is transferred using ASCII format. Therefore, transferring large blocks of data is very slow.
- Only read and write functions are possible. Service Interrupts are not supported.

See Other SCPI Example Programs

```vbscript
option explicit
dim app
set app = CreateObject("AgilentPNA83x.Application")

dim p
set p = app.ScpiStringParser

' Open a new GPIB session on Bus:0 Device:14 Timeout: 100ms
p.Parse "SYST:COMM:GPIB:RDEV:OPEN 0,14,100"
' The following commented-out line shows opening the same session but
' for a USB/GPIB interface with VISA interface number GPIB4
'p.Parse "SYST:COMM:GPIB:RDEV:OPEN 4,14,100"

dim handleAsStr

' Retrieve the handle (ID number)
handleAsStr = p.Parse("SYST:COMM:GPIB:RDEV:OPEN?"

' Convert the handle to an integer
dim handleAsInt
handleAsInt = CInt(handleAsStr)

' Send the "*IDN?" query
p.Parse "SYST:COMM:GPIB:RDEV:WRITE " & handleAsInt & ","*IDN?"

' Read its results
dim idn
```
msbbox idn

' Close the GPIB session
p.Parse "SYST:COMM:GPIB:RDEV:CLOSE " & handleAsInt
This example assumes the user's PC has a National Instruments GPIB board. The example is comprised of three basic parts:

1. Initialization
2. Main Body
3. Cleanup

The Initialization portion consists of getting a handle to the VNA and then doing a GPIB clear of the VNA.

The Main Body consists of the VNA SCPI example.

The last step, Cleanup, releases the VNA for front panel control.

Perform a Guided 2-Port or 4-Port Cal using SCPI

This example performs a Guided 2-Port or 4-port Calibration using ONE set of calibration standards or an ECAL module.

A measurement must first be set up with desired frequency range, power, and so forth, ready to be calibrated.

The SCPI commands in this example are sent over a COM interface using the SCPIStringParser object. You do NOT need a GPIB connection to run this example.

This VBScript (*.vbs) program can be run as a macro in the VNA. To do this, copy the following code into a text editor file, such as Notepad, and save it on the VNA hard drive as *.vbs.

Learn how to setup and run the macro.

See Guided Cal SCPI commands

See Other SCPI Example Programs

```vbs
Dim app
Dim scpi
' Create / Get the VNA application.
Set app = CreateObject("AgilentPNA835x.Application")
Set scpi = app.ScpiStringParser

' To perform 2-port cal, Uncomment TwoPortGuidedCal()
' Then comment FourPortGuidedCal()

'Do 2-port Cal
'TwoPortGuidedCal()

'Do 4-port Cal
FourPortGuidedCal

Sub TwoPortGuidedCal()
' Select the connectors
scpi.Execute("sens:corr:coll:guid:conn:port1 ""APC 3.5 female""
scpi.Execute("sens:corr:coll:guid:conn:port2 ""APC 3.5 male"
scpi.Execute("sens:corr:coll:guid:conn:port3 ""Not used"
scpi.Execute("sens:corr:coll:guid:conn:port4 ""Not used"
MsgBox("Connectors defined for Ports 1 and 2")

' Select the Cal Kit for each port being calibrated.
scpi.Execute("sens:corr:coll:guid:ckit:port1 ""85052D"
```

5298

' To use an ECal module instead, comment out the above two lines
' and uncomment the appropriate lines below:
' Your ECal module must already be connected
' via USB to the VNA.
'shci.Parse "sens:corr:coll:guid:ckit:port1 'N4691-60004 ECal'"

' Non-factory characterizations are specified as follows:
' When two or more ECal modules with the same model number are connected
' also specify the serial number as follows:
' When Disk Memory ECal user characterizations are used,
' specify both the User char and the serial number as follows:
'
MsgBox("Cal kits defined for Ports 1 and 2")

' Initiate the calibration and query the number of steps
numSteps = GenerateSteps()
' Measure the standards, compute and apply the cal
MeasureAndComplete(numSteps)
End Sub

Sub FourPortGuidedCal()
' Select the connectors
scpi.Execute("sens:corr:coll:guid:conn:port1 ""APC 3.5 female"" ")
scpi.Execute("sens:corr:coll:guid:conn:port2 ""APC 3.5 female"" ")
scpi.Execute("sens:corr:coll:guid:conn:port3 ""APC 3.5 female"" ")
scpi.Execute("sens:corr:coll:guid:conn:port4 ""APC 3.5 female"" ")
MsgBox("Connectors defined for Ports 1 to 4")
' Select the Cal Kit for each port being calibrated.
scpi.Execute("sens:corr:coll:guid:ckit:port1 ""85052D"" ")
scpi.Execute("sens:corr:coll:guid:ckit:port3 ""85052D"" ")
' To use an ECal module instead, comment out the above four lines
' and uncomment these four lines and use the part number printed
' on your module (which in our case was N4431-60003), followed
' by the word 'ECal'. Your ECal module must already be connected
' via USB to the VNA.

' see above for ECal options

MsgBox("Cal kits defined for Ports 1 to 4")

' Initiate the calibration and query the number of steps
numSteps = GenerateSteps()
' If your selected cal kit is not a 4-port ECal module which can
' mate to all 4 ports at once, then you may want to choose which
' thru connections to measure for the cal. You must measure at
' least 3 different thru paths for a 4-port cal (for greatest
' accuracy you can choose to measure a thru connection for all 6
' pairings of the 4 ports). If you omit this command, the default
' is to measure from port 1 to port 2, port 1 to port 3, and
' port 1 to port 4. For this example we select to measure
' from port 1 to port 2, port 2 to port 3, and port 2 to port 4.
scpi.Execute("sens:corr:coll:guid:thru:ports 1,2,2,3,2,4")
' Re-generate the connection steps to account for the thru changes
numSteps = GenerateSteps()
' Measure the standards, compute and apply the cal
MeasureAndComplete(numSteps)
End Sub

Function GenerateSteps()
' Initiate the calibration and query the number of steps
scpi.Execute("sens:corr:coll:guid:init")
GenerateSteps =  scpi.Execute("sens:corr:coll:guid:steps?")
End Function

Sub MeasureAndComplete(numSteps)
MsgBox("Number of steps is " + CStr(numSteps))
' Measure the standards
For i = 1 To numSteps
step = "Step " + CStr(i) + " of " + CStr(numSteps)
MsgBox strPrompt, vbOKOnly, step
' Note: if you have set up a slow sweep speed (for example, if
' you're using a narrow IF bandwidth) or you're using ECal, and
' while a cal step is being measured you wish to have your program
' perform other operations (like checking for the click event of a
' Cancel button) and you're NOT using the COM ScpiStringParser,
' you can use the optional ASYNchronous argument with the ACQuire
' command as shown in this commented-out line below. The SCPI
' parser then will return immediately while the cal step measurement
' proceeds (i.e., the parser will NOT block-and-wait for the
' measurement step to finish, so you can send additional commands
' in the meantime). So you can do "*ESR?" or "*STB?" queries to
' monitor the status register bytes to see when the OPC bit gets set,
' which indicates the cal measurement step has finished. This OPC
' detection works for all of the VNA's SCPI parsers except the COM
' ScpiStringParser.
' "sens:corr:coll:guid:acq STAN" + CStr(i) + ",ASYN:*OPC"
scpi.Execute("sens:corr:coll:guid:acq STAN" + CStr(i))
Next
' Conclude the calibration
MsgBox ("Cal is done!")
End Sub
Load Error Terms during a Cal Sequence

This example requires that you already have a Cal Set named "foo" that contains a 1-port cal on port 1 and a 1-port cal on port 2.

This example starts a Guided Calibration specifying an Unknown Thru. It loads the 1-port Cals from the existing "foo" Cal Set, then recalculates the number of steps required to complete the cal. After loading the 1-port cals, only the Unknown Thru standard is left to acquire.

```
SENS:CORR:COLL:GUID:CONN:PORT1 "APC 3.5 female"
SENS:CORR:COLL:GUID:CONN:PORT2 "APC 3.5 female"
SENS:CORR:COLL:GUID:CKIT:PORT1 "85033D/E"
SENS:CORR:COLL:GUID:CKIT:PORT2 "85033D/E"
SENS:CORR:COLL:GUID:METH UNKN
' auto-create user calsets for SCPI
SENS:CORR:PREF:CSET:SAVU 1
SENS:CORR:COLL:GUID:INIT
' should return the number 7
SENS:CORR:COLL:GUID:STEPS?
' to port 1, from port 1 in calset
SENS:CORR:COLL:GUID:ETER:LOAD "foo",1,1
' to port 2, from port 2 in calset
SENS:CORR:COLL:GUID:ETER:LOAD "foo",2,2
' should now return the number 1
SENS:CORR:COLL:GUID:STEPS?
' measure the unknown thru
SENS:CORR:COLL:GUID:ACQ STAN1
' save the cal to new user calset
SENS:CORR:COLL:GUID:SAVE
```
Modify a Calibration Kit using SCPI

This Visual Basic program:

- Modifies Calibration kit number 3
- Completely defines standard #4 (thru)

To run this program, you need:

- An established GPIB interface connection

See Other SCPI Example Programs

```vbnet
'Modifying cal kit number 3
Calkitnum = 3

'Designate the kit selection to be used for performing cal's
GPIB.Write "SENSe:CORRection:COLLect:CKIT:SELect " & Val(Calkitnum)

'Reset to factory default values.
GPIB.Write "SENSe:CORRection:COLLect:CKIT:RESet " & Val(Calkitnum)

'Name this kit with your own name
GPIB.Write "SENSe:CORRection:COLLect:CKIT:NAME 'My Cal Kit'

'Assign standard numbers to calibration classes
'Set Port 1, class 1 (S11A) to be standard #8
GPIB.Write "SENSe:CORRection:COLLect:CKIT:ORDer1 8"
'Set Port 1, class 2 (S11B) to be standard #7
GPIB.Write "SENSe:CORRection:COLLect:CKIT:ORDer2 7"
'Set Port 1, class 3 (S11C) to be standard #3
GPIB.Write "SENSe:CORRection:COLLect:CKIT:ORDer3 3"
'Set Port 1, class 4 (S21T) to be standard #4
GPIB.Write "SENSe:CORRection:COLLect:CKIT:ORDer4 4"
'Set Port 2, class 1 (S22A) to be standard #8

Measurement Setup Converters

The following C# example demonstrates how to set up a modulation distortion converter measurement.

See the Modulation Distortion and Mixer commands.

```csharp
def example01():
    pna = VNA(pna_addr)
    pna.write("syst:fpr")
    pna.write("disp:wind1:stat on")
    pna.write("calc:cust:def 'ch1_MGain21','Modulation Distortion Converters','MGain21'")
    pna.write("disp:wind1:trac1:feed 'ch1_MGain21'")
    pna.write("sens:swe:mode hold")

    freq_in_cent = 3.08e9
    freq_in_span = 300e6
    freq_in_star = freq_in_cent - freq_in_span/2
    freq_in_stop = freq_in_cent + freq_in_span/2
    # Mixer frequencies
    pna.write("SENS:MIX:INPut:FREQ:MODE SWEPt")  # Mixer settings
    pna.write("SENS:MIX:INPut:FREQ:STAR {}").format(freq_in_star)
    pna.write("SENS:MIX:INPut:FREQ:STOP {}").format(freq_in_stop)
    pna.write("SENS:MIX:LO:FREQ:MODE FIXED")
    pna.write("SENS:MIX:LO:FREQ:FIX 2.2e9")
    pna.write("SENS:MIX:LO:POW 9")
    pna.write("SENS:MIX:OUTP:FREQ:SID LOW")
    pna.write("SENS:MIX:CALC Output")
    pna.write("SENS:MIX:APPLY")
    pna.write("SENS:MIX:LO:NAME 'Port 3'")  # First apply the settings, then set LO Name
    pna.write("SENS:MIX:APPLY")
    # SA frequencies
    pna.write("sens:dist:swe:carr:freq {}").format(freq_in_cent)
    pna.write("sens:freq:cent {}").format(freq_in_cent)
    pna.write("sens:freq:span {}").format(freq_in_span)
    # modulate
    pna.write("syst:conf:edev:stat 'myMXG',ON")
    pna.write("sens:dist:mod:sour 'myMXG'")
    pna.write(r"sour:mod:load 'D:\mod\flat\flat_1001.mdx'")
    pna.write("sour:mod:stat 1")
```
#
pna.write("sens:swe:mode cont")
# close
pna.close()
Create Modulation File

This example program creates a source modulation file for modulation distortion measurements.

This VBScript program can be run as a macro in the VNA. To do this, copy the code into a text editor file such as Notepad and save on the VNA hard drive as ModFile.vbs. Learn how to setup and run the macro.

See the Modulation Distortion commands.

See Other SCPI Example Programs

Source Modulation Calibration

The following C# example demonstrates how to perform a source modulation calibration to compensate the IQ data to achieve a flat frequency response in gain and phase at the reference plane.

**Note:** Traditional S-parameter calibration using Cal All... must be performed before performing a Source Modulation Calibration.

See the Modulation Distortion commands.

---

**See Other SCPI Example Programs**

```csharp
using System;
using System.Collections.Generic;
using System.IO;
using System.Numerics;
namespace mod_tests
{
    partial class Vna
    {
        [TestMethod]
        public void Case04()

    System.Threading.Thread.Sleep(100);
    str = _fmtIO.CmdQry("*STB?");
    if (int.Parse(str) > 0)
        break;
    ++safeCnt;
}

fmtIO.Cmd("SOUR:MOD:CORR:STAT ON");
}
Perform a Simple Source Power Cal

This example performs a Source Power Cal using ONE USB Power Sensor, already connected to the VNA.

A measurement must first be set up with desired frequency range, power, and so forth, ready to be calibrated.

The SCPI commands in this example are sent over a COM interface using the SCPIStringParser object. You do NOT need a GPIB connection to run this example.

This VBScript (*.vbs) program can be run as a macro in the VNA. To do this, copy the following code into a text editor file, such as Notepad, and save it on the VNA hard drive as spc.vbs.

Learn how to setup and run the macro.

See Source Power Cal SCPI commands

See Other SCPI Example Programs

```
'Performs a source power cal on channel 1 - port 1 using a USB power sensor
'This example assumes ONE USB power sensor is connected to the VNA

Dim app
Dim scpi
Dim sensor

' Create / Get the VNA application.
Set app = CreateObject("AgilentPNA835x.Application")
Set scpi = app.ScpiStringParser
scpi.parse "SYST:PRES"

' set power accuracy tolerance and iterations
scpi.parse "SOUR1:POW1:CORR:COLL:ITER:NTOL 0.1"
scpi.parse "SOUR1:POW1:CORR:COLL:ITER:COUN 15"

' set power sensor settling tolerance
scpi.parse "SOUR1:POW1:CORR:COLL:AVER:NTOL 0.1"
```
scpi.parse "SOUR1::POW1:CORR:COLL:AVER:COUN 15"

'set offset value for amp or attenuation

scpi.parse "SOUR1::POW1:CORR:OFFS 0 DB"

'show source power cal dialog

scpi.parse "SOUR1::POW1:CORR:COLL:DISP ON"

'read the usb power sensor ID string

sensor=scpi.parse("SYST:COMM:USB:PMET:CAT?")

'specify that sensor

scpi.parse "SYST:COMM:PSEN usb," + sensor

'do the measurement

scpi.parse "SOUR1::POW1:CORR:COLL:ACQ PMR,"ASENSOR"

'save the source cal and create an R-Channel response calset

scpi.parse "SOUR::POW:CORR:COLL:SAVE RREC"
Perform a Source and Receiver Power Cal using SCPI

Programming the VNA using COM or using SICL/VISA over LAN (as in this example) leaves the VNA free to control GPIB devices as needed.

The first example, using Visual Basic, demonstrates the following:

- Performing a source power calibration of Port 2 for Channel 1.
- Reading the calibration data.

The second example performs a Receiver Power Cal using VBScript.

Learn more about Power Calibrations.

See an example that Uploads a Source Power Cal.

Other SCPI Example Programs

To run this program, you need:

- One of the following power meters connected to the VNA through GPIB: E4416A, E4417A, E4418A/B, E4419A/B, 437B, 438A, EPM-441A, EPM-442A

**Note:** If your power meter is other than these, you can create your own Power Meter Driver using our template.

- Your PC and VNA both connected to a LAN (for communicating with each other).
- The SICL and VISA components of Agilent’s I/O Libraries software installed on your PC (both are included when you install the software, unless you already have another vendor’s VISA installed. Then specify Full SICL and VISA installation to overwrite the other vendor’s VISA.
- The module visa32.bas added to your VB project.
- A form with one button labeled cmdRun.
- A VISA interface configured on your remote PC to control the VNA. This could be GPIB interface or a VISA LAN Client.
On the VNA connect a Thru cable from port 1 to port 2.

Note: The `SOURce:POWER:CORRection:COLLect:ACQuire` command, when used with a power meter, cannot be sent over the GPIB unless the power meter is connected to a different GPIB interface. See the alternative methods described in the command details.

```vbnet
Private defRM As Long

' Session to VISA Default Resource Manager
Private viPNA As Long

' VISA function status return code
Private status As Long

Private Sub Form_Load()
    defRM = 0
    End Sub

Private Sub cmdRun_Click()
    ' String to receive data from the VNA.
    ' Dimensioned large enough to receive scalar comma-delimited values
    ' for 21 frequency points (20 ASCII characters per point)
    Dim strReply As String * 420

    Dim strStimulus, strCalValue
    Dim strResult As String

    ' Open the VISA default resource manager
    status = viOpenDefaultRM(defRM)
    If (status < VI_SUCCESS) Then HandleVISError
```
Open a session (viPNA) to the VNA at "address 16" on the VISA interface configured as "GPIB1" on this PC. This could be a VISA LAN Client pointing to the SICL LAN Server on the VNA, or an actual GPIB interface on this PC connected to the VNA GPIB (in which case the power meter would need to be connected to a different GPIB interface on the VNA, such as the Keysight 82357A USB-to-GPIB).

status = viOpen(defRM, "GPIB0::16::INSTR", 0, 0, viPNA)
If (status < VI_SUCCESS) Then HandleVISAError

Set the number of sweep points to 21 on Channel 1.
status = myGPIBWrite(viPNA, "SENS1:SWE:POIN 21")
If (status < VI_SUCCESS) Then HandleVISAError

Specify the GPIB address of the power meter that will be used in performing the calibration.
status = myGPIBWrite(viPNA, "SYST:COMM:GPIB:PMET:ADDR 13")
If (status < VI_SUCCESS) Then HandleVISAError

Turn use of the loss table OFF (this assumes there is virtually no loss in the RF path to the power sensor due to a splitter, coupler or adapter).
status = myGPIBWrite(viPNA, "SOUR:POW:CORR:COLL:TABL:LOSS OFF")
If (status < VI_SUCCESS) Then HandleVISAError

Turn frequency checking OFF (so one power sensor is used for the entire calibration acquisition sweep regardless of frequency span).
status = myGPIBWrite(viPNA, "SOUR:POW:CORR:COLL:FCH OFF")
If (status < VI_SUCCESS) Then HandleVISAError

' Specify a nominal power accuracy tolerance (NTOLerance) in dB for the calibration,
' and the maximum number (COUNt) of iterations to adjust power at each point,
' attempting to achieve within tolerance of the desired power. If at any stimulus
' point the power fails to reach within the set tolerance of the desired power
' after the maximum number of iterations, the power at that point will be set to the
' value determined by the last iteration (the Source Power Cal dialog box will
' indicate the FAIL, but we can still apply the cal if desired when it's complete).
' Each iteration is based upon a SETTLED power reading (see comments preceding the
' next two commands below).

status = myGPIBWrite(viPNA, "SOUR1:POW2:CORR:COLL:ITER:NTOL 0.1")
If (status < VI_SUCCESS) Then HandleVISAError
status = myGPIBWrite(viPNA, "SOUR1:POW2:CORR:COLL:ITER:COUN 3")
If (status < VI_SUCCESS) Then HandleVISAError

' The worst-case window of power uncertainty (for a calibration which meets
' tolerance) is the sum of the iteration tolerance and the power meter settling
' tolerance (which is described below).

' At each stimulus point, the VNA takes power meter readings and determine when
' they have settled by comparing the magnitude difference between consecutive
' readings versus a nominal dB tolerance limit (NTOLerance) on that magnitude
' difference. When consecutive readings are within tolerance of each other, or
' if they are not within tolerance but we've taken a maximum number of readings
' (COUNT), the VNA does a weighted average of the readings taken at that stimulus point and that is considered our settled power reading.

status = myGPIBWrite(viPNA, "SOUR1:POW2:CORR:COLL:AVER:NTOL 0.1")
If (status < VI_SUCCESS) Then HandleVISAError

status = myGPIBWrite(viPNA, "SOUR1:POW2:CORR:COLL:AVER:COUN 5")
If (status < VI_SUCCESS) Then HandleVISAError

' Specify if the cal power level is offset (positive value for a gain, negative value for a loss) from the VNA port power setting on the channel when no source power cal is active. This is to account for components between the VNA test port and cal reference plane. In this example, we will calibrate at the VNA test port, so there is no offset (it is zero).

status = myGPIBWrite(viPNA, "SOUR1:POW2:CORR:OFFS 0 DB")

status = myGPIBWrite(viPNA, "*CLS")
If (status < VI_SUCCESS) Then HandleVISAError

' Setting the I/O timeout value to 6000 milliseconds (6 seconds), because the VNA may take up to that amount of time to respond to some commands/queries
' while the cal ACQuire is progressing.

status = viSetAttribute(viPNA, VI_ATTR_TMO_VALUE, 6000)

If (status < VI_SUCCESS) Then HandleVISAError

' Specify the method (type of device) that will be used to perform the cal.

' Choose from power meter (PMEter), power meter and receiver (PMReceiver)

' or just receiver (REceiver).

' PMReceiver uses the power meter for the first iteration of each point and
' the VNA's reference receiver for subsequent iterations, so is much faster
' than using power meter only. But the power meter accounts for compression
' when calibrating at the output of an active device, whereas the reference
' receiver cannot unless it is coupled to the cal reference plane (on a VNA
' which allows direct access to the receivers).

' Perform the source power cal acquisition sweep using the sensor attached to
' Channel A of the power meter (asking for an OPC reply when it’s done). This
' assumes that the power sensor is already connected to Port 2 of the VNA.

' We'll put up an hourglass cursor while waiting for the acquire to complete.

Screen.MousePointer = vbHourglass

status = myGPIBWrite(viPNA, "SOUR1:POW:CORR:COLL:ACQ PMET,'ASEN','Port 2',ASYNchronous;*OPC")

    ' Acquire the power measurement; returning reply to *OPC? when finished.
response = scpi.Execute( "SENSe:CORRection:COLLect:ACQuire POWER;*OPC?" )
    ' Compute the error term, store to calset and turn on the calibration.
response = scpi.Execute( "SENSe:CORRection:COLLect:SAVE" )
MsgBox "Done with calibration."
Perform a Source Power Cal with TWO Sensors

This example performs a Source Power Cal using TWO power sensors on a Dual-Channel Power Meter connected to the VNA via GPIB. Use of two power sensors is necessary when the frequency range of the measurement is greater than can be attained with a single sensor.

A measurement must first be set up with desired frequency range, power, and so forth, ready to be calibrated.

The SCPI commands in this example are sent over a COM interface using the SCPIStringParser object. You do not need to control the VNA via GPIB to run this example.

This VBScript (*.vbs) program can be run as a macro in the VNA. To do this, copy the following code into a text editor file, such as Notepad, and save it on the VNA hard drive as spc.vbs.

Learn how to setup and run the macro.

See Source Power Cal SCPI commands

```
'Performs a source power cal on channel 1 - port 1 using TWO USB power sensors.

Dim app
Dim scpi
Dim sensor

' Create / Get the VNA application.
set app = CreateObject("AgilentPNA835x.Application")
set scpi = app.ScpiStringParser

scpi.parse "SYST:PRES"

' set power accuracy tolerance and iterations
scpi.parse "SOUR1:POW1:CORR:COLL:ITER:NTOL 0.1"
scpi.parse "SOUR1:POW1:CORR:COLL:ITER:COUN 15"

' set power sensor settling tolerance
scpi.parse "SOUR1:POW1:CORR:COLL:AVER:NTOL 0.1"
scpi.parse "SOUR1::POW1:CORR:COLL:AVER:COUN 15"
```
'set offset value for amp or attenuation
scpi.parse "SOUR1:POW1:CORR:OFFS 0 DB"

'show source power cal dialog

'set frequency ranges for two power sensors
scpi.parse "SOUR:POW:CORR:COLL:ASEN 100E3, 3E9"
scpi.parse "SOUR:POW:CORR:COLL:BSEN 3E9,6E9"

'enable frequency check
scpi.parse "SOUR1:POW:CORR:COLL:FCHeck ON"

'specify the address of the power meter
scpi.parse "SYST:COMM:PSEN GPIB,'14'"

'do the measurements
MsgBox "Connect Sensor A to Port 1"
scpi.parse "SOUR1:POW1:CORR:COLL:ACQ PMR,'ASENSOR'"

MsgBox "Disconnect Sensor A from Port 1 and connect Sensor B to Port 1"
scpi.parse "SOUR1:POW1:CORR:COLL:ACQ PMR,'BSENSOR'"

'save the source cal and create an R-Channel response calset
scpi.parse "SOUR:POW:CORR:COLL:SAVE RREC"
Perform an ECaI User Characterization

This example performs a user-characterization and stores it to both the ECaI module memory and VNA disk memory. It also demonstrates the use of the EXPort, CLEar, IMPort and ‘KNAIe:INF?’ commands.

It then performs two 2-port cals: the first using the characterization from module memory, then using the characterization from disk memory.

Note: This example requires that channel 1 be already calibrated.

The SCPI commands in this example are sent over a COM interface using the SCPIStringParser object. You do NOT need a GPIB connection to run this example.

This VBScript (*.vbs) program can be run as a macro in the VNA. To do this, copy the following code into a text editor file, such as Notepad, and save it on the VNA hard drive as ECaI.vbs.

Learn how to setup and run the macro.

See all ECaI User Characterization SCPI commands

See Other SCPI Example Programs

```vbs
Option Explicit

Dim pna
Set pna = CreateObject("AgilentPNA835x.Application")

Dim scpi
Set scpi = pna.ScpiStringParser

' Substitute here the model number and serial number of your own ECaI.

' Note that this example corresponds to a 4-port ECaI module with
' serial number 00001. If you have a 2-port ECaI module, their model
' numbers are '5x5' numbers -- for example, 'N4691-60001'.

Dim ecalModelNum

ecalModelNum = "N4433A"

Dim ecalSerialNum
```
ecalSerialNum = "00001"

MsgBox "ECal module to be characterized is: " & 

' Set which user characterization number (1-12) the new characterization
' will be stored to in the ECal module when it is done. If you intend to
' store your user characterization just to VNA Disk Memory and NOT the
' ECal module's memory, then omit this command.

Dim characterizationNumber

characterizationNumber = 1

' The following commented-out lines of code show how you can access
' the list of connector type names you can set for the ports of an
' ECal when you user-characterize it. However, please note that if
' you are writing the user characterization to the ECal module's memory,
' as of yet only the Factory Defined set of connector choices will work
' properly (see SENS:CORR:CKIT:ECAL:CHAR:CONN:CAT?). If you will be saving
' your characterization to just VNA Disk Memory only, then all connector
' names returned by this query will work,
' user-defined connector names as well as factory-defined.

'Dim connTypeList

'MsgBox connTypeList

' For each port of the ECal module, specify which connector type
' is at the end of the adapter (or cable or fixture) that is
' connected to that port of the ECal for the characterization
(must be one of the connector types that is included in the list that "SENS:CORR:CKIT:ECAL:CHAR:CONN:CAT?" returns). The default is "No adapter", which assumes you are characterizing that port of the ECal "as is" (nothing attached to it). So in this example, Ports C and D of the ECal are being characterized to just the ECal's connectors.

scpi.Parse "SENS1:CORR:CKIT:ECAL:CHAR:CONN:PORT1 'APC 3.5 male'" ' ECal Port A

As with the connector types, the information set in these next few properties also gets stored within the characterization.

Set the name of the person and/or company that is producing this characterization.

Set user-specified description of the VNA being used.

Set descriptions of what you have connected to the ECal module's ports for the characterization.

Port A of the ECal

scpi.Parse "SENS1:CORR:CKIT:ECAL:CHAR:DESC:PORT1 '3.5 mm adapter, SN 00001'"

Port B of the ECal

scpi.Parse "SENS1:CORR:CKIT:ECAL:CHAR:DESC:PORT2 '3.5 mm adapter, SN 00002'"

Note that the "SENS:CORR:CKIT:ECAL:CHAR:" INITiate, ACQuire and SAVE ('CHAR:SAVE" but not "CHAR:DMEMory:SAVE") commands can all each take a significant amount of time to execute/complete. If you are looking at this example to leverage this functionality into a SCPI via GPIB or SCPI via SICL-LAN (VXI-11.2/11.3) application, then you could issue the "*CLS" and "*ESE 1" commands as shown in the commented-out lines below, and use your I/O libraries' Serial
Poll

' function to repeatedly read the status byte until you detect bit 5 (weight of 32)

' in that byte is set. That will happen when the command you are pairing with

' ":*OPC" has completed its operation. But that technique only works for the

GPLB

' and SICL-LAN interfaces. If you need to use the TCPIP Socket or COM

' ScpiStringParser (as is used in this example) SCPI interfaces where there's

' no "built-in" Serial Poll type of function, to ensure your program operates in

' a

' synchronized manner it will need to wait on the ":*OPC?" reply (and not time out)

' before proceeding to the next line of your program. In that event, we

' recommend

' you execute these commands on a thread of execution separate from your

' program's

' user interface thread.

' Of the "SENS:CORR:CKIT:ECAL:CHAR:" INITiate, ACQuire and SAVE commands, the

' SAVE

' command takes the longest amount of time to complete (unless you've set up your

' measurement channel to have a very slow sweep time, in which case the ACQuire

' command could take longer). For an ECal that is a N469x, N4432A or N4433A, or an

' 8509x or N4431x produced by Keysight in 2005 or later, the SAVE command can

' take a

' maximum of approximately 4 to 5 minutes to complete (that corresponds to a

' characterization that will result in the ECal's memory becoming completely

' filled).

' For an 8509x or N4431x ECal that was produced in 2004 or earlier, the SAVE

' command

' can take a maximum of 9 to 10 minutes to complete (again that corresponds to a

' characterization that will result in the ECal's memory becoming completely

' full).
' Begin a user characterization on Channel 1.

' If you will be storing this characterization to the ECal module's memory, then
' the boolean argument to this command is optional (but if you choose to include
' for that case then you must specify it as 1 or ON). If you will be storing
' characterization to VNA disk memory ONLY, then you should specify 0 or OFF for
' that argument. In this example we will be storing the characterization to both
' module memory and VNA disk memory, so we can just omit the argument and let it
' default to 1.

Dim numSteps

Dim opcReply

' Dim statusByte

' Measure the steps.

' Note: prior to measuring the steps you must already have a calibration of the
' necessary number of ports applied to the channel (which in this example is
' Channel 1).

' Otherwise an error will be reported to the SCPI error queue.

Dim i

For i = 1 To numSteps

' Display the step's description.

' Clear the instrument's Status Byte.

' scpi.Execute "*CLS"

' Enable for the OPC bit (bit 0, which has weight 1) in the instrument's
' Event Status Register, so that when that bit's value transitions from 0 to 1
' then the Event Status Register bit in the Status Byte (bit 5 of that byte,
' weight 32) will become set.
'   scpi.Execute "*ESE 1"
'   Issue the ACQuire command
opcReply = scpi.Parse("SENS1:CORR:CKIT:ECAL:CHAR:ACQ STAN" & CStr(i) & ";*OPC?"
)
'   scpi.Execute "SENS1:CORR:CKIT:ECAL:CHAR:ACQ STAN" & CStr(i) & ";*OPC"
'   Do
   ' here is where if you leverage this example into an environment where
   ' you are using SCPI via GPIB or SICL-LAN, that in this loop you could do a
   ' Serial Poll via that interface to read the status byte into this
   ' statusByte variable. Then this If statement would detect when bit 5 is set.
   If ( (statusByte/32) Mod 2) Then Exit Do
   ' And note that normally you would want to have your program do some other
   ' processing (for example, check for user input from keyboard/mouse, for
   ' a cancellation request) here in this loop.
   Loop
   MsgBox "ACQuire is complete"
Next
MsgBox "Now the user characterization will be saved to the ECal module and to PNA disk memory"
' scpi.Execute "*CLS;*ESE 1"
' Save the user characterization to the ECal module's memory.
)
' Do
   ' again here you could do a Serial Poll to get statusByte if using GPIB or SICL-LAN
   If ( (statusByte/32) Mod 2) Then Exit Do
' Loop
Save the user characterization to VNA Disk Memory.

End Sub
Perform an Unguided Cal on a 4-Port VNA

This topic describes how to perform an unguided calibration on a multiport network analyzer using SCPI. The objective here is to make clear the relationship between the physical port on which a standard is being measured, the actual device in the cal kit, and the SCPI command used to acquire the device.

There are two sets of SCPI commands that acquire calibrations. One set is used for guided cal, the other for unguided. The SCPI commands that provide remote access to unguided cal are in the SENS:CORR:COLL block:

- SENS:CORR:COLL:METHod
- SENS:CORR:COLL:ACQuire
- SENS:CORR:COLL:SAVE

On a four port network analyzer, the remote programmer needs to be aware of the relationship between the physical port and the calibration kit class assignments. The example program (below) illustrates the usage by performing three unique 2 port cals, taking care to acquire the appropriate standards.

Calibration standards classes are ‘categories’ of standard types. To perform a 2 port calibration, the cal wizard requires the user to measure:

**3 reflection standards on the forward port:**

- Class S11A typically an open
- Class S11B typically a short
- Class S11C typically a load

Likewise, **3 reflection standards are required for the reverse port:**

- Class S22A typically an open
- Class S22B typically a short
- Class S22C typically a load

**There is also a transmission standard that is measured in both directions:**
Class S21T typically a thru

The following illustrates the relationship between cal kit physical standards and calibration classes.

Here is a list of the physical devices in my calibration kit.

Standard #1 = "3.5 mm male short"
Standard #2 = "3.5 mm male open"
Standard #3 = "3.5 mm male broadband load"
Standard #4 = "Insertable thru standard"
Standard #5 = "3.5 mm male sliding load"
Standard #6 = "3.5 mm male lowband load"
Standard #7 = "3.5 mm female short"
Standard #8 = "Female to female characterized thru adapter"
Standard #9 = "0-2 Load"
Standard #10 = "Open"
Standard #11 = "Non-insertable thru"
Standard #12 = "3.5 mm female lowband load"
Standard #13 = "3.5 mm female sliding load"
Standard #14 = "3.5 mm female broadband load"
Standard #15 = "3.5 mm female open"

When you perform a calibration remotely using SCPI, you don’t specify the device number directly. Rather, you specify the class you want to measure. Each device in the calibration kit is assigned to a class. And since more than one device can be assigned to the same class, each class contains an ordered list of devices. The class assignments are user-settable using the Advanced Modify Cal Kit dialog or the SCPI command:

```
SENS:CORR:COLL:CKIT:ORDer<class>, <std>, <std>, <std>, <std>,<std>,<std>,<std>
```

The 85052B kit used in the example program had the following standard list for each class: The list was obtained by issuing the corresponding SCPI query:

```
SENS:CORR:COLL:CKIT:OLIST1?  S11A = +2,+15,+0,+0,+0,+0,+0
```
When you perform the calibration, you acquire data by issuing the ACQuire command:

```plaintext
SENS:CORR:COLL:ACQ <class>[, <subst> ]
```

For example:

```plaintext
SENS:CORR:COLL:SFOR 1
SENS:CORR:COLL:ACQ STANA, SST2
```

The SFOR command tells the wizard to make the next acquisition in the forward direction. The ACQuire command specifies that we are measuring the 2nd device in the list for STANA. And since we are measuring SFORward, STANA refers to class #1 or S11A. The list of devices for this class are specified in the OLIST1 query above. The associations are shown in red.

Alternately, you could modify the device order for the S11A class to move device #15 into the first position (SENS:CORR:COLL:CKIT:ORDER1). When the desired device is in the first position, you needn’t specify the order number in the ACQuire command. The default is the first device in the OLIST. This worked well for two port network analyzers where the order for S11A,B,C classes were setup for port 1 and the order for S22A,B,C was set up for port 2. With the kit setup in the proper order, you could eliminate the specification of the substandard number (SST<\text{n}>).

When performing 2 port calibrations on 4 Port Network Analyzers, the wizard applies S11A,B,C standards to the lower numbered port, S22A,B,C standards to the higher numbered port. Since the two classes (S11A,B,C and S22A,B,C) are applied to multiple ports, the programmer must take into account the ports being measured and take greater care when specifying the ACQuire command to ensure that the correct device is being measured.

**Port to class relationship**
The following example program shows one method of handling two port cals on a multiport network analyzer. The connectors at the measurement plane are assumed to be (1) male, (2) female, (3) male, and (4) male. In the example, three cals are performed: 1-2 (insertable male to female), 2-3 (insertable female to male), and 3-4 (noninsertable using an characterized adapter).

```vbscript
option explicit
public scpi
public pna
' assume a 4 port VNA with the following connectors:
' the standard measured on these ports will be the opposite gender
' PORT 1 = 3.5 male
' PORT 2 = 3.5 female
' PORT 3 = 3.5 male
' PORT 4 = 3.5 male
' To perform 2 port calibrations between 1-2, 2-3, and 3-4 you need to do the following

call main

sub main
set pna = CreateObject("AgilentPnA835x.Application")
set scpi = pna.ScpiStringParser
pna.Preset
' select a kit to use for this demonstration
' kit #1 for the N5230A is the 85052B 3.5mm kit with sliding load
scpi.execute("SENS:CORR:COLL:CKIT:SELECT 1")

Perform Global Delta Match Cal

The following program performs a Global Delta Match Calibration. This may be required when performing an Unknown Thru Cal or TRL Cal on PNA-L models. See example of Unknown Thru or TRL Cal.

This VBScript (*.vbs) program can be run as a macro in the VNA. To do this, copy the following code into a text editor file such as Notepad and save it on the VNA hard drive as Delta.vbs. Learn how to setup and run the macro.

```vb
Sub PerformGlobalDeltaMatchCal()
    Set pna = CreateObject("AgilentPNA835x.Application")
    Set scpi = pna.ScpiStringParser

    ' Initiate a Global Delta Match calibration, choosing connector and cal kit
    scpi.Parse "SENS:CORR:COLL:GUID:DMAT 'APC 3.5 female', '85033D/E'"

    ' Query the number of calibration steps
    retStr = scpi.Parse("SENS:CORR:COLL:GUID:STEP?")
    numSteps = CInt(retStr)

    ' Measure the cal standards
    For i = 1 To numSteps
        retVal = MsgBox(prompt, vbOKCancel)
        If retVal = vbCancel Then Exit Sub
        retStr = scpi.Parse("SENS:CORR:COLL:GUID:ACQ STAN" & CStr(i) & " ;*OPC?"")
    Next

    ' Compute the error coefficients and save the cal to Global Delta Match CalSet
    scpi.Parse "SENS:CORR:COLL:GUID:SAVE"
    MsgBox "Cal is done!"
End Sub
```
Perform a Guided 1-Port Cal on Port 2

This VBScript program does the following:

1. Clear measurements from the VNA
2. Create a new S22 measurement
3. Set an instrument state
4. Select the connector types
5. Select a cal kit
6. Initiate a Guided calibration
7. Display a prompt to connect each standard
8. Save the calibration to a newly created cal set

**Note:** This example illustrates an important step when calibrating a reflection measurement in the reverse direction. You MUST create a reverse (S22) measurement and have it be the active (selected) measurement on the channel that is being calibrated. This is not necessary for any calibrating any other measurement parameter.

The SCPI commands in this example are sent over a COM interface using the SCPIStringParser object. You do NOT need a GPIB connection to run this example.

This VBScript (*.vbs) program can be run as a macro in the VNA. To do this, copy the following code into a text editor file such as Notepad and save it on the VNA hard drive as Guided.vbs. Learn how to setup and run the macro.

```vbnet
Dim App
Set App = CreateObject("AgilentPNA835x.Application")
App.Preset

Dim step
Dim Parser
Dim prompt
Dim txtDat
Dim Chan

Rm Clear old measurements
App.Reset

Rm Create a new Measurement
```
Set Parser = App.SCPIStringParser
Parser.Parse "DISPlay:WINDow1:STATE ON"
Parser.Parse "CALCulate:PARameter:DEFine:EXT 'MyMeas',S22"
Parser.Parse "DISPlay:WINDow1:TRACe1:FEED 'MyMeas'"

Rem Initialize state
Set Chan = App.ActiveChannel
Chan.StartFrequency = 200e6
Chan.StopFrequency = 1.5e9
Chan.IFBandwidth = 1000
step = 3

Rem Begin a guided calibration
Parser.Parse "SENS:CORR:COLL:GUID:CONN:PORT1 'Not used'"
Parser.Parse "SENS:CORR:COLL:GUID:CONN:PORT2 'Type N (50) male'"
Parser.Parse "SENS:CORR:COLL:GUID:INIT"

Rem Query the number of steps

Rem Display the number of steps
MsgBox("Number of steps is " + txtDat)

Rem Set the loop counter limit
step = txtDat

Rem Measure the standards
For i = 1 To step
  If i = 1 Then
    MsgBox(prompt)
    Parser.Parse("sens:corr:coll:guid:acq STAN1")
  ElseIf i = 2 then
    MsgBox(prompt)
    Parser.Parse("sens:corr:coll:guid:acq STAN2")
  ElseIf i = 3 then
    MsgBox(prompt)
    Parser.Parse("sens:corr:coll:guid:acq STAN3")
  End If
Next

Rem All standards have been measured. Save the result
Parser.Parse "SENS:CORR:COLL:GUID:SAVE"
MsgBox("The calibration has been completed")
Perform a Guided Calibration using SCPI

This VBScript program performs a Guided Calibration using ECal or Mechanical standards. This example includes optional ECal orientation features.

This example has been updated to include:

- Guided Power Cal (Oct 8, 2010)
- The setting of Unknown Thru or Adapter Removal adapter delay. (March 2006).
- The activation of a channel to be calibrated. (Aug. 2006).

The SCPI commands in this example are sent over a COM interface using the SCPIStringParser object. You do NOT need a GPIB connection to run this example.

This VBScript (*.vbs) program can be run as a macro in the VNA. To do this, copy the following code into a text editor file such as Notepad and save it on the VNA hard drive as Guided.vbs. Learn how to setup and run the macro.

```vbs
' Performing a Guided 2-port cal (Ports 1 and 2)
TwoPortGuidedCal
Sub TwoPortGuidedCal

Dim app
Dim scpi
Dim connList
Dim selectedConn1, selectedConn2
Dim kitList
Dim selectedKit
Dim message

' Create / Get the VNA application.
Set app = CreateObject("AgilentPNA835x.Application")
Set scpi = app.ScpiStringParser

'The following demonstrates that the Active Channel is cal'd
```
'Preset the VNA

Perform Guided ECal using SCPI

This VBScript program performs a Guided ECal Calibration. While this example is good to use as a starting point for Guided ECal, the Guided comprehensive cal example has some advanced features that are not in this program.

The SCPI commands in this example are sent over a COM interface using the SCPIStringParser object. You do NOT need a GPIB connection to run this example.

This VBScript (*.vbs) program can be run as a macro in the VNA. To do this, copy the following code into a text editor file such as Notepad and save it on the VNA hard drive as Guided.vbs. Learn how to setup and run the macro.

```vbs
' Performing a 2-port cal (Ports 1 and 2)
Dim app
Dim scpi

' Create / Get the VNA application.
Set app = CreateObject("AgilentPNA835x.Application")
Set scpi = app.ScpiStringParser

' Specify the DUT connectors
' (for each connector of your DUT, one of the ECal module's ports must have
' that same connector, or else you cannot achieve the cal using that module).
scpi.Execute "sens:corr:coll:guid:conn:port1 ""APC 3.5 female"" "
scpi.Execute "sens:corr:coll:guid:conn:port2 ""APC 3.5 male"" "

' Note: If your VNA has more than 2 ports, you would need to uncomment
' one or both of these next two lines, to explicitly specify this is
' just a 2-port cal.
'scpi.Execute "sens:corr:coll:guid:conn:port3 ""Not used"" "
'scpi.Execute "sens:corr:coll:guid:conn:port4 ""Not used"" "
MsgBox "Connectors defined for Ports 1 and 2"

' Specify ECal modules
scpi.Parse "sens:corr:coll:guid:ckit:port1 'N4691-60004 ECal'

' Non-factory characterizations are specified as follows:
'scpi.Parse "sens:corr:coll:guid:ckit:port2 'N4691-60004 User 1 ECal'

' When two or more ECal modules with the same model number are connected
' also specify the serial number as follows:
```
When Disk Memory ECal user characterizations are used, specify both the User char and the serial number as follows:

```
'
MsgBox "Cal kits defined for Ports 1 and 2"

' Initiate the calibration and query the number of steps
scpi.Execute "sens:corr:coll:guid:init"
MsgBox "Number of steps is " + CStr(numSteps)

' Measure the standards
For i = 1 To numSteps
    step = "Step " + CStr(i) + " of " + CStr(numSteps)
    MsgBox strPrompt, vbOKOnly, step
    scpi.Execute "sens:corr:coll:guid:acq STAN" + CStr(i)
Next

' Conclude the calibration
scpi.Execute "sens:corr:coll:guid:save"
MsgBox "Cal is done!"
Perform Guided Mechanical Cal using SCPI

This VBScript program performs a Guided Calibration using Mechanical standards. While this example is good to use as a starting point for guided mechanical cal, the Guided comprehensive cal example has some advanced features that are not in this program.

The SCPI commands in this example are sent over a COM interface using the SCPIStringParser object. You do NOT need a GPIB connection to run this example.

This VBScript (*.vbs) program can be run as a macro in the VNA. To do this, copy the following code into a text editor file such as Notepad and save it on the VNA hard drive as Guided.vbs. Learn how to setup and run the macro.

' Performing a 2-port cal (Ports 1 and 2)

Dim app
Dim scpi

' Create / Get the VNA application.
Set app = CreateObject("AgilentPNA835x.Application")
Set scpi = app.ScpiStringParser

' Specify the DUT connectors
scpi.Execute "sens:corr:coll:guid:conn:port1 ""APC 3.5 female""
scpi.Execute "sens:corr:coll:guid:conn:port2 ""APC 3.5 male"

' Note: If your VNA has more than 2 ports, you would need to uncomment
' one or both of these next two lines, to explicitly specify this is
' just a 2-port cal.
'scpi.Execute "sens:corr:coll:guid:conn:port3 ""Not used"
'scpi.Execute "sens:corr:coll:guid:conn:port4 ""Not used"
MsgBox "Connectors defined for Ports 1 and 2"

' Select the Cal Kit for each port being calibrated.
scpi.Execute "sens:corr:coll:guid:ckit:port1 ""85052D"
scpi.Execute "sens:corr:coll:guid:ckit:port2 ""85052D"
MsgBox "Cal kits defined for Ports 1 and 2"

' Initiate the calibration and query the number of steps
scpi.Execute "sens:corr:coll:guid:init"
MsgBox "Number of steps is " + CStr(numSteps)

' Measure the standards
'The following series of commands shows that standards
'can be measured in any order. These steps acquire
'measurement of standards in reverse order.
'It is easiest to iterate through standards using
' a For-Next Loop.
For i = numSteps To 1
step = "Step " + CStr(i) + " of " + CStr(numSteps)
MsgBox strPrompt, vbOKOnly, step
scpi.Execute "sens:corr:coll:guid:acq STAN" + CStr(i)
Next

' Conclude the calibration
scpi.Execute "sens:corr:coll:guid:save"
MsgBox "Cal is done!"
Perform Guided TRL Calibration

This VBScript file performs a 2-Port Guided TRL calibration on 2-port VNA analyzers. (See an example of TRL cal on a 4-port VNA.) This program does the following:

- Clear old measurements from the VNA
- Create a new S22 measurement
- Set an instrument state
- Select the connectors and cal kit
- Initiate a Guided calibration
- Display a prompt as each new standard must be connected
- Save the calibration to a newly created cal set.

The SCPI commands in this example are sent over a COM interface using the SCPIStringParser object. You do NOT need a GPIB connection to run this example.

This VBScript (*.vbs) program can be run as a macro in the VNA. To do this, copy the following code into a text editor file such as Notepad and save it on the VNA hard drive as TRL.vbs. Learn how to setup and run the macro.

```vbs
Dim App
Dim Parser
Dim Chan
Dim txtDat
Dim step
Dim parserTxt
Dim prompt
Set App = CreateObject("AgilentPNA835x.Application")
' Clear old measurements
App.Reset
' Create a new Measurement
```
Set Parser = App.SCPIStringParser
Parser.Parse "DISPlay:WINDow1:STATE ON"
Parser.Parse "CALCulate:PARameter:DEFine:EXT 'MyMeas',S12"
Parser.Parse "DISPlay:WINDow1:TRACe1:FEED 'MyMeas'"
' Initialize state
Set Chan = App.ActiveChannel
Chan.StartFrequency = 18.0e9
Chan.StopFrequency = 20.0e9
Chan.IFBandwidth = 1000
' Begin a guided calibrations
Parser.Parse "SENS:CORR:COLL:GUID:CONN:PORT1 'APC 3.5 male'"
Parser.Parse "SENS:CORR:COLL:GUID:CONN:PORT2 'APC 3.5 female'"
' Select TRL cal method.
Parser.Parse "SENS:CORR:COLL:GUID:PATH:CMET 1,2,'TRL'"
txtDat = Parser.Parse("SENS:CORR:COLL:GUID:PATH:CMET? 1,2")
MsgBox("Method " + txtDat)
Parser.Parse "SENS:CORR:COLL:GUID:INIT"
' Query the number of steps
' Display the number of steps
MsgBox("Number of steps is " + txtDat)
' Set the loop counter limit
step = CInt(txtDat)
' Measure the standards
For i = 1 To step
parserTxt = "sens:corr:coll:guid:desc? " + CStr(i)
prompt = Parser.Parse(parserTxt)
MsgBox(prompt)
parserTxt = "sens:corr:coll:guid:acq STAN" + CStr(i)
Parser.Parse (parserTxt)
Next
' All standards have been measured. Save the result
Parser.Parse "SENS:CORR:COLL:GUID:SAVE"
MsgBox("The TRL calibration has been completed")
Perform an Unguided 1-Port Cal on Port 2

This VBScript program does the following:

1. Clear measurements from the VNA
2. Create a new S22 measurement
3. Set an instrument state
4. Select a cal kit
5. Initiate an Unguided calibration
6. Display a prompt to connect each standard
7. Save the calibration to a newly created cal set

Note: This example illustrates an important step when calibrating a reflection measurement in the reverse direction. You MUST create a reverse (S22) measurement and have it be the active (selected) measurement on the channel that is being calibrated. This is not necessary for any calibrating any other measurement parameter.

The SCPI commands in this example are sent over a COM interface using the `SCPIStringParser` object. You do NOT need a GPIB connection to run this example.

This VBScript (*.vbs) program can be run as a macro in the VNA. To do this, copy the following code into a text editor file such as Notepad and save it on the VNA hard drive as Unguided.vbs. Learn how to setup and run the macro.

```vbs
Dim App
Set App = CreateObject("AgilentPNA835x.Application")
App.Preset
Dim Parser
Dim Chan

Rem Clear old measurements
App.Reset

Rem Create a new Measurement
Set Parser = App.SCPIStringParser
Parser.Parse "DISPLAY:WINDow1:STATE ON"
Parser.Parse "CALCulate:PARameter:DEFine:EXT 'MyMeas',S22"
Parser.Parse "DISPLAY:WINDow1:TRACe1:FEED 'MyMeas'"
```
Rem Initialize state
Set Chan = App.ActiveChannel
Chan.StartFrequency = 200e6
Chan.StopFrequency = 1.5e9
Chan.IFBandwidth = 1000

Rem Begin an unguided calibration
Rem Set the calibration method
Parser.Parse "SENSe:CORRection:COLLect:METHOD REFL3"

Rem Turn off continuous sweep
Parser.Parse "INITiate:CONTinuous OFF"

Rem Select a cal kit
Parser.Parse "SENSe:CORRection:COLLect:CKIT:SELECT 1"

Rem Measure the standards
MsgBox("Connect OPEN to port 2. Then press OK")
Parser.Parse ("sens:corr:coll:acq STAN1")

MsgBox("Connect SHORT to port 2. Then press OK")
Parser.Parse ("sens:corr:coll:acq STAN2")

MsgBox("Connect LOAD to port 2. Then press OK")
Parser.Parse ("sens:corr:coll:acq STAN3")

Rem All standards have been measured. Save the result
Parser.Parse "SENS:CORR:COLL:SAVE"

Rem Turn ON continuous sweep
Parser.Parse "INITiate:CONTinuous ON"
MsgBox("The calibration has been completed")
Perform an Unguided 2-Port Mechanical Cal

This VBScript program performs an Unguided, Full 2-Port, calibration using ONE set of mechanical calibration standards.

The SCPI commands in this example are sent over a COM interface using the SCPIStringParser object. You do NOT need a GPIB connection to run this example.

This VBScript (*.vbs) program can be run as a macro in the VNA. To do this, copy the following code into a text editor file such as Notepad and save it on the VNA hard drive as Unguided.vbs. Learn how to setup and run the macro.

```vbs
Set App = CreateObject("AgilentPNA835x.Application")
Set Scpi = App.SCPIStringParser

'Initialize state
Scpi.Execute ("SYSTem:PRESet")

'Select the Preset measurement
Scpi.Execute ("CALCulate:PARameter:SELect 'CH1_S11_1'")

'Set the calibration method
Scpi.Execute ("SENSe:CORRection:COLLect:METHod SPARSOLT")

'Select a cal kit
Scpi.Execute ("SENSe:CORRection:COLLect:CKIT:SELect 1")

'Set one set of standards
Scpi.Execute ("SENSe:CORRection:TSTandards OFF")

'Set acquisition to FORWARD
Scpi.Execute ("SENSe:CORRection:SFORward ON")

'Measure the standards in forward direction
MsgBox "Connect OPEN to Port 1; then press OK"
Scpi.Execute ("SENSe:CORRection:COLLect:ACQuire stan1")

MsgBox "Connect SHORT to Port 1; then press OK"
Scpi.Execute ("SENSe:CORRection:COLLect:ACQuire stan2")

MsgBox "Connect LOAD to Port 1; then press OK"
Scpi.Execute ("SENSe:CORRection:COLLect:ACQuire stan3")

'Set acquisition to REVERSE
Scpi.Execute ("SENSe:CORRection:SFORward OFF")

'Measure the standards in reverse direction
MsgBox "Connect OPEN to Port 2; then press OK"
Scpi.Execute ("SENSe:CORRection:COLLect:ACQuire stan1")
```
MsgBox "Connect SHORT to Port 2; then press OK"
Scpi.Execute ("SENSe:CORRection:COLLect:ACQuire stan2")

MsgBox "Connect LOAD to Port 2; then press OK"
Scpi.Execute ("SENSe:CORRection:COLLect:ACQuire stan3")

'Measure the thru standard
MsgBox "Connect THRU between Ports 1 and 2; then press OK"
Scpi.Execute ("SENSe:CORRection:COLLect:ACQuire stan4")

'OPTIONAL Measure Isolation
MsgBox "Connect LOADS to Port 1 AND Port 2; then press OK"
Scpi.Execute ("SENSe:CORRection:COLLect:ACQuire stan5")

'All standards have been measured. Save the result
Scpi.Execute ("SENS:CORR:COLL:SAVE")
MsgBox "The calibration has been completed"
Perform an Unguided ECal

This VBScript program performs an Unguided Full 2-Port ECal.

The SCPI commands in this example are sent over a COM interface using the SCPIStringParser object. You do NOT need a GPIB connection to run this example.

This VBScript (*.vbs) program can be run as a macro in the VNA. To do this, copy the following code into a text editor file such as Notepad and save it on the VNA hard drive as Unguided.vbs. Learn how to setup and run the macro.

See Sense:Correction commands.

See other SCPI Examples

```vbscript
Set pna = CreateObject("AgilentPNA835x.Application")
Set scpi = pna.ScpiStringParser
' Preset the analyzer
scpi.Execute "SYSTem:PRESet"

' Start frequency of 10 MHz
scpi.Execute "SENSe:FREQuency:STARt 10E6"

' Stop frequency of 9 GHz
scpi.Execute "SENSe:FREQuency:STOP 9E9"

' Select the preset S11 measurement
scpi.Execute "CALCulate:PARameter:SELect 'CH1_S11_1'"
' Read the information about the Keysight factory
' characterization data of ECal module #1 on the USB bus
module1Info = scpi.Execute("SENSe:CORRection:COLLect:CKIT:INFormation? ECAL1,CHAR0")

' Prompt for the ECal module
MsgBox "Description of ECal Module #1:" & Chr(10) & Chr(10) & module1Info & _Chr(10) & Chr(10) & "Make port connections to the ECal module, then press enter"
' ECal full 1 port and 2 port
' Choose a Calibration Type (comment out one of these)
scpi.Execute "SENSe:CORRection:COLLect:METHod refl3"
scki.Execute "SENSe:CORRection:COLLect:METHod SPARSOLT"
' Specify to have the VNA automatically determine which port of the
' ECal module is connected to which port of the VNA.
scki.Execute "SENSe:CORRection:PREFerence:ECAL:ORIentation ON"
' Alternatively, if you are measuring at very low power levels where
' the VNA fails to sense the module's orientation, you may need to turn
' off the auto orientation and specify how the module is connected (as in
' these next two commented lines of code -- "A1,B2" would indicate Port A
' of the module is connected to Port 1 and Port B is connected to Port 2).
```
Acquire and store the calibration terms. *OPC? causes a "+1" to be returned when finished. CHAR0 indicates to use the Keysight factory characterized data within the ECal module (as opposed to a user characterization).

```python
x = scpi.Execute("SENSe:CORRection:COLLect:ACQuire ECAL1,CHAR0;*OPC?"
      ' Note: if you have set up a slow sweep speed (for example, if you’re using a narrow IF bandwidth), and while this calibration is being acquired you wish to have your program perform other operations (like checking for the click event of a Cancel button) and you’re NOT using the COM ScpiStringParser, you can use the optional ASYNchronous argument with the ACQuire command as shown here below instead of sending that command in the way shown above. The SCPI parser then will return immediately while the cal acquisition proceeds (i.e., the parser will NOT block-and-wait for the cal to finish, so you can send additional commands in the meantime). So you can do "*ESR?" or "*STB?" queries to monitor the status register bytes to see when the OPC bit gets set, which indicates the cal has finished. That type of OPC detection works for all of the VNA’s SCPI parsers except the COM ScpiStringParser.
An alternative to querying the status register, is to setup an SRQ handler if your IO Libraries supports that.
When an SRQ event occurs, a call back will automatically
"SENSe:CORRection:COLLect:ACQuire ECAL1,CHAR0,ASYNchronous;*OPC"
MsgBox "Done with calibration."
Perform Unknown Thru or TRL Cal

The following program performs either a 2-port SOLT Unknown Thru Cal or a 2-port TRL Cal. The 85052C Cal Kit used in this program contains both types of standards. This program can be run on 2-port or 4-port VNAs. When run on select PNA-L models, a Delta Match Cal is required.

- See Delta Match Cal example program
- See the Guided Cal commands

This VBScript (*.vbs) program can be run as a macro in the VNA. To do this, copy the following code into a text editor file such as Notepad and save it on the VNA hard drive as Unknown.vbs. Learn how to setup and run the macro.

```vbs
Sub PerformUnknownThruOrTRLCal()
    Set pna = CreateObject("AgilentPNA835x.Application")
    Set scpi = pna.ScpiStringParser
    ' Specify connectors for Ports 1 and 2
    scpi.Parse "SENS:CORR:COLL:GUID:CONN:PORT1 'APC 3.5 female'"
    scpi.Parse "SENS:CORR:COLL:GUID:CONN:PORT2 'APC 3.5 male'"
    ' If your VNA has 3 or 4 ports, uncomment one or both of
    ' these next two lines, to explicitly specify this is a 2-port cal.
    'scpi.Parse "SENS:CORR:COLL:GUID:CONN:PORT3 'Not used'"
    'scpi.Parse "SENS:CORR:COLL:GUID:CONN:PORT4 'Not used'"
    ' Specify cal kit for Ports 1 and 2
    ' Since the 85052C cal kit contains SOLT standards and also TRL
    ' standards, these next two lines set cal and thru method.
    ' Always send the init command before and after these two commands
    scpi.Parse "SENS:CORR:COLL:GUID:INIT"
    scpi.Parse "SENS:CORR:COLL:GUID:PATH:CMEThod 1,2,"SOLT"
End Sub
```
scli.Parse "SENS:CORR:COLL:GUID:PATH:TMETHod 1,2,"Undefined Thru"

' To set up the cal as TRL, comment the previous 'CMET' line and uncomment this next line. The TMETHod is set by default
'scli.Parse "SENS:CORR:COLL:GUID:PATH:CMETHod 1,2,"TRL"

' Initiate the calibration
scli.Parse "SENS:CORR:COLL:GUID:INIT"

' Query the list of ports that need delta match
portList = Split(retStr, ",")

' If portList contains just one element and it's value is 0, then that indicates none of the ports being calibrated require delta match data.
' Note: if each testport on the VNA has it's own reference receiver (R channel),
' then delta match is never needed, so portList will always be just 0.
lowerBound = LBound(portList)
If (UBound(portList) <> lowerBound) Or (CInt( portList(lowerBound) ) <> 0) Then

' Delta match data is required for at least one port.
' For this example, we assume a Global Delta Match Cal has previously been performed so the Global Delta Match CalSet exists.
' The Global Delta Match CalSet is used when the APPL command is invoked without a specific calset ID (GUID).
'scli.Parse "SENS:CORR:COLL:GUID:DMAT:APPL"
End If

' Query the number of calibration steps
retStr = scli.Parse("SENS:CORR:COLL:GUID:STEP?"")
numSteps = CInt(retStr)

' Measure the cal standards
For i = 1 To numSteps
retVal = MsgBox(prompt, vbOKCancel)
If retVal = vbCancel Then Exit Sub
retStr = scpi.Parse("SENS:CORR:COLL:GUID:ACQ STAN" & CStr(i) & ";*OPC?")
Next
' Compute the error coefficients and save the cal to CalSet, and turn it on
scpi.Parse "SENS:CORR:COLL:GUID:SAVE"
MsgBox "Cal is done!"
End Sub
Setting Up a Phase Noise Measurement

This example program creates a Phase Noise measurement setup.

This VBScript program can be run as a macro in the VNA. To do this, copy the code into a text editor file such as Notepad and save on the VNA hard drive as PN_Setup.vbs. Learn how to setup and run the macro.

Spot Noise Measurement

This example program creates a Spot Noise measurement.

This VBScript program can be run as a macro in the VNA. To do this, copy the code into a text editor file such as Notepad and save on the VNA hard drive as PN_Spot_Noise.vbs. Learn how to setup and run the macro.

Pulse Narrowband Setup

The following Python example sets up a narrowband pulsed configuration using the integrated pulse measurement option (N52xxA #008 or S93026A/B). The process defines a 500 ns pulse with a 10% duty cycle that is transmitted from port 1 to port 2 of the VNA. It then completes a guided 2 port calibration (unpulsed) with power and then switches to a couple power sweeps at different frequencies and then recalls the base state again. The program uses the non-default pulse generators 3 and 4 to control the gate and modulator drives in order to show the process for using the non-default settings.

See Other SCPI Example Programs

```python
import visa
import time

# start of PNA_Integrated_Pulse_Narrowband_Setup

Setup Fast CW and FIFO

This example program does the following:

- Setup an A/R and B/R measurement
- Turn ON point averaging
- Set external edge triggering (commented out)
- Set FIFO and Fast CW
- Write data into FIFO data buffer
- Read FIFO data buffer

**IMPORTANT** - Because the IFBW is set to 600 kHz, data will NOT be sent to the FIFO after each acquisition. Learn more.

The SCPI commands in this example are sent over a COM interface using the SCPIStringParser object. You do NOT need a GPIB connection to run this example.

This VBScript (*.vbs) program can be run as a macro in the VNA. To do this, copy the following code into a text editor file such as Notepad and save it on the VNA hard drive as FIFO.vbs. Learn how to setup and run the macro.

See the SCPI FIFO commands.

```
Dim returnStr
Dim app
Dim p
Dim start
Dim complete
Dim init
Dim finished
' Create / Get the VNA application.
```
Set app = CreateObject("AgilentPNA835x.Application")
Set p = app.ScpiStringParser

This program demonstrates how to change source and receive ports when measuring noise figure. It assumes that option 029 ("Fully Corrected Noise Figure") is installed.

If only option 028 ("Noise figure measurements using standard receivers") is installed, switching ports is simpler, since only one noise receiver selection is available.

This program can be run as a macro in the VNA. To do this, copy the code into a text editor file such as Notepad and save on the VNA hard drive as NF.vbs. Learn how to setup and run the macro.

See the Noise figure commands.

```vbs
option explicit
dim app, hostname, parser
set app = CreateObject("Agilentpna835x.application")
set parser = app.ScpiStringParser

' Create Noise Figure measurement
parser.Parse "*RST"
parser.Parse "CALC:PAR:DEL:ALL"
parser.Parse "CALC:CUST:DEF 'NF', 'Noise Figure Cold Source', 'NF' "
parser.Parse "DISP:WIND:TRAC1:FEED 'NF'"

'To change from the default input/output port settings of
'source port = VNA1, receive port = VNA2, you must first
'change the noise receiver, then select the desired ports.
dim srcPort, rcvPort

' Set source=VNA port 3 and receiver=VNA port 4
srcPort = 3
rcvPort = 4

' use VNA receiver for noise measurements
```
set port mapping

To revert back to using the noise receiver, the receive port must
be set to the default value VNA2 BEFORE switching to the noise receiver.

Otherwise, the SCPI error
"The noise receiver is not available for the selected receive port"
will occur.

use dedicated noise receiver for noise measurements
Setup Phase Control

This VBScript program configures and displays Phase Sweep measurements.

The SCPI commands in this example are sent over a COM interface using the SCPIStringParser object. You do NOT need a GPIB connection to run this example.

This VBScript (*.vbs) program can be run as a macro in the VNA. To do this, copy the following code into a text editor file such as Notepad and save it on the VNA hard drive as RxLev.vbs. Learn how to setup and run the macro.

SCPI.Parse "sour1:pow" + srcP + ":alc:mode:rec ON"
Setup Sweep Parameters using SCPI

This Visual Basic program sets up sweep parameters on the Channel 1 measurement. To run this program, you need:

- An established GPIB interface connection

See Other SCPI Example Programs

```vba
GPIB.Write "SYST:PRESET"
' Select the measurement
GPIB.Write "CALC:PAR:SEL 'CH1_S11_1'"
' Set sweep type to linear
GPIB.Write "SEN:SWE:TYPE LIN"

' Set IF Bandwidth to 700 Hz
GPIB.Write "SEN:BAND 700"

' Set Center and Span Freq's to 4 GHz
GPIB.Write "SEN:FREQ:CENT 4ghz"
GPIB.Write "SEN:FREQ:SPAN 4ghz"

' Set number of points to 801
GPIB.Write "SEN:SWE:POIN 801"

' Set sweep generation mode to Analog
GPIB.Write "SEN:SWE:GEN ANAL"

' Set sweep time to Automatic
GPIB.Write "SEN:SWE:TIME:Auto ON"

' Query the sweep time
SweepTime = GPIB.Read
```
Setup the Display using SCPI

This Visual Basic program:

- Sets data formatting
- Turns ON the Trace, Title, and Frequency Annotation
- Autoscales the Trace
- Queries Per Division, Reference Level, and Reference Position
- Turn ON and set averaging
- Turn ON and set smoothing

To run this program, you need:

- An established GPIB interface connection

```
GPIB.Write "SYSTem:PRESet"

'Select the measurement
GPIB.Write "CALCulate:PARameter:SELect 'CH1_S11_1'"

'Set the Data Format to Log Mag
GPIB.Write "CALCulate1:FORMat MLOG"

'Turn ON the Trace, Title, and Frequency Annotation
GPIB.Write "DISPlay:WINDow1:TRACe1:STATe ON"
GPIB.Write "DISPlay:WINDow1:TITLe:STATe ON"
GPIB.Write "DISPlay:ANNotation:FREQuency ON"

'Autoscale the Trace
GPIB.Write "DISPlay:WINDow1:TRACe1:Y:Scale:AUTO"

'Query back the Per Division, Reference Level, and Reference Position
GPIB.Write "DISPlay:WINDow1:TRACe1:Y:SCALe:PDIvision?"
Pdiv = GPIB.Read
GPIB.Write "DISPlay:WINDow1:TRACe1:Y:SCALe:RLEvel?"
Rlev = GPIB.Read
GPIB.Write "DISPlay:WINDow1:TRACe1:Y:SCALe:RPOSition?"
Ppos = GPIB.Read

'Turn ON, and average five sweeps
```
GPIB.Write "SENSe1:AVERage:STATe ON"
GPIB.Write "SENSe1:AVERage:Count 5"

'Turn ON, and set 20% smoothing aperture
GPIB.Write "CALCulate1:SMoothing:STATe ON"
GPIB.Write "CALCulate1:SMoothing:APERture 20"
Show Custom Cal Windows during a Guided Calibration

This VBScript program shows how to send commands that allow you to view specific 'custom' windows, and sweep specific channels, during a UI (Cal Wizard) or remote calibration.

The SCPI commands in this example are sent over a COM interface using the SCPIStringParser object. You do NOT need a GPIB connection to run this example.

This VBScript (*.vbs) program can be run as a macro in the VNA. To do this, copy the following code into a text editor file such as Notepad and save it on the VNA hard drive as CalWindow.vbs. Learn how to setup and run the macro.

These commands are used to show and sweep windows and channels:

- **SENS:CORR:COLL:DISP:WIND**
- **SENS:CORR:COLL:SWE:CHAN**
- **SENS:CORR:COLL:DISP:WIND:AOFF**
- **SENS:CORR:COLL:SWE:CHAN:AOFF**
- **SENS:CORR:COLL:GUID:PACQuire**

See Other SCPI Example Programs

```
Dim app
Dim scpi

' Create / Get the PNA application.
Set app = CreateObject("AgilentPNA835x.Application")
Set scpi = app.ScpiStringParser

' A comment
'Preset the analyzer
'This creates an S11 measurement in channel 1, window 1
scpi.Execute "SYST:PRest"

' Create and turn on window 2
```
scpi.Execute "DISPlay:WINDow2:STATE ON"

'Define an S21 measurement in channel 2
scpi.Execute "CALCulate2:PARameter:DEFine:EXT 'MyMeas',S21"

'Associate ("FEED") the measurement name ('MyMeas') to WINDow2
'and give the new TRACe a number (1).
scpi.Execute "DISPlay:WINDow2:TRACe1:FEED 'MyMeas'"

'The following lines are all you need in order to:
'show and sweep the custom Cal windows during a UI Calibration
'If sending ONLY these commands, make sure you know the
'correct window and channel numbers to show and sweep.
'Flag windows 1 and 2 to show during Ch1 calibration
scpi.Execute "SENS:CORR:COLL:DISP:WIND1 ON"
scpi.Execute "SENS:CORR:COLL:DISP:WIND2 ON"

'Flag channels 1 and 2 to sweep during Ch1 calibration
scpi.Execute "SENS1:CORR:COLL:SWE:CHAN1 ON"
scpi.Execute "SENS1:CORR:COLL:SWE:CHAN2 ON"

'=================================================================

'The following code performs a remote guided Cal on Ch1.
'From a remote cal, the Cal window does not normally show and sweep
'after the previous standard has been acquired.
'This shows how to include the PACQuire (preview) to view and sweep the Cal Window.
'The Custom window also shows and sweeps due to the flag commands above.
'The flags are cleared at the end of this section.

'Specify the DUT connectors
scpi.Execute "sens:corr:coll:guid:conn:port1 ""APC 3.5 female"" "
scpi.Execute "sens:corr:coll:guid:conn:port2 ""APC 3.5 male"" "
' Select the Cal Kit for each port being calibrated.
scpi.Execute "sens:corr:coll:guid:ckit:port1 ""85052D"" "
scpi.Execute "sens:corr:coll:guid:ckit:port2 ""85052D"" "
' Initiate the calibration and query the number of steps
scpi.Execute "sens:corr:coll:guid:init"
MsgBox "Number of steps is " + CStr(numSteps)
' Measure the standards
For i = 1 to numSteps
step = "Step " + CStr(i) + " of " + CStr(numSteps)
' send the Preview Acquire command, then prompt
scpi.Execute "sens:corr:coll:guid:PACquire STAN" + CStr(i)
' Do NOT send any Guided Cal commands here or the cal window will not sweep
MsgBox strPrompt, vbOKOnly, step
scpi.Execute "sens:corr:coll:guid:acq STAN" + CStr(i)
Next
' Conclude the calibration
scpi.Execute "sens:corr:coll:guid:save"
MsgBox "Cal is done!"
'
'Remove the Custom Window flags
scpi.Execute "SENS:CORR:COLL:DISP:WIND:AOFF"
'Remove the channel sweep flags
Perform a Sliding Load Calibration using GPIB

This Visual Basic program does a **only** the sliding load portion of a Calibration. To run this program, you need:

- An established GPIB interface connection
- A measurement and calibration routine to call this sub-program
- STAN3 set up as a sliding load standard

### See Other SCPI Example Programs

```vba
Sub slide()
    'Measure the sliding load for at least 5 and no more than 7 slides
    'Note that "SLSET" and "SLDONE" must be executed before the actual acquisition of a slide
    MsgBox "Connect Sliding Load; set to Position 1; then press OK"
    GPIB.Write "SENS:CORR:COLL SLSET"
    GPIB.Write "SENS:CORR:COLL STAN3;"
    MsgBox "Set Sliding Load to position 2; then press OK"
    GPIB.Write "SENS:CORR:COLL SLSET"
    GPIB.Write "SENS:CORR:COLL STAN3;"
    MsgBox "Set Sliding Load to position 3; then press OK"
    GPIB.Write "SENS:CORR:COLL SLDONE"
    GPIB.Write "SENS:CORR:COLL STAN3;"
End Sub
```
Dim app

Set app = CreateObject("AgilentPna835x.application","hostname")
Set scpi = app.ScpiStringParser
scpi.Parse("SYST:PRESET")
scpi.Parse("calc:par:del:all")
scpi.Parse("calc:cust:define "ENR","Noise Figure Cold Source","ENR""
scpi.Parse("disp:wind:trac1:feed "ENR""
scpi.Parse("SENSe:FREQ:Y:STOP 8.5E+9")
scpi.Parse("SENSe:NOISE:USBSource:SELECT "U1831C MY12345678""
scpi.Parse("SENSe:NOISE:USBSource?")
scpi.Parse("SENSe:NOISE:USBSource:TEMPerature? "U1831C MY12345678""
scpi.Parse("SENSe:NOISE:ENR INTERNAL")

scpi.Parse("SENS:CORR:COLL:GUID:ACQ STAN8")
Socket Client

The following C# example demonstrates how to send SCPI commands to the VNA via a TCP socket connection and how to use a TCP 'control' connection. If the command is a query, the program will read the instrument's response. You can add or replace the SCPI commands in this program with your own.

Learn how to enable Sockets communication on the VNA.

For both of the following methods, first copy the example text below into a Notepad file and name it SocketClient.cs.

To run using Microsoft Visual Studio 2003 or 2005

1. From the Visual Studio File menu, select New, then Project.

2. In the New Project window, select the following items (noting the location of the file folder it is creating for you) then click OK.

   - Project Type: Visual C#
   - Template: Console Application
   - Project Name: SocketClient

1. Copy SocketClient.cs into the folder that was created in the previous step.

2. In the Solution Explorer window pane, right-click Class1.cs (if Visual Studio 2003) or Program.cs (if Visual Studio 2005). Select Delete to delete that file.

3. In the Solution Explorer, right-click SocketClient, and select Add, then Existing Item....

4. Browse to select SocketClient.cs and click OK.

You should then be able to build the project, and test the resulting SocketClient.exe from a command prompt (shell) window.

To run using Mono

Mono is a cross-platform version of .NET. You can download a free version of Mono at http://www.mono-project.com. Once downloaded and installed:

1. Run the Mono command prompt (shell) window.
2. Navigate to the directory where the example SocketClient.cs is stored.

3. Type: **MCS SocketClient.cs** (builds the .exe and saves in that same folder.)

4. Type **mono SocketClient.exe** <VNA name or IP address>

This example was compiled and tested successfully with Mono version 1.1.13. It was run on a PC using the Red Hat version 9.0 distribution of the Linux operating system. It was also run on a PC using Windows XP. This program has not been tested with other versions of Mono, or on other operating systems.

**To run with Keysight T&M Toolkit**

Keysight T&M Toolkit 2.0 is the first version to support communication using Sockets.

Use the following to address the Sockets port: **TCPIP0::<VNA name or IP address>::5025::SOCKET**

```csharp
using System;
using System.Net;
using System.Net.Sockets;

// This C# "Console Application" example program demonstrates SCPI
// communication with a Keysight TCP socket-enabled instrument that
// supports socket "control connections" (such as VNA network analyzers,
// which have support for control connections in their socket
// implementation as of VNA Firmware A.08.33.01).
namespace CSharpSocketClient
{
    /// <summary>
    /// The class supporting the main entry point for the application.
    /// </summary>
    class MainClass
    {
        ...
    }
}
```
static AsyncCallback m_pCallbackFunc;
static string m_AsyncReply;

/// <summary>
/// The main entry point for the application.
/// </summary>

[STAThread]
static int Main(string[] args)
{
    try
    {
        if (args.Length != 1)
        {
            Console.WriteLine(""");
            Console.WriteLine("Usage -- with Microsoft's .NET runtime:");
            Console.WriteLine("SocketClient servernameoraddress");
            Console.WriteLine("Example: SocketClient 192.168.0.1");
            Console.WriteLine("");
            Console.WriteLine("Usage -- with Mono's (www.mono-project.com) .NET runtime:");
            Console.WriteLine("mono SocketClient.exe servernameoraddress");
            Console.WriteLine("Example: mono SocketClient.exe 192.168.0.1");
            return 1;
        }

        string server = args[0];
        Int32 port = 5025; // default socket port number for the VNA
/ Create the primary client socket instance
    Socket client = new Socket(AddressFamily.InterNetwork, SocketType.Stream,
                             ProtocolType.Tcp);

    // Get the DNS IP addresses associated with the instrument.
    // (if 'server' string contains the IP address rather than DNS name, this
    // still works)
    IPHostEntry hostInfo = Dns.Resolve(server);
    IPAddress[] IPaddresses = hostInfo.AddressList;
    if (IPaddresses.GetLength(0) < 1)
        return 1;

    // Create an endpoint to use for opening the socket connection
    IPEndPoint endpoint1 = new IPEndPoint(IPaddresses[0], port);

    // Open the connection to the server instrument
    client.Connect(endpoint1);
    if(!client.Connected)
        return 1;

    // Query the instrument's ID string.
    string id = Parse(client, "*IDN?");

    // Clear the instrument's Status Byte
    Parse(client, "*CLS");

    // Enable for the OPC bit (bit 0, which has weight 1) in the instrument's
    // Event Status Register, so that when that bit's value transitions from 0
to 1
    // then the Event Status Register bit in the Status Byte (bit 5 of that
    byte)
// will become set.
Parse(client, "*ESE 1");

// Enable for bit 5 (which has weight 32) in the Status Byte to generate an
// SRQ when that bit's value transitions from 0 to 1.
Parse(client, "*SRE 32");

// Ask the instrument for the number of a port on which a 'control'
// socket connection can be opened.
string controlPortNumStr = Parse(client, "SYSTem:COMmunicate:TCPip:CONTrol? ");

Int32 controlPortNum = System.Convert.ToInt32(controlPortNumStr);

// Create the client "control connection" socket instance
Socket controlClient = new Socket(AddressFamily.InterNetwork,

// Create an endpoint to use for opening the control connection
IPEndPoint endpoint2 = new IPEndPoint(IPaddresses[0], controlPortNum);
// Connect to the server instrument via the port number that was returned
// by the instrument.
controlClient.Connect(endpoint2);
if(!controlClient.Connected)
    return 1;

// Start the control connection listening for an SRQ message.
BeginListeningForAsyncReply(controlClient);

// Now send a preset command to the instrument, accompanied by 'OPC' such
Parse(client, "SYSTem:PRESet;*OPC");

// Normally at this point you would want to have your program do other things
// right here until the SRQ callback occurs, instead of just idling here waiting
// for it.

do {} while (m_AsyncReply == null);

// Now that the SRQ has occurred, we can issue a Device Clear via the control connection.
Parse(controlClient, "DCL");

// The instrument will respond back with "DCL" (and linefeed character appended
// on the end) via the control connection when it has finished processing the
// Device Clear request. Note that this 'Response' method uses the synchronous
// form of 'Receive', so it could potentially time out if the instrument were
// to take a long time to process the Device Clear. So alternatively the
// 'BeginListeningForAsyncReply' could be used for this instead of 'Response'.
string deviceClearResponse = Response(controlClient);

// Close both of the socket client sessions.
controlClient.Close();
client.Close();
}

Status Reporting using SCPI

This Visual Basic program demonstrates two methods of reading the analyzer’s status registers:

- **Polled Bit Method** - reads the Limit1 register continuously.
- **SRQ Method** - enables an interrupt of the program when bit 6 of the status byte is set to 1. The program then queries registers to determine if the limit line failed.

To run this program, you need:

- An established GPIB interface connection
- A form with two buttons: Poll and SRQ Method
- A means of causing the limit line to fail, assuming it passes initially.

```vba
Private Sub Poll_Click()
    ' POLL THE BIT METHOD
    ' Clear status registers
    GPIB.Write "*CLS"

    'Loop FOREVER
    Do
        DoEvents
        GPIB.Write "STATus:QUEStionable:LIMit1:EVENt?"
        onn = GPIB.Read
    Loop Until onn = 2

    MsgBox "Limit 1 Failed "
End Sub

Private Sub SRQMethod_Click()
    ' SRQ METHOD
    GPIB.Write "SYSTem:PRESet"
    GPIB.Write "CALCulate:PARameter:SELect 'CH1_S11_1'"
    ' slow down the trace
    GPIB.Write "SENS:BWID 150"

    ' Setup limit line
    GPIB.Write "CALC:LIMIT:DATA 2,3e9,6e9,-2,-2"'
    GPIB.Write "CALC:LIMIT:DISP ON"
    GPIB.Write "CALC:LIMIT:STATe ON"

    ' Clear status registers.
```
GPIB.Write "*CLS;*wai"
' Clear the Service Request Enable register.
GPIB.Write "*SRE 0"
' Clear the Standard Event Status Enable register.
GPIB.Write "*ESE 0"

' Enable questionable register, bit(10) to report to the status byte.
GPIB.Write "STATus:QUEStionable:ENABle 1024"

' Enable the status byte register bit3 (weight 8) to notify controller
GPIB.Write "*SRE 8"

' Enable the onGPIBNotify event
GPIB.NotifyMask = cwGPIBRQS
GPIB.Notify
End Sub

----------------------------------------------------
Private Sub GPIB_OnGPIBNotify(ByVal mask As Integer)
' check to see what failed
' was it the analyzer?
GPIB.Write "*STB?"
onn = GPIB.Read
If onn <> 0 Then
' If yes, then was it the questionable register?
  GPIB.Write "STATus:QUEStionable:EVENT?"
  onn = GPIB.Read
  ' Determine if the limit1 register, bit 8 is set.
  If onn = 1024 Then
    ' if yes, then was it trace 1?
    GPIB.Write "STAT:QUES:LIMIT1:EVENT?"
    onn = GPIB.Read
    If onn = 2 Then MsgBox ("Limit Linel Failed")
  End If
End If
End If
End Sub
TDR/TDT Measurement

This example program demonstrates how to perform TDR/TDT setup written in Excel VBA (VISA-COM).

See the TDR commands.

See Other SCPI Example Programs

```vba
Dim rm As VisaComLib.ResourceManager
Dim vna As VisaComLib.FormattedIO488

Sub Message(msg As String)
    Dim NumDmy As Integer
    'Syncronize to VNA
    vna.WriteString "*OPC?"
    NumDmy = vna.ReadNumber
    'Write Message
    MsgBox msg, vbOKOnly
End Sub

Sub TDRTDTMeasure()
    On Error GoTo errorhandler
    Set rm = New VisaComLib.ResourceManager
    Set vna = New VisaComLib.FormattedIO488

    ' Set VNA Address
    Set vna.IO = rm.Open("TCPIP0::K-N5232B-40046::hislip0::INSTR")
    vna.IO.Timeout = 90000
End Sub
```
' Clear Excel Sheet Cells
Range("D5:F5").ClearContents

With vna
    Dim i As Integer

Transfer Data using GPIB

The following RMB examples transfer data to and from a remote PC using the MMEM:TRANsfer command.

Transferring data FROM the VNA -- TO a remote PC:

30  !
40  ! Set up I/O paths
50  !
60  ! Network analyzer address
70  ASSIGN @Na TO 716
75  !
77  ! File to be stored on local computer
80  ! First time -- need to create the file.
90  ! After file name, number records set to 0 (ignored by WinOS)
95  ! Use "PURGE" command to delete if desired.
100 CREATE "mytestdata.s2p",0
110 ASSIGN @File TO "mytestdata.s2p"
120  !
122  ! TRANSFER the data (download)
123  !
125  ! Analyzer has file 'testdata.s2p' in default directory
130 OUTPUT @Na;":MMEM:TRAN? ":"testdata.s2p"
135  !
137  ! Now read the bytes coming back from the analyzer in four steps
138  ! (1) Read and dump the first character - '#'
140  ENTER @Na USING ":,A";A$
141  !
142  ! (2) Read the next character which is the number of digits in the file size
145  ENTER @Na USING ":,A";Digit$
146  !
149  ! (3) Use the value of the number of digits to read back the file byte size
150  ! Create query string using this number of digits
155  Img$="",&Digit$&"A"
159  !
160  ! Byte$ holds the number of bytes in string format
160  ENTER @Na USING Img$;Byte$
161  !
163  ! (4) Read the file contents into a buffer and store the buffer contents to a local file
165  ! Allocate a buffer for holding the data
168  ALLOCATE Dat$[VAL(Byte$)]
170  !
172  ! Set up a different image for filling the buffer
175  Img$=Byte$&"A"
178  !
180  ! Retrieve the actual file data
185  ENTER @Na USING Img$;Dat$
305  !
307  ! Now save the file locally.
310  OUTPUT @File;Dat$
320  END

Transferring data FROM the remote PC - TO the VNA:

40  ! Set up I/O paths
50  !
60  ! Network analyzer address
70  ASSIGN @Na TO 716
77  ! File to be retrieved from local computer
78  ASSIGN @File TO "mytestdata.s2p"
79  !
120  !
122  ! TRANSFER the data
123  !
230  ! Allocate a buffer for holding the data
240  ALLOCATE Dat$[26236]
250  !
260  ! Get data from the file and fill Dat$
270  ENTER @File;Dat$
280  !
325  ! Data to be transferred to analyzer file 'testupld.s2p'
326  ! in default directory.
327  ! A specific block transfer designator must follow the
328  ! file name:
329  ! '7' specifies a block transfer.
330  ! '6' specifies 6 digits to follow.
331  ! '026236' matches the buffer size allocated above
332  ! not counting <NL><END> (new line and end of file).
430  OUTPUT @Na;":MMEM:TRAN ""testupld.s2p"",#6026236",Dat$
520  END
Triggering the Analyzer using SCPI

To understand how to trigger the analyzer using SCPI, it is very important to understand the trigger model. Here is a very simple explanation. These three separate functions control triggering:

1. **Trigger:Source** - Where the trigger signals originate:
   - Internal Continuous
   - Internal Manual (Single)
   - External - a trigger source that is connected to the rear panel.

2. **Trigger:Scope** - what gets triggered:
   - Global - each signal triggers all channels in turn.
   - Channel - each signal triggers ONE channel.

3. **Channel settings (Sense<ch>:Sweep:Mode)** How many triggers will each channel accept before going into hold.
   - HOLD - channel will not trigger.
   - CONTinuous - channel triggers indefinitely.
   - GROups - channel accepts the number of triggers specified with the last SENS:SWE:GRO:COUN <num>.
   - SINGle - channel accepts ONE trigger, then goes to HOLD.
   - Point trigger SENS1:SWE:TRIG:POINt

When controlling the VNA using SCPI, a SINGLE trigger is used to ensure that a complete sweep is taken. This example demonstrates how to Single trigger the VNA using the following two methods:

- **Simplest Triggering**
  - This method uses the default Trigger Source = Internal to send a stream of trigger signals.
  - The channel is configured to ACCEPT only a single trigger signal, then HOLD (Sense<ch>:Sweep:Mode SINGle). This is the ONLY required command.
This method can also be used when an External trigger source sends a continuous stream of trigger signals.

**Advanced Triggering**

- This method SENDS a single trigger from the Source, which can be from either Internal (using INIT:IMM) or External triggering.
- Each channel is configured to accept an unlimited number of triggers. This method is the only way to perform point triggering.
- When you require some channels to accept continuous triggers and other channels to accept single triggers, see INIT:IMM Advanced to learn how.

The SCPI commands in this example are sent over a COM interface using the SCPIStringParser object. You do NOT need a GPIB connection to run this example.

This VBScript (*.vbs) program can be run as a macro in the analyzer. To do this, copy the following code into a text editor file such as Notepad and save it on the analyzer hard drive as Trigger.vbs. Learn how to setup and run the macro.

**Measurement setup example:** This section of code can be used at the start of both methods. It sets up:

- S11 traces on two channels
- 10 data points
- Sweep time of 2 seconds - this is slow enough to allow us to watch as each trace is triggered.

```vbs
Dim app
Dim scpi
' Create / Get the VNA application.
Set app = CreateObject("AgilentPNA835x.Application")
Set scpi = app.ScpiStringParser
'============================================
'Setup the VNA
'Preset the analyzer
scpi.Execute ("SYST:FPReset")
```
' Create and turn on window/channel 1
scpi.Execute("DISPlay:WINDow1:STATE ON")
' Define a measurement name, parameter
scpi.Execute("CALCulate1:PARameter:DEFine:EXT 'MyMeas1',S11")
' Associate ("FEED") the measurement name ("MyMeas") to WINDow (1)
scpi.Execute("DISPlay:WINDow1:TRACe1:FEED 'MyMeas1'")
' Create and turn on window/channel 2
scpi.Execute("DISPlay:WINDow2:STATE ON")
' Define a measurement name, parameter
scpi.Execute("CALCulate2:PARameter:DEFine:EXT 'MyMeas2',S11")
' Associate ("FEED") the measurement name ("MyMeas") to WINDow (2)
scpi.Execute("DISPlay:WINDow2:TRACe2:FEED 'MyMeas2'")

' Set slow sweep so we can see
scpi.Execute("SENS1:SWE:TIME 2")
scpi.Execute("SENS2:SWE:TIME 2")
' set number of points to 10
scpi.Execute("SENS1:SWE:POIN 10")
scpi.Execute("SENS2:SWE:POIN 10")

'=============================================================================

' Put both channels in Hold
scpi.Execute("SENS1:SWE:MODE HOLD")
scpi.Execute("SENS2:SWE:MODE HOLD")

'=============================================================================

' Pick Single Send or Single Accept
resp=Msgbox("Single Send? - Click No for Single Accept", 4, "PNA Trigger Demo")
If resp=6 Then
SingleSend()
Else
Simple Triggering  The following example sends a continuous stream of trigger signals and each
VNA channel is set to ACCEPT only a signal trigger signal, then HOLD.

- This example can be used to configure External triggering where the trigger source sends a continuous
  stream of trigger signals. Configure the type of trigger signal that the VNA responds to using the
  CONTrol:SIGNal command. The command in this example sets the VNA to respond to HIGH TTL signals at
  the rear-panel BNC1 trigger IN connector. This command also automatically sets Trigger Source to External
  Trigger.

- The TRIG SCOPE (Global or Channel) setting is NOT necessary with a continuous stream of trigger signals.
  The example program directly controls when each channel is triggered.

- Point triggering can NOT be used with a continuous stream of trigger signals because in point triggering the
  channel will accept as many triggers as necessary to complete ONE full sweep. Use the single SEND
  example for point triggering.

Sub SingleAccept()

'VNA sends continuous trigger signals
scpi.Execute ("TRIG:SOUR IMMEDIATE")

'Uncomment the following to set External triggering
'scpi.Execute ("CONT:SIGN BNC1,TILHIGH")

AcceptOne()

End Sub

Sub AcceptOne()

'The following command makes the channel immediately sweep
'*OPC? allows the measurement to complete before the controller sends another
command
scpi.Execute ("SENS1:SWE:MODE SINGLe;*OPC?")

' You could do something to ch2 here before sweeping it
scpi.Execute ("SENS2:SWE:MODE SINGLe;*OPC?")
Advanced Trigger This example section performs Single Send triggering. Here, single triggering is accomplished by SENDING one trigger signal from the Trigger source and each channel is setup to accept unlimited trigger signals. See the `INIT:IMM` command for more details.

- Using this method, it is possible to change Trigger:Scope to Global or Channel. Set trigger scope to channel if there is some code to execute between channel measurements. Similarly, this method can be used to set Point triggering. Use this method if there is some code to execute between data point measurements.

- In addition, this method can also be used to perform External triggering if the external trigger source is capable of SENDING single triggers. See the `CONT:SIGNal` command to set the type of signal to which the VNA will respond.

- If the external source can only send a continuous stream of trigger signals, then the Single Accept section must be used.

```vba
Sub SingleSend()
    'Set Source Internal - Manual Triggering
    scpi.Execute("TRIG:SOUR MANual")
    'If using an External trigger source that is capable of
    'sending SINGLE trigger signals, then uncomment the following.
    'This command automatically sets trigger source to External
    'scpi.Execute("CONT:SIGN BNC1,TILHIGH")
    'Setup Trigger Scope
    'WHAT gets triggered
    'Pick one using comments
    'Set Channel triggering
    'scpi.Execute("TRIG:SCOPe CURRent")
End Sub
```
'Set Global triggering (Default)
scpi.Execute ("TRIG:SCOPE ALL")

'Set Channel Settings
'The channels respond to UNLIMITED trigger signals (Default)
scpi.Execute ("SENS1:SWE:MODE CONTinuous")
scpi.Execute ("SENS2:SWE:MODE CONTinuous")

'To do Point trigger on one or more channels, uncomment the following.
'Point trigger automatically sets Trig:Scope to Current/Channel
'scpi.Execute ("SENS1:SWE:TRIG:POINT ON")
'scpi.Execute ("SENS2:SWE:TRIG:POINT ON")

IntTrig()
End Sub

Sub IntTrig()
'If External triggering, replace this Sub with code
to single trigger the External Trig Source
Dim resp
'*OPC? allows the measurement to complete before the controller sends another command
scpi.Execute ("INITiate:IMMediate;*OPC?")
resp=Msgbox ("Another trigger?", 1, "PNA Trigger Demo")
If resp=1 Then
IntTrig()
End If
End Sub
Perform an Unguided Cal on Multiple Channels

This VBScript program performs an Unguided Calibration simultaneously on two channels.

This could be used in the following cases:

- If you need more than the current number of data points per trace, so the additional points must be added to a different channel.
- If you need several channels with independent settings, but you want to calibrate all channels with a minimal number of standard connections. This would be especially critical for on wafer calibration.

The SCPI commands in this example are sent over a COM interface using the SCPIStringParser object. You do NOT need a GPIB connection to run this example.

This VBScript (*.vbs) program can be run as a macro in the VNA. To do this, copy the following code into a text editor file such as Notepad and save it on the VNA hard drive as Unguided.vbs. Learn how to setup and run the macro.

```vbs
Dim app
Dim scpi
Dim NumberOfActiveChannels
NumberOfActiveChannels = 2
' Create / Get the VNA application.
Set app = CreateObject("AgilentPNA835x.Application")
Set scpi = app.ScpiStringParser
' Query the list of connectors that the VNA system recognizes
scpi.Execute("SYST:PRES")
'Wait for successful preset before continuing
done=scpi.Execute("*OPC?")
'The following section sets up 2 channels with different frequency ranges
scpi.Execute("DISP:WIND1:STATE OFF")
'Reset Windows
scpi.Execute("DISP:WIND1:STATE ON")
```
scpi.Execute("DISP:WIND2:STATE ON")

' Assign a measurement to the first window
scpi.Execute("CALC1:PAR:DEF:EXT 'Meas1', S21")
scpi.Execute("DISP:WIND1:TRAC1:FEED 'Meas1'")

'Assign a measurement to the second window
scpi.Execute("CALC2:PAR:DEF:EXT 'Meas2', S21")
scpi.Execute("DISP:WIND2:TRAC1:FEED 'Meas2'")

'Set up two channels with independent parameters
scpi.Execute("SENS1:FREQ:SPAN 1e9")
scpi.Execute("SENS2:FREQ:SPAN 1e6")

'Wait for changes before continuing
done=scpi.Execute("*OPC?")

'This section sets the calibration kits for channel 1 and channel 2
'Select a trace from channel 1 and set calibration type and cal kit
scpi.Execute("CALC1:PAR:SEL 'Meas1'")
scpi.Execute("SENS1:CORR:COLL:METH SPARSOLT")
scpi.Execute("SENS1:CORR:COLL:CKIT 2") '85056D for default settings

'Same standards for forward and reverse direction
scpi.Execute("SENS1:CORR:TST OFF")

'Select a trace from channel 2 and set calibration type and cal kit
scpi.Execute("CALC2:PAR:SEL 'Meas2'")
scpi.Execute("SENS2:CORR:COLL:METH SPARSOLT")
scpi.Execute("SENS2:CORR:COLL:CKIT 2") '85056D for default settings

Upload and Download a Segment List

This VBScript program creates two segments, then uploads the segment data to the VNA.

The second part downloads the segment list from the VNA.

The SCPI commands in this example are sent over a COM interface using the SCPIStringParser object. You do NOT need a GPIB connection to run this example.

This VBScript (*.vbs) program can be run as a macro in the VNA. To do this, copy the following code into a text editor file such as Notepad and save it on the VNA hard drive as Unguided.vbs. Learn how to setup and run the macro.

See all Segment SCPI commands.

Create and Upload a Segment List

```vbscript
Option Explicit

Dim app

Set app = CreateObject("AgilentPNA835x.Application")

' Preset the VNA
app.Preset

Dim scpi

Set scpi = app.ScpiStringParser

' In case of a measurement receiver VNA like N5264B
' which has no source ports, "SOURce:CATalog?" will
' return an empty list (just a pair of quotation marks)

Dim srcPortNames

srcPortNames = Split( scpi.Execute("SOURce:CATalog?") , "," )

Dim numberOfSrcPorts

If Left( srcPortNames(0) , 2 ) = Chr(34) & Chr(34) Then
    numberOfSrcPorts = 0
Else
    numberOfSrcPorts = UBound(srcPortNames) + 1
```
End If

' Building up a string consisting of the sweep segment data
' we want to set up. This example will create two segments.
Dim segData

' Set state of first segment to be ON (1 = ON, 0 = OFF),
' 101 points, start freq of 10 MHz, stop freq of 1 GHz
segData = "1,101,10E6,1E9"

' If you want to include one or more of: IF bandwidth, Dwell Time
' or Port Power, remove the comments from these next two lines
'TurnOnOptions 1 ' Call the subroutine
'segData = AddOptionalSettings(segData, numberOfSrcPorts)

' Set state of second segment to be ON, 201 points,
' start freq of 1 GHz, stop freq of 3 GHz
segData = segData & ",1,201,1E9,3E9"

' Uncomment this line below only if you uncommented the
' AddOptionalSettings line above for the first segment.
'segData = AddOptionalSettings(segData, numberOfSrcPorts)

Const numSegs = 2

' Upload our segment list to the channel
scpi.Execute "SENSe1:SEGMent:LIST STOP," & numSegs & ",," & segData

' Set segment sweep type on Channel 1
scpi.Execute "SENSe1:SWEep:TYPE SEGment"

' Having the VNA display the segment sweep table for the channel
scpi.Execute "DISPlay:WINDow1:TABLE SEGment"

Sub TurnOnOptions(ByVal chan)
    scpi.Execute "SENSe" & chan & ":SEGment:BWIDth:CONTrol ON"
    scpi.Execute "SENSe" & chan & ":SEGment:SWEep:TIME:CONTrol ON"
    scpi.Execute "SENSe" & chan & ":SEGment:POWer:CONTrol ON"
End Sub
' Turning off coupling allows power to vary per each port
scpi.Execute "SOURce"&chan&":POWer:COUPle OFF"

End Sub

Function AddOptionalSettings(ByVal inStr, ByVal numSrcPorts)
' Specifying 1 kHz IF bandwidth and Dwell Time of 0
inStr = inStr & ",1E3,0"
' -10 dBm power for each of the source ports
Dim i

Uploading a Source Power Cal using SCPI

Programming the VNA using COM or using SICL/VISA over LAN (as in this example) leaves the VNA free to control GPIB devices as needed. This Visual Basic program demonstrates:

- Uploading a source power calibration of Port 2 for Channel 1.
- Reading the calibration data.

Learn more about Power Calibrations

Other SCPI Example Programs

To run this program, you need:

- Your PC and VNA both connected to a LAN (if using VISA LAN server / client).
- The SICL and VISA components of Keysight I/O Libraries software installed on your PC (both are included when you install the software, unless you already have another vendor's VISA installed. Then specify Full SICL and VISA installation to overwrite the other vendor's VISA.
- The module visa32.bas added to your VB project.
- A form with two buttons: cmdRun and cmdQuit.
- A VISA interface configured on your remote PC to control the VNA. This could be GPIB interface or a VISA LAN Client.

Private defRM As Long
Private viPNA As Long
Private status As Long

The VISA (Virtual Instrument Software Architecture) **System Communicate** commands used in this example allow you to send SCPI commands to another device through the VNA. VISA is used to communicate with most instrumentation buses including the following:

- GPIB
- USB
- Serial
- Ethernet

**See Other SCPI Example Programs**

```vbnet
option explicit
dim app
set app = CreateObject("AgilentPNA835x.Application")
set scpi = app.ScpiStringParser

's Open a new VISA session and set timeout to 10 ms
scpi.Parse "SYST:COMM:VISA:RDEV:OPEN 'TCPIP0::A-N5242A-10096::hislip1::INSTR',10"

's Retrieve the session ID number
sessionNum = scpi.Parse "SYST:COMM:VISA:RDEV:OPEN?"

's Send session ID number and send RBW command to the device
scpi.Parse "SYST:COMM:VISA:RDEV:WRIT & sessionNum & 'RBW:ARB 1'"

's Send the "*IDN?" query
scpi.Parse "SYST:COMM:VISA:RDEV:WRITE & sessionNum & '*IDN?'"

's Read its results
idnstr = scpi.Parse "SYST:COMM:VISA:RDEV:READ?" & sessionNum

's Close the VISA session
scpi.Parse "SYST:COMM:VISA:RDEV:CLOSE" & sessionNum
```
The General Purpose Interface Bus (GPIB) is a system of hardware and software that allows you to control test equipment to make measurements quickly and accurately. This topic contains the following information:

- The GPIB Hardware Components
- The GPIB / SCPI Programming Elements
- Specifications
- GPIB Interface Capability Codes

**Note:** All of the topics related to programming assume that you already know how to program, preferably using a language that can control instruments.

---

### Other Topics about GPIB Concepts

#### The GPIB Hardware Components

The system bus and its associated interface operations are defined by the IEEE 488 standard. The following sections list and describe the main pieces of hardware in a GPIB system:

---

Early VNA models had only ONE GPIB connector. These models could control other GPIB devices using one of, or a combination of, the following methods:

- Use the SCPI `SYST:COMM:GPIB:RDEV:` commands.
- Use VISA or SICL over LAN to accomplish this. See an example.
- Use USB / GPIB Interface

**Note:** Current VNA models have dedicated Controller and Talker/Listener GPIB ports. See how to configure these ports.

#### Controllers

Controllers specify the instruments that will be the talker and listener in a data exchange. The controller of the bus must have a GPIB interface card to communicate on the GPIB.
The **Active Controller** is the computer or instrument that is currently controlling data exchanges.

The **System Controller** is the only computer or instrument that can take control and give up control of the GPIB to another computer or instrument, which is then called the active controller.

**Talker / Listener Instruments and GPIB Addresses**

- **Talkers** are instruments that can be addressed to send data to the controller.
- **Listeners** are instruments that can be addressed to receive a command, and then respond to the command. All devices on the bus are required to listen.

Every GPIB instrument must have its own unique address on the bus. The VNA address (default = 716) consists of two parts:

1. **The Interface select code** (typically 7) indicates which GPIB port in the system controller is used to communicate with the device.

2. **The primary address** (16) is set at the factory. You can change the primary address of any device on the bus to any number between 0 and 30. To change the analyzer address click System / Configure / SICL-GPIB.

**A secondary address** is sometimes used to allow access to individual modules in a modular instrument system, such as a VXI mainframe. The VNA does NOT have a secondary address.

**Cables**

GPIB Cables are the physical link connecting all of the devices on the bus. There are eight data lines in a GPIB cable that send data from one device to another. There are also eight control lines that manage traffic on the data lines and control other interface operations.

You can connect instruments to the controller in any arrangement with the following limitations:

- Do not connect more than 15 devices on any GPIB system. This number can be extended with the use of a bus extension.
- Do not exceed a total of 20 meters of total cable length or 2 meters per device, whichever is less.
- Avoid stacking more than three connectors on the back panel of an instrument. This can cause unnecessary strain on the rear-panel connector.

**The GPIB / SCPI Programming Elements**

The following software programming elements combine to become a GPIB program:
The GPIB command is the basic unit of communication in a GPIB system. The analyzer responds to three types of GPIB commands:

1. **IEEE 488.1 Bus-management Commands**

These commands are used primarily to tell some or all of the devices on the bus to perform certain interface operations.

All of the functions that can be accomplished with these commands can also be done with IEEE 488.2 or SCPI commands. Therefore, these commands are not documented in this Help system. For a complete list of IEEE 488.1 commands refer to the IEEE 488 standard. **Examples** of IEEE 488.1 Commands

- **CLEAR** - Clears the bus of any pending operations
- **LOCAL** - Returns instruments to local operation

2. **IEEE 488.2 Common Commands**

These commands are sent to instruments to perform interface operations. An IEEE 488.2 common command consists of a single mnemonic and is preceded by an asterisk (*). Some of the commands have a query form which adds a "?" after the command. These commands ask the instrument for the current setting. See a complete list of the **Common Commands** that are recognized by the analyzer. **Examples** of IEEE 488.2 Common Commands

- **OPC** - Operation Complete
- **RST** - Reset
- **OPT?** - Queries the option configuration

3. **SCPI Commands**

The Standard Commands for Programmable Instruments (SCPI) is a set of commands developed in 1990. The standardization provided in SCPI commands helps ensure that programs written for a particular SCPI instrument are easily adapted to work with a similar SCPI instrument. SCPI commands tell instruments to do device specific functions. For example, SCPI commands could tell an instrument to make a measurement and output data to a controller. **Examples** of SCPI Commands:
For more information on SCPI:

- The Rules and Syntax of SCPI Commands provides more detail of the SCPI command structure.

- SCPI Command Tree is a complete list of the SCPI commands for the analyzer

**Programming Statements**

SCPI commands are included with the language specific I/O statements to form program statements. The programming language determines the syntax of the programming statements. SCPI programs can be written in a variety of programming languages such as VEE, HP BASIC, or C++. **Example** of a Visual Basic statement:

- `GPIB.Write "SOURCE:FREQUENCY:FIXED 1000 MHz"`

**Note about examples**

**Instrument Drivers**

Instrument drivers are subroutines that provide routine functionality and can be reused from program to program. GPIB industry leaders have written standards for use by programmers who develop drivers. When programmers write drivers that comply with the standards, the drivers can be used with predictable results. To comply with the standard, each instrument driver must include documentation describing its functionality and how it should be implemented.

**GPIB Specifications**

**Interconnected devices** - Up to 15 devices (maximum) on one contiguous bus.

**Interconnection path** - Star or linear (or mixed) bus network, up to 20 meters total transmission path length or 2 meters per device, whichever is less.

**Message transfer scheme** - Byte-serial, bit-parallel, asynchronous data transfer using an interlocking 3-wire handshake.

**Maximum data rate** - 1 megabyte per second over limited distances, 250 to 500 kilobytes per second typical maximum over a full transmission path. The devices on the bus determine the actual data rate.

**Address capability** - Primary addresses, 31 Talk and 31 Listen; secondary addresses, 961 Talk and 961 Listen. There can be a maximum of 1 Talker and up to 14 Listeners at a time on a single bus. See also previous section on **GPIB addresses**.
The IEEE 488.1 standard requires that all GPIB compatible instruments display their interface capabilities on the rear panel using codes. The codes on the analyzer, and their related descriptions, are listed below:

- **SH1** full source handshake capability
- **AH1** full acceptor handshake capability
- **T6** basic talker, serial poll, no talk only, unaddress if MLA (My Listen Address)
- **TEO** no extended talker capability
- **L4** basic listener, no listen only, unaddress if MTA (My Talk Address)
- **LEO** no extended listener capability
- **SR1** full service request capability
- **RL1** full remote / local capability
- **PPO** **no parallel poll capability**
- **DC1** full device clear capability
- **DT1** full device trigger capability
- **C1** system controller capability
- **C2** send IFC (Interface Clear) and take charge controller capability
- **C3** send REN (Remote Enable) controller capability
- **C4** respond to SRQ (Service Request)
The Rules and Syntax of SCPI

Most of the commands used for controlling instruments on the GPIB are SCPI commands. The following sections will help you learn to use SCPI commands in your programs.

- Branches on the Command Tree
- Command and Query
- Multiple Commands
- Command Abbreviation
- Bracketed (Optional) Keywords
- Vertical Bars (Pipes)
- MIN and MAX Parameters

Other Topics about GPIB Concepts

Branches on the Command Tree

All major functions on the analyzer are assigned keywords which are called ROOT commands. (See GPIB Command Finder for a list of SCPI root commands). Under these root commands are branches that contain one or more keywords. The branching continues until each analyzer function is assigned to a branch. A root command and the branches below it is sometimes known as a subsystem.

For example, under `SOURCE:POWER` are several branch commands.

Sometimes the same keyword, such as `STATE`, is used in several branches of the command tree. To keep track of the current branch, the analyzer's command parser uses the following rules:

- **Power On and Reset** - After power is cycled or after `*RST`, the current path is set to the root level commands.

- **Message Terminators** - A message terminator, such as a `<NL>` character, sets the current path to the root command level. Many programming language output statements send message terminators automatically. Message terminators are described in Sending Messages to the Analyzer.

- **Colon (:)** - When a colon is between two command keywords, it moves the current path down one level in the command tree. For example, the colon in `:SOURCE:POWER` specifies that `POWER` is one level below `SOURCE`. When the colon is the first character of a command, it specifies that the following keyword is a root level command. For example, the colon in `:SOURCE` specifies that source is a root level command.
Note: You can omit the leading colon if the command is the first of a new program line. For example, the following two commands are equivalent:
SOUR:POW:ATT:AUTO
:SOUR:POW:ATT:AUTO

- **<WSP>** - Whitespace characters, such as <tab> and <space>, are generally ignored. There are two important exceptions:
  - Whitespace inside a keyword, such as :CALCULATE, is not allowed.
  - Most commands end with a parameter. You must use whitespace to separate these ending parameters from commands. **Always refer to the command documentation.** In the following example, there is whitespace between STATE and ON.

CALCULATE1:SMOOTHING:STATE ON

- **Comma (,)** - If a command requires more than one parameter, you must separate adjacent parameters using a comma. For example, the SYSTEM:TIME command requires three values to set the analyzer clock: one for hours, one for minutes, and one for seconds. A message to set the clock to 8:45 AM would be SYSTEM:TIME 8,45,0. Commas do not affect the current path.

- **Semicolon(;)** - A semicolon separates two commands in the same message without changing the current path. See **Multiple Commands** later in this topic.

- **IEEE 488.2 Common Commands** - Common commands, such as *RST, are not part of any subsystem. An instrument interprets them in the same way, regardless of the current path setting.

**Command and Query**

A SCPI command can be an Event command, Query command (a command that asks the analyzer for information), or both. The following are descriptions and examples of each form of command. GPIB Command Finder lists every SCPI command that is recognized by the analyzer, and its form.

<table>
<thead>
<tr>
<th>Form</th>
<th>Examples</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Event commands</strong> - cause an action to occur inside the analyzer.</td>
<td>:INITIATE:IMMEDIATE</td>
</tr>
<tr>
<td><strong>Query commands</strong> - query only; there is no associated analyzer state to set.</td>
<td>:SYSTem:ERRor?</td>
</tr>
<tr>
<td><strong>Command and query</strong> - set or query an analyzer setting. The query form appends a question mark (?) to the set form</td>
<td>:FORMat:DATA ! Command :FORMat:DATA? ! Query</td>
</tr>
</tbody>
</table>
Multiple Commands

You can send multiple commands within a single program message. By separating the commands with semicolons the current path does not change. The following examples show three methods to send two commands:

1. **Two program messages:**

   ```
   SOURCE:POWER:START 0DBM
   SOURCE:POWER:STOP 10DBM
   ```

2. **One long message.** A colon follows the semicolon that separates the two commands causing the command parser to reset to the root of the command tree. As a result, the next command is only valid if it includes the entire keyword path from the root of the tree:

   ```
   SOURCE:POWER:START 0DBM;:SOURCE:POWER:STOP 10DBM
   ```

3. **One short message.** The command parser keeps track of the position in the command tree. Therefore, you can simplify your program messages by including only the keyword at the same level in the command tree.

   ```
   SOURCE:POWER:START 0DBM;STOP 10DBM
   ```

Common Commands and SCPI Commands

You can send Common commands and SCPI commands together in the same message. (For more information on these types of commands see [GP-IB Fundamentals](#).) As in sending multiple SCPI commands, you must separate them with a semicolon.

**Example** of Common command and SCPI commands together

```
*RST;SENSE:FREQUENCY:CENTER 5MHZ;SPAN 100KHZ
```
The following is unacceptable - The first three keywords use neither short or long form.

```
SOURc: Powe: Atten: Auto on
```

The following is acceptable - All keywords are either short form or long form.

```
SOUR: POWer: ATT:AUTO on
```

In addition, the analyzer accepts lowercase and uppercase characters as equivalent as shown in the following equivalent commands:

```
source: POW:att: auto ON
Source: Pow: Att: Auto on
```

Optional [Bracketed] Keywords

You can omit some keywords without changing the effect of the command. These optional, or default, keywords are used in many subsystems and are identified by brackets in syntax diagrams.

**Example of Optional Keywords**

The HCOPY subsystem contains the optional keyword IMMEDIATE at its first branching point. Both of the following commands are equivalent:

```
"HCOPY: IMMEDIATE"
"HCOPY"
```

The syntax in this Help system looks like this:

```
HCOPY[: IMMEDIATE]
```

**Vertical Bars | Pipes**

Vertical bars, or "pipes", can be read as "or". They are used in syntax diagrams to separate alternative parameter options.

**Example of Vertical Bars:**

```
SOURce: POWer: ATTenuation: AUTO <on|off>
```

Either ON or OFF is a valid parameter option.

**MIN and MAX Parameters**

The special form parameters "MINimum" and "MAXimum" can be used with commands that specify single frequency (Hz) and time (seconds) as noted in the command documentation. **Note:** Also with these commands, kHz, MHz, and GHz are accepted as suffixes/units.

The short form (min) and long form (minimum) of these two keywords are equivalent.
- MAXimum refers to the largest value that the function can currently be set to
- MINimum refers to the smallest value that the function can currently be set to.

For example, the following command sets the start frequency to the smallest value that is currently possible:

```
SENS:FREQ:START MIN
```

In addition, the max and min values can also be queried for these commands.

For example, the following command returns the smallest value that Start Frequency can currently be set to:

```
SENS:FREQ:START? MIN
```

An error will be returned if a numeric parameter is sent that exceeds the MAX and MIN values.

For example, the following command will return an "Out of range" error message.

```
SENS:FREQ:START 1khz
```
Configure for GPIB, SCPI, and SICL

The following settings are used to configure the analyzer for remote control using SCPI commands.

**How to Configure for SICL / GPIB Operation**

**Using Hardkey/SoftTab/Softkey**

1. Press **System > System Setup > Remote Interface...**

**Using a mouse**

1. Click **Utility**
2. Select **System**
3. Select **System Setup**
4. Select **Remote Interface...**

**SICL / GPIB** dialog box help

![Remote Interface dialog box help](image-url)
**GPIB**

**Talker/Listener Address**  Sets the VNA address used to send and receive GPIB/SCPI commands to the system controller (external computer).

Use the National Instruments interface or the ACE (Keysight Connection Expert) interface to change the System Controller address. Use the VNA as the system controller of external devices. Learn about the [VNA as controller](#).

See the rear panel of the [VNA-X](#) and N522x models.

---

**SICL**

**SICL Enabled**  When checked, the analyzer is capable of running GPIB programs on its computer to control analyzer functions. The programs must be run from a GPIB-capable programming environment (VEE, Visual Basic). This mode does not allow control of external GPIB instruments. To uncheck this box, exit the VNA application - (Click File, then Exit). The VNA restarts with the SICL enabled box unchecked unless **Automatically Enable on Startup** is checked.

Learn more about [Configuring for VISA and SICL](#).

**Note:** When **SICL Enabled** is checked, the VNA VXI-11.2 interface is enabled, and if the VNA hard disk image is new enough to have the VXI-11.3 interface, it also enables that. Learn more about [LXI/VXI](#).

**Address**  Sets the VNA address.

**Automatically Enable on Startup**  When checked, SICL Enabled is automatically selected when starting the VNA application.

---

**LAN Sockets/Telnet**

Provides ability to communicate with the VNA from a PC that uses a Windows, or non-Windows, operating system.

- These settings are checked by default. If you have security concerns, clear these check boxes.

- These settings remain after the VNA is shutdown and restarted.

**Sockets Enabled**  When checked, provides the ability to control the VNA from a remote SCPI program using port number 5025. See the C# example that illustrates how this is done.
**Telnet Enabled**  When checked, provides the ability to send single SCPI commands from a remote Windows, or non-Windows, PC to the VNA using port number 5024.

How to send single SCPI commands using Telnet:

1. On the remote PC, click **Start**, then type **cmd** in the **Search programs and files** text field.

2. **Type: telnet <computer name> 5024**
   where <computer name> is the full computer name of the VNA. See how to find the computer name of the VNA.

3. A Telnet window with a **SCPI>** prompt should appear on the remote PC screen.

4. From the SCPI prompt:
   - Type single SCPI commands
   - If an invalid SCPI command is sent, the prompt will disappear. Press **Enter** or **Ctrl C** to recover the SCPI prompt.
   - To exit the telnet window click **X** in the upper-right corner.
   - To get a normal telnet prompt, press **Ctrl │** (closing bracket).
   - To close the normal telnet window, type **Quit** and press **Enter**.

**HiSLIP**

HiSLIP has the same functionality as VXI 11 (SICL) with better performance. Therefore, it is enabled by default on the analyzer.

**Address** 0 by default. No change is necessary.

On the remote computer, use address string TCPIP0::<hostname>::hislip<address>. ("hislip" is case-sensitive).

**Security**

**Enable Remote Drive Access**  When checked allows access to the hard disk. The default is unchecked. When unchecked, hard disk access is blocked and any of the following commands will return an error:

**MMEM:CAT:FILE?**

**MMEM:CAT:STAT?**
Show SCPI Parser Console  Launches a window that is used to send single SCPI/GPIB commands from the analyzer keyboard. This window can also be used to capture the SCPI traffic used over HiSLIP.

- Type a valid command, with appropriate arguments and press enter.
- Use the arrow keys to recall previous commands.

IO Monitor enables monitoring activity on the remote control.

Clicking on the Configure button accesses the IO Monitor Configuration dialog to enable/disable this function.
Enabling the IO monitor provides detailed error message with debug information.

Example of Error message:

- On: -109, "Missing parameter; calc:par:def aaa<Err>
- Off: -109, "Missing parameter"

Disabling the IO monitor increases measurement speed.

Local and Remote Operation

The analyzer LCL and RMT (Local and Remote) operation labels appear in the lower right corner of the status bar.

Note: The status bar is NOT visible when the analyzer is preset. See how to make the status bar visible.

- **LCL** appears when NOT under SCPI control
- **RMT** appears when under SCPI control. The RMT label does NOT appear when under COM control. Remote operation disables the front panel keys except for the Macro/Local key.

To return to Local (front panel) operation, press the Macro / Local key

Sending the GPIB "GTL" (go to local) command also returns the analyzer to Local operation.

Sending the GPIB "LLO" (local lockout) command disables the front panel Local button.
Getting Data from the Analyzer

Data is sent from the analyzer in response to program queries. Data can be short response messages, such as analyzer settings, or large blocks of measurement data. This topic discusses how to read query responses and measurement data from the analyzer in the most efficient manner.

- Response Message Syntax
- Clearing the Output Queue
- Response Data Types
- Transferring Measurement Data

**Note:** Some PCs use a modification of the IEEE floating point formats with the byte order reversed. To reverse the byte order for data transfer into a PC, use the FORMat:BORDER command.

**Other Topics about GPIB Concepts**

**Response Message Syntax**

Responses sent from the analyzer contain data, appropriate punctuation, and message terminators. <NL><^END> is always sent as a response message terminator. Most programming languages handle these terminators transparent to the programmer.

Response messages use commas and semicolons as separators in the following situations:

- a comma separates response data items when a single query command returns multiple values

  ```
  FORM:DATA? 'Query
  ASC, +0 'Analyzer Response
  ```

- a semicolon separates response data when multiple queries are sent within the same messages

  ```
  SENS:FREQ:STAR?;STOP? --Example Query
  +1.2300000000E+08; +7.8900000000E+08<NL><^END> 'Analyzer Response
  ```

**Clearing the Output Queue**
After receiving a query, the analyzer places the response message in its output queue. Your program should read the response immediately after the query is sent. This ensures that the response is not cleared before it is read. The response is cleared when one of the following conditions occur:

- When the query is not properly terminated with an ASCII carriage return character or the GPIB <^END> message.
- When a second program query is sent.
- When a program message is sent that exceeds the length of the input queue
- When a response message generates more response data than fits in the output queue.
- When the analyzer is switched ON.

Response Data Types

The analyzer sends different response data types depending on the parameter being queried. You need to know the type of data that will be returned so that you can declare the appropriate type of variable to accept the data. For more information on declaring variables see your programming language manual. The GPIB Command Finder lists every GPIB command and the return format of data in response to a query. The analyzer returns the following types of data:

- **Numeric Data**
- **Character Data**
- **String Data**
- **Block Data**

**Numeric Data**

All numeric data sent over the GPIB is ASCII character data. Your programming environment may convert the character data to numeric data for you. Boolean data (1 | 0 ) is a type of numeric data.

**Character Data**

Character data consists of ASCII characters grouped together in mnemonics that represent specific analyzer settings. The analyzer always returns the short form of the mnemonic in upper-case alpha characters. Character data looks like string data. Therefore, refer to the GPIB Command Finder to determine the return format for every command that can be queried.

**Example of Character Data**

MLOG
String Data

String data consists of ASCII characters. String parameters can contain virtually any set of ASCII characters. When sending string data to the analyzer, the string must begin with a single quote (') or a double quote (" ) and end with the same character (called the delimiter).

**Note:** The analyzer responds best to all special characters if the string is enclosed in single quotes. If quotes are not used, the analyzer will convert the text to uppercase. The analyzer may not respond as you expect.

The analyzer always encloses data in double quotes when it returns string data.

**Example** of String Data

```
GPIB.Write "DISP:WINDow:TITLe:DATA?"
"This is string response data."
```

Block Data

Block data is used to transfer measurement data. Although the analyzer will accept either definite length blocks or indefinite length blocks, it always returns definite length block data in response to queries unless the specified format is ASCII. The following graphic shows the syntax for definite block data:

```
#  <num_digits>  <byte_count>  data byte  <NL>  <End>
```

<num_digits> specifies how many digits are contained in <byte_count>

<byte_count> specifies how many data bytes will follow in <data bytes>

**Example** of Definite Block Data

```
#210ABCDE+WXYZ<nl><end>
```

Where:

- # - always sent before definite block data
- 2 - specifies that the byte count is two digits (2)
- 10 - specifies the number of data bytes that will follow, not counting <NL><END>
Transferring Measurement Data

Measurement data is blocks of numbers that result from an analyzer measurement. Measurement data is available from various processing arrays within the analyzer. For more information on the analyzer's data processing flow, see Accessing Data Map. Regardless of which measurement array is read, transferring measurement data is done the same.

See an example.

When transferring measurement data, the FORMat:DATA command allows you to choose from the following two data types:

- REAL
- ASCII

The following graphic shows the differences in transfer times between the two:

![Data Transfer Times Graph]

REAL Data

REAL data (also called floating-point data) types transfer faster. This is because REAL data is binary and takes about half the space of ASCII data. The disadvantage of using REAL data is that it requires a header that must be read. See definite length block data. The binary floating-point formats are defined in the IEEE 754-1985 standard. The following choices are available in REAL format:

- **REAL,32** - IEEE 32-bit format - single precision (not supported by HP BASIC)
- **REAL,64** - IEEE 64-bit format - double precision

ASCII Data

The easiest and slowest way to transfer measurement data is to use ASCII data. ASCII data is sent if the
data contains both numbers and characters (the setting of FORMat:DATA is ignored). ASCII data is separated by commas.
Synchronizing the VNA and Controller

Synchronizing the VNA (Vector Network Analyzer) and Controller means to keep VNA and the controller working at approximately the same pace. In this topic:

- The Problem and the Solution
- VNA Queues
- Synchronization Methods
- When To Synchronize the Analyzer and Controller
  - Completion of a Measurement
  - Measurements with External Trigger
  - Averaged Measurements
  - During Calibration Acquire

See Also

- Synchronize an External PSG Source
- Triggering the VNA using SCPI

The Problem

The controller sends commands to the VNA as fast as the bus will allow. The VNA stores these commands in the VNA Input queue. However, the VNA executes those commands at a slower rate than they are accepted. If left unchecked, the VNA input buffer will contain a long list of commands waiting to be executed.

At some point, the controller will send a query command which requires a response from the VNA. The controller will not send more commands until a response is received. It will wait for a response from the VNA for the amount of time set by the Timeout setting. If the VNA is working off a long list of commands in the input buffer, it may not execute and respond to the query command until the controller has quit waiting, or "timed out".

The Solution

The easiest way to keep the controller and the VNA "synched" is to send query commands often. This
stops the controller from sending more commands until the VNA executes and responds to the query. This limits the number of commands that are waiting in the VNA input queue to be processed.

Although any query will stop the controller from sending more commands, a good practice is to send *OPC? Most of the time, as soon as this query is executed, the VNA will immediately reply. The exception to this is the Overlapped command.

- **Sequential** commands are executed quickly and in the order in which they are received.

- **Overlapped** (also known as Asynchronous) commands take longer to execute. Therefore, they allow the VNA to execute other commands while waiting. However, the programmer may want to prevent the analyzer from processing new commands until the overlapped command has completed. If the VNA is executing an overlapped command when a *OPC? is received, it will wait until the overlapped command is complete before processing new commands.

**Note:** The analyzer has two overlapped commands:

- INITiate:IMMediate
- SENSE:SWEep:MODE GROUPS (when INIT:CONT is ON)

Several calibration commands have an optional ASYNcronous argument which allows them to behave like overlapped commands. Learn more.

### Analyzer Queues

Queues are memory buffers that store messages until they can be processed. The analyzer has the following queues:

- **Input Queue**
- **Output Queue**
- **Error Queue**

### Input Queue

The controller sends statements to the analyzer without regard to the amount of time required to execute the statements. The input queue is very large (31k bytes). It temporarily stores commands and queries from the controller until they are read by the analyzer's command parser. The input queue is cleared when the analyzer is switched ON.

### Output Queue

When the analyzer parses a query, the response is placed in the output queue until the controller reads
it. Your program should immediately read the response or it may be cleared from the output queue. The following conditions will clear a query response:

- When a second query is sent before reading the response to the first. This does not apply when multiple queries are sent in the same statement.
- When a program statement is sent that exceeds the length of the input queue.
- When a response statement generates more data than fits in the output queue.
- When the analyzer is switched ON.

**Error Queue**

Each time the analyzer detects an error, it places a message in the error queue. When the `SYSTEM:ERROR?` query is sent, one message is moved from the error queue to the output queue so it can be read by the controller. Error messages are delivered to the output queue in the order they were received. The error queue is cleared when any of the following conditions occur:

- When the analyzer is switched ON.
- When the `*CLS` command is sent to the analyzer.
- When all of the errors are read.

If the error queue overflows, the last error is replaced with a "Queue Overflow" error. The oldest errors remain in the queue and the most recent error is discarded.

**Synchronization Methods**

The following common commands are used to synchronize the analyzer and controller. Examples are included that illustrate the use of each command in a program. See the SCPI command details to determine if a command is an overlapped command.

- `*WAI`
- `*OPC?`
- `*OPC`

**WAI**

The *WAI command:
• **Stops the analyzer** from processing subsequent commands until all overlapped commands are completed.

• **It does NOT stop the controller** from sending commands to this and other devices on the bus. This is the easiest method of synchronization.

**Example** of the *WAI command

```
"ABORT;:INITIATE:IMMEDIATE" 'Restart the measurement.
"CALCULATE:MARKER:SEARCH:MAXIMUM" 'Search for max amplitude.
"CALCULATE:MARKER:X?" 'Which frequency?
```

The following time line shows how the processing times of the three commands relate to each other:

```
ABORT;:INITIATE:IMMEDIATE

CALCULATE:MARKER:MAXIMUM

CALCULATE:MARKER:X?
```

**INITIATE:IMMEDIATE** is an overlapped command. It allows the immediate processing of the sequential command, **CALCULATE:MARKER:SEARCH:MAXIMUM**. However, the **INITIATE:IMMEDIATE** is not considered complete until the measurement is complete. Therefore, the marker searches for maximum amplitude before the measurement completes. **The **CALCULATE:MARKER:X?** query could return an inaccurate value.**

To solve the problem, insert a *WAI command.

```
"ABORT;:INITIATE:IMMEDIATE" 'Restart the measurement.
"*WAI" 'Wait until complete.
"CALCULATE:MARKER:MAXIMUM" 'Search for max amplitude.
"CALCULATE:MARKER:X?" 'Which frequency
```

The time line now looks like this:

```
ABORT;:INITIATE:IMMEDIATE

*WAI

CALCULATE:MARKER:MAXIMUM

CALCULATE:MARKER:X?
```

The **WAI command keeps the MARKER:SEARCH:MAXIMUM from taking place until the measurement is completed. The **CALCULATE:MARKER:X?** query returns the correct value.**
**Note:** Although *WAI stops the analyzer from processing subsequent commands, it does not stop the controller. The controller could send commands to other devices on the bus.

**OPC?**

The *OPC? query stops the controller until all pending commands are completed.

In the following example, the `Read` statement following the *OPC? query will not complete until the analyzer responds, which will not happen until all pending commands have finished. Therefore, the analyzer and other devices receive no subsequent commands. A "1" is placed in the analyzer output queue when the analyzer completes processing an overlapped command. The "1" in the output queue satisfies the `Read` command and the program continues.

**Example of the *OPC? query**

This program determines which frequency contains the maximum amplitude.

```
"ABORT; :INITIATE:IMMEDIATE"! Restart the measurement
"*OPC?" 'Wait until complete
Meas_done = GPIB.Read 'Read output queue, throw away result
"CALCULATE:MARKER:MAX" 'Search for max amplitude
"CALCULATE:MARKER:X?" 'Which frequency?
Marker_x = GPIB.Read
PRINT "MARKER at " & Marker_x & " Hz"
```

**OPC**

The *OPC command allows the analyzer and the controller to process commands while processing the overlapped command.

When the analyzer completes processing an overlapped command, the *OPC command sets bit 0 of the standard event register to 1. This requires polling of status bytes or use of the service request (SRQ) capabilities of your controller. See *Reading the Analyzer's Status Registers* for more information about the standard event status register, generating SRQs, and handling interrupts.

**Note:** Be careful when sending commands to the analyzer between the time you send *OPC and the time you receive the interrupt. Some commands could jeopardize the integrity of your measurement. It also could affect how the instrument responds to the previously sent *OPC.

**Example of polled bit and SRQ processes.**

**When To Synchronize the Analyzer and Controller**

The need to synchronize depends upon the situation in which the overlapped command is executed. The following section describes situations when synchronization is required to ensure a successful
operation.

- Completion of a Measurement
- Measurements with External Trigger
- Averaged Measurements

**Completion of a Measurement**

To synchronize the analyzer and controller to the completion of a measurement, use the \texttt{ABORT; INITIATE; IMMEDIATE} command sequence to initiate the measurement.

This command sequence forces data collection to start (or restart) under the current measurement configuration. A restart sequence, such as \texttt{ABORT; INITIATE; IMMEDIATE} is an overlapped command. It is complete when all operations initiated by that restart command sequence, including the measurement, are finished. The \texttt{*WAI}, \texttt{*OPC?} and \texttt{*OPC} commands allow you to determine when a measurement is complete. This ensures that valid measurement data is available for further processing.

**Measurements with External Trigger**

See Triggering the VNA using SCPI.

**External Triggering**

**Averaged Measurements**

Averaged measurements are complete when the average count is reached. The average count is reached when the specified number of individual measurements is combined into one averaged measurement result. Use synchronization to determine when the average count has been reached.

If the analyzer continues to measure and average the results after the average count is reached, use synchronization to determine when each subsequent measurement is complete.

**During Calibration Acquire**

During a calibration with slow sweep speeds, such as when using a narrow IF bandwidth, you may want to have your program perform other operations, such as checking for the click event of a Cancel button.

To do this, use the optional ASYNchronous argument with the ACQuire command as shown in several calibration example programs. The VNA parser returns immediately while the cal step measurement proceeds. It does NOT block commands and wait for the measurement step to finish. You can send \texttt{*ESR?} or \texttt{*STB?} queries to monitor the status register bytes to see when the OPC (operation complete) bit gets set, which indicates the cal measurement step has finished. Learn more about status registers.
Note: Do NOT issue the *OPC? query when using the ASYN argument. Using the *OPC? query during the ASYN command will cause the program to block immediately. Instead, use the default SYNC argument.

When using the ASYN argument, set the timeout value in the IO settings to at least 5 seconds. There are intervals during the cal acquires when the VNA takes a several seconds to respond to additional commands, such as when the processor is calculating error terms.

The following commands have this argument:

<table>
<thead>
<tr>
<th>Command</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>SENS:CORR:COLL:GUID:ACQuire (Guided Cal)</td>
<td>Guided 2-Port or 4-Port Cal</td>
</tr>
<tr>
<td>SENS:CORR:COLL:ACQuire (Unguided Cal)</td>
<td>Perform Unguided ECAL</td>
</tr>
<tr>
<td></td>
<td>(shows polling loop)</td>
</tr>
</tbody>
</table>

In addition, the SENS:CORR:COLL:GUIDed:INITialize command has this optional argument for long calibration initialization, such as a CalAll calibration.
Calibrating the Analyzer Using SCPI

There are several ways to calibrate the analyzer using SCPI depending on your measurement needs. As from the Cal Wizard, you can perform a Guided Cal, Unguided Cal, or ECal. This topic explains the differences in these calibration choices when using SCPI commands.

- Guided Calibrations
- ECal
- Creating Cal Sets
- Applying Cal Sets and Cal Types
- Uploading Error Terms
- Unguided Cals and Calibration Classes

Note: ALWAYS send ALL measurement setup commands BEFORE initializing a remote calibration.

See Also

Synchronizing the Analyzer and Controller (During a calibration)

See SCPI Calibration Examples

Guided Calibrations

Guided versus Unguided is the style of calibration that is selected on the first page of the Calibration Wizard. A remote 'guided' cal does not present the cal wizard, but prompts for specific standards to be connected. In a remote 'Unguided', the steps must be 'hard-coded'.

- To perform a Guided Calibration, use ONLY Sens:Corr:Coll:Guided commands.

- These commands calibrate the ACTIVE channel. Activate a channel by selecting a measurement on the channel to be calibrated using Calc:Par:Select.

- Full 1,2,3,4-port SOLT and TRL calibrations - No response cals.

- All of the advanced calibration features (Thru method, specify DUT connectors and Cal kits for each port, port pairings).

- A Cal Set is applied to the channel and saved at the completion of a guided cal according to the preference
setting SENS:CORR:PREF:CSET:SAVE

Note: To perform an **Unguided Calibration**, use ONLY the Sens:Corr commands (NOT Guided).

**ECal**

From the Cal Wizard or from a SCPI program, ECal is fast, accurate, and very repeatable. Unlike from the Cal Wizard, you can use SCPI to perform ECal using either the Guided or Unguided commands. The Unguided commands are easiest to use. However, the following situations require that you use the Guided commands.

- To maximize accuracy, all ECal calibrations on the analyzer perform an Unknown Thru measurement of the ECal module Thru state **IF** the analyzer model being used has 1 reference receiver per port. If your analyzer does NOT have 1 reference receiver per port, use Guided ECal commands and specify a Thru method.

- If your ECal module connectors do NOT match the DUT connectors, and you choose not to perform a User Characterization, use Guided ECal commands and specify the Thru method.

**ECAL Notes:**

- When using either Guided or Unguided ECal commands under low power situations, use the Orientation settings. The Guided example shows the use of these commands. When using Unguided, they must appear before the Acquire command.

- The frequency range of the measurement must be within the range of the ECal module. Otherwise, the calibration will fail.

- You do NOT have to send the ECal module state 'switch' commands. The ECal algorithm switches ECal states automatically.

- All of these ECal choices are listed in the Programming Command Finder function in this Help file.

See **Using ECal** to learn about all of the ECal features.

**Creating Cal Sets**

There are several ways to store guided cal data into a unique Cal Set. The following is probably the easiest. It does not require the name of an existing Cal Set and it allows you to name the Cal Set.
Applying Cal Sets and Cal Types

A Cal Set is applied to the channel and saved at the completion of a guided cal according to the preference setting SENS:CORR:PREF:CSET:SAVE.

When you select a Cal Set to apply to an uncalibrated channel, the analyzer attempts to find the most comprehensive calibration type in the Cal Set and turn it ON. In addition, changing a measurement parameter (for example, from S11 to S21) will also initiate an attempt to apply the best Cal Type and turn correction ON.

There may be times when you do not want the most comprehensive Cal Type. For example, say there is a Full 2-port Cal Set applied, but there is only an S11 measurement displayed. If measurement speed is a concern, you can apply a Full 1-Port Cal Type from that same Cal Set and save time by not doing the extra background sweeps. Learn more about background sweeps.

If you change the measurement parameter, the analyzer will reapply the Full 2-Port Cal Type.

See the SCPI and COM commands for Cal Sets and Cal Types.

Uploading Error Terms

Note: There was a method described here for WinCal 3.x that involved a preference setting. That method is no longer supported.

To upload error terms into a created or selected Cal Set:

SENS:CORR:CSET:CREAtE or SENS:CORR:CSET:GUID
SENS:CORR:CSET:Data <term> <port> <port> <data>
SENS:CORR:CSET:SAVE

This method puts error terms into a Cal Set, outside of a Guided or Unguided calibration session.

The Cal Set can then be applied at any time.

See SENS:CORR:CSET commands.
Unguided Cals and Calibration Classes

- Use Sens:Correction commands.
- 1-port, 2-port, Response.
- Can select 2 sets of standards.
- TRL is NOT recommended.

The following describes how to perform an unguided calibration using SCPI. The objective here is to make clear the relationship between the physical port on which a standard is being measured, the actual device in the cal kit, and the SCPI command used to acquire the device.

Calibration standards classes are ‘categories’ of standard types. To perform a 2 port calibration, the cal wizard requires the following types of standards to be measured:

3 reflection standards on the forward port:

- Class S11A typically an open
- Class S11B typically a short
- Class S11C typically a load

Likewise, 3 reflection standards are required for the reverse port:

- Class S22A typically an open
- Class S22B typically a short
- Class S22C typically a load

There is also a transmission standard that is measured in both directions:

- Class S21T typically a thru

The following illustrates the relationship between cal kit physical standards and calibration classes. Here is a list of the physical devices in my calibration kit.

Standard #1 = "3.5 mm male short"
Standard #2 = "3.5 mm male open"
Standard #3 = "3.5 mm male broadband load"
Standard #4 = "Insertable thru standard"
Standard #5 = "3.5 mm male sliding load"
Standard #6 = "3.5 mm male lowband load"
Standard #7 = "3.5 mm female short"
Standard #8 = "female to female characterized thru adapter"
Standard #9 = "0-2 Load"
Standard #10 = "Open"
Standard #11 = "Non-insertable thru"
Standard #12 = "3.5 mm female lowband load"
Standard #13 = "3.5 mm female sliding load"
Standard #14 = "3.5 mm female broadband load"
Standard #15 = "3.5 mm female open"

When you perform a calibration remotely using SCPI, you don’t specify the device number directly. Rather, you specify the class you want to measure. Each device in the calibration kit is assigned to a class. And since more than one device can be assigned to the same class, each class contains an ordered list of devices. The class assignments are set using the Advanced Modify Cal Kit dialog or the SCPI command:

SENS:CORR:COLL:CKIT:ORDER <class>, <std>, <std>, <std>, <std>,<std>,<std>,<std>

The 85052B kit used in the example program has the following standard list for each class: The list was obtained by issuing the corresponding SCPI query:

SENS:CORR:COLL:CKIT:OLIST1? S11A = +2,+15,+0,+0,+0,+0,+0
SENS:CORR:COLL:CKIT:OLIST2? S11B = +1,+7,+0,+0,+0,+0,+0
SENS:CORR:COLL:CKIT:OLIST3? S11C = +6,+5,+3,+12,+13,+14,+0
SENS:CORR:COLL:CKIT:OLIST4? S21T = +4,+8,+0,+0,+0,+0,+0
SENS:CORR:COLL:CKIT:OLIST5? S22A = +2,+15,+0,+0,+0,+0,+0
SENS:CORR:COLL:CKIT:OLIST6? S22B = +1,+7,+0,+0,+0,+0,+0
When you perform the calibration, you acquire data by issuing the `ACQuire` command:

```
SENS:CORR:COLL:ACQ <class>[, <subst> ]
```

For example:

```
SENS:CORR:COLL:SFOR 1

SENS:CORR:COLL:ACQ STANA, SST2
```

The `SFOR` command tells the wizard to make the next acquisition in the forward direction. The `ACQuire` command specifies that we are measuring the 2nd device in the list for STANA. And since we are measuring `SFOR`ward, then STANA refers to class #1 or S11A. The list of devices for this class are specified in the `OLIST1` query above.

Alternately, you could modify the device order for the S11A class to move device #15 into the first position (SENS:CORR:COLL:CKIT:ORDER1). When the desired device is in the first position, you need not specify the order number in the `ACQuire` command. The default is the first device in the `OLIST`. This works well for two port network analyzers where the order for S11A,B,C classes is set up for port 1 and the order for S22A,B,C is set up for port 2. With the kit set up in the proper order, you eliminate the need to specify the substandard number (SST<n>).

See an example: Perform an Unguided 2-port Cal on a 4-port analyzer.
The VNA as a USB Device

The VNA can be controlled as a USB Device using SCPI. This is done through the Keysight I/O Libraries which must be installed on your remote computer.

All data types, especially Binary block data, transfer MUCH faster using USB as compared to GPIB.

To communicate with the VNA as a USB device

1. Connect the VNA to the remote computer using the rear-panel device-side USB connector.
2. The 'Found New Hardware' wizard is launched. Follow the prompts to install the VNA driver software.
3. The Keysight I/O Libraries will recognize the VNA as a Test and Measurement device and show the following dialog.

Note: The VNA is not a USB Mass Storage Device. Therefore, Windows Explorer does NOT recognize it as a USB device. You can NOT use Windows Explorer to transfer files to and from the VNA. or file transfer, use the SCPI command MMEM:TRANsfer.

Alias name  Change this to a name that is easy to recognize. Once configured, use the Alias name to communicate with the USB device using applications such as VISA and SICL:

- VISA: viOpen (...,"UsbDevice1",...)
- **SICL**: `iopen ("UsbDevice1")`

For more information, see the Connectivity Guide in the Keysight I/O libraries.
Reading the Analyzer's Status Register

The VNA has several status registers that your program can read to know when specific events occur. There are two methods of reading the status registers in the analyzer: the Polled Bit method and the Service Request method.

- The Status Registers
- Setting and Reading Bits in Status Registers
- Polled Bit Method
- Service Request Method

See Also

IEE 482 Common commands
Example: Status Reporting
Status Commands

Other Topics about GPIB Concepts

Important Notes:

- A new Limit Line Fail command that makes it easy to determine if Limit Line testing has failed.
- *OPC? can be used to easily determine when a channel has completed a sweep. This requires no interaction with the Status Register system. Most VNA programming examples use *OPC?.
- Most of the Status Register system can NOT be used with the SCPIStringParser Object. However, *OPC? can be used.

The Status Registers

Most of the status registers in the analyzer have sixteen bits. For simplicity, this topic will illustrate their use with 8-bit registers. Bits in registers represent the status of different conditions inside of the analyzer. In the following graphic, a register is represented by a row of boxes; each box represents a bit. Bit 3 is ON.
Each VNA Status Register is actually comprised of the following registers. See an image of the VNA Status registers.

- **Enable Registers** - When using the SRQ method of polling, you first set bits in the enable register which tells the VNA which events to monitor. This is not necessary using the Polled Bit method, as you can only monitor a single event. A *CLS (clear status) command will not clear the enable register. The *ESE and *ESE? commands are used to set and query Enable bits, while *ESR is used to read and clear an Enable register. Learn how to set bits.

- **Condition Registers** - A condition register continuously monitors events in the VNA. Bits in the condition register change real time as conditions occur. These bits are not latched, so this register is used mainly for diagnostic purposes. The registers that only summarize lower level registers do NOT have a condition register.

- **Event Registers** - This is the register that is read to determine if an event has occurred. An event register latches the bits from the corresponding condition register. When an event register bit is set, subsequent changes to the corresponding condition register bit are ignored. The bit remains set until a query command such as *CLS clears the bit. Learn how to read the Event Register.

- **Positive and Negative Transition Registers** - Transition registers control what type of condition register will set the corresponding bit in the event register.
  - **Positive** transitions (0 to 1) are only reported to the event register if the corresponding positive transition bit is set to 1.
  - **Negative** transitions (1 to 0) are only reported to the event register if the corresponding negative transition bit is set to 1.
  - Setting both transition bits to 1 causes both positive and negative transitions to be reported.

Transition registers are read-write and are unaffected by *CLS (clear status) or queries. They are reset to their default settings at power-up and after *RST and SYSTem:PRESet commands. The following are the default settings for the transition registers:

- All Positive Transition registers = 1
- All Negative Transition registers = 0

This means that, by default, the analyzer will latch all event registers on the negative to positive transition (0 to 1).

The following is an example of why you would set transition registers:

A critical measurement requires that you average 10 measurements and then restart averaging. You decide to poll the averaging bit. When averaging is complete, the bit makes a positive transition. After restart, you poll the bit to ensure that it is set back from 1 to 0, a negative
transition. You set the negative transition bit for the averaging register.

### Setting and Reading Bits in Status Registers

Both the Polled-Bit method and Service Request method require that you set and read status register bits. Most of the VNA status registers contain 16 bits, numbered 0 to 15. Each bit has a weighted value. The following example shows how to set the bits in a 8-bit status register.

<table>
<thead>
<tr>
<th>Bit</th>
<th>0</th>
<th>1</th>
<th>2</th>
<th>3</th>
<th>4</th>
<th>5</th>
<th>6</th>
<th>7</th>
</tr>
</thead>
<tbody>
<tr>
<td>Weight</td>
<td>1</td>
<td>2</td>
<td>4</td>
<td>8</td>
<td>16</td>
<td>32</td>
<td>64</td>
<td>128</td>
</tr>
</tbody>
</table>

How to set bits 4 and 5 in the Standard Event Status Enable register:

<table>
<thead>
<tr>
<th>Step</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. Determine the weighted bit value for these weights 16 and 32 (respectively) bits</td>
<td></td>
</tr>
<tr>
<td>2. Add these values together</td>
<td>16 + 32 = 48</td>
</tr>
<tr>
<td>3. Send this number as an argument in the appropriate command. (see Status Commands)</td>
<td>STAT:QUES:LIMIT1:ENAB 48</td>
</tr>
</tbody>
</table>

### The Polled Bit Method

With the Polled Bit Method, your program monitors a bit in the status register that represents the condition of interest to you. When the VNA sets the bit to 1, your program sees it and responds accordingly.

- If your program **periodically** monitors a bit in the status register, it is free to do other things as well. However, your program can respond only as fast as the bit is polled.

- If your program **continually** monitors a bit, it can respond immediately, but will be unavailable to do anything other than poll the bit.

**Advantage:** This method requires very little programming.

**Procedure:**

1. Decide which condition to monitor. The Status Commands topic lists all of the possible conditions that can be monitored in the analyzer.

2. Determine the command to be used to monitor the bit.
3. Determine how often to poll the bit until it is set.

4. Construct the routine to respond when the bit is set.

---

**The Service Request (SRQ) Method**

Your program enables the bits in the status registers representing the condition of interest. When the condition occurs, the VNA actively interrupts your program from whatever it is doing, and an event handler in your program responds accordingly. Do this method if you have several conditions you want to monitor or the conditions are such that it is not practical to wait for the condition to occur.

**Advantage:** This method frees your program to do other things until the condition occurs. The program is interrupted to respond to the condition.

**Disadvantage:** This method can require extensive programming depending on the number and type of conditions that you want to monitor.

**Procedure:**

1. Decide which conditions to monitor. The Status Commands topic lists all of the possible analyzer conditions that can be monitored.

2. Set the enable bits in the **summary** registers and the **status byte** register.

   **Enabling** is like making power available to a light. Without power available, the switch can be activated, but the light won't turn ON. In the analyzer, without first enabling a bit, the condition may occur, but the controller won't see it unless it is enabled.

   The condition, and the bit in the **summary** registers in the reporting path, must be enabled. This is like streams (conditions) flowing into rivers (summary registers), and rivers flowing into the ocean (controller). See the diagram of status registers in Status Commands.

   Bit 6 of the **status byte** register is the only bit that can interrupt the controller. When any representative bit in the status byte register goes ON, bit 6 is automatically switched ON.

3. Enable your program to interrupt the controller. This is done several ways depending on the programming language and GPIB interface card you use. An example program is provided showing how this is done with in Visual Basic with a National Instruments GPIB card.

4. Construct a subroutine to handle the interrupt event. If you are monitoring more than one condition in your system, your event handler must determine which condition caused the interrupt. Use the *SPE command to determine the instrument that caused the interrupt, then poll the summary registers, then poll condition registers to determine the cause of the interrupt.
Referring to Traces, Measurements, Channels, and Windows Using SCPI

Sometimes in a SCPI program you may need to refer to traces that you have not created. This can be a bit confusing in the VNA. Here are the THREE ways to refer to a specific measurement trace.

**Note:** The terms "Trace" and "Measurement" effectively mean the same thing in this discussion.

1. **The Measurement Name** is picked by you when you first create a trace using the `CALCulate<cnum>:PARameter[:DEFine]:EXTended <Mname>,<param>` command. The measurement name is only used by SCPI.

2. **The Trace Number** is also picked by you when ‘feeding’ a newly-created measurement name to a window number using `DISP:WINDow<wmun>:TRACe<tnum>:FEED`. The trace number is used ONLY by SCPI and is mainly used to refer to traces in the DISPlay node. This is NOT the number that appears as Tr# on the screen. While you can assign any Trace number you want, when a measurement is created from the GUI, the VNA assigns numbers to the traces sequentially, starting with one in each window. Therefore, when there is more than one window, these numbers are not unique.

3. **The Tr#** that appears on the VNA screen is the third and most visible way to refer to a trace. Since we already have a "Trace Number", we call this the **Measurement Number** in the VNA Help file. This number is issued sequentially by the VNA regardless of channel and window. It is therefore unique among all traces. Use `CALC<ch>:PAR:MNUM?` just after the trace is created to read the measurement number.

The concept of the **Active measurement** versus **Selected Measurement** is also a bit confusing. As seen on the screen, the Active measurement has the highlighted Tr#. While there can only be ONE active measurement, every channel has a selected measurement. The target measurement must first be selected before most CALC node settings can be made. There are two ways to select a measurement for each channel:

1. Use `CALC<ch>:PAR:SEL <measName>` which requires the channel number and measurement name.
2. Use `CALC<ch>:PAR:MNUM <measNum>` which requires the channel and measurement (Tr) number.

Here are other relevant commands for referring to traces, measurements, channels, and windows:

- `CALC<cnum>:PAR:TNUMber?` - Returns the Trace Number of the selected trace.
- `CALC<cnum>:PAR:WNUMber?` - Returns the window number of the selected trace.
- `SYSTem:ACTive:CHANnel?` - Returns the number of the active channel. The active channel is the channel number that contains the active measurement.
- **SYSTem:ACTive:MEAS?** - Returns the name of the active measurement. As seen on the screen, the Active measurement has the highlighted Tr#.

- **SYSTem:CHANnels:CATalog?** - Returns the channel numbers currently in use.

- **SYSTem:WINDows:CATalog?** - Returns the window numbers that are currently being used.

- **SYSTem:MEAS:CATalog? [chan]** - Returns ALL measurement numbers, or optionally measurement numbers from a specified channel.

- **SYSTem:MEAS<n>:NAME?** - Returns the name of the specified measurement (Tr#) number.

- **SYSTem:MEAS<n>:TRACe?** - Returns the trace number of the specified measurement number.

- **SYSTem:MEAS<n>:WINDow?** - Returns the window number of the specified measurement number.
SCPI Control of USB and GPIB Devices Connected to a VNA

See GPIB Devices below.

USB Devices

The following procedure is the USB equivalent of the VNA "GPIB Pass-Through" feature. This allows you to send SCPI commands from a remote PC to a USB device (such as a USB power sensor) that is connected to the VNA.

The PC must have the Keysight I/O Libraries installed.

1. On the VNA, press Utility, System, System Setup, then Remote Interface...

2. Check SICL Enabled.

3. On your PC, start Keysight Connection Expert which is the wizard for Keysight I/O Libraries.

4. In the dialog, select the Manual Configuration tab.

5. Click Remote USB interface.

6. In the Remote USB Interface dialog (shown above), do EITHER of the following:
6. Select **Hostname**, then enter the Full Computer Name of the VNA.

7. Select **IP address**, then enter the IP address of the VNA.

In the above dialog, the VISA interface ID is **USB1**. Therefore, a VISA program on the PC could send commands to the sensor that is connected to the VNA at the VISA resource string beginning with **USB1::<interface>**.

7. Click the **Accept** button. The **Instruments** tab is selected listing available instruments.

8. Click on the device you want to communicate with (U2000A in this example) then click **Send Commands To This Instrument**.

9. Type a command, then click **Send Command** or **Read Response**.

---

**SCPI Control of GPIB Devices Connected to a VNA**

Access the VNA GPIB System Controller port from your PC as though it were a local GPIB card on your PC.

This allows you to send SCPI commands from a remote PC to a GPIB device such as a Power Meter, that is connected to the VNA.

The PC must have the Keysight I/O Libraries installed.

1. On the VNA, press **Utility**, **System**, **System Setup**, then **Remote Interface**...

2. Check SICL Enabled.

3. On your PC, start Keysight Connection Expert which is the wizard for Keysight I/O Libraries.

4. In the dialog, select the **Manual Configuration** tab.
5. Click **Remote GPIB interface**.

![Remote GPIB interface dialog](image)

In the above dialog, use the default settings EXCEPT where specified here:

- **Interface name on remote host** - Enter ‘gpib0’
- Do **EITHER** of the following:
  - Select **Hostname**, then enter the Full Computer Name of the VNA.
  - Select **IP address**, then enter the IP address of the VNA.
- Click the **Accept** button.

Then access the VNA GPIB System Controller port using the SICL interface ID shown in the dialog (gpib1 in above dialog image).

For example, with a power meter at address 13, you would open a VISA session on the PC to `GPIB1::13::INSTR` and then send commands to it while the device is connected to the VNA Controller port.

**Important:** Close any open VISA session handles to that interface before the VNA controls device.
Configure for SCPI LAN using SICL / VISA

- VNA Supported Interfaces
- Keysight I/O Libraries
- SICL / VISA Programs Running on the VNA
- Configure the VNA for SICL / VISA
- Configure the External Controller

Other Topics about GPIB Concepts

VNA Supported Interfaces

The VNA supports the following interfaces for SICL / VISA communication:

- **LAN** - as a remote GPIB interface. The VNA LAN is presented as a virtual GPIB interface. It does NOT support simple TCPIP-based control. Therefore, when configuring the Keysight IO libraries on your PC, add a REMOTE GPIB interface, which uses the LAN client interface.

- **GPIB** - requires that your external controller have a GPIB card.

**Note:** For optimum LAN interface performance, use COM to control the VNA. SCPI commands can be sent to the VNA using the COM SCPIStringParser object.

The following interfaces are NOT supported:

- **USB**
- **Serial**
Important Note:

To enable VISA or SICL communication over LAN, you must do the following:

1. On the VNA, click **Utility, System, System Setup...**, then select **Remote Interface...**.

2. Check **SICL Enabled**. To automatically enable SICL when the VNA is booted, check **Automatically enable on Startup**.

3. Click **OK**.

The VNA is now ready to be controlled over LAN.

Learn more about this dialog box.

**Keysight I/O Libraries**

The Keysight I/O libraries includes the drivers to allow you to communicate with Keysight test instruments. Every VNA is shipped with the Keysight I/O libraries installed. We recommend you do NOT upgrade the Keysight I/O libraries on the VNA as unexpected results may occur. If you choose to upgrade the Keysight I/O libraries on the VNA, do NOT change the default folder path in the InstallShield Wizard.

To communicate with the VNA, the Keysight I/O libraries must also be installed on your external controller. To purchase the Keysight I/O libraries, or download a free upgrade, go to [www.Keysight.com](http://www.Keysight.com) and search for IO Libraries. Scroll to find Software, Firmware & Drivers.

**SICL / VISA Programs Running on the VNA**

You can run your SICL / VISA program on the VNA to control the VNA. Although the Keysight I/O libraries are already installed on the VNA, it is configured as the **Host**. You must also configure a SICL or VISA LAN **Client** interface on the VNA, specifying the LAN hostname of that same VNA.

If your program uses the COM interface to VISA, and is compiled on a PC with the Keysight IO Libraries Suite (version 14 or later), and the resulting executable is copied and run on the VNA, it will produce a “type mismatch error”. This is because the VNA has the ‘M’ version of Keysight I/O libraries. The following Visual Basic code is an example of how to avoid this error when communicating with the VNA from within the VNA:

```vbnet
Dim rm As IResourceManager
Dim fmio As IFormattedIO488
Set rm = CreateObject("AgilentRM.SRMCls")
```
Controlling the VNA over LAN while controlling other instruments over GPIB

The VNA can NOT be both a controller and talker/listener on the same GPIB bus. Using SICL / VISA, you can use LAN to control the VNA, leaving the VNA free to use the rear-panel GPIB interface to control other GPIB devices.

Configure the VNA for SICL / VISA

1. Open the Keysight Connection Expert.

2. Select each GPIB Interface and verify (or make) the default settings in the following table. These settings are REQUIRED when using a 82357A USB / GPIB Interface with the VNA.

3. When complete, click Accept to close the Keysight Connection Expert.

<table>

Configure the External Controller

Please refer to the Keysight I/O libraries documentation to learn how to configure your controller to communicate with the VNA. These links can show you how to find the following VNA information:

- VNA full computer name
- GPIB Address
- IP Address

This example program can help test your VISA configuration.
Beginning in Dec. 2005, Keysight VEE Pro RunTime is installed on new VNAs. This means that programs written with Keysight VEE (.vxe files) can be run directly on the VNA.

VNAs without Keysight VEE installed can go to the Keysight VEE website and download Keysight VEE Pro 6.2 RunTime to the VNA and begin to run VEE programs directly on the VNA. This version does not require Keysight I/O Libraries suite 14. Do NOT upgrade to Keysight I/O libraries suite 14 on the VNA.

With Keysight VEE Pro RunTime installed on the VNA, the following examples can be run directly on the VNA:

- Basic Control of the VNA

For more VEE examples, see the PNA support website.

For more information on Keysight VEE, see www.Keysight.com/find/VEE
This VEE Pro 6.0 example does the following:

- Controls VNA windows and traces.
- Changes stimulus settings.
- Measures all four S parameters.
- Create markers and displays marker readout.

If this Help file is on a VNA and VEE Pro RunTime is installed, then:

1. Run the BasicControl.vxe example

2. Then click Open on the following dialog box to run the program.

Otherwise, you can modify the example program using VEE, save the VEE BasicControl.vee

Learn how to run this program as a Macro on the VNA.

The following dialog box will be visible on the VNA when the example program is running.

- Click Fwd to activate the Forward (S11 and S21) measurements.
- Click **Rev** to activate the Reverse (S22 and S12) measurements.
- Click **Update Markers** to sweep the VNA.
- Type values to change Marker Frequencies.
ECal with Confidence Check using VEE

This VEE Pro 6.0 example performs an ECal and subsequent ECal confidence Check.

If this Help file is on a VNA and VEE Pro RunTime is installed:

- Run the .vxe example
- Then click Open on the following dialog box to run the program.

Or to modify the example program using VEE, save the VEE BasicControl.vee

Learn how to run this program as a Macro on the VNA.

The following dialog box will be visible on the VNA when the example program is running.

- Click Fwd to activate the Forward (S11 and S21) measurements.
- Click Rev to activate the Reverse (S22 and S12) measurements.
- Click Update Markers to sweep the VNA.
- Type values to change Marker Frequencies.
Interface Control

The Interface Control feature allows you to send remote commands and data to the following VNA rear-panel Interfaces: GPIB, Material Handler I/O, Test Set I/O, and Auxiliary I/O.

- Overview
- How to Access Interface Control Settings
- Interface Control Dialog Box
- Z5623A H08 Test Set Commands

Other System Configuration Topics

Overview

The Interface Control feature allows you to send data to control external equipment such as GPIB instruments, a material handler, test set, or other equipment, without needing to create a remote program. The VNA manages the timing and required interface setup. See Rear Panel Tour.

- A unique set of control data can be sent for each channel. In addition, a unique set of control data can be sent before the channel sweep starts, and after the sweep ends.
- Interface Control settings can be saved and recalled from the Interface Control dialog box, or with Instrument State Save and Recall.
- Interface Control settings can be copied to other channels using Copy Channels.
- Control data can only be WRITTEN to the interfaces, NOT READ from the interfaces.
- Control data is sent in the following order. This order cannot be changed.

1. GPIB Interface
2. Material Handler Interface
3. Test Set Interface
4. Aux Interface
5. Dwell Time
How to access Interface Control settings

Using Hardkey/SoftTab/Softkey

1. Press Setup > Internal Hardware > Interface Control...

Using a mouse

1. Click Instrument
2. Select Setup
3. Select Internal Hardware
4. Select Interface Control...

Interface Control dialog box help

GPIB and VISA Commands

Notes:

- GPIB instruments CAN be connected to the VNA using a USB/GPIB adapter.
- Any type of interface (LAN, USB, GPIB) is available through the VISA connection string.
- GPIB/VISA Queries are NOT supported. Commands can be sent only.

Enable Control  Enables and disables sending commands out the GPIB or VISA interface.

Multi-line edit control  Each line contains a GPIB or VISA command using the following syntax:

```
address  command
```

Where:

address

- A number between 0 and 31. The VNA will look through all of the GPIB interfaces for an instrument connected to the specified address. If an instrument with that address is not recognized, an error is returned.

- A valid VISA connection string.
**command**: a SCPI command, with or without enclosing quotes. Enclosing quotes are ignored.

Address and command are separated by at least one space.

Commands should be separated by a new line, or carriage return. For example:

```
19 "init:cont off"
16 init:imm
```

```
TCPIP0::141.121.78.100::inst0::INSTR outp:ON
```

The front-panel **Enter** key inserts a new line into the field.

The number of GPIB/VISA commands that can be entered is limited only by the available memory of the VNA.

See [Z5326A H08 Test Set Commands](#).

**Material Handler I/O**

**Enable Control**: Enables and disables sending data out the **Material Handler I/O connector** (PNA), **Handler IO Connector (ENA)**

**Ports A, B, C, D**: Sends values to the respective Handler I/O port. Although ports C and D are normally bidirectional, ONLY Output mode is allowed using the Interface Control feature. It cannot read from these, or any other, ports.

**Test Set I/O**

Note: The VNA has a separate interface for **controlling the E5091A Test Set**.

**Enable Control**: Enables and disables sending data out the **External Test Set I/O connector**.

**Multi-line edit control**: Each line contains a Write command using the following syntax:

```
address.value
```

Where:

- **address**: any positive integer.
- **value**: numeric character. Entries that require **alpha** characters should use the **GPIB**
Address and value are separated by a period. For example:

```
18.2
27.3
```

Entries should be separated by a new line, or carriage return. The VNA front-panel Enter key inserts a new line into the field.

All entries are sent out the Test Set I/O port using the WriteData Method.

The number of entries is limited only by the available memory of the VNA.

**Aux I/O Output Voltage**

**Note:** The 9-pin PWR I/O (Power I/O) D connector on the rear-panel replaces much of the functionality of the AUX I/O connector on older VNA models. The Power I/O voltages can be set using the following methods:

- `CONTrol:AUXiliary:OUTPut:VOLTage` or `put_OutputVoltage Method` (no GUI equivalent, global scoped, and settings not saved as part of the instrument state)
- `SOURce:DC:START` and `SOURce:DC:STOP` (DC Source dialog is the GUI equivalent, channel scoped, and settings saved as part of the instrument state)
- Interface Control dialog (no remote equivalent, channel scoped, and settings saved as part of the instrument state)

To avoid unexpected behavior, choose one method only to set the Power I/O voltages.

**Enable Control** Enables and disables sending data out the Auxiliary I/O connector.

**DAC1, DAC2** Sets voltages on the Aux I/O connector pins 2 (DAC1) and pin 3 (DAC2).

**Dwell After Command** Specifies a wait time, in milliseconds, after all commands to all interfaces are sent. Any positive integer is allowed. This is used to allow all external devices to settle before beginning a measurement. An erratic trace could indicate that more settling time is necessary.

**Reset All** Sets ALL fields on ALL channels to their default values.

**Save and Recall** Saves and recalls the contents of this dialog box. If the Interface Control dialog box is populated with settings during an Instrument State Save, the settings are automatically recalled with the Instrument State settings.

Interface control uses an *.xml file type. An example file is stored on the VNA hard drive. You can recall it into the dialog, or you can open and edit it with a word processor, such as Word Pad.
OK  Applies the settings and closes the dialog box.

Cancel  Does not apply changes that were made, and closes the dialog box.

Z5623A H08 Test Set Commands

The following table lists the commands that are used to control the popular Keysight Z5623A H08 Test Set. These commands can be entered into the GPIB Interface control.

External Test Set I/O Connector

General Description

This DB-25 female connector is used to control external test sets. The external test set bus consists of 13 multiplexed address and data lines, three control lines, and an open-collector interrupt line. The Test Set IO is not compatible with the 8753 test sets.

You can change the settings on the External Test Set IO connector through SCPI and COM programming commands. The settings are NOT accessible through the front-panel keys or display menu.

Notes:

- The External Test Set pin settings are NOT affected by Instrument State Save/Recall or Instrument Preset.
- At VNA Power Up and return from Hibernation, the External Test Set bus data lines, address lines, and control lines are set HIGH, and no strobe lines are pulsed.

Caution: Do not mistake this connector with a Parallel Printer port. A printer may be damaged if connected to this port.

**SEL0-SEL3 (pins 1,15,16,18)**

**Description**

Selects addresses of test sets that are "daisy chained" to this port. The select code is set to zero at the VNA connector and is incremented by one as it goes through each successive external test set. Therefore, the first test set in the chain has address zero and so on, for up to 16 test sets.

**HW Details**
Connected to ground inside the VNA.

**Timing**

None

---

**Sweep Holdoff In (pin 2)**

**Description**

Input line used by the test set for holding off a sweep. Holding off a sweep is one way of introducing a delay that allows an external device to settle before the VNA starts taking data. You must write a program that will query the line and perform the delay. The program needs to query the line and keep VNA from sweeping while the line remains low. When a subsequent query detects that the line went high the program would then trigger the VNA to start the sweep.

Use either Single or External trigger mode to control the VNA sweep.

**HW Details**

This pin has a series 215-ohms resistor followed by 4.7k-ohm pull-up and then an "ABT" TTL buffered register.

**Timing**

This input is not latched by the VNA hardware. Therefore the input level must be held at the desired state by the test set until it's read by your program.

---

**AD0-AD12 (pins 3-6, 9-11, 17, 19-23)**

**Description**

Thirteen lines are used to output data addresses or input / output data. Several SCPI and COM commands are available for reading and writing to these lines. You can choose to use commands where the VNA provides the appropriate timing signals needed for strobing the addresses and data. Or you can choose to control the timing signal directly. The timing signals are RLW, LAS and LDS. If you decide to do direct control refer to the corresponding SCPI and COM command details. Close attention to detail is needed to insure the desired results.

After a write command, lines AD0-AD12 are left in the state they were programmed. Default setting for Mode is Read / Input).

After a read command, lines AD0-AD12 are left in input mode. While in this mode an external test set attached to the IO is free to set the level on each line.

**HW Details**
Each of these I/O pins has a series 215-ohm resistor followed by 4.7k-ohm pull-up resistor.

Write/Read is implemented by an output tri-state TTL buffer / latch for latching and enabling write data in parallel with a TTL input buffer for reading.

**Timing**

Output Address and data setup and hold times are 1us minimum.

---

**Address & Data I/O Write**

---

**Address & Data I/O Read** - Data must be valid for 1us before and after strobe

---

**GND (pins 7, 12)**

**Description**

Two ground pins used as ground references by the test set.

**HW Details**

Connected to digital ground.

**Timing**

None.
LAS (Low Address Strobe) (pin 8)

Description

This line has two behaviors that are command dependent. Refer to the SCPI and COM commands for further details.

In one behavior LAS is one of the lines used by the VNA to provide appropriate timing for writing Address and Data to the Test Set. In this case LAS is controlled automatically by the VNA and is intended to be used as the strobe for the Address. When LAS is low, lines AD0 - AD12 represent the Address. LAS will return to its normally high state when the transaction is finished.

In the second behavior the VNA will NOT provide appropriate timing. In this case LAS is controlled directly by the user through a SCPI or COM command. When the transaction is finished LAS is left set to the state it was programmed to until another command changes it. (Default for LAS is TTL High).

HW Details

This output pin is driven by a TTL latched buffer with a series 215-ohm resistor followed by 2.15k-ohm pull-up.

Timing

Strobe length, setup and hold times are all 1us minimum.

See the description for AD0-AD12 for more timing information.

Interrupt In (pin 13)

Description

Query this line with a SCPI or COM command.

HW Details

This line is a non-latched TTL input, has series 215-ohms followed by 4.64k-ohm pull-up.

Timing

The Test Set must maintain at the desired TTL level until its read.

(pin 14) No Connect (previously +22V)

WARNING: Early versions of the VNA had +22v on this pin. Connecting a printer to this port will usually damage the printer.

Description
+22V, 100mA max. The 25-pin D connector is the same as a computer parallel printer port connector. Pin (14) corresponds to a printer's "autofeed" line. **Connecting a printer to this port will damage the printer if +22v is present** since printers requires less than 5V on all control lines.

**HW Details**

No connect

**Timing**

None

---

**LDS (Low Data Strobe) (pin 24)**

**Description**

This line has two behaviors that are command dependent. Refer to the External Test Set IO SCPI and COM commands for further details. (Default setting for LDS is TTL High)

In one behavior LDS is one of lines used by the VNA to provide appropriate timing for writing Address and Data to the Test Set. In this case LDS is controlled automatically by the VNA and is intended to be used as the strobe for the Data. When LDS is low, lines AD0 - AD12 represents Data. LDS will return to its normally high state when the transaction is finished.

In the second behavior the VNA will NOT provide appropriate timing. In this case LDS is controlled directly by the user through a SCPI or COM command. When the transaction is finished the LDS is left set to the state it was programmed to.

**HW Details**

This output pin is driven by a TTL latched buffer with a series 215-ohm resistor followed by 2.15k-ohm pull-up.

**Timing**

Strobe length, setup and hold times are all 1us minimum.

See the description for **AD0-AD12** for more timing information.

---

**RLW (pin 25)**

**Description**

This line is the output for the Read Write signal. It has two behaviors that are command dependent. Refer to the External Test Set IO SCPI and COM commands for further details. (Default setting for RLW is TTL High)

In one behavior RWL is controlled automatically by the VNA during a Read Write operation. When RLW is low, lines AD0 - AD12 represent output Data. When RLW is high, the lines represent input Data.

In the second behavior the VNA does NOT provide the timing. The user must control it directly through the SCPI or COM command. In this case the line is left set to the state it was programmed to.

**HW Details**

This pin is a TTL latched output with a series 215-ohm resistor followed by 2.15k-ohm pull-up resistor.
Timing

Strobe length, setup and hold times are all 1us minimum.

See the description for AD0-AD12 for more timing information.
Material Handler I/O Connector

This rectangular 36-pin female connector provides communication signals between the VNA and a material parts handler. You can change the settings on the Material Handler IO connector using SCPI and COM commands. The settings are NOT accessible through the front-panel keys or display menu.

- Overview - Controlling a Material Handler
- Pin Assignments
- Pin Descriptions
- Timing Diagrams
- Input Output Electrical Characteristics

Note: On early VNAs this connector is labeled "GPIO". It is covered to indicate that the connector is not functional.

Overview - Controlling a Material Handler

The VNA is capable of interacting with an external material handler or part handler. This allows the VNA to be used in an automated test environment, where devices to be tested are inserted into a test fixture by a part handler, and sorted into pass/fail bins by the handler after testing is complete. By connecting the part handler to the VNA Auxiliary or Material Handler I/O ports, the VNA and part handler can synchronize their activities in a way that makes automated testing possible.

VNA and Part Handler Preparation

1. **Define the measurements** you want to make.

2. **Define limits** for each of the measurements.

3. Configure the VNAs Material Handler port so that it is compatible with your part handler. This usually involves setting the handler logic, pass/fail logic, pass/fail scope, and pass/fail mode. These settings are made remotely using SCPI or COM commands.

4. Use a cable to connect the VNA to your part handler.

5. Put the VNA in **External Trigger** mode.
6. Load parts in handler per manufacturer instructions.

**Note:** The Material Handler configuration settings REMAIN after an Instrument Preset. The settings will revert to their default settings ONLY after the VNA is restarted, or until they are changed by you. Material Handler settings are saved and recalled with Instrument State.

**Flow Diagram**

The following diagram and descriptions summarizes the events that occur during automated testing. 'DUT' refers to Device Under Test.

### Text Descriptions

**0.** (Optional). The VNA sends values out the Material Handler to configure external instruments. The A,B,C, and D ports of the Material Handler can be used to control devices used in testing, such as step attenuators, part handlers, or even the DUT itself. Also, the DAC1 and DAC2 lines on the Power I/O connector can be used to provide bias voltages for devices and instruments. If you wish to use the Material Handler for testing, you will need to write a program to send values out the various lines and ports, as there is no activity on these lines by default.

**1.** The part handler receives a **Ready for Trigger** signal from the VNA. This indicates that the VNA is properly configured and ready to take a measurement.

**2.** The part handler sends an **External Trigger** signal to the VNA. This signals that the part handler has settled, and allows the VNA to begin taking measurements.
3. The VNA takes measurements on all triggerable channels.

4. The Index line on the material handler goes to a Low state (default), which means that all required data has been collected by the VNA.

5. The part handler removes the DUT from the test fixture, and inserts a new DUT into the fixture. This operation is often referred to as part handler indexing. The device just tested is staged (removed from the fixture and prepared for binning), and the next part to be tested is put into the fixture. The removed DUT cannot be assigned to a Pass/Fail bin yet, as the Pass/Fail status is not available.

6. The VNA sends the Pass/Fail Status.

7. The VNA sends the Pass/Fail Strobe meaning that the Pass/Fail status has been determined.

8. The part handler reads the Pass/Fail Status line.

9. The part handler bins the staged part based on the Pass/Fail Status.

10. The test process repeats at step 1, waiting for Ready for Trigger from the VNA.

Pin Descriptions

**Input1**

When this Input line receives a Low pulse from the material handler, data is latched on the OUTPUT1 and OUTPUT2 lines. See OUTPUT1|2 Data Output Write Timing

The Input Line activity can be read:

```
SCPI
CONTrol:HANDler:INPut?
```

**Output1, Output2**

See OUTPUT1|2 Data Output Write Timing

The current state of these latched TTL outputs may be set High or Low (Default setting) using the (non-user) SCPI put_Output (COM) commands.

The next state (following a negative edge on the INPUT1 line) may be pre-loaded to High or Low (Default setting) using the user commands.

For example, on the next negative pulse on the INPUT1 line, you want the OUTPUT1 line to go from 0 to 1. To do this:

```
CONT:HAND:OUTP1:DATA 0  'Force the OUTPUT1 line to 0
CONT:HAND:OUTP1:USER 1  'Set the OUTPUT1:USER buffer to 1, indicating the next state
```

Write User Data
Read last value written
Write non-user data
Read last value written
**Output Ports A and B**

These two general purpose, 8-bit output ports are used to write data to the material handler. When any line changes state, all output lines are latched to the I/O connector as the **Output Write Strobe** goes Low.

The default state for data is Low.

**See Data Output Write Timing Diagram**

**Set Port Logic:**

The logic for the data lines can be set to either: Positive (1 = High) or Negative (1 = Low). This setting affects all data ports. They cannot be set independently.

```
SCPI
CONTrol:HANDler:LOGic

COM
PortLogic Property
```

**Combine to read or write data to Port F:**

Ports A and B can be virtually combined to write data to one 16-bit I/O port **F**.

```
SCPI
CONTrol:HANDler:F <num>

COM
put Port (F)
```

---

**Input/Output Ports C and D**

These two general purpose 4-bit Input/Output ports are used to write data (Output) or read data (Input). These lines could be used to write to an external device such as a step attenuator.

When any line changes state, all output lines are latched to the I/O connector as the **Output Write Strobe** goes Low. **See Data Output Write Timing.**

**Set Input | Output Mode:**

Each port may be independently defined as Output or Input.

```
SCPI
CONTrol:HANDler:C:MODE

COM
PortMode Property
```
Set Port Logic:

The logic for the data lines can be set to either: Positive (1 = High) or Negative (1 = Low). This setting affects all data ports. They cannot be set independently.

Read or write data:

Ports C and D can be virtually combined to read or write data to one 8-bit I/O port \( E \). When combined, both C and D ports must be set to either INPUT or OUTPUT mode.

Port C Status, Port D Status

These two output lines indicate the Read / Write mode of the C and D ports.

- A Low level indicates that the associated port is in \textbf{INPUT} mode (read only).
- A High level indicates that the associated port is in \textbf{OUTPUT} mode (write only).

These logic of these status outputs cannot be changed.

See Input/Output Ports C and D to learn how to set I/O Mode

See Data Output Write Timing
**Output Port Write Strobe**

This Output line goes Low to write data from Ports A and B and Ports C and D when a change is detected on any of the data lines.

These logic of this strobe output cannot be changed.

See Data Output Write Timing

**External Trigger**

When trigger source is set to external, this Input line accepts a trigger signal from the material handler. This usually means that a part is in place and ready to be tested.

See Trigger Timing Diagram

**Index**

A Low signal (default) on this Output line indicates to the material handler that the measurement is complete. This usually means that the handler can connect the next device. However, measurement data is not available until data is calculated. See Trigger Timing Diagram.

**Set Function:**

This line also serves as a data line. Set the function using the following commands:

<table>
<thead>
<tr>
<th>SCPI</th>
<th>COM</th>
</tr>
</thead>
<tbody>
<tr>
<td>CONTrol:HANDler:INDex:STATe</td>
<td>IndexState</td>
</tr>
</tbody>
</table>
### Ready for Trigger

When this output line goes low (default), it indicates to the material handler that the VNA is ready for a trigger signal.

**See Trigger Timing Diagram**

**See Pass/Fail Timing Diagram**

**Set Function:**

This line also serves as a data line. Set the function using the following commands:

```
SCPI
CONTrol:HANDler:RTTrigger:STATe
```

### Pass/Fail State

This Output line indicates to the handler whether the limit test has passed or failed.

Pass/Fail state is valid only when the limit test function is ON and while Pass/Fail strobe line is Low. **See Pass/Fail Timing Diagram**

**Set Pass / Fail Logic:**

- Positive Logic: High=Pass, Low=Fail. (Default setting)
- Negative Logic: High=Fail, Low=Pass.

```
SCPI
CONTrol:HANDler:PASSfail:LOGic
```

### Set Default Conditions:

- **PASS** - the line stays in PASS state. When a device fails, then the line goes to fail after the Sweep End line is asserted.

- **FAIL** - the line stays in FAIL state. When a device passes, then the line goes to PASS state after the Sweep End line is asserted.

- **No Wait** - the line stays in PASS state. When a device fails, then the line goes to fail IMMEDIATELY. (Default setting)
Set Pass / Fail Scope:

- **Channel scope**: The line resets to the default state after the measurements on a channel have completed.
- **Global scope**: The line resets to the default state after the measurements on all triggerable channels have completed. (Default setting)

### Pass/Fail Write Strobe

A Low pulse indicates that **Pass/Fail** line is valid and the Pass / Fail State is output to the material handler.

The Pass/Fail Strobe is fixed in duration and timing. However, when the strobe occurs depends on the Pass/Fail Mode and Pass/Fail Scope (Channel or Global) settings. [See Pass/Fail State](#)

[See Pass/Fail Timing Diagram](#)

### +5V

+5V nominal output (100mA max).

Protected by self-healing fuse.
**Sweep End**

This output line indicates the status of the VNA sweep. The sweep includes sweeping the source and taking data.

- **Low** (falling edge) indicates that the specified sweep event has finished. This does NOT indicate that all calculations have finished.

- **High** indicates that the specified sweep event is active.

**See Trigger Timing Diagram**

**Set Sweep Event Mode:**

- **Sweep**: indicates that a single source sweep has finished.

- **Channel**: indicates that a single channel has finished.

- **Global**: indicates that all enabled channels have finished. (Default setting)

```
SCPI
 CONTol:HANDler:SWEepend

COM
 SweepEndMode Property
```

**Timing Diagrams**

**Trigger Timing**

![Trigger Timing Diagram](image)

- **T1**: External Trigger (to VNA)
- **T2**: Index (from VNA) meas. complete
- **Sweep End**: (from VNA) sweep complete
- **Ready for Trigger**: (from VNA)
All signals are active low.

**T1 = 1 \mu s**  External Trigger pulse width

**T2 > 10 \mu s** Sweep End pulse width (both High and Low)

---

### Pass / Fail Timing

- **Pass / Fail Status**
- **/ Pass / Fail Write Strobe**
- **/ Ready for Trigger**

---

**T1 = 1 \mu s**  Pulse width and response time of Pass / Fail Strobe

---

### Ports A-F(H) Data Output Write Timing

- **Ports A-F (H) any data line changing level**
- **/ Write Strobe**

---

**T1 = 1 \mu s**  Write Strobe response time

**T2 = 1 \mu s**  Write Strobe pulse width
OUTPUT1|2 Data Output Write Timing

The old state to new state transition can be either low to high (as shown) or high to low.

\[ T_1 = 0.6 \, \mu s \]  Output1|2 response time

\[ T_2 = 1 \, \mu s \]  Input1 Strobe pulse width

Input / Output Electrical Characteristics

All Material Handler I/O Input and Output lines are TTL compatible.

Input and Input/Output lines

Lines carrying information IN (or bidirectional) to the VNA from the material handler.

<table>
<thead>
<tr>
<th>Maximum Input Voltages:</th>
<th>-0.5 V to 5.5 V</th>
</tr>
</thead>
<tbody>
<tr>
<td>TTL High level:</td>
<td>2.0 V to 5.0 V</td>
</tr>
<tr>
<td>TTL Low level:</td>
<td>0 V to 0.5 V</td>
</tr>
</tbody>
</table>

Output Lines

Lines carrying information OUT of the VNA to the material handler.

<table>
<thead>
<tr>
<th>Output Current</th>
<th>Maximum Output Current:</th>
<th>-10 mA to 10 mA</th>
</tr>
</thead>
<tbody>
<tr>

See Pulse SCPI and COM commands

N1966A Pulse I/O Adapter
This D connector to RF adapter makes accessing the Pulse I/O connector more convenient.
Power I/O Connector

The 9-pin D connector replaces much of the functionality of the AUX I/O connector on older VNA models. See Rear Panel

New Programming Commands

The following are new programming commands for VNA release A.15.40.xx/A.15.50.xx See What's New.

<table>
<thead>
<tr>
<th>X- and Y-Axis Commands</th>
<th>SCPI</th>
<th>COM</th>
</tr>
</thead>
<tbody>
<tr>
<td>Returns the current units of the X-axis.</td>
<td>CALCulate:MEASure:X:AXIS:UNIT?</td>
<td>None</td>
</tr>
<tr>
<td>Returns the current units of the Y-axis,</td>
<td>CALCulate:MEASure:Y:AXIS:UNIT?</td>
<td>None</td>
</tr>
<tr>
<td>Returns the Y-axis values for the selected measurement in the current units.</td>
<td>CALCulate:MEASure:Y[:VALues]?</td>
<td>None</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Misc. Commands</th>
<th>SCPI</th>
<th>COM</th>
</tr>
</thead>
<tbody>
<tr>
<td>Returns the current state of the Modify setting (NONE, NREFlect, or NXTalk).</td>
<td>CALCulate:FSIMulator:CIRCuit:FILE:MODify?</td>
<td>None</td>
</tr>
<tr>
<td>Sets all reflection and crosstalk parameters on the DUT side to zero.</td>
<td>CALCulate:FSIMulator:DRAFt:CIRCuit:FILE:MODify</td>
<td>None</td>
</tr>
<tr>
<td>Returns TRUE if user is only using legacy SCPI fixture commands.</td>
<td>CALCulate:FSIMulator:LEGacy?</td>
<td>None</td>
</tr>
<tr>
<td>Sets and returns the Primary Clock setting and is controlled by the internal or external pulse generator which is the primary system clock.</td>
<td>SENSE:SWEep:PULSe:PRIMary:CLOCk</td>
<td>None</td>
</tr>
</tbody>
</table>
Returns whether or not the **Enable Remote Drive Access** is checked in the Remote Interface dialog.

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
<th>Command</th>
<th>Status</th>
</tr>
</thead>
<tbody>
<tr>
<td>SYSTem:COMMunicate:DRIVe:ENABle?</td>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The following are new programming commands for VNA release A.15.30.xx See What's New.

**Fixturing Power Compensation Command**

Adjust the source power compensation for gain/loss through “ALL” fixture components or through “DEEMbed” components only.

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
<th>Command</th>
<th>Status</th>
</tr>
</thead>
<tbody>
<tr>
<td>CALCulate:FSIMulator:POWer:COMPensate:MODE</td>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Licensing Command**

Enables/disables showing the licensed features dialog on startup.

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
<th>Command</th>
<th>Status</th>
</tr>
</thead>
<tbody>
<tr>
<td>SYSTem:PREFerences:ITEM:DIALog:SHOW:LIcense</td>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Shared Memory Data Transfer Commands**

Closes the specified memory mapped buffer.

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
<th>Command</th>
<th>Status</th>
</tr>
</thead>
<tbody>
<tr>
<td>SYSTem:DATA:MEMory:CLOSe</td>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Closes the specified memory file.

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
<th>Command</th>
<th>Status</th>
</tr>
</thead>
<tbody>
<tr>
<td>SYSTem:DATA:MEMory:CLOSe:FILE</td>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Creates the memory buffer and saves the buffer to a file.

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
<th>Command</th>
<th>Status</th>
</tr>
</thead>
<tbody>
<tr>
<td>SYSTem:DATA:MEMory:COMMit:FILE</td>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

This command resets the current repeat index to 0.

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
<th>Command</th>
<th>Status</th>
</tr>
</thead>
<tbody>
<tr>
<td>SYSTem:DATA:MEMory:REPeat:RESet</td>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
### TOPology Commands

<table>
<thead>
<tr>
<th>Description</th>
<th>Command</th>
<th>Parameter</th>
</tr>
</thead>
<tbody>
<tr>
<td>Saves the current active fixture topology to a file.</td>
<td>CALCulate:FSIMulator:TOPology:SAVE</td>
<td>None</td>
</tr>
<tr>
<td>Loads an active fixture topology file.</td>
<td>CALCulate:FSIMulator:TOPology:LOAD</td>
<td>None</td>
</tr>
</tbody>
</table>

### Misc. Commands

<table>
<thead>
<tr>
<th>Description</th>
<th>Command</th>
<th>Parameter</th>
</tr>
</thead>
<tbody>
<tr>
<td>This query compares the stimulus of &quot;chanNumber&quot; with the stimulus stored in the specified calset.</td>
<td>CSET:VALIDate?</td>
<td>None</td>
</tr>
<tr>
<td>Enable/disable using existing source power calibration array when acquiring calibration standard data:</td>
<td>SENSe:CORRection:COLLect:GUIDed:PCAL:APPLy</td>
<td>None</td>
</tr>
<tr>
<td>Selects between a small- and medium-sized font displayed below the trace area of the display.</td>
<td>SENSe:DISTortion:TABLE:DISPLAY:FONT</td>
<td>None</td>
</tr>
<tr>
<td>Returns the ID string, and optionally visa address, of power meters / sensors that are connected to the VNA via GPIB.</td>
<td>SYStem:COMMunicate:GPIB:PMETer:CATalog?</td>
<td>None</td>
</tr>
</tbody>
</table>

The following are new programming commands for VNA release A.15.05.xx See What's New.
### GCA/GCX Phase Commands
Remaps the source port to Port 1.

<table>
<thead>
<tr>
<th>Command</th>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SENSE:GCSetup:PMAP:SOURce:OVERride</td>
<td>None</td>
<td>None</td>
</tr>
</tbody>
</table>

### Misc. Commands
Returns the time the first point of a Time Sweep is measured.

<table>
<thead>
<tr>
<th>Command</th>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SENSE:SWEep:TIME:STARt?</td>
<td>None</td>
<td>None</td>
</tr>
</tbody>
</table>

Sets the time the analyzer takes to complete one sweep.

<table>
<thead>
<tr>
<th>Command</th>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SENSE:SWEep:TIME[:STOP]</td>
<td>None</td>
<td>None</td>
</tr>
</tbody>
</table>

The following are new programming commands for VNA release A.14.80.xx See What's New.

### Automatic Fixture Removal (AFR) Commands
Turns ON or OFF AFR mode conversion.

<table>
<thead>
<tr>
<th>Command</th>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>AFR:ADVanced:MCONversion[:STATe]</td>
<td>None</td>
<td>None</td>
</tr>
</tbody>
</table>

Resets the AFR configuration.

<table>
<thead>
<tr>
<th>Command</th>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>AFR:ADVanced:RESet</td>
<td>None</td>
<td>None</td>
</tr>
</tbody>
</table>

Gets or sets the manual start time in AFR configuration.

<table>
<thead>
<tr>
<th>Command</th>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>AFR:ADVanced:TIME:STARt</td>
<td>None</td>
<td>None</td>
</tr>
</tbody>
</table>

Gets or sets the manual stop time in AFR configuration.

<table>
<thead>
<tr>
<th>Command</th>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>AFR:ADVanced:TIME:STOP</td>
<td>None</td>
<td>None</td>
</tr>
</tbody>
</table>

Gets or sets the manual window type in AFR configuration.

<table>
<thead>
<tr>
<th>Command</th>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>AFR:ADVanced:WINDow:COEFFicient</td>
<td>None</td>
<td>None</td>
</tr>
</tbody>
</table>

Turns ON or OFF the manual window coefficient of the

<table>
<thead>
<tr>
<th>Command</th>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>AFR:ADVanced:WINDow:MANual[:STATe]</td>
<td>None</td>
<td>None</td>
</tr>
</tbody>
</table>
AFR.

| Sets "System Z0" to Calibration Reference Z0. | AFR:FIXTure:SET:SYSZ[:STATe] | None |
| Specifies whether thru's are used in case of multi-port fixtures. | AFR:FIXTure:USE:THRUs[:STATe] | None |
| Specifies whether the port impedances are normalized in saving the AFR fixture files. | AFR:SAVE:IMPedance:NORMalize[:STATe] | None |
| Measures calibration standard. | AFR:STANdard:MEASure | None |

### GCA/GCX Phase Commands

<p>| Set and read the desired phase to measure compression. | SENSe:GCSetup:COMPression:PHASe:LEVel | None |
| Set and read compression format to be either magnitude, phase, or magnitude and phase. | SENSe:GCSetup:COMPression:PHASe:MODE | None |
| Set and read the state of the mixer reference. | SENSe:GCSetup:MIXer:REFerence | None |
| Set and read the aperture to use when computing the linear input power. | SENSe:GCSetup:POWer:LINear:INPut:COMPute:APERture | None |</p>
<table>
<thead>
<tr>
<th>Description</th>
<th>Command</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Set and read the state of the power smoothing.</td>
<td>SENSE:GCSsetup:SWEep:POWer:SMOoth</td>
<td>None</td>
</tr>
<tr>
<td>Set and read the power smoothing aperture in percent.</td>
<td>SENSE:GCSsetup:SWEep:POWer:SMOoth:APERture</td>
<td>None</td>
</tr>
</tbody>
</table>

### Modulation Distortion Edit Multitone Commands

<table>
<thead>
<tr>
<th>Action</th>
<th>Command</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Set all tone states to on or off.</td>
<td>SOURce:MODulation:FILE:TONE:ALL[:STATe]</td>
<td>None</td>
</tr>
<tr>
<td>Returns the number of tones.</td>
<td>SOURce:MODulation:FILE:TONE:COUNt?</td>
<td>None</td>
</tr>
<tr>
<td>Returns the tone frequency in Hz relative to the carrier.</td>
<td>SOURce:MODulation:FILE:TONE:FREQuency?</td>
<td>None</td>
</tr>
<tr>
<td>Loads the specified multitone file.</td>
<td>SOURce:MODulation:FILE:TONE:LOAD</td>
<td>None</td>
</tr>
<tr>
<td>Sets and reads the phase in degrees of the specified tone number.</td>
<td>SOURce:MODulation:FILE:TONE:PHASE</td>
<td>None</td>
</tr>
<tr>
<td>Sets and reads the power in dBm of the specified tone number.</td>
<td>SOURce:MODulation:FILE:TONE:POWer</td>
<td>None</td>
</tr>
<tr>
<td>Saves the specified multitone file.</td>
<td>SOURce:MODulation:FILE:TONE:SAVE</td>
<td>None</td>
</tr>
<tr>
<td>Set specified tone state to on or off.</td>
<td>SOURce:MODulation:FILE:TONE[:STATe]</td>
<td>None</td>
</tr>
</tbody>
</table>

### Residual Phase Noise Commands

<table>
<thead>
<tr>
<th>Description</th>
<th>Command</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td>None</td>
</tr>
<tr>
<td>Sets and returns the noise type to phase or residual noise.</td>
<td>SENSE:PN:NTYPE</td>
<td>None</td>
</tr>
<tr>
<td>----------------------------------------------------------</td>
<td>-----------------</td>
<td>------</td>
</tr>
<tr>
<td>Sets and returns receiver at the DUT input for residual phase noise measurements.</td>
<td>SENSE:PN:RESidual:INPut</td>
<td>None</td>
</tr>
<tr>
<td>Sets and returns receiver at the DUT output for residual phase noise measurements.</td>
<td>SENSE:PN:RESidual:OUTput</td>
<td>None</td>
</tr>
</tbody>
</table>

**LO Feedthru Monitor Commands**

<table>
<thead>
<tr>
<th>Return the last monitor result of LO feedthru monitor.</th>
<th>SENSE:SA:COHerance:LO:FTHRu:MONitor:LAST:FAILED</th>
<th>None</th>
</tr>
</thead>
<tbody>
<tr>
<td>Return the last monitor value of LO feedthru monitor.</td>
<td>SENSE:SA:COHerance:LO:FTHRu:MONitor:LAST:VALUE</td>
<td>None</td>
</tr>
<tr>
<td>Set and read the target receiver for LO Feedthru monitor.</td>
<td>SENSE:SA:COHerance:LO:FTHRu:MONitor:RECeiver</td>
<td>None</td>
</tr>
<tr>
<td>Set and read the LO feedthru monitoring state.</td>
<td>SENSE:SA:COHerence:LO:FTHRu:MONitor[:STATe]</td>
<td>None</td>
</tr>
<tr>
<td>Set and read the threshold level for warning.</td>
<td>SENSE:SA:COHerence:LO:FTHRu:MONitor:TOLerance</td>
<td>None</td>
</tr>
</tbody>
</table>
Set and read the monitoring method for LO feedthru monitor.

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SENSE:SA:COHerence:LO:FTHRu:MONitor:TYPE</td>
<td>None</td>
</tr>
</tbody>
</table>

**Fixture Simulator Commands**

These commands are used to query and set fixture values on a scratch fixture.

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CALCulate:FSIMulator:DRAFt: Commands</td>
<td>None</td>
</tr>
</tbody>
</table>

These commands are used to query ONLY fixture values on the active fixture.

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CALCulate:FSIMulator: Active Commands</td>
<td>None</td>
</tr>
</tbody>
</table>

**Phase Control Commands**

Returns the available internal ports that the external port can be set to.

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SOURce:PHASe:EXTernal:CATalog?</td>
<td>None</td>
</tr>
</tbody>
</table>

Sets and returns the internal port that the external port is routed through.

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SOURce:PHASe:EXTernal:PORT</td>
<td>None</td>
</tr>
</tbody>
</table>

Returns the available phase control modes for the specified port.

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SOURce:PHASe:MODE:CATalog?</td>
<td>None</td>
</tr>
</tbody>
</table>

Sets and returns the Phase Control mode.

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SOURce:PHASe:MODE[:VALue]</td>
<td>None</td>
</tr>
</tbody>
</table>

Returns the available parameters.

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SOURce:PHASe:PARameter[:CATalog?]</td>
<td>None</td>
</tr>
</tbody>
</table>

Sets and returns the ratioed
receivers (parameter) to use for phase control.

| Returns the available ports that can be used as phase control reference ports for the phase controlled port. | SOURce:PHASe:REFerence:CATalog? | None |
| Sets and returns the reference port for the Phase Control measurement. | SOURce:PHASe:REFerence:PORT | None |

**Misc. Commands**

| Sets and returns the IF bandwidth filter shape | SENSE:IF:BANDwidth:FILTer | None |

The following are new programming commands for VNA release A.14.60.xx See What's New.

Dark shaded commands existed before this release. They are provided here for convenience.

**Phase Reference Commands**

<p>| Reads the number of phase reference modules connected. | CONTrol:PHASE:COUNT? | None |
| Reads the calibration data from the phase reference of the specified module (x), and writes the data to the Path | CONTrol:PHASE:MODule[x]:DATA:STORe | None |</p>
<table>
<thead>
<tr>
<th>Command Description</th>
<th>Command Code</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>Reads the model number of the specified module (x).</td>
