CF_Power Commands

The Power softkeys vary depending on which measurement class is currently active. Click on a measurement class link below to view the corresponding softkeys.

Standard
Active Hot Parameters
Gain Compression and Gain Compression Converters
Differential I/Q
IM Spectrum and IM Spectrum Converters
Swept IMD and Swept IMD Converters
Modulation Distortion and Modulation Distortion Converters
Noise Figure Cold Source and Noise Figure Converters
Phase Noise
Scalar Mixer/Converter + Phase and Vector Mixer/Converter
Spectrum Analyzer

The Setup softkeys vary depending on which measurement class is currently active. Click on a measurement class link below to view the corresponding softkeys.

**Standard**
- Active Hot Parameters
- Gain Compression
- Differential I/Q
- IM Spectrum
- Swept IMD

**Modulation Distortion and Modulation Distortion Converters**
- Noise Figure Cold Source
- Phase Noise
- Spectrum Analyzer
- Gain Compression Converters
- IM Spectrum Converters
- Swept IMD Converters
- Noise Figure Converters
- Scalar Mixer/Converter + Phase
- Vector Mixer/Converter
- TDR (Time Domain Reflectometry)

CF_Setup Commands - MOD

Setup Commands - Modulation Distortion and Modulation Distortion Converters Measurement Class

Only the Main Setup commands corresponding to the Modulation Distortion and Modulation Distortion Converters measurement class are documented here. All other commands are identical to the Setup commands for the Standard measurement class and can be accessed by clicking here or by clicking on the softtabs on the graphic below.

Click here to view links to Setup commands for all Measurement Classes.

CF_Setup Commands - SMC

Setup Commands - Scalar Mixer/Converter + Phase Measurement Class

Only the Main and Layout Setup commands corresponding to the Scalar Mixer/Converter + Phase measurement class are documented here. All other commands are identical to the Setup commands for the Standard measurement class and can be accessed by clicking [here](#) or by clicking on the softtabs on the graphic below.

Click [here](#) to view links to Setup commands for all Measurement Classes.

Create and Cal a Diff IQ Measurement

Create a Differential IQ Measurement

This VBScript (*.vbs) program can be run as a macro in the VNA. To do this, copy the following code into a text editor file such as Notepad and save it on the VNA hard drive as DIQ.vbs. Learn how to setup and run the macro.

See Also

DIQ Object

See other COM Examples

```vbs
Set app = CreateObject("AgilentPNA835x.Application")
app.CreateCustomMeasurementEx 2, "Differential I/Q", "IPwrF1"
Set Diq = app.ActiveChannel.CustomChannelConfiguration
Diq.AddRange
Diq.RangeStartFrequency(1) = 1e9
Diq.RangeStopFrequency(1) = 2e9
Diq.RangeCoupleState(2) = 1
Diq.RangeCoupleId(2)=1
Diq.RangeMultiplier(2) = 2
Diq.RangeIFBW(2) = 1000
Diq.SourceRange("Port 1") = 1
Diq.SourceState("Port 1") = naPortON
Diq.MatchState("Port 1") = 1
Diq.MatchFrequencyRange("Port 1") = 1
Diq.MatchTestReceiver("Port 1") = "b3"
Diq.MatchRefReceiver("Port 1") = "a3"
Diq.PowerSweepState("Port 1")=0
Diq.PortStartPower("Port 1")=-5
Diq.PortAttenuator("Port 1") = 5
Diq.AutoRangeState("Port 1") = 1
```
Dynamic Uncertainty

This example does the following in separate subprograms:

- Setup Uncertainty Manager Workspace
- Perform a standard 2-port Guided Cal
- Perform a Cable Characterization
- Perform a Noise Characterization
- Perform a 2-Port Uncertainty Cal
- Make Uncertainty Trace Settings

The cable repeatability and noise characterizations can be performed once, and then they are good for possibly months.

However, the uncertainty calibrations should be performed just as often as traditional non-uncertainty measurement calibrations.

This VBScript (*.vbs) program can be run as a macro in the VNA. To do this, copy the following code into a text editor file, such as Notepad, and save it on the VNA hard drive as *.vbs.

Get Data using VB.NET

In VB.NET, you can use the `getData` and `putData` functions shown in the `IArrayTransfer` interface. However, those functions return Variant data types, and VB.NET does not support Variant data types.

In this example, `getData` returns an "object", which is actually an "object[]" (array of object). Each object in the array is a "float". A new array of floats is created and then each instance is cast within the array to a float.

```vbnet
Dim DataAsObject As Object
Dim DataAsObjectArray(NumPoints - 1) As Object
Dim ResultData (NumPoints - 1) As Double

DataAsObject = na.Measurements.Item(1)

DataAsObjectArray = DataAsObject.getData(AgilentPNA835x.NADataStore.naMeasResult, AgilentPNA835x.NADataFormat.naDataFormat_LogMag)

For i As Integer = 0 To NumPoints - 1
    ResultData(i) = CType(DataAsObjectArray(i), Double)
Next i
```
IFPathConfiguration Setup

The following demonstrates how to:

  Set the Source 1 Pulse Mod to enable
  Set the Source 2 Pulse Mod to disable. In effect, this sets Source 2 to 'CW' (or OFF)
  Set the Pulse Mod drive to Pulse1

See the entire list of IF Path Configuration settings.

```
' Create / Get the VNA application
Dim app
Set app = CreateObject("AgilentPNA835x.Application")
' Preset the instrument
app.Preset
' Get a channel interface on which to operate
Dim chan
Set chan = app.ActiveChannel
' Set the Source 1 Pulse Mod to enable
chan.PathConfiguration.Element("Src1Out1PulseModEnable").Value = "Enable"
' Set the Source 2 Pulse Mod to disable
chan.PathConfiguration.Element("Src2Out1PulseModEnable").Value = "Disable"
' Set the Pulse Mod drive to Pulse1
chan.PathConfiguration.Element("PulseModDrive").Value = "Pulse1"
```
Perform a CalAllChannels Calibration

This example sets up an SMC channel and a standard channel. It then performs a 'Cal All Channels' calibration which calibrates both channels.

Note: The example does NOT modify any path configuration settings.

Example Program: performs a phase reference calibration between 1Ghz to 10Ghz on Ports 1, 2, and 4.

```vbscript
Set app = CreateObject("agilentpna835x.application")
app.preset
app.activechannel.hold 1
Set PhaseReferenceCal = app.GetCalManager().PhaseReferenceCalibration
' always call reset at the beginning of your cal
PhaseReferenceCal.Reset
PhaseReferenceCal.StartFrequency = 1e9
PhaseReferenceCal.StopFrequency = 10e9
' Read serial numbers of connected phase references
' Into variant array
refs = PhaseReferenceCal.GetConnectedPhaseReferences
' Change the following to your own phase reference name
PhaseReferenceCal.PhaseReference = "MYPILOT44"
PhaseReferenceCal.SourceAttenuator = 10
PhaseReferenceCal.Calset = "Remote Phase Reference"
PhaseReferenceCal.ConnectorType = "APC 3.5 female"
PhaseReferenceCal.CalKitType = "85052D"
' Perform the calibration on Port 4 (Port 1 and Port 2 are always included)
PhaseReferenceCal.IncludePort(4) = true
' Uncomment the following line to use an unknown mixer
' to extend the phase reference cal down to 10 Mhz
' If an unknown mixer is used, then the start frequency is always 10 Mhz
' PhaseReferenceCal.IncludeUnknownMixer = true
```
Set guidedCal = PhaseReferenceCal.GuidedCalibration
Steps = guidedCal.GenerateSteps
for i = 1 to steps
    MsgBox guidedCal.GetStepDescription(i)
    guidedCal.AcquireStep i
next
Msgbox guidedCal.GenerateErrorTerms
Msgbox "done"
OBS_AcquireCalConfidenceCheckECAL

Transfers confidence data from the specified ECal module into the measurement's memory trace. The data is transferred to the specified S-parameter on the same channel as this Calibrator object.

The characterization within the ECal module that the confidence data will be read from is specified by the **ECALCharacterization property** on the ICalibrator2 interface. The default value of the ECALCharacterization property is `naECALFactoryCharacterization`.

**VB Syntax**

```vbnet
cal.AcquireCalConfidenceCheckECAL Sparam[,ecalModule]
```

<table>
<thead>
<tr>
<th>Variable</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><em>cal</em></td>
<td>A Calibrator (object)</td>
<td></td>
</tr>
<tr>
<td><em>Sparam</em></td>
<td>(String) S-parameter to transfer confidence data to. This parameter must be present on the same channel as the calibrator object.</td>
<td></td>
</tr>
<tr>
<td><em>ecalModule</em></td>
<td>(enum NAECALModule) – Optional argument. ECal module. Choose from: 0 - naECALModule_A (default, if unspecified) 1 - naECALModule_B</td>
<td></td>
</tr>
</tbody>
</table>

**Return Type**

None

**Default**

Not applicable

**Examples**

```vbnet
Cal.AcquireCalConfidenceCheckECAL "S11", naECALModule_A
```

**C++ Syntax**

```cpp
HRESULT AcquireCalConfidenceCheckECAL(_bstr_t strParameter, enum NAECALModule ecalModule);
```
Interface

ICalibrator
## OBSAcquirePowerReadings Method

### VB Syntax

```vbnet
powerCalibrator.AcquirePowerReadings device [,sync]
```

### Variable

<table>
<thead>
<tr>
<th>(Type)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>(object)</td>
<td>A <code>SourcePowerCalibrator</code> object</td>
</tr>
</tbody>
</table>
| (enum NAPowerAcquisitionDevice) | The specific device (sensor on the power meter) to be used for the acquisition. Choose from:
- 0 – `naPowerSensor_A`
- 1 – `naPowerSensor_B`

To use the sensor that currently corresponds to the frequency of interest, use the value from the `PowerAcquisitionDevice` property.

| (boolean) | Optional argument. If not specified, value is set to False. Choose from:
- True (1) – The method does not return until this acquisition has completed (the program calling this method is halted while waiting for the method to return).
- False (0) – The method initiates an acquisition then returns immediately (while the acquisition still proceeds). The program calling this method can then perform other operations during the acquisition. |

### Return Type

None

### Default

Not Applicable

### Examples

```
powerCalibrator.AcquirePowerReadings naPowerSensor_A, True
```

### C++ Syntax

```cpp
HRESULT AcquirePowerReadings(tagNAPowerAcquisitionDevice enumAcqDevice, VARIANT_BOOL bSync);
```

### Interface

`ISourcePowerCalibrator`
AddRange Method

Description
Adds a frequency range using the next available range name. For example, with only the default F1 range name present, sending this command will create F2. On the Measurement Setup dialog this is the New setting.

VB Syntax
DIQ.AddRange

Variable
(Type) - Description

DIQ A DIQ Object

Return Type
Not Applicable

Default
Not Applicable

Examples
diq.AddRange 'Adds a new frequency range at the next available.
See example program

C++ Syntax
HRESULT AddRange()

Interface
DIQ1
OBSApplyPowerCorrectionValues Method

Applies the array of power correction values to the channel memory and turns correction ON. Perform after completing a source power cal acquisition sweep.

This command does NOT save the correction values. To save correction values, save an instrument / calibration state (*.cst file) after performing a source power cal.

VB Syntax

```vbnet
powerCalibrator.ApplyPowerCorrectionValues
```

Variable (Type) - Description

<table>
<thead>
<tr>
<th>powerCalibrator (object) - A SourcePowerCalibrator object</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
</tr>
</tbody>
</table>

Return Type

None

Default

Not Applicable

Examples

```vbnet
powerCalibrator.ApplyPowerCorrectionValues
```

C++ Syntax

```cpp
HRESULT ApplyPowerCorrectionValues();
```

Interface

ISourcePowerCalibrator
BandpowerData Property

Description
Returns the Y-axis data from the band power marker.

VB Syntax
value = mkr.BandpowerData

Variable (Type) - Description

value
Variable to store the returned Y-axis value.

mkr
A Marker (object)

Return Type
Double

Default
Not Applicable

Examples
See example program

C++ Syntax
HRESULT get_BandpowerData(double* pVal)

Interface
IMarker6
# CascadeS2PFiles Method

**Description**

Combines the losses and phase shift of two S2P files into a single S2P file. [Learn more.](#)

**VB Syntax**

```
calmgr.CascadeS2PFiles (s2p1, s2p2, s2pResult, format)
```

<table>
<thead>
<tr>
<th>Variable</th>
<th>(Type) - Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>calMgr</td>
<td>Cal Manager (Object)</td>

Default
Not Applicable

Examples
```
CalManager.CharacterizeFixture ("Tier1", "Tier2", 1,"C:\Users\PNA-ADMIN\AppData\Local\Keysight\Network Analyzer\CPM\FixtureA.s2p",1,0)
```

C++ Syntax
```
HRESULT CharacterizeFixture(BSTR strCset1, BSTR strCset2, long pNum, BSTR fileName, tagNAPairedDataFormat format, Int dcPhase);
```

Interface
ICalManager10
**OBSCfgEnhancedNB Method**

This subroutine determines, then returns, the proper configuration for pulsed measurements on the PNA-X ONLY using the spectral nulling technique. The configuration returned needs to be sent to the VNA and any other related external equipment.

The routine will take a desired Pulse Repetition Frequency (PRF) and measurement IFBW and return a possibly modified PRF and IFBW for proper pulsed operation on the VNA.

**VB Syntax**

```
Pulsed.ConfigEnhancedNB (PRF, BW, PhysicalIF, NCO, Stage1TapArray, Stage2TapArray, Stage3TapArray, FixedPRF)
```

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pulsed</td>
<td>(interface) An interface to the agilentpnapulsed.dll application interface.</td>
</tr>
<tr>
<td>PRF</td>
<td>(Double) The Pulse Repetition Frequency.</td>
</tr>
<tr>
<td>[out]</td>
<td>The pulse repetition frequency that has been optimized for use with the VNA. NOTE: This value may be different from the value requested.</td>
</tr>
<tr>
<td>[in]</td>
<td>The desired pulse repetition frequency.</td>
</tr>
<tr>
<td>BW</td>
<td>(Long) The VNA IF Bandwidth.</td>
</tr>
<tr>
<td>[out]</td>
<td>The VNA IF bandwidth that has been optimized for use with the VNA. NOTE: This value may be different from the value requested. Zero (0) is returned if no solution is found for the specified PRF and BW.</td>
</tr>
<tr>
<td>[in]</td>
<td>The desired VNA IF bandwidth.</td>
</tr>
</tbody>
</table>
PhysicalIF
(Double) Returns physical intermediate frequency.

NCO
(Double) Returns numeric controlled oscillator frequency.

Stage1TapArray
(Long array) Returns the stage 1 filter coefficients

Stage2TapArray
(Long array) Returns the stage 2 filter coefficients

Stage3TapArray
(Long array) Returns the stage 3 filter coefficients

FixedPRF
(Boolean)
1 (True) Signals the .DLL routine to NOT adjust the PRF value; rather adjust ONLY the IF Bandwidth. This is the default setting.
0 (False) Adjust both the PRF and IF Bandwidth values as necessary.

Return Type
Not Applicable

Default
Not Applicable

Example
See an example using this command.

C++ Syntax
HRESULT ConfigEnhancedNB(double *pPRF, long *pBW, double *pIF, double *pNCO, double *pStg1, double *pStg2, double *pStg3)

Interface
AgilentPNAPulsed.Application
### CopyNoiseToAllPorts Method

**Description**  
Copies the characterized noise data associated with the specified port, to all the other ports.

**VB Syntax**  
oPorts.CopyNoiseToAllPorts (value)

**Variable**  
<table>
<thead>
<tr>
<th>(Type)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>oPorts</td>
<td>A Ports Collection</td>
</tr>
<tr>
<td>value</td>
<td>(Long) Port number from which noise data is to be copied.</td>
</tr>
</tbody>
</table>

**Return Type**  
Not Applicable

**Default**  
Not Applicable

**Examples**  
`oPorts.CopyNoiseToAllPorts(2)`  
See example program

**C++ Syntax**  
HRESULT CopyNoiseToAllPorts([in] long fromPortNumber);  

**Interface**  
IUncertaintyPorts
OBS Create SParameterEX Method

Write-only

About Measurement Parameters

CreateSParameterEx Method - Superseded

Description

Note: This method is replaced by Create SParameter method. The Load port selection is no longer necessary.

Creates a new S-Parameter measurement in an existing or new window and specifies the load port for 3-port devices.

VB Syntax

app.CreateSParameterEx chan,recvr,source[,loadPort][,window]

Variable (Type) - Description

app

(Application (object)

chan

(long integer) - Channel number of the new measurement.

recv

(long integer) - Port number of the test port receiver.

source

(long integer) - Port number of the source.

Note: If the port is defined by a string name, such as an external source, a balanced port, or one of the Source 2 outputs on the 2-port 2-source VNA-x model, then you must use chan.getPortNumber to translate the string into a port number. To learn more see Remotely Specifying a Source Port.

loadPort

(long integer) - Port number of the load. Required for reflection measurements of 3-port devices on multiport VNA models.

window

(long integer) - Optional argument. Choose between 1 and the maximum number of windows allowed on the VNA. See also Traces, Channels, and Windows on the VNA. If unspecified, the S-Parameter will be created in the Active Window.

Return Type

Not Applicable

Default

Not Applicable

Examples

app.CreateSParameterEx 1,2,1,1 'Creates a new S21 measurement in channel 1 and New window(1)
app.CreateSParameterEx 2,1,1,3,1 'Creates a new S11 measurement on channel 2 with port 3 as the load. Create in the active window

C++ Syntax

HRESULT CreateSParameterEx(long ChannelNum, long RcvPort, long SrcPort, long LoadPort, long windowNumber)

Interface

IApplication
### OBS_CreateCustomMeasurement Method

**VB Syntax**

```vbnet
app.CreateCustomMeasurement chanNum,guid[,window]
```

**Variable**

<table>
<thead>
<tr>
<th>Variable</th>
<th>(Type)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>app</strong></td>
<td>(object)</td>
<td>An Application object</td>
</tr>
<tr>
<td><strong>chanNum</strong></td>
<td>(long)</td>
<td>Channel number used by the new measurement; can exist or be a new channel.</td>
</tr>
<tr>
<td><strong>guid</strong></td>
<td>(string)</td>
<td>the GUID (Globally Unique IDentifier) of the new custom measurement object. The new custom measurement must be installed and registered on the PNA. Should be in “registry format”. See example below.</td>
</tr>
<tr>
<td><strong>window</strong></td>
<td>(long)</td>
<td>Optional argument. Number of the window the new custom measurement will be placed in. Choose 1 to 16. If unspecified, the measurement is placed in the active window.</td>
</tr>
</tbody>
</table>

**Return Type**

Not Applicable

**Default**

Not Applicable

**Examples**

```vbnet
app.CreateCustomMeasurement 1, "\{12345678-56D3-11D5-AD50-00108334AE98\}
'Not an actual custom measurement - for example purpose only
```

**C++ Syntax**

```cpp
HRESULT CreateCustomMeasurement (long ChannelNum, BSTR guid, long windowNumber)
```

**Interface**

IApplication
## OBS_DataToDivisor Method

**Write-only**

**About Receiver Cal**

**DataToDivisor Method**  **Superseded**

### Description

Note: This property is replaced by DoReceiverPowerCal Method.

Stores the measurement's data to the measurement's "divisor" buffer for use by the Normalization data processing algorithm. Normalization is currently supported only on measurements of unratioed power, for purpose of receiver power calibration. If DataToDivisor is called on a ratioed measurement (such as an S-parameter), it will return an error.

### VB Syntax

```
meas.DataToDivisor
```

### Variable (Type) - Description

- `meas` (object) - A Measurement object

### Return Type

Not Applicable

### Default

Not Applicable

### Examples

```
meas.DataToDivisor
```

### C++ Syntax

```
HRESULT DataToDivisor();
```

### Interface

```
IMeasurement
```
## DeleteRange Method

**Description**
Deletes the specified frequency range. On the Measurement Setup dialog this is the Remove setting.

**VB Syntax**
DIQ.DeleteRange (n)

**Variable**
- **(Type) - Description**
- **DIQ** - A DIQ Object
- **n** - (Long) Frequency range number to delete.

**Return Type**
Not Applicable

**Default**
Not Applicable

**Examples**
```vbnet
diq.DeleteRange 2 'removes frequency range 2
See example program
```

**C++ Syntax**
HRESULT DeleteRange(long range);

**Interface**
IDIQ
## DiscreteGetMaxPower Method

**Description**

Returns a single max leveled power value (in dBm) indicating the most restrictive maximum for all discrete maximum powers (the minimum of all maximum leveled powers).

\[\text{maxPower} = \text{powerRange}.\text{DiscreteGetMaxPower}\]

**VB Syntax**

```vbnet
maxPower = powerRange.DiscreteGetMaxPower
```

**Variable**

<table>
<thead>
<tr>
<th>(Type)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>powerRange</code></td>
<td>A <code>PowerRange</code> (object)</td>
</tr>
<tr>
<td><code>maxPower</code></td>
<td>(Double) Variable to store the most restrictive maximum power level in dBm.</td>
</tr>
</tbody>
</table>

**Return Type**

(Double)

**Default**

Not Applicable

```csharp
maxPower = powerRange.DiscreteGetMaxPower
```

**C++ Syntax**

```c++
HRESULT get_DiscreteGetMaxPower(double* pMax);
```

**Interface**

`IPowreRange`
DiscreteGetMaxPowerArray Method

Description
Returns an array of max leveled power values (in dBm), where each element corresponds to the maximum leveled power possible for CW stimulus at the corresponding frequency set by the DiscreteFrequencies property.

VB Syntax
maxPower = powerRange.DiscreteGetMaxPowerArray

Variable
(powerRange) - Description
powerRange
A PowerRange (object)

maxPower
(Variant array) Variable to store the list of maximum leveled power values in dBm.

Return Type
Variant array

Default
Not Applicable

C++ Syntax
HRESULT get_DiscreteGetMaxPowerArray(VARIANT* pMax);

Interface
IPowreRange
DiscreteGetMinPower Method

Description
Returns a single minimum power value (in dBm) indicating the most restrictive minimum for all discrete minimum powers (the maximum of all minimum powers).

VB Syntax
minPower = powerRange.DiscreteGetMinPower

Variable
(Type) - Description

powerRange
A PowerRange (object)

minPower
(Double) Variable to store the most restrictive minimum power level in dBm.

Return Type
(Double)

Default
Not Applicable

C++ Syntax
HRESULT get_DiscreteGetMinPower(double* pMin);

Interface
IPowreRange
### DiscreteGetMinPowerArray Method

**Description**

Returns an array of minimum power values (in dBm), where each element corresponds to the minimum power possible for CW stimulus at the corresponding frequency set by the `DiscreteFrequencies` property.

**VB Syntax**

```
minPower = powerRange.DiscreteGetMinPowerArray
```

**Variable**

<table>
<thead>
<tr>
<th>(Type)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>powerRange</code></td>
<td>A <code>PowerRange</code> (object)</td>
</tr>
<tr>
<td><code>minPower</code></td>
<td>(Variant array) Variable to store the list of minimum power values in dBm.</td>
</tr>
</tbody>
</table>

**Return Type**

Variant array

**Default**

Not Applicable

**C++ Syntax**

```
HRESULT get_DiscreteGetMinPowerArray(VARIANT* pMin);
```

**Interface**

`IPowreRange`
OBS_DoECAL1Port Method

Does a 1-Port calibration using an ECAL module. You must first have a 1-port measurement active to perform the calibration.

The characterization within the ECal module that will be used for the calibration is specified by the ECALCharacterization property on the ICalibrator2 interface. The default value of the ECALCharacterization property is naECALFactoryCharacterization.

VB Syntax

cal.DoECAL1Port [port][,module]

<table>
<thead>
<tr>
<th>Variable</th>
<th>(Type)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cal</td>
<td>A Calibrator (object)</td>
<td></td>
</tr>
<tr>
<td>port</td>
<td>(long integer) Optional argument - Port number to calibrate. Choose from:</td>
<td>1 - Calibrate port 1 (default if unspecified)</td>
</tr>
<tr>
<td></td>
<td></td>
<td>2 - Calibrate port 2</td>
</tr>
<tr>
<td>module</td>
<td>(enum NAECalModule)</td>
<td>Optional argument - ECAL module. Choose from:</td>

<tr>
<td></td>
<td></td>
<td>0 - naECALModule_A - (default if unspecified)</td>
</tr>
<tr>
<td></td>
<td></td>
<td>1 - naECALModule_B</td>
</tr>
</tbody>
</table>

Return Type

None

Default

Not Applicable

Examples

cal.DoECAL1Port,2,naECALModule_B

C++ Syntax

HRESULT DoECAL1Port(long port, tagNAECALModule ecalModule);

Interface

ICalibrator
OBS_DoECAL2Port Method

Does a 2-Port calibration using an ECAL module. You must first have a 2-port measurement active to perform the calibration.

The characterization within the ECal module that will be used for the calibration is specified by the ECALCharacterization property on the ICalibrator2 interface. The default value of the ECALCharacterization property is naECALFactoryCharacterization.

VB Syntax

```
cal.DoECAL2Port(portA[,portB][,module])
```

<table>
<thead>
<tr>
<th>Variable</th>
<th>(Type) - Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cal</td>
<td>A Calibrator (object)</td>
</tr>
<tr>
<td>portA</td>
<td>(long integer) Optional argument - Number of the receive port to calibrate.</td>
</tr>
<tr>
<td></td>
<td>Choose from:</td>
</tr>
<tr>
<td></td>
<td>1 - Calibrate port 1 (default, if unspecified)</td>
</tr>
<tr>
<td></td>
<td>2 - Calibrate port 2</td>

</tr>
<tr>
<td></td>
<td>0 - naECALModule_A (default, if unspecified)</td>
</tr>
<tr>
<td></td>
<td>1 - naECALModule_B</td>
</tr>
</tbody>
</table>

Return Type
None

Default
Not Applicable

Examples
```
cal.DoECAL2Port,1,2,naECALModule_B
```
C++ Syntax

HRESULT DoECAL2Port(long rcvport, long srcPort, tagNAECALModule ecalModule);

Interface

ICalibrator
OBS_Get ECAL Module Info Method

Description

Note: This property is replaced by GetECALModuleInfoEx Method

Returns the following information about the connected ECAL module: model number, serial number, connector type, calibration date, min and max frequency.

The characterization within the ECAL module that this information will be read from is specified by the ECALCharacterization property on the ICalibrator2 interface. The default value of the ECALCharacterization property is naECALFactoryCharacterization.

VB Syntax

moduleInfo = cal.GetECALModuleInfo (module)

Variable

moduleInfo (string) - variable to store the module information

cal A Calibrator (object)

module (enum NAECALModule) – ECAL module. Choose from:

0 - naECALModule_A

1 - naECALModule_B

Return Type

String

Default

Not Applicable

Examples

info = cal.GetECALModuleInfo(naECALModule_A)

Example return string:

ModelNumber: 85092–60007, SerialNumber: 01386, ConnectorType: N5FN5F, PortAConnector: Type N (50) female, PortBConnector: Type N (50) female, MinFreq: 30000, MaxFreq: 9100000000, NumberOfPoints: 250, Calibrated: July 4 2002

C++ Syntax

HRESULT GetECALModuleInfo(tagNAECALModule ecalModule, BSTR* info);

Interface

ICalibrator
**OBSget InputVoltage Method**

**VB Syntax**

\[ volts = AuxIO.get_InputVoltage \]

**Variable**

<table>
<thead>
<tr>
<th>(Type)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>volts</td>
<td>(double) - variable to store the return value</td>
</tr>
<tr>
<td>AuxIO</td>
<td>(object) - A Hardware Auxiliary Input / Output object</td>
</tr>
</tbody>
</table>

**Return Type**

Double

**Default**

0

**Examples**

```vba
Dim aux as HWAuxIO
Set aux = PNA.getAuxIO
volts = aux.get_InputVoltage 'read voltage on Analog In (pin 14)
```

**C++ Syntax**

```cpp
HRESULT get_InputVoltage ( double* Voltage );
```

**Interface**

HWAuxIO
# OBS_get SourcePowerCalData Method

**Read-only**

**About Source Power Cal**

### getSourcePowerCalData Method - Superseded

- **Description**
  Retrieves (as variant data type) requested source power calibration data, if it exists, from this channel.

  *Note: This method is replaced by GetSourcePowerCalDataEx Method.*

  *Note: This method returns a variant which is less efficient than methods available on the ISourcePowerCalData interface*

- **VB Syntax**
  
  ```vbnet
  data = chan.getSourcePowerCalData sourcePort
  ```

- **Variable**
  
  - **(Type) - Description**
  
    - **data**
      (variant) – Array to store the data.
    
    - **chan**
      (object) – A Channel object
    
    - **sourcePort**
      (long integer) – The source port for which calibration data is being requested.

- **Return Type**
  Variant array – automatically dimensioned to the size of the data.

- **Default**
  Not Applicable

- **Examples**
  ```vbnet
  Dim varData As Variant
  Const port1 As Long = 1
  varData = chan.getSourcePowerCalData port1
  'Print the data
  For i = 0 To chan.NumberOfPoints - 1
     Print varData(i)
  Next i
  ```

- **C++ Syntax**
  ```cpp
  HRESULT getSourcePowerCalData(long sourcePort, VARIANT *pData);
  ```

- **Interface**
  IChannel
**OBS_get SourcePowerCalDataScalar Method**

**Read-only**

**getSourcePowerCalDataScalar Method - Superseded**

**Description**

Retrieves (as scalar values) requested source power calibration data, if it exists, from this channel.

*Note: This method is replaced by GetSourcePowerCalDataScalarEx Method*

**VB Syntax**

chandata.getSourcePowerCalDataScalar sourcePort, numValues, data

**Variable**

- **chandata** *(interface)* — An ISourcePowerCalData interface pointing to a Channel (object)
- **sourcePort** *(long integer)* — The source port for which calibration data is being requested.
- **numValues** *(long integer)* — Number of data values.
  - **[out]** specifies number of data values returned.
  - **[in]** specifies number of values being requested (this must not be larger than the capacity of the data array).
- **data** *(single)* — Array to store the data.

**Return Type**

Single

**Default**

Not Applicable

**Examples**

```vbnet
dim numValues as long
Dim scalarCalValues() As Single
Dim chanData As ISourcePowerCalData
Const port1 As Long = 1
numValues = app.ActiveChannel.NumberOfPoints
ReDim scalarCalValues(numValues)
Set chanData = app.ActiveChannel

chanData.getSourcePowerCalDataScalar port1, numValues, scalarCalValues(0)

'Print the data
For i = 0 to numValues - 1
print scalarCalValues(i)
next i
```

**C++ Syntax**

```cpp
HRESULT getSourcePowerCalDataScalar(long sourcePort, long *pNumValues, float *pVals);
```
OBS_Get Standard Method

Description

This command has been replaced with Get StandardByString

Retrieves data that was acquired for a specific cal standard. This method returns the actual measurement data - not the calculated error terms.

This method returns a variant which is less efficient than getStandardComplex on the ICalData interface.

Learn about reading and writing Calibration data.

VB Syntax

data = cal.getStandardClass,rcv,srcclass

Variable (Type) - Description

data

Variant array to store the data.

cal

A Calibrator (object)

class (enum NACalClass) Standard to be measured. Choose from:

1 - naClassA
2 - naClassB
3 - naClassC
4 - naClassD
5 - naClassE
6 - naReferenceRatioLine
7 - naReferenceRatioThru

SOLT Standards
1 - naSOLT_Open
2 - naSOLT_Short
3 - naSOLT_Load
4 - naSOLT_Thru
5 - naSOLT_Isolation

TRL Standards
1 - naTRL_Reflection
2 - naTRL_Line_Reflection
3 - naTRL_Line_Tracking
4 - naTRL_Thru
5 - naTRL_Isolation

rcv

(long integer) - Receiver Port

src

(long integer) - Source Port

Return Type

(variant) - two-dimensional array (0:1, 0:NumberOfPoints-1)
<table>
<thead>
<tr>
<th>Default</th>
<th>Not Applicable</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Examples</strong></td>
<td></td>

</tbody>
</table>
GetSnPData Method

Returns noise parameter and S-parameter S2P data for vector noise figure measurements. Noise parameters are NOT valid for NFX or Scalar noise figure measurements.

**Data = nf.GetSnPData**

**variable**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>data</td>
<td>Variant array to store the data.</td>
</tr>
<tr>
<td>nf</td>
<td>A NoiseFigure (object)</td>
</tr>
<tr>
<td>type</td>
<td>(string) - Choose &quot;NoiseParameter&quot; - Noise parameter data.</td>
</tr>
</tbody>
</table>

**Return Type**

Variant – 3 dimensional array.

First dimension size is number of parameters returned

Second dimension size is number of points in the channel.

Third dimension size is 2; format is specified with SnPFormat Property

Data is returned in this order:

<real S11> <imag S11> <real S21> <imag S21> <real S12> <imag S12> <real S22> <imag S22>

Then noise parameters:

<NFMin dB> <mag GammaOpt> <phase GammaOpt> <Rn/Z0>

**Default**

Not Applicable

**Examples**

```vbnet
snp = nf.GetSnPData("NoiseParameter")
```

**C++ Syntax**

```c
HRESULT GetSnPData( BSTR type, VARIANT * response)
```

**Interface**

INoiseFigure7
# InitiateCableCharacterization Method

**Description**
Initializes a cable repeatability characterization for the specified channel and port.

**VB Syntax**

```vbnet
UncertChar.InitiateCableCharacterization (chan, port, iterations)
```

**Variable**

<table>
<thead>
<tr>
<th>Variable</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>UncertChar</td>
<td>A Characterizer (object)</td>
<td></td>
</tr>
<tr>

<td>(Long)</td>
<td>Channel number to calibrate.</td>
</tr>
<tr>
<td>port</td>
<td>(Long)</td>
<td>Port number to use in the characterization.</td>
</tr>
<tr>
<td>iterations</td>
<td>(Long)</td>
<td>Number of Iterative connections of the standards to be measured for the characterization.</td>
</tr>
</tbody>
</table>

**Note:** chan MUST be the active channel.

**Return Type**
Not Applicable

**Default**
Not Applicable

**Examples**

```vbnet
oUncertChar.InitiateCableCharacterization(2,2,20)
```

**C++ Syntax**

```csharp
HRESULT InitiateCableCharacterization([in] long channel, [in] long portNum, [in] long numIterationsPerStep, [out,retval] long* pNumSteps);
```

**Interface**

<table>
<thead>
<tr>
<th>Interface</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>IUncertaintyCharacterizer</td>
<td></td>
</tr>
</tbody>
</table>

The following existing commands on the GuidedCal object are used to perform the initialized cable repeatability characterization:

- GenerateSteps Method
- Get StepDescription Method
- MinimumIterationsForStep Property
- AcquireStep Method
- IterationCountForStep Property
- ResetStep Method
- Save (CalSet) Method
- Abort Method
# InitiateNoiseCharacterization Method

**Description**
Initializes a noise characterization for the specified channel and port.

**VB Syntax**
```
UncertChar.InitiateNoiseCharacterization (chan, firstPort, secondPort, iterations)
```

**Variable**
<table>
<thead>
<tr>

<td>(Long)</td>
<td>Second VNA port number on which the noise characterization is to be performed.</td>
</tr>
<tr>
<td>iterations</td>
<td>(Long)</td>
<td>Number of Iterative connections of the standards to be measured for the characterization.</td>
</tr>
</tbody>
</table>

**Return Type**
Not Applicable

**Default**
Not Applicable

**Examples**
```
UncertChar.InitiateNoiseCharacterization(2,1,2,20)
```

**C++ Syntax**
```
```

**Interface**
IUncertaintyCharacterizer

The following existing commands on the GuidedCal object are used to perform the initialized noise characterization:

- GenerateSteps Method
- Get StepDescription Method
- MinimumIterationsForStep Property
- AcquireStep Method
- IterationCountForStep Property
- ResetStep Method
- Save (CalSet) Method
- Abort Method
Load Method

Recalls the parameters and/or frequency ranges that you previously defined and saved.

**VB Syntax**

```
DIQ.Load (name, type)
```

**Variable**

(Type) - Description

A DIQ Object

**name**

(String) Full path (optional) and filename with or without the *.xml extension. If the full path is not provided, the file is loaded from D:\.

**type**

((Enum NADIQSaveLoadType) Choose the type of settings to be recalled:

- naParameterList - just the parameters.
- naFrequencyRange - just the frequency settings.
- naALL - both parameters and frequency settings.

**Return Type**

Not Applicable

**Default**

naParameterList

**Examples**

```
Diq.Load "myParams",naParameterList
Diq.Load "D:\myParams.xml",naALL
```

**C++ Syntax**

```
HRESULT Load(BSTR name,tag NADIQSaveLoadType type);
```

**Interface**

IDIQ2
**OBS_put SourcePowerCalData Method**

RangeGetMaxPower Method

Description
Returns the minimum of all max leveled power values from RangeStartFrequency to RangeStopFrequency (inclusive).

VB Syntax
maxPower = powerRange.RangeGetMaxPower

Variable (Type) - Description

    powerRange
    A PowerRange (object)

    maxPower
    (Double) Variable to store the power level in dBm.

Return Type (Double)
Default Not Applicable

C++ Syntax
HRESULT get_RangeGetMaxPower(double* pMax);

Interface IPowreRange
# RangeGetMinPower Method

**Description**

Returns the maximum of all minimum power values from `RangeStartFrequency` to `RangeStopFrequency` (inclusive).

**VB Syntax**

```vbnet
minPower = powerRange.RangeGetMinPower
```

**Variable**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>minPower</code></td>

```

**Interface**

`IPowreRange`
## ResetStep Method

**Description**
Resets the specified guided cal connection step as unmeasured. This clears all previous measurements made for that step.

**VB Syntax**
guided.ResetStep (n)

**Variable (Type) - Description**

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>guided</td>
<td><strong>GuidedCalibration (object)</strong></td>
</tr>
<tr>
<td>n</td>
<td>Guided Cal step number to reset as unmeasured. Use <strong>GenerateSteps Method</strong> to read the number of steps in the calibration.</td>
</tr>
</tbody>
</table>

**Return Type**
Not Applicable

**Default**
Not Applicable

**Examples**

```vbnet
obj.ResetStep(4)
```

**C++ Syntax**

```c++
HRESULT ResetStep(long step);
```

**Interface**
IGuidedCalibration10
### Save diq Method

**Description**
Stores the list of parameters and frequency range settings to an *.xml file for recall at a later time.

Use **Load Method** to recall files.

**Note:** The Frequency Range settings and the **DIQ Parameters** are saved and recalled from a single *.xml file.

**VB Syntax**

`DIQ.Save (filename)`

**Variable**

<table>
<thead>
<tr>
<th>(Type)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>DIQ</code></td>
<td>A <strong>DIQ Object</strong></td>
</tr>
<tr>
<td><code>filename</code></td>
<td>(String) Full path (optional) and filename with or without the *.xml extension. If the full path is not provided, the file is saved to the D:\ drive.</td>
</tr>
</tbody>
</table>

**Return Type**
Not Applicable

**Default**
Not Applicable

**Examples**

```vbnet
Diq.Save "myDIQfile"
or
Diq.Save "D:\myDIQfile.xml"
```

**C++ Syntax**

```cpp
HRESULT Save(BSTR filename);
```

**Interface**

`IDIQ2`
## SelectCableForAllPorts Method

**Description**
Selects the name of the cable to be associated with all the ports currently enabled on the VNA.

### VB Syntax
```
oPorts.SelectCableForAllPorts (value)
```

### Variable
- `value` (String) Name of the cable.

### Examples
```
oPorts.SelectCableForAllPorts("myCable")
```

### C++ Syntax
```
HRESULT SelectCableForAllPorts([in] BSTR cableName);
```

### Interface
`IUncertaintyPorts`
## OBS_SetCalInfo (power) Method

**Write-only**

**About Source Power Cal**

### SetCalInfo Method (for source power cals) - Superseded

<table>
<thead>
<tr>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>This command is replaced by <strong>SetCalInfoEx Method</strong></td>
</tr>
</tbody>
</table>

Specifies the technique to be used for the source power calibration about to be performed, and the channel and source port for which it is to be performed.

### VB Syntax

```vbnet
powerCalibrator.SetCalInfo calMethod, channel, sourcePort, calPower
```

### Variable (Type) - Description

- **powerCalibrator**
  - (object) - A SourcePowerCalibrator object

- **calMethod**
  - (enum NASourcePowerCalMethod) The method of gathering the source power correction data.

- **channel**
  - (long integer) - Number of the VNA channel (not power meter channel) on which the source power cal will be performed. If the channel doesn’t already exist, it will be created.

- **sourcePort**
  - (long integer) - Port number on which the source power cal will be performed.

- **calPower**
  - (double) - Specifies the power level that is expected at the desired reference plane (input or output of DUT) following the source power cal.

### Return Type

None

### Default

Not Applicable

### Examples

```vbnet
powerCalibrator.SetCalInfo naPowerMeter, 1, 1, -10
```

### C++ Syntax

```cpp
HRESULT SetCalInfo(tagNASourcePowerCalMethod calMethod, long channel, long sourcePort, double calPower);
```

### Interface

ISourcePowerCalibrator
# OBS SetCalInfo2 Method

**Write-only**

### About Source Power Cal

**SetCalInfo2 Method (for source power cals) - Superseded**

<table>
<thead>
<tr>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>This command is replaced by <a href="#">SetCalInfoEx Method</a></td>
</tr>
</tbody>
</table>

Specifies the technique, the channel, and the source port to be used for the source power calibration about to be performed.

### VB Syntax

```vbnet
powerCalibrator.SetCalInfo2 calMethod, channel, sourcePort, [powerOffset,] [display]
```

### Variable (Type) - Description

<table>
<thead>
<tr>
<th>powerCalibrator</th>
<th>(object) - A <code>SourcePowerCalibrator3</code> object</th>
</tr>
</thead>
<tbody>
<tr>
<td>calMethod</td>
<td>(enum NASourcePowerCalMethod) Selects the calibration method to be used for the source power cal acquisition.</td>
</tr>
<tr>
<td>channel</td>
<td>(long integer) - Number of the VNA channel (not power meter channel) on which the source power cal will be performed. If the channel does not already exist, it will be created.</td>
</tr>
<tr>
<td>sourcePort</td>
<td>(long integer) - Port number on which the source power cal will be performed.</td>
</tr>
<tr>
<td>[powerOffset]</td>
<td>(double) - Optional argument. Sets or returns a power level offset from the VNA test port power. This can be a gain or loss value (in dB) to account for components you connect between the source and the reference plane of your measurement. For example, specify 10 dB to account for a 10 dB amplifier at the input of your DUT. Following the calibration, the VNA power readouts are adjusted by this value. This argument performs the same function as <code>chan.SourcePowerCalPowerOffset</code> Property</td>
</tr>
<tr>
<td>[display]</td>
<td>(boolean) Optional argument. Enables and disables the display of power readings on the VNA screen. After the source power cal data is acquired, this setting is reset to ON. If unspecified, value is set to ON.</td>
</tr>
</tbody>
</table>

| True | Display of power readings is ON |
| False| Display of power readings is OFF |

### Return Type

None

### Default

Not Applicable

### Examples

```vbnet
powerCalibrator.SetCalInfo2 naPowerMeter, 1, 1, -10, True
```

### C++ Syntax

```cpp
HRESULT SetCalInfo2( tagNASourcePowerCalMethod enumCalMethod, long Channel, long SourcePort, double PowerOffset = 0., VARIANT_BOOL bDisplay = VARIANT_TRUE);
```
Interface

ISourcePowerCalibrator3
## UnselectCalset Method

**Description**
Unselects a Cal Set from the channel.

**VB Syntax**
```vbnet
channel.UnselectCalSet
```

**Variable**
(Type) - Description

- `channel`
  
  (object) - A `Channel` object

**Return Type**
Not Applicable

**Default**
Not Applicable

**Example**
```vbnet
channel.UnselectCalSet
```

**C++ Syntax**
```cpp
HRESULT UnselectCalSet();
```

**Interface**
`IChannel24`
Cable Object

Description

Provides access to the properties and methods that are used to reset data associated with the cable object.

Accessing the Cable object

Get a handle to the Cable object through the Cables Collection.

```vba
Dim app As AgilentPNA835x.Application
Set app = CreateObject("AgilentPNA835x.Application", <analyzerName>)

Dim oCables as UncertaintyManager
Set oCables = app.UncertaintyManager.Cables

Dim oCable1 as Cables(1)
```

Cables Collection

Description

Child of the UncertaintyManager Object. A collection that provides a mechanism for iterating through the Cable objects.

Accessing the Cables collection

Get a handle to an individual cable by specifying an item of the Cables collection.

```vba
Dim app As AgilentPNA835x.Application
Set app = CreateObject("AgilentPNA835x.Application", <analyzerName>)

Dim cabs As Cables
Set cabs = app.UncertaintyManager.Cables(1)
```

Characterizer Object

Description

Provides access to the properties and methods that are used to characterize Noise and Cables for the Dynamic Uncertainty application.

Accessing the Characterizer object

Get a handle to the Characterizer object.

```vba
Dim app As AgilentPNA835x.Application
Set app = CreateObject("AgilentPNA835x.Application", <analyzerName>)

Dim oChar as Characterizer
Set oChar = app.UncertaintyManager.Characterizer
```

DIQMeasurement Object

Description

Controls the Differential I/Q application settings.

Note: There are TWO objects for making Differential IQ settings.

See the DIQ Object

Accessing the Diff IQ and Diff IQMeas objects

```vba
Dim app as AgilentPNA835x.Application
app.CreateCustomMeasurementEx 2, "Differential I/Q", "IPwrF1"
Dim DIQ
Set DIQ = app.ActiveChannel.CustomChannelConfiguration
Dim DiqMeas
Set DiqMeas = app.ActiveMeasurement.CustomMeasurementConfiguration
```

</tbody>
</table>
ActiveXAxis Property

Description
Sets the information to display on the X-axis of the selected DIQ measurement. This command does not change the default setting for new traces.

See Also:
XAxisSource Property
XAxisDomain Property

VB Syntax

diqMeas.ActiveXAxis (domain) = source

Variable

(Type) - Description

diqMeas
A DIQMeas (object)

domain
(Enum as NAAxisDomainType) - Domain to display on the X-axis. Choose from:
0 – naFrequency - display the primary frequency range.
   1 – naPower - display the power sweep range
   2 – naPhase - display the phase sweep range
   3 – naDCValue - display the DC sweep range
   4 – naPoints - display the data points in the range

source
(String) Specific source for the selected domain.

Return Type
Enum

Default
0 – naFrequency

Examples

diqMeas.ActiveXAxis(1) = "Port 2" 'Write
variable = diqMeas.ActiveXAxis(1) 'Read

C++ Syntax

HRESULT put_ActiveXAxis(tagNAAxisDomainType domainType, BSTR source);

Interface
IDifferentialIQMeas
AutoRangeState Property

Description
Sets and reads the ON/ OFF state of auto range source attenuation.

On the Source Configuration dialog under Power, this is the Auto range source attenuator setting.

VB Syntax
DIQ.AutoRangeState (port) = value

Variable
(Type) - Description
DIQ
A Differential I/Q (object)
port
(String) Source port name. Use SourcePortNames to read a list of valid source ports.
value
(Boolean) Choose from:
ON or 1 - Auto range the source attenuation.
OFF or 0 - Do not Auto range the source attenuation.

Return Type
Boolean

Default
ON

Examples

diq.AutoRangeState = True 'Write

value = diq.AutoRangeState 'Read

C++ Syntax
HRESULT get_AutoRangeState(BSTR port, BOOL* AutoRangeState);
HRESULT put_AutoRangeState(BSTR port, BOOL AutoRangeState);

Interface
IDifferentialIQ
BalPort1PowerOffset Property

Sets and returns the power offset for Balanced port 1. \texttt{balStim.Mode} must be set to a True Stimulus mode. Applicable only with \texttt{Opt S93460A/B - iTMSA}.

**VB Syntax**

\texttt{balStim.BalPort1PowerOffset = value}

**Variable**

\texttt{balStim} \hspace{1cm} \text{A \textit{BalancedStimulus} (object)}

\texttt{value} \hspace{1cm} \text{(Double) - Power Offset in dB.}

**Return Type**

\texttt{Double}

**Default**

0

**Examples**

\texttt{balStim.BalPort1PowerOffset = 2 } \texttt{'Write}
\texttt{variable = balStim.BalPort1PowerOffset \hspace{1cm} 'Read}

**C++ Syntax**

\texttt{HRESULT get_BalPort1PowerOffset (double *pVal)}
\texttt{HRESULT put_BalPort1PowerOffset (double newVal)}

**Interface**

\texttt{IBalancedStimulus}
CalibrateAllChannelsEx Property

Description
Perform multiple instances of CalibrateAllChannels. You can assign a single client channel to multiple cal all instances. However, care should be taken here. If you create user calsets, all calsets will be created but only the last one will be applied. If you are only using a cal register, only the last cal all will be written to the cal register (only supports one calibration). The order that the cal alls are created should be the order in which they are saved (GenerateErrorTerms). This ensures that the client channel imports the proper ETerms.

VB Syntax
var = mgr.CalibrateAllChannelsEx (calAllNumber)

Variable
mgr
A CalManager (object)

var
Variable to store the returned calibration number.

calAllNumber
(Double) Calibration number.

Return Type
Not Applicable

Default
1

Examples
See the programming example.

C++ Syntax
HRESULT get_CalibrateAllChannelsEx(VARIANT* calAllNumber);

Interface
ICalManager13
CalKitType PhaseRef Property

Description
Sets and returns the Cal Kit to be used during the S-parameter portion of a Phase Reference calibration.

VB Syntax
phaseRef.CalKitType = value

Variable
(object) - Description

object
Any of the following:
PhaseReferenceCalibration (object)

value
(string) - Calibration Kit type. Case-sensitive. Use GetCompatibleCalKits to return a list of valid Cal Kits.

Return Type
String

Default
Not Applicable

Examples
phaseRef.CalKitType = "85052C"

C++ Syntax
HRESULT get_CalKitType(BSTR *calkit)
HRESULT put_CalKitType(BSTR calkit)

Interface
IPhaseReference2
### ChannelClients Property

**Description**
Returns the numbers of the channels using the calset.

**VB Syntax**

```vbnet
value = calSet.ChannelClients
```

**Variable**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>calSet</td>
<td>A <code>CalSet</code> (object)</td>
</tr>
</tbody>
</table>

**Return Type**

1-dimensional variant array

**Default**
Not Applicable

**Examples**

```vbnet
Set app = CreateObject("AgilentPNA835x.Application")
Set calset = app.GetCalManager.CalSets.Item(2)
arry = calSet.ChannelClients
For i = 0 to UBound(arry)
    MsgBox (arry(i))
Next
```

**C++ Syntax**

```cpp
HRESULT get_ChannelClients (VARIANT* vals)
```

**Interface**

`ICalSet8`
## ContentDescriptor Property

**Description**
Returns the Cal Types from the calset. Learn more about Cal Type.

**VB Syntax**

```vbnet
value = calSet.ContentDescriptor
```

**Variable**

- **Type**: Description
- **calSet**: A `CalSet` (object)

**Return Type**
1-dimensional variant array

**Default**
Not Applicable

**Examples**

```vbnet
Set app = CreateObject("AgilentPNA835x.Application")
Set calset = app.GetCalManager.CalSets.Item(2)
desc = calSet.ContentDescriptor
For i = 0 to UBound(desc)
    MsgBox (desc(i))
Next
```

**C++ Syntax**

```c++
HRESULT get_ContentDescriptor (VARIANT* vals)
```

**Interface**

`ICalSet8`
CoverageFactor Property

Sets and returns the coverage factor value to apply to the displayed uncertainty for the selected measurement trace. Coverage Factor corresponds to the level of confidence used in computing the specified measurement uncertainties.

VB Syntax

uncert.CoverageFactor = value

Variable

(Type) - Description

uncert
An Uncertainty (object)

value
Long. Choose from:

Coverage Factor  Approximate confidence level

1  67%
2  95%
3  99%
4  >99%

Return Type
Long

Default
2

Examples

uncert.CoverageFactor = True

C++ Syntax

HRESULT get_CoverageFactor(long *pSigma);
HRESULT put_CoverageFactor(long sigma);

Interface
IUncertainty
DeembedCoupler Property

Description
Sets and returns the state of de-embedding (reversing) the port 2 coupler.

VB Syntax
phaseRef.DeembedCoupler = value

Variable
(Type) - Description

object
PhaseReferenceCalibration (object)

value
(Boolean) Port 2 couple de-embed state. Choose from:

True - Configures the calibration to include additional measurements to de-embed the effects of reversing the coupler. (This is the same as clearing the “Omit Coupler” checkbox.)

False - Exclude additional measurements for de-embedding the effects of reversing the coupler.

Return Type
Boolean

Default
True

Examples
phaseRef.DeembedCoupler = True

value = phaseRef.DeembedCoupler  'Read

C++ Syntax
HRESULT get_DeembedCoupler(VARIANT_BOOL *value)
HRESULT put_DeembedCoupler(VARIANT_BOOL value)

Interface
IPhaseReference2
DisplayType Property

Description
Sets and returns the display type for uncertainties for the selected measurement trace.

VB Syntax
```
uncert_DisplayType = value
```

Variable
(Type) - Description

- uncert
  An Uncertainty (object)

- value
  (Enum as NAUncertaintyDisplayType) Display type. Choose from:
    - 0 or naUncertaintyDisplayNone - Display the trace without uncertainties.
    - 1 or naUncertaintyDisplayMaximum - Display the trace as the uncertainty maximum (measured or memory data + upper limit uncertainty values). Not supported with Smith Chart or Polar display format.
    - 2 or naUncertaintyDisplayMinimum - Display the trace as the uncertainty minimum (measured or memory data - lower limit uncertainty values). Not supported with Smith Chart or Polar display format.
    - 3 or naUncertaintyDisplayBar - Display the uncertainties as “error bars” around the trace. Not supported with Smith Chart or Polar display format.
    - 4 or naUncertaintyDisplayShade - Display the uncertainties as a shaded region around the trace. Not supported with Smith Chart or Polar display format.
    - 5 or naUncertaintyDisplayEllipse - Display the uncertainties in ellipse form. Supported only in Smith Chart or Polar display format.

Return Type
Enum as NAUncertaintyDisplayType

Default
naUncertaintyDisplayNone

Examples
```
uncert_DisplayType = naUncertaintyDisplayMaximum
```

C++ Syntax
```
HRESULT get_DisplayType(enum NAUncertaintyDisplayType *pDispType);

HRESULT put_DisplayType(enum NAUncertaintyDisplayType dispType);
```

Interface
IUncertainty
OBS_ECALCharacterization Property

Specifies the characterization data within an ECal module to be used for the calibration.

Learn more about ECal User Characterization.

VB Syntax

cal.ECALCharacterization(mod) = value

<table>
<thead>
<tr>
<th>Variable</th>
<th>(Type) - Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cal</td>
<td>Calibrator (object)</td>
</tr>
<tr>
<td>module</td>
<td>1 - ECal module</td>
</tr>
<tr>
<td>value</td>
<td>(Long) – Characterization data within the ECal module to be used for ECal operations. Choose from:</td>
</tr>
<tr>
<td></td>
<td>0 – Factory Characterization</td>
</tr>
<tr>
<td></td>
<td>1 – UserCharacterization1</td>
</tr>
<tr>
<td></td>
<td>2 – UserCharacterization2</td>
</tr>
<tr>
<td></td>
<td>3 – UserCharacterization3</td>
</tr>
<tr>
<td></td>
<td>4 – UserCharacterization4</td>
</tr>
<tr>
<td></td>
<td>5 – UserCharacterization5</td>
</tr>
</tbody>
</table>

Return Type
Long

Default
0 - Factory Characterization

Interface
ICalibrator2
OBS_ECALCharacterizationIndexList Property

Description
Returns a list of characterizations stored in the specified ECal module. Learn more about ECal User characterization.

VB Syntax
clist = cal.ECALCharacterizationIndexList(moduleNum)

Variable
(Type) - Description
clist
Variable to store the returned list of characterization index numbers.

cal
Calibrator (object)
module
ECal module from which to read user characterization numbers.

Return Type
Variant

Default
Not Applicable

Examples
Module 1 contains User Characterizations 1 and 3.
clist = cal.ECALCharacterizationIndexList(1)
Returns the following (0 always indicates the factory characterization):
0,1,3

C++ Syntax
HRESULT get_ECALCharacterizationIndexList( long moduleNumber, VARIANT *characterizations);

Interface
ICalibrator6
OBS_ECALPortMap_Property

Description

Note: This command is replaced by ECALPortMapEx

Specifies which ports of the ECal module are connected to which ports of the VNA for the DoECAL1Port and DoECAL2Port methods when the OrientECALModule property = False.

VB Syntax

cal.ECALPortMap = value

Variable

(Type) - Description

cal A Calibrator (object)

value (string)

(string) - Format this parameter in the following manner:

Aw,Bx,Cy,Dz

where

A, B, C, and D are literal ports on the ECAL module
w,x,y, and z are substituted for VNA port numbers to which the ECAL module port is connected.

Ports of the module which are not used are omitted from the string.

For example, on a 4-port ECal module with

port A connected to VNA port 2
port B connected to VNA port 3
port C not connected
port D connected to VNA port 1

the string would be: A2,B3,D1

DoECAL1Port or DoECAL2Port methods will fail if the port numbers passed to those methods are not in the string of this property and OrientECALModule property = False.

Return Type

String

Default

Not Applicable

Examples

Dim cal As Calibrator
Dim sPortMap As String
Set cal = PNAapp.ActiveChannel.Calibrator
cal.ECALPortMap = "a2,b1" 'Write
sPortMap = cal.ECALPortMap 'Read

C++ Syntax
HRESULT put_ECALPortMap(tagNAECALModule ecalModule, BSTR strPortMap);
HRESULT get_ECALPortMap(tagNAECALModule ecalModule, BSTR *strPortMap);

Interface
ICalibrator3
HiSLIPAddress Property

Description Set and returns HiSLIP instrument number.

VB Syntax

IOConfig.HiSLIPAddress = value

Variable (Type) - Description

IOConfig An IOConfiguration object.

value (Long) HiSLIP instrument number.

Return Type Long

Default 0 (which renders "inst0")

Examples

IOConfig.HiSLIPAddress = 1 'Write
value = IOConfig.HiSLIPAddress 'Read

C++ Syntax

HRESULT get HiSLIPAddress(long Address);
HRESULT put HiSLIPAddress(long * Address);

Interface IIOConfiguration
## HiSLIPPort Property

**Description**  
Set and returns the TCPIP port for HiSLIP communication.

**VB Syntax**  
```vbnet
IOConfig.HiSLIPPort = value
```

**Variable**  
*(Type) - Description*

- **IOConfig**  
  An **IOConfiguration** object.

- **value**  
  (Long) HiSlip port number.

**Return Type**  
Long

**Default**  
4880

**Examples**  
```vbnet
IOConfig.HiSLIPPort = 4880 'Write
tvalue = IOConfig.HiSLIPPort 'Read
```

**C++ Syntax**  
```cpp
HRESULT get HiSLIPPort(long port);
HRESULT put HiSLIPPort(long * port);
```

**Interface**  
**IIOConfiguration**
**IMDECalExtrapolation Property**

**Description**
Sets whether a Swept IMD or IMDx calibration can exceed the stop frequency limit of an ECal module.

**VB Syntax**
```vbnet
pref.IMDECalExtrapolation = bool
```

**Variable**
(Type) - Description

`pref`
A `Preferences` (object)

`bool`
(Boolean) - Choose from:
False - Do NOT allow extrapolation.
True - Allow extrapolation.

**Return Type**
Boolean

**Default**
False

**Examples**
```vbnet
pref.IMDECalExtrapolation = False 'Write
prefer = pref.IMDECalExtrapolation 'Read
```

**C++ Syntax**
```cpp
HRESULT put_IMDECalExtrapolation( VARIANT_BOOL bExtrap)
HRESULT get_IMDECalExtrapolation( VARIANT_BOOL *bExtrap)
```

**Interface**
`IPreferences14`
InSituCharacterization Property

Description
Sets or returns whether the device (CalPod module) that was specified by ECallID will be characterized as an in situ device. Learn more.

VB Syntax
ecalUser.InSituCharacterization = value

Variable
(Type) - Description

ecalUser An ECalUserCharacterizer (object)

value (Boolean) In situ state. Choose from:
True - Characterize the CalPod module as an in situ device.
False - Do NOT characterize the CalPod module as an in situ device.

Return Type
Boolean

Default
True

Examples
ecalUser.InSituCharacterization = False ' Write

Value = ecalUser.InSituCharacterization

C++ Syntax
HRESULT get_InSituCharacterization(VARIANT_BOOL *value);

HRESULT put_InSituCharacterization(VARIANT_BOOL value);

Interface
IECalUserCharacterizer3
InterfaceTypes Property

Description  Returns the valid interface types for the VNA.

VB Syntax  

value = IOConfig.InterfaceTypes

Variable  

(Type) - Description
value  (Variant) variable to store the returned information.

IOConfig  An IOConfiguration object.

Return Type  Array of strings

Default  Not Applicable

Examples  

values = IO.InterfaceTypes
For i = lbound(values) to ubound(values)
  Wscript.echo values(i)
next

C++ Syntax  

HRESULT InterfaceTypes(VARIANT* recognizedTypes);

Interface  IIOConfiguration
IsBlocked Property

Description
Reads whether the specified channel is currently 'blocked' from sweeping. Learn more about the Mechanical Devices dialog.

VB Syntax
value = chan.IsBlocked

Variable
(Type) - Description
value (boolean) - Choose either:
False - The channel IS blocked.
True - The channel is NOT blocked.

chan Channel (object)

Return Type
Boolean

Default
Not Applicable

Examples
block = chan.IsBlocked 'Read

C++ Syntax
HRESULT get_IsBlocked (VARIANT_BOOL *bBlock);

Interface
IChannel19
**OBS_IsECALModuleFound Property**

**Description**
Tests communication between the VNA and the specified ECal module.

**Note:** This property is replaced by `IsECALModuleFoundEx Property`.

**VB Syntax**
```
modFound = cal.IsECALModuleFound (module)
```

**Variable**

<table>
<thead>
<tr>
<th>Variable</th>
<th>(Type)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>modFound</td>
<td>(boolean)</td>
<td>Variable to store the returned test result. True - The VNA identified the presence of the specified ECal module. False - The VNA did NOT identify the presence of the specified ECal module.</td>
</tr>
</tbody>
</table>

| cal | (object) | A Calibrator object |

<table>
<thead>
<tr>
<th>module</th>
<th>(enum NAECALModule)</th>
<th>ECAL module. Choose from:</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>naECALModule_A</td>
<td></td>
</tr>
<tr>
<td>1</td>
<td>naECALModule_B</td>
<td></td>
</tr>
</tbody>
</table>

**Return Type**

Boolean

**Default**

Not applicable

**Examples**
```
Set cal = pna.ActiveChannel.Calibrator
moduleFound = cal.IsECALModuleFound(naECALModule_A)
```

**C++ Syntax**
```
HRESULT get_IsECALModuleFound(tagNAECALModule moduleNumber, VARIANT_BOOL *bModuleFound);
```

**Interface**

Calibrator
IterationCountForStep Property

Description
Designed to be used for an iterative cal standard such as a sliding load, this command returns the number of iterative measurement acquisitions that has been made for the specified step.

Zero (0) is returned if the step has not yet been measured.

For most cal steps that have already been measured, this command returns 1.

To count acquisition steps, set SlidingLoadAcquisitionBehavior.
value = guided.IterationCountForStep (n)

VB Syntax

Variable

`value` (Long) Variable to store the returned number of iterations that have been measured for the step.

`guided` GuidedCalibration (object)

`n` Guided Cal step number for which the acquisition number will be returned.

Use GenerateSteps Method to read the number of steps in the calibration.

Return Type
Long

Default
Not Applicable

Examples

`value = obj.IterationCountForStep(4)`

C++ Syntax

`HRESULT get_IterationCountForStep (long step, long *iterations);`

Interface
IGuidedCalibration10
LevelingMethod Property

Description: Sets and returns the tone power leveling mode.

VB Syntax: 
```
object.LevelingMethod = value
```

Variable (Type) - Description

- object: One of the following:
  - IMSpectrum Object
  - SweptIMD Object

- value (enum NAIMDLevelMethod) - Choose from:
  - 0 - naNOLevel
  - 1 - naLevelInput
  - 2 - naEqualizeOutput
  - 3 - naLevelOutput

Return Type: Enum

Default: naNOLevel

Examples:
- `imd.LevelingMethod = naEqualizeOutput` 'Write'
- `levMode = ims.LevelingMethod` 'Read'

C++ Syntax:
```
HRESULT get_LevelingMethod(tagNALevelingMethods* pVal)
HRESULT put_LevelingMethod(tagNALevelingMethods newVal)
```

Interface:
- IIMSpectrum
- ISweptIMD
**LOCount Property**

**Description**
Returns the number of LO acquisitions determined by the Image Reject selection and the span.

**VB Syntax**

```vb
value = sa.LOCount
```

**Variable**

- **sa**
  - A `SpectrumAnalyzer` (object)
- **value**
  - (Long) Variable to store the returned number of LOs.

**Return Type**
Long

**Default**
N/A

**Examples**

```vb
value = sa.LOCount
```

See an example program.

**C++ Syntax**

```cpp
HRESULT get_LOCount(long* val);
```

**Interface**
ISpectrumAnalyzer
MatchFrequencyRange Property

Description
Sets and reads the existing frequency ranges over which Match Correction is to be performed.

On the Source Configuration dialog under Match Correction, this is the Match Frequency Range setting.

VB Syntax
DIQ.MatchFrequencyRange (port) = value

Variable
(Type) - Description

DIQ
A Differential I/Q (object)

port
(String) Source port name. Use SourcePortNames to read a list of valid source ports.

value
(String) Frequency ranges, including the "F<n>", where <n> is the range number. Separate each range with a comma.

Return Type
String

Default
Depends on <port>

Examples

<table>
<thead>
<tr>
<th>Expression</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>oDIQ.MatchFrequencyRange(&quot;port 1&quot;) = &quot;F1,F2,F3&quot;</td>
<td></td>
</tr>
<tr>
<td>Value = oDIQ.MatchFrequencyRange(&quot;port 2&quot;)</td>
<td>Read</td>
</tr>
</tbody>
</table>

C++ Syntax
HRESULT get_MatchFrequencyRange(BSTR port, BSTR* MatchFrequencyRange);
HRESULT put_MatchFrequencyRange(BSTR port, BSTR MatchFrequencyRange);

Interface
IDIQ
**MatchRefReceiver Property**

**Description**

Sets and reads the reference receiver to be used to perform Match Correction.

On the *Source Configuration* dialog under Match Correction, this is the Reference Receiver setting.

**VB Syntax**

```
DIQ.MatchRefReceiver (port) = value
```

**Variable**

*(Type) - Description*

- **DIQ**
  
  *A Differential I/Q (object)*

- **port**
  
  *(String) Source port name. Use *SourcePortNames* to read a list of valid source ports.*

- **value**
  
  *(String) Choose any of the reference receivers in the analyzer using logical receiver notation. [Learn more](#). These would be "a_" where _ is the test port number.*

**Return Type**

String

**Default**

Depends on <port>

**Examples**

```
oDIQ.MatchRefReceiver("port 1") = "a1"
```

```
Value = oDIQ.MatchRefReceiver("port 2") 'Read
```

**C++ Syntax**

```
HRESULT get_MatchRefReceiver(BSTR port, BSTR* MatchRefReceiver);
HRESULT put_MatchRefReceiver(BSTR port, BSTR MatchRefReceiver);
```

**Interface**

IDIQ
MatchState Property

Description
Sets and reads the Match Correction ON/OFF state.

On the Source Configuration dialog under Match Correction, this is the Match Correction ON setting.

VB Syntax
DIQ.MatchState (port) = value

Variable
(Type) - Description

DIQ
A Differential I/Q (object)

port
(String) Source port name. Use SourcePortNames to read a list of valid source ports.

value
(Boolean) Choose from:

    True - Perform Match Correction
    False - Do not perform Match Correction.

Return Type
Boolean

Default
False

Examples

    oDIQ.MatchState("port 2") = True

    Value = oDIQ.MatchState("port 2") 'Read

C++ Syntax
HRESULT get_MatchState(BSTR port, BOOL* MatchState);
HRESULT put_MatchState(BSTR port, BOOL MatchState);

Interface
IDIQ
MatchTestReceiver Property

**Description**
Sets and reads the test port receiver to be used to perform Match Correction.

On the Source Configuration dialog under Match Correction, this is the Test Receiver setting.

**VB Syntax**

```
DIQ.MatchTestReceiver (port) = value
```

**Variable**

<table>
<thead>
<tr>
<th>(Type)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>DIQ</code></td>
<td>A Differential I/Q (object)</td>
</tr>
</tbody>
</table>

```
port (String) Source port name. Use SourcePortNames to read a list of valid source ports.
```

```
value (String) Choose any of the test port receivers in the analyzer using logical receiver notation. Learn more.
These would be "b_" where _ is the test port number.
```

**Return Type**

String

**Default**

Depends on <port>

**Examples**

```
oDIQ.MatchTestReceiver("port 1") = "b1"
```

```
Value = oDIQ.MatchTestReceiver("port 2") 'Read
```

**C++ Syntax**

```
HRESULT get_MatchTestReceiver(BSTR port, BSTR* MatchTestReceiver);
HRESULT put_MatchTestReceiver(BSTR port, BSTR MatchTestReceiver);
```

**Interface**

IDIQ
MeasurementNoiseUncertainty Property

**Description**
Sets and returns whether the noise contribution is currently included in the uncertainty values for the measurement trace.

**VB Syntax**
```
uncert.MeasurementNoiseUncertainty = value
```

**Variable**
(Type) - Description

uncert
(A n Uncertainty (object)

value
(Boolean) Choose from:
False - Noise contribution is NOT included.
True - Noise contribution is included.

**Return Type**
Boolean

**Default**
True

**Examples**
```
uncert.MeasurementNoiseUncertainty = True
```

**C++ Syntax**
```
HRESULT get_MeasurementNoiseUncertainty(VARIANT_BOOL *pState);

HRESULT put_MeasurementNoiseUncertainty(VARIANT_BOOL state);
```

**Interface**
IUncertainty
**MinimumIterationsForStep Property**

**Description**

Designed to be used for an iterative cal standard such as a sliding load, this command returns the minimum number of required iterative measurement acquisitions for the specified step.

For most connection steps this will return 1, but for an iterative cal standard such as a sliding load, it will return a number such as 5.

To count acquisition steps, set `SlidingLoadAcquisitionBehavior`.

```vbnet
value = guided.MinimumIterationsForStep(n)
```

**Variable**

- **value** (Type) - Description
  - (Long) Variable to store the returned number of minimum iterations for the step.
- **guided**
  - `GuidedCalibration` (object)
  - Guided Cal step number for which to return the number of iterative measurement acquisitions that have been made.

*Use GenerateSteps Method to read the number of steps in the calibration.*

**Return Type**

Long

**Default**

Not Applicable

**Examples**

```vbnet
value = obj.MinimumIterationsForStep(4)
```

**C++ Syntax**

```cpp
HRESULT get_MinimumIterationsForStep (long step, long *iterations);
```

**Interface**

`IGuidedCalibration10`
NarrowBand Property

Description
Turns narrowband noise figure compensation ON and OFF.

VB Syntax
noise.NarrowBand = value

Variable
- noise (variable) - A NoiseFigure (object)
- value (boolean) - Narrowband compensation state.
  - False - Narrowband compensation OFF
  - True - Narrowband compensation ON

Return Type
Boolean

Default
False

Examples
noise.NarrowBand = OFF 'Write
Narrowband = noise.NarrowBand 'Read

C++ Syntax
HRESULT get_NarrowBand(VARIANT_BOOL* on);
HRESULT put_NarrowBand(VARIANT_BOOL on);

Interface
INoiseFigure
### NoiseCalTemperature Property

**Description**
Read the cal temperature of the noise source.

**VB Syntax**
```vbnet
temp = enr.NoiseCalTemperature()
```

<table>
<thead>
<tr>
<th>Variable</th>
<th>(Type) - Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>temp</td>
<td>Variable to store the returned noise source temperature.</td>
</tr>
</tbody>
</table>

| enr       | An ENRFile (object) |

| Return Type | Double |
| Default     | Not Applicable |

<table>
<thead>
<tr>
<th>Examples</th>
<th>See example program</th>
</tr>
</thead>
</table>

| C++ Syntax | HRESULT NoiseCalTemperature(double* temp); |
| Interface  | IENRFile            |
OBS_Normalization Property

Write/Read          About Receiver Cal
Normalization Property  Superseded

Description

Note: This property is replaced by DoReceiverPowerCal Method.
Sets or returns normalization ON or OFF for the measurement. Normalization is currently supported only on measurements of unratioed power for the purpose of performing a receiver power calibration. If this property is set to ON for a ratioed measurement (such as S-parameter), it will return an error. This property will also return an error when set to ON if the divisor buffer doesn’t yet exist.

VB Syntax

meas.Normalization = value

Variable

(meas) - Description
(meas) - A Measurement object

(value) - (boolean)
False – Turns normalization OFF
True – Turns normalization ON

Return Type

Boolean

Default

False

Examples

meas.Normalization = False 'Write
normalized = meas.Normalization 'Read

C++ Syntax

HRESULT put_Normalization(VARIANT_BOOL bState);
HRESULT get_Normalization(VARIANT_BOOL *bState);

Interface

IMeasurement
**Number (ports) Property**

**Description**
Returns the VNA port number.

**VB Syntax**
```
value = port.Number
```

**Variable**
<table>
<thead>
<tr>
<th>(Type)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>port</td>
<td>A \texttt{Port} (object)</td>
</tr>
<tr>
<td>value</td>
<td>\texttt{Long Integer} - Variable to store the returned Port number.</td>
</tr>
</tbody>
</table>

**Return Type**
Long

**Default**
Not Applicable

**Examples**
```
value = port.Number \ 'Read the value
```

**C++ Syntax**
```
HRESULT get_Number([out,retval] long *port);
```

**Interface**
iPort
PhaseSweepState Property

Description
Sets and reads the ON / OFF state of phase sweep.

On the Source Configuration dialog under Phase, this is the Sweep Phase (On|Off) setting.

VB Syntax
DIQ.PhaseSweepState (port) = value

Variable
(Type) - Description

DIQ
A Differential I/Q (object)

port (String) Source port name. Use SourcePortNames to read a list of valid source ports.

value (Boolean) Choose from:

  True - Sweep phase.
  False - Do not sweep phase.

Return Type
Boolean

Default
False

Examples
oDIQ.PhaseSweepState("port 2") = True
Value = oDIQ.PhaseSweepState("port 2") 'Read

C++ Syntax
HRESULT get_PhaseSweepState(BSTR port, BOOL* PhaseSweepState);
HRESULT put_PhaseSweepState(BSTR port, BOOL PhaseSweepState);

Interface
IDIQ
PortAttenuator Property

Description
Sets and reads the amount of source attenuation. Sending this command will set AutoRangeState Property False.

On the Source Configuration dialog under Power, this is the Source Attenuation setting.

VB Syntax
DIQ.PortAttenuator (port) = value

Variable
(Type) - Description

DIQ
A Differential I/Q (object)

port
(String) Source port name. Use SourcePortNames to read a list of valid source ports.

value
(Double) Source Attenuation value. Choose from 0 to the maximum amount of source attenuation in the correct step size.

Rounding will occur when the selected value can not be achieved.

See attenuators for all VNA models.

Return Type
Double

Default
0

Examples
oDIQ.PortAttenuator("port 2") = 0

Value = oDIQ.PortAttenuator("port 2") 'Read

C++ Syntax
HRESULT get_PortAttenuator(BSTR port, double* PortAttenuator);
HRESULT put_PortAttenuator(BSTR port, double PortAttenuator);

Interface
IDIQ
PortLevelingMode Property

Description
Sets and reads the leveling mode to be used for the specified source port.

On the Source Configuration dialog under Power, this is the Leveling Mode setting.

VB Syntax
DIQ.PortLevelingMode (port) = value

Variable (Type) - Description

DIQ
A Differential I/Q (object)

port (String) Source port name. Use SourcePortNames to read a list of valid source ports.

value (String) Leveling mode. Choose from:
"Internal" - Standard internal analyzer leveling mode.
"Internal-R<n>,<p>" - Receiver Leveling, where:
<n> is the receiver name.
<p> is the source port to be leveled.

"Open Loop" - Open loop leveling, used during pulse conditions with the internal source modulators. NOT available on all models. No leveling is used in setting the source power. The lowest settable power, without attenuation, is limited to -30dBm. The source power level accuracy is very compromised. Use a source power calibration to make the source power somewhat more accurate.

"Open Loop-<n>,<p>" - Open loop leveling, where:
<n> is the receiver name.
<p> is the source port to be leveled

Return Type
String

Default
"Internal"

Examples

Value = oDIQ.PortLevelingMode("port 2") 'Read

C++ Syntax

HRESULT get_PortLevelingMode(BSTR port, BSTR* PortLevelingMode);
HRESULT put_PortLevelingMode(BSTR port, BSTR PortLevelingMode);

Interface
IDIQ
**PortPhaseParameter Property**

**Description**

Sets and reads the receivers to be used to measure the phase of the sources. The phase measurement will be the difference between these two receivers.

Select the receivers based on your application. You are responsible to make sure that your DUT configuration routes the signals of interest to the correct receivers. Otherwise, the phase will not be properly controlled.

On the **Source Configuration** dialog under Phase, this is the Control Receiver setting.

**VB Syntax**

```vbnet
DIQ.PortPhaseParameter (port) = value
```

**Variable**

- **(Type)** - Description

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DIQ</td>
<td>A Differential I/Q (object)</td>
</tr>
<tr>
<td>port</td>
<td>(String) Source port name. Use <strong>SourcePortNames</strong> to read a list of valid source ports.</td>
</tr>
<tr>
<td>value</td>
<td>(String) Phase parameter using the following syntax: <strong>rCont/rRef</strong></td>
</tr>
</tbody>
</table>

Where:

- **rCont** is the receiver used to measure the controlled source.
- **rRef** is the receiver used to measure the reference source.

Only logical receiver notation (a1,b1, etc) is available. Learn more.

Enclose the entire parameter in quotes.

**Return Type**

String

**Default**

Depends on `<port>`

**Examples**

```vbnet
oDIQ.PortPhaseParameter("port 1") = "a1/a3"
```

Value = oDIQ.PortPhaseParameter("port 2") 'Read

**C++ Syntax**

```c++
HRESULT get_PortPhaseParameter(BSTR port, BSTR* PortPhaseParameter);
HRESULT put_PortPhaseParameter(BSTR port, BSTR PortPhaseParameter);
```

**Interface**

IDIQ
PortPhaseStart Property

Description
Sets and reads the start value for a phase sweep.

On the Source Configuration dialog under Phase, this is the Start Phase setting.

VB Syntax
DIQ.PortPhaseStart (port) = value

Variable
(Type) - Description

DIQ
A Differential I/Q (object)

port (String) Source port name. Use SourcePortNames to read a list of valid source ports.

value (Double) Start phase sweep value in degrees. Choose any positive or negative value.

Return Type
Double

Default
0

Examples
oDIQ.PortPhaseStart("port 2") = -90

Value = oDIQ.PortPhaseStart("port 2") 'Read

C++ Syntax
HRESULT get_PortPhaseStart(BSTR port, double* PortPhaseStart);
HRESULT put_PortPhaseStart(BSTR port, double PortPhaseStart);

Interface
IDIQ
PortPhaseState Property

Sets and reads the ON/OFF state of phase control.

On the Source Configuration dialog under Phase, this is the Phase State setting.

### VB Syntax

```vbnet
DIQ.PortPhaseState (port) = value
```

### Variable

- **Type** - Description
  - **DIQ** - A Differential I/Q (object)
  - **port** - (String) Source port name. Use SourcePortNames to read a list of valid source ports.
  - **value** - (Enum as NAPhaseControlMode) Choose from:
    - **naPhaseControlOff or 0** - Phase is NOT set or controlled.
    - **naPhaseControlParameter or 1** - Phase is measured and iterated to within the specified tolerance. Specify the receivers and iteration properties using the Source:Phase commands.
    - **naPhaseControlOpenLoop or 3** - Phase is set, but receivers are NOT used to measure and iterate the phase of the source. Therefore, the setting of phase is not as accurate or stable. Open Loop mode can be used with phase sweep (for example, from 0 to 360 degrees). However, each sweep may not start at 0 degrees. NO settings on the Phase Control Setup dialog are used in Open Loop. After selecting Open Loop, set each source to ON (not Auto).

- **Return Type** - Enum
- **Default** - naPhaseControlOff or 0
- **Examples**
  ```vbnet
diq.PortPhaseState = naPhaseControlOff 'Write
value = diq.PortPhaseState 'Read
```

- **C++ Syntax**
  ```cpp
  HRESULT get_PortPhaseStateBSTR (BSTR port, tagNAPhaseControlMode* PortPhaseState);
  HRESULT put_PortPhaseState (BSTR port, tagNAPhaseControlMode PortPhaseState);
  ```

- **Interface**
  ```cpp
  IDifferentialIQ
  ```
PortPhaseStop Property

Description
Sets and reads the Stop value for a phase sweep.
On the Source Configuration dialog under Phase, this is the Stop Phase setting.

VB Syntax
DIQ.PortPhaseStop (port) = value

Variable (Type) - Description

DIQ
A Differential I/Q (object)

port (String) Source port name. Use SourcePortNames to read a list of valid source ports.

value (Double) Stop phase sweep value in degrees. Choose any positive or negative value.

Return Type
Double

Default
0

Examples
oDIQ.PortPhaseStop("port 2") = -90
Value = oDIQ.PortPhaseStop("port 2") 'Read

C++ Syntax
HRESULT get_PortPhaseStop(BSTR port, double* PortPhaseStop);
HRESULT put_PortPhaseStop(BSTR port, double PortPhaseStop);

Interface
IDIQ
PortReference Property

Description
Sets and reads the port to be used as a reference when controlling phase for the specified <port>.

On the Source Configuration dialog under Phase, this is the Refer To setting.

VB Syntax
DIQ.PortReference (port) = value

Variable
(Type) - Description

DIQ
A Differential I/Q (object)

port
(String) Source port name. Use SourcePortNames to read a list of valid source ports.

value
(String) Reference port. Use SourcePortNames to return a list of valid port names.

The two internal VNA sources are available ONLY at specific ports. For example on a 4-port PNA-X, the possible port pairings are: 1/3, 1/4, 2/3, or 2/4. Port 1 can NOT be paired with Port 2, and Port 3 can NOT be paired with Port 4. Learn more about these limitations.

Return Type
String

Default
Depends on <port>

Examples

<table>
<thead>
<tr>
<th>oDIQ.PortReference(&quot;port 1&quot;) = &quot;Port 3&quot;</th>
</tr>
</thead>
</table>

Value = oDIQ.PortReference("port 2")  'Read

C++ Syntax

HRESULT get_PortReference(BSTR port, BSTR* PortReference);
HRESULT put_PortReference(BSTR port, BSTR PortReference);

Interface
IDIQ

7945
PortStartPower Property

Description
Sets and reads the start value of a power sweep.

On the Source Configuration dialog under Power, this is the Start Power setting.

VB Syntax
DIQ.PortStartPower (port) = value

Variable
(Type) - Description

DIQ
A Differential I/Q (object)

port
(String) Source port name. Use SourcePortNames to read a list of valid source ports.

value
(Double) Power sweep start value in dBm. Choose start and stop value within a single attenuator range of the analyzer (generally about 30 dB).

Return Type
Double

Default
-5 dBm

Examples
oDIQ.PortStartPower("port 2") = 0

C++ Syntax
HRESULT get_PortStartPower(BSTR port, double* PortStartPower);
HRESULT put_PortStartPower(BSTR port, double PortStartPower);

Interface
IDIQ
PortStopPower Property

Description
Sets and reads the stop value of a power sweep.
On the Source Configuration dialog under Power, this is the Stop Power setting.

VB Syntax
DIQ.PortStopPower (port) = value

Variable
(Type) - Description

DIQ
A Differential I/Q (object)

port
(String) Source port name. Use SourcePortNames to read a list of valid source ports.

value
(Double) Power sweep stop value in dBm. Choose start and stop value within a single
attenuator range of the analyzer (generally about 30 dB).

Return Type
Double

Default
-5 dBm

Examples
oDIQ.PortStopPower("port 2") = 0
Value = oDIQ.PortStopPower("port 2") 'Read

C++ Syntax
HRESULT get_PortStopPower(BSTR port, double* PortStopPower);
HRESULT put_PortStopPower(BSTR port, double PortStopPower);

Interface
IDIQ
PowerSweepState Property

Description
Sets and reads the state of sweeping power.

On the Source Configuration dialog under Power, this is the Sweep Power (On|Off) setting.

VB Syntax
DIQ.PowerSweepState (port) = value

Variable
(Type) - Description

DIQ (object)

port (String) Source port name. Use SourcePortNames to read a list of valid source ports.

value (Boolean) Sweep Power state. Choose from:
- True - Perform power sweep.
- False - Do not perform power sweep.

Return Type
Boolean

Default
False

Examples
oDIQ.PowerSweepState("port 2") = True

Value = oDIQ.PowerSweepState("port 2") 'Read

C++ Syntax
HRESULT get_PowerSweepState(BSTR port, BOOL* PowerSweepState);
HRESULT put_PowerSweepState(BSTR port, BOOL PowerSweepState);

Interface
IDIQ
Properties Property

Description
Returns the properties of the calset. See the Calset Properties page.

VB Syntax
value = calSet.Properties

Variable
(Type) - Description

calSet  A CalSet (object)

Return Type
String

Default
Not Applicable

Examples
Set app = CreateObject("AgilentPNA835x.Application")
Set calset = app.GetCalManager.CalSets.Item(2)
props = CalSet.Properties
Msgbox (props)

C++ Syntax
HRESULT get_Properties (BSTR* vals);

Interface
ICalSet8
**PulseTimingDevice Property**

**Description**
Sets and reads the device being controlled by the pulse generator output.

**VB Syntax**
```
obj.TriggerInType = value
```

**Variable**
(Type) - Description

- **pulse** (Type) - Description
  - A PulseGenerator (object)

- **value** (enum NAPulseGenToDevice) Choose from:
  - 0 - ADC_TRIGGER - Enables offset pulses using ADC delay.
  - 1 - RF_MODULATOR - Indicates that the pulse signal is used to drive the RF modulator. Only one pulse generator output can be used to drive an RF source. If you try to set more than one pulse generator output to RF_MODULATOR, then the other one will be set to UserN (where "N" is the pulse generator number).
  - 2 - ADC_ACTIVITY - (Pulse4 only) Pulse4 can also be set to monitor ADC activity. This selection outputs a signal on Pulse4 when the ADC is active. This is the same as Pulse4OutAsADCAActivity.
  - 3 - USER1 - Use Pulse1 to control a DUT, DC biases, or other signals.
  - 4 - USER2 - Use Pulse2 to control a DUT, DC biases, or other signals.
  - 5 - USER3 - Use Pulse3 to control a DUT, DC biases, or other signals.
  - 6 - USER4 - Use Pulse4 to control a DUT, DC biases, or other signals.

**Return Type**
Enum

**Default**
RF_MODULATOR

**Examples**
```
pulse.PulseTimingDevice = RF_MODULATOR 'Write
```
```
value = pulse.PulseTimingDevice 'Read the value
```

**C++ Syntax**
```
HRESULT get_PulseTimingDevice(enum NAPulseGenToDevice *val);
HRESULT put_PulseTimingDevice(enum NAPulseGenToDevice val);
```

**Interface**
IPulseGenerator6
## RangeCoupleId Property

**Description**
Sets and reads the frequency range to couple settings to.

On the **Frequency Range** dialog under Coupling, this is the range to Couple To setting.

**VB Syntax**
```
DIQ.RangeCoupleId (n) = value
```

**Variable**

<table>
<thead>
<tr>
<th>(Type) - Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>DIQ</strong></td>
</tr>
<tr>
<td>A Differential I/Q (object)</td>
</tr>
</tbody>
</table>

| (Long Integer) Frequency range number. |
| **n** |

| (Long Integer) Frequency range number to couple to. This range should be already created using AddRange Method. |
| **value** |

**Return Type**
Long

**Default**
1

**Examples**
```vba
diq.RangeCoupleId 2 = 1 'Write, range 2 is coupled to range 1
value = diq.RangeCoupleId 2 'Read
```

**C++ Syntax**
```
HRESULT get_RangeCoupleId(long range, long* RangeCoupleId);
HRESULT put_RangeCoupleId(long range, long RangeCoupleId);
```

**Interface**
IDIQ
RangeCoupleState Property

Description
Sets and reads the ON / OFF state of frequency range coupling.

On the Frequency Range dialog under Coupling, this is the Couple (On|Off) setting.

VB Syntax
DIQ.RangeCoupleState (n) = value

Variable
(Type) - Description

DIQ
A Differential I/Q (object)

n (Long) Frequency range number.

value (Boolean) Choose from the following:
True - Range is coupled
False - Range is NOT coupled

Return Type
Boolean

Default
False

Examples
diq.RangeCoupleState 2 = True 'Write, range 2 is coupled to range 1
value = diq.RangeCoupleState 2 'Read

C++ Syntax
HRESULT get_RangeCoupleState(long range, VARIANT_BOOL* RangeCoupleState);
HRESULT put_RangeCoupleState(long range, VARIANT_BOOL RangeCoupleState);

Interface
IDIQ
RangeDivisor Property

Description
Sets and reads the value by which the coupled range will be divided to achieve the frequency range specified by <rNum>.

On the Frequency Range dialog under Coupling, this is the Divisor setting.

VB Syntax
DIQ.RangeDivisor (n) = value

Variable
(Type) - Description

DIQ
A Differential I/Q (object)

n (Long Integer) Frequency range number.

value (Long Integer) Divisor value. Choose a positive or negative integer.

Return Type
Long

Default
1

Examples

diq.RangeDivisor 2 = 2 'Write

value = diq.RangeDivisor 2 'Read

C++ Syntax
HRESULT get_RangeDivisor(long range, long* RangeDivisor);
HRESULT put_RangeDivisor(long range, long RangeDivisor);

Interface
IDIQ
RangeIFBW Property

**Description**
Sets and reads the receiver IF bandwidth setting.

On the Frequency Range dialog under Frequency, this is the IFBW setting.

**VB Syntax**

```vbnet
DIQ.RangeIFBW (n) = value
```

**Variable**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DIQ</td>
<td>A Differential I/Q (object)</td>
</tr>
</tbody>
</table>

| n      | (Long Integer) Frequency range number. |
| value  | (Double) IF Bandwidth in Hz. The list of valid IF Bandwidths is different depending on the analyzer model. (See the list.) If an invalid number is specified, the analyzer will round up to the closest valid number. |

**Return Type**
Double

**Default**
1e5

**Examples**

```vbnet
diq.RangeIFBW 1 = 1e3 'Write
```

```vbnet
value = diq.RangeIFBW 'Read
```

**C++ Syntax**

```cpp
HRESULT get_RangelFBW(long range, double* RangeIFBW);
HRESULT put_RangelFBW(long range, double RangeIFBW);
```

**Interface**

IDIQ
### RangeMultiplier Property

#### Description
Sets and reads the value by which the coupled range will be multiplied to achieve the frequency range specified by \( n \).

On the Frequency Range dialog under Coupling, this is the Multiplier setting.

#### VB Syntax
```
DIQ.RangeMultiplier (n) = value
```

SlidingLoadAcquisitionBehavior Property

Description
Specifies the behavior for guided cal steps that involve a sliding load in a cal that is about to be performed.

Send this command BEFORE sending the Initialize command.

VB Syntax
guided.\texttt{SlidingLoadAcquisitionBehavior} = value

Variable
\texttt{guided} - Description

\texttt{value} - (Enum as NASlidingLoadAcquisitionBehavior) Choose from:

0 - \texttt{naShowDialog} - The ‘Move Sliding Load’ prompt is presented on the VNA screen. All slide positions are measured from a single invocation of the acquire command.

1 - \texttt{naMeasureSlidePosition} - Each invocation of the acquire command for a sliding load step measures a single slide position and increments the slide position counter. No ‘Move Sliding Load’ prompt is presented on the VNA screen.

Return Type
Enum

Default
0 – \texttt{naShowDialog}

Examples
\begin{verbatim}
obj.SlidingLoadAcquisitionBehavior = naMeasureSlidePosition
\end{verbatim}

C++ Syntax
\begin{verbatim}
HRESULT put_SlidingLoadAcquisitionBehavior(enum NASlidingLoadAcquisitionBehavior behavior);
HRESULT get_SlidingLoadAcquisitionBehavior(enum NASlidingLoadAcquisitionBehavior *behavior);
\end{verbatim}

Interface
IGuidedCalibration10
### SourceRange Property

**Description**
Sets and reads the frequency range number to which the specified source port will be set. At the top of the Source Configuration dialog this is the Frequency Range setting.

**VB Syntax**

```
DIQ.SourceRange (port) = value
```

**Variable**

- **DIQ**
  A Differential I/Q (object)
- **port**
  (String) Source port name. Use SourcePortNames to read a list of valid source ports.
- **value**
  (Long) Frequency range number.

**Return Type**

Long

**Default**

1

**Examples**

```
oDIQ.SourceRange("port 2") = 1
Value = oDIQ.SourceRange("port 2") 'Read
```

**C++ Syntax**

```
HRESULT get_SourceRange(long range, long* SourceRange);
HRESULT put_SourceRange(long range, long SourceRange);
```

**Interface**

IDIQ
Stage3Coefficients Property

Sets and returns Stage3Coefficients.

VB Syntax

```vbnet
spm4.Stage3Coefficients = values
```

Variable

(Type) - Description

`spm4` A `SignalProcessingModuleFour` (object)

`values` (Float array) Filter coefficients

Return Type

Variant

Default

Not Applicable

Examples

```vbnet
spm4.Stage3Coefficients = +0.0E+000,+6.4E+001,+2.56E+002
mode = spm4.Stage3Coefficients
```

C++ Syntax

```cpp
HRESULT get_Stage3Coefficients(Float* pCoefs);
HRESULT put_Stage3Coefficients(Float pCoefs);
```

Interface

`ISignalProcessingModuleFour2`
Stage3MaximumCoefficient Property

Description
Returns the maximum value of the stage 3 coefficients.

VB Syntax
value = spm4.Stage3MaximumCoefficient

Variable
(Type) - Description

value  
(Float) Variable to store the returned Max coefficient.

spm4  
A SignalProcessingModuleFour (object)

Default
Not Applicable

Examples
mode = spm4.Stage3MaximumCoefficient

C++ Syntax
HRESULT get Stage3MaximumCoefficient(float* val);

Interface
ISignalProcessingModuleFour2
Stage3MaximumCoefficientCount Property

Description
Returns the maximum number of coefficients for Stage3 (102400).

VB Syntax
value = spm4.Stage3MaximumCoefficientCount

Variable
(Type) - Description
value (Long) Variable to store the returned Max coefficient count.

spm4
A SignalProcessingModuleFour (object)

Default
Not Applicable

Examples
mode = spm4.Stage3MaximumCoefficientCount 'Read

C++ Syntax
HRESULT get_Stage3MaximumCoefficientCount(long* val);

Interface
ISignalProcessingModuleFour2
Stage3MinimumCoefficient Property

Description  Returns the Minimum value of the stage 3 coefficients.

VB Syntax  

    value = spm4.Stage3MinimumCoefficient

Variable  

(Type) - Description

value  (Float) Variable to store the returned Min coefficient.

spm4  A SignalProcessingModuleFour (object)

Default  Not Applicable

Examples  

    mode = spm4.Stage3MinimumCoefficient

C++ Syntax  

    HRESULT get_Stage3MinimumCoefficient(float* val);

Interface  

    ISignalProcessingModuleFour2
Stage3MinimumCoefficientCount Property

Description
Returns the minimum number of coefficients for Stage3 (2).

VB Syntax
\[ \text{value} = \text{spm4.Stage3MinimumCoefficientCount} \]

Variable
(Type) - Description

value
(Long) Variable to store the returned Min coefficient count.

spm4
A SignalProcessingModuleFour (object)

Default
Not Applicable

Examples
\[ \text{mode} = \text{spm4.Stage3MinimumCoefficientCount} \]

C++ Syntax
HRESULT get_Stage3MinimumCoefficientCount(long* val);

Interface
ISignalProcessingModuleFour2
StandardDefinitionsEnabled Property

Description
Sets and returns the ON/OFF state of allowing the uncertainty associated with the standard definitions in the cal kits to contribute to the uncertainty of a calibration performed using Dynamic Uncertainty. The uncertainty data for the Cal standards must also be present at the time the calibration is performed.

VB Syntax
uncertMan.StandardDefinitionsEnabled = value

Variable
(Type) - Description

uncertMan
An UncertaintyManager Object

desvalue
(Boolean) Enable state. Choose from:
True - Standard definition uncertainty ON.
False - Standard definition uncertainty OFF.

Return Type
Boolean

Default
True

Examples
uncertMan.StandardDefinitionsEnabled = True
See example program

C++ Syntax
HRESULT get.StandardDefinitionsEnabled([out,retval] VARIANT_BOOL* pState);
HRESULT put.StandardDefinitionsEnabled([in] VARIANT_BOOL state);

Interface
IUncertaintyManager
SupportsInSituCharacterization Property

Description
Returns whether the device that was specified by ECallID is a CalPod module, which is capable of being characterized as an in situ device.

VB Syntax
value = ecalUser.SupportsInSituCharacterization

Variable
(Type) - Description
value (Boolean)
True - Device is a CalPod module
False - Device is NOT a CalPod module

ecalUser
An ECalUserCharacterizer (object)

Return Type
Boolean

Examples
Value = ecalUser.SupportsInSituCharacterization

C++ Syntax
HRESULT get_SupportsInSituCharacterization(VARIANT_BOOL *value);

Interface
IECalUserCharacterizer3
TraceDeviationType Property

Description
Calculates the deviation from a least-squares best fit line.

VB Syntax
meas.TraceDeviationType = value

Variable (Type) - Description
meas
A Measurement (object)
value
(enum NATraceDeviationType) - Choose from:
0 - naTraceDeviationOff
1 - naTraceDeviationLinear
2 - naTraceDeviationParabolic
3 - naTraceDeviationCubic

Return Type
Enum

Default
0 - naTraceDeviationOff

Examples
meas.TraceDeviationType = naTraceDeviationLinear 'Write
DeviationType = meas.TraceDeviationType 'Read

C++ Syntax
HRESULT get_TraceDeviationType(tag NATraceDeviationType* devType)
HRESULT put_TraceDeviationType(tag NATraceDeviationType devType)

Interface
IMeasurement20
UnknownMixerInputPower Property

Description
Sets and returns the input power level to the unknown mixer.

VB Syntax
phaseRef.UnknownMixerInputPower = value

Variable
(Type) - Description

object
PhaseReferenceCalibration (object)

value
(Double) Input power level in dBm.

Return Type
Double

Default
-15 dBm

Examples
phaseRef.UnknownMixerInputPower = 0
value = phaseRef.UnknownMixerInputPower 'Read

C++ Syntax
HRESULT get_UnknownMixerInputPower(double *value)
HRESULT put_UnknownMixerInputPower(double value)

Interface
IPhaseReference2
UnknownMixerLOFrequency Property

Description
Sets and returns the LO Frequency to the unknown mixer.

VB Syntax
phaseRef.UnknownMixerLOFrequency = value

Variable
(Type) - Description

object
PhaseReferenceCalibration (object)

value
(Double) LO frequency in Hz. Choose a value between 3 GHz and (Max Frequency minus 1GHz).

For a 26.5 GHz VNA, the range is 3 GHz to 25.5 GHz.

For best results, use the default LO frequency. 3.351GHz. This frequency produces no spurs from the input/LO frequency. And also the Input frequency will have no band breaks.

Return Type
Double

Default
3.351 GHz

Examples
phaseRef.UnknownMixerLOFrequency = 3.351e9
value = phaseRef.UnknownMixerLOFrequency  'Read

C++ Syntax
HRESULT get_UnknownMixerLOFrequency(double *value)
HRESULT put_UnknownMixerLOFrequency(double value)

Interface
IPhaseReference2
# UnknownMixerLOPower Property

**Description**
Sets and returns the LO power level to the unknown mixer.

**VB Syntax**
phaseRef.UnknownMixerLOPower = value

**Variable**
- **Object**
  - `PhaseReferenceCalibration (object)`
- **Value**
  - (Double) LO power level in dBm.

**Return Type**
Double

**Default**
10 dBm

**Examples**

<table>
<thead>
<tr>
<th>Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>phaseRef.UnknownMixerLOPower = 10</code></td>
<td></td>
</tr>
<tr>
<td><code>value = phaseRef.UnknownMixerLOPower</code> 'Read'</td>
<td></td>
</tr>
</tbody>
</table>

**C++ Syntax**

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>HRESULT get_UnknownMixerLOPower(double *value)</td>
<td></td>
</tr>
<tr>
<td>HRESULT put_UnknownMixerLOPower(double value)</td>
<td></td>
</tr>
</tbody>
</table>

**Interface**
IPhaseReference2
UseInternalCalFactors Property

Description
Enables/disables use of internal calibration factors for power sensors with built-in calibration factors and reads the current state.

VB Syntax
pwrSensor.UseInternalCalFactors = state

Variable
pwrSensor
(Type) - Description
A PowerSensorAsReceiver (object)

state
(boolean)
False - Disables the use of internal calibration factors.
True - Enables the use of internal calibration factors.

Return Type
Boolean
Default
False

Examples
' This example script demonstrates the set/get of the 'UseInternalCalFactors' property
' on the PMAR PowerSensor COM object for an existing PMAR named 'MyPMAR'.
Option Explicit
dim app
Set app = CreateObject("AgilentPNA835x.Application")
app.Preset
app.ActiveChannel.Hold True
app.ActiveChannel.CWFrequency = 1E9
app.ActiveChannel.SweepType = 3 'naCWTimeSweep
app.ActiveChannel.NumberOfPoints = 3
dim externalDevices
Set externalDevices = app.ExternalDevices
dim externalDevice
Set externalDevice = externalDevices.Item("MyPMAR")
externalDevice.Active = True
'Create a PMAR trace with power sensor connected to port 3
app.ActiveMeasurement.ChangeParameter "MyPMAR", 3
dim PMAR
Set PMAR = externalDevice.ExtendedProperties
' Disable use of the sensor's internal cal factors, take a sweep and report the Mean
PMAR.UseInternalCalFactors = False
externalDevice.IOEnable = True
app.ActiveChannel.Single True
MsgBox "UseInternalCalFactors = " & PMAR.UseInternalCalFactors & ", Mean measured val = " & app.ActiveMeasurement.Mean
' Enable use of the sensor's internal cal factors, take another sweep and report the Mean again
externalDevice.IOEnable = False
PMAR.UseInternalCalFactors = True
externalDevice.IOEnable = True
app.ActiveChannel.Single True
MsgBox "UseInternalCalFactors = " & PMAR.UseInternalCalFactors & ", Mean measured val = " & app.ActiveMeasurement.Mean

C++ Syntax

```cpp
HRESULT get_UseInternalCalFactors(VARIANT_BOOL *pVal)
HRESULT put_UseInternalCalFactors(VARIANT_BOOL Val)
```

Interface

IPowerSensorAsReceiver3
VisaResourceString Property

Description
Returns the valid resource string for the specified interface type.

Use InterfaceTypes Property to read the valid interface types for the VNA.

VB Syntax
value = IOConfig.VisaResourceString (InterfaceType)

Variable (Type) - Description
value
(String) variable to store the returned information.

IOConfig
An IOConfiguration object.

InterfaceType
(String) Name of Interface Type

ReturnType
String

Default
Not Applicable

Examples
value = IOConfig.VisaResourceString "HISLIP"
returns: TCPIP0::<compID>::hislip0::INST

C++ Syntax
HRESULT get VisaResourceString(BSTR interfaceType, long visaResourceID, BSTR* resourceString);

Interface
IIOConfiguration
XAxisSource Property

Description
Returns the X-Axis source of the selected measurement.

See Also:
ActiveXAxis Property
XAxisDomain Property

VB Syntax
\[ src = 
\]

Variable (Type) - Description
\( src \) (String) - Variable to store the returned source for the domain that is displayed on the X-axis. See ActiveXAxis Property for possible returned values.

DIQMeas A DIQMeas (object)

Example
\[
src = \text{diqMeas.XAxisSource} \quad \text{'Read}
\]
\[
\text{'Returns "Port 1"}
\]

C++ Syntax
HRESULT get_XAxisSource(BSTR* source);

Interface
IDIQMeas

DIQ

Calculate:DIQ:XAXis Commands

Allows you to set the DIQ channel X-Axis domain and source.

Click to view the command details.

**see Also**

Sense:DIQ commands
Example Programs
Learn about Differential IQ Application
Synchronizing the Analyzer and Controller
SCPI Command Tree

```
CALCulate<ch>:DIQ:XAXis <domain>,<source>
```

Applicable Models: N522xB, N524xB

*(Write-only)* Sets the information to display on the X-axis of the selected DIQ measurement. This command does not change the default setting for new traces.

**Parameters**

- `<ch>`
  - *The Differential IQ channel number. If unspecified, value is set to 1.*

- `<domain>`
  - Character - Domain to display on the X-axis. Choose from:
    - FREQuency - display the primary frequency range
    - POWER - display the power sweep range
    - PHASe - display the phase sweep range
    - DCValue - display the DC sweep range
    - POINTs - display the data points in the range

- `<source>`
  - String - Specific source for the selected domain. Choose from the following:
For this X-Axis Domain:  | Choose one of these X-Axis Sources
---|---
Frequency | Frequency Range (F1, F2, etc.)
Power | Source port (Port 1, Port 2, etc.)
Phase | Source port (Port 1, Port 2, etc.)
DC Value | DC Source (AO1, AO2, etc.)
Points | Points (N/A)

Examples

CALC:DIQ:XAX FREQ,"F2"
calculate:diq:xaxis power,"Port 1"

Query Syntax
Not Applicable

Default
FREQ,"F1"

CALCulate<ch>:DIQ:XAXis:DOMain?

Applicable Models: N522xB, N524xB

(Read-only) Returns the X-Axis domain of the selected measurement.

Parameters

<ch>
The Differential IQ channel number. If unspecified, value is set to 1.

Example

CALC:DIQ:XAX:DOM?

'Possible returned values:
FREQuency - display the primary frequency range.
POWer - display the power sweep range
PHASe - display the phase sweep range
DCValue - display the DC sweep range
POINts - display the data points in the range

Return Type
Character

Default
FREQuency
CALCulate<ch>:DIQ:XAXis:SOURce?

Applicable Models: N522xB, N524xB

(Read-only) Returns the X-Axis source of the selected measurement.

- SCPI Command Tree

Notes:
Critical Note: CALCulate commands act on the selected measurement. You can select one measurement for each channel using Calc:Par:MNUM or Calc:Par:Select. Learn more.

CALC:PAR:CAT? alone can NOT be used to return a balanced measurement parameter. If a balanced measurement transform is being performed, then additional querying of the CALC:FSIM system is required to determine the balanced parameter type. See an example.

BPORt versus LPORt commands - For each command in this subsystem that includes a BPORt keyword, there is an LPORt equivalent. The commands are identical except for the way in which the balanced / logical port numbers are specified:

The BPORt commands refer to the Balanced port number. There can only be up to two balanced ports. This method is compatible with the ENA network analyzer.

The LPORt commands refer to the Logical port number. A balanced port can appear as either logical port 1, 2, or 3. These are the references as they appear in the front-panel user interface.

CALCulate<cnum>:FSIMulator:BALun:BPORt<pnum>:OFFSet:PHASE <value>

Applicable Models: All
(Read-Write) Sets the phase offset between the two balanced stimulus ports. This command only applies when CALC:FSIM:BAL:STIM:MOD is set to a True Mode - Not Single-Ended. Requires Opt S93460A/B. Learn more about iTMSA Power and Phase offset.
See Critical Note

Parameters

<cnum> Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, <cnum> is set to 1.
Balanced port number. Choose from 1 to 999.

Phase offset value in degrees.

**Examples**

```
CALC:FSIM:BAL:BPOR:OFFS:PHAS 10
calculate2:fsimulator:balun:bport:offset:phase 300
```

See example iTMSA program

**Query Syntax**

```
CALCulate<cnum>:FSIMulator:BALun:BPORt<pnum>:OFFSet:PHASe?
```

**Return Type**

Numeric

**Default**

0

---

**CALCulate<cnum>:FSIMulator:BALun:BPORt<pnum>:OFFSet:POWer <value>**

Applicable Models: All

(Read-Write) Sets the power offset between the two balanced stimulus ports. This command only applies when CALC:FSIM:BAL:STIM.MOD is set to a True Mode - Not Single-Ended. Requires Opt S93460A/B. Learn more about iTMSA Power and Phase offset.

See Critical Note

**Parameters**

**<cnum>**

Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, <cnum> is set to 1.

**<pnum>**

Balanced port number. Choose from 1 to 999.

**<value>**

Power offset value in dB.

**Examples**

```
CALC:FSIM:BAL:BPOR:OFFS:POW 2
calculate2:fsimulator:balun:bport:offset:power .2
```

See example iTMSA program

**Query Syntax**

```
CALCulate<cnum>:FSIMulator:BALun:BPORt<pnum>:OFFSet:POWer?
```

**Return Type**

Numeric

**Default**

0

---

**CALCulate<cnum>:FSIMulator:BALun:BPORt<pnum>:STIMulus:TRUe:STATe <bool>**
Applicable Models: All
(Read-Write) Sets and reads the True Mode state for a specified balanced port.

See Critical Note

Parameters

<cnum> Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, <cnum> is set to 1.

<pnum> Balanced port number. Choose from 1 to 999.

<bool> Choose from:
OFF (or 0) Turns True Mode OFF
ON (or 1) Turns True Mode ON

Examples

CALC:FSIM:BAL:BPOR2:STIM:TRU:STAT 1
calculate2:fsimulator:balun:bport2:stimulus:state off

Query Syntax
CALCulate<cnum>:FSIMulator:BALun:BPORt<pnum>:STIMulus:TRUe:STATe?

Return Type Boolean

Default Off

CALCulate<cnum>:FSIMulator:BALu:BPORt<pnum>:SWEep:PHASe:STARt <value>

Applicable Models: All
(Read-Write) Sets the start value for a phase sweep.
Learn more about Phase Sweep.
See Critical Note

Parameters

<cnum> Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, <cnum> is set to 1.

<pnum> Balanced port number. Choose any VNA port (1 to 999). Only one port can have phase sweep.

<value> Phase sweep start value in degrees. Choose a value between -360 and 360.

Examples

**CALCulate<cnum>:FSIMulator:BALun:BPORt<pnum>:SWEep:PHASe:STARt**?

**Return Type** Numeric

**Default** 0

---

**CALCulate<cnum>:FSIMulator:BALun:BPORt<pnum>:SWEep:PHASe:STOP <value>**

Applicable Models: All

(Read-Write) Sets the stop value for a phase sweep.

Learn more about Phase Sweep.

See Critical Note

**Parameters**

- **<cnum>**
  Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, <cnum> is set to 1.

- **<pnum>**
  Balanced port number. Choose any VNA port (1 to 999). Only one port can have phase sweep.

- **<value>**
  Phase sweep stop value in degrees. Choose a value between -360 and 360.

**Examples**

```
```

```
```

---

**CALCulate<cnum>:FSIMulator:BALun:CZConversion:BPORt<pnum>:IMAG <value>** Superseded

Applicable Models: All

(Read-Write) Sets the imaginary part of the impedance value for the common port impedance conversion function.

See Critical Note

**Parameters**

---

7995
<cnum> Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, <cnum> is set to 1.

<pnum> Balanced port number. Choose from 1 to 999.

Note: The numbering of logical ports is different from balanced ports. This command works the same as the ENA network analyzer. If there is only one balanced port, it is Balanced Port 1, regardless of the port mapping assignment. Learn more.

)value> Imaginary part of the Impedance value in Units. Choose a number between 0 and 1E18.

Examples

```
CALC:FSIM:BAL:CZC:BPOR:IMAG 0
```

```
calculate2:fsimulator:balun:czconversion:bport:imag 300
```

Query Syntax

```
CALCulate<cnum>:FSIMulator:BALun:CZConversion:BPORt<pnum>:IMAG?
```

Return Type Numeric

Default 0
CALCulate<cnum>:FSIMulator:BALun:CZConversion:BPORt<pnum>:Z0[:R] <value> Superseded

Applicable Models: All

(Read-Write) Sets the real part of the impedance value for the common port impedance conversion function. Set either this single value or set the real and imaginary parts separately. The imaginary part is set to 0.0 using this command.

See Critical Note

Parameters

<cnum> Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, <cnum> is set to 1.

<pnum> The number of balanced ports. For example, if the device topology was SE-BAL-SE-BAL, then this configuration would have 6 logical ports and 3 balanced ports. Learn more about logical and balanced ports.

<value> Impedance value in ohms. Choose a number between 0 to 1E7.

Examples

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CALC:FSIM:BAL:ZC:BPORT:Z0 50</td>
<td></td>
</tr>
<tr>
<td>calculate2:fsimulator:balun:czconversion:bport:z0:r 75</td>
<td></td>
</tr>
</tbody>
</table>

Query Syntax

CALCulate<cnum>:FSIMulator::BALun:CZConversion:BPORt<pnum>:Z0[:R]?

Return Type

Numeric

Default

See Common Mode Port Z Conversion Default

---

CALCulate<cnum>:FSIMulator:BALun:CZConversion:STATE <bool> Superseded

Applicable Models: All

(Read-Write) Sets the common port impedance conversion function ON/OFF. Must also set the fixture simulator function to ON using CALC:FSIM:STAT.

See Critical Note

Parameters

---
### Channel number of the measurement

There must be a selected measurement on that channel. If unspecified, `<cnum>` is set to 1.

### State of common port impedance conversion function

Choose from:
- **OFF** (or 0) Conversion OFF
- **ON** (or 1) Conversion ON

#### Examples

```
CALC:FSIM:BAL:CZC:STAT 1
calculate2:fsimulator:balun:czconversion:state off
```

#### Query Syntax

```
CALCulate<cnum>:FSIMulator:BALun:CZConversion:STATe?
```

#### Return Type

Boolean

#### Default

Off

### Superseded

#### Parameters

- **<cnum>**
  - Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, `<cnum>` is set to 1.

- **<pnum>**
  - Logical port number. Choose from 1 to 999.

  **Note:** See Balanced port versus Logical port.

- **<value>**
  - Imaginary part of the Impedance value in Units. Choose a number between 0 and 1E18.

#### Examples

```
CALC:FSIM:BAL:CZC:LPOR:IMAG 0
calculate2:fsimulator:balun:czconversion:lport:imag 300
```

#### Query Syntax

```
CALCulate<cnum>:FSIMulator:BALun:CZConversion:LPORt<pnum>:IMAG?
```

#### Return Type

Numeric

#### Default

0
**CALCulate<cnm>:FSIMulator:Balun:CZConversion:LPORt<pnm>:REAL <vlue>**  Superseded

Applicable Models: All

*Read-Write* Sets the real part of the impedance value for the common port impedance conversion function.

See Critical Note

### Parameters

**<cnm>**
Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, `<cnm>` is set to 1.

**<pnm>**
Logical port number. Choose from 1 to 999.

*Note: See Balanced port versus Logical port.*

**<vlue>**
Real part of the Impedance value in Units. Choose a number between 0 and 1E18.

### Examples

```
```

```
calculate2:fsimulator:balun:czconversion:lport:real 50
```

### Query Syntax

```
CALCulate<cnm>:FSIMulator:Balun:CZConversion:LPORt<pnm>:REAL?
```

### Return Type
Numeric

### Default
See Common Mode Port Z Conversion Default

---

**CALCulate<cnm>:FSIMulator:Balun:CZConversion:LPORt<pnm>:Z0[:R] <vlue>**  Superseded

Applicable Models: All

*Read-Write* Sets the real part of the impedance value for the common port impedance conversion function. Set either this single value or set the real and imaginary parts separately. The imaginary part is set to 0.0 using this command.

See Critical Note

### Parameters

**<cnm>**
Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, `<cnm>` is set to 1.

**<pnm>**
Logical port number. Choose from 1 to 999.

*Note: See Balanced port versus Logical port.*

---
**<value>**

Impedance value in ohms. Choose a number between 0 to 1E7.

**Examples**

```
cALC:FSIM:BAI\L:CAZC:LPOP:R 20 50
calculate2:fsimulator:balun:czconversion:1port:z0:r 75
```

**Query Syntax**

CALCulate<cnum>:FSIMulator:BAI\Lun:CZConversion:LPOP<pnum>:Z0[:R]?

**ReturnType**

Numeric

**Default**

See Common Mode Port Z Conversion Default

---

**CALCulate<cnum>:FSIMulator:BAI\Lun:DEVice <char>**

Applicable Models: All

(Read-Write) Selects the device type for the balanced measurement. To map the device type logical ports to the VNA physical ports, use the CALCulate:DTOPology, CALC:FSIM:BAI\Lun:TOP:XXXXX command.

See Critical Note

### Parameters

- **<cnum>**
  
  Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, <cnum> is set to 1.

- **<char>**
  
  - BALanced - 1 port balanced device (2 ports)
  - BBALanced - Balanced - Balanced device (4 ports).
  - BALSended - Balanced - Single-ended device (3 ports).
  - SBALanced - Single-ended - Balanced device (3 ports).
  - CUST - Define custom device type for systems with greater than 4 ports.

**Examples**

```
cALC:FSI\M:BAI\L:DEV SSB
calculate2:fsimulator:balun:device bbal
```

**Query Syntax**

CALCulate<cnum>:FSIMulator:BAI\Lun:DEVice?

**ReturnType**

Character

**Default**

SBALanced

---

**CALCulate<cnum>:FSIMulator:BAI\Lun:D\MCircuit:BPOPrt<pnum>:PARameters:C <value>**

Superseded

Applicable Models: All

(Read-Write) Sets the Capacitance value of the differential matching circuit.

- **Parameters**
  - `<cnum>`: Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, `<cnum>` is set to 1.
  - `<pnum>`: Balanced port number. Choose from 1 to 999.
  - `<value>`: Capacitance value in farads. Choose a number between -1E18 to 1E18

- **Examples**
  ```
  ```

- **Query Syntax**
  ```
  CALCulate<cnum>:FSIMulator:BALun:DMCircuit:BPORt<pnum>:PARameters:C?
  ```

- **Return Type** Numeric

- **Default** 0

---

(Read-Write) Sets the Conductance value of the differential matching circuit.

- **Parameters**
  - `<cnum>`: Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, `<cnum>` is set to 1.
  - `<pnum>`: Balanced port number. Choose from 1 to 999.

- **Note**: The numbering of logical ports is different from balanced ports. This command works the same as the ENA network analyzer. If there is only one balanced port, it is Balanced Port 1, regardless of the port mapping assignment. Learn more.

- **Examples**
  ```
  CALC:FSIM:BAL:DMC:BPOR:PARameters:G <value>
  ```

- **Applicable Models**: All

- **Superseded**

- **Query Syntax**
  ```
  CALCulate<cnum>:FSIMulator:BALun:DMCircuit:BPORt<pnum>:PARameters:G <value>
  ```

- **Return Type** Numeric

- **Default** None

---
### Conductance value in siemens

Choose a number between $-1E18$ to $1E18$.

#### Examples

<table>
<thead>
<tr>

<th>Command</th>
<th>Value</th>
</tr>
</thead>
</table>

#### Query Syntax

```
CALCulate<cnum>:FSIMulator:BALun:DMCircuit:BPORt<pnum>:PARameters:R?
```

#### Return Type

Numeric

#### Default

0

---

Applicable Models: All

(Read-Write) Sets the Inductance value of the differential matching circuit.

See Critical Note

---

### Parameters

#### <cnum>

Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, <cnum> is set to 1.

#### <pnum>

Balanced port number. Choose from 1 to 999.

Note: The numbering of logical ports is different from balanced ports. This command works the same as the ENA network analyzer. If there is only one balanced port, it is Balanced Port 1, regardless of the port mapping assignment. Learn more.

#### <value>

Inductance value in henries. Choose a number between $-1E18$ to $1E18$.
### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;cnum&gt;</td>
<td>Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, &lt;cnum&gt; is set to 1.</td>
</tr>
<tr>
<td>&lt;pnum&gt;</td>
<td>Balanced port number. Choose from 1 to 999. Note: The numbering of logical ports is different from balanced ports. This command works the same as the ENA network analyzer. If there is only one balanced port, it is Balanced Port 1, regardless of the port mapping assignment. Learn more.</td>
</tr>
<tr>
<td>&lt;value&gt;</td>
<td>Resistance value in ohms. Choose a number between -1E18 to 1E18.</td>
</tr>
</tbody>
</table>

### Examples

```
CALC:FSIM:BAL:DMC:BPORT:PARAMETERS:R 100
```

### Query Syntax

```
CALCulate<cnum>:FSIMulator:BALun:DMCircuit:BPORT<pnum>:PARAMeters:R?
```

### Return Type

Numeric

### Default

0

---

### Applicable Models: All

(Read-Write) Sets the Resistance value of the differential matching circuit.

See Critical Note

### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;cnum&gt;</td>
<td>Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, &lt;cnum&gt; is set to 1.</td>
</tr>
<tr>
<td>&lt;pnum&gt;</td>
<td>Balanced port number. Choose from 1 to 999.</td>
</tr>
</tbody>
</table>

---

### Applicable Models: All

(Read-Write) Sets the differential matching circuit type. To select a user-defined circuit, specify IN ADVANCE the 2-port touchstone filename with `CALC:FSIM:BAL:DMC:BPORT:USER:FILename`. If you do not specify the appropriate file and you select USER, an error occurs and NONE is automatically selected.

See Critical Note

### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;cnum&gt;</td>
<td>Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, &lt;cnum&gt; is set to 1.</td>
</tr>
<tr>
<td>&lt;pnum&gt;</td>
<td>Balanced port number. Choose from 1 to 999.</td>
</tr>
</tbody>
</table>
Note: The numbering of logical ports is different from balanced ports. This command works the same as the ENA network analyzer. If there is only one balanced port, it is Balanced Port 1, regardless of the port mapping assignment. Learn more.

Circuit type. Choose from:

NONE - Specifies no-circuit.

PLPC - Specifies the circuit that consists of shunt L and shunt C.

USER - Specifies the user-defined circuit.

Examples

```
CALC:FSIM:BAL:DMC:BPOR2 PLPC
```

```
calculate2:fsimulator:balun:dmcircuit:bport1:type none
```

Query Syntax

```
CALCulate<cnum>:FSIMulator:BALun:DMCircuit:BPORt<pnum>:TYPE?
```

Return Type

Character

Default

PLPC

CALCulate<cnum>:FSIMulator:BALun:DMCircuit:BPORt<pnum>:USER:FILename <string> Superseded

Applicable Models: All

(Read-Write) Specifies the 2-port touchstone file in which the information on the user-defined differential matching circuit is saved. Following this command, send CALC:FSIM:BAL:DMC:BPOR2 USER. If the specified file does not exist, an error occurs when you set the type of differential matching circuit to USER.

See Critical Note

Parameters

- `<cnum>`
  Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, `<cnum>` is set to 1.

- `<pnum>`
  Balanced port number. Choose from 1 to 999.

- `<string>`
  File name and extension (.s2P) of the differential matching circuit. Files are stored in the default folder "D:\". To recall from a different folder, specify the full path name.
CALCulate<cnum>:FSIMulator:BALun:DMCircuit:STATe <bool> Superseded

Applicable Models: All

(Read-Write) Sets the differential matching circuit embedding function ON/OFF. Must also set the fixture simulator function to ON using CALC:FSIM:STAT.

See Critical Note

Parameters

<cnum>
Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, <cnum> is set to 1.

<bool>
State of differential matching circuit embedding function. Choose from

OFF (or 0) Matching circuit OFF
ON (or 1) Matching circuit ON

Examples
CALC:FSIM:BAL:DMC:STAT 1
calculate2:fsimulator:balun:dmcircuit:state off

Query Syntax
CALCulate<cnum>:FSIMulator:BALun:DMCircuit:STATe?

Return Type
Boolean

Default
Off

CALCulate<cnum>:FSIMulator:BALun:DMCircuit:LPORt<pnum>:PARameters:C <value> Superseded

Applicable Models: All

(Read-Write) Sets the Capacitance value of the differential matching circuit.
Parameters

<cnun> Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, <cnun> is set to 1.

<pnum> Logical port number. Choose from 1 to 999.

Note: See Balanced port versus Logical port.

<value> Capacitance value in farads. Choose a number between -1E18 to 1E18

Examples

Query Syntax

CALCulate<cnun>:FSIMulator:BALun:DMCircuit:LPORt<pnum>:PARameters:C?

Return Type

Numeric

Default

0

CALCulate<cnun>:FSIMulator:BALun:DMCircuit:LPORt<pnum>:PARameters:G <value> Superseded

Applicable Models: All

(Read-Write) Sets the Conductance value of the differential matching circuit.

See Critical Note

Parameters

<cnun> Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, <cnun> is set to 1.

<pnum> Logical port number. Choose from logical 1 to 999.

Note: See Balanced port versus Logical port.

<value> Conductance value in siemens. Choose a number between -1E18 to 1E18.

Examples

calculate2:fsimulator:balun:dmcircuit:lport:parameters:g 1E-3

Query Syntax

CALCulate<cnun>:FSIMulator:BALun:DMCircuit:LPORt<pnum>:PARameters:G?
CALCulate<cnum>:FSIMulator:BALun:DMCircuit:LPORt<pnum>:PARameters:L <value>

Applicable Models: All

(Read-Write) Sets the Inductance value of the differential matching circuit.

See Critical Note

Parameters

<cnum> Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, <cnum> is set to 1.

<pnum> Logical port number. Choose from 1 to 999.

Note: See Balanced port versus Logical port.

[value] Inductance value in henries. Choose a number between -1E18 to 1E18.

Examples

Query Syntax

CALCulate<cnum>:FSIMulator:BALun:DMCircuit:LPORt<pnum>:PARameters:L?

Return Type Numeric

Default 0

CALCulate<cnum>:FSIMulator:BALun:DMCircuit:LPORt<pnum>:PARameters:R <value>

Applicable Models: All

(Read-Write) Sets the Resistance value of the differential matching circuit.

See Critical Note

Parameters
### Parameters

- **<cnum>**
  
  Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, `<cnum>` is set to 1.

- **<pnum>**
  
  Logical port number. Choose from 1 to 999.

  **Note:** See Balanced port versus Logical port.

- **<value>**
  
  Resistance value in ohms. Choose a number between -1E18 to 1E18.

### Examples

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CALC:FSIM:BAL:DMC:LPOR:PARameters:R 100</td>
<td>Set resistance to 100 ohms</td>
</tr>
<tr>
<td>calculate2:fsimulator:balun:dmcircuit:lport:parameters:r 4E3</td>
<td>Set resistance to 4E3 ohms</td>
</tr>
</tbody>
</table>

### Query Syntax

```
CALCulate<cnum>:FSIMulator:BALun:DMCircuit:LPORt<pnum>:PARameters:R?
```

### Return Type

Numeric

### Default

0

---

**CALCulate<cnum>:FSIMulator:BALun:DMCircuit:LPORt<pnum>[:TYPE] <char>** Superseded

*Applicable Models: All*

*(Read-Write)* Sets the differential matching circuit type. To select a user-defined circuit, specify IN ADVANCE the 2-port touchstone filename with `CALC:FSIM:BAL:DMC:LPOR:USER:FILename`. If you do not specify the appropriate file and you select USER, an error occurs and NONE is automatically selected.

See Critical Note

#### Parameters

- **<cnum>**
  
  Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, `<cnum>` is set to 1.

- **<pnum>**
  
  Logical port number. Choose from 1 to 999.

  **Note:** See Balanced port versus Logical port.

- **<char>**
  
  Circuit type. Choose from:

  - **NONE** - Specifies no-circuit.
  - **PLPC** - Specifies the circuit that consists of shunt L and shunt C.
  - **USER** - Specifies the user-defined circuit.

#### Examples

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CALC:FSIM:BAL:DMC:LPOR2 PLPC</td>
<td>Set PLPC circuit</td>
</tr>
<tr>
<td>calculate2:fsimulator:balun:dmcircuit:lport1:type none</td>
<td>Set type to none</td>
</tr>
</tbody>
</table>
### Query Syntax

```
CALCulate<cnum>:FSIMulator:BALun:DMCircuit:LPORt<pnum>:TYPE?
```

### Return Type

Character

### Default

PLPC

---

### Applicable Models: All

**Superseded**

*(Read-Write)* Specifies the 2-port touchstone file in which the information on the user-defined differential matching circuit is saved. Following this command, send `CALC:FSIM:BAL:DMC:BPOR2 USER`. If the specified file does not exist, an error occurs when you set the type of differential matching circuit to USER.

See Critical Note

### Parameters

- **<cnum>**
  Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, <cnum> is set to 1.

- **<pnum>**
  Logical port number. Choose from 1 to 999.

  **Note:** See Balanced port versus Logical port.

- **<string>**
  File name and extension (.s2P) of the differential matching circuit. The default location where files are stored is "D:\". To recall from a different folder, specify the full path name.

### Examples

```
calculate2:fsimulator:balun:dmcircuit:lport:user:filename
"D:\myFile.s2P"
```

### Query Syntax

```
CALCulate<cnum>:FSIMulator:BALun:DMCircuit:LPORt<pnum>:USER:FILename <string> Superseded
```

### Return Type

String

### Default

Not Applicable

---

### Applicable Models: All

**Superseded**

```
CALCulate<cnum>:FSIMulator:BALun:DZConversion:BPORt<pnum>:IMAG <value> Superseded
```

Applicable Models: All

---

8009

(Read-Write) Sets the imaginary part of the impedance value for the differential port impedance conversion function.

See Critical Note

Parameters

<cnum> Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, <cnum> is set to 1.

<pnum> Balanced port number. Choose from 1 to 999.

Note: The numbering of logical ports is different from balanced ports. This command works the same as the ENA network analyzer. If there is only one balanced port, it is Balanced Port 1, regardless of the port mapping assignment. Learn more.

<value> Imaginary part of the Impedance value in Units. Choose a number between 0 and 1E18.

Examples

```
CALC:FSIM:BL:DZC:BPOR:IMAG 0
calculate2:fsimulator:balun:dczconversion:bport:imag 300
```

Query Syntax

```
CALCulate<cnum>:FSIMulator:BLUn:DZConversion:BPORt<pnum>:IMAG?
```

Return Type Numeric

Default 0

---

`CALCulate<cnum>:FSIMulator:BLUn:DZConversion:BPORt<pnum>:REAL <value>` Superseded

Applicable Models: All

(Read-Write) Sets the real part of the impedance value for the differential port impedance conversion function.

See Critical Note

Parameters

<cnum> Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, <cnum> is set to 1.

<pnum> Balanced port number. Choose from 1 to 999.

Note: The numbering of logical ports is different from balanced ports. This command works the same as the ENA network analyzer. If there is only one balanced port, it is Balanced Port 1, regardless of the port mapping assignment. Learn more.
<value> Real part of the Impedance value in Units. Choose a number between 0 and 1E18

Examples

<table>
<thead>
<tr>
<th>Command</th>
</tr>
</thead>
<tbody>
<tr>
<td>CALC:FSIM:BAL:dzc:bpor:real 50</td>
</tr>
<tr>

---

CALCulate<cnum>:FSIMulator:BALun:FIXTure:OFFSet:PHASe <bool>

Applicable Models: N522xB, N523xB, N524xB, M937xA, P937xA
(Read-Write) Sets and reads the state of "Phase Offset - Offset as Fixture" with True Mode balanced measurements. Learn more about iTMSA phase and power offset.

See Critical Note

Parameters

<cnum>

Channel number of the measurement. There must be a selected true mode balanced measurement on that channel. If unspecified, <cnum> is set to 1.

<bool>

State of phase Offset as Fixture.

OFF (or 0) Offset is applied but is NOT included as a fixture in the output calculations.

ON (or 1) Offset is applied and included as a fixture in the output calculations.

Examples

CALC:FSIM:BAL:FIXT:OFFS:PHAS 0
calculate2:fsimulator:balun:fixture:offset:phase on

See example iTMSA program

Query Syntax

CALCulate<cnum>:FSIMulator:BALun:FIXTureOFFSet:PHASe?
**CALCulate\(<cnum>\):FSIMulator:BA Lun:FIXTure:OFFSet:POWer <bool>**

Applicable Models: N522xB, N523xB, N524xB, M937xA, P937xA

(Read-Write) Sets and reads the state of "Power Offset - Offset as Fixture" with True Mode balanced measurements.

Learn more about iTMSA phase and power offset.

See Critical Note

**Parameters**

\(<cnum>\) Channel number of the measurement. There must be a selected true mode balanced measurement on that channel. If unspecified, \(<cnum>\) is set to 1.

\(<bool>\) State of power Offset as Fixture.

**OFF** (or 0) Offset is applied but is NOT included as a fixture in the output calculations.

**ON** (or 1) Offset is applied and included as a fixture in the output calculations.

**Examples**

```
CALC:FSIM:BAL:FIXT:OFFS:POW 0
```

```
calculate2:fsimulator:balun:fixture:offset:power on
```

**Query Syntax**

```
CALCulate\(<cnum>\):FSIMulator:BA Lun:FIXTureOFFSet:POWer?
```

**Return Type** Boolean

**Default** Off

---

**CALCulate\(<cnum>\):FSIMulator:BA Lun:FIXTure:PHASe <bool>**

Applicable Models: N522xB, N523xB, N524xB, M937xA, P937xA

(Read-Write) Sets and reads the state of "Phase Sweep - Offset as Fixture" (labeling on GUI).

Learn more about iTMSA Phase Sweep.

See Critical Note

**Parameters**

\(<cnum>\) Channel number of the measurement. There must be a selected true mode balanced measurement on that channel. If unspecified, \(<cnum>\) is set to 1.
State of phase sweep offset as a fixture:

OFF (or 0)  Phase Sweep offset disabled.
ON (or 1)  Phase Sweep offset enabled.

Examples

<table>
<thead>
<tr>
<th>Query Syntax</th>
<th>Return Type</th>

See example iTMSA program

CALCulate<cnum>:FSIMulator:BALun:LPORt<pnum>:OFFSet:POWer <value>

Applicable Models: All
(Read-Write) Sets the power offset between the two balanced stimulus ports. This command only applies when CALC:FSIM:BAL:STIM:MOD is set to a True Mode - Not Single-Ended. Requires Opt S93460A/B. Learn more about iTMSA Power and Phase offset.

See Critical Note

Parameters

<cnum> Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, <cnum> is set to 1.

<pnum> Logical port number. Choose from 1 to 999.

<value> Power offset value in dB.

Examples

```
CALC:FSIM:BAL:LPOR:OFFS:POW 2
calculate2:fsimulator:balun:lport:offset:power .2
```

See example iTMSA program

Query Syntax

```
CALCulate<cnum>:FSIMulator:BALun:LPORt<pnum>:SWEep:PHASe:STARt <value>
```

Applicable Models: All

(Read-Write) Sets the start value for a phase sweep.

Learn more about Phase Sweep.

See Critical Note

Parameters

<cnum> Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, <cnum> is set to 1.

<pnum> Logical port number. Choose any VNA port (1 to 999). Only one port can have phase sweep.

<value> Phase sweep start value in degrees. Choose a value between -360 and 360.

Examples

```
```

Query Syntax

```
CALCulate<cnum>:FSIMulator:BALun:LPORt<pnum>:SWEep:PHASe:STARt?
```
Return Type: Numeric

Default: 0

**CALCulate<cnum>:FSIMulator: BALun:LPORt<pnum>:SWEep:PHASe:STOP <value>**

Applicable Models: All
(Read-Write) Sets the stop value for a phase sweep.
Learn more about Phase Sweep.
See Critical Note

Parameters

- `<cnum>`: Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, `<cnum>` is set to 1.
- `<pnum>`: Logical port number. Choose any VNA port (1 to 999). Only one port can have phase sweep.
- `<value>`: Phase sweep stop value in degrees. Choose a value between -360 and 360.

Examples

```plaintext
```

Query Syntax: `CALCulate<cnum>:FSIMulator: BALun:LPORt<pnum>:SWEep:PHASe:STOP?`

Return Type: Numeric

Default: 0

**CALCulate<cnum>:FSIMulator: BALun:PARameter<n>:BALSended[:DEFine] <char>**

Applicable Models: All
(Read-Write) For a Balanced-Single-ended device type, selects the measurement parameter for the specified trace.
Set device type using `CALC:FSIM: BAL:DEV`
See Critical Note

Parameters

- `<cnum>`: Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, `<cnum>` is set to 1.
Trace number on the specified channel <cnum>

Balanced - Single-ended Measurement parameter. Choose from:

<table>
<thead>
<tr>

Sdd11

---

**CALCulate<cnum>:FSIMulator:BALun:PARameter<n>:BALanced[:DEFine] <char>**

Applicable Models: All

(Read-Write) For a Balanced device type, selects the measurement parameter for the specified trace. Set device type using **CALC:FSIM:BAL:DEV**

See Critical Note

Parameters

- `<cnum>`
  
  Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, `<cnum>` is set to 1.

- `<n>`
  
  Trace number on the specified channel `<cnum>`

- `<char>`
  
  Balanced Measurement parameter. Choose from:
  
  SDD11 - Specifies Sdd11.
  SCD11 - Specifies Scd11.
  SDC11 - Specifies Sdc11.
  SCC11 - Specifies Scc11.

Examples

```
CALC:FSIM:BAL:PAR:BAL SDD11
```
**CALCulate<cnum>:FSIMulator:BALun:PARameter<n>:BBALanced[:DEFine] <char>**

- **Applicable Models:** All
- **(Read-Write)** For a Balanced - Balanced device type, selects the measurement parameter for the specified trace. Set device type using CALC:FSIM:BAL:DEV
- **See Critical Note**

### Parameters

- **<cnum>**
  - Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, <cnum> is set to 1.

- **<n>**
  - Trace number on the specified channel <cnum>

- **<char>**
  - Balanced- Balanced Measurement parameter. Choose from:

<table>
<thead>
<tr>
<th>Sdd11</th>
<th>Sdd12</th>

CALCulate<cnum>:FSIMulator:BALun:PARameter:CATalog?

Applicable Models: All

(Read-only) This query returns the list of measurement parameters available for the currently selected device type and topology.

Balanced parameters are defined by specifying a topology: selecting which ports are balanced ports and which ports are single ended. Once a topology has been specified, that topology will yield a set of available measurement parameters. Set the topology using CALC:FSIM:BAL:DEVice.
**CALCulate<n>:FSIMulator:BALun:PARameter:CUSTom[:DEFine] <string>**

Applicable Models: Multi-port systems with > 4 ports

*(Read-Write)* Defines a balanced measurement parameter corresponding to a custom topology for systems where the port count is expandable beyond 4 ports. The device type parameter must be set to CUST using the `CALC:FSIM:BAL:DEV` command to use this command.

**See Also:**
- `CALC:FSIM:BAL:PAR:CAT?` - returns the list of parameters available for the currently selected device type and topology.
- `CALC:DTOPology` - maps device type logical ports to VNA physical ports.

**See Critical Note**

**Parameters**

- `<cnum>`: Channel number.
- `<string>`: Balanced measurement parameter name. The parameter selections depend on the currently selected topology.

**Examples**

```
CALC:PAR:COUNT 1
CALC:FSIM:BAL:DEV CUST
CALC:FSIM:BAL:PAR:STATE ON
CALC:DTOPology "SSBSS",1,2,4,5,3,6
CALC:FSIM:BAL:PAR:CUST:DEF "SDD22"
```

**Query Syntax**

`CALCulate<n>:FSIMulator:BALun:PARameter:CUSTom[:DEFine]?`

**Return Type**

String

**Default**

Not Applicable

---

**CALCulate<n>:FSIMulator:BALun:PARameter<n>:SBALanced[:DEFine] <char>**
Applicable Models: All
(Read-Write) For a Single-ended - Balanced device type, selects the measurement parameter for the specified trace. Set device type using CALC:FSIM:BAL:DEV
See Critical Note

Parameters

<cnum> Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, <cnum> is set to 1.

<n> Trace number on the specified channel <cnum>

<char> Single-ended - Balanced Measurement parameter. Choose from:

<table>
<thead>
<tr>
<th>Sss11</th>
<th>Ssd12</th>
<th>Ssc12</th>
</tr>
</thead>
<tbody>
<tr>
<td>Sds21</td>
<td>Sdd22</td>
<td>Sdc22</td>
</tr>
<tr>
<td>Scs21</td>
<td>Scd22</td>
<td>Scc22</td>
</tr>
<tr>
<td>Imb</td>
<td>CMRR1</td>
<td>CMRR2</td>
</tr>
<tr>
<td></td>
<td>(Sds21/Scs21)</td>
<td>(Ssd12/Ssc12)</td>
</tr>
</tbody>
</table>

Examples

CALC:FSIM:BAL:PAR:SBAL SSD12
calculate1:fsimulator:balun: parameter2:sbalanced:define imb

Query Syntax

CALCulate<cnum>:FSIMulator:BALun:PARameter<n>:SBBalanced[:DEFine]?

Return Type Character

Default Sss11

---

CALCulate<cnum>:FSIMulator:BALun:PARameter<n>:SSBalanced[:DEFine] <char>

Applicable Models: All
(Read-Write) For a Single-ended - Single-ended - Balanced device type, selects the measurement parameter for the specified trace. Set device type using CALC:FSIM:BAL:DEV
See Critical Note

Parameters

<cnum> Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, <cnum> is set to 1.
Trace number on the specified channel <cnum>

Single-ended - Single-ended - Balanced Measurement parameter. Choose from:

<table>
<thead>
<tr>
<th>Sss11</th>
<th>Sss12</th>
<th>Ssd13</th>
<th>Ssc13</th>
</tr>
</thead>
<tbody>
<tr>
<td>Sss21</td>
<td>Sss22</td>
<td>Ssd23</td>

```

 calculus1:fsimulator:balun: parameter2:ssbalanced:define imb1

Query Syntax

```
CALCulate<cnum>:FSIMulator:BALun:PARameter<n>:SSBalanced[:DEFine]?
```

Return Type

Character

Default

Sss11

---

**CALCulate<cnum>:FSIMulator:BALun:PARameter:STATe <bool>**

Applicable Models: All

(Read-Write) Turns balanced transform ON and OFF.

See Critical Note

Parameters

- **<cnum>**
  - Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, <cnum> is set to 1.

- **<bool>**
  - State of balanced transform. Choose from
    - OFF (or 0) Balanced Transform OFF
    - ON (or 1) Balanced Transform ON

Examples

```
CALC:FSIM:BAL:PAR:STAT 1
```

 calculus1:fsimulator:balun:parameter:state off

Query Syntax

```
CALCulate<cnum>:FSIMulator:BALun:PARameter:STATe?
```
Return Type  Boolean

**Default**  OFF

### CALCulate\(<cnum>\):FSIMulator:BALun:PHASe:SWEep:PORT \(<\text{intValue}>\)

**Applicable Models:** All

(Read-Write) For a Balanced device type, specifies which balanced port the phase will be swept if `CALC:FSIM:BAL:PHAS:SWE:STAT` is set to ON.

See Critical Note

**Parameters**

\(<\text{cnum}>\)  
Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, \(<\text{cnum}>\) is set to 1.

\(<\text{intValue}>\)  
Balanced port. Enter 1 or 2. Up to 2 True Mode balanced ports are possible.

**Examples**

```
CALC:FSIM:BAL:PHAS:SWE:PORT 2
```

```
calculate1:fsimulator:balun:phase:sweep:port 2
```

**Query Syntax**

```
CALCulate\(<\text{cnum}>\):FSIMulator:BALun:PHASe:SWEep:PORT?
```

**Return Type**  Numeric

**Default**  Not Applicable

### CALCulate\(<cnum>\):FSIMulator:BALun:PHASe:SWEep:STATe \(\text{<bool}>\)

**Applicable Models:** N522xB, N523xB, N524xB

(Read-Write) Sets and reads the state of phase sweep.

Learn more about iTMSA Phase Sweep.

See Critical Note

**Parameters**

\(<\text{cnum}>\)  
Channel number of the measurement. There must be a selected true mode balanced measurement on that channel. If unspecified, \(<\text{cnum}>\) is set to 1.

\(\text{<bool}>\)  
State of phase sweep:

- OFF (or 0)  Phase Sweep disabled.
- ON (or 1)  Phase Sweep enabled.
CALCulate<cnum>:FSIMulator:BALun:PHASe:SWEep:STATe?

Return Type: Boolean

Default: Off

CALCulate<cnum>:FSIMulator:BALun:STIMulus:MODE <value>

Applicable Models: M98xxA, P50xxA, E5080B

(Read-Write) Sets the stimulus mode of the VNA source. True Mode settings requires Opt S9x460A/B.

Learn more about iTMSA.

See Critical Note

Parameters

<cnum> Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, <cnum> is set to 1.

/value> Stimulus mode. When a True-Mode is selected, the Balanced port powers are automatically uncoupled. Choose from:

- SE - Single-Ended stimulus
- TM - True-Mode stimulus
- FTM - Forward only True-Mode stimulus
- RTM - Reverse only True-Mode stimulus
- STM - Source only True-Mode stimulus

Examples

CALC:FSIM:BAL:PHAS:SWE:STAT 0
calculate2:fsimulator:balun:phase:sweep:state on

CALC:FSIM:BAL:STIM:MODE SE
calculate2:fsimulator:balun:stimulus:mode rtm

See example program

Query Syntax

CALCulate<cnum>:FSIMulator:BALun:STIMulus:MODE?

Return Type: Character

Default: SE
CALCulate<cnum>:FSIMulator:BA Lun:TOPology:BALSended[:PPORts] <bPos>,<bNeg>,<se>

Applicable Models: All
(Read-Write) For a Balanced - Single-ended device type, maps the VNA ports to the DUT ports.
Set the Balanced - Single-ended device type using CALC:FSIM:BA L:DEV
See Critical Note

Parameters

<cnum> Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, <cnum> is set to 1.
<bPos> VNA port number that connects to each of the following DUT ports:
<bNeg>
<se>

Examples
CALC:FSIM:BA L:TOP:BA LS 1,2,3
calculate1:fsimulator:balun:topology:balsended:pports 4,3,2

Query Syntax
CALCulate<cnum>:FSIMulator:BA Lun:TOPology:BALSended[:PPORts]?

Return Type Numeric - Returns three numbers separated by commas.

Default Not Applicable

---

CALCulate<cnum>:FSIMulator:BA Lun:TOPology:BA Lanced[:PPORts] <p1Pos>,<p1Neg>

Applicable Models: All
(Read-Write) For a Balanced device type, maps the VNA ports to the DUT ports.
Set the Balanced - Balanced device type using CALC:FSIM:BA L:DEV
See Critical Note

Parameters

<cnum> Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, <cnum> is set to 1.
<p1Pos> VNA port number that connects to each of the following DUT ports:
<p1Neg>
Examples

CALC:FSIM:BAL:TOP:BAL 1,2

Query Syntax

CALCulate<cnum>:FSIMulator:BALun:TOPology:BBALanced[:PPORts]

Return Type

Numeric - Returns two numbers separated by commas.

Default

Not Applicable

**CALCulate<cnum>:FSIMulator:Balun:Topo:BBALanced[:PPORts]**

### Parameters

- `<cnum>` Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, `<cnum>` is set to 1.
- `<p1Pos>` VNA port number that connects to each of the following DUT ports:
- `<p1Neg>`
- `<p2Pos>`
- `<p2Neg>`

Applicable Models: All

(Read-Write) For a Balanced - Balanced device type, maps the VNA ports to the DUT ports.

Set the Balanced - Balanced device type using **CALC:FSIM:DEV**

See Critical Note

Examples

CALC:FSIM:BAL:TOP:BBAL 1,2,3,4

Query Syntax

CALCulate<cnum>:FSIMulator:BALun:TOPology:BBALanced[:PPORts]

Return Type

Numeric - Returns four numbers separated by commas.
CALCulate\(<cnum>\)::FSIMulator:BALun:TOPology:BSSended[\:<PPORts>\]<bPos>,<bNeg>,<se1>,<se2>

Applicable Models: All
(Read-Write) Balanced-Single-ended - Single-ended device type, maps the VNA ports to the DUT ports.
Set the Balanced - Balanced device type using CALC:FSIM:BAL:DEV
See Critical Note

Parameters

\(<cnum>\) Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, \(<cnum>\) is set to 1.

\(<bPos>\) VNA port number that connects to each of the DUT ports:

\(<bNeg>\)

\(<se1>\)

\(<se2>\)

Examples

\(\text{CALC:FSIM:TOP:BSS 1,2,3,4}\)

\(\text{calculate1:fsimulator:balun: topology:bssended:pports 4,3,2,1}\)

Query Syntax

CALCulate\(<cnum>\)::FSIMulator:BALun:TOPology:BSSended[\:<PPORts>\]?

Return Type

Numeric - Returns four numbers separated by commas.

Default

Not Applicable

CALCulate\(<cnum>\)::FSIMulator:BALun:TOPology:SBALanced[\:<PPORts>\]<se>,<bPos>,<bNeg>

Applicable Models: All
(Read-Write) For a Single-ended - Balanced device type, maps the VNA ports to the DUT ports.
Set the Single-ended - Balanced device type using CALC:FSIM:BAL:DEV
See Critical Note

Parameters
<cnum>  
Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, <cnum> is set to 1.

<se>  
VNA port number that connects to each of the following DUT ports:

<table>
<thead>
<tr>
<th>Single-end Prc 1</th>
<th>Bal Port 2</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;se&gt; DUT</td>
<td>&lt;bPos&gt;</td>
</tr>
<tr>
<td></td>
<td>&lt;bNeg&gt;</td>
</tr>
</tbody>
</table>

Examples
CALC:FSIM:BAL:TOP:SBAL 1,2,3
calculate1:fsimulator:balun:topology:ssbalanced:pports 4,3,2

Query Syntax
CALCulate<cnum>:FSIMulator:BALun:TOPology:SSBalanced[:PPORts]?

ReturnType  
Numeric - Returns three numbers separated by commas.

Default  
Not Applicable

---

CALCulate<cnum>:FSIMulator:Balun:TOPOlogy:SSBalanced[:PPORts] <se1>,<se2>,<bPos>,<bNeg>

Applicable Models: All

(Read-Write) For a Single-ended - Single-ended - Balanced device type, maps the VNA ports to the DUT ports.

See Critical

Parameters

<cnum>  
Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, <cnum> is set to 1.

<se1>  
VNA port number that connects to each of the following DUT ports:

<table>
<thead>
<tr>
<th>Single-end Prc 1</th>
<th>Bal Port 3</th>
</tr>

Critical Note: CALCulate commands act on the selected measurement. You can select one measurement for each channel using Calc:Par:MNUM or Calc:Par:Select. Learn more.

**CALCulate<cnum>:FSIMulator:EMBed:NETWork<n>:FILename <string>** Superseded

Applicable Models: All

(Read-Write) Specifies the 4-port touchstone file (*.s4p) in which the network to embed or de-embed resides. Following this command, send CALC:FSIM:EMB:NETW:TYPE. If the specified file does not exist, an error occurs when type command is sent. Learn about 4-port network embedding.
**CALCulate<cnum>:FSIMulator:EMBed:NETWork<n>:PMAP <inA>,<inB>,<outA>,<outB>** Superseded

Applicable Models: All

*(Read-Write)* Set and return the port mapping for a 4-port SNP file to be embedded.
Learn about 4-port network embedding.

**Parameters**

- `<cnum>`: Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, `<cnum>` is set to 1.
- `<n>`: Network position. Choose from 1 or 2.
- `<inA> <inB> <outA> <outB>`: Port Mapping. Use four port numbers in any order.

**Example**

```
CALC:FSIM:EMB:NETW1:PMAP 1,3,2,4
```

**Query Syntax**

`CALCulate<cnum>:FSIMulator:EMBed:NETWork<n>:PMAP?`

**Return Type**

Comma-separated numeric

**Default**

1,2,3,4

---

**CALCulate<cnum>:FSIMulator:EMBed:NETWork<n>:TYPE <char>** Superseded

Applicable Models: All

*(Read-Write)* Specify the type of processing to take place on the specified 4-port network. First specify the network filename with `CALC:FSIM:EMB:NETW:FIL`. Learn about 4-port network embedding.

**Parameters**

- `<cnum>`: Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, `<cnum>` is set to 1.
- `<n>`: Network position. Choose from 1 or 2.
- `<string>`: File name and extension (.s4P) of the circuit. Files are stored in the "D:" drive. To recall from a different folder, specify the full path name.

**Examples**

```
10 calculate2:fsimulator:embed:network2:filename "D:\myFile.s4P"
20 calculate2:fsimulator:embed:network2:type embed
```
Parameters

<cnum> Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, <cnum> is set to 1.

<n> Network position. Choose from 1 or 2.

<char> Processing type. Choose from:
- NONE - The same as disabling.
- EMBed - Add Network circuit.
- DEEMbed - Remove Network circuit.

Example

<table>
<thead>
<tr>
<th>Number</th>
<th>Command</th>
</tr>
</thead>
<tbody>
<tr>
<td>10</td>
<td>CALC:FSIM:EMB:NETW2:FIL 'myFile.s4p'</td>
</tr>
<tr>
<td>20</td>
<td>CALC:FSIM:EMB:NETW2:TYPE EMBed</td>
</tr>
</tbody>
</table>

Query Syntax

CALCulate<cnum>:FSIMulator:EMBed:NETWork<n>:TYPE?

Return Type

Character

Default

NONE

CALCulate<cnum>:FSIMulator:EMBed:STATe <bool> Superseded

Applicable Models: All

This command is changed to CALCulate:FSIMulator:DRAFt:SECTION:CIRCuit:ENABLE <ON | OFF> and CALCulate:FSIMulator:SECTION:CIRCuit:ENABLE? Learn about Using Fixture Simulator.

(Read-Write) Turns ON or OFF 4-port Network Embedding/De-embedding for all ports on the specified channel.

Parameters

<cnum> Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, <cnum> is set to 1.

<bool> Choose from:
- ON or 1 - Turns 4-port Network Embedding/De-embedding ON
- OFF or 0 - Turns 4-port Network Embedding/De-embedding OFF

Examples

Query Syntax
CALCulate<cnum>:FSIMulator:EMBed:TOPology:C:PORTs?
### CALCulate<cnun>:FSIMulator:EMBed:TOPology:D:PORTs <p1>,<p2>,<p3>,<p4>...<pN> Superseded

**Applicable Models:** All

*(Read-Write)* Specifies the VNA port connections for VNAs having greater than 4 ports. Specify topology using `CALC:FSIM:EMBed:TYPE`. Learn more.

**Parameters**

- `<cnum>`: Channel number of the measurement.
- `<p1>,<p2>,<p3>,<p4>...<pN>`: VNA port number assignment.

**Examples**

- `CALC:FSIM:EMB:TOP:D:PORT 2,1,4,3,6,5,8,7`
- `calculate2:fsimulator:embed:topology:d:ports 1,2,3,4,5,6,7,8`

**Query Syntax**

`CALCulate<cnun>:FSIMulator:EMBed:TOPology:D:PORTs?`

**Return Type**

- Numeric

**Default**

- `1,2,3,4`

---

### CALCulate<cnun>:FSIMulator:EMBed:TYPE <char> Superseded

**Applicable Models:** All

*(Read-Write)* Specifies the VNA / DUT topology. Learn more about these and other VNA/DUT configurations.

**Parameters**

- `<cnum>`: Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, `<cnum>` is set to 1.
- `<char>`: VNA / DUT topology. Choose from:
  - A - 2 PNA/DUT Ports
  - B - 3 PNA/DUT Ports
  - C - 4 PNA/DUT Ports
  - D - >4 VNA/DUT Ports

<tr>
<td>&lt;value&gt;</td>
<td>Inductance value in henries. Choose a value between -1E18 to 1E18</td>
</tr>
</tbody>
</table>

**Examples**

```
cALC:FSIM:GLO:DEEM:PAR:L 0.00002
```

```
calculate2:fsimulator:gloop:deembed:parameters:l 0.00003
```

**Query Syntax**

```
cALCulate<cnum>:FSIMulator:GLOop:DEEMbed:PARameters:L?
```

**Return Type**

Numeric
### CALCulate<cnum>:FSIMulator:GLOop:DEEMbed:PARameters:R <value>

**Applicable Models:** All

**(Read-Write)** Sets and returns the Resistance, 'R' value for the ground loop de-embedding of the specified channel.

**Note:** This command affects ALL measurements on the specified channel.

#### Parameters

- `<cnum>`: Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, `<cnum>` is set to 1.
- `<value>`: Resistance value in ohms. Choose a value between -1E18 to 1E18

#### Examples

```
CALC:FSIMGLO:DEEM:PAR R 0.00002
```

```
calculate2:fsimulator:gloop:deembed:parameters:r 0.00003
```

#### Query Syntax

```
CALCulate<cnum>:FSIMulator:GLOop:DEEMbed:PARameters:R?
```

#### Return Type

Numeric

**Default**

0

### CALCulate<cnum>:FSIMulator:GLOop:DEEMbed:STATE <bool>

**Applicable Models:** All

**(Read-Write)** Turns ON or OFF De-embedding for the specified channel.

**Note:** This command affects ALL measurements on the specified channel.

#### Parameters

- `<cnum>`: Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, `<cnum>` is set to 1.
- `<bool>`: Choose from:
  - `ON` or `1` - Turns De-embedding ON
OFF or 0 - Turns De-embedding OFF

Examples

<table>
<thead>
<tr>
<th>Query Syntax</th>
<th>Return Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>CALC:FSIM:GLO:DEEM:STAT 1</td>
<td>Boolean</td>
</tr>
<tr>
<td>calculate2:fsimulator:gloop:deembed:state 0</td>
<td></td>
</tr>
</tbody>
</table>

Query Syntax

CALCulate<cnum>:FSIMulator:GLOop:DEEMbed:STATe?

Return Type

Boolean

Default

OFF

**CALCulate<cnum>:FSIMulator:GLOop:DEEMbed:TYPE <char>**

Applicable Models: All

*(Read-Write)* Specifies the circuit model type for ground loop de-embedding.

Parameters

- `<cnum>` Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, `<cnum>` is set to 1.
- `<char>` Choose from:
  - RL - Selects Shunt L circuit model.
  - RC - Selects Shunt C circuit mode.

Examples

<table>
<thead>
<tr>
<th>Query Syntax</th>
<th>Return Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>CALC:FSIM:GLO:DEEM:TYPE RL</td>
<td>Character</td>
</tr>
<tr>
<td>calculate2:fsimulator:gloop:deembed:type RC</td>
<td></td>
</tr>
</tbody>
</table>

**CALCulate<cnum>:FSIMulator:GLOop:DEEMbed:USER:FILENAME <filename>**

Applicable Models: All

*(Read-Write)* Specifies the filename of the s1p file to load for ground loop de-embedding.
Note: This command affects ALL measurements on the specified channel.

Parameters

<cnum>
Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, <cnum> is set to 1.

<filename>
File name and extension (.s1P) of the de-embedding circuit.

Files are stored in the default folder "D:"

To recall from a different folder, specify the full path name.

Examples

```
CALC:FSIM:GLO:DEEM:USER:FIL 'myFile.s1P'
calculate2:fsimulator:loop:deembed:user:filename "D:\myFile.s1P"
```

Query Syntax

CALCulate<cnum>:FSIMulator:GLOop:DEEMbed:USER:FILENAME?

Return Type

String

Default

Not Applicable

CALCulate<cnum>:FSIMulator:GLOop:EMBed:PARameters:C <value>

Applicable Models: All

(Read-Write) Sets and returns the Capacitance, 'C' value for the ground loop embedding of the specified channel.

Note: This command affects ALL measurements on the specified channel.

Parameters

<cnum>
Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, <cnum> is set to 1.

<value>
Capacitance value in farads. Choose a value between \(-1E18\) to \(1E18\)

Examples

```
CALC:FSIM:GLO:EMB:PAR:C 0.00002
calculate2:fsimulator:loop:embed:parameters:c 0.00003
```

Query Syntax

CALCulate<cnum>:FSIMulator:GLOop:EMBed:PARameters:C?

Return Type

Numeric

Default

0
CALCulate<cnum>:FSIMulator:GLOop:EMBed:PARameters:L <value>

Applicable Models: All

*(Read-Write)* Sets and returns the Inductance, 'L' value for the ground loop embedding of the specified channel.

**Note:** This command affects ALL measurements on the specified channel.

**Parameters**

- `<cnum>` Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, `<cnum>` is set to 1.
- `<value>` Inductance value in henries. Choose a value between -1E18 to 1E18

**Examples**

```
CALC:FSIM:GLO:EMB:PAR:L 0.00002
calculate2:fsimulator:gloop:embed:parameters:l 0.00003
```

**Query Syntax**

CALCulate<cnum>:FSIMulator:GLOop:EMBed:PARameters:L?

**Return Type**

Numeric

**Default**

0

---

CALCulate<cnum>:FSIMulator:GLOop:EMBed:PARameters:R <value>

Applicable Models: All

*(Read-Write)* Sets and returns the Resistance, 'R' value for the ground loop embedding of the specified channel.

**Note:** This command affects ALL measurements on the specified channel.

**Parameters**

- `<cnum>` Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, `<cnum>` is set to 1.
- `<value>` Resistance value in ohms. Choose a value between -1E18 to 1E18

**Examples**

```
CALC:FSIM:GLO:EMB:PAR:R 0.00002
calculate2:fsimulator:gloop:embed:parameters:r 0.00003
```

**Query Syntax**

CALCulate<cnum>:FSIMulator:GLOop:EMBed:PARameters:R?

**Return Type**

Numeric

**Default**

0
**CALCulate<cnum>:FSIMulator:GLOop:EMBed:STATe <bool>**

Applicable Models: All

*(Read-Write)*  Turns ON or OFF Embedding for the specified channel.

**Note:** This command affects ALL measurements on the specified channel.

**Parameters**

- **<cnum>**  
  Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, <cnum> is set to 1.

- **<bool>**  
  Choose from:
  
  - ON or 1 - Turns Embedding ON
  - OFF or 0 - Turns Embedding OFF

**Examples**

```
CALC:FSIM:GLO:EMB:STAT 1
calculate2:fsimulator:gloop:embed:state 0
```

**Query Syntax**

```
CALCulate<cnum>:FSIMulator:GLOop:EMBed:STATe?
```

**Return Type**

Boolean

**Default**

OFF

**CALCulate<cnum>:FSIMulator:GLOop:EMBed:TYPE <char>**

Applicable Models: All

*(Read-Write)*  Specifies the circuit model type for ground loop embedding. Learn more.

**Parameters**

- **<cnum>**  
  Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, <cnum> is set to 1.

- **<char>**  
  Choose from:
  
  - RL - Selects Shunt L circuit model.
  - RC - Selects Shunt C circuit mode.
**Examples**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>CALC:FSIM:GLO:EMB:TYPE RL</code></td>
<td>Example command</td>
</tr>
<tr>
<td><code>calculate2:fsimulator:gloop:embed:type RC</code></td>
<td>Example command</td>
</tr>
</tbody>
</table>

**Query Syntax**

`CALCulate<cnum>:FSIMulator:GLOop:EMBed:TYPE?`  

**Return Type**

Character  

**Default**

RL

---

**CALCulate<cnum>:FSIMulator:GLOop:EMBed:USER:FILename <filename>**

---

**Applicable Models:** All

**Read-Write**  
Specifies the filename of the .s1p file to load for ground loop embedding.

**Note:** This command affects ALL measurements on the specified channel.

---

**Parameters**

- `<cnum>`: Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, `<cnum>` is set to 1.
- `<filename>`: File name and extension (.s1P) of the embedding circuit.

Files are stored in the default folder "D:\"

To recall from a different folder, specify the full path name.

---

**Examples**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>CALC:FSIM:GLO:EMB:USER:FIL 'myFile.s1P'</code></td>
<td>Example command</td>
</tr>
<tr>
<td><code>calculate2:fsimulator:gloop:embed:user:filename &quot;D:\myFile.s1P&quot;</code></td>
<td>Example command</td>
</tr>
</tbody>
</table>

**Query Syntax**

`CALCulate<cnum>:FSIMulator:GLOop:EMBed:USER:FILename?`  

**Return Type**

String  

**Default**

Not Applicable

---

**CALCulate<cnum>:FSIMulator:GLOop:PORTs <p1>,<p2>,<p3>,<p4>**

---

**Applicable Models:** All

**Read-Write**  
Specifies the VNA port connections for ground loop embedding/de-embedding. Ground loop ports are typically automatically determined based on the requested measurements, fixturing ports, and calibration ports. However, if it is desired to set them specifically, use this command.
### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>&lt;cnum&gt;</code></td>
<td>Channel number of the measurement.</td>
</tr>
<tr>
<td><code>&lt;p1&gt;,&lt;p2&gt;,&lt;p3&gt;,&lt;p4&gt;</code></td>
<td>VNA port number assignment.</td>
</tr>
</tbody>
</table>

#### Examples

- `CALC:FSIM:GLO:PORT 1,2`
- `calculate2:fsimulator:gloop:ports 3,4`

#### Query Syntax

```plaintext
CALCulate<cnum>:FSIMulator:GLOop:PORTs?
```

#### Return Type

- **Numeric**
- **Default**: Not Applicable
Specifies settings for embedding and de-embedding Single-Ended (2-port) fixturing circuits.

```
CALCulate:FSIMulator:SENDed:
  DEEMbed
    PORT
      SNP:REVerse
      [TYPE]
      USER:FILename
    STATe
  OORDer
  PMCircuit
    PORT
      PARameters
        C
        G
        L
        R
        [TYPE]
        USER:FILename
      STATe
  POWer:PORT:COMPensation
    ZCONversion
      PORT
        IMAG
        REAL
        Z0[:R]
```

Applicable Models: All

(Read-Write) Set and read whether or not to reverse ports on a 2-port fixture or adapter to be de-embedded. Learn more.

Parameters

- `<cnum>`: Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, `<cnum>` is set to 1.
- `<port>`: VNA port number to which SNP file is to be de-embedded.
- `<bool>`: Choose from:
  - ON or 1 - Reverse ports
  - OFF or 0 - Do NOT Reverse ports

Examples

```
CALC:FSIM:SEND:DEEM:PORT1:SNP:REV 1
```

```
calculate2:fsimulator:sended:deembed:port2:snp:reverse 0
```

Query Syntax

```
CALCulate<cnum>:FSIMulator:SENDed:DEEMbed:PORT<n>:SNP:REVerse?
```

Return Type: Boolean

Default: OFF

CALCulate<cnum>:FSIMulator:SENDed:DEEMbed:PORT<n>[:TYPE] <char> Superseded

Applicable Models: All

(Read-Write) Select whether or not to load a 2-port De-embedding circuit model for the specified port number. Circuit model USER is valid when an associated .s2p file is specified with CALC:FSIM:SEND:DEEM:PORT1:USER:FILename.

Note: This command affects ALL measurements on the specified channel.

Parameters

- **<cnum>**: Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, <cnum> is set to 1.
- **<port>**: Port number to receive circuit model.
- **<char>**: Choose from:
  - **NONE**: Port does not have a circuit model.
  - **USER**: Circuit model for the port will be loaded from VNA drive.

Examples

- `CALC:FSIM:SEND:DEEM:PORT1 USER`
- `calculate2:fsimulator:sendded:deembedded:port2:type none`

Query Syntax

`CALCulate<cnum>:FSIMulator:SENDed:DEEMbed:PORT<n>[:TYPE]?

Return Type

- **Character**

Default

- **None**

---

**CALCulate<cnum>:FSIMulator:SENDed:DEEMbed:PORT<n>:USER:FILename <string> Superseded**

Applicable Models: All

(Read-Write) Specifies the filename of the circuit model to be used for de-embedding. Circuit model is applied when both CALC:FSIM:SEND:DEEM:PORT1 USER is selected and the filename is specified with this command.

Note: This command affects ALL measurements on the specified channel.

Parameters

- **<cnum>**: Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, <cnum> is set to 1.
- **<port>**: Port number to receive circuit model.
- **<string>**: File name and extension (.s2P) of the de-embedding circuit.
  - Files are stored in the default folder "D:\".
  - To recall from a different folder, specify the full path name.
### Examples

<table>
<thead>
<tr>
<th>Query Syntax</th>
<th>Return Type</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>calculate2:fsimulator:deembed:port2:user:file &quot;D:\myFile.s2P&quot;</code></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

### CALCulate<nun>:FSIMulator:SENDed:DEEMbed:STATe <bool> Superseded

Applicable Models: All

This command is changed to `CALCulate:FSIMulator:DRAFt:SECTion:CIRCuit:ENABle <ON | OFF>`, `CALCulate:FSIMulator:SECTion:CIRCuit:ENABle?` Learn about Using Fixture Simulator.

(Read-Write) Turns de-embedding ON or OFF for all ports on the specified channel.

Note: This command affects ALL measurements on the specified channel.

**Parameters**

- `<cnum>`: Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, `<cnum>` is set to 1.
- `<bool>`: Choose from:
  - ON or 1 - Turns de-embedding ON
  - OFF or 0 - Turns de-embedding OFF

**Examples**

<table>
<thead>
<tr>
<th>Query Syntax</th>
<th>Return Type</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>CALC:FSIM:SEND:DEEM:STAT 1</code></td>
<td>String</td>
<td>Not Applicable</td>
</tr>
<tr>
<td><code>calculate2:fsimulator:sended:deembed:state 0</code></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

### CALCulate<nun>:FSIMulator:SENDed:OORDer <a,b,c,d>

Applicable Models: All

(Read-Write) Sets and returns the order in which Single-ended Fixture Operations occur. Learn more about these operations.

Note: The operation for ground loop embedding and ground loop de-embedding will always occur as the 3rd step. It cannot be moved. By default, this is after the 2-Port DeEmbedding operation.

Note: This command affects ALL measurements on the specified channel.

**Parameters**
<cnum> Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, <cnum> is set to 1.

<a,b,c,d> Order of operations, where:
0 - Port Extension operation
1 - 2-Port DeEmbedding operation
2 - Port Matching operation
3 - Arbitrary Impedance operation

Examples
CALC:FSIM:SEND:OORD 1,2,3,0
calculate2:fsimulator:sended:oorer 1,2,3,0

Query Syntax  CALCulate<cnum>:FSIMulator:SENDed:OORDer?

Return Type Comma-separated values

Default 0,1,2,3
CALCulate<cnum>:FSIMulator:SENDed:PMCircuit:PORT<n>:PARameters:G <value> Superseded

Applicable Models: All

The command set of CALCulate:FSIMulator:SENDed:PMCircuit:PORT:XXXX is changed to CALCulate:FSIMulator:DRAFt:CIRCuit:YYYY and CALCulate<cnum>:FSIMulator::CIRCuit:YYYY?

Learn about Using Fixture Simulator.

(Read-Write) Sets and returns the value for the 'G' (Conductance) circuit element for a port matching circuit model to simulate on port 'n'. The port matching circuit model is selected using CALCulate<cnum>:FSIMulator:SENDed:PMCircuit:PORT<n>[:TYPE]<char>. You can specify G, G1, or G2 based on the selected port matching circuit model. Setting a value not used by the selected circuit will have no affect. Learn more.

There are three steps to set up a port matching circuit model simulation on a specified port:

Select the port matching circuit model to simulate using CALCulate<cnum>:FSIMulator:SENDed:PMCircuit:PORT<n>[:TYPE]<char>.

Set the values for R (Resistance), G (Conductance), C (Capacitance), and L (Inductance) corresponding to the selected port matching circuit model.

Turn the feature on using CALCulate<cnum>:FSIMulator:SENDed:PMCircuit:STATe to simulate the circuit and compute the measurement as if the circuit were attached to the port.

Note: This command affects ALL measurements on the specified channel.

Parameters

- `<cnum>` Channel number of the measurement. If unspecified, `<cnum>` is set to 1.
- `<n>` Port number to receive value.
- `<value>` Conductance value in siemens. Choose a value between -1E18 to 1E18

Examples

CALC:FSIM:SEND:PMC:PORT1:PAR:G 0.00002
calculate2:fsimulator:sended:pmcircuit:port2:parameters:g 0.00003

Query Syntax

CALCulate<cnum>:FSIMulator:SENDed:PMCircuit:PORT<n>:PARameters:G?

Return Type

Numeric

Default

0

CALCulate<cnum>:FSIMulator:SENDed:PMCircuit:PORT<n>:PARameters:L <value> Superseded

Applicable Models: All

(Read-Write) Sets and returns the value for the 'L' (Inductance) circuit element for a port matching circuit model to simulate on port 'n'. The port matching circuit model is selected using CALCulate<cnum>:FSIMulator:SENDed:PMCircuit:PORT<n>[TYPE]<char>. You can specify L, L1, or L2 based on the selected port matching circuit model. Setting a value not used by the selected circuit will have no affect. Learn more.

There are three steps to set up a port matching circuit model simulation on a specified port:

Select the port matching circuit model to simulate using

Set the values for R (Resistance), G (Conductance), C (Capacitance), and L (Inductance) corresponding to the selected port matching circuit model.

Turn the feature on using CALCulate<cnum>:FSIMulator:SENDed:PMCircuit:STATe to simulate the circuit and compute the measurement as if the circuit were attached to the port.

Note: This command affects ALL measurements on the specified channel.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;cnum&gt;</td>
<td>Channel number of the measurement. If unspecified, &lt;cnum&gt; is set to 1.</td>
</tr>
<tr>
<td>&lt;n&gt;</td>
<td>Port number to receive value.</td>
</tr>
<tr>
<td>&lt;value&gt;</td>
<td>Inductance value in henries. Choose a value between -1E18 to 1E18</td>
</tr>
</tbody>
</table>

Examples

CALC:FSIM:SEND:PMC:PORT1:PAR:L 0.00002
CALC:FSIM:SEND:PMC:PORT1:PAR:L 0.00003

Query Syntax

CALCulate<cnum>:FSIMulator:SENDed:PMCircuit:PORT<n>:PARameters:L?

Return Type

Numeric

Default

0

CALCulate<cnum>:FSIMulator:SENDed:PMCircuit:PORT<n>:PARameters:R <value> Superseded

Applicable Models: All

(Read-Write) Sets and returns the value for the 'R' (Resistance) circuit element for a port matching circuit model to simulate on port 'n'. The port matching circuit model is selected using CALCulate<cnum>:FSIMulator:SENDed:PMCircuit:PORT<n>[TYPE]<char>. You can specify R, R1, or R2 based on the selected port matching circuit model. Setting a value not used by the selected circuit will have no affect. Learn more.

There are three steps to set up a port matching circuit model simulation on a specified port:

Select the port matching circuit model to simulate using

Set the values for R (Resistance), G (Conductance), C (Capacitance), and L (Inductance) corresponding to the selected port matching circuit model.

Turn the feature on using `CALCulate<cnum>:FSIMulator:SENDed:PMCircuit:STATe` to simulate the circuit and compute the measurement as if the circuit were attached to the port.

**Note:** This command affects ALL measurements on the specified channel.

### Parameters

- `<cnum>`
  - Channel number of the measurement. If unspecified, `<cnum>` is set to 1.

- `<n>`
  - Port number to receive value.

- `<value>`
  - Resistance value in ohms. Choose a value between \(-1E18\) to \(1E18\)

### Examples

- `CALC:FSIM:SEND:PMC:PORT1:PAR:R 0.00002`
- `calculate2:fsimulator:sended:pmcircuit:port2:parameters:r 0.00003`

### Query Syntax

- `CALCulate<cnum>:FSIMulator:SENDed:PMCircuit:PORT<n>:PARameters:R?`

### Return Type

- Numeric

### Default

- 0

---

**CALCulate<cnum>:FSIMulator:SENDed:PMCircuit:PORT<n>:TYPE <char> Superseded**

**Applicable Models:** All

**(Read-Write)** Select whether or not to load a 2 port matching circuit model for the specified port number. Circuit model USER is valid when an associated .s2p file is specified with `CALC:FSIM:SEND:PMC:PORT1:USER:FIL`.

**Note:** This command affects ALL measurements on the specified channel.

### Parameters

- `<cnum>`
  - Channel number of the measurement. If unspecified, `<cnum>` is set to 1.

- `<n>`
  - Port number to receive circuit model.

- `<char>`
  - Circuit model. Choose from
    - NONE  No circuit model
    - SLPC  Series L - Parallel C
    - PCSL  Parallel C - Series L
    - PLSC  Parallel L - Series C
    - SCPL  Series C - Parallel L

**Return Type**

Numeric

**Default**

0

---

**CALCulate<cnum>:FSIMulator:SENDed:ZCONversion:PORT<n>:REAL <value> Superseded**

Applicable Models: All

*(Read-Write)* Sets and returns the Real portion of the impedance value for the specified single-ended port. Use `CALC:FSIM:SEND:ZCON:PORT:IMAG` to set the imaginary value. Or use `CALC:FSIM:SEND:ZCON:PORT:Z0` to set both values together.

**Note:** This command affects ALL measurements on the specified channel.

**Parameters**

- `<cnum>` Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, `<cnum>` is set to 1.
<n> Port number to receive value.

<value> Real Impedance value in ohms. Choose a value between 0 to 1E7

Examples
CALC:FSIM:SEND:ZCON:PORT1:REAL 51
Calculate2:fsimulator:sended:zconversion:port2:real 75

Query Syntax
CALCulate<cnum>:FSIMulator:SENDed:ZCONversion:PORT<n>:REAL?

Return Type
Numeric

Default
50

CALCulate<cnum>:FSIMulator:SENDed:ZCONversion:PORT<n>:Z0[:R] <value> Superseded

Applicable Models: All

(Read-Write) Sets and returns the Real portion of the impedance value for the specified single-ended port. The imaginary portion is automatically set to 0.0.

Note: This command affects ALL measurements on the specified channel.

Parameters

<cnum> Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, <cnum> is set to 1.

<n> Port number to receive value.

<value> Port Impedance value in ohms. Choose a value between 0 to 1E7

Examples
CALC:FSIM:SEND:ZCON:PORT1:Z0 51
Calculate2:fsimulator:sended:zconversion:port2:z0:r 75

Query Syntax
CALCulate<cnum>:FSIMulator:SENDed:ZCONversion:PORT<n>:Z0[:R]?

Return Type
Numeric

Default
50

CALCulate<cnum>:FSIMulator:SENDed:ZCONversion:STATe <bool> Superseded

Applicable Models: All

(Read-Write) Turns Port Impedance ON or OFF for all ports on the specified channel.

Note: This command affects ALL measurements on the specified channel.

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>&lt;cnum&gt;</code></td>

**Examples**

```
CALC:FSIM:SEND:ZCON:STAT 1
calculate2:fsimulator:sended:zconversion:state 0
```

**Query Syntax**

```
CALCulate<cnum>:FSIMulator:SENDed:ZCONversion:STATe?
```

**Return Type**

Boolean

**Default**

OFF
MarkerPNOP

Initiates a Power Normal Operating Point marker search and reads the results.

These commands are **Superseded** by the CALCulate:MEASure:MARKer:PNOP commands.

**CALCulate:MARKer:PNOP**

**Critical Note:** CALCulate commands act on the selected measurement. You can select one measurement for each channel using Calc:Par:MNUM or Calc:Par:Select. Learn more.

**CALCulate<cnum>:MARKer:PNOP:BACKoff <num>**

*Applicable Models: N522xB, N523xB, N524xB, M937xA, P937xA*  
*(Read-Write)*

Turns on and sets markers 1, 2, 3, and 4 to calculate various PNOP parameters. Either this command, or the POFFset command, will initiate the PNOP search markers.

To turn off the PNOP markers, either turn them off individually or turn them All Off.
To search a User Range with the PNOP search, first activate marker 1 and set the desired User Range. Then send CALC:MARK:PNOP:BACK. The user range used with the PNOP search only applies to marker 1 searching for the linear gain value. The other markers may fall outside the user range.

### Parameters

- `<cnum>` Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, `<cnum>` is set to 1.
- `<num>` Backoff value. Choose any number between -500 and 500

### Examples

```
CALC:MARK:PNOP:BACK?
calculate2:marker:pnop:backoff 10
```

### Query Syntax

CALCulate<cnum>:MARKer:PNOP:BACKoff?

### Return Type

Numeric

### Default

Not applicable

---

### CALCulate<cnum>:MARKeR:PNOP:BACKoff:GAIN?

Applicable Models: N522xB, N523xB, N524xB, M937xA, P937xA

(Read-only) Reads the power backoff gain value from a PNOP marker search.

PBO Gain = PBO Out - PBO In

See Critical Note

### Parameters

- `<cnum>` Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, `<cnum>` is set to 1.

### Examples

```
CALC:MARK:PNOP:BACK:GAIN?
```

### Default

Not applicable

---

### CALCulate<cnum>:MARKeR:PNOP:BACKoff:PIN?

Applicable Models: N522xB, N523xB, N524xB, M937xA, P937xA

(Read-only) Reads the power backoff input value from a PNOP marker search.

PBO In = Marker 2 X-axis

See Critical Note
CALCulate\(<cnum>\):MARKer:PNOP:BACKoff:POUT?

Applicable Models: N522xB, N523xB, N524xB, M937xA, P937xA
(Read-only) Reads the power backoff output value from a PNOP marker search.

PBO Out = Marker 2 Y-axis

See Critical Note

Parameters

\(<cnum>\) Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, \(<cnum>\) is set to 1.

Examples

\[
\text{CALC:MARK:PNOP:BACK:POUT?}
\]

Default Not applicable

CALCulate\(<cnum>\):MARKer:PNOP:COMpression?

Applicable Models: N522xB, N523xB, N524xB, M937xA, P937xA
(Read-only) Reads the PNOP compression value from a PNOP marker search.

Pnop Comp = Pnop Gain - Linear Gain (not shown on marker readout).

See Critical Note

Parameters

\(<cnum>\) Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, \(<cnum>\) is set to 1.

Examples

\[
\text{CALC:MARK:PNOP:COMP?}
\]

Default Not applicable

CALCulate\(<cnum>\):MARKer:PNOP:COMPresision:MAXimum?
Applicable Models: N522xB, N523xB, N524xB, M937xA, P937xA

(Read-only) Reads the max compression value from a PNOP marker search.
Comp Max = Gain Max - Linear Gain (not shown on marker readout).
See Critical Note

Parameters

```
<cnum> Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, <cnum> is set to 1.
```

Examples

```
CALC : MARK : PNOP : COMP : MAX?
```

Default Not applicable

---

`CALCulate<cnum>:MARKer:PNOP:GAIN?`

Applicable Models: N522xB, N523xB, N524xB, M937xA, P937xA

(Read-only) Reads the PNOP gain value from a PNOP marker search.
Pnop Gain = Pnop Out - Pnop In.
See Critical Note

Parameters

```
<cnum> Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, <cnum> is set to 1.
```

Examples

```
CALC : MARK : PNOP : GAIN?
```

Default Not applicable

---

`CALCulate<cnum>:MARKer:PNOP:GAIN:MAXimum?`

Applicable Models: N522xB, N523xB, N524xB, M937xA, P937xA

(Read-only) Reads the max gain from a PNOP marker search.
Gain Max = PMax Out - PMax In
See Critical Note

Parameters
<cnum> Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, <cnum> is set to 1.

Examples

```
CALC : MARK : PNOP : GAIN : MAX?
```

Default Not applicable

CALCulate<cnum>:MARKer:PNOP:PIN?

Applicable Models: N522xB, N523xB, N524xB, M937xA, P937xA
(Read-only) Reads the PNOP input value from a PNOP marker search.

Pnop In = Marker 4 X-axis value

See Critical Note

Parameters

<cnum> Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, <cnum> is set to 1.

Examples

```
CALC : MARK : PNOP : PIN?
```

Default Not applicable

CALCulate<cnum>:MARKer:PNOP:PIN:MAXimum?

Applicable Models: N522xB, N523xB, N524xB, M937xA, P937xA

(Read-only) Reads the max input power from a PNOP marker search.

PMax In = Marker 3 X-axis value

See Critical Note

Parameters

<cnum> Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, <cnum> is set to 1.

Examples

```
CALC : MARK : PNOP : PIN : MAX?
```

Default Not applicable

CALCulate<cnum>:MARKer:PNOP:POFFset <num>

Applicable Models: N522xB, N523xB, N524xB, M937xA, P937xA
(Read-Write) Turns on and sets markers 1, 2, 3, and 4 to calculate various PNOP parameters.

Either this command, or the Backoff command, will initiate the PNOP search markers.

To turn off the PNOP markers, either turn them off individually or turn them All Off.

To search a User Range with the PNOP search, first activate marker 1 and set the desired User Range. Then send the CALC:MARK:PNOP:POFF command. The user range used with the PNOP search only applies to marker 1 searching for the linear gain value. The other markers may fall outside the user range.

See Critical Note

Parameters

<cnum> Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, <cnum> is set to 1.

<num> Power Offset value in dB. Choose any number between -500 and 500

Examples

CALC:MARK:PNOP:POFF 3
calculate2:marker:pnop:poffset 10

Query Syntax  CALCulate<cnum>:MARKer:PNOP:POFFset?

Return Type  Numeric

Default  ??

CALCulate<cnum>:MARKer:PNOP:POUT?

Applicable Models: N522xB, N523xB, N524xB, M937xA, P937xA

(Read-only) Reads the output power value of the offset marker from a PNOP marker search.

Pnop Out = Marker 4 Y-axis value

See Critical Note

Parameters

<cnum> Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, <cnum> is set to 1.

Examples

CALC:MARK:PNOP:POUT?

Default  Not applicable

CALCulate<cnum>:MARKer:PNOP:POUT:MAXimum?

Applicable Models: N522xB, N523xB, N524xB, M937xA, P937xA

(Read-only) Reads the max output power from a PNOP marker search.
PMax Out = Marker 3 Y-axis value

See Critical Note

Critical Note: CALCulate commands act on the selected measurement. You can select one measurement for each channel using Calc:Par:MNUM or Calc:Par:Select. Learn more.

```
CALCulate<cnum>:MARKer:PSATuration:BACKoff <num>
```

Applicable Models: N522xB, N523xB, N524xB, M937xA, P937xA
(Read-Write) Turns on and sets markers 1, 2, and 3 to calculate various Power Saturation parameters. The `<num>` parameter sets and reads the back-off value for a Power Saturation marker search. To turn off the Power Saturation markers, either turn them off individually or turn them All Off.

To search a User Range with the PSAT search, first activate marker 1 and set the desired User Range. Then send the CALC:MARK:PSAT:BACK command. The user range used with the PSAT search only applies to marker 1 searching for the linear gain value. The other markers may fall outside the user range.

See Critical Note

Parameters

- `<cnum>`: Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, `<cnum>` is set to 1.
- `<num>`: Backoff value. Choose any number between -500 and 500

Examples

- `CALC:MARK:PSAT:BACK 3`
- `calculate2:marker:psaturation:backoff 10`

Query Syntax

`CALCulate<cnum>:MARKer:PSATuration:BACKoff?`

Return Type

Numeric

Default

0

**CALCulate<cnum>:MARKer:PSATuration:COMPression:MAXimum?**

Applicable Models: N522xB, N523xB, N524xB, M937xA, P937xA

(Read-only) Reads the compression maximum value from a PSAT marker search.

Comp Max = Gain Max - Gain Linear

Use `CALC:MARK:PSAT:BACK` to initiate a PSAT search.

See Critical Note

Parameters

- `<cnum>`: Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, `<cnum>` is set to 1.

Examples

- `CALC : MARK : PSAT : COMP : MAX ?`

Default

Not applicable

**CALCulate<cnum>:MARKer:PSATuration:COMPression:SATuration?**

Applicable Models: N522xB, N523xB, N524xB, M937xA, P937xA

(Read-only) Reads the compression saturation value from a PSAT marker search.

Comp Sat = Gain Sat - Gain Linear
Use `CALC:MARK:PSAT:BACK` to initiate a PSAT search.

See Critical Note

### Parameters

### Default

Not applicable
CALCulate<cnum>:MARKer:PSATuration:GAIN:MAXimum?

Applicable Models: N522xB, N523xB, N524xB, M937xA, P937xA
(Read-only) Reads the maximum gain value from a PSAT marker search.
Gain Max = PMax Out - PMax In
Use CALC:MARK:PSAT:BACK to initiate a PSAT search.
See Critical Note

Parameters

<cnum> Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, <cnum> is set to 1.

Examples

CALC:MARK:PSAT:GAIN:MAX?

Default Not applicable

CALCulate<cnum>:MARKer:PSATuration:PIN?

Applicable Models: N522xB, N523xB, N524xB, M937xA, P937xA
(Read-only) Reads the power saturation input value from a PSAT marker search.
Psat In = Marker 2 X-axis value
Use CALC:MARK:PSAT:BACK to initiate a PSAT search.
See Critical Note

Parameters

<cnum> Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, <cnum> is set to 1.

Examples

CALC:MARK:PSAT:PIN?

Default Not applicable

CALCulate<cnum>:MARKer:PSATuration:PIN:MAXimum?

Applicable Models: N522xB, N523xB, N524xB, M937xA, P937xA
(Read-only) Reads the maximum input power from a PSAT marker search.
PMax In = Marker 3 X-axis value
Use CALC:MARK:PSAT:BACK to initiate a PSAT search.
See Critical Note

Parameters
<cnum>

Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, <cnum> is set to 1.

Examples

```
CALC:MARK:PSAT:PIN:MAX?
```

Default

Not applicable

CALCulate<cnum>:MARKer:PSATuration:POUT?

Applicable Models: N522xB, N523xB, N524xB, M937xA, P937xA

(Read-only) Reads the back-off output power from a PSAT marker search.

PSat Out = Marker 2 Y-axis value

Use `CALC:MARK:PSAT:BACK` to initiate a PSAT search.

See Critical Note

Parameters

<cnum>

Channel number of the measurement. There must be a selected measurement on that channel. If unspecified, <cnum> is set to 1.

CALCulate<ch>:MEASure<mnum>:PN:AVARiance:DEViation? <avg_time>,<fcutoff>

Applicable Models: N522xB, N524xB with Phase Noise Option S93031xB

(Read-only) Returns the calculated Allan deviation using the measured average time and the measured cut-off frequency for the selected measurement.

Parameters

<ch> Channel number of the measurement (optional).
<mnum> Measurement number for each measurement.
<avg_time> Measured average time (sec).
<fcutoff> Measured cut-off frequency (Hz).

Examples

```
CALC:MEAS2:PN:AVAR:DEV? 0.001,10 kHz
```

Return Type Numeric

Default Not applicable

CALCulate<ch>:MEASure<mnum>:PN:AVARIance:JITTer? <avg_time>,<fcutoff>

Applicable Models: N522xB, N524xB with Phase Noise Option S93031xB

(Read-only) Returns the calculated Jitter using the measured average time and the measured cut-off frequency for the selected measurement.

Parameters

<ch> Channel number of the measurement (optional).
<mnum> Measurement number for each measurement.
<avg_time> Measured average time (sec).
<fcutoff> Measured cut-off frequency (Hz).

Examples

```
CALC:MEAS2:PN:AVAR:JITT? 0.001,10 kHz
```

Return Type Numeric

Default Not applicable
**CALCulate<ch>:MEASure<mnum>:PN:AVARiance:VARiance? <avg_time>,<fcutoff>**

Applicable Models: N522xB, N524xB with Phase Noise Option S93031xB

*(Read-only)* Returns the calculated Allan variance using the measured average time and the measured cut-off frequency for the selected measurement.

**Parameters**

- `<ch>`: Channel number of the measurement (optional).
- `<mnum>`: Measurement number for each measurement.
- `<avg_time>`: Measured average time (sec).
- `<fcutoff>`: Measured cut-off frequency (Hz).

**Examples**

```
CALC:MEAS2:PN:AVAR:VAR? 0.001,10 kHz
```

**Return Type**

Numeric

**Default**

Not applicable

---

**CALCulate<ch>:MEASure<mnum>:PN:CARRier:FREQuency?**

Applicable Models: N522xB, N524xB with Phase Noise Option S93031xB

*(Read-only)* Returns the measured carrier frequency.

**Parameters**

- `<ch>`: Channel number of the measurement (optional).
- `<mnum>`: Measurement number for each measurement.

**Examples**

```
CALC:MEAS2:PN:CARR:FREQ?
calculate2:measure2:pn:carrier:frequency?
```

**Return Type**

Numeric

**Default**

Not applicable
CALCulate<ch>:MEASure<mnum>:PN:CARRier:LEVel?

Applicable Models: N522xB, N524xB with Phase Noise Option S93031xB

(Read-only) Returns the measured carrier power level.

Parameters

<ch> Channel number of the measurement (optional).

<mnum> Measurement number for each measurement.

Examples

```
CALC:MEAS2:PN:CARR:LEV?
calculate2:measure2:pn:carrier:level?
```

Return Type

Numeric

Default

Not applicable

CALCulate<ch>:MEASure<mnum>:PN:DATA:PDATa

Applicable Models: N522xB, N524xB with Phase Noise Option S93031xB

(Read-Write) Sets and returns the dBc data array for the selected measurement.

Parameters

<ch> Channel number of the measurement (optional).

<mnum> Measurement number for each measurement.

Examples

```
CALC:MEAS2:PN:DATA:PDAT -81.285,-97.663,-100.02,-100.15,-103.37,-117.93
calculate2:measure2:pn:ndata:pdata -81.285,-97.663,-100.02,-100.15,-103.37,-117.93
```

Query Syntax

```
CALCulate<ch>:MEASure<mnum>:PN:DATA:PDATa?
```

Return Type

Numeric

Default

Not applicable
CALCulate<ch>:MEASure<mnum>:PN:DATA:PMEMory

Applicable Models: N522xB, N524xB with Phase Noise Option S93031xB

(Read-Write) Sets and returns the dBc memory data for the selected measurement.

Parameters

<ch> Channel number of the measurement (optional).

<mnum> Measurement number for each measurement.

Examples

CALC:MEAS2:PN:DATA:PDAT -81.285, -97.663, -100.02, -100.15, -103.37, -117.93
calculate2:measure2:pn: data: pdata -81.285, -97.663, -100.02, -100.15, -103.37, -117.93

Query Syntax

CALCulate<ch>:MEASure<mnum>:PN:DATA:PDATa?

Return Type

Numeric

Default

Not applicable

CALCulate<ch>:MEASure<mnum>:PN:DATA:SPData?

Applicable Models: N522xB, N524xB with Phase Noise Option S93031xB

(Read-only) Returns the spurious data (0 or 1) for the selected measurement.

Parameters

<ch> Channel number of the measurement (optional).

<mnum> Measurement number for each measurement.

Examples

CALC:MEAS2:PN:DATA:SPData?
calculate2:measure2:pn: data: spdata?

Return Type

Numeric

Default

Not applicable

CALCulate<ch>:MEASure<mnum>:PN:DATA:SPMemory?
Applicable Models: N522xB, N524xB with Phase Noise Option S93031xB

(Read-only) Returns the spurious memory data (0 or 1) for the selected measurement.

Parameters

<ch> Channel number of the measurement (optional).

<mnum> Measurement number for each measurement.

Examples

CALC:MEAS2:PN:DATA:SPMemory?
calculate2:measure2:pn:data:spmemory?

Return Type Numeric

Default Not applicable

CALCulate<ch>:MEASure<mnum>:PN:INTegral:RANGe[1-4]:DATA? <enum>

Applicable Models: N522xB, N524xB with Phase Noise Option S93031xB

(Read-only) Returns the specified data for the selected range number. RANGe[1-4] allows selection of the desired integration range. The following commands are used to configure these integration ranges:

CALCulate<ch>:MEASure<mnum>:PN:INTegral:RANGe[1-4]:TYPE

CALCulate<ch>:MEASure<mnum>:PN:INTegral:RANGe[1-4]:STARt

CALCulate<ch>:MEASure<mnum>:PN:INTegral:RANGe[1-4]:STOP

CALCulate<ch>:MEASure<mnum>:PN:INTegral:RANGe[1-4]:WEIGhting

Parameters

<ch> Channel number of the measurement (optional).

<mnum> Measurement number for each measurement.

<enum> (Enumeration) Choose from:

IPN - Integrated Noise
RFM - Residual FM
RAM - Residual AM
RPM - Residual PM
RMSJ - RMS Jitter
RMSR - RMS Radian
RMSD - RMS Degree

Examples
calculate2:measure2:pn:rangel:data? RFM

Return Type Numeric
Default IPN

CALCulate<ch>:MEASure<mnum>:PN:INTegral:RANGe[1-4]:STARt <value>

Applicable Models: N522xB, N524xB with Phase Noise Option S93031xB

(Read-Write) Sets and returns the start frequency of the selected integration range. RANGe[1-4] allows selection of the desired integration range. The CALCulate:MEASure:PN:INTegral:RANGe:TYPE command must be set to CUSTom.

Parameters

<ch> Channel number of the measurement (optional).
<mnum> Measurement number for each measurement.
<value> Start frequency of integration range. If the range is unspecified, the start frequency is assigned to RANGe1.

Examples
CALC:MEAS2:PN:INT:RANG1 10 MHz
calculate2:measure2:pn:integral:rangel:start 10 MHz

Query Syntax CALCulate<ch>:MEASure<mnum>:PN:INTegral:RANGe[1-4]:STARt?

Return Type Numeric
Default Minimum frequency of the analyzer

CALCulate<ch>:MEASure<mnum>:PN:INTegral:RANGe[1-4]:STOP <value>

Applicable Models: N522xB, N524xB with Phase Noise Option S93031xB
(Read-Write) Sets and returns the stop frequency of the selected integration range. RANGe[1-4] allows selection of the desired integration range. The CALCulate:MEASure:PN:INTegral:RANGe:TYPE command must be set to CUSTom.

Parameters

- `<ch>` Channel number of the measurement (optional).
- `<mnum>` Measurement number for each measurement.
- `<value>` Stop frequency of integration range. If the range is unspecified, the stop frequency is assigned to RANGe1.

Examples

```
CALC:MEAS2:PN:INT:RANG1 10 GHz
calculate2:measure2:pn:integral:range1:start 10 GHz
```

Query Syntax

```
CALCulate<ch>:MEAS< Именно<mnum>>:PN:INTegral:RANGe[1-4]:STOP?
```

Return Type

Numeric

Default

Maximum frequency of the analyzer

---

CALCulate<ch>:MEAS< Именно<mnum>:PN:INTegral:RANGe[1-4]:TYPE <enum>

Applicable Models: N522xB, N524xB with Phase Noise Option S93031xB

(Read-Write) Sets and returns the integration range type of the selected integration range. RANGe[1-4] allows selection of the desired integration range.

Parameters

- `<ch>` Channel number of the measurement (optional).
- `<mnum>` Measurement number for each measurement.
- `<enum>` (Enumeration) Choose from:
  - OFF - Turn integration range off. The range will not be measured.
  - FULL - Set integration range to full span.
  - CUSTom - Set user-defined start and stop frequency range.

Examples

```
CALC:MEAS2:PN:INT:RANG1:TYPE FULL
calculate2:measure2:pn:integral:range1:type full
```
**CALCulate<ch>:MEASure<mnum>:PN:INTegral:RANGe[1-4]:WEIGhting <string>*

**Applicable Models:** N522xB, N524xB with Phase Noise Option S93031xB

(Read-Write) Sets and returns the weighting filter of the selected integration range. RANGe[1-4] allows selection of the desired weighting filter. This command selects a weighting filter whose values are applied to the calculation of residual effects. The file should be saved in the following directory: C:\Program Data\Keysight\Network Analyzer\WeightingFilter.

**Parameters**

- `<ch>`: Channel number of the measurement (optional).
- `<mnum>`: Measurement number for each measurement.
- `<string>`: Weighting filter file name which contains the weighting data.

**Examples**

```
CALC:MEAS2:PN:INT:RANG1:WEIG "Filter_A"
calculate2:measure2:pn:range1:weighting "Filter_A"
```

**Query Syntax**

CALCulate<ch>:MEASure<mnum>:PN:INTegral:RANGe[1-4]:WEIGhting?

**Return Type**

String

**Default**

Not applicable

---

**CALCulate<ch>:MEASure<mnum>:PN:SNOise:DECades[:STATe] <bool>**

**Applicable Models:** N522xB, N524xB with Phase Noise Option S93031xB

(Read-Write) Enables and disables the spot noise calculation on every decade offset frequency.

**Parameters**

- `<ch>`: Channel number of the measurement (optional).
- `<mnum>`: Measurement number for each measurement.
Choose from:

0 - OFF - Disable spot noise calculation on every decade offset frequency.
1 - ON - Enable spot noise calculation on every decade offset frequency.

**Examples**

```
CALCULATE:MEAS2:PN:SN0ise:DECades ON
calculate2:measure2:pn:snoise:decades:state ON
```

**Query Syntax**

```
CALCULATE<ch>:MEASURE<mnum>[:PN]:SN0ise:DECades[:STATe]?
```

**Return Type**

Boolean

**Default**

ON

---

**CALCulate<ch>:MEASURE<mnum>[:PN]:SN0ise:DECades:X?**

- **Applicable Models:** N522xB, N524xB with Phase Noise Option S93031xB

(Read-only) Returns the spot noise x-axis array of all decade offset frequencies.

**Parameters**

- `<ch>`: Channel number of the measurement (optional).
- `<mnum>`: Measurement number for each measurement.

**Examples**

```
CALCULATE:MEAS2:PN:SN0ise:DECades:X?
calculate2:measure2:pn:snoise:decades:x?
```

**Return Type**

Numeric

**Default**

Not applicable

---

**CALCulate<ch>:MEASURE<mnum>[:PN]:SN0ise:DECades:Y?**

- **Applicable Models:** N522xB, N524xB with Phase Noise Option S93031xB

(Read-only) Returns the spot noise y-axis array of all decade offset frequencies.

**Parameters**

- `<ch>`: Channel number of the measurement (optional).
Measurement number for each measurement.

Examples

```
CALC:MEAS2:PN:SNO:DEC:y?
calculate2:measure2:pn:snoise:decades:y?
```

Return Type

Numeric

Default

Not applicable

---

**CALCulate<ch>:MEASure<mnum>:PN:SNOise[:STATE] <bool>**

Applicable Models: N522xB, N524xB with Phase Noise Option S93031xB

(Read-Write) Enables and disables spot noise calculation for the selected measurement number.

Parameters

- `<ch>` Channel number of the measurement (optional).
- `<mnum>` Measurement number for each measurement.
- `<bool>` Choose from:
  - 0 - OFF - Disable spot noise.
  - 1 - ON - Enable spot noise.

Examples

```
CALC:MEAS2:PN:SNOise ON
calculate2:measure2:pn:snoise:state ON
```

Query Syntax

`CALCulate<ch>:MEASure<mnum>:PN:SNOise[:STATE]?`

Return Type

Boolean

Default

OFF

---

Applicable Models: N522xB, N524xB with Phase Noise Option S93031xB

(Read-Write) Enables and disables spot noise calculation for the specified user-defined offset frequency.

Parameters

- `<ch>` Channel number of the measurement (optional).
<mnum> Measurement number for each measurement.

<bool> Choose from:
0 - OFF - Disable spot noise calculation for the specified user-defined offset frequency.
1 - ON - Enable spot noise calculation for the specified user-defined offset frequency.

Examples
CALC:MEAS2:PN:SNOise:USER2 ON
calculate2:measure2:pn:snoise:user2:state ON

Query Syntax
CALCulate<ch>:MEASure<mnum>:PN:SNOiseUSER[1-6]:STATe?

Return Type
Boolean

Default
ON

CALCulate<ch>:MEASure<mnum>:PN:SNOise:USER[1-6]:X

Applicable Models: N522xB, N524xB with Phase Noise Option S93031xB
(Read-Write) Sets and returns the offset frequency on which the spot noise is calculated. Up to six offset frequencies can be defined.

Parameters

<ch> Channel number of the measurement (optional).

<mnum> Measurement number for each measurement.

Examples
CALC:MEAS2:PN:SNO:USER2:X 1.234 kHz
calculate2:measure2:pn:snoise:user2:x 1.234 kHz

Query Syntax
CALCulate<ch>:MEASure<mnum>:PN:SNOiseUSER[1-6]:X?

Return Type
Numeric

Default
Not applicable

CALCulate<ch>:MEASure<mnum>:PN:SNOise:USER[1-6]:Y?

Applicable Models: N522xB, N524xB with Phase Noise Option S93031xB
(Read-only) Returns the spot noise y-axis value of the specified offset frequency. The offset frequency is defined using the 

Parameters

  <ch> Channel number of the measurement (optional).

  <mnum> Measurement number for each measurement.

Examples

calculate2:measure2:pn:snoise:user2:y?

Return Type Numeric

Default Not applicable

CALCulate<ch>:MEASure<mnum>:PN:SPURious:ANALysis[:STATe] <bool>

Applicable Models: N522xB, N524xB with Phase Noise Option S93031xB

(Read-Write) Enables and disables spurious analysis.

Parameters

  <ch> Channel number of the measurement (optional).

  <mnum> Measurement number for each measurement.

  <bool> Choose from:

           0 - OFF - Disable spurious analysis.
           1 - ON - Enable spurious analysis.

Examples

CALC:MEAS2:PN:SPUR:ANAL ON
calculate2:measure2:pn:spurious:analysis:state ON

Query Syntax CALCulate<ch>:MEASure<mnum>:PN:SPURious:ANALysis[:STATe]?

Return Type Boolean

Default OFF

CALCulate<ch>:MEASure<mnum>:PN:SPURious:DATA?
CALCulate<ch>:MEASure<mnum>:PN:SPURious:OMISsion[:STATe] <bool>

Applicable Models: N522xB, N524xB with Phase Noise Option S93031xB

(Read-Write) Enables and disables spur omission.

Parameters

<ch> Channel number of the measurement (optional).
<mnum> Measurement number for each measurement.
<bool> Choose from:

0 - OFF - Disable spurious omission.
1 - ON - Enable spurious omission.

Examples

CALC:MEAS2:PN:SPUR:OMIS ON
calculate2:measure2:pn:spurious:omission:state ON

Query Syntax

CALCulate<ch>:MEASure<mnum>:PN:SPURious:OMISsion[:STATe]?

Return Type

Boolean

Default

OFF

CALCulate<ch>:MEASure<mnum>:PN:SPURious:OSSPur:DATA <data>

Applicable Models: N522xB, N524xB with Phase Noise Option S93031xB

(Read-only) Returns a list of detected spurs. Data per spur includes frequency, power, and jitter.

Parameters

<ch> Channel number of the measurement (optional).
<mnum> Measurement number for each measurement.

Examples

CALC:MEAS2:PN:SPUR:DATA?
calculate2:measure2:pn:spurious:data?
Applicable Models: N522xB, N524xB with Phase Noise Option S93031xB

(Read-Write) Sets and returns the User Spur Table data which defines spurs to omit.

Parameters

- `<ch>`: Channel number of the measurement (optional).
- `<mnum>`: Measurement number for each measurement.
- `<data>`: (Array) List of spurious frequencies of spurs to omit.

Examples

```
CALC:MEAS2:PN:SPUR:OSSP:DATA 1.0e3,10.0e3
```
```
calculate2:measure2:pn:spurious:osspur:data 1.0e3,10.0e3
```

Query Syntax

```
CALCulate<ch>:MEASure<mnum>:PN:SPURious:OSSPur:DATA?
```

Return Type: Array

Default: Not applicable

---

**CALCulate<ch>:MEASure<mnum>:PN:SPURious:OSSPur:DELete**

Applicable Models: N522xB, N524xB with Phase Noise Option S93031xB

(Write-only) Deletes the User Spur Table data which defines spurs to omit.

Parameters

- `<ch>`: Channel number of the measurement (optional).
- `<mnum>`: Measurement number for each measurement.

Examples

```
CALC:MEAS2:PN:SPUR:OSSP:DEL
```
```
calculate2:measure2:pn:spurious:osspur:delete
```

Default: Not applicable

---

**CALCulate<ch>:MEASure<mnum>:PN:SPURious:OSSPur[:STATe] <bool>**

Applicable Models: N522xB, N524xB with Phase Noise Option S93031xB

(Read-Write) Enables and disables user specified spur omission.

Parameters
### Channel number of the measurement (optional).

### Measurement number for each measurement.

### Choose from:

- **0 - OFF** - Disable user specified spurious omission.
- **1 - ON** - Enable user specified spurious omission.

### Examples

```
CALC:MEAS2:PN:SPUR:OSSP ON
```

```
calculate2:measure2:pn:spurious:osspur:state ON
```

### Query Syntax

`CALCulate<ch>:MEASure<mnum>:PN:SPURious:OSSPur[:STATe]?

### Return Type

Boolean

### Default

OFF

----

### CALCulate<ch>:MEASure<mnum>:PN:SPURious:SENSibility <num>

**Applicable Models:** N522xB, N524xB with Phase Noise Option S93031xB

(Read-Write) Sets and returns the spurious sensibility number.

### Parameters

- `<ch>`
  - Channel number of the measurement (optional).
- `<mnum>`
  - Measurement number for each measurement.
- `<num>`
  - Spurious sensibility value. The default is 3 (3 x standard deviation).

### Examples

```
CALC:MEAS2:PN:SPUR:SENS 3
```

```
calculate2:measure2:pn:spurious:sensibility 3
```

### Query Syntax

`CALCulate<ch>:MEASure<mnum>:PN:SPURious:SENSibility?

### Return Type

Numeric

### Default

Not applicable

----

### CALCulate<ch>:MEASure<mnum>:PN:SPURious:SORT <enum>

---

8089
Applicable Models: N522xB, N524xB with Phase Noise Option S93031xB

(Read-Write) Sets and returns the spurious table sorting order.

Parameters

<ch> Channel number of the measurement (optional).
<mnum> Measurement number for each measurement.
<enum> (Enumeration) Choose from:
- POWER - Sort spurious table by power.
- OFFSET - Sort spurious table by offset.

Examples

```
CALC:MEAS2:PN:SPUR:SORT POW
```
```
calculate2:measure2:pn:spurious:sort offset
```

Query Syntax

```
CALCulate<ch>:MEASure<mnum>:PN:SPURious:SORT?
```

Return Type  Enumeration

Default  POWER

---

CALCulate<ch>:MEASure<mnum>:PN:SPURious:THReshold:LEVel:MINimum <num>

Applicable Models: N522xB, N524xB with Phase Noise Option S93031xB

(Read-Write) Sets and returns the minimum spurious threshold level.

Parameters

<ch> Channel number of the measurement (optional).
<mnum> Measurement number for each measurement.
<num> Minimum spurious threshold level. The range is -500 dBC to 500 dBc.

Examples

```
```
```
calculate2:measure2:pn:spurious:threshold:level:minimum -500 dBc
```

Query Syntax

```
CALCulate<ch>:MEASure<mnum>:PN:SPURious:THReshold:LEVel:MINimum?
```

Return Type  Numeric

---

8090
CALCulate<ch>:MEASure<mnum>:PN:SPURious:THReshold:TABle:DATA <data>

Applicable Models: N522xB, N524xB with Phase Noise Option S93031xB

(Read-Write) Sets and returns the spurious threshold table data.

Parameters

- `<ch>`: Channel number of the measurement (optional).
- `<mnum>`: Measurement number for each measurement.
- `<data>`: (Array) Spurious threshold table data: start freq, lower threshold (dB), upper threshold (dB).

Examples

```
CALC:MEAS2:PN:SPUR:THR:TAB:DATA 1,0,10
```

Query Syntax

```
CALCulate<ch>:MEASure<mnum>:PN:SPURious:THReshold:TABle:DATA?
```

Return Type

Array

Default

Not applicable

---

CALCulate<ch>:MEASure<mnum>:PN:SPURious:THReshold:TABle:DELe

Applicable Models: N522xB, N524xB with Phase Noise Option S93031xB

(Write-only) Deletes the spurious threshold table.

Parameters

- `<ch>`: Channel number of the measurement (optional).
- `<mnum>`: Measurement number for each measurement.

Examples

```
```

Default

Not applicable
MeasureY

Controls the display of Y-axis for various measurements.

CALCulate:MEASure:Y
AXIS
UNIT?
[:VALues]

Click a keyword to view the command details.

See Also
Synchronizing the Analyzer and Controller
SCPI Command Tree

CALCulate<ch>:MEASure<mnum>:Y:AXIS:UNIT?

Applicable Models: All

(Read-only) Returns the current units of the Y-axis (HZ | SEcond | MINute | HOUR | DAY | DB | DBM | DBMV | WATTs | FARad | HENRy | OHM | MHO | SIEMen | VOLT | DEGRee | RADians | METer | DPHZ | UNIT | NONE | TNORMalized | NTEMPerature | KELVin | CENTigrade | FAHRenheit | FEET | INCH | DBMAAMPere | VOLTAge | DBUV | PERCentage | DMVRoothz | DUVRoothz | DMARoothz | WPHZ | VROothz | ARooothz | DBC | DCPerhz | DBPerhz | HZPerhz | PRHz | VPHz | DBV|DEFault).

This command can be used for all Measurement Classes.

Parameters

<ch> Channel number of the measurement (optional).
<mnum> Measurement number for each measurement.

Examples

CALC:MEAS2:Y:AXIS:UNIT?

Return Type

Enumeration

Default

FREQuency

CALCulate<ch>:MEASure<mnum>:Y[:VALues]?

Applicable Models: All
(Read-only) Returns the Y-axis values for the selected measurement in the current units.

This command can be used for all Measurement Classes.

Parameters

<ch> Channel number of the measurement (optional).

<num> Measurement number for each measurement.

Examples

CALC:MEAS2:Y?

Return Type

Array of data

Default

Not applicable
Control SCPI
Control Auxiliary Commands

Specifies the settings to remotely control the Auxiliary IO connector.

Note: The PNA-X, N522xA and N523xA models do NOT have this connector. However, the following commands are used to control ADC voltages on the Power I/O connector: CONT:AUX:OUTP:VOLT and CONT:AUX:INPut:VOLT?. Sending other Control:AUX commands may result in unusual behavior.

CONTrol:AUXiliary

C FOOTswitch? INPUT OUTPUT PASSfail SWEepend

MODE MODE VOLtagge

[DATA] LOGic MODE VOLTage? LOGic MODE SCOPe POLicy STATus

Click on a blue keyword to view the command details.

CONTrol:AUXiliary:C[:DATA] <num>

Applicable Models: N522xB, N523xB, N524xB

(Read-Write) Reads and writes a 4-bit value to Port C on the Aux I/O connector. This port is connected internally to the Handler IO connector. Therefore this command will also affect the state of Port C on the Handler IO

Parameters

<num> Data value. Choose any number 0 to 15.

Examples

CONTrol:AUXiliary:C:DATA 15
For Positive Logic Port C lines C0, C1, C2, C3 go High or if in Negative Logic they go Low.

CONTrol:AUXiliary:C:DATA?
A returned value of 15 when in Positive Logic indicates Port C lines C0, C1, C2, C3 are High, or if in Negative Logic they are Low.

Query Syntax

CONTrol:AUXiliary:C:DATA?
**Return Type**

Numeric

**Default**

0

---

**CONTroll:AUXiliary:C:LOGic <char>**

**Applicable Models:** N522xB, N523xB, N524xB

**(Read-Write)** Reads and writes the logic mode of Port C on the AUX IO. This port is connected to Port C of the Handler IO connector. Therefore, it will have the same logic setting.

**Parameters**

<char>  
Logic of Port C. Choose from:

POSitive - when a value of one is written the associate line goes High.

NEGative - when a value of one is written the associate line goes Low.

When Port C is in Output/Write mode, a change in logic causes the output lines to change state immediately. For example, Low levels change to High levels.

When Port C is in Input/Read mode, a change in logic does NOT cause the lines to change, but data read from Port C will reflect the change in logic.

**Examples**

CONT:AUX:C:LOG POS 'Positive logic is applied to Port C data.'

**Query Syntax**

CONTroll:AUXiliary:C:LOGic?

**Return Type**

Character

**Default**

NEGative

---

**CONTroll:AUXiliary:C:MODE <char>**

**Applicable Models:** N522xB, N523xB, N524xB

**(Read-Write)** Sets Port C to read or write mode. This port is connected to Port C of the Handler IO connector. Therefore, it will have the same mode setting.

**NOTE:** When Port C is set to INPut mode, data writes are NOT applied to the lines. MODE must be set to OUTPut mode before writing.

**Parameters**

<char>  
INPut - set the port for reading
OUTPut - set the port for writing

**Examples**

```
CONT:AUX:C:MOD INP 'set Port C to Input Mode for reading.
CONT:AUXiliary:C:MODE? 'queries the input/output mode that the port set to.
```

**Query Syntax**

CONT:AUXiliary:C:MODE?

**Return Type**

Character

**Default**

INPut

---

**CONTrol:AUXiliary:FOOTswitch[:STATe]?**

Applicable Models: N522xB, N523xB, N524xB

*(Read only)* Reads the Auxiliary connector Footswitch Input.

**Examples**

```
CONT:AUX:FOOT?
control:auxiliary:footswitch:state?
```

**Return Type**

Boolean

ON (or 1) = pressed

OFF (or 0) = released

**Default**

OFF (0) - Released

---

**CONTrol:AUXiliary:FOOTswitch:MODe <char>**

Applicable Models: N522xB, N523xB, N524xB

*(Read-Write)* This command sets the mode of the "FootSwitch In" line on the Auxiliary IO. These mode settings determine what occurs when the footswitch is pressed. Examine your results carefully when using these command modes.

**Parameters**

*<char>*

IGNore - While in this mode any Footswitch presses are ignored.

SWEep - While in this mode a Footswitch press will trigger the sweep.

**NOTE:** The instrument must be in Manual Trigger Mode.
RECall - While in this mode a Footswitch press will recall an instrument state. When more than one state is available each footswitch press recalls the next state, then starts over from the beginning.

MACR0 - While in this mode a Footswitch press will load and run a macro. When more than one macro are available each successive footswitch press loads and runs the next macro, then starts over from the beginning.

**Examples**

```plaintext
CONT:AUX:FOOT:MODE MACRo
```

This sets the footswitch mode to MACRo causing a macro to be loaded and run with a footswitch press.

```plaintext
CONTrol:AUXiliary:FOOTswitch:MODE?
```

This query returns the footswitch mode setting.

**Query Syntax**

```plaintext
CONTrol:AUXiliary:FOOTswitch:MODE?
```

**Return Type**

Character

**Default**

IGNore

---

**CONTrol:AUXiliary:INPut<n>:VOLTage?**

*Applicable Models: N522xB, N523xB, N524xB*  
*(Read-Only)*

Reads voltage on the Power I/O connector.

From the Control:Aux commands, ONLY this and `CONT:AUX:OUTP:VOLT` can be used on the PNA-X.

**Parameters**

<n>  
Port number. If unspecified, value is set to 1.

Choose from

1. Reads voltage on the AUX I/O connector (pin 14) or on the Power I/O connector Analog In 1 port (pin 7).
2. Reads voltage on the Power I/O connector Analog In 2 port (pin 8).
3. Reads voltage on Power I/O connector GndSens (pin 6) PNA-X only.

**Examples**

```plaintext
CONT:AUX:INPut2:VOLT?
```

**Return Type**

Numeric

**Default**

Not Applicable

---

**CONTrol:AUXiliary:OUTPut<n>:MODE <char>**
Applicable Models: N522xB, N523xB, N524xB

(Read-Write) This command sets the mode of the selected "Analog Out" line on the Power I/O connector. The modes give the user the option to have the requested voltage applied immediately or not until the sweep is done.

Parameters

<n>  
Port number. If unspecified, value is set to 1.

<char>  
WAIT - While in this mode any voltage changes sent to the selected analog out will only get applied to the output between sweeps.

NOWait - While in this mode any voltage changes sent to the selected analog out will occur right away without waiting until the end of a sweep.

Examples

CONT:AUX:OUTP1:MOD WAIT This sets the mode so that voltages sent to "Analog Out 1" are only applied at the end of a sweep.

CONT:AUX:OUTP2:MOD? This query returns the current mode for "Analog Out 2".

Query Syntax

CONTrol:AUXiliary:OUTPut<n>:MODe?

'Reads the output mode

Return Type  
Character

Default  
WAIT

CONTrol:AUXiliary:OUTPut<out>:VOLTage <num>

Applicable Models: N522xB, N523xB, N524xB, E5080B

(Read-Write)  
Sets and reads voltage on the Power I/O connector AnalogOut1|2 (PNA), AUX Out 1|2 (E5080B).

(PNA) From the Control:Aux commands, ONLY this and CONT:AUX:INPut:VOLT? can be used.

Note: The 9-pin PWR I/O (Power I/O) D connector on the rear-panel replaces much of the functionality of the AUX I/O connector on older VNA models. The Power I/O voltages can be set using the following methods:

- CONTrol:AUXiliary:OUTPut:VOLTage or put_OutputVoltage Method (no GUI equivalent, global scoped, and settings not saved as part of the instrument state)
- SOURce:DC:START and SOURce:DC:STOP (DC Source dialog is the GUI equivalent, channel scoped, and settings saved as part of the instrument state)
- Interface Control dialog (no remote equivalent, channel scoped, and settings saved as part of the instrument state)

To avoid unexpected behavior, choose one method only to set the Power I/O voltages.
### Parameters

**<out>**

DAC output number. Choose from:

1 - PNA: Output 1 (Aux I/O pin 3) and (Power I/O pin 3), E5080B AUX Out 1
2 - PNA: Output 2 (Aux I/O pin 2) and (Power I/O pin 4), E5080B AUX Out 2

**<num>**

Output Voltage. Choose a voltage value between -10 and +10 volts

### Examples

```
CONT:AUX:OUTP1:VOLT 5
control:auxiliary:output2:voltage 5
```

### Query Syntax

```
CONTroll:AUXiliary:OUTPut<out>:VOLTage?
```

'Reads the output DAC voltage

### Return Type

Numeric

### Default

0

---

### CONTroll:AUXiliary:PASSfail:LOGic <char>

Applicable Models: N522xB, N523xB, N524xB

(Read-Write) Sets the logic of the PassFail line (pin 12) on the Material Handler IO (pin 33).

**Parameters**

**<char>**

Choose from:

- **POSitive** - Causes the PassFail line to have positive logic (high = pass, low = fail).
- **NEGative** - Causes the PassFail line to have negative logic (high = fail, low = pass).

**Examples**

```
CONT:AUX:PASS:LOG POS
control:auxiliary:passfail:logic negative
```

**Query Syntax**

```
CONTroll:AUXiliary:PASSfail:LOGic?
```

Return Type: Character

**Default**

**POSitive**

---

### CONTroll:AUXiliary:PASSfail:MODe <char>

Applicable Models: N522xB, N523xB, N524xB
(Read-Write) Sets and reads the default logical pass/fail state. This is the state the pass/fail line stays in until a failure occurs (if the mode is NOWait), or until an end-of-sweep condition occurs (if the modes is PASS or FAIL).

The end-of-sweep condition is determined by the **CONTrol:AUXiliary:PASSfail:SCOPe** command.

### Parameters

<table>
<thead>
<tr>
<th>&lt;char&gt;</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>PASS</strong> - the line stays in PASS state until the end-of-sweep condition occurs, at which time the pass/fail line is set, and the pass/fail strobe (line 36) is activated.</td>
</tr>
<tr>
<td><strong>FAIL</strong> - the line stays in FAIL state until the end-of-sweep condition occurs, at which time the pass/fail line is set, and the pass/fail strobe (line 36) is activated.</td>
</tr>
<tr>
<td><strong>NOWait</strong> - the pass/fail line is set, and the pass/fail strobe (line 36) is activated as soon as a failure condition occurs.</td>
</tr>
</tbody>
</table>

### Examples

```
CONT:AUX:PASS:MODE NOW
control:auxiliary:passfail:mode fail
```

### Query Syntax

**CONTrol:AUXiliary:PASSfail:MODE?**

**Return Type**

Character

**Default**

**NOWait**

---

**CONTrol:AUXiliary:PASSfail:SCOPe** <char>

**Applicable Models:** N522xB, N523xB, N524xB

(Read-Write) Sets and reads the scope of pass/fail testing. The pass/fail line can report the status of all measurements on each channel, or all measurements on all channels. This command selects which option to use.

### Parameters

<table>
<thead>
<tr>
<th>&lt;char&gt;</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>CHANnel</strong> - A pass/fail result is computed and written to the output pins at the end of all sweeps on a channel.</td>
</tr>
<tr>
<td><strong>GLOBal</strong> - A pass/fail result is computed and written to the output pins at the end of all sweeps on a channel.</td>
</tr>
</tbody>
</table>

If the pass/fail mode is NOWait (as set by **CONTrol:AUXiliary:PASSfail:MODE**), the status and strobe pins are written immediately. Otherwise the pins are written as indicated above. Regardless of the mode value, the pass/fail line is returned to its default state (as set by the **MODE** command) at the end of channel or group of channels.
Examples

CONT:AUX:PASS:SCOP CHAN
control:auxiliary:passfail:scope sweep

Query Syntax
CONTrol:AUXiliary:PASSfail:SCOPE?

Return Type
Character

Default
GLOBal

CONTrol:AUXiliary:PASSfail:POLicy <char>

Applicable Models: N522xB, N523xB, N524xB

(Read-Write) Sets the policy used to determine how global pass/fail is computed.

Parameters

<char>
Name of the policy to use. Choose from:

- ALLTests - Pass/Fail Status returns PASS if all tests on all measurements pass.

- ALLMeas - Pass/Fail Status returns PASS if all measurements have associated tests, and all tests pass. FAIL is returned if even one measurement has no associated limit test.

Only those measurements which are not in HOLD mode contribute to the pass/fail result.

Examples

CONT:AUX:PASS:POL ALLM
control:auxiliary:passfail:policy alltests

Query Syntax
CONTrol:AUXiliary:PASSfail:POLicy?

Return Type
Character

Default
ALLTests

CONTrol:AUXiliary:PASSfail:STATus?

Applicable Models: N522xB, N523xB, N524xB

(Read-Only) Returns the most recent pass/fail status value. Use this command as follows:

- Set the VNA trigger scope to ALL
- Set the VNA trigger source to MANUAL or EXTERNAL.
- Trigger the VNA.
- Use the *OPC? command to determine when the sweep is complete.
- Use the CONT:AUX:PASS:STAT? query to obtain the global pass/fail result.
Return Type

Character - One of the following is returned:
PASS - all measurements not in HOLD mode have been swept, and all associated limit tests have passed.
FAIL - all measurements not in HOLD mode have been swept, and one or more limit tests failed according to the specified Pass/Fail policy.
NONE - status cannot be determined because measurements are in progress.

Default
Not Applicable

CONTrol:AUXiliary:SWEepend <char>

Applicable Models: N522xB, N523xB, N524xB

(Read-Write) Specifies the event that will cause the Sweep End line pin 11) to go to a low (false) state of the Material Handler IO. The line will return to a high state after the appropriate calculations are complete.

Parameters

<char>
Choose from:
SWEep - the line goes low when each sweep is complete.
CHANnel - The line goes low when all of the sweeps for each channel is complete.
GLOBal - The line goes low when all the sweeps for all channels are complete.

Examples
CONT:AUX:SWE SWE
control:auxiliary:sweepend channel

Query Syntax
CONTrol:AUXiliary:SWEepend?

Return Type
Character

Default
SWEep
Control SCPI
Control External Test Set Commands

Specifies the settings to remotely control the External Test Set IO connector.

```
CONTrol:EXTernal
   TESTset
      DATA    INTerrupt?    RAWData     SWEpHoldoff?
```

Click on a blue keyword to view the command details.

- See a pinout and detailed description of the External Test Set IO connector

CONTrol:EXTernal:TESTset:DATa <addr>,<data>

Applicable Models: N522xB, N523xB, N524xB

(Read-Write) Reads and writes 13 bits of data to the specified address using the AD0 through AD12 lines of the external test set connector. The instrument generates the appropriate timing signals (strokes the address, then the data) to control an external test set.

Parameters

- `<addr>`: Decimal equivalent of the 13 bit binary address.
- `<data>`: Decimal equivalent of the 13 bit binary data

Examples

```
CONT:EXT:TEST:DATA 12,3
CONTrol:external:testset:DATA 12,3
```

Query Syntax

```
CONTrol:EXTernal:TESTset:DATA? <addr>
```

'Reads the decimal equivalent of the binary data from the specified address

Return Type

Numeric

Default: Not Applicable
CONTrol:EXTernal:TESTset:INTerrupt?

Applicable Models: N522xB, N523xB, N524xB

(Read-Only) Reads the boolean state of the Interrupt In line (pin 13) on the external test set connector.

Examples

```
CONT:EXT:TEST:INT?
control:external:testset:interrupt?
```

Return Type

Boolean

False (0) - the line is being held at a TTL High.

True (1) - the line is being held at a TTL Low.

Default

Not Applicable

CONTrol:EXTernal:TESTset:RAWData <data>

Applicable Models: N522xB, N523xB, N524xB

(Read-Write) Reads and writes 16 bits of data through the AD0 through AD12 and three timing lines of the external test set connector. Does NOT generate appropriate timing signals.

Note: During a WRITE, Bit 13 must always be low. Otherwise Bit 0-12 will tristate

Parameters

```
<data>
Decimal equivalent of the binary data.
```

Format of data WRITTEN with RAWData:

<table>
<thead>
<tr>
<th>Pin</th>
<th>Bit</th>
<th>Signal name</th>
</tr>
</thead>
<tbody>
<tr>
<td>22</td>
<td>0</td>
<td>AD0*</td>
</tr>
<tr>

<td>19</td>
<td>7</td>
<td>AD7*</td>
</tr>
<tr>
<td>6</td>
<td>8</td>
<td>AD8*</td>
</tr>
<tr>
<td>5</td>
<td>9</td>
<td>AD9*</td>
</tr>
</tbody>
</table>
* This Output will float if RLW (bit-13) is set high

### Examples

```
CONT:EXT:TEST:RAW 8001
CONT:EXT:TESTset:rawdata 1234
```

### Query Syntax

```
CONT:EXT:TESTset:RAWData?
```

### Return Format

Format of data **READ** with **RAWData**?

<table>
<thead>
<tr>
<th>Pin</th>
<th>Bit</th>
<th>Signal name</th>
</tr>
</thead>
<tbody>
<tr>
<td>22</td>
<td>0</td>
<td>AD0*</td>
</tr>
<tr>
<td>23</td>
<td>1</td>
<td>AD1*</td>
</tr>
<tr>
<td>11</td>
<td>2</td>

<tr>
<td>13</td>
<td>14</td>
<td>Interrupt In (inverted internally)</td>
</tr>
</tbody>
</table>
na 15 Always Zero, grounded internally

*These lines are dependent on the state of RLW (pin25).
Writing a 0(low) to RLW will set lines AD0-AD12 to write mode.
Writing a 1(high) to RLW will set lines AD0-AD12 to read mode.

Default
Not Applicable

**CONTroll:EXTernal:TESTset:SWEepholdoff?**

Applicable Models: N522xB, N523xB, N524xB

(Read-Only) Reads the Sweep Holdoff line (pin 2) on the external test set connector.

Examples

```
CONT:EXT:TEST:SWE?
control:external:testset:sweepholdoff?
```

Return Type

Boolean

TRUE (1) - the pin is set to a TTL High
FALSE (0) - the pin is set to TTL Low

Default
Not Applicable
Control SCPI
Control Handler Commands

CONTrol:HANDler:C:MODE <char>

Applicable Models: N522xB, N523xB, N524xB, E5080, All PXIe VNAs with M9341A/B

(Read-Write) Sets and reads the direction of data flow for Port C.

Parameters

<char> Direction of flow. Choose from:

INPut - Port C is used to input data

OUTPut - Port C is used to output data

Examples

CONT:HAND:C:MODE INP
control:handler:c:mode output

Query Syntax

CONTrol:HANDler:C:MODE?

Return Type

Character

Default

INPut
**CONTrol:HANDler:D:MODE <char>**

Applicable Models: N522xB, N523xB, N524xB, E5080, All PXIe VNAs with M9341A/B

*(Read-Write)* Sets and reads the direction of data flow for Port D.

**Parameters**

<char>  
Direction of flow. Choose from:

**INPut** - Port D is used to input data

**OUTPut** - Port D is used to output data

**Examples**

```
CONT:HAND:D:MODE INP
control:handler:d:mode output
```

**Query Syntax**

`CONTrol:HANDler:D:MODE?`

**Return Type**

Character

**Default**  
Input

---

**CONTrol:HANDler:<port>[:DATa] <num>**

Applicable Models: N522xB, N523xB, N524xB, E5080, All PXIe VNAs with M9341A/B

*(Read-Write)* Writes and reads data on the specified port.

**Parameters**

<port>  
Port identifier to set bits for. Choose from:

A,B,C,D,E,F,G,H

<num>  
The number of the data bits to set. Refer to the following table for the maximum number for each port. The minimum number for each port is 0.

<table>
<thead>
<tr>
<th>Port</th>
<th>Max allowable &lt;num&gt;</th>
<th>MSB..................................LSB</th>
<th>Write-only</th>
</tr>
</thead>
<tbody>
<tr>
<td>A</td>
<td>255</td>
<td>A7...A0</td>
<td></td>
</tr>
<tr>
<td>B</td>
<td>255</td>
<td>B7...B0</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>---</td>
<td>---</td>
<td>---</td>
<td>---</td>
</tr>
<tr>
<td>C</td>
<td>15</td>
<td>C3...C0</td>
<td>Read-Write</td>
</tr>
<tr>
<td>D</td>
<td>15</td>
<td>D3...D0</td>
<td>Read-Write</td>
</tr>
<tr>
<td>E</td>
<td>255</td>
<td>D3...D0 + C3...C0</td>
<td>Read-Write</td>
</tr>
<tr>
<td>F</td>
<td>65535</td>
<td>B7...B0 + A7...A0</td>
<td>Write-only</td>
</tr>
<tr>
<td>G</td>
<td>1048575</td>
<td>C3...C0 + B7...B0 + A7...A0</td>
<td>Write-only</td>
</tr>
<tr>
<td>H</td>
<td>16777215</td>
<td>D3...D0 + C3...C0 + B7...B0 + A7...A0</td>
<td>Write-only</td>
</tr>
</tbody>
</table>

**Note:** When writing to port G, port C must be set to output mode. When writing to port H, both port C and port D must be set to output mode. Use `CONT:HAND:C:MODE OUTP` and `CONT:HAND:D:MODE OUTP`.

**Examples**

```
CONT:HAND:A 254
control:handler:c:data 12
```

**Query Syntax**

`CONT:HAND:<port>:DATA?`

**Return Type**

Numeric

**Default**

Not Applicable

### CONT:HANDler[:EXTension]:INDex:LOGic <char>

**Applicable Models:** E5080B, All PXIe VNAs with M9341A/B, M937xA, P937xA, M980xA/P50xxA with I/O Adapter.

(Read-Write) Sets the logic of the index line. There is no soft front-panel element for this feature.

(M937xA) Index is on "Trig Out" port on the last PXIe module

**Parameters**

<char>

Choose from:

- **POSitive** - Causes the Index line to have positive logic (Low signal indicates that the measurement is complete).
- **NEGative** - Causes the Index lines to have negative logic (High signal indicates that the measurement is complete).
CONT:HAND:IND:LOG NEG
control:handler:extension:index:logic negative

Query Syntax
CONTrol:HANDler[:EXTension]:INDex:LOGIC?

Return Type
Character

Default
POSitive

CONTrol:HANDler[:EXTension]:INDex[:STATe] <bool>

Applicable Models: N522xB, N523xB, N524xB, E5080, All PXIe VNAs with M9341A/B

(Read-Write) Determines the control of Material Handler connector Pin 20. A "Mnemonic not implemented" error is returned if the VNA does NOT have this capability.

Parameters

<bool>
Choose from:
ON (1) - Pin 20 is controlled by the Index signal
OFF (0) - Pin 20 is controlled by Output Port B6

Examples
CONT:HAND:IND 1
control:handler:extension:index:state off

Query Syntax
CONTrol:HANDler[:EXTension]:INDex[:STATe]?

Return Type
Boolean

Default
OFF

CONTrol:HANDler[:EXTension]:RTRigger[:STATe] <bool>

Applicable Models: N522xB, N523xB, N524xB, E5080, All PXIe VNAs with M9341A/B

(Read-Write) Determines the control of Material Handler connector Pin 21. A "Mnemonic not implemented" error is returned if the VNA does NOT have this capability.

Parameters

<bool>
Choose from:
ON (1) - Pin 21 is controlled by the Ready for Trigger signal
OFF (0) - Pin 21 is controlled by Output Port B7

Examples
CONT:HAND:RTR 1
control:handler:extension:rtrigger:state off
**Query Syntax**

```
CONTol:HANDler[:EXTension]:RTRigger[:STATe]?
```

**Return Type**  
Boolean

**Default**  
OFF

---

**CONTol:HANDler:INPut?**

Applicable Models: N522xB, N523xB, N524xB, E5080, M9485A, All PXIe VNAs with M9341A/B

*(Read-Only)* Reads a hardware latch that captures high to low transitions on Input1 of the Material Handler IO. Reading the latch causes it to reset and is ready for the next transition. The hardware latch is only capable of capturing one transition per query. Additional transitions are ignored until after the next query.

Momentarily driving Input1 high, then low, will cause a transition to be detected and latched.

**Examples**

```
CONT:HAND:INP?
control:handler:input?
```

**Return Type**  
Integer - Returns a value of zero or one.

0 - No transition detected since last query.

1 - Transition detected.

**Default**  
Not Applicable

---

**CONTol:HANDler:LOGic <char>**

Applicable Models: N522xB, N523xB, N524xB, E5080

*(Read-Write)* Sets the logic of the Data ports A-H on the Handler connector. Some of these lines are connected internally to the AuxIO.

**Parameters**

**<char>**

Choose from:

- POSitive- Causes the Port lines to have positive logic (high = 1, low = 0).
- NEGative- Causes the Port lines to have negative logic (high = 0, low = 1).

For ports that are in output (write) mode, a change in logic causes the output lines to change state immediately. For example, Low levels change immediately to High levels.

For ports that are in input (read) mode (C,D,E only), a change in logic will be reflected when data is read from that port. For example, if a line read 0, the next read after a logic change will read 1.
CONT:HAND:LOG POS
control:handler:logic negative

Query Syntax
CONTrol:HANDler:LOGic?

Return Type
Character
Default NEGative

CONTrol:HANDler:OUTPut<port>:DAta <num>

Parameters

<port> Output port. Choose from:
1 - output 1 (default)
2 - output 2 (M9341 does not support this)

<num> 0 - Low
1 - High

Examples
CONT:HAND:OUTPut1 1
control:handler:output2:DATA 0

Query Syntax
CONTrol:HANDler:OUTPut<port>:DAta?

Return Type
Boolean
Default 0 - Low

CONTrol:HANDler:OUTPut<port>:USER[:DAta] <num>

Parameters

<port> (Read-Write) Sets or reads the specified USER output line.

Examples
CONT:HAND:OUTPut1 1
control:handler:output2:DATA 0

Query Syntax
CONTrol:HANDler:OUTPut<port>:USER[:DAta]?

Return Type
Boolean
Default 0 - Low

CONTrol:HANDler:OUTPut<port>:USER[:DAta] <num>

Parameters

<port> Type 1 and Type 2 configurations: Returns the last value written to the selected output pin.
Type 3 configuration: Returns the current state of the selected output pin. If an Input1 trigger occurs, the state may not be the same value as was written.

Examples
CONT:HAND:OUTPut1 1
control:handler:output2:DATA 0

Query Syntax
CONTrol:HANDler:OUTPut<num>:DAta?

Return Type
Boolean
Default 0 - Low

CONTrol:HANDler:OUTPut<port>:USER[:DAta] <num>

Parameters

<port> Type 1 and Type 2 configurations: Returns the last value written to the selected output pin.
Type 3 configuration: Returns the current state of the selected output pin. If an Input1 trigger occurs, the state may not be the same value as was written.
Learn about User Output.

Parameters

<port>  
USER Output port. Choose from:

1 - User output 1 (default)

2 - User output port. (M9341 does not support this)

<num>  
0 - Low
1 - High

Examples

CONT:HAND:OUTPut1:USER 1
control:handler:output2:user:data 0

Query Syntax

CONTrol:HANDler:OUTPut<num>:USER:DATA?

Return Type

Boolean

Default

0 - Low

CONTrol:HANDler:PASSfail:LATCh <bool>

Applicable Models: E5080,

(Read-Write) Enable the compatible mode with the E5071C for pass/fail status. If this is enabled, the pass/fail result of the Material Handler IO (pin33) is kept until next measurement. The default pass/fail state set is defined by CONTrol:HANDler:PASSfail:MODe <char>, and this function works independently from the command “CONTrol:HANDler:PASSfail:MODe <char>”. This mode does not provide full compatibility with the E5071C in the timing chart perspective.

Parameters

<char>  
Choose from:
OFF (0)- Off.
ON (1)- Enable Pass/Fail line latch mode. E5071C compatible.

Examples

CONT:HAND:PASS:LATC 1
control:handler:passfail:latch on

Query Syntax

CONTrol:HANDler:PASSfail:LATCh?

Return Type

Boolean

Default

OFF (0)
**CONTrol:HANDler:PASSfail:LOGic <char>**

Applicable Models: N522xB, N523xB, N524xB, E5080, All PXIe VNAs with M9341A/B

(Read-Write) Sets the logic of the PassFail line of the Material Handler IO (pin 33).

**Parameters**

<char>

Choose from:

POSitive- Causes the PassFail line to have positive logic (high = pass, low = fail).

NEGative- Causes the PassFail line to have negative logic (high = fail, low = pass).

**Examples**

```
CONT:HAND:PASS:LOG POS
cONTrol:HANDler:PASSfail:logic negative
```

**Query Syntax**

```
CONTrol:HANDler:PASSfail:LOGic?
```

**Return Type**

Character

**Default**

POSitive

---

**CONTrol:HANDler:PASSfail:MODE <char>**

Applicable Models: N522xB, N523xB, N524xB, E5080, All PXIe VNAs with M9341A/B

(Read-Write) Sets and reads the default logical pass/fail state. This is the state the pass/fail line stays in until a failure occurs (if the mode is NOWait), or until an end-of-sweep condition occurs (if the mode is PASS or FAIL).

The end-of-sweep condition is determined by the **CONTrol:HANDler:PASSfail:SCOPe** command.

**Parameters**

<char>

Choose from:

PASS- the line stays in PASS state until the end-of-sweep condition occurs, at which time the pass/fail line is set, and the pass/fail strobe (line 36) is activated.

FAIL- the line stays in FAIL state until the end-of-sweep condition occurs, at which time the pass/fail line is set, and the pass/fail strobe (line 36) is activated.

NOWait- the pass/fail line is set, and the pass/fail strobe (line 36) is activated as soon as a failure condition occurs.

**Examples**

```
CONT:HAND:PASS:MODE NOW
cONTrol:HANDler:PASSfail:mode fail
```

**Query Syntax**

```
CONTrol:HANDler:PASSfail:MODE?
```
CONTrol:HANDler:PASSfail:SCOPe <char>

Applicable Models: N522xB, N523xB, N524xB, E5080, All PXIe VNAs with M9341A/B

(Read-Write) Sets and reads the scope of pass/fail testing. The pass/fail line on the material handler port can report the status of all measurements on each channel, or all measurements on all channels. This command selects which option to use.

Parameters

<char>  
Choose from:

CHANnel - A pass/fail result is computed and written to the output pins at the end of all sweeps on a channel.

GLOBal - A pass/fail result is computed and written to the output pins at the end of all sweeps on a channel.

If the pass/fail mode is NOWait (as set by CONTrol:HANDler:PASSfail:MODe), the status and strobe pins are written immediately. Otherwise the pins are written as indicated above. Regardless of the mode value, the pass/fail line is returned to its default state (as set by the MODE command) at the end of channel or group of channels.

Examples

```
CONT:HAND:PASS:SCOP CHAN
control:handler:passfail:scope sweep
```

Query Syntax

CONTrol:HANDler:PASSfail:SCOPe?

Return Type  Character

Default  NOWait

CONTrol:HANDler:PASSfail:POLicy <char>

Applicable Models: N522xB, N523xB, N524xB, E5080, All PXIe VNAs with M9341A/B

(Read-Write) Sets the policy used to determine how global pass/fail is computed.

Parameters

<char>  
Name of the policy to use. Choose from:
ALLTests - **Pass/Fail Status** returns PASS if all tests on all measurements pass.

ALLMeas - **Pass/Fail Status** returns PASS if all measurements have associated tests, and all tests pass. FAIL is returned if even one measurement has no associated limit test.

Only those measurements which are not in HOLD mode contribute to the pass/fail result.

### Examples

```
CONT:HAND:P
control:handler:passfail:policy
```

### Query Syntax

```
CONTroll:HANDler:PASSfail:POLicy?
```

### Return Type

**Character**

### Default

ALLTests

---

**CONTroll:HANDler:PASSfail:STATus?**

**Applicable Models:** N522xB, N523xB, N524xB, E5080, M9485A, All PXIe VNAs with M9341A/B

*(Read-Only)* Returns the most recent pass/fail status value. Use this command as follows:

1. Set the VNA trigger scope to GLOBAL
2. Set the VNA trigger source to MANUAL or EXTERNAL.
3. Configure and enable Limit Testing.
4. Trigger the VNA.
5. Use the *OPC? command to determine when the sweep is complete.
6. Use the CONT:HAND:PASS:STAT? query to obtain the global pass/fail result.

### Return Type

**Character** - One of the following is returned:

- **PASS** - all measurements not in HOLD mode have been swept, and all associated limit tests have passed.
- **FAIL** - all measurements not in HOLD mode have been swept, and one or more limit tests failed according to the specified Pass/Fail policy.
- **NONE** - status cannot be determined because measurements are in progress.

### Default

Not Applicable

---

**CONTroll:HANDler:SWEepend <char>**

**Applicable Models:** N522xB, N523xB, N524xB, E5080, All PXIe VNAs with M9341A/B
(Read-Write) Specifies the event that will cause the Handler Sweep End line to strobe. The strobe is at least 10µs in duration, and is activated when all calculations for the associated measurement are complete. This line is connected internally to the Sweep End line of the AUX IO connector.

Parameters

<char> Choose from:
SWEep - the line goes low when each sweep is complete
CHANnel - the line goes low when all the sweeps for each channel is complete.
GLOBal - the line goes low when all sweeps for all channels are complete.

The default state of the passFail line (before a measurement occurs) and after a failure occurs is set by

  CONTrol:HANDler:PASSfail:MODe

Examples

  CONT:HAND:SWE SWE
  control:handler:sweepend channel

Query Syntax

  CONTrol:HANDler:SWEepe?

Return Type

  Character

Default

  GLOBal
# Display Colors

Controls the color settings of the VNA display.

---

**DISPlay:COLor<n>:ABACkground <num, num, num>**

**Applicable Models:** All

*(Read-Write)* Set and return the background color for the active window on the VNA display or hardcopy print.

**Parameters**
Colors to modify. Choose from:
1 - Display colors
2 - Print colors
If unspecified, <n> is set to 1 (Display colors).

**<n>, <num, num, num>**

To find RGB values: from the Display Colors dialog, click Change Color, then Define Custom Color.

**DISPlay:COLor<n>:GRAT2 <num, num, num>**

*Applicable Models: All*

*(Read-Write)* Set and return the inner lines of all grid in all windows, and the grid frame in inactive windows for the VNA display or hardcopy print. *(GRID)*

**Parameters**

<n>  
Colors to modify. Choose from:

1 - Display colors  
2 - Print colors  

If unspecified, <n> is set to 1 (Display colors).

<num, num, num>  
Numeric. Red, Green, and Blue (RGB values) that specify a color.

To find RGB values: from the Display Colors dialog, click Change Color, then Define Custom Color.
Examples

```
DISP:COL:GRAT2 10,10,10
display:color1:grat2 80,80,80
```

Query Syntax

DISPlay:COlor<n>:GRAT2?

Return Type

Numeric (n,n,n)

Default

Display = 100,100,100
Print = 50,50,50

---

**DISPlay:COlor<n>:ILABel <num, num, num>**

**Applicable Models:** All

*(Read-Write)* Set and return the Inactive (not selected) Window Labels for the VNA display or hardcopy print.

**Parameters**

<n>

Colors to modify. Choose from:

1 - Display colors
2 - Print colors

If unspecified, <n> is set to 1 (Display colors).

<num, num, num>

Numeric. Red, Green, and Blue (RGB values) that specify a color.

To find RGB values: from the Display Colors dialog, click Change Color, then Define Custom Color.

Examples

```
DISP:COL:ILAB 10,10,10
display:color1:ilabel 80,80,80
```

Query Syntax

DISPlay:COlor<n>:ILABel?

Return Type

Numeric (n,n,n)

Default

Display = 160,160,160
Print = 0,0,0 (Black)

---

**DISPlay:COlor<n>:LIM1 <num, num, num>**

**Applicable Models:** All

*(Read-Write)* Set and return the limit line color of failed traces or failure indicators (dots) and the word Fail.

**Parameters**

<n>

Colors to modify. Choose from:
1 - Display colors
2 - Print colors

If unspecified, \(<n>\) is set to 1 (Display colors).

\(<\text{num, num, num}>\)

Numeric. Red, Green, and Blue (RGB values) that specify a color.

To find RGB values: from the Display Colors dialog, click Change Color, then Define Custom Color.

Examples

```
DISP:COL:LIMIT 10,10,10
display:color1:limit 80,80,80
```

Query Syntax

```
DISPlay:COLor\(<n>\):LIMIT?
```

Return Type

Numeric (n,n,n)

Default

Display = 255,20,20
Print = 255,20,20

**DISPlay:COLor\(<n>\):LOAD \(<value>\)**

**Applicable Models:** All

*(Write-only)* Load a color theme from a disc file.

**Parameters**

\(<n>\)
Colors to load. Choose from:

1 - Display colors
2 - Print colors

If unspecified, \(<n>\) is set to 1 (Display colors).

\(<value>\)
String. Filename of the stored theme. The .colors suffix is automatically appended.

By default, files are stored in C:\Program Files(x86)\Keysight\Network Analyzer\Colors. To store and load files from a different folder, specify the full path and filename.

Examples

```
DISP:COL:LOAD "myDisplayTheme"
display:color2:load "myPrintTheme"
```

Query Syntax

Not Applicable

Default

Not Applicable

**DISPlay:COLor\(<n>\):RESet**

**Applicable Models:** All
(Write-only) Resets the current theme to the default VNA colors.

Parameters

<n>
Colors to reset. Choose from:
1 - Display colors
2 - Print colors
If unspecified, <n> is set to 1 (Display colors).

Examples

<table>
<thead>
<tr>
<th>Command</th>
</tr>
</thead>
<tbody>
<tr>
<td>DISP:COL:RES</td>
</tr>
<tr>
<td>display:color2:reset</td>
</tr>
</tbody>
</table>

Query Syntax

Not Applicable

Default

Not Applicable

DISPlay:COLor<n>:STORe <value>

Applicable Models: All

(Write-only) Saves the current color theme to a disc file.

Parameters

<n>
Colors to store. Choose from:
1 - Display colors
2 - Print colors
If unspecified, <n> is set to 1 (Display colors).

<value>
String. Filename. The .colors suffix is automatically appended.
By default, files are stored in C:\Program Files(x86)\Keysight\Network Analyzer\Colors. To store and load files from a different folder, specify the full path and filename.

Examples

<table>
<thead>
<tr>
<th>Command</th>
</tr>
</thead>
<tbody>
<tr>
<td>DISP:COL:STOR &quot;myDisplayTheme&quot;</td>
</tr>
<tr>
<td>display:color2:store &quot;myPrintTheme&quot;</td>
</tr>
</tbody>
</table>

Query Syntax

Not Applicable

Default

Not Applicable

DISPlay:COLor<n>:TRACe<nth>:DATA <num, num, num>

Applicable Models: All

(Read-Write) Set and return the color of Data and Limit Lines for nth trace in a window.

Parameters
Colors to modify. Choose from:
1 - Display colors
2 - Print colors
If unspecified, <n> is set to 1 (Display colors).

Numeric. Relative trace number in the window for which colors are set. This is not necessarily the trace number. Learn more.
Choose from 1 to 8.
If unspecified, <nth> is set to 1 (first trace).

Numeric. Red, Green, and Blue (RGB values) that specify a color.
To find RGB values: from the Display Colors dialog, click Change Color, then Define Custom Color.

Examples

```
DISP:COL:TRAC2:DATA 10,10,10
display:color1:trace5:DATA 80,80,80
```

Query Syntax

```
DISPlay:COLor<n>:TRACe<nth>:DATA?
```

Return Type

Numeric (n,n,n)

Default

Varies for each trace.

```
DISP:COLor<n>:TRACe<nth>:MARKer <num, num, num>
```

**Applicable Models:** All
**(Read-Write)** Set and return the color of data trace markers for nth trace in a window.

Parameters

Colors to modify. Choose from:
1 - Display colors
2 - Print colors
If unspecified, <n> is set to 1 (Display colors).

Numeric. Relative trace number in the window for which colors are set. This is not necessarily the trace number. Learn more.
Choose from 1 to 8.
If unspecified, <nth> is set to 1 (first trace).

Numeric. Red, Green, and Blue (RGB values) that specify a color.
To find RGB values: from the Display Colors dialog, click Change Color, then Define Custom Color.
Examples

<table>
<thead>
<tr>
<th>Display Colors</th>
<th>Query Syntax</th>
<th>Return Type</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>DISP:COL:TRAC2:MARK 10,10,10</td>
<td>display:color1:trace5:marker 80,80,80</td>
<td>Numeric (n,n,n)</td>
<td>Varies for each trace.</td>
</tr>
</tbody>
</table>

Applicable Models: All

Set and return the memory trace color for nth trace in a window.

Parameters

<n>
Colors to modify. Choose from:
- 1 - Display colors
- 2 - Print colors
If unspecified, <n> is set to 1 (Display colors).

<nth>
Numeric. Relative trace number in the window for which colors are set. This is not necessarily the trace number. Learn more.
Choose from 1 to 8.
If unspecified, <nth> is set to 1 (first trace).

<num, num, num>
Numeric. Red, Green, and Blue (RGB values) that specify a color.
To find RGB values: from the Display Colors dialog, click Change Color, then Define Custom Color.

Examples

<table>
<thead>
<tr>
<th>Display Colors</th>
<th>Query Syntax</th>
<th>Return Type</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>DISP:COL:TRAC2:MEM 10,10,10</td>
<td>display:color1:trace5:memory 80,80,80</td>
<td>Numeric (n,n,n)</td>
<td>Varies for each trace.</td>
</tr>
</tbody>
</table>

Applicable Models: All

Set and return the color of memory trace markers for nth trace in a window.

Parameters

<n>

<nth>

<num, num, num>
Parameters

<n>
Colors to modify. Choose from:
1 - Display colors
2 - Print colors
If unspecified, <n> is set to 1 (Display colors).

<nth>
Numeric. Relative trace number in the window for which colors are set. This is not necessarily the trace number. Learn more.
Choose from 1 to 8.
If unspecified, <nth> is set to 1 (first trace).

<num, num, num>
Numeric. Red, Green, and Blue (RGB values) that specify a color.
To find RGB values: from the Display Colors dialog, click Change Color, then Define Custom Color.

Examples

DISP:COL:TRAC2:MMAR 10,10,10
display:color1:trace5:mmarker 80,80,80

Query Syntax

DISPlay:COLOr<n>:TRACe<nth>:MMARker?

Return Type

Numeric (n,n,n)

Default

Varies for each trace.
Local Lockout

Normally, a GPIB instrument is put in remote mode by asserting the Remote Enable (REN) GPIB line. At that time, all front panel keys (except the Local key) are locked to prevent user interaction.

Sending the LLO message over the GPIB further locks out the keyboard, mouse, and Local key during execution of your GPIB program. The syntax of the LLO message depends on the GPIB driver you are using. Consult your GPIB driver software users manual.

The VNA requires these two actions to occur in order:

- Controller sends the LLO (Local Lockout) message
- Controller asserts the REN (Remote Enable) GPIB line

The VNA will then go into remote mode with full lockout capability.

This feature is also supported using SICL over LAN.

Use the `LocalLockoutState` COM command when using TCPIP/LAN.
CorrCollGuidPSens
Sense:Correction:Collect:Guided:PSensor Commands

Configures the power sensors to be used during a SmartCal (Guided) Power Calibration.

Three of these commands can be used with Applications Channels. Learn more.

```
SENSe:CORRection:COLLect:GUIDed:PSEN<n>:CKIT
SENSe:CORRection:COLLect:GUIDed:PSEN<n>:CONN
```

Click on a keyword to view the command details.

**Notes**

EXCEPT for the following THREE commands, the commands listed on this page are supported ONLY on standard channels.

These can be used with Application channels. See NFX example.

```
SENSe:CORRection:COLLect:GUIDed:PSEN<n>:CKIT
SENSe:CORRection:COLLect:GUIDed:PSEN<n>:CONN
```

When using two sensors with a Dual Power Meter, use SOUR:POW:CORR:COLL:<pmChan>SEN:SEL to select a power sensor.

See Also

SENSe:CORRection:COLLect:GUIDed commands
SENSe<ch>:CORRection:COLLect:GUIDed:PSENor<pnum>:CKIT <kit>, [src]

(Read-Write) Specifies the calibration kit to be used when an adapter is necessary to connect the power sensor to the port <pnum> during a guided calibration. This command can also be used with Application channels. See NFX example. When used with Guided Power Cal, first enable a power cal using SENS:CORR:COLL:GUID:PSEN ON

Specify the connector type for the adapter with SENS:CORR:COLL:GUID:PSEN:CONN

Query the valid available kits for the connector with SENS:CORR:COLL:GUID:CKIT:CAT? <conn>

Specify the kit using this command.

Perform a query of this command. If the <kit> parameter was incorrectly entered, an error will be returned.

Parameters

<ch> Channel being calibrated, depending on the CHAN:MODE setting. If unspecified, value is set to 1.

<pnum> Source port being calibrated. If unspecified, value is set to 1. For NFX cals, port number must be 1.

<kit> Calibration kit to be used for the specified port.

When using an ECal module, include the characterization name in the <kit> string. Use SENS:CORR:COLL:GUID:CKIT:CAT? to read the list of characterizations available in the module and in VNA disk memory.

If two or more identical ECal modules are connected to the VNA, the serial number must be included to distinguish the ECal modules.

While this argument can be used to make settings for ALL ports, it is designed to access ports such as an external source, true mode balanced port, or one of the Source outputs on the 2-port VNA-x model with multiple sources such as "Port 1 Src2".

Otherwise, the <port> argument performs the same function. If both arguments are specified, [src] takes priority.

See Remotely Specifying a Source Port

Examples

SENS:CORR:COLL:GUID:PSEN1:CKIT '85055A'
'The following includes a serial number when two or more ECal mods are connected
SENSe<ch>:CORRection:COLLect:GUIDed:PSENsor<pnum>:CONNector <conn>, [src]

(Read-Write) Specifies the connector type for a power sensor when a power calibration is part of the Guided Calibration process. Valid connector names are stored within calibration kits. Some cal kits may include both male and female connectors. Therefore, specifying connector gender may be required.

This command can also be used with Application channels. See NFX example.

Follow these steps to ensure port connectors are specified correctly:

When used with Guided Power Cal, first enable a power cal using SENSe:CORR:COLL:GUID:PSEN ON

Set a connector type for each port using this command.

Perform a query of this command. If the connector type was incorrectly entered, an error will be returned.

Specify the cal kit to use for each port with SENSe:CORR:COLL:GUID:PSENsor:CKIT

Parameters

<ch> Channel being calibrated, depending on the CHAN:MODE setting. If unspecified, value is set to 1.

<pnum> Source port being calibrated. If unspecified, value is set to 1.

<conn> String - Power sensor connector type to connect to the specified VNA port <pnum>.

Because the default for this argument is "Ignored", by specifying a connector type, you imply that you want to calibrate and correct for the effects of the adapter.

While this argument can be used to make settings for ALL ports, it is designed to access ports such as an external source, true mode.
balanced port, or one of the Source outputs on the 2-port VNA-x model with multiple sources such as "Port 1 Src2".

Otherwise, the <port> argument performs the same function. If both arguments are specified, [src] takes priority.

See Remotely Specifying a Source Port

Examples

```
SENS:CORR:COLL:GUID:PSEN1:CONN "3.5 mm (50) male"
```

```
sense:correction:collect:guided:psensor1:connector "3.5 mm (50) female"
```

See example program

Query Syntax

```
SENSe<ch>:CORRection:COLLect:GUIDed:PSENsor<pnum>:CONNector?
```

Return Type

String

Default

"Ignored"

---

**SENS<ch>:CORR<e>ction:COLL<e>ct:GUID<ed>PSENsor<pnum>:MULT<e>l<e>e:ADD <s<tring>>**

**Applicable Models:** All

*(Write-only) Adds a power sensor to be used during a Guided Power Calibration. Use when multiple power sensors are to be used to calibrate the entire frequency span. The Name argument is used to recognize the sensor in the User Interface. An item number is automatically assigned to the sensor. Use that number to refer to the sensor. The item number of the newly-added sensor is always equal to the number returned by SENS:CORR:COLL:GUID:PSEN:MULT:COUN? after the ADD.*

**Note:** The "multiple sensors" commands are supported ONLY on standard channels.

Learn about using multiple power sensors

```

Not Applicable
SENSe<ch>:CORRection:COLLect:GUIDed:PSENsor<pnum>:MULTiple<id>:CKIT <string>

(Read-Write) Set and read the Cal Kit to be used when an adapter is necessary to connect the power sensor to the cal plane and you choose to remove its effects from the measurement. Use this command when multiple power sensors are to be used to calibrate the entire frequency span. Learn about using multiple power sensors.

Applicable Models: All

Parameters

<ch>
Channel being calibrated, depending on the CHAN:MODE setting. If unspecified, value is set to 1.

<pnum>
Source port being calibrated. If unspecified, value is set to 1.

<id>
Power sensor item number. This 1-based number is assigned automatically when a power sensor is added using SENS:CORR:COLL:GUID:PSEN:MULT:ADD. Use SENS:CORR:COLL:GUID:PSEN:MULT:COUN? to return the number of power sensor items that are configured for use on the channel.

<string>
Calibration kit to be used for the specified source port. When using an ECal module, include the characterization name in the <kit> string. Use SENSE:CORR:COLL:GUID:CKIT:CAT? to read the list of characterizations available in the module and in VNA disk memory.

If two or more identical ECal modules are connected to the VNA, the serial number must be included to distinguish the ECal modules.

Examples

SENS:CORR:COLL:GUID:PSEN1:MULT2:CKIT '85055A'
'The following includes a serial number when two or more ECal mods are connected.'

sense:correction:collect:guided:psensor2:multiple1:ckit '85092-60010 ECal 10685'

SENSe<ch>:CORRection:COLLect:GUIDed:PSENsor<pnum>:MULTiple<id>:CONNECTor <conn>

(Read-Write) Set and read the connector type of a power sensor to be used when an adapter is necessary to connect the power sensor to the cal plane and you choose to remove its effects from the measurement. Use this command when multiple power sensors are to be used to calibrate the entire frequency span. Learn about using multiple power sensors.

Applicable Models: All

Parameters
### SENSE<ch>:CORRection:COLLect:GUIDed:PSENsor<pnum>:MULTiple<id>:CONNector?

**Description:**
Returns the string value of the power sensor connector type to connect to the specified source port <pnum>. Because the default for this argument is 'Ignored', by specifying a connector type, you imply that you want to calibrate and correct for the effects of the adapter.

**Query Syntax:**
```
SENSe<ch>:CORRection:COLLect:GUIDed:PSENsor<pnum>:MULTiple<id>:CONNector?
```

**Return Type:**
String

**Default:**
"Ignored"

**Examples:**
```
SENS:CORR:COLL:GUID:PSEN1:MULT1:CONN "3.5 mm (50) male"
```

**See example program**

---

### SENSE<ch>:CORRection:COLLect:GUIDed:PSENsor<pnum>:MULTiple<COUNT?

**Description:**
(Read-only) Returns the number of configured power sensors to be used during a Guided Power Calibration.

**Query Syntax:**
```
SENSe<ch>:CORRection:COLLect:GUIDed:PSENsor<pnum>:MULTiple<COUNT?
```

**Return Type:**
Numeric

**Default:**
Not Applicable

**Examples:**
```
SENS:CORR:COLL:GUID:PSEN1:MULT1:COUN?
```

**See example program**

---

### SENSE<ch>:CORRection:COLLect:GUIDed:PSENsor<pnum>:MULTiple<id>:FREQuency:STARt <num>

**Description:**
(Read-Write) Set and read the start frequency for the specified power sensor (port number). Use this command when multiple power sensors are to be used to calibrate the entire frequency span.

**Query Syntax:**
```
SENSe<ch>:CORRection:COLLect:GUIDed:PSENsor<pnum>:MULTiple<id>:FREQuency:STARt <num>
```

---

**Parameters**
- `<ch>`: Channel being calibrated, depending on the `CHAN:MODE` setting. If unspecified, value is set to 1.
- `<pnum>`: Source port being calibrated. If unspecified, value is set to 1.
- `<id>`: Power sensor item number. This 1-based number is assigned automatically when a power sensor is added using `SENS:CORR:COLL:GUID:PSEN:ADD`. Use `SENS:CORR:COLL:GUID:PSEN:MULT:COUN?` to return the number of power sensor items that are configured for use on the channel.
- `<conn>`: String - Power sensor connector type to connect to the specified source port `<pnum>`. Because the default for this argument is 'Ignored', by specifying a connector type, you imply that you want to calibrate and correct for the effects of the adapter.
Parameters

<ch>
Channel being calibrated, depending on the CHAN:MODE setting. If unspecified, value is set to 1.

<pnum>
Source port being calibrated. If unspecified, value is set to 1.

{id>
Power sensor item number. This 1-based number is assigned automatically when a power sensor is added using SENS:CORR:COLL:GUID:PSEN:MULT:ADD. Use SENS:CORR:COLL:GUID:PSEN:MULT:COUN? to return the number of power sensor items that are configured for use on the channel.

<num>
Start frequency in Hz. Choose a value between the start frequency and stop frequency of the VNA.

Examples

SENS:CORR:COLL:GUID:PSEN1:MULT1:FREQ:STAR 1e9
See example program

Query Syntax

SENSe<ch>:CORRection:COLLect:GUIDed:PSENsor<pnum>:MULTiple<id>:FREQuency:STARt?

Return Type

Numeric

Default

Start frequency of the VNA

(Read-Write) Set and read the stop frequency for the specified power sensor (port number). Use this command when multiple power sensors are to be used to calibrate the entire frequency span. Learn about using multiple power sensors

Parameters

<ch>
Channel being calibrated, depending on the CHAN:MODE setting. If unspecified, value is set to 1.

<pnum>
Source port being calibrated. If unspecified, value is set to 1.

{id>
Power sensor item number. This 1-based number is assigned automatically when a power sensor is added using SENS:CORR:COLL:GUID:PSEN:MULT:ADD. Use SENS:CORR:COLL:GUID:PSEN:MULT:COUN? to return the number of power sensor items that are configured for use on the channel.

<num>
Stop frequency in Hz. Choose a value between the start frequency and stop frequency of the VNA.

Examples

SENS:CORR:COLL:GUID:PSEN1:MULT1:FREQ:STOP 2e9
See example program

Query Syntax

SENSe<ch>:CORRection:COLLect:GUIDed:PSENsor<pnum>:MULTiple<id>:FREQuency:STOP?
SENSe<ch>:CORRection:COLLect:GUIDed:PSENsor<pnum>:MULTiple<id>:NAME <string>

(Read-Write) Set and read the name of the power sensor. Learn about using multiple power sensors.

Parameters

<ch> Channel being calibrated, depending on the CHAN:MODE setting. If unspecified, value is set to 1.

<pnum> Source port being calibrated. If unspecified, value is set to 1.

<id> Power sensor item number. This 1-based number is assigned automatically when a power sensor is added using SENS:CORR:COLL:GUID:PSEN:MULT:ADD. Use SENS:CORR:COLL:GUID:PSEN:MULT:COUN? to return the number of power sensor items that are configured for use on the channel.

<string> Sensor name. The power sensor must be already configured as a PMAR device using this name. Learn how to remotely configure a PMAR device.

Examples

SENSe<ch>:CORRection:COLLect:GUIDed:PSENsor1:MULT1:NAME "26GHzPwrSensor"

See example program

Query Syntax

SENSe<ch>:CORRection:COLLect:GUIDed:PSENsor<pnum>:MULTiple<id>:NAME?

Return Type

String

Default

(Applicable Models: All)

(Write-only) Deletes a power sensor from the sensors to be used during a Guided Power Calibration.

Parameters

<ch> Channel being calibrated, depending on the CHAN:MODE setting. If unspecified, value is set to 1.

<pnum> Source port being calibrated. If unspecified, value is set to 1.

<id> Power sensor item number to remove. Use SENS:CORR:COLL:GUID:PSEN:MULT:COUN? to return the number of power sensor items that are configured for use on the channel.
### SENSE<ch>:CORRection:COLLect:GUIDed:PSENsor<pnum>:MULTiple[:STATe] <value>

*(Read-Write)* Enables the use of multiple power sensors to calibrate the entire frequency span of the channel. Learn about using multiple power sensors.

**Parameters**

- `<ch>`: Channel being calibrated, depending on the `CHAN:MODE` setting. If unspecified, value is set to 1.
- `<pnum>`: Source port being calibrated. If unspecified, value is set to 1. ONLY one port may be calibrated with a Guided Power Cal.
- `<value>`: Boolean
  - ON (or 1): Use multiple power sensors.
  - OFF (or 0): Do NOT use multiple power sensors.

**Examples**

```
SENS:CORR:COLL:GUID:PSEN1:MULT 0
sense:correction:collect:guided:psensor2:multiple:state ON
```

**Query Syntax**

```
SENSe<ch>:CORRection:COLLect:GUIDed:PSENsor<pnum>:MULTiple[:STATe]? 
```

**Return Type**

Boolean

**Default**

OFF (0)

### SENSE<ch>:CORRection:COLLect:GUIDed:PSENsor<pnum>:POWer:LEVel <value>, [src]

*(Read-Write)* Specifies the power level at which to perform a power calibration during a guided calibration. This command can also be used with Application channels. See NFX example.

When used with Guided Power Cal, first enable a power cal using `SENS:CORR:COLL:GUID:PSEN ON`.

**Parameters**

- `<ch>`: Channel being calibrated, depending on the `CHAN:MODE` setting. If unspecified, value is set to 1.
Source port being calibrated. If unspecified, value is set to 1. For NFX cals, port number must be 1.

Power level in dBm at which to perform the power calibration. Learn more.

While this argument can be used to make settings for ALL ports, it is designed to access ports such as an external source, true mode balanced port, or one of the Source outputs on the 2-port VNA-x model with multiple sources such as "Port 1 Src2".

Otherwise, the <port> argument performs the same function. If both arguments are specified, [src] takes priority.

See Remotely Specifying a Source Port

**Examples**

```
SENS:CORR:COLL:GUID:PSEN1:POW:LEV 0
Setting calibration power for Gain Compression Converters (GCX)
SENS:CORR:COLL:GUID:PSEN1:POW:LEV -21 'Sets the cal power over the input frequencies where port 1 is the input of the mixer
SENS:CORR:COLL:GUID:PSEN2:POW:LEV -6 'Sets the cal power over the output frequencies where port 2 is the output of the mixer
```

See example program

**Query Syntax**

SENSe<ch>:CORRection:COLLect:GUIDed:PSENsor<pnum>:POWer:LEVel?

**Return Type**

Numeric

**Default**

0

SENSe<ch>:CORRection:COLLect:GUIDed:PSENsor<pnum>:POWTable <file>, [src]

Applicable Models: N522xB, N523xB, N524xB

(Read-Write) Loads a file that defines a power table to be used during a SMC Guided Power Cal or Cal All Channels on a mmWave system. This feature is available because power sensors are NOT typically available at mmWave frequencies. Learn more.

**Parameters**

<ch>

Channel being calibrated, depending on the CHAN:MODE setting. If unspecified, value is set to 1.

<pnum>

Source port being calibrated. If unspecified, value is set to 1. For NFX cals, port number must be 1.
(String) Full path and filename of a *.prn file that defines the power table. An error is returned if the file is not found.

While this argument can be used to make settings for ALL ports, it is designed to access ports such as an external source, true mode balanced port, or one of the Source outputs on the 2-port VNA-x model with multiple sources such as "Port 1 Src2".

Otherwise, the <port> argument performs the same function. If both arguments are specified, [src] takes priority.

See Remotely Specifying a Source Port

Examples

SENS:CORR:COLL:GUID:PSEN1:POWT "C:/powertable1.prn"

SENSe:CORRection:COLLect:GUIDed:PSENsor<pnum>:POWTable?

Query Syntax

SENSe<ch>:CORRection:COLLect:GUIDed:PSENsor<pnum>:POWTable?

Return Type

String

Default

Not Applicable

SENSe<ch>:CORRection:COLLect:GUIDed:PSENsor<pnum>[:STATe] <value>, [src]

(Applicable Models: All)

(Read-Write) Enables Guided Power Cal and sets the source port to be calibrated.

Parameters

<ch> Channel being calibrated, depending on the CHAN:MODE setting. If unspecified, value is set to 1.

<pnum> Source port being calibrated. If unspecified, value is set to 1. ONLY one port may be calibrated with a Guided Power Cal.

<value> Boolean

ON (or 1) Perform Power Cal.
OFF (or 0) Do NOT perform Power Cal.

While this argument can be used to make settings for ALL ports, it is designed to access ports such as an external source, true mode balanced port, or one of the Source outputs on the 2-port VNA-x model with multiple sources such as "Port 1 Src2".

8139
Otherwise, the <port> argument performs the same function. If both arguments are specified, [src] takes priority.

NOTE: To configure a power meter and sensor see SOURce:POWer: commands.

Applicable Models: All with SMC Options (S9x082A/B, S9x083A/B)
(Read-Write) Specifies the S2P filename to embed or de-embed on the input or output of your mixer measurement. Learn more.

Parameters

<ch> Any existing channel number. If unspecified, value is set to 1

<p> Apply network to input or output of mixer. Choose from:
1 - Input of mixer
2 - Output of mixer

<string> Filename of the S2P used for embedding or de-embedding. Use the full path name, file name, and .S2P suffix, enclosed in quotes.

Examples

Query Syntax

Return Type String

Default Not Applicable

Applicable Models: All with SMC Options (S9x082A/B, S9x083A/B)
(Read-Write) Allows you to embed (add) or de-embed (remove) circuit network effects on the input and output of your mixer measurement. Learn more.

Parameters

<ch> Any existing channel number. If unspecified, value is set to 1

<p> Apply network to input or output of mixer. Choose from:
1 - Input of mixer
2 - Output of mixer

<char> Choose from:

NONE - Do nothing with effects of S2P file.
EMBed - Add effects of S2P file from the measurement results.
DEEMbed - Remove effects of S2P file from the measurement results.

Examples

Query Syntax

SENSe<ch>:CORRection:COLLect:GUIDed:SMC:IMP <calName>, <dataset>

Applicable Models: All with SMC Options (S9x082A/B, S9x083A/B)
(Write-only) Imports Guided Power Cal or Phase Reference Cal into the current SMC calibrations.

For the Guided Power Cal:
The port of the mixer input must have the same source attenuator setting between the SMC channel and the
Guided Power Cal Set. The frequencies of the Guided Power Cal must include all the mixer frequencies.
Interpolation will be applied to the Guided Power Cal frequencies if they do not exactly match.

For the Phase Reference Cal:
The port of the mixer input must have the same source attenuator setting as used in the phase reference cal. The
phase reference cal must include all the mixer frequencies. Interpolation will be applied to the phase reference cal
frequencies if they do not exactly match. Learn more about Phase Reference Cal.

The following error message may appear (it is not written to the VNA Error Log):

Interpolation target is out of range. Cannot interpolate when incompatible frequency ranges occur.

Parameters

<ch> Any existing channel number. If unspecified, value is set to 1
<calName> (String) Name of existing Cal Set from which to import power data.
<dataset> (String) Name of the data set. Choose from:
POWER_STEP -import the Guided Power Cal data.
"POWER_AND_PHASE" - Import the Phase Reference + power cal data. When this command is
sent, the SMC Cal Method is automatically set to Use Phase Reference Cal. Learn more. There
is no other command to set this.

Examples

See example program
SENS:CORR:COLL:GUID:SMC:IMP "MyPhaseRefCal","POWER_AND_PHASE"
See example program

Query Syntax Not Applicable

Default Not Applicable

Applicable Models: All with SMC Options (S9x082A/B, S9x083A/B)
(Read-Write) Sets and returns whether or not the LO power cal step is included in the cal steps when an SMC or GCx cal is performed. Learn more.

**Parameters**

- `<cnum>`
  - Any existing channel number; if unspecified, value is set to 1.
- `<n>`
  - LO Stage. Choose 1.
- `<bool>`
  - LO Power Cal state. Choose from:
    - O or OFF - Skips over the LO Power Cal when calibrating.
    - 1 or ON - Includes a step for LO Power Cal when calibrating

**Examples**

```
SENS:CORR:COLL:GUID:SMC:LO1:PCAL 0
```

**Query Syntax**

**Return Type**

Boolean

**Default**

OFF or 0

---

Applicable Models: All with SMC Options (S9x082A/B, S9x083A/B) (Except M9485A)

(Read-Write) Set and return the known delay through the calibration mixer. Learn more.

**Parameters**

- `<ch>`
  - Any existing channel number. If unspecified, value is set to 1.
- `<char>`
  - Known delay through the calibration mixer in seconds.

**Examples**

```
```

**Query Syntax**

**Return Type**

Numeric

**Default**

0 seconds

---

To select Phase Reference Cal method for correcting an SMC+Phase measurement, use SENS:CORR:COLL:GUID:SMC:IMPort

Parameters

-ch-

Any existing channel number. If unspecified, value is set to 1

<char>

Choose from:

FIXed - use a known delay value set with SENS:CORR:COLL:GUID:SMC:PHAS:DEL
MIXer - use the S2P file set with SENS:CORR:COLL:GUID:SMC:PHAS:MIX

Examples

Query Syntax
SENSe<ch>:CORRection:COLLect:GUIDed:SMC:PHASe:METHod?

Return Type
Character

Default
FIXed

SENS<ch>:CORRection:COLLect:GUIDed:SMC:PHASe:MIXer <string>

Applicable Models: All with SMC Options (S9x082A/B, S9x083A/B) (Except M9485A)
(Write-only) Set the filename of the S2P file used to characterize the calibration mixer. Learn more.

Parameters

-ch-

Any existing channel number. If unspecified, value is set to 1

<string>

Calibration mixer filename. Use the following rules to specify path names:
The default folder is "D:\"
You can change the active directory using MMEMory:CDIRectory.
Specify only the file name if using the active directory.
You can also use an absolute path name to specify the folder and file.

Examples

SENS:CORR:COLL:GUID:SMC:PHAS:MIX "MyCalMixer.s2p"
sense2:correction:collect:guided:smc:phase:mixer "MyCalMixer.s2p"

Query Syntax
Not Applicable

Default
Not Applicable
Applicable Models: All with SMC Options (S9x082A/B, S9x083A/B)

(Write-only) Aborts a power cal. This command should be sent when a power cal is running.

**Parameters**

<ch>  
Channel number of the SMC cal being performed. If unspecified, value is set to 1.

**Examples**

```
```

**Query Syntax**

Not Applicable

**Default**

Not Applicable

---

Applicable Models: All with SMC Options (S9x082A/B, S9x083A/B)

(Read-Write) Set whether to use the reference receiver for faster iteration during power cal or use a power meter.

This command should be set during calibration setup. Learn more.

**Parameters**

<ch>  
Any existing channel number. If unspecified, value is set to 1.

<bool>  
OFF or 0 - Use a power meter only.
ON or 1 - Use a power meter for the first reading and the reference receiver for all subsequent readings.

**Examples**

```
SENS:CORR:COLL:GUID:SMC:PWRC:REC 1
```

**Query Syntax**

```
```

**Return Type**

Boolean

**Default**

ON or 1

---

Applicable Models: All with SMC Options (S9x082A/B, S9x083A/B)

(Read-Write) Specifies whether to use a Thru standard or to use two power sensor connections during the power cal of an SMC calibration.

**Note:** This command must be sent BEFORE ALL other calibration commands.

**Parameters**

<ch>  
Any existing channel number. If unspecified, value is set to 1.
OFF or 0 - Perform Cal with Thru standard.
ON or 1 - Do NOT use a Thru, but instead perform separate power cals on Input and Output reference planes.

Query Syntax

```
```

Return Type

String

Default

D:\default.s2p

---

Applicable Models: All with VMC Options (S9x083A/B)

(Read-Write) Sets the mixer characterization method to CKIT (Ecal or Mechanical) or load a previously-performed mixer characterization (*.s2p) file. Learn about the requirements of the characterization mixer file.
Parameters

<ch>
Channel number to be calibrated. If unspecified, value is set to 1.

<char>
Choose from:

CKIT - Use an ECal or Mechanical Cal Kit for the mixer characterization. Use SENS:CORR:COLL:GUID:CKIT:PORT to specify the cal kit. For the output of the calibration mixer, specify port 3. If port 3 is already used for the output of the DUT mixer, then specify port 4.

FILE, <filename> - Retrieve a mixer characterization file. Also specify the filename of the .S2P used for mixer characterization. Use the VMC:CHARacterize:CAL:FiLeName command to query the filename.

Examples

'S or

Query Syntax

Return Type

String

Default

CKIT

Applicable Models: All with VMC Options (S9x083A/B)
(Read-Write) Specifies the direction in which to characterize the calibration mixer. Learn more about the calibration mixer.

Parameters

<ch>
Channel number to be calibrated. If unspecified, value is set to 1.

<bool>

OFF (0) - Characterize the calibration mixer in the SAME direction as that specified in the mixer setup.

ON (1) - Characterize the calibration mixer in the REVERSE direction as that specified in the mixer setup.

Examples

Query Syntax

Return Type

Boolean

Default

OFF

Applicable Models: All with VMC Options (S9x083A/B)
(Read-Write) Sets the port mapping for the mixer characterization with ECal. This command is required if SENS:CORR:COLL:GUID:VMC:MIX:CHAR:CAL:OPT ECAL is specified.
Parameters

<ch> Channel number to be calibrated. If unspecified, value is set to 1.

<mod> 1 - Electronic Calibration Module

<string> Choose from:

"A1" - ECAL module port A is connected to VNA port 1
"B1" - ECAL module port B is connected to VNA port 1

Examples

<table>
<thead>
<tr>
<th>Command</th>

Query Syntax

SENSe<ch>:CORRection:COLLect:GUIDed:VMC:MIXer:ECAL:PORTmap <mod>?

Return Type String

Default "A1"

SENSe<ch>:CORRection:COLLect:GUIDed:VMC:OPERation <string>

Applicable Models: All with VMC Options (S9x083A/B)

(Read-Write) Perform either full VMC calibration or mixer characterization only.

Parameters

<ch> Channel number to be calibrated. If unspecified, value is set to 1.

<char> 'CAL' - full calibration and mixer characterization

'CHAR' - mixer characterization only (no reference mixer required) - Saves an .S2P file with the filename specified in SENSe<ch>:CORR:COLL:GUID:VMC:CHARacterize:CAL:FILename <filename>. If none is specified, a filename is automatically generated and can be queried using the filename command.

Examples

SENSe<ch>:CORRection:COLLect:GUIDed:VMC:OPER 'CAL'

Query Syntax

SENSe<ch>:CORRection:COLLect:GUIDed:VMC:OPERation?

Return Type String

Default "CAL"
ECalCharacterize
SENSe:CORR:CKIT:ECAL:CHARacterize Commands

Controls the settings used to perform an ECal User Characterization. These commands do NOT perform the calibration that is required before measuring the ECal module. An S-Parameter channel must already be calibrated. Learn more.

Synchronizing the Analyzer and Controller
SCPI Command Tree

SENSe<ch>:CORRection:CKIT:ECAL:CHARacterize:ACQuire STAN<step>

Applicable Models: All
(Write-only) Initiates the measurement of the ECal module. The user characterization process must have been initiated first using SENS:CORR:CKIT:ECAL:CHAR:INIT. Currently, only ONE step is required to measure the ECal module.

Note: This command is an overlapped command. When *OPC is issued with it, the OPC bit in the VNAs Standard Event Status Register is not set until this command has completed its operation. Learn more.

Parameters

<ch> Channel number being calibrated. If unspecified, value is set to 1. Channel number being calibrated.

<step> Integer User characterization step number to be measured.

Examples

SENS:CORR:CKIT:ECAL:CHAR:ACQ STAN1, *OPC

Query Syntax Not Applicable

Default Not Applicable

SENSe<ch>:CORRection:CKIT:ECAL:CHARacterize:CNUMber <n>

Applicable Models: All
(Read-Write) Sets and reads the number to which the User Characterization will be stored in the ECal module. The number must be set before sending SENS:CORR:CKIT:ECAL:CHAR:INIT or the default value (1) will be used. This command is NOT necessary when saving the User Characterization to the VNA disk memory.

Parameters

<ch> Channel number being calibrated. If unspecified, value is set to 1
User Characterization number. Choose a value between 1 and 12.

**Examples**

```
SENS:CORR:KIT:ECAL:CHAR:CNUM 2
```

**Query Syntax**

```
SENS<ch>:CORRection:KIT:ECAL:CHARacterize:CNUMber?
```

**Return Type**

Numeric

**Default**

1

**SENSe:CORRection:KIT:ECAL:CHARacterize:CONNector:CATalog?**

*Applicable Models: All*

(Read-only) Returns a list of connector names that are valid for use with user-characterized ECAL modules. Use an item from the returned list to specify a connector for **SENS:CORR:KIT:ECAL:CHAR:CONN:PORT**.

Use only factory-defined connector types when you store a user characterization to VNA disk memory.

**Parameters**

None

**Examples**

```
```

*Example returned string: "APC 3.5 male, APC 3.5 female, Type N (50) female, Type N (50) male, APC 7, Type A (50), Type B"

**Return Type**

Comma-separated string

**Default**

Not Applicable

*Applicable Models: All*

(Read-Write) Specifies a connector type name for every ECAL module port used during the user characterization. Valid connector names are returned using **SENS:CORR:KIT:ECAL:CHAR:CONN:CAT?**.

This command refers to the ECAL ports by number instead of letter (1 = Port A, 2 = Port B, and so forth). The connector names should be set for the ports before sending **SENS:CORR:KIT:ECAL:CHAR:INIT**.

The following steps could be followed to ensure port connectors are specified correctly:

2. Specify a connector type using this command. If the <string> parameter was incorrectly entered, an error will be returned.

*Note: Use only factory-defined connector types when you store a user characterization to VNA disk memory.*

**Parameters**

- `<ch>`
  - Channel number being calibrated. If unspecified, value is set to 1

- `<n>`
  - ECAL test port number for which a connector type will be specified. Choose 1 to 2 for a 2-port ECAL module, 1 through 4 for a 4-port module.

- `<string>`
  - ECAL connector type and gender (if applicable).
When the User Characterization is to be stored in the ECal module, then the connector type is limited to a Factory-defined connector type. See the list.

When the User Characterization is to be stored in VNA disk memory, then the connector type can also be a User-defined connector type.

Examples

```
$SENSe:CORr:CKIT:ECAL:CHAR:CONN:PORT2 "APC 3.5 female"
```

Query Syntax

```
$SENSe<ch>:CORr:CKIT:ECAL:CHAR:CONN:PORT<n>[:SElECT]?
```

Return Type

String

Default

"No adapter"

---

**SENSe<ch>:CORr:CKIT:ECAL:CHAR:DESCrip[ion][:STEP]? <stepN>**

Applicable Models: All

(Read-only) Returns the connection description for the specified step of the ECal user characterization process. The user characterization process must have been initiated first using $SENSe:CORr:CKIT:ECAL:CHAR:INIT.

Parameters

<ch>  
Channel number being calibrated. If unspecified, value is set to 1

<stepN>  
Integer - User characterization step number for which a description will be returned. Use $SENSe:CORr:CKIT:ECAL:CHAR:STEP? to query the number of steps.

Examples

```
"Example return string:
Connect ECal Module Ports A and B to PNA Ports 1 and 2"
```

Return Type

String

Default

Not Applicable

---

**SENSe<ch>:CORr:CKIT:ECAL:CHAR:DESCrip[ion]:USER <string>**

Applicable Models: All

(Read-Write) Sets and reads the description of the person and/or company who is producing the ECal user characterization. This description is stored with the characterization.

Set this description before sending $SENSe:CORr:CKIT:ECAL:CHAR:INIT or the default (empty string) will be used.

Parameters

<ch>  
Channel number being calibrated. If unspecified, value is set to 1

<string>  
Descriptive text, limited to 19 characters maximum.
Examples

```
```

Query Syntax

```
```

Return Type

String

Default

" " (Empty String)

---

**SENSe<ch>:CORRection:CKIT:ECAL:CHARacterize:DESCription:VNA <string>**

Applicable Models: All
(Read-Write) Sets and reads a description of the Vector Network Analyzer used to perform the User Characterization. This description is stored with the user characterization.

Set this description before sending SENS:CORR:CKIT:ECAL:CHAR:INIT or the default (empty string) will be used.

Parameters

<ch>
Channel number being calibrated. If unspecified, value is set to 1

<string>
Descriptive text, limited to 14 characters maximum.

Examples

```
```

Query Syntax

```
```

Return Type

String

Default

" " (Empty String)

---

Applicable Models: All
(Read-Write) For each port of the ECal module that is going to be characterized, sets and reads the description of the adapters, cable, or fixture to be included in the user characterization. This command refers to the ECal ports by number instead of letter (1 = Port A, 2 = Port B, and so forth). This description is stored with the user characterization.

Set this description before sending SENS:CORR:CKIT:ECAL:CHAR:INIT or the default (empty string) will be used.

Parameters

<ch>
Channel number being calibrated. If unspecified, value is set to 1

<n>
ECal port number. Choose 1 to 2 for a 2-port ECal module, 1 to 4 for a 4-port module.

<string>
Descriptive text, limited to 24 characters maximum.

Examples

```
SENSe:CORR:CKIT:ECAL:CHAR:DESC:PORT1 "3.5 mm adapter, SN 00001"  
```

8157
SENSe<ch>:CORRection:CKIT:ECAL:CHARacterize:DMEMory:SAVE <charName>

(Application Models: All)
(Write-only) Completes an ECal user characterization by writing the characterization data to the VNA disk. To write the characterization data to the ECal module, use SENSe:CORR:CKIT:ECAL:CHAR:SAVE. A User Characterization can be saved to both VNA disk memory and ECal module memory.

Use this <charName> for performing future calibrations with this User Characterization.

Note: An ECal confidence check can NOT be performed remotely from User Characterizations that are stored on the VNA disk.

Parameters

<ch>
Channel number being calibrated. If unspecified, value is set to 1.

<charName>
String. User characterization name. Although there is no limit to the number of characters, only about 10 characters appear in the Cal Wizard dialog when selecting a user characterization for use.

Examples

SENSe:CORR:CKIT:ECAL:CHAR:DMEM:SAVE "DUT1 User Char"

Query Syntax

SENSe<ch>:CORRection:CKIT:ECAL:CHARacterize:ID <model, sn>

(Application Models: All)
(Read-Write) Selects the model and serial number of the ECal module to be characterized. This command does not Set the model and serial number of the ECal module.

Parameters

<ch>
Channel number being calibrated. If unspecified, value is set to 1

<model, sn>
Model and serial number of the ECal module to be characterized.

Examples

SENSe:CORR:CKIT:ECAL:CHAR:ID "N4433A,00001"

SENSe<ch>:CORRection:CKIT:ECAL:CHARacterize:ID?
SENSe<ch>:CORRection:CKIT:ECAL:CHARacterize:INITiate [bool]

Applicable Models: All

(Write-only) Initiates an ECal User Characterization. The specified channel number must be an S-parameter measurement channel. The channel must already be calibrated using the same, or greater number of VNA ports as the ECal module. Also, the calibrated VNA ports must begin with Port 1 and use sequential port numbers.

After this command is executed, subsequent commands can be used to query the number of measurement steps, issue the acquisition commands, query the connection description strings, and subsequently complete an Ecal User characterization.

Parameters

<ch> Channel number of a calibrated S-parameter channel. If unspecified, value is set to 1

[bool] Optional argument. If unspecified, value is set to 1.

ON (or 1) Check ECal memory to ensure that a new characterization with the channels current number of points will fit in the module memory. Select for User Characterizations to be stored in internal ECal memory.

OFF (or 0) Skip the check. Select for User Characterizations to be stored to VNA disk memory.

Examples

SENSe:CORR:CKIT:ECAL:CHAR:INIT
sense2:correction:kit:ecal:characterize:initiate off

Query Syntax

Not Applicable

Default

Not Applicable

SENSe<ch>:CORRection:CKIT:ECAL:CHARacterize:INSitu:ENABle?

Applicable Models: N522xB, N523xB, N524xB, M937xA, P937xA

(Read-only) Returns whether the device that was specified by SENS:CORR:CKIT:ECAL:CHAR:ID is a CalPod module, which is capable of being characterized as an in-situ device. Learn more.

Parameters

<ch> Channel number being calibrated. If unspecified, value is set to 1.

Examples

SENSe:CORR:CKIT:ECAL:CHAR:INSitu:ENABLE?

Return Type

Boolean

1 Device is a CalPod module

0 Device is NOT a CalPod module

Default

Not Applicable
**SENSe<ch>:CORRection:CKIT:ECAL:CHARacterize:INSitu[:STATe] <bool>**

Applicable Models: N522xB, N523xB, N524xB, M937xA, P937xA

(Read-Write) Sets or returns whether the device (CalPod module) that was specified by `SENS:CORR:CKIT:ECAL:CHAR:ID` will be characterized as an in situ device. Learn more.

**Parameters**

- `<ch>` Channel number being calibrated. If unspecified, value is set to 1.
- `<bool>` In situ state. Choose from:
  - ON (or 1) - Characterize the CalPod module as an in situ device.
  - OFF (or 0) - Do NOT characterize the CalPod module as an in situ device.

**Examples**

```
SENS:CORR:CKIT:ECAL:CHAR:INSitu 1
```

**Query Syntax**

```
SENSe<ch>:CORRection:CKIT:ECAL:CHARacterize:INSitu[:STATe]?
```

**Return Type**

Boolean

**Default**

ON or 1

---

**SENSe<ch>:CORRection:CKIT:ECAL:CHARacterize:SAVE**

Applicable Models: All

(Write-only) Completes an ECal user characterization by writing the characterization data to the ECal module memory. To write the characterization data to VNA disk memory, use `SENS:CORR:CKIT:ECAL:CHAR:DMEM:SAVE`. A User Characterization can be saved to both VNA disk memory and ECal module memory.

**Note:** This command is an overlapped command. When `*OPC` is issued with it, the OPC bit in the VNAs Standard Event Status Register is not set until this command has completed its operation. Learn more.

**Parameters**

- `<ch>` Channel number being calibrated. If unspecified, value is set to 1.

**Examples**

```
```

**Query Syntax**

Not Applicable

**Default**

Not Applicable

---

**SENSe<ch>:CORRection:CKIT:ECAL:CHARacterize:STEPs?**

Applicable Models: All

(Read-only) Returns the number of steps required to measure the ECal module. Currently, only ONE is required.
### Parameters

<ch>

Channel number being calibrated. If unspecified, value is set to 1

### Examples

<table>
<thead>
<tr>
<th>Command</th>
</tr>
</thead>
<tbody>
<tr>
<td>SENS:CORR:CKIT:ECAL:CHAR:STEP?</td>
</tr>

Scratch vs Applied Mixer Properties

Each mixer configuration has two sets of properties:

Scratch mixer contains the properties that have been set, but NOT YET applied. Send the SENSE<ch>:MIXer:APPLy command to copy these properties to the Applied mixer.

Applied mixer contains the properties that makeup the current mixer configuration.

Power settings are immediately applied to both the Scratch and Applied mixer.

A successful Calculate also perform an Apply.

Note: Queries always return the Applied mixer properties. Therefore, first send SENSE<ch>:MIXer:APPLy before querying new settings.

SENSe<ch>:MIXer:SEGMen<n>:ADD <value>

Applicable Models: All

(Write only) Adds the specified number of segments to the scratch mixer beginning at the last segment position. All segments are added with default settings.
Parameters

<ch>
  Channel number of the mixer measurement. If unspecified, value is set to 1.

<n>
  Position at which to add segments. Valid range is between 1 and the current segment count +1. Using count +1 adds segments to the end of the segment table. Use SENS:MIX:SEGM:COUN? to read the current count in the Applied Mixer.

<value>
  Optional argument. Number of segments to add. If unspecified, 1 segment is added.

Examples

SENS:MIX:SEGM1:ADD 3 'Adds 3 segments beginning at position 1. For a preset state, this results in a total of 4 segments.'

Query Syntax

Not Applicable

Return Type

Numeric

Default

Not Applicable

SENSe<ch>:MIXer:SEGMen<n>:BWIDth <value>

Applicable Models: All
(Read/Write) Sets and returns the IF Bandwidth for the sweep segment.

Parameters

<ch>
  Channel number of the mixer measurement. If unspecified, value is set to 1.

<n>
  Existing segment for which IF Bandwidth is to be set.
  Use SENS:MIX:SEGM:COUN? to read the current count in the Applied Mixer.

<value>
  IF Bandwidth in Hz. The list of valid IF Bandwidths is different depending on the VNA model. (Click to see the lists.) If an invalid number is specified, the analyzer will round up to the closest valid number.
  This parameter supports MIN and MAX as arguments. Learn more.

Examples

SENS:MIX:SEGM1:BWID 1e3

Query Syntax

SENSe<ch>:MIXer:SEGMen<n>:BWIDth?

Send Apply before sending this query. Learn more.

Return Type

Numeric

Default

10 kHz
SENSe<ch>:MIXer:SEGMent<n>:CALCulate <char>

Applicable Models: All

(Write only) Calculates the Input, IF, or Output frequencies of the mixer setup and updates the channel settings.

Parameters

<ch> Any existing channel number. If unspecified, value is set to 1

<n> Existing segment to calculate. Use SENS:MIX:SEGM:COUN? to read the current count in the Applied Mixer.

<char> Mixer port to be calculated. Choose from:

Examples
SENS:MIX:SEGM2:CALC Output

Query Syntax
Not Applicable

Default
Not Applicable

**SENSe<ch>:MIXer:SEGment:COUNt?**

Applicable Models: All
(Read-only) Returns the number of segments on the Applied mixer.

Parameters

<ch> 
Channel number of the mixer measurement. If unspecified, value is set to 1.

Examples
SENS:MIX:SEGM:COUN?

Return Type
Numeric

Default
Not Applicable

**SENSe<ch>:MIXer:SEGment<n>:DELeTe <value>**

Applicable Models: All
(Write only) Removes the specified number of segments from the scratch mixer starting at the index position.

Parameters

<ch> 
Channel number of the mixer measurement. If unspecified, value is set to 1.

<n> 
Position at which to start removing segments. Valid index range is between 1 and the current segment count. Use SENS:MIX:SEGM:COUN? to read the current count in the Applied Mixer.
Optional argument. Number of segments to remove. If unspecified, 1 segment is removed.

### Examples

```
SENS:MIX:SEG1:DEL 5 'Removes 5 segments beginning at the first position.
```

### Default

Not Applicable

---

**SENSe<ch>:MIxer:SEGMent:DELete:ALL**

Applicable Models: All

(Write only) Removes all segments from the scratch mixer.

#### Parameters

- `<ch>`: Channel number of the mixer measurement. If unspecified, value is set to 1.

#### Examples

```
SENS:MIX:SEG:DEL:ALL
```

#### Query Syntax

Not Applicable

#### Default

Not Applicable

---

**SENSe<ch>:MIxer:SEGMent<n>:DWELI**

Applicable Models: All

(Read-Write) Sets or returns the Input sweep mode of the segment.

#### Parameters

- `<ch>`: Channel number of the mixer measurement. If unspecified, value is set to 1.
- `<n>`: Existing segment for which Input frequency mode is to be set.

Use `SENS:MIX:SEG:MOUN?` to read the current count in the Applied Mixer.

#### Examples

```
SENS:MIX:SEG2:DWELI
```

#### Query Syntax

Send Apply before sending this query. Learn more.

#### Return Type

Character
SENSe<ch>:MIXer:SEGMen<n>:IF:FREQuency:SIDeband <char>

Applicable Models: All

(Read-Write) When two LO stages are used, sets or returns whether to select the sum or difference for the IF1 product. (Input + or - LO1 = IF1)

This setting corresponds to the buttons on LO1 on the Mixer Setup dialog.

This setting is ignored when ONE LO stage is selected.

Also set SENS:MIX:OUTP:FREQ:SID to LOW or HIGH to set the output frequency of the mixer.

Parameters

<ch> Channel number of the mixer measurement. If unspecified, value is set to 1.

<n> Existing segment for which IF Sideband is to be set. Use SENS:MIX:SEG:COUNT? to read the current count in the Applied Mixer.

<char> Sideband value. Choose from

LOW - Difference (-)
HIGH - Sum (+)

Examples

SENSe:MIX:SEG2:IF:FREQ:SID LOW

Query Syntax

SENSe<ch>:MIXer:SEGMen<n>:IF:FREQuency:SIDeband?

Send Apply before sending this query. Learn more.

Return Type

Character

Default

LOW

SENSe<ch>:MIXer:SEGMen<n>:INPut:FREQuency:FIXed <value>

Applicable Models: All

(Read-Write) Sets or returns the Input fixed frequency of the segment. Also, set SENS:MIX:SEG:INP:FREQ:MODE FIXED.

Parameters

<ch> Channel number of the mixer measurement. If unspecified, value is set to 1.
### Input Fixed Frequency

Existing segment for which input fixed frequency is to be set.

Use `SENS:MIX:SEGM:COUN?` to read the current count in the Applied Mixer.

**Examples**

```
SENSe2:MIXer:SEGMent2:INPut:FREQ:FIX 1e9
```

**Query Syntax**

```
SENSe<ch>:MIXer:SEGMent<n>:INPut:FREQ:FIXed?
```

Send Apply before sending this query. Learn more.

**Return Type**

Numeric

**Default**

Start frequency of the VNA.

---

### Input Frequency Mode

`SENSe<ch>:MIXer:SEGMent<n>:INPut:FREQuency:MODE <char>`

Applicable Models: All

(Read-Write) Sets or returns the Input sweep mode of the segment.

**Parameters**

- `<ch>`: Channel number of the mixer measurement. If unspecified, value is set to 1.
- `<n>`: Existing segment for which Input frequency mode is to be set.
  
  Use `SENS:MIX:SEGM:COUN?` to read the current count in the Applied Mixer.
- `<char>`: Input sweep mode. Choose either FIXED or SWEPT

**Examples**

```
SENS:MIX:SEGm2:INP:FREQ:MODE FIXED
```

**Query Syntax**

```
SENSe<ch>:MIXer:SEGMent<n>:INPut:FREQuency:MODE?
```

Send Apply before sending this query. Learn more.

**Return Type**

Character

**Default**

Swept

---

### Input Start Frequency

`SENSe<ch>:MIXer:SEGMent<n>:INPut:FREQuency:STARt <value>`

Applicable Models: All

(Read-Write) Sets or returns the Input start frequency value of the segment. Also, set `SENS:MIX:SEGM:FREQ:MODE SWEPT`.

---
Parameters

<ch>  
Channel number of the mixer measurement. If unspecified, value is set to 1.

<n>  
Existing segment for which Input start frequency is to be set.

Use SENS:MIX:SEGM:COUN? to read the current count in the Applied Mixer.

<value>  
Input Start frequency. Choose a value between the start and stop frequency of the VNA.

Examples

SENSe2: MIXer: SEGment2: INPut: FREQ: START 1000000000

Query Syntax

SENSe<ch>: MIXer: SEGment<n>: INPut: FREQuency: STARt?

Send Apply before sending this query. Learn more.

Return Type

Numeric

Default

Start frequency of the VNA.

SENSe<ch>: MIXer: SEGment<n>: INPut: POWer <value>

Applicable Models: All

(Read-Write) Sets or returns the Input stop frequency value of the segment.

Parameters

<ch>
Channel number of the mixer measurement. If unspecified, value is set to 1.

<n>
Existing segment for which Input stop frequency is to be set.

Use SENS:MIX:SEGM:COUN? to read the current count in the Applied Mixer.

<value>  
Input Stop frequency. Choose a value between the start and stop frequency of the VNA.

Examples

SENSe2: MIXer: SEGment2: INPut: FREQ: STOP 1000000000

Query Syntax

SENSe<ch>: MIXer: SEGment<n>: INPut: FREQuency: STOP?

Send Apply before sending this query. Learn more.

Return Type

Numeric

Default

Stop frequency of the VNA.
Applicable Models: All
(Read-Write) Sets or returns the Input power value of the segment.

Parameters

<ch>
Channel number of the mixer measurement. If unspecified, value is set to 1.

<n>
Existing segment for which Input power is to be set.
Use SENS:MIX:SEGM:COUN? to read the current count in the Applied Mixer.

<value>
Input power level in dBm. Choose a value within the power range of the VNA.

Examples
SENSe2:MIXer:SEGMent2:INPut:POWer 0

Query Syntax
SENSe<ch>:MIXer:SEGMent<n>:INPut:POWer?
Send Apply before sending this query. Learn more.

Return Type
Numeric

Default
-15 dBm

SENSe<ch>:MIXer:SEGMent<n>:LO<x>:FREQuency:FIXed <value>

Applicable Models: All
(Read-Write) Sets or returns the LO1 and LO2 fixed frequency value of the segment.

Parameters

<ch>
Channel number of the mixer measurement. If unspecified, value is set to 1.

<n>
Existing segment for which the LO1 and LO2 fixed frequency value is to be set.
Use SENS:MIX:SEGM:COUN? to read the current count in the Applied Mixer.

<x>
LO stage number for which the fixed frequency is to be set. Choose 1 or 2.
Set number of stages for the mixer using SENS<ch>:MIXer:STAGe.

<value>
The LO1 and LO2 fixed frequency value in Hz. Choose a value within the frequency range of the source.

Examples
SENSe2:MIXer:SEGMent2:LO1:FREQ:FIX 1e9

Query Syntax
SENSe<ch>:MIXer:SEGMent<n>:LO<x>:FREQuency:FIXed?
Send Apply before sending this query. Learn more.

Return Type
Numeric
SENSe<ch>:MIXer:SEGment<n>:LO<x>:FREQuency:ILT<bool>

Applicable Models: All
(Read-Write) Specifies whether to use the Input frequency that is greater than the LO or less than the LO. To learn more, see the mixer setup dialog box help.

Parameters

<ch> Channel number of the mixer measurement. If unspecified, value is set to 1.

<n> Existing segment for which the LO1 and LO2 fixed frequency value is to be set. Use SENS:MIX:SEGM:COUN? to read the current count in the Applied Mixer.

<x> LO stage number for which ILT is to be set. Choose 1 or 2.

<bool> ON (1) - Use the Input that is Greater than the specified LO. OFF (0) - Use the Input that is Less than the specified LO.

Examples

SENSe2:MIXer:SEGment2:LO1:FREQ:ILT 1

Query Syntax

SENSe<ch>:MIXer:SEGment<n>:LO<x>:FREQuency:ILT?

Send Apply before sending this query. Learn more.

Return Type

Boolean

Default

OFF

SENSe<ch>:MIXer:SEGment<n>:LO<x>:FREQuency:MODE <char>

Applicable Models: All
(Read-Write) Sets or returns the LO1 or LO2 sweep mode of the segment.

Parameters

<ch> Channel number of the mixer measurement. If unspecified, value is set to 1.

<n> Existing segment for which LO frequency mode is to be set. Use SENS:MIX:SEGM:COUN? to read the current count in the Applied Mixer.

<x> LO stage number for which ILT is to be set. Choose 1 or 2.
Set number of stages for the mixer using `SENS<ch>:MIXer:STAGe`.

**Examples**

```
SENS:MIX:SEGM2:LO1:FREQ:MODE FIXED
```

**Query Syntax**

```
SE Nes<ch>:MIXer:SEGMent<n>:LO<n>:FREQuency:MODE?
```

Send **Apply** before sending this query. Learn more.

**Return Type**

Character

**Default**

Fixed

---

**SENS<ch>:MIXer:SEGMent<n>:LO<x>:FREQuency:STARt <value>**

**Applicable Models:** All

(Read-Write) Sets or returns the LO start frequency value of the segment.

**Parameters**

- `<ch>`
  - Channel number of the mixer measurement. If unspecified, value is set to 1.

- `<n>`
  - Existing segment for which LO start frequency is to be set.
    - Use `SENS:MIX:SEGM:COUN?` to read the current count in the **Applied Mixer**.

- `<x>`
  - LO stage number. Choose 1 or 2.
    - Set number of stages for the mixer using `SENS<ch>:MIXer:STAGe`.

- `<value>`
  - LO Start frequency. Choose a value between the start and stop frequency of the VNA.

**Examples**

```
SENS2:MIXer:SEGMent2:LO1:FREQ:STARt 1000000000
```

**Query Syntax**

```
SENS<ch>:MIXer:SEGMent<n>:LO<x>:FREQuency:STARt?
```

Send **Apply** before sending this query. Learn more.

**Return Type**

Numeric

**Default**

Start frequency of the VNA.

---

**SENS<ch>:MIXer:SEGMent<n>:LO<x>:FREQuency:STOP <value>**

**Applicable Models:** All

(Read-Write) Sets or returns the LO stop frequency value of the segment.

---
Parameters

<ch> Channel number of the mixer measurement. If unspecified, value is set to 1.

<n> Existing segment for which LO stop frequency is to be set. Use SENS:MIX:SEGM:COUN? to read the current count in the Applied Mixer.

<x> LO stage number. Choose 1 or 2. Set number of stages for the mixer using SENSe<ch>:MIXer:STAGE.

<value> LO Stop frequency. Choose a value between the start and stop frequency of the VNA.

Examples
SENSe2:MIXer:SEGMen2:LO<x>:FREQ:STOP 1000000000

Query Syntax
SENSe<ch>:MIXer:SEGMen>n:LO<x>:FREQuency:STOP?
Send Apply before sending this query. Learn more.

Return Type Numeric

Default Stop frequency of the VNA.

SENSe<ch>:MIXer:SEGMen<n>:LO<x>:POWer <value>

Applicable Models: All
(Read-Write) Sets or returns the LO power of the segment.

Parameters

<ch> Channel number of the mixer measurement. If unspecified, value is set to 1.

<n> Existing segment for which LO power is to be set. Use SENS:MIX:SEGM:COUN? to read the current count in the Applied Mixer.

<x> LO stage number. Choose 1 or 2. Set number of stages for the mixer using SENSe<ch>:MIXer:STAGe.

<value> LO power level in dBm. Choose a value within the power range of the VNA.

Examples
SENSe2:MIXer:SEGMen2:INPut:POWer 0

Query Syntax
SENSe<ch>:MIXer:SEGMen<n>:INPut:POWer?
Send Apply before sending this query. Learn more.

Return Type Numeric
**Default**

-10 dBm

**SENSe<ch>:MIXer:SEGMen<n>:OUTPut:FREQuency:FIXed <value>**

Applicable Models: All

(Read-Write) Sets or returns the Output fixed frequency of the segment. Also, set `SENS:MIX:SEG:M:INP:FREQ:MODE FIXED`.

**Parameters**

- `<ch>`: Channel number of the mixer measurement. If unspecified, value is set to 1.
- `<n>`: Existing segment for which Output fixed frequency is to be set. Use `SENS:MIX:SEG:M:COUN?` to read the current count in the Applied Mixer.
- `<value>`: Output fixed frequency. Choose a value between the start and stop frequency of the VNA.

**Examples**

```bash
SENSe2:MIXer:SEGMen2:OUTP:FREQ:FIX 1e9
```

**Query Syntax**

Send Apply before sending this query. Learn more.

**Return Type**

Numeric

**Default**

Start frequency of the VNA.

---

**SENSe<ch>:MIXer:SEGMen<n>:OUTPut:FREQuency:MODE <char>**

Applicable Models: All

(Read-Write) Sets or returns the Output sweep mode of the segment.

**Parameters**

- `<ch>`: Channel number of the mixer measurement. If unspecified, value is set to 1.
- `<n>`: Existing segment for which Output frequency mode is to be set. Use `SENS:MIX:SEG:M:COUN?` to read the current count in the Applied Mixer.
- `<char>`: Output sweep mode. Choose either FIXED or SWEPT

**Examples**

```bash
```

8175
SENSe<ch>:MIXer:SEGMent<n>:OUTPut:FREQuency:SIDeband <char>

Applicable Models: All

(Read-Write) When two LO stages are used, sets or returns whether to select the sum or difference for the Output product. Use for both 1 or 2 stage mixers.

This setting corresponds to the \( \pm \) buttons on the Output on the Mixer Frequency dialog.

Also set SENS:MIX:IF:FREQ:SID to LOW or HIGH to determine the IF frequency for 2-stage mixers.

Parameters

<ch> Channel number of the mixer measurement. If unspecified, value is set to 1.

<n> Existing segment for which Output Sideband is to be set. Use SENS:MIX:SEGM:COUN? to read the current count in the Applied Mixer.

<char> Sideband value. Choose from

LOW - Difference (-)

HIGH - Sum (+)

Examples

\[ \text{SENS:MIX:SEG2:OUTP:FREQ:SID LOW} \]

Query Syntax

SENSe<ch>:MIXer:SEGMent<n>:OUTPut:FREQuency:SIDeband?

Send Apply before sending this query. Learn more.

Return Type

Character

Default

LOW

SENSe<ch>:MIXer:SEGMent<n>:OUTPut:FREQuency:STARt <value>

Applicable Models: All

(Read-Write) Sets or returns the Output start frequency value of the segment. Also, set SENS:MIX:SEGM:FREQ:MODE SWEPT.
Parameters

<ch> Channel number of the mixer measurement. If unspecified, value is set to 1.

<n> Existing segment for which Output start frequency is to be set.

Use SENS:MIX:SEGM:COUN? to read the current count in the Applied Mixer.

<value> Output Start frequency. Choose a value between the start and stop frequency of the VNA.

Examples

SENSe<ch>:MIXer:SEGMent<n>:OUTPut:FREQ:STARt 1000000000

Query Syntax

SENSe<ch>:MIXer:SEGMent<n>:OUTPut:FREQ:STARt?

Send Apply before sending this query. Learn more.

Return Type

Numeric

Default

Start frequency of the VNA.

SENSe<ch>:MIXer:SEGMent<n>:OUTPut:FREQ:STOP <value>

Applicable Models: All

(Read-Write) Sets or returns the Output stop frequency value of the segment.

Parameters

<ch> Channel number of the mixer measurement. If unspecified, value is set to 1.

<n> Existing segment for which Output stop frequency is to be set.

Use SENS:MIX:SEGM:COUN? to read the current count in the Applied Mixer.

<value> Output Stop frequency. Choose a value between the start and stop frequency of the VNA.

Examples

SENSe2:MIXer:SEGMent2:OUTPut:FREQ:STOP 1000000000

Query Syntax

SENSe<ch>:MIXer:SEGMent<n>:OUTPut:FREQ:STOP?

Send Apply before sending this query. Learn more.

Return Type

Numeric

Default

Stop frequency of the VNA.

SENSe<ch>:MIXer:SEGMent<n>:OUTPut:POWer <value>
Applicable Models: All
(Read-Write) Sets or returns the Output power value of the segment.

Parameters

**<ch>**
Channel number of the mixer measurement. If unspecified, value is set to 1.

**<n>**
Existing segment for which Output power is to be set.
Use SENS:MIX:SEGM:COUN? to read the current count in the Applied Mixer.

**<value>**
Output power level in dBm. Choose a value within the power range of the VNA.

**Examples**
SENSe2:MIXer:SEGMen2:OUTPut:POWer 0

**Query Syntax**
SENSe<ch>:MIXer:SEGMent<n>:OUTPut:POWer?
Send Apply before sending this query. Learn more.

**Return Type**
Numeric

**Default**
-10 dBm

---

SENSe<ch>:MIXer:SEGMent<n>:POINts <value>

Applicable Models: All
(Read/Write) Sets and returns the number of data points for the sweep segment.

Parameters

**<ch>**
Channel number of the mixer measurement. If unspecified, value is set to 1.

**<n>**
Existing segment for which number of points is to be set.
Use SENS:MIX:SEGM:COUN? to read the current count in the Applied Mixer.

**<value>**
Number of data points. Choose any number between 1 and the VNA maximum number of points.
This parameter supports MIN and MAX as arguments. Learn more.

**Examples**
SENSe:MIX1:POIN 3

**Query Syntax**
SENSe<ch>:MIXer:SEGMent<n>:POINts?
Send Apply before sending this query. Learn more.

**Return Type**
Numeric
SENS<ch>:MIXer:SEGMen<n>:STATe <bool>

Applicable Models: All
(Read/Write) Sets and returns the ON/OFF state for the segment.

Parameters

<ch> Channel number of the mixer measurement. If unspecified, value is set to 1.

<n> Existing segment to be set ON or OFF.
Use SENS:MIX:SEGM:COUN? to read the current count in the Applied Mixer.

<bool> Segment state. Choose from:
ON (or 1) - Turns the segment ON.
OFF (or 0) - Turns the segment OFF.

Examples

SENS:MIX:SEG1:STATe 1

Query Syntax

SENSe<ch>:MIXer:SEGMen<n>:STATe?

Send Apply before sending this query. Learn more.

Return Type

Boolean

Default

ON
Role

Sense:Role Commands

Controls the path configuration settings.

SENSe:ROLE:
| CATalog?
| DEVice

Example Programs
Synchronizing the Analyzer and Controller
SCPI Command Tree

SENSe<ch>:ROLE:CATalog?

Applicable Models: N522xB, N523xB, N524xB
(Read-only) This command replaces SENs:MIX:ROLE:CATalog?
Returns the roles for which sources can be used for the channel.

Parameters

<ch> Channel number of the measurement. If unspecified, value is set to 1.

Examples
SENS:ROLE:CAT?

Return Type
Comma-separated list of double-quoted strings.

Default
Not Applicable

SENSe<ch>:ROLE:DEVice <role>,<source>

Applicable Models: N522xB, N523xB, N524xB
(Read-Write) This command replaces SENs:MIX:ROLE:DEVice
Set and return the source to be used in the specified role. For example, use this command to set a source name to be used as the RF2 tone for a Swept IMD channel.

Parameters

<ch> Channel number of the measurement. If unspecified, value is set to 1.
(String) Role of the source. Not context-sensitive. Use SENSe:ROLE:CATalog? to read the valid roles for the channel.

(String) Source name to be used in the specified role. Use SYSTem:CONFigure:EDEVice:CAT? to read a list of configured sources.

Example:
SENSe2:ROLE:DEV "RF2", "MyEsq"

Query Syntax
SENSe<ch>:ROLE:DEVice? <role>

Return Type
String

Default
Not Applicable
## SweepPulse

Configures the channel to make pulse measurements using the Integrated Pulse Application.

SENSe<ch>:SWEep:PULSe:CWTime[:AUTO] <bool>

Applicable Models: VNAs with Pulsed RF Measurement Option

(Read-Write) This command replaces SENSe:SWEep:PULSe:IFBW[:AUTO]. Sets and returns the state of automatic CW sweep time (used in Pulse Profile mode). This setting is labeled Autoselect Profile Sweep Time on the UI.

Parameters

<ch>          Channel number of the pulse measurement. If unspecified, value is set to 1.
<bool>        Choose from:

OFF (or O) - The Sweep Time is not changed automatically.

ON (or 1) - In Pulse Profile mode, adjusts the default X-axis start time to zero and the stop time to double the Pulse Width. This allows you to see one complete pulse.

Examples

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SENSe:SWEep:PULSe:CWT 1</td>
<td></td>
</tr>
<tr>
<td>sense2:sweep:pulse:cwtime:auto off</td>
<td></td>
</tr>
</tbody>
</table>

Query Syntax

SENSe<ch>:SWEep:PULSe:CWTime[:AUTO]?

Return Type

Boolean

Default

ON

SENSe<ch>:SWEep:PULSe:DETectmode[:AUTO] <bool>

Applicable Models: VNAs with Pulsed RF Measurement Option

(Read-Write) Set pulse mode automatically or manually (Narrowband or Wideband) for the channel. This setting is labeled Autoselect Pulse Detection Method on the UI.

Parameters

<ch>          Channel number of the pulse measurement. If unspecified, value is set to 1.
<bool>        Choose from:

OFF (or O) - Manually set the pulse mode. Use SENSe:SWEep:PULSe:WIDE to set the pulse mode.

ON (or 1) - Automatically set the pulse mode.

Examples

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SENSe:SWEep:PULSe:DET 1</td>
<td></td>
</tr>
<tr>
<td>sense2:sweep:pulse:detectmode:auto off</td>
<td></td>
</tr>
</tbody>
</table>
SENSe<ch>:SWEep:PULSe:DETectmode[:AUTO]?

Return Type: Boolean
Default: ON

SENSe<ch>:SWEep:PULSe:DRIVe[:AUTO] <bool>

Applicable Models: VNAs with Pulsed RF Measurement Option (Read-Write) In Narrowband pulse mode, set the drive for the source modulation automatically or manually.

Parameters
- `<ch>`: Channel number of the pulse measurement. If unspecified, value is set to 1.
- `<bool>`: Choose from:
  - OFF (or O) - Manually set source modulation.
  - ON (or 1) - Automatically set pulse gen 1 as the modulation source and pulse gen 2 as the gate source for all gates.

Examples
SENSe:SWE:PULS:DRIV 1
sense2:sweep:pulse:drive:auto off

SENSe<ch>:SWEep:PULSe:IFBW[:AUTO] <bool> - Superseded

Applicable Models: VNAs with Pulsed RF Measurement Option (Except M9485A) (Read-Write) This command is replaced with SENS:SWEep:PULSe:CWTime[:AUTO]. In Wideband pulse mode, set the IF bandwidth automatically or manually.

Parameters
- `<ch>`: Channel number of the pulse measurement. If unspecified, value is set to 1.
- `<bool>`: Choose from:
  - OFF (or O) - Manually set the IFBW for the measurement.
  - ON (or 1) - Automatically set the IFBW for the measurement.
Examples
SENSe:SWEep:PULSe:IFBW 1
SENSe2:SWEep:PuLPSe:IFBW:auto off

Query Syntax
SENSe<ch>:SWEep:PULSe:IFBW[:AUTO]?

Return Type
Boolean

Default
ON

SENSe<ch>:SWEep:PULSe:IFGain[:AUTO] <bool>

Applicable Models: VNAs with Pulsed RF Measurement Option (Except M9485A, M980xA, P50xxA)

(Read-Write) In Narrowband pulse mode, set the IF Gain automatically or manually. This setting is labeled Autoselect IF Path Gain and Loss on the UI.

Parameters

<ch>
Channel number of the pulse measurement. If unspecified, value is set to 1.

<bool>
Choose from:

OFF (or O) - Manually set the IF Gain for the measurement.
ON (or 1) - Automatically set the IF Gain for the measurement.

Examples
SENSe:SWEep:PULSe:IFG 1
SENSe2:SWEep:PuLPSe:IFG:auto off

Query Syntax
SENSe<ch>:SWEep:PULSe:IFGain[:AUTO]?

Return Type
Boolean

Default
ON

SENSe<ch>:SWEep:PULSe:MODE <char>

Applicable Models: VNAs with Pulsed RF Measurement Option

(Read-Write) Sets and returns the pulse measurement state for the channel.

Parameters

<char>
Channel number of the pulse measurement. If unspecified, value is set to 1.

<char>
Choose from:

OFF - Turn OFF pulse measurements.
STD - Turn ON standard pulse measurements.
PROFILE - Turn ON pulse profile measurements.

Examples

```
SENS:SWE:PULS:MODE PROFILE
sense2:sweep:pulse:mode off
```

Query Syntax
SENSe<ch>:SWEep:PULSe:MODE?

Return Type
Character

Default
OFF

-----

**SENSe<ch>:SWEep:PULSe:PRF[:AUTO] <bool>**

Applicable Models: VNAs with Pulsed RF Measurement Option (Except M9485A, M980xA, P50xxA)

*(Read-Write)* In Narrowband pulse mode, choose to set the Pulse Repetition Frequency automatically or manually. This is labeled "Optimize Pulse Frequency" on the user-interface. To make changes manually, use SENS:SWE:PULS:PRIM:FREQ or SENS:SWE:PULS:PRIM:PER.

Parameters

- `<ch>` Channel number of the pulse measurement. If unspecified, value is set to 1.
- `<bool>` Choose from:
  - OFF (or O) - Manually set the PRF for the measurement.
  - ON (or 1) - Automatically set the PRF for the measurement.

Examples

```
SENS:SWE:PULS:PRF 1
sense2:sweep:pulse:prf:auto off
```

Query Syntax
SENSe<ch>:SWEep:PULSe:PRF[:AUTO]?

Return Type
Boolean

Default
ON

-----

**SENSe<ch>:SWEep:PULSe:PRIMary:CLOCk <string>**

Applicable Models: VNAs with Pulsed RF Measurement Option

*(Read-Write)* Sets and returns the Primary Clock setting and is controlled by the internal or external pulse generator which is the primary pulse clock. [Learn more.](#)
Note: If there is a defined pulse generator in the external devices list, its name will be displayed in the Pulse Setup dialog Primary Clock control and it will also be an accepted choice for this command.

Parameters

`<ch>` Channel number of the pulse measurement. If unspecified, value is set to 1.

`<string>` Primary clock (Internal or External).

Examples

```
SENS:SWE:PULS:PRIM:CLOC "Internal"
sense2:sweep:pulse:primary:clock "External"
```

Query Syntax

```
SENi<ch>:SWEep:PULSe:PRIMary:CLOCk?
```

Return Type

String

Default

N/A

```
SENS<ch>:SWEep:PULSe:PRIMary:FREQuency <value>
```

Applicable Models: VNAs with Pulsed RF Measurement Option

(Read-Write) Sets and returns the primary pulse measurement frequency. The frequency is 1/period, so this value can also be set using SENS:SWE:PULS:PRIM:PERiod.

Note: On the Pulse Setup dialog, this command is a 'Basic setting, which is intended to be used with the 'Auto' selections set to ON.

Parameters

`<ch>` Channel number of the pulse measurement. If unspecified, value is set to 1.

`<value>` Primary frequency.

Examples

```
SENS:SWE:PULS:PRIM:FREQ 1e9
sense2:sweep:pulse:primary:frequency 1e6
```

Query Syntax

```
SENi<ch>:SWEep:PULSe:PRIMary:FREQuency
```

Return Type

Value

Default

1 kHz

```
SENS<ch>:SWEep:PULSe:PRIMary:PERiod <value>
```

Applicable Models: VNAs with Pulsed RF Measurement Option

(Read-Write) Sets and returns the primary pulse period. The period is 1/frequency, so this value can also be set using SENS:SWE:PULS:PRIM:FREQ.
Note: On the Pulse Setup dialog, this command is a 'Basic' setting, which is intended to be used with the 'Auto' selections set to ON.

### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;ch&gt;</td>
<td>Channel number of the pulse measurement. If unspecified, value is set to 1.</td>
</tr>
<tr>
<td>&lt;value&gt;</td>
<td>Primary period in seconds.</td>
</tr>
</tbody>
</table>

### Examples

```
SENS:SWE:PULS:PRIM:PER 1e-6
sense2:sweep:pulse:primary:period 1e-3
```

### Query Syntax

```
SENSe<ch>:SWEep:PULSe:PRIMary:PERiod?
```

### Return Type

**Value**

### Default

1 msec

---

**SENSe<ch>:SWEep:PULSe:PRIMary:WIDth <value>**

**Applicable Models:** VNAs with Pulsed RF Measurement Option

(Read-Write) Sets and returns the primary pulse width.

Note: On the Pulse Setup dialog, this command is a 'Basic' setting, which is intended to be used with the 'Auto' selections set to ON.

### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;ch&gt;</td>
<td>Channel number of the pulse measurement. If unspecified, value is set to 1.</td>
</tr>
<tr>
<td>&lt;value&gt;</td>
<td>Primary pulse width in seconds.</td>
</tr>
</tbody>
</table>

### Examples

```
SENS:SWE:PULS:PRIM:WIDTh
sense2:sweep:pulse:primary:width
```

### Query Syntax

```
SENSe<ch>:SWEep:PULSe:PRIMary:WIDTh?
```

### Return Type

**Value**

### Default

100 microseconds

---

**SENSe<ch>:SWEep:PULSe:PROFile:STARt <value>**

**Applicable Models:** VNAs with Pulsed RF Measurement Option

(Read-Write) Sets and returns the start time of the pulse. Pulse profile measurements provide a time domain (CW frequency) view of the pulse envelope. Profiling is performed using a measurement technique that "walks" a narrow receiver "snapshot"
across the width of the pulse. This is analogous to using a camera to take many small snapshots of a wide image, then piecing them together to form a single, panoramic view.

Parameters

<ch> Channel number of the pulse measurement. If unspecified, value is set to 1.

<value> Start time in seconds.

Note: The start value cannot be negative.

Examples

SENS:SWE:PULS:PROF:STAR 1e-6
sense2:sweep:pulse:profile:start 1e-3

Query Syntax
SENSe<ch>:SWEep:PULSe:PROFile:STARt?

Return Type Value

Default 0

---

SENS<ch>:SWEep:PULSe:PROFile:STOP <value>

Applicable Models: VNAs with Pulsed RF Measurement Option

(Read-Write) Sets and returns the stop time of the pulse. Pulse profile measurements provide a time domain (CW frequency) view of the pulse envelope. Profiling is performed using a measurement technique that "walks" a narrow receiver "snapshot" across the width of the pulse. This is analogous to using a camera to take many small snapshots of a wide image, then piecing them together to form a single, panoramic view.

Parameters

<ch> Channel number of the pulse measurement. If unspecified, value is set to 1.

<value> Stop time in seconds.

Note: The stop value cannot be negative.

Examples

SENS:SWE:PULS:PROF:STOP 1e-6
sense2:sweep:pulse:profile:stop 1e-3

Query Syntax SENSe<ch>:SWEep:PULSe:PROFile:STOP?

Return Type Value

Default N/A

---

SENS<ch>:SWEep:PULSe:SHAPe <char>

Applicable Models: VNAs with Pulsed RF Measurement Option
Sets and returns the pulse shape type.

**Parameters**

- `<ch>`
  Channel number of the pulse measurement. If unspecified, value is set to 1.

- `<char>`
  Choose from:

  **Normal** - Normal pulse shape

  **Fast** - Fast rise time with low on/off ratio. This is available only for M980xA and P50xxA with S9x025A/B (M980xA and P50xxA with S9x024B do not support FAST mode.)

**Examples**

```
SENS:SWE:PULS:SHAP "FAST"
sense2:sweep:pulse:shape "Fast"
```

**Query Syntax**

`SENS<ch>:SWEep:PULSe:SHAPe?`

**Return Type**

Character

**Default**

Normal

---

`SENS<ch>:SWEep:PULSe:SHAPe:CATalog?`

Applicable Models: VNAs with Pulsed RF Measurement Option

(Read-Write) Returns the list of available pulse shape type.

**Parameters**

- `<ch>`
  Channel number of the pulse measurement. If unspecified, value is set to 1.

**Examples**

```
SENS:SWE:PULS:SHAP:CAT?
sense2:sweep:pulse:shape:catalog?
```

**Query Syntax**

`SENS<ch>:SWEep:PULSe:SHAPe:CATalog?`

**Return Type**

Character

**Default**

Not applicable

---

`SENS<ch>:SWEep:PULSe:SWGate[:STATe] <bool>`

Applicable Models: VNAs with Pulsed RF Measurement Option (Except M9485A, M980xA, P50xA)
When set to OFF, the improved software gating sensitivity is turned OFF and all data outside the measurement band is zeroed. This setting is used for troubleshooting purposes.

Parameters

<ch> Channel number of the pulse measurement. If unspecified, value is set to 1.

<bool> Choose from:

OFF (or O) - Turn OFF software gating.

ON (or 1) - Turn ON software gating.

Examples

SENS:SWE:PULS:SWG 0
sense2:sweep:pulse:swgate:state on

Query Syntax

SENSe<ch>:SWEep:PULSe:SWGate[:STATe]?

Return Type

Boolean

Default

ON

SENS<ch>:SWEep:PULSe:TIMing[:AUTO] <bool>

Applicable Models: VNAs with Pulsed RF Measurement Option

(Read-Write) In Narrowband pulse mode, choose to set the delay and width automatically or manually. This setting is labeled Autoselect Width and Delay on the UI.

Parameters

<ch> Channel number of the pulse measurement. If unspecified, value is set to 1.

<bool> Choose from:

OFF (or O) - Manually set the delay and width for the measurement.

ON (or 1) - Automatically set the delay and width for the measurement.

Examples

SENS:SWE:PULS:TIM 1
sense2:sweep:pulse:timing:auto off

Query Syntax

SENSe<ch>:SWEep:PULSe:TIMing[:AUTO]?

Return Type

Boolean

Default

ON

SENS<ch>:SWEep:PULSe:WIDeband[:STATe] <bool>
Applicable Models: VNAs with Pulsed RF Measurement Option (Except M9485A, M980xA, P50xxA)

*(Read-Write)* Set and read the pulse mode detection method.

**Parameters**

- `<ch>`: Channel number of the pulse measurement. If unspecified, value is set to 1.
- `<bool>`: Choose from:
  - OFF (or 0) - Narrowband mode.
  - ON (or 1) - Wideband mode

**Examples**

```
SENS:SWE:PULS:WID 1
sense2:sweep:pulse:wideband:state off
```

**Query Syntax**

`SENSe<ch>:SWEep:PULSe:WIDeband[:STATe]?`

**Return Type**

Boolean

**Default**

SCPI Command Tree

SENSe<cnum>:CORRection:TDR:COLLection:DLComp:LOAD <int>

Applicable Models: All with TDR Options (S9x011A/B)
This command executes load measurement, as a part of Loss Compensation sequence.

**Parameters**
- `<cnum>`
  - Channel number of the measurement. If unspecified, `<cnum>` is set to 1.
- `<int>`
  - Port number where load measurement is executed. The range is 1 to 4.

**Examples**
- `SENS:CORR:TDR:COLL:DLC:LOAD 1`
- `sense:correction:tdr:collection:dlcomp:load 1`

**Default**
- Not Applicable

---

This command executes open (with Thru) measurement, as a part of Loss Compensation sequence. This is used for Single Ended 1 Port only.

**Parameters**
- `<cnum>`
  - Channel number of the measurement. If unspecified, `<cnum>` is set to 1.
- `<int>`
  - Port number where open measurement is executed. The range is 1 to 4.

**Examples**
- `SENS:CORR:TDR:COLL:DLC:OPEN 1`
- `sense:correction:tdr:collection:dlcomp:open 1`

**Default**
- Not Applicable

---

This command saves the result of the Loss Compensation sequence.

**Parameters**
- `<cnum>`
  - Channel number of the measurement. If unspecified, `<cnum>` is set to 1.

**Examples**
- `SENS:CORR:TDR:COLL:DLC:SAVE`

**Default**
- Not Applicable
SENSe<cnum>:CORRection:TDR:COLLection:DLComp:THRU <num>,<num>

Applicable Models: All with TDR Options (S9x011A/B)

(Write-only) This command executes a thru measurement, as a part of Loss Compensation sequence.

Parameters

- `<cnum>`
  - Channel number of the measurement. If unspecified, `<cnum>` is set to 1.

- `<num>,<num>`
  - Enter the port numbers where the thru is connected. For example, 1,2 indicates that the thru is connected between ports 1 and 2. The range is 1 to 4.

Examples

```
SENS:CORR:TDR:COLL:DLC:THRU 1,2
sense:correction:tdr:collection:dlcomp:thru 1,2
```

Default

Not Applicable

---

SENSe<cnum>:CORRection:TDR:COLLection:ECAL:FCOMp:IMMediate

Applicable Models: All with TDR Options (S9x011A/B)

(Write-only) This command executes fixture compensation after ECAL.

Parameters

- `<cnum>`
  - Channel number of the measurement. If unspecified, `<cnum>` is set to 1.

Examples

```
```

Default

Not Applicable

---

SENSe<cnum>:CORRection:TDR:COLLection:ECAL:IMMediate

Applicable Models: All with TDR Options (S9x011A/B)

(Write-only) This command executes full calibration using the ECal module.

Parameters

- `<cnum>`
  - Channel number of the measurement. If unspecified, `<cnum>` is set to 1.

Examples

```
SENS:CORR:TDR:COLL:ECAL:IMM
sense:correction:tdr:collection:ecal:immediate
```

Default

Not Applicable
SENSe\(<cnum>\):CORRection:TDR:DCONstant \(<value>\)

Applicable Models: All with TDR Options (S9x011A/B)

(Read-Write) This command sets the dielectric constant value.

**Parameters**

- \(<cnum>\) Channel number of the measurement. If unspecified, \(<cnum>\) is set to 1.
- \(<value>\) Dielectric constant value. The range is 10m to 100.

**Examples**

```
SENS:CORR:TDR:DCON 0.01
sense:correction:tdr:dconstant 0.01
```

**Query Syntax**

SENSe\(<cnum>\):CORRection:TDR:DCONstant?

**Return Type**

Double

**Default**

1

---

SENSe\(<cnum>\):CORRection:TDR:EXTension:AUTO:IMMediate

Applicable Models: All with TDR Options (S9x011A/B)

(Write-only) This command executes deskew (auto port extension).

**Parameters**

- \(<cnum>\) Channel number of the measurement. If unspecified, \(<cnum>\) is set to 1.

**Examples**

```
SENS:CORR:TDR:EXT:AUTO:IMM
sense:correction:tdr:extension:auto:immediate
```

**Default**

Not Applicable

---

SENSe\(<cnum>\):CORRection:TDR:EXTension:AUTO:STANdard \(<enum>\)

Applicable Models: All with TDR Options (S9x011A/B)

(Read-Write) This command sets the standard for deskew (auto port extension).

**Parameters**

- \(<cnum>\) Channel number of the measurement. If unspecified, \(<cnum>\) is set to 1.
- \(<enum>\) Standard for deskew. Choose from:
  - OPEN - Open termination.
SHORT - Short termination.

Examples

SENS:CORR:TDR:EXT:AUTO:STAN OPEN
sense:correction:tdr:extension:auto:standard open

Query Syntax
SENSecnum>:CORRection:TDR:EXTension:AUTO:STANdard?

Return Type
String

Default
OPEN

SENSe<cnum>:CORRection:TDR:RIMPedance <value>

Applicable Models: All with TDR Options (S9x011A/B)

(Read-Write) This command sets the reference impedance value.

Parameters

<cnum> Channel number of the measurement. If unspecified, <cnum> is set to 1.

<value> Reference impedance value. The range is 1m to 10M.

Examples

SENS:CORR:TDR:RIMP 0.001
sense:correction:tdr:rimpedance 0.001

Query Syntax
SENSecnum>:CORRection:TDR:RIMPedance?

Return Type
Double

Default
50
Temperature

Applicable Models: This feature is available on ALL models except the N523x models and the 4-port N5244A and N5245A models with DSP Version 4.

**(Read-only)** Returns the temperature on the Receiver microcircuit.

Learn more about Receiver Temperature.

**Parameters**

- `<char>`: Choose from CELSius or FAHRenheit

**Examples**

- `SENS:TEMP? CELS`
- `sense:temperature? fahrenheit`

**Return Type**

- Numeric

**Default**

- Not Applicable

**SENSe<cnum>:ZA:CORRection:CSET:IMPort:FIXTure <bool>**

Applicable Models: All with Impedance Measurement Options (S9x041B)

*(Read-Write)* Sets and returns the ON | OFF state of Fixture Compensation. The Fixture Compensation data from the selected Cal Sets is enabled.

**Parameters**

- `<cnum>`: Any existing channel number. If unspecified, value is set to 1
ON | OFF state. Choose from
0 - Fixture Compensation is disabled
1 - Fixture Compensation is enable

Examples
SENS:ZA:CORR:CSET:IMP:FIXT ON
sense2:za:correction:cset:import:fixture 1

Query Syntax
SENSe<cnm>:ZA:CORRection:CSET:IMPort:FIXTure?

Return Type
Boolean

Default
OFF

SENSe<cnm>:ZA:CORRection:CSET:IMPort:SPARm <bool>

Applicable Models: All with Impedance Measurement Options (S9x041B)
(Read-Write) Sets and returns the ON | OFF state of S-Parameter calibration. The S-Parameter calibration data from the selected Cal Sets is enabled.

Parameters

<cnm>
Any existing channel number. If unspecified, value is set to 1

<bool>
ON | OFF state. Choose from
0 - S-Parameter calibration is disabled
1 - S-Parameter calibration is enable

Examples
SENS:ZA:CORR:CSET:IMP:SPAR ON
sense2:za:correction:cset:import:sparam 1

Query Syntax
SENSe<cnm>:ZA:CORRection:CSET:IMPort:SPARm?

Return Type
Boolean

Default
OFF

SENSe<cnm>:ZA:FIXTure:RESPonse:FILE <FileName>

Applicable Models: All with Impedance Measurement Options (S9x041B)
This command selects the fixture (16198A-010) calibration data file (.dat) which is provided by Keysight.

**Parameters**

- `<cnum>` Channel number of the measurement. If unspecified, `<cnum>` is set to 1.
- `<FileName>` calibration data file

**Examples**

```
SENS:ZA:FIXT:SEL "C:\Fixture_Data_xxxxxxxxx.dat"
sense:za:fixture:select "C:\Fixture_Data_xxxxxxxxx.dat"
```

**Query Syntax**

`SENSe<cnum>:ZA:FIXTure:SELect?`

**Return Type**

String

**Default**

Null

---

`SENSe<cnum>:ZA:FIXTure:CKIT:OPEN:G <value>`

Applicable Models: All with Impedance Measurement Options (S9x041B)

(Read-Write) This command sets/returns the G value of Open Standard for the fixture compensation.

**Parameters**

- `<cnum>` Channel number of the measurement. If unspecified, `<cnum>` is set to 1.
- `<value>` G value of Open Standard

**Examples**

```
sense:za:fixture:ckit:open:g 1e-5
```

**Query Syntax**

`SENSe<cnum>:ZA:FIXTure:CKIT:OPEN:G?`

**Return Type**

Numeric

**Default**

0

---

`SENSe<cnum>:ZA:FIXTure:CKIT:OPEN:C <value>`

Applicable Models: All with Impedance Measurement Options (S9x041B)

(Read-Write) This command sets/returns the capacitance value of Open Standard for the fixture compensation.

**Parameters**

- `<cnum>` Channel number of the measurement. If unspecified, `<cnum>` is set to 1.
### Sense:C:CIT:OPEN:C

- **C** value of Open Standard

**Examples**

```
```

**Query Syntax**

`SENSe<cnum>:ZA:FIXTure:CKIT:OPEN:C?`

**Return Type**

Numeric

**Default**

0

### Sense:C:CIT:SHORT:R

- **<value>** R value of Open Standard

**Examples**

```
```

**Query Syntax**

`SENSe<cnum>:ZA:FIXTure:CKIT:SHORT:R?`

**Return Type**

Numeric

**Default**

0

### Sense:C:CIT:SHORT:L

- **<value>** L value of Open Standard

**Examples**

```
```

**Query Syntax**

`SENSe<cnum>:ZA:FIXTure:CKIT:SHORT:L?`

**Return Type**

Numeric

**Default**

0
**Query Syntax**  
SENSe<cnum>:ZA:FIXTure:CKIT:SHORt:L?

**Return Type**  
Numeric

**Default**  
0

---

**SENSe<cnum>:ZA:PORT <string>**

Applicable Models: All with Impedance Measurement Options (S9x041B)  
(Read-Write) This command sets/returns the port for the impedance

**Parameters**

- `<cnum>`: Channel number of the measurement. If unspecified, <cnum> is set to 1.
- `<string>`: Port number

**Examples**

- `SENS:ZA:PORT "1"`
- `sense:za:port "2"`

**Query Syntax**  
SENSe<cnum>:ZA:PORT?

**Return Type**  
Numeric

**Default**  
"1"
SourceDC
SOURce:DC commands

Controls the internal and external DC sources.

---

**SOURce<ch>:DC:CATalog?**

Applicable Models: N524xB, E5080B, All PXIe/USB VNAs

*(Read-only)* Returns the names of the configured and active DC sources for the specified channel. Use `SYST:CONF:EDEV:CAT?` to read a list of all configured external devices, including inactive devices.

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>

**Examples**

```
SOUR:DC:CAT?
'Returns the following...
"AO1,AO2,MyDCSupply"
'A01 and A02 are PNA-X internal DC Sources
```

**Return Type**

String, Names are separated by commas.

**Default**

Not Applicable
SOURce<ch>:DC:CURRent:CLAMP:NEGative <name>,<num>

Applicable Models: All PXIe VNAs

(Read-Write) Sets and returns the negative current limit (in Amps) when output regulation is in voltage priority mode. This command is available for PXI SMU only. This is the same function with "IKtM911xOutputChannelCurrent Interface” section, “NegativeLimit” property of the M911x driver.

Parameters

<ch> Any existing channel number. If unspecified, value is set to 1

{name} String. DC Source Name. The name and port must EXACTLY match those in the DC Source Control dialog.

<num> Negative current limit value in Amps

Examples

SOUR2:DC:CURR:CLAMP:NEG "SMU1", -2

Query Syntax

SOURce<ch>:DC:VOLTage:CLAMP:NEGative? <name>

Return Type

Numeric

Default

-3.06

SOURce<ch>:DC:CURRent:CLAMP:POSitive <name>,<num>

Applicable Models: All PXIe VNAs

(Read-Write) Sets and returns the positive current limit (in Amps) when output regulation is in voltage priority mode. This command is available for PXI SMU only. This is the same function with "IKtM911xOutputChannelCurrent Interface” section, “PositiveLimit” property of the M911x driver.

Parameters

<ch> Any existing channel number. If unspecified, value is set to 1

{name} String. DC Source Name. The name and port must EXACTLY match those in the DC Source Control dialog.

"SMU*" represents the SMU DC Meter name. “*” is the SMU module number.

<num> Positive current limit value in Amps

Examples

SOUR2:DC:CURR:CLAMP:POS "SMU1", 2

8206
SOURce<ch>:DC:VOLTage:CLAm:POSitive? <name>

Return Type  Numeric
Default  3.06

SOURce<ch>:DC:CURR:RANGe <name>,<num>

Applicable Models: All PXIe VNAs

(Read-Write) Sets and returns a current output range in Amps. This command is available for both PXI SMU and Digital/Analog I/O M9341B. For PXI SMU, this is the same function with “IKtM911xOutputChannelCurrent.Range Property” section of the M911x driver.

Parameters

<ch>  Any existing channel number. If unspecified, value is set to 1
[M9341B] If different setting is set between channels, the channel which is not same as active channel will be blocked to avoid wearing out an internal mechanical relay.
SENSe:SWEep:BLOCked? can detect the blocked status.

<name>  String. DC Source Name. The name and port must EXACTLY match those in the DC Source Control dialog.

[SMU] "SMU*" represents the SMU DC Meter name. “*” is the SMU module number.

[M9341B] "AO1“ or “AO2“

<num>  [SMU] Current range in Amps (0.01 or 3)

[M9341B] Current range in Amps. The range is 0.5 to 0.05, but Analog Out2 can’t be set to 0.5. If an invalid number is specified, the analyzer will round up to the closest valid number.

AO1 (Mode1: 0.5, Mode2: 0.05)
AO2 (Mode1: 0.1, Mode2: 0.05)

Examples
SOUR2:DC:CURR:RANG "SMU1",1m

Query Syntax  SOURce<ch>:DC:CURRent:RANGe? <name>
Return Type  Numeric
Default  (SMU) 3, (M9341B) 0.05

SOURce<ch>:DC:DATA <name[,port]>,<data>
(Read-Write) Sets and returns the DC stimulus values per point to be sent from the specified DC source. This setting overrides the Start and Stop DC settings for the channel. Only the values that are set with this command can be read by this command. The read command does NOT read the values that are set using the Start and Stop settings.

**Parameters**

- `<ch>`
  Any existing channel number. If unspecified, value is set to 1

- `<name[,port]>`
  String. The name and port must EXACTLY match those in the DC Source Control dialog.
  - **name** - DC Source Name. See note for specifying internal DC Sources.
  - **[port]** - Optional. VNA port for DC Source data. This is equivalent to the `<per port>` setting in the DC Source Control dialog.
  If unspecified, data is applied to ALL ports.
  
  **Important**: When you specify a port for this command, it must also be included for ALL DC Source commands that have this optional [port] specifier.

- `<data>`
  The stimulus value array to be set. The size of the array should be equal to the sweep point number.

**Examples**

```plaintext
'Set 3 data points on the channel
scpi.Execute "SENS:SWE:POIN 3"

'Enable DC Source output
scpi.Execute "SOUR:DC:ENAB ON"

'Set AO1 state to be always ON (no port value)
scpi.Execute "SOUR:DC:STATe 'AO1',ON"

'Set DC value for each data point
scpi.Execute "SOUR:DC:DATA 'AO1',1,5,1"

'Read data back
data = scpi.Execute ("SOUR:DC:DATA? 'AO1'")
msgbox data
```

**Query Syntax**

SOURce<ch>:DC:DATA? <name[,port]>

**Return Type**

Comma-separated values

**Default**

Not Applicable
Applicable Models: N524xB, E5080B, All PXIe/USB VNAs

(Read-Write) Sets and returns the ON / Off state of all configured DC sources for the specified channel. This setting is the same as the checkbox at the top of the DC Source Control dialog. 
Individual DC sources must ALSO be enabled using SOUR:DC:STATe.
Use SYST:CONF:EDEV:CAT? to read a list of all configured external devices.
Use SOUR:DC:CAT? to read a list of ACTIVE configured DC source names.

Parameters

- `<ch>`: Any existing channel number. If unspecified, value is set to 1.
- `<bool>`: ON / Off state. Choose from:
  - ON or 1 - All DC sources enabled.
  - OFF or 0 - All DC sources disabled.

Examples

```
SOUR:DC:ENAB 0
```

Query Syntax

SOURce<ch>:DC:Enable?

Return Type

Boolean

Default

1

---

SOURce<ch>:DC:LIMit:MAXimum <name>,<num>

Applicable Models: All

(Read-Write) Sets and returns the Max DC limit value for a DC source.

Parameters

- `<ch>`: Any existing channel number. If unspecified, value is set to 1.
- `<name>`: String. DC Source Name. See note for specifying internal DC Sources.
  The name must EXACTLY match those in the DC Source Control dialog.
- `<num>`: Max DC limit value. Choose a value within the range of the DC source.

Examples

```
SOUR2:DC:LIM:MAX "myDCSource",10
source:dc:limit:maximum "myDCSource",10
```
**SOURce<ch>:DC:LIMit:MAXimum? <name>**

**Return Type**
Numeric

**Default**
10

---

**SOURce<ch>:DC:LIMit:MINimum <name>,<num>**

Applicable Models: All

*(Read-Write)* Sets and returns the Min DC limit value for a DC source.

**Parameters**

- `<ch>`
  Any existing channel number. If unspecified, value is set to 1.

- `<name>`
  String. DC Source Name. See note for specifying internal DC Sources.
  The name must EXACTLY match those in the DC Source Control dialog.

- `<num>`
  Min DC limit value. Choose a value within the range of the DC source.

**Examples**

```
SOUR2:DC:LIM:MIN "myDCSource",-10
source:dc:limit:minimum "myDCSource",-10
```

---

**SOURce<ch>:DC:LOCK:OUTPut:RELay:CLOSed <name>, <bool>**

Applicable Models: All PXIe VNAs

*(Read-Write)* Sets and reads the locked-down state of the output relays on SMU units with output relays. When enabled/locked, the output relays remain closed. When disabled, the output relays open and close as the output toggles on and off. This command is available for PXI SMU only. This is the same function with “IKtM911xOutputChannelRelay Interface” section, “LockEnabled” property of the M911x driver.

**Parameters**

- `<ch>`
  Any existing channel number. If unspecified, value is set to 1. This command is common for all channels and the setting is ignored.
**<name>**

String. DC Source Name. The name must EXACTLY match those in the DC Source Control dialog.

**<bool>**

ON / Off state. Choose from:

ON or 1 - The output relays remain closed

OFF or 0 - The output relays open and close as the output toggles on and off.

**Examples**

SOUR:DC:LOCK:OUTP:REL:CLOS 0

**Query Syntax**

SOURce<ch>:DC:LOCK:OUTPut:RELay:CLOSe? <name>

**Return Type**

Boolean

**Default**

0

---

**SOURce<ch>:DC:PROTection:CATalog?**

Applicable Models: All PXIe VNAs, E5080B

*(Read-only)* Returns the module list or name of DC source in which protection function is activated due to over current or voltage. This command is available for both PXI SMU and Digital/Analog I/O M9341B and E5080B.

**Parameters**

<ch> Any existing channel number. If unspecified, value is set to 1. This command is common for all channels and the setting is ignored.

**Examples**

SOUR:DC:PROT:CAT?

**Query Syntax**

SOURce<ch>:DC:PROTection:CATalog?

**Return Type**

String, Names are separated by commas. "NONE" is returned if no modules are detected.

**Default**

Not Applicable

---

**SOURce<ch>:DC:PROTection:ENABle <name>, <bool>**

Applicable Models: All PXIe VNAs

*(Read-Write)* Sets and reads the DC output protection state. This command is available for PXI SMU only.

**Parameters**
### SOURce<ch>:DC:PROTection:ENABle <name>, <bool>

Applicable Models: All PXIe VNAs

**(Read-Write)** Sets and reads the protection voltage level for the DC output. This command is available for PXI SMU only.

<table>
<thead>
<tr>
<th>Parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>&lt;ch&gt;</code></td>
</tr>
<tr>
<td><code>&lt;name&gt;</code></td>
</tr>
<tr>

**Examples**

```
SOUR:DC:PROT:ENAB "SMU1", 0
```

**Query Syntax**

```
SOURce<ch>:DC:PROTection:ENABle? <name>
```

**Return Type**

Boolean

**Default**

1

### SOURce<ch>:DC:PROTection:LEVel <name>, <num>

Sets and reads the protection voltage level for the DC output. This command is available for PXI SMU only.

<table>
<thead>
<tr>
<th>Parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>&lt;ch&gt;</code></td>
</tr>
<tr>
<td><code>&lt;name&gt;</code></td>

**Examples**

```
SOUR:DC:PROT:LEV "SMU1", 10
```

**Query Syntax**

```
SOURce<ch>:DC:PROTection:LEVel? <name>
```

**Return Type**

Numeric

**Default**

14.4

### SOURce<ch>:DC:PROTection:RESet <name>

8212
Applicable Models: All PXIe VNAs, E5080B

(Write Only) Resets the instrument's output protection circuit after a protection condition occurs. If successful, the output will return to the output enabled state. Remove the fault condition that caused the protection trip before resetting the protection circuit in order to prevent the protection from tripping again. This command is available for both PXI SMU and Digital/Analog I/O M9341B and E5080B.

Parameters

<ch> Any existing channel number. If unspecified, value is set to 1. This command is common for all channels and the setting is ignored.

<string> String. DC Source Name. The name must EXACTLY match those in the DC Source Control dialog.

[SMU] "SMU*" represents the SMU DC Meter name. "*" is the SMU module number.

[M9341B] "AO1" or "AO2"

[E5080B] "AO1" or "AO2" or both

Examples

SOUR:DC:PROT:RES "SMU1"

Query Syntax Not Applicable

Return Type Not Applicable

Default Not Applicable

SOURce<ch>:DC:NAMes?

Applicable Models: N524xB, E5080B, All PXIe/USB VNAs

(Read-only) Reads the DC source names

Parameters

<ch> Any existing channel number. If unspecified, value is set to 1

Examples

SOUR:DC:NAM?

Query Syntax SOURce<ch>:DC:NAMes?

Return Type

Default Not Applicable
SOURce<ch>:DC:SEQuencing[:STATe] <bool>

Applicable Models: All PXIe VNAs

(Read-Write) Sets and reads the DC output sequencing state. This command is valid for SMU sources only. Other DC sources, such as “AO1”, “AO2”, do not have the sequencing control. This command is available for PXI SMU only.

Parameters

Any existing channel number. If unspecified, value is set to 1.

String. DC Source Name. The name must EXACTLY match those in the DC Source Control dialog.

ON / Off state. Choose from:

ON or 1
OFF or 0

Examples

SOUR:DC:SEQ 1

Query Syntax SOURce<ch>:DC:SEQuencing[:STATe]?

Return Type Boolean

Default 0

SOURce<ch>:DC:SEQuencing:STIMe <num>

Applicable Models: All PXIe VNAs

(Read-Write) Sets and reads the DC output sequencing settling time. This command is available for PXI SMU only. Other DC sources, such as “AO1”, “AO2”, do not have the sequencing control.

Parameters

Any existing channel number. If unspecified, value is set to 1.

String. DC Source Name. The name must EXACTLY match those in the DC Source Control dialog.

Source settling time in second.

Examples

SOUR:DC:SEQ:STIM 1
### Query Syntax

### SOURce<ch>:DC:STARt <name[,port]>,<num>

**Applicable Models:** N524xB, E5080B, All PXIe/USB VNAs

*(Read-Write)* Sets and returns start DC value for the specified DC source.

**Parameters**

- `<ch>`: Any existing channel number. If unspecified, value is set to 1
- `<name[,port]>`: String. The name and port must EXACTLY match those in the DC Source Control dialog.
  - name - DC Source Name. See note for specifying internal DC Sources.
  - [port] - Optional. VNA port for DC Source start value. This is equivalent to the <per port> setting in the DC Source Control dialog.
  - If unspecified, DC Start value is applied for ALL ports.

**Examples**

```plaintext```
SOUR2:DC:STARt "myDCSource",3
source:dc:start "AO1,Port 1",1
```

**Query Syntax**

<table>
<thead>
<tr>

</tr>
</tbody>
</table>

### SOURce<ch>:DC:STATe <name[,port]>,<bool>

**Applicable Models:** N524xB, E5080B, All PXIe/USB VNAs

*(Read-Write)* Sets and returns the ON / Off state of the specified DC source and port.

Use SYST:CONF:EDEV:CAT? to read a list of all configured external devices.
Use `SOUR:DC:CAT?` to read a list of ACTIVE configured DC source names

Parameters

- `<ch>`
  Any existing channel number. If unspecified, value is set to 1

- `<name[,port]>`
  String. The name and port must EXACTLY match those in the DC Source Control dialog. Name - DC Source Name. See note for specifying internal DC Sources.
  [port] - Optional. VNA port for DC Source state. This is equivalent to the <per port> setting in the DC Source Control dialog.

  If unspecified, DC is ALWAYS ON or OFF for ALL ports.

  **Important:** When you specify a port for this command, it must also be included for ALL DC Source commands that have this optional [port] specifier.

- `<bool>`
  ON / Off state. Choose from:
  ON or 1 - DC source/port enabled.
  OFF or 0 - DC source/port disabled.

Examples

- 'Set AO1 to always ON
  `source:dc:state "AO1",1`
  'Set MyDCSource to ON when RF source Port 1 is ON
  `SOUR:DC:STAT "MyDCSource,Port 1",ON`
  'Read state for MyDCSource,Port 1
  `SOUR:DC:STAT? "MyDCSource,Port 1"`

Query Syntax

```
SOURce<ch>:DC:STATe? <name[,port]>
```

Return Type: Boolean

Default: 0 - OFF

**SOURce<ch>:DC:STOP <name[,port]>,<num>**

Applicable Models: N524xB, E5080B, All PXIe/USB VNAs

(Read-Write) Sets and returns stop DC value for the specified DC source.

Parameters

- `<ch>`
  Any existing channel number. If unspecified, value is set to 1
<name[,port]>

String. The name and port must EXACTLY match those in the DC Source Control dialog.

name - DC Source Name. See note for specifying internal DC Sources.

[port] - Optional. VNA port for DC Stop value. This is equivalent to the <per port> setting in the DC Source Control dialog.

If unspecified, DC Stop is applied for ALL ports.

Important: When you specify a port for this command, it must also be included for ALL DC Source commands that have this optional [port] specifier.

<num>

Stop value. Choose a value within the range of the DC source.

Examples

SOUR2:DC:STOP "myDCSource", 3

Query Syntax

SOURce<ch>:DC:STOP?<name[,port]>

Return Type

Numeric

Default

0

SOURce<ch>:DC:TYPE <name>,<char>

Applicable Models: All PXIe VNAs

(Read-Write) Sets and returns the output regulation mode. This command is available for PXI SMU only. This is the same function with “IKtM911xOutputChannel Interface” section, “PriorityMode” property of the M911x driver.

Parameters

<ch>

Any existing channel number. If unspecified, value is set to 1

$name$

String. DC Source Name. The name and port must EXACTLY match those in the DC Source Control dialog.

<char>

Source control type.

VOLTage - voltage priority

CURRent - current priority

Examples

SOUR2:DC:TYPE "SMU1",VOLT

Query Syntax

SOURce<ch>:DC:TYPE? <name>
Return Type: Character

Default: VOLTage

**SOURce<ch>:DC:VOLTage:CALIbrate:DATE <name>**

Applicable Models: All PXIe VNAs

*(Read only)* Returns the date of execution output voltage calibration. This command is available for M9341B only.

**Parameters**

<ch> Any existing channel number. If unspecified, value is set to 1. This command is common for all channels and the setting is ignored.

<name> String. DC Source Name. The name and port must EXACTLY match those in the DC Source Control dialog “AO1” or “AO2” or both.

**Examples**

```
SOUR2:DC:VOLT:CALB:DATE? "AO1,AO2"
```

**Query Syntax**

SOURce<ch>:DC:VOLTage:CALIbrate:DATE? <name>

**Return Type** String. Comma separated numbers representing year, month and day.

**Default** Not Applicable

---

**SOURce<ch>:DC:VOLTage:CALIbrate:EXECute <name>**

Applicable Models: All PXIe VNAs

*(Write only)* Execute the output voltage calibration for both AO1 and AO2. The calibration is finished within 1 second, so this is not an overlapped command. This command is available for M9341B only.

**Parameters**

<ch> Any existing channel number. If unspecified, value is set to 1. This command is common for all channels and the setting is ignored.

<name> String. DC Source Name. The name and port must EXACTLY match those in the DC Source Control dialog “AO1” or “AO2” or both. Even either "AO1" or "AO2" is selected, both ports are calibrated at the same time.
### SOURce<ch>:DC:VOLTage:CALIbrate:TIME <name>

**Applicable Models:** All PXIe VNAs

*(Read only)* Returns the time of execution output voltage calibration. If the calibration is not executed, “[SCPI: 1111]: Calibration data is missing.” is returned. This command is available for M9341B only.

**Parameters**

- `<ch>`: Any existing channel number. If unspecified, value is set to 1. This command is common for all channels and the setting is ignored.
- `<name>`: String. DC Source Name. The name and port must EXACTLY match those in the DC Source Control dialog “AO1” or “AO2” or both.

**Examples**

```
SOUR2:DC:VOLT:CALB:TIME "AO1, AO2"
```

**Query Syntax**

SOURce<ch>:DC:VOLTage:CALIbrate:TIME? <name>

**Return Type**

String. Comma separated numbers representing hours, minutes and seconds.

**Default**

Not Applicable

---

### SOURce<ch>:DC:VOLTage:BANDwidth <name>,<string>

**Applicable Models:** All PXIe VNAs

*(Read-Write)* Sets and returns a voltage bandwidth to optimize the output response time with capacitive loads. This command is available for PXI SMU only. This is the same function with “IKtM911xOutputChannelVoltage.Bandwidth Property” section of the M911x driver.

**Parameters**

- `<ch>`: Any existing channel number. If unspecified, value is set to 1
<name> String. DC Source Name. The name and port must EXACTLY match those in the DC Source Control dialog. "SMU*" represents the SMU DC Meter name. "*" is the SMU module number.

<string> Source control type. "LOW", "HIGH1", "HIGH2", or "HIGH3"

Examples SOUR2:DC:VOLT:CLAM "SMU1", "LOW"

Query Syntax SOURce<ch>:DC:VOLTage:CLAMp? <name>

Return Type String

Default "LOW"

SOURce<ch>:DC:VOLTage:CLAMp <name>,<num>

Applicable Models: All PXIe VNAs

(Read-Write) Sets and returns the positive voltage limit in Volts when output regulation is in current priority mode. This command is available for PXI SMU only. This is the same function with "IKtM911xOutputChannelVoltage Interface" section, “Limit” property of the M911x driver.

Parameters

<ch> Any existing channel number. If unspecified, value is set to 1

<string> String. DC Source Name. The name and port must EXACTLY match those in the DC Source Control dialog. "SMU*" represents the SMU DC Meter name. "*" is the SMU module number.

<num> Limit value in Volts

Examples SOUR2:DC:VOLT:CLAM "SMU1", 5

Query Syntax SOURce<ch>:DC:VOLTage:CLAMp? <name>

Return Type Numeric

Default 6.12

SOURce<ch>:DC:VOLTage:RANGe <name>,<num>
Applicable Models: All PXIe VNAs

(Read-Write) Sets and returns a voltage output range in Volts. This command is available for both PXI SMU only. This is the same function with “IKtM911xOutputChannelVoltage.Range Property” section of the M911x driver.

Parameters

<ch> Any existing channel number. If unspecified, value is set to 1

$name$ String. DC Source Name. The name and port must EXACTLY match those in the DC Source Control dialog.

"SMU*" represents the SMU DC Meter name. “*” is the SMU module number.

<num> Voltage range (6 or 13)

Examples

SOUR2:DC:VOLT:RANG "SMU1", 13

Query Syntax

SOURce<ch>:DC:VOLTage:RANGE? <name>

Return Type

Numeric

Default

6
Source Multi-Dimensional Sweep

Controls for setting up a multi-dimensional sweep.

### SOURce<ch>:DC:DImension:ORDer <name[,port]>,<value>

**Applicable Models:** N522xB, N523xB, N524xB

(Read-Write) Set and read the order for the specified DC source in the multi-dimensional sweep.

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;ch&gt;</td>
<td>Any existing SA channel. If unspecified, value is set to 1.</td>
</tr>
<tr>
<td>&lt;name[,port]&gt;</td>
<td>String. The name and port must EXACTLY match those in the DC Source Control dialog.</td>
</tr>
<tr>
<td>[port]</td>
<td>Optional. PNA port for DC Source start value. This is equivalent to the &lt;per port&gt; setting in the DC Source Control dialog.</td>
</tr>
</tbody>
</table>

- **Important:** When you specify a port for this command, it must also be included for ALL DC Source commands that have this optional [port] specifier.

</table>
If unspecified, DC Start value is applied for ALL ports.

**Important:** When you specify a port for this command, it must also be included for ALL DC Source commands that have this optional [port] specifier.

Choose from:

0 - **OFF** - Disable the specified DC source in multi-dimensional sweep.

1 - **ON** - Enable the specified DC source in multi-dimensional sweep.

**Examples**

```
SOUR:DC:DIM "AO1",1
source:dc:dimension "MyDCSource,Port 1",ON
```

**Query Syntax**

```
SOURce<ch>:DC:DIEMension[:STATe]? <name[,port]>
```

**Return Type**

Boolean

**Default**

0

---

**SOURce<ch>:DIMension<dim>:CATalog?**

**Applicable Models:** N522xB, N523xB, N524xB

(Read-only) Read the names of source domains in the multi-dimensional sweep whose state is ON and whose dimension order is the specified dimension order.

**Parameters**

- `<ch>`: Any existing SA channel. If unspecified, value is set to 1.
- `<dim>`: Dimension order. If unspecified, value is set to 1.

**Examples**

```
SOUR:DIM3:CAT?
'
Returns the following...
"SOUR:FREQ1,SOUR:FREQ3"
```

**Return Type**

String, Names are separated by commas.
Not Applicable

**Default**

Not Applicable

---

**SOURce<ch>:DIMension:COUNt?**

**Applicable Models:** N522xB, N523xB, N524xB

(Read-only) Read the highest dimension order in the multi-dimensional sweep.

**Parameters**

- `<ch>`: Any existing SA channel. If unspecified, value is set to 1.

**Examples**

```
SOUR:DIM:COUN?
```

**Return Type**

Numeric

**Default**

0

---

**SOURce<ch>:DIMension<dim>:POINts <value>**

**Applicable Models:** N522xB, N523xB, N524xB

(Read-Write) Set and read the point count for the specified dimension order in the multi-dimensional sweep.
PARAMETERS

Any existing SA channel. If unspecified, value is set to 1.
Dimension order. If unspecified, value is set to 1.

VALUE

Point count. Choose an integer value of 1 or higher.

Examples

SOUR:DIM2:POIN 3
source:dimension4:points 4

QUERY SYNTAX

SOURce<ch>:DIМension<dim>:POINts?

RETURN TYPE

Integer

Default

1

SOURce<ch>:DIМension<dim>:REP:COUNT <value>

Applicable Models: N522xB, N523xB, N524xB

(Read-Write) Set and read the repeat count for the specified dimension order in the multi-dimensional sweep.

Parameters

Any existing SA channel. If unspecified, value is set to 1.
Dimension order. If unspecified, value is set to 1.

VALUE

Repeat count. Choose an integer value of 1 or higher.

Examples

SOUR:DIM2:REP:COUN 3
source:dimension4:repeat:count 4

QUERY SYNTAX

SOURce<ch>:DIМension<dim>:REP:COUNT?

RETURN TYPE

Integer

Default

1

SOURce<ch>:FREQuency<port>:DIМension:ORDer <value>[,src]

Applicable Models: N522xB, N523xB, N524xB

(Read-Write) Set and read the source frequency domain’s order in the multi-dimensional sweep.

Parameters

Any existing SA channel. If unspecified, value is set to 1.
Source port number of the PNA. If unspecified, value is set to 1. To make settings for ports that are not simple numbers, use the [src] argument.
Dimension order. Choose an integer value of 1 or higher.

Examples

SOUR:FREQ:DIM:ORDER 2
source2:frequency:dimension:order 4,"Port 1 Src2"

QUERY SYNTAX

SOURce<ch>:FREQuency<port>:DIМension:ORDer?

RETURN TYPE

Integer

Default

1

SOURce<ch>:FREQuency<port>:DIМension[:STATe] <bool>[,src]
Applicable Models: N522xB, N523xB, N524xB

(Read-Write) Set and read the source frequency domain's ON/OFF state in the multi-dimensional sweep.

Parameters
- `<ch>` Any existing SA channel. If unspecified, value is set to 1.
- `<port>` Source port number of the PNA. If unspecified, value is set to 1. To make settings for ports that are not simple numbers, use the `[src]` argument.
- `<bool>` Choose from:
  - 0 - OFF - Disable the specified source frequency domain in multi-dimensional sweep.
  - 1 - ON - Enable the specified source frequency domain in multi-dimensional sweep.
- `[src]` String. (NOT case sensitive). Source port. Optional. Use SOUR:CAT? to return a list of valid port names. While this argument can be used to make settings for ALL ports, it is designed to access ports such as an external source, or one of the Source outputs on the 2-port PNA-X model with multiple sources such as "Port 1 Src2". Otherwise, the `<port>` argument performs the same function. If both arguments are specified, [src] takes priority.

Examples
```
SOUR:FREQ:DIM 1
source2:frequency:dimension 0,"Port 1 Src2"
```

Query Syntax
```
SOURce<ch>:FREQuency<port>:DIMension[:STATe]?
```

Return Type
Boolean

Default
0

Applicable Models: N522xB, N523xB, N524xB

(Read-WRITE) Set and read the fixed frequency value for a specific port.

Parameters
- `<ch>` Any existing SA channel. If unspecified, value is set to 1.
- `<port>` Source port number of the PNA. If unspecified, value is set to 1. To make settings for ports that are not simple numbers, use the [src] argument.
- `<num>` fixed frequency value.
- `[src]` String. (NOT case sensitive). Source port. Optional. Use SOUR:CAT? to return a list of valid port names. While this argument can be used to make settings for ALL ports, it is designed to access ports such as an external source, or one of the Source outputs on the 2-port PNA-X model with multiple sources such as "Port 1 Src2". Otherwise, the `<port>` argument performs the same function. If both arguments are specified, [src] takes priority.

Examples
```
SOUR:FREQ:FIX 1e9
source2:frequency:fixed 1e9,"Port 1 Src2"
```

Query Syntax
```
SOURce<ch>:FREQuency<port>[:FIXed]?
```

Return Type
Numeric

Default
1 GHz

Applicable Models: N522xB, N523xB, N524xB

(Read-Write) Set and read the start frequency value for a specific port.

Parameters
- `<ch>` Any existing SA channel. If unspecified, value is set to 1.
- `<port>` Source port number of the PNA. If unspecified, value is set to 1. To make settings for ports that are not simple numbers, use the [src] argument.

Examples
```
SOUR:FREQ:STARt 1e9
source2:frequency:start 1e9,"Port 1 Src2"
```

Query Syntax
```
SOURce<ch>:FREQuency<port>[:STARt]?
```

Return Type
Numeric

Default
1 GHz
### SOURce<ch>:FREQuency<port>:STARt <num>,[src]

Start frequency value.

- **Parameters**
  - `<ch>`: Any existing SA channel. If unspecified, value is set to 1.
  - `<port>`: Source port number of the PNA. If unspecified, value is set to 1. To make settings for ports that are not simple numbers, use the `[src]` argument.

- **Examples**
  - SOUR:FREQ:STAR 1e9
  - source2:frequencystart 1e9,"Port 1 Src2"

- **Query Syntax**
  - SOURce<ch>:FREQuency<port>:STARt?

- **Return Type**
  - Numeric

- **Default**
  - Minimum frequency of the PNA.

### SOURce<ch>:FREQuency<port>:STOP <num>[,src]

Applicable Models: N522xB, N523xB, N524xB

(Read-Write) Set and read the stop frequency value for a specific port.

- **Parameters**
  - `<ch>`: Any existing SA channel. If unspecified, value is set to 1.
  - `<port>`: Source port number of the PNA. If unspecified, value is set to 1. To make settings for ports that are not simple numbers, use the `[src]` argument.

- **Examples**
  - SOUR:FREQ:STOP 1e9
  - source2:frequencystop 1e9,"Port 1 Src2"

- **Query Syntax**
  - SOURce<ch>:FREQuency<port>:STOP?

- **Return Type**
  - Numeric

- **Default**
  - Maximum frequency of the PNA.

### SOURce<ch>:PHASe<port>:DIMension:ORDer <value>[,src]

Applicable Models: N522xB, N523xB, N524xB

(Read-Write) Set and read the source phase domain's order in the multi-dimensional sweep.

- **Parameters**
  - `<ch>`: Any existing SA channel. If unspecified, value is set to 1.
  - `<port>`: Source port number of the PNA. If unspecified, value is set to 1. To make settings for ports that are not simple numbers, use the `[src]` argument.

- **Examples**
  - SOUR:PHAS:DIM:ORDER 2
SOURce<ch>:PHAS<port>:DIMension[:STATe] <bool>[,src]

Applicable Models: N522xB, N523xB, N524xB

(Read-Write) Set and read the source phase domain’s ON/OFF state in the multi-dimensional sweep.

Parameters

- `<ch>`: Any existing SA channel. If unspecified, value is set to 1.
- `<port>`: Source port number of the PNA. If unspecified, value is set to 1. To make settings for ports that are not simple numbers, use the [src] argument.
- `<bool>`: Choose from:
  - 0 - OFF - Disable the specified source phase domain in multi-dimensional sweep.
  - 1 - ON – Enable the specified source phase domain multi-dimensional sweep.

Examples

SOUR:PHAS:DIM 1

source2:phase:dimension:order 0,"Port 1 Src2"

SOURce<ch>:POWer<port>:DIMension:ORDER <value>[,src]

Applicable Models: N522xB, N523xB, N524xB

(Read-Write) Set and read the source power domain’s order in the multi-dimensional sweep.

Parameters

- `<ch>`: Any existing SA channel. If unspecified, value is set to 1.
- `<port>`: Source port number of the PNA. If unspecified, value is set to 1. To make settings for ports that are not simple numbers, use the [src] argument.
- `<value>`: Dimension order. Choose an integer value of 1 or higher.

Examples

SOUR:POW:DIM:ORDER 2

source2:power:dimension:order 4,"Port 1 Src2"
SOURce<ch>:POWer<port>:DIMension[:STATe] <bool>[,src]

**Applicable Models:** N522xB, N523xB, N524xB

(Read-Write) Set and read the source power domain’s ON/OFF state in the multi-dimensional sweep.

**Parameters**

- `<ch>`: Any existing SA channel. If unspecified, value is set to 1.
- `<port>`: Source port number of the PNA. If unspecified, value is set to 1. To make settings for ports that are not simple numbers, use the `[src]` argument.
- `<bool>`: Choose from:
  - 0 - OFF - Disable the specified source power domain in multi-dimensional sweep.
  - 1 - ON - Enable the specified source power domain in multi-dimensional sweep.

While this argument can be used to make settings for ALL ports, it is designed to access ports such as an **external source**, or one of the Source outputs on the 2-port PNA-X model with multiple sources such as “Port 1 Src2”. Otherwise, the `<port>` argument performs the same function. If both arguments are specified, `[src]` takes priority.

**Examples**

```
SOUR:FREQ:DIM 1
source2:power:dimension 0,"Port 1 Src2"
```

**Query Syntax**

SOURce<ch>:POWer<port>:DIMension[:STATe]?

**Return Type**

Boolean

**Default**

0
SourcePhase

Makes phase control settings (Option S93088A)

```
SOURce:PHASe:
  | CONTROL
  | COUPLE[:STATE]
  | ITERation
  | TOLERance
  | CORREction
  | DATA
  | [:STATE]
  | EXTERNAL
  | CATalog?
  | PORT
  | [FIXed]
  | MODE
  | CATalog?
  | [:VALUE]
  | PARameter
  | CATalog?
  | MODE
  | CATalog?
  | PORT
  | [:VALUE]
  | OFFSET
  | CORREction
  | DATA
  | [:STATE]
```
SOURce<ch>:=PHASE<port>:CONTrol:COUPle[:STATe] <bool>[,src]

Applicable Models: N522xB, N524xB

(Read-Write) Write and read whether to couple phase control settings (IFBW, Tolerance, Max Iterations).

**Parameters**

- `<ch>`
  Channel number of phase control measurement. If unspecified, value is set to 1.

- `<port>`
  Phase controlled port number. If unspecified, value is set to 1. To make settings for ports that are not simple numbers, use the [src] argument.

- `<bool>`
  Coupling state. Choose from:

  - ON or 1 - Couple phase control settings. The phase control settings from `<port>` are copied to the other phase-controlled ports.
  - OFF or 0 - Do NOT couple phase control settings. The phase control settings for each phase-controlled port are made independently.

- `[src]`

  While this argument can be used to make settings for ALL ports, it is designed to access ports such as an external source, true mode balanced port, or one of the Source outputs on the 2-port PNA-X model with multiple sources such as "Port 1 Src2". Otherwise, the
<port> argument performs the same function. If both arguments are specified, [src] takes priority.

Use SOUR:CAT? to return a list of valid port names.

### Examples

```
SOUR:PHAS2:CONT:COUP 1
source2:phase:control:couple:state ON,"Port 1 Src2"
```

### Query Syntax

```
SOURce<ch>:PHASe<port>:CONTrol:COUPle[:STATe]? [src]
```

### Return Type

Boolean

### Default

OFF

---

SOURce<ch>:PHASe<port>:CONTrol:ITERation <num>[,src]

Applicable Models: N522xB, N524xB

(Read-Write) Write and read the maximum number of background phase sweeps to perform.

### Parameters

- `<ch>`
  - Channel number of phase control measurement. If unspecified, value is set to 1.

- `<port>`
  - Phase controlled port number. If unspecified, value is set to 1. To make settings for ports that are not simple numbers, use the [src] argument.

- `<num>`
  - Number of background sweep iterations. Choose a value between 1 and 25.

- `[src]`

While this argument can be used to make settings for ALL ports, it is designed to access ports such as an external source, true mode balanced port, or one of the Source outputs on the 2-port PNA-X model with multiple sources such as "Port 1 Src2". Otherwise, the <port> argument performs the same function. If both arguments are specified, [src] takes priority.

Use SOUR:CAT? to return a list of valid port names.

### Examples

```
SOUR:PHAS2:CONT:ITER 3
source2:phase:control:iteration 4,"Port 1 Src2"
```

### Query Syntax

```
SOURce<ch>:PHASe<port>:CONTrol:ITERation? [src]
```

### Return Type

Numeric

### Default

10
### SOUR<ch>:PHA<port>:CONT:TO<ch>le<port>:TOLerance <num>[,.src]

#### Parameters

- `<ch>`: Channel number of phase control measurement. If unspecified, value is set to 1.
- `<port>`: Phase controlled port number. If unspecified, value is set to 1. To make settings for ports that are not simple numbers, use the `[src]` argument.
- `<num>`: Tolerance for background sweeps in degrees. Choose a value between 1 and 5.

While this argument can be used to make settings for ALL ports, it is designed to access ports such as an external source, true mode balanced port, or one of the Source outputs on the 2-port PNA-X model with multiple sources such as "Port 1 Src2". Otherwise, the `<port>` argument performs the same function. If both arguments are specified, `[src]` takes priority.

Use **SOUR:CAT?** to return a list of valid port names.

#### Examples

```
SOUR:PHAS2:CONT:TOL 3
source2:phase:control:tolerance 6,"Port 1 Src2"
```

#### Query Syntax

```
SOURce<ch>:PHASe<port>:CONTRol:TOLerance? [src]
```

#### Return Type

Numeric

#### Default

1 degree

---

### SOUR<ch>:PHA<port>:COR<ch>rection:DATA <data>[,.src]

#### Parameters

- `<ch>`: Channel number of phase control measurement. If unspecified, value is set to 1.
- `<port>`: Phase controlled port number. If unspecified, value is set to 1. To make settings for ports that are not simple numbers, use the `[src]` argument.

---
Phase offset data array.

[String. (NOT case sensitive). Source port. Optional argument.]

While this argument can be used to make settings for ALL ports, it is designed to access ports such as an external source, true mode balanced port, or one of the Source outputs on the 2-port PNA-X model with multiple sources such as "Port 1 Src2". Otherwise, the <port> argument performs the same function. If both arguments are specified, [src] takes priority.

Use SOUR:CAT? to return a list of valid port names.

### Examples

```
SOUR:PHAS2:CORR:DATA
source2:phase:correction:data 10,15,20,"Port 1 Src2"
```

### Query Syntax

```
SOURce<ch>:PHASe<port>:CORRection:DATA? [src]
```

### Return Type

Depends on FORMat:DATA

---

**SOURce<ch>:PHASe<port>:CORRection[:STATe] <bool>[,src]**

Applicable Models: N522xB, N524xB

(Read-Write) Write and read whether to use the phase correction offset array.

### Parameters

- **<ch>**
  
  Channel number of phase control measurement. If unspecified, value is set to 1.

- **<port>**
  
  Phase controlled port number. If unspecified, value is set to 1. To make settings for ports that are not simple numbers, use the [src] argument.

- **<bool>**
  
  Phase correction array state.

  - ON (1) Apply phase correction offset array.
  - OFF(0) Do NOT apply phase correction offset array.

- **[src]**
  

  While this argument can be used to make settings for ALL ports, it is designed to access ports such as an external source, true mode balanced port, or one of the Source outputs on the 2-port PNA-X model with multiple sources such as "Port 1 Src2". Otherwise, the <port> argument performs the same function. If both arguments are specified, [src] takes priority.
Use `SOUR:CAT?` to return a list of valid port names.

**Examples**

```plaintext
SOUR:PHAS2:CORR 1
source2:phase:correction:state OFF,"Port 1 Src2"
```

**Query Syntax**

```
SOURce<ch>:PHASe<port>:CORRection[:STATe]? [src]
```

**Return Type**

Boolean

**Default**

OFF

---

**SOURce<ch>:PHASe<port>:EXTernal:CATalog?**

**Applicable Models:** N522xB, N524xB

*(Read-only)* Returns the available internal ports that the external port can be set to. This command is only intended to be executed for external sources. The command will execute if the port is not an external source but does not do anything meaningful.

**Parameters**

- `<ch>`
  
  Channel number of phase control measurement. If unspecified, value is set to 1.

- `<port>`
  
  External port number. If unspecified, value is set to 1. To make settings for ports that are not simple numbers, use the `[src]` argument.

- `[src]`
  

  While this argument can be used to make settings for ALL ports, it is designed to access ports such as an external source, true mode balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model such as "Port 1 Src2". Otherwise, the `<port>` argument performs the same function. If both arguments are specified, `[src]` takes priority.

  Use `SOUR:CAT?` to return a list of valid port names.

**Examples**

```plaintext
SOUR:PHAS2:EXT:CAT?
source2:phase:external:catalog?
```

**Return Type**

String of comma-separated ports.

**Default**

Not Applicable

---

**SOURce<ch>:PHASe<port>:EXTernal:PORT <num>[,src]**

**Applicable Models:** N522xB, N524xB
Sets and returns the internal port that the external port is routed through. This command is only intended to be executed for external sources. The command will execute if the port is not an external source but does not do anything meaningful.

**Parameters**

- `<ch>`: Channel number of phase control measurement. If unspecified, value is set to 1.
- `<port>`: External port number. If unspecified, value is set to 1. To make settings for ports that are not simple numbers, use the [src] argument.
- `<num>`: Internal port number.

While this argument can be used to make settings for ALL ports, it is designed to access ports such as an external source, true mode balanced port, or one of the Source outputs on the 2-port PNA-X model with multiple sources such as "Port 1 Src2". Otherwise, the `<port>` argument performs the same function. If both arguments are specified, [src] takes priority.

Use SOUR:CAT? to return a list of valid port names.

**Examples**

The following sets source port "Port 1 Src2" on channel 2 to use "Port 1" for the measurement
SOUR2:PHAS:EXT:PORT 1,"PORT 1 Src2"

The following sets source port 2 on channel 1 to use Port 1 for the measurement
source:phas2:external:port 1

**Query Syntax**

SOURce<ch>:PHASe<port>:EXTernal:PORT? [src]

**Return Type**

Character

**Default**

3

---

SOURce<ch>:PHAS<port>[:FIXed] <num>[,src]

Applicable Models: N522xB, N524xB

(Read-Write) Write and read the fixed phase value. Must not be in logarithmic sweep.

**Parameters**

- `<ch>`: Channel number of phase control measurement. If unspecified, value is set to 1.
Phase controlled port number. If unspecified, value is set to 1. To make settings for ports that are not simple numbers, use the [src] argument.

Phase value in degrees. Choose a value between -360 and 360.

While this argument can be used to make settings for ALL ports, it is designed to access ports such as an external source, true mode balanced port, or one of the Source outputs on the 2-port PNA-X model with multiple sources such as "Port 1 Src2". Otherwise, the <port> argument performs the same function. If both arguments are specified, [src] takes priority.

Use SOUR:CAT? to return a list of valid port names.

Examples

SOUR:PHAS2 60
source2:phase:fixed 120,"Port 1 Src2"

Query Syntax

SOURce<ch>:PHASe<port>[:FIXed]? [src]

Return Type

Numeric

Default

0 degrees

SOURce<ch>:PHASE<port>:MODE:CATalog?

Applicable Models: N522xB, N524xB

(Read-only) Returns the available phase control modes for the specified port.

Parameters

<ch> Channel number of phase control measurement. If unspecified, value is set to 1.

<port> Phase controlled port number. If unspecified, value is set to 1. To make settings for ports that are not simple numbers, use the [src] argument.

While this argument can be used to make settings for ALL ports, it is designed to access ports such as an external source, true mode balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model such as "Port 1 Src2". Otherwise, the <port> argument performs the same function. If both arguments are specified, [src] takes priority.

Use SOUR:CAT? to return a list of valid port names.
### Examples

```
SOUR:PHAS2:MODE:CAT?
source2:phase:mode:catalog?
```

### Return Type

String of comma-separated phase control modes.

For example, OFF, OPENloop, PARameter, REFerence.

### Default

Not Applicable

---

**SOURce<ch>:PHASe<port>:MODE[:VALue] <char>[,src]**

Applicable Models: N522xB, N524xB

(Read-Write) Sets and returns the Phase Control mode.

#### Parameters

- `<ch>`: Channel number of phase control measurement. If unspecified, value is set to 1.
- `<port>`: Phase controlled port number. If unspecified, value is set to 1. To make settings for ports that are not simple numbers, use the [src] argument.
- `<char>`: Choose from:
  - OFF - Turn phase control OFF
  - OPENloop - Sets a raw phase value for either swept phase or fixed phase, but no receivers are used to control the phase.
  - PARameter - Sets and controls the phase of the signal at <port>.
  - REFerence (Read-only) - Use SOUR:PHAS:PARarameter to set.

While this argument can be used to make settings for ALL ports, it is designed to access ports such as an external source, true mode balanced port, or one of the Source outputs on the 2-port PNA-X model with multiple sources such as "Port 1 Src2". Otherwise, the `<port>` argument performs the same function. If both arguments are specified, [src] takes priority.

Use SOUR:CAT? to return a list of valid port names.

#### Examples

```
SOUR:PHAS2:MODE PAR
source2:phase:mode:value off
```

#### Query Syntax

```
SOURce<ch>:PHASe<port>:MODE[:VALue]? [src]
```

#### Return Type

Character

#### Default

OFF

---

**SOURce<ch>:PHASE<port>:PARameter <string>[,src]**
Applicable Models: N522xB, N524xB

(Read-Write) Write and read the ratioed receivers (parameter) to use for phase control.

Parameters

- `<ch>`
  Channel number of phase control measurement. If unspecified, value is set to 1.

- `<port>`
  Phase controlled port number. If unspecified, value is set to 1. To make settings for ports that are not simple numbers, use the `[src]` argument.

- `<string>`
  Ratioed parameter. Choose any two VNA physical receivers. Use either standard receiver notation ("R/R3") or logical receiver notation ("a1/a3"). Separate the two receiver names by a forward slash '/'. For example: "a3/a1".

- `[src]`

  While this argument can be used to make settings for ALL ports, it is designed to access ports such as an external source, true mode balanced port, or one of the Source outputs on the 2-port PNA-X model with multiple sources such as "Port 1 Src2". Otherwise, the `<port>` argument performs the same function. If both arguments are specified, `[src]` takes priority.

  Use SOUR:CAT? to return a list of valid port names.

Examples

- SOUR:PHAS2:PAR: "a3/a1", "Port 3"
- source2:phase:parameter "a3/a1", "Port 3"

Query Syntax

- SOURce<ch>:PHASe<port>:PARameter?
  Returns the ratioed parameter name.

Return Type

- String

Default

- "a1/b1"

SOURce<ch>:PHASe<port>:PARameter:CATalog?

Applicable Models: N522xB, N524xB

(Read-only) Returns the available parameters that are set using the SOURce:PHASe:PARameter command. This command applies to phase control only. This command does not apply to DIQ. DIQ does not restrict the parameters that can be set. It shows an empty string if nothing is settable. Usually this means that the reference port has not been set yet. SOUR:PHAS:REF:PORT <port> needs to be set first.

For an external source, SOURce:PHASe:EXTernal:PORT <port> should be set first, then the reference port, then the control parameter. But I try to figure out the relevant information, if the external port or reference is not set.
Parameters

<ch> Channel number of phase control measurement. If unspecified, value is set to 1.

<port> Phase controlled port number. If unspecified, value is set to 1. To make settings for ports that are not simple numbers, use the [src] argument.

While this argument can be used to make settings for ALL ports, it is designed to access ports such as an external source, true mode balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model such as "Port 1 Src2". Otherwise, the <port> argument performs the same function. If both arguments are specified, [src] takes priority.

Use SOUR:CAT? to return a list of valid port names.

Examples

SOUR:PHAS2:REFCAT?

source2:phase:reference:catalog?

Return Type

String of comma-separated phase control parameters.

Default Not Applicable

SOURce<ch>:PHAS<port>:PARameter:MODE <char>[,src]

Applicable Models: N522xB, N524xB
(Read-Write) Sets and returns the Phase Control mode.

Parameters

<ch> Channel number of phase control measurement. If unspecified, value is set to 1.

<port> Phase controlled port number. If unspecified, value is set to 1. To make settings for ports that are not simple numbers, use the [src] argument.

<char> Choose from:
OFF - Turn phase control OFF
OPENloop - Sets a raw phase value for either swept phase or fixed phase, but no receivers are used to control the phase.
PARameter - Sets and controls the phase of the signal at <port>.
REFerence (Read-only) - Use SOUR:PHAS:PARameter to set.

While this argument can be used to make settings for ALL ports, it is designed to access ports such as an external source, true mode balanced port, or one of the Source outputs on the 2-port PNA-X model with multiple sources such as "Port 1 Src2". Otherwise, the
<port> argument performs the same function. If both arguments are specified, [src] takes priority.

Use **SOUR:CAT?** to return a list of valid port names.

### Return Type

Character

### Default

OFF

---

**SOURce**:<ch>:**PHASE**:<port>:**PARameter**:**MODE**:**CATalog**?

**Applicable Models:** N522xB, N524xB

**Parameters**

- **<ch>**
  - Channel number of phase control measurement. If unspecified, value is set to 1.

- **<port>**
  - Phase controlled port number. If unspecified, value is set to 1. To make settings for ports that are not simple numbers, use the [src] argument.

- **[src]**

While this argument can be used to make settings for ALL ports, it is designed to access ports such as an **external source**, **true mode balanced port**, or one of the **Source 2 outputs** on the 2-port 2-source PNA-X model such as "Port 1 Src2". Otherwise, the <port> argument performs the same function. If both arguments are specified, [src] takes priority.

Use **SOUR:CAT?** to return a list of valid port names.

### Examples

<table>
<thead>
<tr>
<th>Query Syntax</th>
<th>Return Type</th>
<th>Default</th>
</tr>
</thead>
</table>
| **SOUR:PHAS2:PAR:MODE:CAT?**

For example, OFF, OPENloop, PARameter, REFerence.
Applicable Models: N522xB, N524xB

(Read-Write) Sets and returns the reference port for the Phase Control measurement.

Parameters

<ch>
Channel number of phase control measurement. If unspecified, value is set to 1.

<port>
Phase controlled port number. If unspecified, value is set to 1. To make settings for ports that are not simple numbers, use the [src] argument.

<num>
Reference port number. ONLY specific ports are available to be a reference for each source port. Learn more.

<src>

While this argument can be used to make settings for ALL ports, it is designed to access ports such as an external source, true mode balanced port, or one of the Source outputs on the 2-port PNA-X model with multiple sources such as "Port 1 Src2". Otherwise, the <port> argument performs the same function. If both arguments are specified, [src] takes priority.

Use SOUR:CAT? to return a list of valid port names.

Examples

The following sets source port "Port 1 Src2" on channel 2 to use "Port 1" as the phase reference
SOUR2:PHAS:PAR:PORT 1,"PORT 1 Src2"

The following sets source port 2 on channel 1 to use Port 1 as the phase reference
source:phas2:PAR:PORT 1

Query Syntax

SOURce<ch>:PHASe<port>:PARameter:PORT? [src]

Return Type

Character

Default

3

SOURce<ch>:PHASe<port>:PARameter[:VALue] <string>[,src]

Applicable Models: N522xB, N524xB

(Read-Write) Sets and returns the ratioed receivers (parameter) to use for phase control.

Parameters

<ch>
Channel number of phase control measurement. If unspecified, value is set to 1.
Phase controlled port number. If unspecified, value is set to 1. To make settings for ports that are not simple numbers, use the [src] argument.

Ratioed parameter. Choose any two VNA physical receivers. Use either standard receiver notation ("R/R3") or logical receiver notation ("a1/a3").

Separate the two receiver names by a forward slash '/'. For example: "a3/a1".

**Note:** Phase control does not allow any two VNA physical receivers. Can only choose from an option of ax/ay, ay/ax, or ax/bx, where x is the control port and y is the reference port. DIQ application allows any two VNA physical receivers.

While this argument can be used to make settings for ALL ports, it is designed to access ports such as an external source, true mode balanced port, or one of the Source outputs on the 2-port PNA-X model with multiple sources such as "Port 1 Src2". Otherwise, the <port> argument performs the same function. If both arguments are specified, [src] takes priority.

Use SOUR:CAT? to return a list of valid port names.

**Examples**

```
SOUR:PHAS2:PAR: "a3/a1","Port 3"
source2:phase:parameter:value "a3/a1","Port 3"
```

**Query Syntax**

```
SOURce<ch>:PHASe<port>:PARameter[:VALue]?
```

Returns the ratioed parameter name.

**Return Type**

String

**Default**

"a1/b1"

---

**SOURce<ch>:PHASe<port>:POFFset:CORRection:DATA <data>[,src]**

Applicable Models: N522xB, N524xB

*(Read-Write)* Write and read a ratio amplitude offset array. This allows the setting of arbitrary impedance, which is used for active load applications.

**Parameters**

- `<ch>`: Channel number of phase control measurement. If unspecified, value is set to 1.
- `<port>`: Phase controlled port number. If unspecified, value is set to 1. To make settings for ports that are not simple numbers, use the [src] argument.
- `<num>`: Ratio amplitude offset data array.

While this argument can be used to make settings for ALL ports, it is designed to access ports such as an external source, true mode balanced port, or one of the Source outputs on the 2-port PNA-X model with multiple sources such as "Port 1 Src2". Otherwise, the <port> argument performs the same function. If both arguments are specified, [src] takes priority.

Use **SOUR:CAT?** to return a list of valid port names.

**Default**

OFF

---

SOURce<ch>:PHASe<port>:POFFset:FIXed <num>[,src]

**Applicable Models:** N522xB, N524xB

*(Read-Write)* Write and read the fixed power ratioed value. Must NOT be in power sweep to use this value during phase control.

**Parameters**

<ch> Channel number of phase control measurement. If unspecified, value is set to 1.

<port> Phase controlled port number. If unspecified, value is set to 1. To make settings for ports that are not simple numbers, use the [src] argument.

<num> Fixed power ratio value within the allowable range of the VNA.

While this argument can be used to make settings for ALL ports, it is designed to access ports such as an external source, true mode balanced port, or one of the Source outputs on the 2-port PNA-X model with multiple sources such as "Port 1 Src2". Otherwise, the <port> argument performs the same function. If both arguments are specified, [src] takes priority.

Use SOUR:CAT? to return a list of valid port names.

**Examples**

SOUR:PHAS2:POFF:FIX 1

source2:phase:poffset:fixed -5,"Port 1 Src2"

**Query Syntax**

SOURce<ch>:PHASe<port>:POFFset:FIXed? [src]

**Return Type**

Numeric

**Default**

0 dBc

---

SOURce<ch>:PHASe<port>:POFFset:STARt <num>[,src]

**Applicable Models:** N522xB, N524xB

*(Read-Write)* Write and read the start power ratioed value. Must also send SENS:SWE:TYPE POWER to put the analyzer into power sweep mode.
### Parameters

- `<ch>`
  - Channel number of phase control measurement. If unspecified, value is set to 1.

- `<port>`
  - Phase controlled port number. If unspecified, value is set to 1. To make settings for ports that are not simple numbers, use the `[src]` argument.

- `<num>`
  - Start power ratio value in dBc. Must be within the allowable range of the VNA

- `[src]`

  While this argument can be used to make settings for ALL ports, it is designed to access ports such as an external source, true mode balanced port, or one of the Source outputs on the 2-port PNA-X model with multiple sources such as "Port 1 Src2". Otherwise, the `<port>` argument performs the same function. If both arguments are specified, `[src]` takes priority.

  Use `SOUR:CAT?` to return a list of valid port names.

### Examples

```
SOUR:PHAS2:POFF:STAR 0
source2:phase:poffset:start -5,"Port 1 Src2"
```

### Query Syntax

```
SOURce<ch>:PHASE<port>:POFFset:STARt? [src]
```

### Return Type

Numeric

### Default

0 dBc

---

**`SOURce<ch>:PHASE<port>:POFFset:STOP <num>[,src]`**

Applicable Models: N522xB, N524xB

(Read-Write) Write and read the start power ratioed value. Must also send `SENS:SWE:TYPE POWer` to put the analyzer into power sweep mode.

### Parameters

- `<ch>`
  - Channel number of phase control measurement. If unspecified, value is set to 1.

- `<port>`
  - Phase controlled port number. If unspecified, value is set to 1. To make settings for ports that are not simple numbers, use the `[src]` argument.

- `<num>`
  - Stop power ratio value in dBc. Must be within the allowable range of the VNA

- `[src]`
While this argument can be used to make settings for ALL ports, it is designed to access ports such as an external source, true mode balanced port, or one of the Source outputs on the 2-port PNA-X model with multiple sources such as "Port 1 Src2". Otherwise, the <port> argument performs the same function. If both arguments are specified, [src] takes priority.

Use SOUR:CAT? to return a list of valid port names.

**Examples**

```
SOUR:PHAS2:POFF:STOP 0
source2:phase:poffset:stop -5,"Port 1 Src2"
```

**Query Syntax**

```SOURce<ch>:PHASe<port>:POFFset:STOP? [src]```

**Return Type**

Numeric

**Default**

0 dBc

---

**SOURce<ch>:PHASE<port>:REFERENCE:CATalog?**

Applicable Models: N522xB, N524xB

(Read-only) Returns the available ports that can be used as phase control reference ports for the phase controlled port.

**Parameters**

- `<ch>`
  - Channel number of phase control measurement. If unspecified, value is set to 1.

- `<port>`
  - Phase controlled port number. If unspecified, value is set to 1. To make settings for ports that are not simple numbers, use the [src] argument.

- [src]

While this argument can be used to make settings for ALL ports, it is designed to access ports such as an external source, true mode balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model such as "Port 1 Src2". Otherwise, the <port> argument performs the same function. If both arguments are specified, [src] takes priority.

Use SOUR:CAT? to return a list of valid port names.

**Examples**

```
SOUR:PHAS2:REF:CAT?
source2:phase:reference:catalog?
```

**Return Type**

String of comma-separated phase control reference ports.

**Default**

Not Applicable
SOURce<ch>:PHASe<port>:REFerence:PORT <num>[,src]

Applicable Models: N522xB, N524xB

(Read-Write) Sets and returns the reference port for the Phase Control measurement.

**Parameters**

- `<ch>`: Channel number of phase control measurement. If unspecified, value is set to 1.
- `<port>`: Phase controlled port number. If unspecified, value is set to 1. To make settings for ports that are not simple numbers, use the [src] argument.
- `<num>`: Reference port number. ONLY specific ports are available to be a reference for each source port. Learn more. Use the SOURce:PHASE:REFerence:CATalog? command to see which ports are available.

While this argument can be used to make settings for ALL ports, it is designed to access ports such as an external source, true mode balanced port, or one of the Source outputs on the 2-port PNA-X model with multiple sources such as "Port 1 Src2". Otherwise, the <port> argument performs the same function. If both arguments are specified, [src] takes priority.

Use SOUR:CAT? to return a list of valid port names.

**Examples**

The following sets source port "Port 1 Src2" on channel 2 to use "Port 1" as the phase reference.
SOUR2:PHAS:REF:PORT 1,"PORT 1 Src2"

The following sets source port 2 on channel 1 to use Port 1 as the phase reference.
source:phas2:REF:PORT 1

**Query Syntax**

SOURce<ch>:PHASe<port>:REFerence:PORT? [src]

**Return Type**

Character

**Default**

3

-------------------

SOURce<ch>:PHASe<port>:STARt <num>[,src]

Applicable Models: N522xB, N524xB

(Read-Write) Write and read the start value of phase sweep. Must also send SENS:SWE:TYPE PHASE to put the analyzer into phase sweep mode.

**Parameters**

- `<ch>`
- `<port>`
- `<num>`
- `[src]`
<ch>
Channel number of phase control measurement. If unspecified, value is set to 1.

<port>
Phase controlled port number. If unspecified, value is set to 1. To make settings for ports that are not simple numbers, use the [src] argument.

<num>
Start phase value in degrees. Choose a value between -360 and 360.

[src]

While this argument can be used to make settings for ALL ports, it is designed to access ports such as an external source, true mode balanced port, or one of the Source outputs on the 2-port PNA-X model with multiple sources such as "Port 1 Src2". Otherwise, the <port> argument performs the same function. If both arguments are specified, [src] takes priority.

Use SOUR:CAT? to return a list of valid port names.

Examples
SOUR:PHAS2:STAR 60

Query Syntax
SOURce<ch>:PHASe<port>:STARt? [src]

Return Type
Numeric

Default
0 degrees

SOURce<ch>:PHASe<port>:STOP <num>[,src]

Applicable Models: N522xB, N524xB
(Read-Write) Write and read the stop value of phase sweep. Must also send SENS:SWE:TYPE PHASE to put the analyzer into phase sweep mode.

Parameters

<ch>
Channel number of phase control measurement. If unspecified, value is set to 1.

<port>
Phase controlled port number. If unspecified, value is set to 1. To make settings for ports that are not simple numbers, use the [src] argument.

<num>
Stop phase value in degrees. Choose a value between -360 and 360.

[src]

While this argument can be used to make settings for ALL ports, it is designed to access ports such as an external source, true mode balanced port, or one of the Source outputs on the 2-port PNA-X model with multiple sources such as "Port 1 Src2". Otherwise, the
<port> argument performs the same function. If both arguments are specified, [src] takes priority.

Use SOUR:CAT? to return a list of valid port names.

### Examples

```plaintext
SOUR:PHAS2:STOP 60
source2:phase:stop 120,"Port 1 Src2"
```

### Query Syntax

SOURce<ch>:PHASe<port>:STOP? [src]

### Return Type

### SOURce<ch>:POWer<port>:ALC[:MODE]:RECeiver:ACQuisition:MODE <char>, [src]

**Applicable Models:** N522xB, N523xB, N524xB

*(Read-Write)* Sets all ports to pre-sweep or point leveling mode for the specified channel. A channel cannot be set to both pre-sweep and point leveling. For point leveling, the source power is adjusted per point until the leveling receiver reports that the power is within tolerance (or the maximum iteration setting is reached). When the iteration is done, it moves immediately to the next point. This function is enabled using the SOURce:POWer:ALC[:MODE]:RECeiver:ITERation:ENABle command.

Learn more about Receiver Leveling

**Parameters**

- `<ch>`
  - *Channel number to be receiver leveled. If unspecified, value is set to 1*

- `<port>`
  - *Source port being used for Receiver Leveling. If unspecified, value is set to 1. To make settings for ports that are not simple numbers, use the [src] argument.*

- `<char>`
  - *Acquisition mode. Choose from:*
    - PRESweep - Leveling sweeps are performed in the background (not visible) before every measurement sweep to measure and apply source correction data.
    - POINt - Source power is adjusted per point.

- `[src]`

While this argument can be used to make settings for ALL ports, it is designed to access ports such as an external source, true mode balanced port, or one of the Source outputs on the 2-port PNA-X model with multiple sources such as "Port 1 Src2". Otherwise, the
<port> argument performs the same function. If both arguments are specified, [src] takes priority.

### Examples

```
SOUR:POW:ALC:REC:ACQ:MODE PRES
source2:power2:alc:mode:receiver:acquisition:mode presweep
```

See ReceiverLeveling example

### Query Syntax

```
SOURce<ch>:POWer<port>:ALC[:MODE]:RECeiver:ACQuisition:MODE? [src]
```

### Return Type

Character

### Default

PRESweep

---

**SOURce<ch>:POWer<port>:ALC[:MODE]:RECeiver:FAST <bool>, [src]**

**Applicable Models:** N522xB, N523xB, N524xB

**(Read-Write)** Sets and returns the state of a separate IFBW setting for leveling sweeps. ON allows a higher (faster) IFBW than the measurement sweep. It also causes leveling sweeps to be noisier.

Learn more about Receiver Leveling

### Parameters

**<ch>**

Channel number to be receiver leveled. If unspecified, value is set to 1

**<port>**

Source port being used for Receiver Leveling. If unspecified, value is set to 1. To make settings for ports that are not simple numbers, use the [src] argument.

**<bool>**

Separate IFBW setting state.

ON or 1 - Separate IFBW setting. Specify IFBW using SOUR:POW:ALC:MODE:REC:IFBW

OFF or 0 - Same IFBW as the measurement sweep. Specify IFBW using Sens:BWID

**[src]**

While this argument can be used to make settings for ALL ports, it is designed to access ports such as an external source, true mode balanced port, or one of the Source outputs on the 2-port PNA-X model with multiple sources such as "Port 1 Src2". Otherwise, the <port> argument performs the same function. If both arguments are specified, [src] takes priority.

### Examples

```
SOUR:POW:ALC:REC:FAST 1
source2:power2:alc:mode:receiver:fast off
source:power:alc:mode:receiver:fast off,"Port 1 Src2"
```
See ReceiverLeveling example

**SOURce<ch>:POWer<port>:ALC[:MODE]:RECeiver:FTYPe <char>, [src]**

Applicable Models: N522xB, N523xB, N524xB

*(Read-Write)* Sets and returns the frequency range to use for receiver leveling. On the user interface, this is the "Receiver frequency is determined by:" setting.

Learn more about Receiver Leveling

**Parameters**

- `<ch>`
  - Channel number to be receiver leveled. If unspecified, value is set to 1

- `<port>`
  - Source port being used for Receiver Leveling. If unspecified, value is set to 1. To make settings for ports that are not simple numbers, use the [src] argument.

- `<char>`
  - Frequency range. Choose from:
    - AUTO - always uses the frequency range that is assigned to the measurement receiver.
    - INPut - Mixer/Converter input frequency range.
    - OUTPut - Mixer/Converter input frequency range.
    - RECeiver - FOM Receiver frequency range.
    - SOURce - FOM Source frequency range

- [src]

While this argument can be used to make settings for ALL ports, it is designed to access ports such as an external source, true mode balanced port, or one of the Source outputs on the 2-port PNA-X model with multiple sources such as "Port 1 Src2". Otherwise, the `<port>` argument performs the same function. If both arguments are specified, [src] takes priority.

**Examples**

- `SOUR:POW:ALC:REC:FTYP AUTO`
- `source2:power2:alc:mode:receiver:ftype input`
- `source:power:alc:mode:receiver:ftype output,"Port 1 Src2"`

See ReceiverLeveling example
SOURce<ch>:POWer<port>:ALC[:MODE]:RECeiver:IFBW <value>, [src]

Applicable Models: N522xB, N523xB, N524xB

(Read-Write) Sets and returns the IFBW to be used for leveling sweeps. Enable separate IFBW for leveling sweeps using SOUR:POW:ALC:MODE:REC:FAST 1

Learn more about Receiver Leveling

Parameters

<ch> Channel number to be receiver leveled. If unspecified, value is set to 1

<port> Source port being used for Receiver Leveling. If unspecified, value is set to 1. To make settings for ports that are not simple numbers, use the [src] argument.

<value> IFBW for leveling sweeps in Hz. The list of valid IF Bandwidths is different depending on the VNA model. (Click to see the lists.) If an invalid number is specified, the analyzer will round up to the closest valid number.

This parameter supports MIN and MAX as arguments. Learn more.

While this argument can be used to make settings for ALL ports, it is designed to access ports such as an external source, true mode balanced port, or one of the Source outputs on the 2-port PNA-X model with multiple sources such as "Port 1 Src2". Otherwise, the <port> argument performs the same function. If both arguments are specified, [src] takes priority.

Examples

SOUR:POW:ALC:REC:IFBW 100E3
source2:power2:alc:mode:receiver:ifbw 100khz
source:power:alc:mode:receiver:ifbw 70e3,"Port 1 Src2"

See ReceiverLeveling example

Query Syntax SOURce<ch>:POWer<port>:ALC[:MODE]:RECeiver:IFBW? [src]

Return Type Numeric

Default 100 kHz
SOURce<ch>:POWer<port>:ALC[:MODE]:RECeiver:ITERation:ENABle <bool>, [src]

Applicable Models: N522xB, N523xB, N524xB

(Read-Write) Enables or disables the receiver leveling maximum iteration search function set using the SOURce:POWer:ALC[:MODE]:RECeiver:ACQuisition:MODE. The maximum iterations are set using the SOURce:POWer:ALC[:MODE]:RECeiver:ITERation:VALue command.

Learn more about Receiver Leveling

Parameters

- **<ch>**
  - Channel number to be receiver leveled. If unspecified, value is set to 1

- **<port>**
  - Source port being used for Receiver Leveling. If unspecified, value is set to 1. To make settings for ports that are not simple numbers, use the [src] argument.

- **<bool>**
  - Safe mode state.
    - ON or 1 - Enable receiver leveling maximum iteration search.
    - OFF or 0 - Disable receiver leveling maximum iteration search. The prior value for maximum iterations is retained.

- **[src]**

  While this argument can be used to make settings for ALL ports, it is designed to access ports such as an external source, true mode balanced port, or one of the Source outputs on the 2-port PNA-X model with multiple sources such as "Port 1 Src2". Otherwise, the <port> argument performs the same function. If both arguments are specified, [src] takes priority.

Examples

```
SOUR:POW:ALC:REC:ITER:ENAB 1
source2:power2:alc:mode:receiver:iteration:enable on
source:power:alc:mode:receiver:iteration:enable off,"Port 1 Src2"
```

See ReceiverLeveling example

Query Syntax

SOURce<ch>:POWer<port>:ALC[:MODE]:RECeiver:ITERation:VALue <value>, [src]

Return Type

Boolean

Default

ON
Applicable Models: N522xB, N523xB, N524xB

(Read-Write) Sets and returns the maximum iterations to be used in order to achieve the tolerance setting.

Learn more about Receiver Leveling

Parameters

<ch>  
Channel number to be receiver leveled. If unspecified, value is set to 1

<port>  
Source port being used for Receiver Leveling. If unspecified, value is set to 1. To make settings for ports that are not simple numbers, use the [src] argument.

<value>  
Max iterations. Choose a value 0 to 50.

Note: Entering a value of 0 is allowed and sets the receiver leveling to Prior-Sweep mode. Learn more.

[src]  

While this argument can be used to make settings for ALL ports, it is designed to access ports such as an external source, true mode balanced port, or one of the Source outputs on the 2-port PNA-X model with multiple sources such as "Port 1 Src2". Otherwise, the <port> argument performs the same function. If both arguments are specified, [src] takes priority.

Examples

source2:power2:alc:mode:receiver:iteration:value 10  
source:power:alc:mode:receiver:iteration:value 7,"Port 1 Src2"

See ReceiverLeveling example

Query Syntax

SOURce<ch>:POWer<port>:ALC[:MODE]:RECeiver:ITERation:VALue? [src]

Return Type

Numeric

Default

10

SOURce<ch>:POWer<port>:ALC[:MODE]:RECeiver:LSPC <bool>, [src]

Applicable Models: N522xB, N523xB, N524xB

(Read-Write) Sets and returns the state of Use Last Result for Source Power Cal. When Leveling Mode is switched back to Internal, this feature turns Source Power Cal correction ON using the latest receiver leveling correction data.

Learn more about Receiver Leveling
Parameters

<ch>  
Channel number to be receiver leveled. If unspecified, value is set to 1

<port>  
Source port being used for Receiver Leveling. If unspecified, value is set to 1. To make settings for ports that are not simple numbers, use the [src] argument.

<bool>  
State of Use Last Result for Source Power Cal.
ON or 1 - When Leveling Mode is switched back to Internal, Source Power Cal correction is turned ON using the latest receiver leveling correction data.
OFF or 0 - When Leveling Mode is switched back to Internal, Source Power Cal correction is NOT turned ON.

[src]  

While this argument can be used to make settings for ALL ports, it is designed to access ports such as an external source, true mode balanced port, or one of the Source outputs on the 2-port PNA-X model with multiple sources such as "Port 1 Src2". Otherwise, the <port> argument performs the same function. If both arguments are specified, [src] takes priority.

Examples
SOUR:POW:ALC:REC:LSPC 1
source2:power2:alc:mode:receiver:lspc off
source:power:alc:mode:receiver:lspc off,"Port 1 Src2"

See ReceiverLeveling example

Query Syntax
SOURce<ch>:POWer<port>:ALC[:MODE]:RECeiver:LSPC? [src]

Return Type
Boolean

Default
OFF

SOURce<ch>:POWer<port>:ALC[:MODE]:RECeiver:MODulation:APERture:OFFSet <value>, [src]

Applicable Models: N524xB with S93070xB, and/or N522xB, N523xB, N524xB with S9x09xA/B, S9x090A/B, M980xA/P50xxA with 090/190 + S9x090B and/or S95070xA/B (M980xA only)

(Read-Write) Sets and returns the offset of the frequency aperture used to measure the signal power. Since the ideal modulation signal is known, the total power is calculated from this value. The SOURce:POWer:ALC:MODE:RECeiver:MODulation:APERture:STATe must be set to ON to enable this setting.

Learn more about Receiver Leveling

Parameters
Channel number to be receiver leveled. If unspecified, value is set to 1

Source port being used for Receiver Leveling. If unspecified, value is set to 1. To make settings for ports that are not simple numbers, use the [src] argument.

Receiver leveling aperture offset in Hz.

While this argument can be used to make settings for ALL ports, it is designed to access ports such as an external source, true mode balanced port, or one of the Source outputs on the 2-port PNA-X model with multiple sources such as "Port 1 Src2". Otherwise, the <port> argument performs the same function. If both arguments are specified, [src] takes priority.

Examples

Query Syntax

SOURce<ch>:POWer<port>:ALC[:MODE]:RECeiver:MODulation:APERture:OFFSet? [src]

Return Type

Numeric

Default

0

SOURce<ch>:POWer<port>:ALC[:MODE]:RECeiver:MODulation:APERture:SPAN <value>, [src]

Applicable Models: N524xB with S93070xB, and/or N522xB, N523xB, N524xB with S9x09xxA/B, S9x090A/B, M980xA/P50xxA with 090/190 + S9x090B and/or S95070xA/B (M980xA only)

(Read-Write) Sets and returns the span of the frequency aperture used to measure the signal power. Since the ideal modulation signal is known, the total power is calculated from this value. The SOURce:POWer:ALC:MODE:RECeiver:MODulation:APERture:STATe must be set to ON to enable this setting.

Learn more about Receiver Leveling

Parameters

<ch>

Channel number to be receiver leveled. If unspecified, value is set to 1

<port>

Source port being used for Receiver Leveling. If unspecified, value is set to 1. To make settings for ports that are not simple numbers, use the [src] argument.

<value>

Receiver leveling aperture span in Hz.

[src]

While this argument can be used to make settings for ALL ports, it is designed to access ports such as an external source, true mode balanced port, or one of the Source outputs on the 2-port PNA-X model with multiple sources such as "Port 1 Src2". Otherwise, the <port> argument performs the same function. If both arguments are specified, [src] takes priority.

**Examples**

source2:power2:alc:mode:receiver:modulation:aperture:span
10e6,"MXG_Vector"

**Query Syntax**

SOURce<ch>:POWer<port>:ALC[:MODE]:RECeiver:MODulation:APERture:SPAN? [src]

**Return Type**

Numeric

**Default**

10e6

SOURce<ch>:POWer<port>:ALC[:MODE]:RECeiver:MODulation:APERture[:STATe] <bool>, [src]

Applicable Models: N524xB with S93070xB, and/or N522xB, N523xB, N524xB with S9x09xxA/B, S9x090A/B, M980xA/P50xxA with 090/190 + S9x090B and/or S95070xA/B (M980xA only)

*(Read-Write)* Sets and returns the state of the receiver leveling aperture settings for the specified source for Modulation Distortion measurements. Enabling the aperture settings will measure the power more quickly by reducing the span of the measurement. Enter the span and offset of the frequency aperture used to measure the signal power. Since the ideal modulation signal is known, the total power is calculated from this value.

**Learn more about Receiver Leveling**

**Parameters**

- `<ch>`
  Channel number to be receiver leveled. If unspecified, value is set to 1

- `<port>`
  Source port being used for Receiver Leveling. If unspecified, value is set to 1. To make settings for ports that are not simple numbers, use the [src] argument.

- `<bool>`
  State of receiver leveling aperture settings.
  ON or 1 - Enable span and offset aperture settings.
  OFF or 0 - Disable span and offset aperture settings.

- `[src]`

While this argument can be used to make settings for ALL ports, it is designed to access ports such as an external source, true mode balanced port, or one of the Source outputs on the 2-port PNA-X model with multiple sources such as "Port 1 Src2". Otherwise, the
<port> argument performs the same function. If both arguments are specified, [src] takes priority.

**Examples**

```
SOUR:POW:ALC:REC:MOD:APER 1
source2:power2:alc:mode:receiver:modulation:aperture:state 1,"MXG_Vector"
```

**Query Syntax**

```
SOURce<ch>:POWer<port>:ALC[:MODE]:RECeiver:MODulation:APERture[:STATe]? [src]
```

**Return Type**

Boolean

**Default**

OFF

---

**SOURce<ch>:POWer<port>:ALC[:MODE]:RECeiver:MODulation:BANDwidth:NOISe <value>, [src]**

Applicable Models: N524xB with S93070xB, and/or N522xB, N523xB, N524xB with S9x09xxA/B, S9x090A/B, M980xA/P50xxA with 090/190 + S9x090B and/or S95070xA/B (M980xA only)

*(Read-Write)* Sets and returns the receiver noise bandwidth value for the specified source for Modulation Distortion measurements. Noise bandwidth is equal to the Resolution bandwidth divided by the Vector Average factor. The `SOURce:POWer:ALC:MODE:RECeiver:FAST` command must be set to ON to enable this setting.

Learn more about Receiver Leveling

**Parameters**

- `<ch>`
  - Channel number to be receiver leveled. If unspecified, value is set to 1

- `<port>`
  - Source port being used for Receiver Leveling. If unspecified, value is set to 1. To make settings for ports that are not simple numbers, use the [src] argument.

- `<value>`
  - Noise bandwidth value in Hz.

- `[src]`

While this argument can be used to make settings for ALL ports, it is designed to access ports such as an external source, true mode balanced port, or one of the Source outputs on the 2-port PNA-X model with multiple sources such as "Port 1 Src2". Otherwise, the `<port>` argument performs the same function. If both arguments are specified, [src] takes priority.

**Examples**

```
SOUR:POW:ALC:REC:MOD:BAND:NOIS 1e3
```

**Query Syntax**

```
SOURce<ch>:POWer<port>:ALC[:MODE]:RECeiver:MODulation:BANDwidth:NOISe? [src]
```
SOURce<ch>:POWer<port>:ALC[:MODE]:RECeiver:OFFSet <value>, [src]

Applicable Models: N522xB, N523xB, N524xB

(Read-Write) Sets and returns the power level offset value.

Learn more about Receiver Leveling

Parameters

- `<ch>`: Channel number to be receiver leveled. If unspecified, value is set to 1
- `<port>`: Source port being used for Receiver Leveling. If unspecified, value is set to 1. To make settings for ports that are not simple numbers, use the [src] argument.
- `<value>`: Power level offset in dB. Choose a value between +200 and -200.

While this argument can be used to make settings for ALL ports, it is designed to access ports such as an external source, true mode balanced port, or one of the Source outputs on the 2-port PNA-X model with multiple sources such as "Port 1 Src2". Otherwise, the <port> argument performs the same function. If both arguments are specified, [src] takes priority.

Examples

```
SOUR:POW:ALC:REC:OFFS 10
source2:power2:alc:mode:receiver:offset 5
source:power:alc:mode:receiver:offset 7,"Port 1 Src2"
```

See ReceiverLeveling example

Query Syntax

SOURce<ch>:POWer<port>:ALC[:MODE]:RECeiver:RATio? [src]

Return Type

Numeric

Default

0

SOURce<ch>:POWer<port>:ALC[:MODE]:RECeiver:RATio? [src]

Applicable Models: N522xB, N523xB, N524xB
(Read-only) Returns the receiver ratio to be used with receiver leveling. This receiver ratio parameter is the same as the one set in \texttt{SOUR:PHAS:PARameter}.

Learn more about Receiver Leveling

**Parameters**

- \texttt{<ch>}\hspace{1cm} Channel number to be receiver leveled. If unspecified, value is set to 1
- \texttt{<port>}\hspace{1cm} Source port being used for Receiver Leveling. If unspecified, value is set to 1. To make settings for ports that are not simple numbers, use the [src] argument.
- [src]\hspace{1cm} String. (NOT case sensitive). Source port. Optional. Use \texttt{SOUR:CAT?} to return a list of valid port names.

While this argument can be used to make settings for ALL ports, it is designed to access ports such as an \textit{external source}, \textit{true mode balanced port}, or one of the Source outputs on the 2-port PNA-X model with multiple sources such as "Port 1 Src2". Otherwise, the \texttt{<port>} argument performs the same function. If both arguments are specified, [src] takes priority.

**Examples**

\texttt{SOUR:POW:ALC:REC:RAT 10}
\texttt{source2:power2:alc:mode:receiver:ratio "a1/a3,3"}
\texttt{source:power:alc:mode:receiver:ratio "R1/R3,3","Port 1 Src2"}

See ReceiverLeveling example

**Query Syntax**

\texttt{SOURce<ch>:POWer<port>:ALC[MODE]:RECeiver:RATio? [src]}

Returned is two VNA physical receivers that are controlled by different sources and the port that is 'paired' with \texttt{<port>}. The receivers and paired port are separated by a comma.

**Return Type**\hspace{1cm} String

**Default**\hspace{1cm} "a1/a3,3"

---

\texttt{SOURce<ch>:POWer<port>:ALC[MODE]:RECeiver:REFerence <rec>, [src]}

Applicable Models: N522xB, N523xB, N524xB

(Read-Write) Sets and returns the reference receiver to be used with Receiver Leveling.

Learn more about Receiver Leveling

**Parameters**

- \texttt{<ch>}\hspace{1cm} Channel number to be receiver leveled. If unspecified, value is set to 1
**<port>**

Source port being used for Receiver Leveling. If unspecified, value is set to 1. To make settings for ports that are not simple numbers, use the [src] argument.

**<rec>**

(String) VNA receiver. Choose the VNA physical receiver that works with the source port <port>.

For example: `<port 1> = "R1"

**[src]**

While this argument can be used to make settings for ALL ports, it is designed to access ports such as an external source, true mode balanced port, or one of the Source outputs on the 2-port PNA-X model with multiple sources such as "Port 1 Src2". Otherwise, the <port> argument performs the same function. If both arguments are specified, [src] takes priority.

**Examples**

```
SOUR:POW:ALC:REC:REF 'r1'
source2:power2:alc:mode:receiver:reference 'r2'
source:power:alc:mode:receiver:reference "r1","Port 1 Src2"
'Read the last setting back
source:power:alc:mode:receiver:reference? "Port 1 Src2"
'Returns:
"R1,1"
```

*See ReceiverLeveling example*

**Query Syntax**

`SOURce<ch>:POWer<port>:ALC[:MODE]:RECeiver:REFerence? [src]`

**Return Type**

String - Name of the reference receiver.

**Default**

Not Applicable

---

**SOURce<ch>:POWer<port>:ALC[:MODE]:RECeiver:SAFE[:STATe] <bool>, [src]**

Applicable Models: N522xB, N523xB, N524xB

*(Read-Write)* Sets and returns the state of Safe Mode.

*Learn more about Receiver Leveling*

**Parameters**

**<ch>**

Channel number to be receiver leveled. If unspecified, value is set to 1

**<port>**

Source port being used for Receiver Leveling. If unspecified, value is set to 1. To make settings for ports that are not simple numbers, use the [src] argument.
### <bool>

Safe mode state.

**ON or 1 - Safe mode ON**

**OFF or 0 - Safe mode OFF**

### [src]

While this argument can be used to make settings for ALL ports, it is designed to access ports such as an external source, true mode balanced port, or one of the Source outputs on the 2-port PNA-X model with multiple sources such as "Port 1 Src2". Otherwise, the <port> argument performs the same function. If both arguments are specified, [src] takes priority.

**Examples**

```
SOUR:POW:ALC:REC:SAFE 1
source2:power2:alc:mode:receiver:safe on
source:power:alc:mode:receiver:safe:state off,"Port 1 Src2"
```

*See Receiver Leveling example*

**Query Syntax**

SOURce<ch>:POWer<port>:ALC[:MODE]:RECeiver:SAFE[:STATe]? [src]

**Return Type**

Boolean

**Default**

OFF

---

**SOURce<ch>:POWer<port>:ALC[:MODE]:RECeiver:SAFE:MAX <value>, [src]**

**Applicable Models:** N522xB, N523xB, N524xB

(Read-Write) Sets and returns the maximum power level for Safe Mode.

The MAX/MIN limit is always used regardless of the safe mode state. In addition, the MAX/MIN limit is for port power and related to power offset. If the power offset is not set correctly, the MAX/MIN limit is not correct and it may impact the leveling. Ensure that the power offset in the channel is the same as power offset during calibration. If the exact power offset is not known, choose a limit for source and then it will not be related to power offset.

*Learn more about Receiver Leveling*

**Parameters**

- **<ch>**
  
  Channel number to be receiver leveled. If unspecified, value is set to 1

- **<port>**
  
  Source port being used for Receiver Leveling. If unspecified, value is set to 1. To make settings for ports that are not simple numbers, use the [src] argument.
**Example**

```
SOUR:POW:ALC:REC:SWE:MAX 10
source2:power2:alc:mode:receiver:safe:max 20
source:power:alc:mode:receiver:safe:max 15,"Port 1 Src2"
```

See ReceiverLeveling example

---

### Parameters

- `<ch>`
  - Channel number to be receiver leveled. If unspecified, value is set to 1

- `<port>`
  - Source port being used for Receiver Leveling. If unspecified, value is set to 1. To make settings for ports that are not simple numbers, use the `[src]` argument.

- `<value>`
  - Minimum power level in dB.
**SOURce<ch>:POWer<port>:ALC[:MODE]:RECeiver:SAFE:MIN -50**
source2:power2:alc:mode:receiver:safe:min -80
source:power:alc:mode:receiver:safe:min -40,"Port 1 Src2"

See ReceiverLeveling example

Return Type
Numeric

Default
1 dB

SOURce<ch>:POWer<port>:ALC[:MODE]:RECeiver[:STATe] <bool>, [src]

Applicable Models: N522xB, N523xB, N524xB

(Read-Write) Sets and returns the state of Receiver Leveling for the specified source port.

Learn more about Receiver Leveling

Parameters

<ch>  
Channel number to be receiver leveled. If unspecified, value is set to 1

<port>  
Source port being used for Receiver Leveling. If unspecified, value is set to 1. To make settings for ports that are not simple numbers, use the [src] argument.

<bool>  
Receiver Leveling state.
ON or 1 - Receiver Leveling ON
OFF or 0 - Receiver Leveling OFF

[src]  

While this argument can be used to make settings for ALL ports, it is designed to access ports such as an external source, true mode balanced port, or one of the Source outputs on the 2-port PNA-X model with multiple sources such as "Port 1 Src2". Otherwise, the <port> argument performs the same function. If both arguments are specified, [src] takes priority.

Examples

SOUR:POW:ALC:REC 1
source2:power2:alc:mode:receiver on
source:power:alc:mode:receiver:state off, "Port 1 Src2"

See ReceiverLeveling example

Query Syntax
SOURce<ch>:POWer<port>:ALC[:MODE]:RECeiver[:STATe]? [src]
Return Type: Boolean
Default: OFF

**SOURce<ch>:POWer<port>:ALC[:MODE]:REceiver:TOLerance <value>, [src]**

Applicable Models: N522xB, N523xB, N524xB

(Read-Write) Sets and returns the tolerance value for leveling sweeps.

Learn more about Receiver Leveling

**Parameters**

<ch>  Channel number to be receiver leveled. If unspecified, value is set to 1

<port>  Source port being used for Receiver Leveling. If unspecified, value is set to 1. To make settings for ports that are not simple numbers, use the [src] argument.

<value>  Tolerance level in dB.

While this argument can be used to make settings for ALL ports, it is designed to access ports such as an external source, true mode balanced port, or one of the Source outputs on the 2-port PNA-X model with multiple sources such as "Port 1 Src2". Otherwise, the <port> argument performs the same function. If both arguments are specified, [src] takes priority.

**Examples**

```
SOUR:POW:ALC:REC:TOL .01
source2:power2:alc:mode:receiver:tolerance .5
source:power:alc:mode:receiver:tolerance .2,"Port 1 Src2"
```

See ReceiverLeveling example

**Query Syntax**

SOURce<ch>:POWer<port>:ALC[:MODE]:RECeiver:TOLerance? [src]

**Return Type** Numeric

**Default** .1 dB
Status Keywords SCPI
Status Command Keywords

The following keywords can be appended to the node or nodes that represent the Status register you want to control.

:CONDition?
:ENABLE
:ENABLE?
:EVENT?
:MAP
:NTRansition
:PTRansition

Learn about Status Registers
SCPI Command Tree

:CONDition?
Monitors the conditions as they occur REAL TIME. That is, a condition may occur, and then clear before the condition is read. Reading this register returns a 16-bit decimal weighted number.

:ENABLE <bit>
Enables register bits that will monitored using the service request (SRQ) method. (To use the direct read method, you do not have to enable the bit.)

Default value for STATus:QUEStionable:ENABLE and STATus:OPERation:ENABLE is 0: No bits enabled.

Default value for all other registers :ENABLE <bits> is 32767; ALL BITS ENABLED.

Therefore it is ONLY necessary to send the ENABLE keyword if you want to DISABLE some conditions. For example, to enable ONLY Trace1 (bit 2) of the LIMIT1 register (disable all other traces), send:
STATus:QUEStionable:LIMIT1:ENABLE 4

:ENABLE?
Read the enable register to verify the bits that you enabled. Returns a 16 bit weighted sum of the bits that are enabled.
[:EVENt]?

Query only - This is the Default keyword for most registers. Use it to determine if a condition has occurred. These bits remain set until they are read or otherwise cleared.

---

:MAP <bit>,<error>

 Associates a bit is the User register with an error number. For example

```
STATus:QUESTionable:DEFine:USER2:MAP 0,-113
```

0 is the bit that will be set

-113 is the error

When error -113 "Undefined Header" occurs, bit 0 in the USER2 register will be set to 1.

---

:NTRansition <bits>

Write-Read - Negative Transition register bits set the condition to be set on the Negative going (True to False) transition. Use this register if you are only interested in a condition changing from True to False.

:NTRansition?

queries the register to verify that you set a negative transition.

---

:PTRansition <bits>

Write-Read - Positive Transition register bits set the condition to be set on the False to True transition. Use this register if you are only interested in the change of a condition from False to True.

:PTRansition?

Queries the register to verify that you set a positive transition.

---

**DISPlay:TDR:EYE:Y:SCALe:AUTO:STATe <bool>**

**Applicable Models:** All with TDR Options (S9x011A/B)

**(Read-Write)** Turns the continuous auto-scale mode for the eye y-axis ON or OFF.

**Parameters**

- `<bool>`
  - ON or 1 - Turns continuous auto-scale ON.
  - OFF or 0 - Turns continuous auto-scale OFF.
Examples

DISP:TDR:EYE:Y:SCAL:AUTO:STAT ON
display:tdr:eye:y:scale:auto:state off

Query Syntax

DISPLAY:TDR:EYE:SCALe:AUTO:STATe?

Return Type

Boolean

Default

ON

DISP:TDR:EYE:Y:SCAL:PDIVision <value>

Applicable Models: All with TDR Options (S9x011A/B)
(Read-Write) This command sets the value of the y-axis scale per division for eye diagram.

Parameters

<value>
Value of eye diagram y-axis scale per division. The range is 1E-18 to 5.

Examples

DISP:TDR:EYE:Y:SCAL:PDIV 300E-03
display:tdr:eye:y:scale:pdivision 300e-03

Query Syntax

DISPLAY:TDR:EYE:Y:SCALe:PDIVision?

Return Type

Double

Default

200m

DISP:TDR:EYE:Y:SCAL:RLEVel <value>

Applicable Models: All with TDR Options (S9x011A/B)
(Read-Write) This command sets the value of the eye diagram y-axis reference line.

Parameters

<value>
Value of eye diagram y-axis reference line. The range is -5 to +5.

Examples

DISP:TDR:EYE:Y:SCAL:RLEV 0.01
display:tdr:eye:y:scale:rlevel 0.01

Query Syntax

DISPLAY:TDR:EYE:Y:SCALe:RLEVel?

Return Type

Double

Default

0
**Display:TDR:Eye:Y:Scale:RPosition <value>**

Applicable Models: All with TDR Options (S9x011A/B)

*(Read-Write)* This command sets the value of the eye diagram y-axis reference position.

**Parameters**

*<value>* Value of eye diagram y-axis reference position. The range is 0 to 10.

**Examples**

```
 DISPLAY:TDR:EYE:Y:SCALE:RPOSITION 10
 display:tdr:eye:y:scale:rposition 10
```

**Query Syntax**

```
 DISPLAY:TDR:EYE:Y:SCALE:RPOSITION?
```

**Return Type** Integer

**Default** 0

---

**Display:TDR:Image <enum>**

Applicable Models: All with TDR Options (S9x011A/B)

*(Read-Write)* This command changes the background color of the screen.

**Parameters**

*<enum>* Screen background color. Choose from:

- **NORMAL** - Black background color.
- **INVert** - White background color.

**Examples**

```
 DISPLAY:TDR:IMAGE NORM
 display:tdr:image normal
```

**Query Syntax**

```
 DISPLAY:TDR:IMAGE?
```

**Return Type** String

**Default** NORMal

---

**Display:TDR:Measure[1-16]:DMemory:Type <enum>**

Applicable Models: All with TDR Options (S9x011A/B)

*(Read-Write)* This command sets the display to off, data type, memory type, or data and memory type.

**Parameters**

*<enum>* Data/memory display. Choose from:

- **OFF** - Nothing is displayed on the graph plot.
- **DATA** - Data only is displayed on the graph plot.

**Examples**

```
 DISPLAY:TDR:MEASURe:DMEMOrY:TYPE DATA
 display:tdr:measure:dmemory:type data
```
MEMory - Memory only is displayed on the graph plot.
DMEMory - Data and Memory are displayed on the graph plot.

Examples
DISP:TDR:MEAS1:DMEM:TYPE OFF
display:tdr:measure1:dmemory:off

Query Syntax
DISPlay:TDR:MEASure[1-16]:DMEMory:TYPE?

Return Type
String

Default
DATA

DISPlay:TDR:MEASure[1-16]:X:SCALe:AUTO

Applicable Models: All with TDR Options (S9x011A/B)

(Write-only) This command executes x-axis auto scaling.

Examples
DISP:TDR:MEAS1:X:SCAL:AUTO
display:tdr:measure1:x:scale:auto

DISPlay:TDR:MEASure[1-16]:X:SCALe:PDIVision <value>

Applicable Models: All with TDR Options (S9x011A/B)
(Read-Write) This command sets the value of the x-axis scale per division.

Parameters

<value> Value of x-axis scale per division.

Examples
DISP:TDR:MEAS1:X:SCAL:PDIV 1E-9
display:tdr:measure1:scale:pdivision 1e-9

Query Syntax
DISPlay:TDR:MEASure[1-16]:X:SCALe:PDIVision?

Return Type
Double

Default
2n

DISPlay:TDR:MEASure[1-16]:X:SCALe:RLEVel <value>

Applicable Models: All with TDR Options (S9x011A/B)
(Read-Write) This command sets the value of the x-axis reference line.

Parameters

<value> Value of x-axis reference line.
Examples

| DISPlay:TDR:MEAS1:X:SCALe:RLEV 20E-9 |
| display:tdr:measure1:x:scale:rlevel 20e-9 |

Query Syntax

| DISPlay:TDR:MEASure[1-16]:X:SCALe:RLEVel? |

Return Type

| Double |

Default

| 10n |

---

**DISPlay:TDR:MINimize:STATe <bool>**

Applicable Models: All with TDR Options (S9x011A/B)

*(Read-Write)* Sets or gets the minimize state.

**Parameters**

- `<bool>`
  - ON or 1 - Turns minimize state ON.
  - OFF or 0 - Turns minimize state OFF.

**Examples**

| DISPlay:TDR:MIN:STAT ON |
| display:tdr:minimize:state off |

**Query Syntax**

| DISPlay:TDR:MINimize:STATe? |

**Return Type**

| Boolean |

**Default**

| OFF |

---

**DISPlay:TDR:SCALe:AUTO**

Applicable Models: All with TDR Options (S9x011A/B)

*(Write-only)* This command executes y-axis auto scaling.

**Examples**

| DISPlay:TDR:SCAL:AUTO |
| display:tdr:scale:auto |

---

**DISPlay:TDR:VIEW <enum>**

Applicable Models: All with TDR Options (S9x011A/B)

*(Read-Write)* This command selects the view point for waveform analysis either before or after the DUT.

**Parameters**

- `<enum>`
  - X-axis reference position. Choose from:
STIMulus - Stimulus view, observation point before DUT.
RESPonse - Response view, observation point after DUT.

Examples
DISP:TDR:VIEW STIM
display:tdr:view stimulus

Query Syntax
DISPlay:TDR:VIEW?

Return Type
String
Default
STIMulus

DISPlay:TDR:X:SCALe:RPOSition <enum>

Applicable Models: All with TDR Options (S9x011A/B)

(Read-Write) This command sets the x-axis reference position for the time domain measurement.

Parameters
<enum> X-axis reference position. Choose from:

<p>| | |</p>

### MMEMory:TDR:LOAD:EYE:BPATtern <filename>

**Applicable Models:** All with TDR Options (S9x011A/B)

(Write-only) This command loads the specified user bit pattern file. The extension of file should be .txt. The bit pattern editing is not available through the command.
Parameters
<filename>

File name of the user bit pattern (.txt)

Examples
MMEM:TDR:LOAD:EYE:BPAT "C:\TDR\mybitpattern.txt"
memory:tdr:load:eye:bpattern "c:\tdr\mybitpattern.txt"

Default
Not Applicable

**MMEMory:TDR:LOAD:EYE[:MASK] <filename>**

Applicable Models: All with TDR Options (S9x011A/B)

(Write-only) This command loads eye-mask file. The format of the eye mask file should be the same as the format of the Infiniium DCA (86100C). The extension of the file should be .msk. The MASK pattern editing is not available through the command.

Parameters
<filename>

File name of the eye mask (.msk)

Examples
MMEM:TDR:LOAD:EYE:MASK "C:\TDR\FC0133.msk"
memory:tdr:load:eye:mask "c:\tdr\FC0133.msk"

Default
Not Applicable

**MMEMory:TDR:LOAD:STATe <filename>**

Applicable Models: All with TDR Options (S9x011A/B)

(Write-only) Loads the specified instrument state file (.sta).

Parameters
<filename>

String - Name of any valid file that does not already exist.

Examples
MMEM:TDR:LOAD:STAT 'myState'
memory:tdr:load:state 'c:\tdr\myState.sta'

Query Syntax
Not applicable

Default
Not applicable

**MMEMory:TDR:STORe:EYE:BPATtern <filename>**

Applicable Models: All with TDR Options (S9x011A/B)
(Write-only) This command stores the user bit pattern file. The extension of file should be .txt. The bit pattern editing is not available through the command.

Parameters

<filename>  
File name of the user bit pattern (.txt)

Examples

MMEM:TDR:STOR:EYE:BPAT "C:\TDR\mybitpattern.txt"
memory:tdr:store:eye:bpattern "c:\tdr\mybitpattern.txt"

Default  
Not Applicable

**MMEMory:TDR:STORe:EYE[:MASK] <filename>**

Applicable Models: All with TDR Options (S9x011A/B)

(Write-only) This command stores the eye-mask file. The format of the eye mask file should be the same as the format of the Infinium DCA (86100C). The extension of the file should be .msk. The MASK pattern editing is not available through the command.

Parameters

<filename>  
File name of the eye mask (.msk)

Examples

MMEM:TDR:STOR:EYE:MASK "C:\TDR\mymask.msk"
memory:tdr:store:eye:mask "c:\tdr\mymask.msk"

Default  
Not Applicable

**MMEMory:TDR:STORe:FDATa <filename>**

Applicable Models: All with TDR Options (S9x011A/B)

(Write-only) Stores the specified measurement data file of the active trace.

Parameters

<filename>  
String - Name of any valid file that does not already exist.

Examples

MMEM:TDR:STOR:FDATa 'myFdata'
memory:tdr:store:fdata 'c:\tdr\myFdata'

Query Syntax  
Not applicable

Default  
Not applicable
### MMEMory:TDR:STORe:FDATa:ALL <filename>

**Applicable Models:** All with TDR Options (S9x011A/B)

**(Write-only)** Stores the specified measurement data file for all traces.

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;filename&gt;</td>
<td>String - Name of any valid file that does not already exist.</td>
</tr>
</tbody>

memory:tdr:store:fdata:all 'c:\tdr\myFdata'
```

**Query Syntax**

Not applicable

**Default**

Not applicable

### MMEMory:TDR:STORe:SNP <n>

**Applicable Models:** All with TDR Options (S9x011A/B)

**(Write-only)** Stores the SnP measurement data. Learn more about SnP data.

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;n&gt;</td>
<td>SnP measurement data to store. If unspecified, &lt;n&gt; is set to 2. The number you specify must be less than or equal to the number of available ports on the VNA. Choose from: 1 (S1P) stores 1-Port data for the active measurement if the active measurement is a reflection parameter such as S11 or S22. The behavior is UNDEFINED if the active measurement is a transmission parameter such as an S21. 2 (S2P) stores data for the four 2 port parameters associated with the current measurement. Default. Data that is not available is zero-filled. 3 (S3P) stores data for the nine 3 port parameters associated with the current measurement. Data that is not available is zero-filled. 4 (S4P) stores data for the sixteen 4 port parameters associated with the current measurement. Data that is not available is zero-filled.</td>
</tr>
</tbody>
</table>

**Examples**

```plaintext
MMEM:TDR:STOR:SNP 1  
memory:tdr:store:snp 1
```

**Query Syntax**

Not applicable

**Default**

Not applicable
MMEMory:TDR:STOR:STATe <filename>

Applicable Models: All with TDR Options (S9x011A/B)
(Write-only) Stores the specified instrument state file (.sta).

Parameters

<filename>  String - Name of any valid file that does not already exist.

Examples

- MMEM:TDR:STOR:STAT 'myState'
- mmemory:tdr:store:state 'c:\tdr\myState.sta'

SOURce<cnum>:TDR:POWer[:LEVel][:IMMediate][:AMPLitude] <value>

Applicable Models: All with TDR Options (S9x011A/B)
(Read-Write) This command sets the source power level.

Parameters

<cnum> Channel number of the measurement. If unspecified, <cnum> is set to 1.

<value> Source power level in dBm.

Examples

SOUR:TDR:POW 20
source:tdr:power:level:immediate:amplitude 20

Query Syntax

SOURce:TDR:POWer[:LEVel][:IMMediate][:AMPLitude]?

Return Type

Double

Default

-8 dBm

Create and Cal a VMC Measurement

Note: This example program uses SCPI commands that were used BEFORE VNA release A.09.33. While these commands still work, we encourage you to use the newer VMC commands that were introduced with the A.09.33 release. See newer commands and example program.

This VB Script example creates and calibrates a Vector mixer measurement. To run this example without modification you need the following:

A Mixer setup file saved on the VNA: C:\Program Files(x86)\Keysight\Network Analyzer\Documents\Mixer\MyMixer.mxr.

If the mixer file uses an external LO source, it must also be attached and configured.

An ECal module that covers the frequency range of the measurement.

The SCPI commands in this example are sent over a COM interface using the SCPIStringParser object. You do NOT need a GPIB connection to run this example. However, some modification is necessary to make the program run on a traditional GPIB Interface.

This VBScript (*.vbs) program can be run as a macro in the VNA. To do this, copy the following code into a text editor file such as Notepad and save it on the VNA hard drive as VMC.vbs. Learn how to setup and run the macro.

```vbs
Dim app
Dim scpi
' Create / Get the VNA application.
Set app = CreateObject("AgilentPNA835x.Application")
Set scpi = app.ScpiStringParser
'---Create a Vector Mixer Measurement
'First, delete all measurements on the channel
scpi.Parse "CALC:PAR:DEL:ALL"
'Create a forward scalar mixer measurement and configure
'it in channel 1.
'The first parameter is a unique identifying string
'(specified by the user) to allow subsequent
'commands to be directed at this specific measurement.
scpi.Parse "CALC:CUST:DEF 'My VC21', 'Vector Mixer/Converter', 'VC21'"
'Setup the new measurement as the 2nd trace in the active window
scpi.Parse "DISP:WIND:TRAC2:FEED 'My VC21'"
'Make the new trace the active measurement
scpi.Parse "CALC:PAR:SEL 'My VC21'"
'The parameters of the mixer measurement can now be configured.
'This can be done by either using the SENS:MIX commands
'for each of the parameters or by loading a mixer setup file.
'This example loads a mixer setup file. The path name
'for the mixer file may be loaded from other mapped drives.
scpi.Parse "SENS:MIXer:Load 'c:\\users\\public\\network analyzer\\documents\\Mixer\\MyMixer.mxr'"

'---------------------Perform A Vector Mixer Calibration---------------------
'Initialize an VMC guided calibration for session number 6
scpi.Parse "SENS:CORR:COLL:SESS6:INIT ""VMC"""
'This sets the VMC operation to full system cal as opposed to
'performing a mixer characterization only.
```
This example uses ECal for the 2-port cal portion of the procedure. To use a mechanical kit you will have to use the following command:
```
```
If you select the mechanical method then you also have to specify the connector types and the cal kits for each of the ports.

The comments below show an example of how that is done:
```
' scpi.Parse "SENS:CORR:COLL:SESS6:CONN:PORT1:SEL "APC 3.5 male"
```

Choose the between ECal or Mechanical calibration for the Mixer Characterization portion of the VMC cal.
```
```
Specify the ECal module and the ECal characterization for the two port calibration portion of this session. FCA calibrations currently only support ECal module number 1. In this example the factory characterization is used by specifying 0 for the characterization number.
```
scpi.Parse "SENS:CORR:COLL:SESS6:VMC:TWOP:ECAL:CHAR 1,0"
```
Specify the thru measurement method. This applies to both ECal and mechanical calibrations. For ECal 'DEFAULT' will use the ECal thru. Other choices may be used depending on the genders and types of the connectors on the test interface.
```
```
Omit the isolation part of the 2-port cal.
```
```
Tell the wizard to generate and report the number of steps in this cal session.
```
Dim steps
Dim desc
'Determine the number of steps required to complete the calibration.
' First send the write command, then the query.
scpi.Parse "SENS:CORR:COLL:SESS6:STEP"
For i = 1 To steps
'Display the prompt for each step
MsgBox (desc)
'Perform the measurement for each step
scpi.Parse "SENS:CORR:COLL:SESS6:ACQ " & CStr(i)
Next
'Finish the cal and save the calset

Msgbox("VMC Cal Complete!")
Create and Cal an SMC Measurement

Note: This example program uses SCPI commands that were used BEFORE VNA release A.09.33. While these commands still work, we encourage you to use the newer SMC commands that were introduced with the A.09.33 release. See newer commands and example program.

This Visual Basic example creates and calibrates a scalar mixer measurement.

To run this example without modification you need the following:

A Mixer setup file saved on the VNA: C:\Program Files(86)\Keysight\Network Analyzer\Documents\Mixer\MyMixer.mxr.

If the mixer file uses an external LO source, it must also be attached and configured.

An ECAL module that covers the frequency range of the measurement.

A power meter must be attached to the VNA. If this example is run in the VNA, the power meter does not need to be attached using a GPIB/USB interface.

The SCPI commands in this example are sent over a COM interface using the SCPIStringParser object. You do NOT need a GPIB connection to run this example. However, some modification is necessary to make the program run on a traditional GPIB Interface. For example, during the power meter portion of this calibration, scpi.Parse will not process a command until the power meter routine has completed. Traditional GPIB would require a serial polling technique to ensure the routine has completed before proceeding.

This VBScript (*.vbs) program can be run as a macro in the VNA. To do this, copy the following code into a text editor file such as Notepad and save it on the VNA hard drive as SMC.vbs. Learn how to setup and run the macro.

```
Dim app
Dim scpi
' Create / Get the VNA application.
Set app = CreateObject("AgilentPNA835x.Application")
Set scpi = app.ScpiStringParser
'---Create a Scalar Mixer Forward Measurement
'First, delete all measurements on the channel
scpi.Parse "CALC:PAR:DEL:ALL"
'Create a forward scalar mixer measurement and configure it in
'channel 1. The first parameter is a unique
'identifying string (specified by the user) to allow subsequent
'commands to be directed at this specific measurement.
scpi.Parse "CALC:CUST:DEF 'My SC21', 'Scalar Mixer/Converter', 'SC21'"

'Setup the new measurement as the 2nd trace in the active window
scpi.Parse "DISP:WIND:TRAC2:FEED 'My SC21'
'Make the new trace the active measurement
scpi.Parse "CALC:PAR:SEL 'My SC21'"
'The parameters of the mixer measurement can now be configured.
'This can be done by either using the individual SENS:MIX commands
'for each of the parameters or by loading a mixer setup file. This
'exmaple loads a mixer setup file. The path name
'for the mixer file may be loaded from other mapped drives
scpi.Parse "SENS:MIXer:Load ""C:\Program Files(x86)\Keysight\Network Analyzer\Documents\Mixer\MyMixer.mx"
'------------------Perform A Scalar Mixer Calibration------------------
'Initialize an SMC guided calibration for session number 6
```
Select to use an ECal for the 2-port cal portion of the procedure.
To use a mechanical kit you will have to use the following command:

If you select the mechanical method then you also have to specify the connector types and the cal kits for each of the ports. The comments below show an example of how that is done:
'scrii.Parse "SENS:CORR:COLL:SESS6:CONN:PORT1:SEL ""APC 3.5 male"

Specify the ECal module and the ECal characterization for this session. FCA calibrations currently only support ECal module number 1. In this example the factory characterization is used by specifying 0 for the characterization number.
'scrii.Parse "SENS:CORR:COLL:SESS6:SMC:ECAL:CHAR 1,0"

Specify the thru measurement method. This applies to both ECal and mechanical calibrations. For ECal 'DEFAULT' will use the ECal thru. Other choices may be used depending on the genders and types of the connectors on the test interface.

Omit the isolation part of the 2-port cal

Turn on auto orientation for the ECal

Tell the wizard to generate and report the number of steps in this cal session
Dim steps
Dim desc
'Determine the number of steps required to complete the calibration.
'First send the write command, then the query.
scrii.Parse "SENS:CORR:COLL:SESS6:STEP"
steps = scrii.Parse ("SENS:CORR:COLL:SESS6:STEP?"
For i = 1 To steps
'Display the prompt for each step
MsgBox (desc)
'Perform the measurement for each step
scrii.Parse "SENS:CORR:COLL:SESS6:ACQ " & CStr(i)
Next

Dim calset
'Finish the cal and save the calset
Msgbox ("SMC Cal Complete!")
Create SMC Embedded LO Measurement

This VB Script example creates a SC21 SMC measurement for a mixer with an Embedded LO.

To make an embedded LO measurement:

Set the LO frequency for each stage to the nominal frequency of the embedded LO. Set the LO source to "Not Controlled".

Calibrate as usual at the end of the measurement setup. To do this, copy the Calibration section from Create and Cal an SMC Measurement.

The following are the mixer settings:

Single-stage Fixed LO's - Uncomment the **Blue** lines to measure DUAL stage mixers.

Swept Input and Output

Set Input and LO frequencies - Calculate the Output frequencies

The SCPI commands in this example are sent over a COM interface using the SCPIStringParser object. You do NOT need a GPIB connection to run this example.

This VBScript (*.vbs) program can be run as a macro in the VNA. To do this, copy the following code into a text editor file such as Notepad and save it on the VNA hard drive as SMC.vbs. Learn how to setup and run the macro.

```vbnet
Dim app
Dim scpi
' Create / Get the VNA application.
Set app = CreateObject("AgilentPNA835x.Application")
Set scpi = app.ScpiStringParser
scpi.Parse "SYSTem:PRESet"
' Create a Scalar Mixer Forward Measurement
' First, delete all measurements on the channel
scpi.Parse "CALC:PAR:DEL:ALL"
' Create a forward scalar mixer measurement and configure it in
' channel 1. The first parameter is a unique
' identifying string (specified by the user) to allow subsequent
' commands to be directed at this specific measurement.
scpi.Parse "CALC:CUST:DEF 'My SC21', 'Scalar Mixer/Converter', 'SC21'"
' Setup the new measurement as the 2nd trace in the active window
scpi.Parse "DISP:WIND:TRAC2:FEED 'My SC21'"
' Make the new trace the active measurement

Dynamic Uncertainty

This example does the following in separate subprograms:

- Setup Uncertainty Manager Workspace
- Perform a standard 2-port Guided Cal
- Perform a Cable Characterization
- Perform a Noise Characterization
- Perform a 2-Port Uncertainty Cal
- Make Uncertainty Trace Settings

The SCPI commands in this example are sent over a COM interface using the `SCPIStringParser` object. You do NOT need a GPIB connection to run this example.

This VBScript (*.vbs) program can be run as a macro in the VNA. To do this, copy the following code into a text editor file, such as Notepad, and save it on the VNA hard drive as *.vbs.

Getting and Putting Data

This Rocky Mountain Basic example does the following:

- Takes a sweep, and reads the formatted data trace into an array. The trace is read as a definite length block.
- Instructs you to remove DUT
- Downloads the trace back to the analyzer as an definite length block.

---

```
The channel number used for the SENSe header is determined by the **SYST:CAL:ALL:GUID:CHAN?** command. You must query this channel number – do not assume that it will always be a particular value.
**Multiple Instances of Calibrate All Channels**

**Note:** You can assign a single client channel to multiple cal all instances. However, care should be taken here. If you create user calsets, all calsets will be created but only the last one will be applied. If you are only using a cal register, only the last cal all will be written to the cal register (only supports one calibration). The order that the cal alls are created should be the order in which they are saved (SENS200:CORR:COLL:GUID:SAVE). This ensures that the client channel imports the proper ETerms.

```
# create 4 total channels:
# does one calall on channels 1/2 with ports 1/2 selected and power cal on P1
# does another calall on channels 3/4 with ports 3/4 selected and no power cal

SENS500:CORR:COLL:GUID:SAVE

The channel number used for the SENSe header is determined by the SYST:CAL:ALL:GUID:CHAN? command. You must query this channel number – do not assume that it will always be a particular value.
Noise Power Ratio (NPR) Correction Example

The following example uses port 4 and port 1, and a MXG named "MyMXG". The MXG is connected to port 4's rear panel. It uses a NPR modulation file "D:\ModulationFile\npr.csv" and saves the corrected modulation file into "D:\ModulationFile\npr.mdx".

Perform a Guided Cal using Multiple Power Sensors

This example performs a Guided Calibration using TWO power sensors that are setup as PMAR devices. Use of two power sensors is necessary when the frequency range of the measurement is greater than can be attained with a single sensor.

A measurement must first be set up with desired frequency range, power, and so forth, ready to be calibrated.

The SCPI commands in this example are sent over a COM interface using the SCPIStringParser object. You do not need to control the VNA via GPIB to run this example.

This VBScript (*.vbs) program can be run as a macro in the VNA. To do this, copy the following code into a text editor file, such as Notepad, and save it on the VNA hard drive as mps.vbs.

Learn how to setup and run the macro.

See Guided Power Sensor SCPI commands

See Other SCPI Example Programs
next
s.parse "SENS:CORR:COLL:GUID:SAVE"
Perform a Guided Cal with Sliding Load

This example sets the sliding load behavior, then performs a Guided Calibration that uses a sliding load. A measurement must first be set up with desired frequency range, power, and so forth, ready to be calibrated.

The SCPI commands in this example are sent over a COM interface using the `SCPIStringParser` object. You do not need to control the VNA via GPIB to run this example.

This VBScript (*.vbs) program can be run as a macro in the VNA. To do this, copy the following code into a text editor file, such as Notepad, and save it on the VNA hard drive as guided.vbs.

Learn how to setup and run the macro.

See Guided Cal commands.

```
Set app = CreateObject("AgilentPNA835x.Application")
Set scpi = app.ScpiStringParser

' Specify that any sliding loads should be measured using the
' remote iterative method rather than launching sliding load dialog.
scpi.Execute "sens:corr:coll:guid:conn:port1 ""APC 3.5 female"" "
scpi.Execute "sens:corr:coll:guid:conn:port2 ""APC 3.5 male"" "
' 85052B cal kit uses sliding loads
scpi.Execute "sens:corr:coll:guid:ckit:port1 ""85052B"" "
scpi.Execute "sens:corr:coll:guid:ckit:port2 ""85052B"" "
scpi.Execute "sens:corr:coll:guid:init"

' Measure the standards
For i = 1 To numSteps
    step = "Step " + CStr(i) + " of " + CStr(numSteps)
    MsgBox strPrompt, vbOKOnly, step
    minIterations = scpi.Execute("sens:corr:coll:guid:iter:min? " + CStr(i))
    For j = 1 To minIterations
        If minIterations > 1 Then MsgBox "Adjust/position the standard for measurement " + CStr(j) + " of " + CStr(minIterations), vbOKOnly
        scpi.Execute "sens:corr:coll:guid:acq STAN" + CStr(i)
    Next
    If iterationCount <> minIterations Then
        MsgBox "Unexpected error!", vbOKOnly, step
        scpi.Execute "sens:corr:coll:guid:iter:res " + CStr(i)
    End If
```
Next

' Conclude the calibration

scpi.Execute "sens:corr:coll:guid:save"
Perform a Guided QSOLT Cal

This example performs a Guided QSOLT calibration on a 4-port VNA.

Because the DUT port 1 is female and the other ports are male, a 'Zero Thru' can be used between port 1 and the other ports. If this were NOT the case, a "Defined Thru" would be needed in the listed Cal Kits for those ports. Learn more about Thru methods.

Although no standards are used for ports 2, 3, and 4, a Cal Kit must be defined for these ports.

The SCPI commands in this example are sent over a COM interface using the SCPIStringParser object. You do not need to control the VNA via GPIB to run this example.

This VBScript (*.vbs) program can be run as a macro in the VNA. To do this, copy the following code into a text editor file, such as Notepad, and save it on the VNA hard drive as qsolt.vbs.

scpi.Execute "Sens1:CORR:COLL:GUID:PATH:CMET 1,4,'QSOLT1'"
' Initiate the calibration and query the number of steps
scpi.Execute "sens1:corr:coll:guid:init"
MsgBox "Number of steps is " + CStr(numSteps)
```
' Measure the standards
For i = 1 To numSteps
step = "Step " + CStr(i) + " of " + CStr(numSteps)
MsgBox strPrompt, vbOKOnly, step
scpi.Execute "sens:corr:coll:guid:acq STAN" + CStr(i)
Next
' Conclude the calibration
scpi.Execute "SENS1:CORR:COLL:GUID:SAVE"
Perform a VMC Mixer Characterization

This example performs a VMC Mixer Characterization ONLY.
To run this example program without error:

Replace the ECal module model and serial number with that of your own, or a mechanical cal kit model.

Store a 'default.csa' instrument state file on the VNA with the setup information for your mixer. Or add mixer setup information to this program. See an example.

The SCPI commands in this example are sent over a COM interface using the SCPIStringParser object. You do NOT need a GPIB connection to run this example.

This VBScript (*.vbs) program can be run as a macro in the VNA. To do this, copy the following code into a text editor file, such as Notepad, and save it on the VNA hard drive as *.vbs.

Learn how to setup and run the macro.

Perform Unguided THRU Response Cal

This example program performs Thru Response cals in both the forward and reverse directions. It does this by selecting the appropriate measurement right before acquiring the standard. The cal infers the direction from the measurement.

This program also demonstrates the use of the SENSE:CORR:PREF:CSET:SAVE command. The details are in the comments.

The SCPI commands in this example are sent over a COM interface using the SCPIStringParser object. You do NOT need a GPIB connection to run this example.

This VBScript (*.vbs) program can be run as a macro in the VNA. To do this, copy the following code into a text editor file such as Notepad and save it on the VNA hard drive as Unguided.vbs. Learn how to setup and run the macro.

```
Dim App
Set App = CreateObject("AgilentPNA835x.Application")
Dim Parser
Set Parser = App.SCPIStringParser
'Preset and delete measurement

MsgBox("The calibration has been completed")
Set ECal States

This example cycles through the state settings on the first ECal module it finds on the USB bus.

The state settings include all of the ECal states on Port A, Port B and the AB thru path. The first state on a port-pair path such as AB is the thru state that is used during calibrations. The second state on that path is the "confidence state" which is the equivalent of an attenuator that is used by the ECal Confidence Check feature.

The SCPI commands in this example are sent over a COM interface using the SCPIStringParser object. You do NOT need a GPIB connection to run this example.

This VBScript (*.vbs) program can be run as a macro in the VNA. To do this, copy the following code into a text editor file, such as Notepad, and save it on the VNA hard drive as *.vbs.

Learn how to setup and run the macro.

Next
End Sub
Setup an FCA Segment Sweep

This example program shows how to setup a segment sweep in FCA.

The SCPI commands in this example are sent over a COM interface using the `SCPIStringParser` object. You do NOT need a GPIB connection to run this example.

This VBScript (*.vbs) program can be run as a macro in the VNA. To do this, copy the following code into a text editor file, such as Notepad, and save it on the VNA hard drive as FCASeg.vbs.

Learn how to setup and run the macro.

```
option explicit
dim App, scpi
set App = CreateObject("Agilentpna835x.application")
App.Reset
' Create FCA Scalar Mixer/Converter channel with an SC21 measurement:
App.CreateCustomMeasurementEx 1, "Scalar Mixer/Converter", "SC21", 1
' Access the COM SCPI string parser
set scpi = App.ScpiStringParser
' Delete all existing segments, and create three new ones
scpi.Parse("sens:mix:segm:del:all")
scpi.Parse("sens:mix:segm:add 3")
' Turn #1 ON
scpi.Parse("sens:mix:segm1:stat on")

' Set segment sweep
' The following 'type:segm' command discards the changes made to the scratch mixer
' Therefore, precede with Apply
' Also, always do this before setting the LO port
scpi.Parse("sens:mix:apply")
scpi.Parse("sens:swe:type segm")
' Setup segment #1
' Input is swept: [1.1GHz, 1.39GHz]
' LO1 is fixed: 2.2 GHz
' Output is low-side mixing swept and calculated
' from input and LO1.
' Number of points is 21
' Input power is -10 dBm
```
' LO1 power is 10.0 dBm
scpi.Parse("sens:mix:segm1:inp:freq:star 1.10E9")
scpi.Parse("sens:mix:segm1:inp:pow -10.0")
scpi.Parse("sens:mix:segm1:lol:freq:fix 2.2E9")
scpi.Parse("sens:mix:segm1:lol:freq:mode fixed")
scpi.Parse("sens:mix:segm1:lol:pow 10.0")
scpi.Parse("sens:mix:segm1:poin 21")
scpi.Parse("sens:mix:segm1:stat on")
scpi.Parse("sens:mix:segm1:calc outp")
' Setup segment #2:
scpi.Parse("sens:mix:segm2:inp:pow -10.0")
scpi.Parse("sens:mix:segm2:lol:freq:fix 2.2E9")
scpi.Parse("sens:mix:segm2:lol:pow 10.0")
scpi.Parse("sens:mix:segm2:poin 21")
scpi.Parse("sens:mix:segm2:stat on")
scpi.Parse("sens:mix:segm2:calc outp")
' Setup segment #3:
scpi.Parse("sens:mix:segm3:inp:freq:star 1.50E9")
scpi.Parse("sens:mix:segm3:inp:freq:stop 1.6E9")
scpi.Parse("sens:mix:segm3:inp:pow -10.0")
scpi.Parse("sens:mix:segm3:lol:freq:fix 2.2E9")
scpi.Parse("sens:mix:segm3:lol:pow 10.0")
scpi.Parse("sens:mix:segm3:poin 21")
scpi.Parse("sens:mix:segm3:stat off")
scpi.Parse("sens:mix:segm3:calc outp")
' Mixer Input to be port 1
' Mixer output to Port 2
' Mixer LO to Port 3
scpi.Parse("sens:mix:lol:name ""Port 3"""")
' Apply the scratch mixer
scpi.Parse("sens:mix:apply")
Use an Existing Power Cal During an SMC Cal

This example shows how to use an existing Source Power Cal instead of the power cal that is performed during an SMC calibration. To run this program without modification, you need the following:

- A Mixer setup file saved on the VNA: C:\Program Files(x86)\Keysight\Network Analyzer\Documents\Mixer\MyMixer.mxr.
- If the mixer file uses an external LO source, it must also be attached and configured.
- An ECAL module that covers the frequency range of the measurement.
- An SMC cal set named "SMC_CAL". This is the cal set that source power correction data will be imported from. The input and output frequency ranges of the cal set must cover the corresponding ranges used during calibration, or guided cal initialization will fail.

**Error Messages**

If you attempt to import power cal data from an SMC calset that uses different ports than the ones currently in use, the message “The necessary calibration standards were not found.” will appear.

If the imported Cal Set does not cover the frequency range of the current cal, the message “Interpolation target is out of range. Cannot interpolate.” will appear.

Sens:Corr:Coll:Guid:SMC commands

This VBScript (*.vbs) program can be run as a macro in the VNA. To do this, copy the following code into a text editor file such as Notepad and save on the VNA hard drive as SMC.vbs. Learn how to setup and run the macro.

```vbs
Dim app
Dim scpi
' Create / Get the VNA application.
Set app = CreateObject("AgilentPNA835x.Application")
Set scpi = app.ScpiStringParser
'---Create a Scalar Mixer Forward Measurement
'First, delete all measurements on the channel
scpi.Parse "CALC:PAR:DEL:ALL"
'Create a forward scalar mixer measurement and configure it in channel 1. The first parameter is a unique identifying string (specified by the user) to allow subsequent commands to be directed at this specific measurement.
scpi.Parse "CALC:cust:DEF 'My SC21', 'Scalar Mixer/Converter', 'SC21'
'Setup the new measurement as the 2nd trace in the active window
scpi.Parse "DISP:WIND:TRAC2:FEED 'My SC21'
'Make the new trace the active measurement
```
scpi.Parse "CALC:PAR:SEL 'My SC21'"

'The parameters of the mixer measurement can now be configured.
'This can be done by either using the individual SENS:MIX commands
'for each of the parameters or by loading a mixer setup file. This
'exemple loads a mixer setup file. The path name
'for the mixer file may be loaded from other mapped drives
scpi.Parse "SENS:MIxer:Load ""C:\Program Files(x86)\Keysight\Network
Analyzer\Documents\Mixer\MyMixer.mxr"

'-------------Perform A Scalar Mixer Calibration-----------------------
'Specify the connector types and the cal kits for each of the ports.
scpi.Parse "SENS:CORR:COLL:GUID:CONN:PORT1:SEL ""APC 3.5 male""

'Import power cal data from the existing SMC calset "MySMC"

'Specify the thru measurement method. This applies to both ECal
'and mechanical calibrations.
'Always send the init command before the Thru method command
scpi.Parse "SENS:CORR:COLL:GUID:INIT"
scpi.Parse "SENS:CORR:COLL:GUID:PATH:TMET 1,2,""DEFINED THRU"
'Omit the isolation part of the 2-port cal (default behavior).
scpi.Parse "SENS:CORR:COLL:GUID:ISOL NONE"
'Turn on auto orientation for the ECal (default behavior).
scpi.Parse "SENS:CORR:PREF:ECAL:ORI ON"
'Initialize an SMC guided calibration.
scpi.Parse "SENS:CORR:COLL:GUID:INIT"
'Tell the wizard to generate and report the number of steps in this cal.
Dim steps
Dim desc
'Determine the number of steps required to complete the calibration.
steps = scpi.Parse ("SENS:CORR:COLL:GUID:STEP?")
    For i = 1 To steps
    'Display the prompt for each step
    MsgBox (desc)
    'Perform the measurement for each step
    scpi.Parse "SENS:CORR:COLL:GUID:ACQ STANSTAN" & CStr(i)
    Next
Dim calset
'Finish the cal and save the calset
calset = scpi.Parse("SENS:CORR:COLL:GUID:SAVE OFF")
Msgbox("SMC cal saved to cal register")
Learning about COM

The following topics can help you learn more about controlling the VNA using COM.

- COM versus SCPI
- Configure for COM-DCOM Programming
- COM Fundamentals
- Getting a Handle to an Object
- COM Collections in the VNA
- VNA Automation Interfaces
- COM Data Types
- Working with VNA Events
- Read and Write Calibration Data using COM
- C++ and the COM Interface
- Using COM with .NET

See more VNA programming information and examples at: http://na.support.keysight.com/pna/programming/.
Learning about GPIB

The following topics can help you learn more about controlling the VNA using SCPI and the GPIB.

- COM versus SCPI
- GPIB Fundamentals
- The Rules and Syntax of SCPI Commands
- Configure for SCPI / SICL over GPIB
- Configure for VISA / SICL over LAN
- Calibrating the VNA Using SCPI
- Getting Data from the VNA using SCPI
- The VNA as a USB Device
- Remote Control of SCPI USB Devices Connected to a VNA
- Reading the VNA Status Registers
- New Referring to Traces, Measurements, Channels, and Windows Using SCPI
- Synchronizing the VNA and Controller
- Shut Down the VNA Remotely

## SA Marker Settings

Sets and reads the bandwidth of the band density marker.

Returns the band density level in dBm/Hz from the band density marker.

Marker to SA

Read Band Power

Read/Set Band Power Span

Read/Set Band Power State

Sets and reads the state of the band density noise marker.

Sets and reads the bandwidth of the band power density marker.

Sets and reads the state of the band power density marker.

Sets and reads the bandwidth of the band tone density marker.

Sets and reads the state of the band tone density marker.

Sets and reads the spacing of the band tone density marker.

<tr>
<td>Sets and reads the integration bandwidth marker.</td>
<td>CALCulate:MEASure:SA:MARKer:BAND:IBW</td>
<td>None</td>
</tr>
</tbody>
</table>
Sets and reads the ACPR density marker.
CALCulate:MEASure:SA:MARKer:BDENsity:ACPR[:STATe]
CALCulate:SA:MARKer:BDENsity:ACPR[:STATe]

Sets and reads the NPR density marker.
CALCulate:MEASure:SA:MARKer:BDENsity:NPR[:STATe]
CALCulate:SA:MARKer:BDENsity:NPR[:STATe]

Executes the search ACPR density marker.
CALCulate:MEASure:SA:MARKer:SEARch:ACPR

Executes the search NPR density marker.
CALCulate:MEASure:SA:MARKer:SEARch:NPR

Measurement Data

Retrieves trace data (Y data) from the modulation distortion measurement.
CALCulate:MEASure:DATA:BUFFer:Y?
GetDataBuffer
GetDataBufferCompact

Retrieves frequency tone data from the modulation distortion measurement.
CALCulate:MEASure:DATA:BUFFer:X?
GetXDataBuffer
GetXDataBufferCompact

Replacement Commands

As we expand the capability of the VNA, we will continue to develop new commands. Sometimes, a command is replaced with a new command that delivers more capability. The old (superseded) command will continue to work as usual, but we recommend using the new (replacement) command in new code that you develop.

In very few cases, commands become obsolete and no longer work as before. Obsolete commands will likely NOT have a replacement.

<td></td>
<td></td>
<td>&quot;External&quot;</td>
</tr>
</tbody>
</table>
PNA-X - 224  2 ports, add internal 2nd source, combiner & mechanical switches

Ref# | Element Name | Settings
---|-------------|----------
#1 | "Combiner" | "Normal"  
This selection only draws connection lines. No switches are thrown.  
"Reversed"
#2 | "Src1Out1LowBand" | "Filtered"  
"HiPwr"
#3 | "Src2Out1LowBand" | "Filtered"  
"HiPwr"
#4 | "Port1Bypass" | "Thru"  
"Combiner"
#5 | "Port2Bypass" | "Thru"  
"RearPanel"
#6 | "Port1RefMxr" | "Internal"  
"External"
This selection only draws connection lines. No switches are thrown.

Labeled: Src2 Main Bypass Switch

(routes Src1 signal to J6 on rear panel)

N5227A/47A only (routes Src2 signal to J12 on rear panel)

(SMC measurements only. Learn more.)

**Choose from element value 8 or 9**

- Returns the ADC delay.
  - SENSE:PULSe:HDELay:ADC?
  - ADCDelay
- Sets the time lag between the pulse drive signal and the actual RF output.
  - SENSE:PULSe:HDELay:MODulator
  - ModulatorDelay
- Enables / Disables offset delays.
  - SENSE:PULSe:HDELay[:STATe]
  - EnableOffsetDelays
- Sets and reads the device being controlled by the pulse generator output.
  - SENSE:PULSe:MTIMing:DEVice
  - PulseTimingDevice
- Enable pulse4 to monitor ADC activity.
  - SENSE:PULSe4:OPTion
  - Pulse4OutAsADCActivity
- Sets the specific PULSe4 behavior.
  - SENSE:PULSe4:MODE
  - None

Your Programs on Windows

Programs that run on Workstations

If your program is running on a separate workstation and talking to the VNA using SCPI or DCOM, you may encounter problems when your program saves data to the root directory of the VNA HDD. This is because of User Account Control (UAC), a new security model with Windows 7 or Windows 10.

In the UAC default security setting, programs will not be able to save files to the root folder of the VNA. Try changing the UAC setting to the lowest security level. If it runs, but it is not acceptable to rewrite the program, then leave the UAC in this setting. The VNA software runs with UAC on either of these settings.

To access UAC settings for Windows 7:

- Minimize the VNA application
- Click the Windows Start button
- In Search Programs and Files, type UAC
To access UAC settings for Windows 10:

Minimize the VNA application
Click the Type here to search icon
In the Type here to search text field, type UAC

Default setting

![Default setting image]

Lowest security setting

![Lowest security setting image]

Programs that run on the VNA

The following issues relate to problems that may occur when you install and run your programs on the VNA. Most programs that run in Windows XP will run without changes on Windows 7 or Windows 10. However, there are differences between the two operating systems that could break more complicated programs. These incompatibilities are the same issues that software developers deal with on personal computers.

32-bit Programs

If your 32-bit program is saving files, Windows will redirect memory access to correct for different file locations. If problems occur, the path locations may need to be modified. See new path locations.

16-bit Programs

On Windows XP, there was a compatibility layer for 16-bit programs. This compatibility layer has been removed. So, your very old 16-bit programs will no longer be able to run on the VNA.

Special note about .NET applications with 64-bit Windows
In Visual Studio 2008 and earlier, the default .NET platform target was AnyCPU. On Windows 7 or Windows 10 64-bit, .NET applications that are written against the "AnyCPU" platform will compile down to a native 64-bit application. This can cause odd failures in your code as you will not be able to load any 3rd party libraries that are 32-bit only. You should always be compiling .NET applications as the "x86" platform. Starting with Visual Studio 2010, the default platform was changed to x86.

VGA Connector Learn more
USB Hub

This USB hub contains two SuperSpeed USB ports to power your VNA peripherals. There is also one USB port below the LAN connector, on USB device port, and four USB ports on the front panel.

Limitation: The total power consumption for all eight USB ports is limited to 4.0 amps. If this limit is exceeded, all USB ports are disabled until a device is removed and power consumption falls below the limit. The total current limit for all rear panel USB ports is 2.3 amps. The total current limit for all front panel USB ports is 2 amps. When first connected, Keysight ECal modules 8509x and N4431 draw significantly more current than other modules. See Specifications.

**How to turn ON an external monitor**

1. Minimize the VNA application.

2. Click Start > Control Panel > Hardware and Sound > Display.

3. Under Multiple displays select Duplicate desktop on 1 and 2.

4. Click OK, then OK again to confirm.

**How to view both the VNA screen and the external monitor**

The VNA must be set to the default resolution (640 x 480). While on any other resolution setting, only the external monitor can be viewed. To change resolution:

- Minimize the VNA application.
- Right-click on the VNA desktop, then click Screen resolution.
- Adjust display resolution.

Move App to Back

When running an external program on the VNA, such as a support program, the program may have a dialog that becomes blocked by the VNA application. When this happens, there are several ways to cause your program to again have focus on top of the VNA. An easy way to do this is to cause the VNA App to move to the back of the applications.

This operation must be performed each time the VNA application is selected, which again moves it to the top of another application.

<table>

To learn how to perform a full 4-port on-wafer calibrations manually using the 4-port 20 GHz PNA-L network analyzer, visit www.Keysight.com and search for 5989-2287EN.

Caution: Avoid expensive repairs to your analyzer. Read Electrostatic Discharge Protection.
Dynamic Uncertainty Plots
Plotting Data in Uncertainty Manager

The following selections appear in Uncertainty Manager under the Plot menu:

- Plot Data
- Show Uncertainty
- Format
- Frequency
- Scale
- Memory
- Marker
- Copy Plot to ClipBoard
- Labels and Colors

Note: Plot settings are NOT saved with a workspace (*.ml4) file.

Plot Parameters dialog box help
This choice can also be made by clicking Plot, then Plot Data, then select a parameter.

A parameter is available when the selected Uncertainty Item has data to plot. For example, Standard is available when a standard is selected on the Cal Kit Editor tab.

Click one of the selections, then click OK to plot the data.

Learn more about Standards, Port Noise, or Cable Repeatability data.

Show Uncertainty dialog box help
This dialog is available ONLY when plotting Cal Kit standard data.

**Trace Type**

- **Normal** - Display the trace without uncertainties.
- **UMax** – Display the trace as the uncertainty maximum (measured or memory data PLUS upper limit uncertainty values).
- **UMin** - Display the trace as the uncertainty minimum (measured or memory data MINUS lower limit uncertainty values).
- **UBars** – Display the uncertainties as “error bars” around the trace.
- **Shade** – Display the uncertainties as a shaded region around the trace.
- **Ellipse** – Display the uncertainties in ellipse form. Supported ONLY in Smith Chart or Polar display format.

**Coverage Factor** - Sets the level of confidence used in computing the specified measurement uncertainties. The higher the coverage factor, the higher the confidence that the computed uncertainty region includes the “true” measured data.

Allows you to plot the uncertainty associated with the selected standard data.

**Show Uncertainty dialog box help**

This dialog is available ONLY when plotting Cal Kit standard data.
This dialog is used to set the frequencies for plotting Cal Kit standards.

When a standard is selected, the response is plotted at these frequencies
When the standard is databased, the data is interpolated.
When the standard is polynomial, the model is computed at each of these frequencies.
When a standard response is exported as touchstone or DSD file, the data will contain these frequencies.

Simulation Frequencies - Shows the current list of frequencies.

**To add or remove a few frequencies:**

Insert frequencies - To add frequencies, enter a value in GHz, then click <<
Remove - To remove frequencies, select the value, then click remove.

**To quickly replace the values with a evenly-spaced step size/data points:**

Click Reset table to remove all frequencies.
Click Start/Stop to show the following dialog:

![Sweep Set Dialog](image)

Enter the Start and Stop frequencies.
Select, then enter either the (number of) Points or the Step size in GHz.
Click OK

Store - Saves the frequency list to a text file.
Retrieve - Loads the frequency list from a text file.

**Perform Math on Plotted Characterization Data**

Noise or Repeatability characterization data can be stored in Uncertainty Manager memory, then math can be performed on the Data vs. Memory.

To show this dialog, first plot data, then click Plot, then Memory.
Selection - Choose a memory location, then click Data => Memory. The current characterization data can be stored in up to 6 memory locations.

View - Select one or more of the following:

- Check a Memory location to view on the plot. Only the locations with memory saved to them are available for selection.
- Check Math to view an additional trace of the selected math operation.
- Check Data to view the original data trace

Math - Select one of the following math operations to perform on the Data and Memory location. Learn about Data Math operations.

Graphic Properties dialog box help
Scale / Format tab
To manually change scale on the X, Y, or 2nd Y axis:

Clear (uncheck) Auto.

Enter or use the +/- buttons to set the Min and Max scale of the plot. Each rectilinear plot has 10 vertical and 10 horizontal divisions.

**Draw**

Choose one or more of the following:

- **Line** - Data points are connected with a line.
- **Tag** - Each data point is highlighted.
- **Hold** - Traces remain visible after plotting new traces. The scale becomes fixed, although the plot can be rescaled manually. This is useful for comparing similar traces.

**Format**

For Noise and Repeatability, choose from Linear or Log.

For Standards, choose from all formats.

Learn about these formats.

**More tab**
Marker

- **Font** - Select the size and font for the marker readout.
- **Transparent** - Check to make the traces and grid show through the marker label.
- **Data Digits** - Select the resolution of the readout.

Trace

Select the trace for which the following settings will be made.

- **Set Lines** - Sets the trace width, color, and type.
- **Legend** - Edit the legend that appears in the upper left corner of the chart.
- **Font** - Select the size and font for the trace title.
- **2nd Axis** - Check to associate this trace with the 2nd (right) Y-axis.
- **Set as Default** - Check to make the settings apply to all traces.

Smoothing

- Drag the slider to achieve the desired amount of trace smoothing.
- **On** - Check to quickly turn ON / OFF the smoothing value.

Buttons

- **1st Axis Font** - Click, then set the size, color, and font for the primary Y-axis.
- **Grid Lines** - Click, then set the style, color, and thickness of the grid lines.
- **2nd Axis Font** - Click, then set the size, color, and font for the 2nd Y-axis.
To show this dialog, first plot data, then click **Plot**, then **Marker**.

You can add up to 4 markers for each trace.

To add a marker - Select a marker from the drop-down selector. The marker that is selected when this dialog is closed is the **ACTIVE** marker.

Move the marker using the slider. You can also move the **ACTIVE** marker by clicking on the plot with a mouse. The marker moves to the X-axis location of the mouse cursor when clicked.

Click **Delete All** or **Delete** to remove markers.

Label - Check to show a readout just above the selected marker.

Data Window - Check to show readouts for all four markers in a sizeable and movable window as shown below.

```
<table>
<thead>
<tr>
<th>Mk</th>
<th>Trk</th>
<th>GHz</th>
<th>dB</th>
<th>Deg</th>
</tr>
</thead>
<tbody>
<tr>
<td>M1</td>

</tr>
<tr>
<td>M4</td>
<td>S11</td>
<td>14.00</td>
<td>-63.26 -26.80 -999.0k</td>
<td>176.69 +/−1196.16</td>
</tr>
</tbody>
</table>
```
Application Look - Select a color scheme for the entire Uncertainty Manager workspace.

Legend On - Check to show the legend on the current plot.

Titles On - Check to show Titles on the current plot.

Set Plot Titles - Starts a dialog that allows you to change all of the titles for the current plot.

Copy Plot to Clipboard - Copies an image of the current plot. You can then paste it into a word processing or image editing software.
Port Subset Correction

It is often convenient to calibrate all the ports of the instrument so that corrected data is available at every port. However, applying the resulting calset results in every port being swept. This level of correction is appropriate if every port is connected to the DUT. However, sweeping ports that are disconnected unnecessarily slows down measurement throughput. To remedy this situation, the user can tell the instrument to exclude selected ports from the correction process. This is called "port sub-setting" or "devolve calibration". This process does not modify the calset in any way. There are two settings associated with port sub-setting: an on/off state, and the list of ports that should be included in the correction for the channel.

Port sub-setting values are independent of calset selection. They are essentially a mask that is applied to the calset.

Restricting correction to Enabled Ports

For example, on a 4 port instrument, the user is measuring two DUTs. Device #1 is connected to ports 1 and 2. Device #2 is connected to ports 3 and 4. The two devices are not interconnected in any way. Channel 1 is used to measure device #1. Channel 2 is used to measure device #2. If you apply a 4 port calset to each of these channels, both channels will sweep all 4 ports. Port sub-setting can be used to reduce the level of the correction for each channel.

<table>
<thead>
<tr>
<th>Channel</th>
<th>Port subset values</th>
<th>Measurements</th>
<th>Correction applied</th>
</tr>
</thead>
<tbody>
<tr>
<td>Channel 1</td>
<td>ON, ports 1 and 2 enabled</td>
<td>S11, S21, S12, S22</td>
<td>Full 2 Port (1,2)</td>
</tr>
<tr>
<td>Channel 2</td>
<td>ON, ports 3 and 4 enabled</td>
<td>S33, S43, S34, S44</td>
<td>Full 2 Port (3,4)</td>
</tr>
</tbody>
</table>

In this condition, when the user performs a 4 port calibration and applies the same user calset to both channels. Channel 1 sweeps ports 1 and 2. Channel 2 sweeps ports 3 and 4.

Best Effort on Disabled Ports

If measurements are added to the channel that utilize ports that are disabled in port sub-setting, those measurements will be corrected on a "best effort" basis: some correction may be applied depending on the contents of the calset. The level of correction is limited to enhanced response calibration or simple response calibration.

<table>

This "best effort" correction cannot be turned off using the dialog. But there are SCPI commands for disabling this feature.

The correction pop up pane, accessed from the status bar, indicates port by port correction methods for VNA with 12 or less test ports. This table is updated when the port subset correction is turned on to reflect the correction methods being applied. In the image below, the pane indicates a full 4 Port calibration. On the right, the table indicates the methods after the correction was devolved to ports 1,2,3.
Power Cal for Apps

This dialog appears when the Source Cal Settings button is clicked from Swept IMD and GCA calibrations.

**Source Calibration Settings - dialog box help**

![Source Calibration Settings dialog box](image)

**Note:** Be sure that the frequency range of your power sensor covers the frequency range of your measurement. This does NOT occur automatically.

*See Important First-time USB connection note.*

**Power**

- **Port Selection**: Select the port for which the Source Cal settings will apply.
- **Power Offset**: Allows you to specify a gain or loss (in dB) to account for components you connect between the source and the reference plane of your measurement. For example, specify 10 dB to account for a 10 dB amplifier in the path to your DUT. Following the calibration, the VNA power readouts are adjusted to this value.
- **Power Level** of the calibration is set within the Application. This can be from the Cal Wizard page, or from the power level setting of the source or port.

**Accuracy**

- **Tolerance**: Sets the maximum desired deviation from the specified Cal Power level.
- **Max Number of Readings**: Sets the maximum number of readings to take at each data point for iterating the source power.

**Use Reference Receiver for Fast Iteration**  When checked, the first reading at each data point uses a power meter to calibrate the reference receiver. Subsequent readings, if necessary to meet your accuracy requirement, are measured using the reference receiver. This technique is much faster than using the power meter with almost no degradation in accuracy.

*Note: Do NOT use the Reference Receiver for Fast Iteration feature if there is a component before the power sensor that exhibits non-linear behavior, such as a power amplifier in compression.*
Power Meter Config  Invokes the Power Meter Settings dialog box. From this dialog, you can configure two power sensors to cover the frequency range of interest.

Learn more about standard Source Power Cal.
Caution: Avoid expensive repairs to your analyzer. Read Electrostatic Discharge Protection.
Equation Editor and MatLab

MATLAB can be used with Equation Editor in two different ways:

1. When you install a full version of MATLAB on the VNA, MATLAB functions can be called directly from Equation Editor.

   Install the full 32 bit version of MATLAB.
   Press Math > Analysis > Equation Editor...
   In the Equation Editor dialog, click the Enable MATLAB button.
   You can then start calling MATLAB from within your equation editor entry field.
   Here are a few example of how you would do this:
   Matlab("S11.*S22") -> produces an array of multiplying S11*S22
   Matlab("phase(S11)") -> produces an array of unwrapped phase of the S11 trace.

2. Compile a MATLAB *.dll using the full version on your PC. Then import the *.dll into Equation Editor

   Learn how to Import Functions into Equation Editor

   The MATLAB Compile Runtime on the VNA is currently 7.14, which is shipped with R2010b (7.11).
   If you compile your *.dll using that version of MATLAB, then you don't need to change the version of MCR on the VNA.
   Determine the version of MATLAB you will use.
   You will need this version of MATLAB installed on your development machine (Step 2). You will also need a C++ compiler (Step 3).
   You will need the appropriate version of MATLAB Compiler Runtime (MCR) installed on your target machines (Step 5).

   To see installed version of MCR, check the following locations:

   On a 32-bit Windows system:
   
   C:\Program Files\Matlab\Matlab Compiler Runtime\
   C:\Program Files\Matlab\Matlab Component Runtime\

   On a 64-bit Windows system:
Use the chart below to compare MATLAB, MCR, and Compiler versions.

Install MATLAB (32-bit) on your development machine.

If your development system is 64-bit, manually navigate to \bin\win32\ on your install disk and run setup.exe to use the 32-bit installer. This requirement will be removed in future releases.

You must install with the MATLAB Compiler toolbox.

Install a compatible C++ compiler on your development machine.

For R2011b through R2013b, Windows SDK 7.1 with .NET 4.0 is sufficient.

Due to issues with the SDK installer, it is recommended to separately install .NET first, if not already installed.

The current SDK installer will also fail if Visual Studio redistributables are installed.

For a list of compatible compilers, see http://www.mathworks.com/support/compilers/

Note that LCC is only a C compiler, not C++, and is not an acceptable option.

In MATLAB, select your installed compiler by running the command: >>> mbuild -setup

Install the correct MCR on all target machines. This requires a reboot even if not prompted to do so by the installer.

Creating a MATLAB DLL

Open the MATLAB Compiler Deployment Tool, either through the user interface or with >>> deploytool, and choose to make a "C++ Shared Library" project.

Add any .m files to your project that you need in the DLL through the Deployment Tool window. This includes any helpers for functions need to execute.

Functions must take in 0 to 32 arguments and return 1 value to be used on traces.
The return value can be an array the size of a trace or a single value.
Functions not conforming aren't directly accessible from Equation Editor but must be included if other functions rely on them.

Optional: Add function descriptors. These are separate functions which provide default arguments and tooltips for the function.

Descriptors must have the same name as the function they describe with the postfix “desc”. For example, “MyFunc” could have a descriptor “MyFuncdesc”.

Descriptors take no input arguments.
Descriptors return a single string with the format “defaultArgs;tooltip”. For example, “S11,S22;Performs an operation.”

Build the project. This may take a few minutes and, if there are no errors, will generate project, src and distrib folders. The DLL will be under the distrib folder.
Some of the other generated files may be useful but are not needed for Equation Editor. Optional: Package all the distributable files.
This package can also include the appropriate MCR installer (as large as 0.5 GB).
In general this step isn't needed, only the generated DLL is required.

Notes about Writing Scripts

The MATLAB functions that will be accessed directly by the Equation Editor must follow a specific format, as noted briefly above.

Inputs: 0 to 32 vectors with dimensions [1, Sweep Size].

Constants (0, e, channel(), etc.) are expanded and passed as [1, Sweep Size] vectors.
Outputs: 1 vector with dimensions [1, Sweep Size] or [1, 1].

Outputs size [1, 1] are expanded to [1, Sweep Size] vectors automatically.
Functions with other input/output sets are not directly accessible from Equation Editor but may be included in your DLL and used by other functions, meaning helpers can be used without risk.
Existing functions that do not fit these parameters can be included along with wrapper functions which convert the parameters and outputs within the MATLAB environment.
Outputting Data Guide
Print, Save, and Recall Data

- Save and Recall a File
- Print a Displayed Measurement
- Drive Mapping

**Caution:** Avoid expensive repairs to your analyzer. Read *Electrostatic Discharge Protection.*
This topic contains the measurement uncertainty equations used to generate the uncertainty curves in Specifications documents.

It also contains general information about determining system measurement uncertainties.

Note: RSS Computations are included along with worst case computations.

**Measurement Uncertainty Equations**

Any measurement result is the vector sum of the actual test device response plus all error terms. The precise effect of each error term depends on its magnitude and phase relationship to the actual test device response. When the phase of an error response is not known, phase is assumed to be worst case (-180° to +180°).

Note: The uncertainty equations are derived for two-port measurement uncertainties. However, uncertainties for a one-port device can be derived by setting S21=0 then computing the reflection uncertainties.

View the abbreviations for residual systematic errors used in the equations.

View the abbreviations for random errors used in the error models and equations.

**Forward Reflection Uncertainty**

**Equation 1: Forward Reflection Magnitude Uncertainty (Worst Case Computation)**
Equation 2: Forward Reflection Phase Uncertainty (Worst Case Computation)

\[ \Delta S_{11(\text{worst})} = \sin^{-1} \left( \frac{\sqrt{\text{Systematic}^2 + \text{Stability}^2 + \text{Noise}^2}}{S_{11}} \right) + 2C_{\theta 1} \]

where:

\[ \text{Systematic} = R_{EF} + B_{EF} S_{11} + B_{EF} S_{11}^2 + S_{11} S_{11} \left( B_{EF} + 2 B_{EF} B_{EF} S_{11} + B_{EF} S_{12} \right) + A_{EF} S_{11} \]

\[ \text{Stability}^2 = C^2 + R^2 \]

\[ C^2 = C_{\text{Max}}^2 \left( 1 + S_{11}^2 \right) + 4 C_{\text{Max}}^2 S_{11}^2 + C_{\text{Max}}^2 S_{12}^2 S_{12}^2 \]

\[ R^2 = \left( R_{EF} \left( 1 + S_{11}^2 \right) + 2 R_{EF} S_{11} \right)^2 + \left( R_{EF} S_{12} \right)^2 \]

\[ \text{Noise}^2 = \left( N_{F} S_{11} \right)^2 + N_{F}^2 \]

Equation 3: Forward Reflection Magnitude Uncertainty (RSS Computation)

\[ \Delta S_{11(\text{worst})} = \sqrt{\text{Systematic}^2 + \text{Stability}^2 + \text{Noise}^2} \]

where:

\[ \text{Systematic}^3 = E_{EF}^2 + E_{EF}^2 S_{11}^2 + E_{EF}^2 S_{11}^4 + S_{11}^2 S_{11} \left( E_{EF} + 2 E_{EF} E_{EF} S_{11} + E_{EF} S_{12} \right) + A_{EF}^2 S_{11} \]

\[ \text{Stability}^3 = C^2 + R^2 \]

\[ C^2 = C_{\text{Max}}^2 \left( 1 + S_{11}^4 \right) + 4 C_{\text{Max}}^2 S_{11}^2 + C_{\text{Max}}^2 S_{12}^2 S_{12}^2 \]

\[ R^2 = R_{EF}^2 \left( 1 + S_{11}^4 \right) + 4 R_{EF}^2 S_{11}^2 + R_{EF}^2 S_{12}^2 S_{12}^2 \]

\[ \text{Noise}^2 = \left( N_{F} S_{11} \right)^2 + N_{F}^2 \]

Equation 4: Forward Reflection Phase Uncertainty (RSS Computation)
\[ \Delta S_{\text{mag}}(\text{Worst}) = \sqrt{\sin^{-1}\left( \frac{\sqrt{\text{Systematic}^2 + \text{Stability}^2 + \text{Noise}^2}}{S_{11}} \right)}^2 + 4C_{22}^2 \]

\[ \text{where:} \]

- \( \text{Systematic}^2 = B_{\text{eff}}^2 + B_{\text{sp}}^2 S_{11}^2 + B_{\text{sp}}^2 S_{21}^2 + B_{\text{sp}}^2 S_{12}^2 + B_{\text{sp}}^2 S_{22}^2 + B_{\text{sp}}^2 S_{12}^2 + B_{\text{sp}}^2 S_{22}^2 \times \sin^2(A_p) \times C_{11}^2 \)
- \( \text{Stability}^2 = C^2 + R^2 \)
- \( C^2 = C_{\text{inv}}^2 + 4C_{\text{inv}}^2 S_{11}^2 + C_{\text{inv}}^2 S_{11}^2 S_{12}^2 \)
- \( R^2 = R_{11}^2 (1 + S_{11}^2) + 4R_{11}^2 S_{11}^2 + R_{12}^2 S_{21}^2 S_{11}^2 \)
- \( \text{Noise}^2 = (N_p S_{11})^2 + N_p^2 \)

**Forward Transmission Uncertainty**

Equation 5: Forward Transmission Magnitude Uncertainty (Worst Case Computation)

\[ \Delta S_{\text{mag}}(\text{Worst}) = \sqrt{\sin^{-1}\left( \frac{\text{Systematic}^2 + \text{Stability}^2 + \text{Noise}^2}{S_{11}} \right)}^2 + 4C_{22}^2 \]

\[ \text{where:} \]

- \( \text{Systematic} = E_{\text{eff}} + S_{21}(E_{\text{sp}} + E_{\text{sp}} S_{11} + E_{\text{sp}} S_{21} + E_{\text{sp}} E_{\text{sp}} (S_{21} S_{12} + S_{11} S_{22}) + A_{sp}) \)
- \( \text{Stability} = \sqrt{C^2 + R^2} \)
- \( C^2 = C_{\text{inv}}^2 + 4C_{\text{inv}}^2 S_{11}^2 + C_{\text{inv}}^2 S_{11}^2 S_{12}^2 \)
- \( R^2 = R_{11}^2 (1 + S_{11}^2) + 4R_{11}^2 S_{11}^2 + R_{12}^2 S_{21}^2 S_{11}^2 \)
- \( \text{Noise}^2 = (N_p S_{11})^2 + N_p^2 \)

Equation 6: Forward Transmission Phase Uncertainty (Worst Case Computation)

\[ \Delta S_{\text{phase}} = \sin^{-1}\left( \frac{\sqrt{\text{Systematic}^2 + \text{Stability}^2 + \text{Noise}^2}}{S_{11}} \right) + C_{22}^2 + C_{22}^2 \]

\[ \text{where:} \]

- \( \text{Systematic} = E_{\text{eff}} + S_{21}(E_{\text{sp}} + E_{\text{sp}} S_{11} + E_{\text{sp}} S_{21} + E_{\text{sp}} E_{\text{sp}} (S_{21} S_{12} + S_{11} S_{22}) + \sin(A_p)) \)
- \( \text{Stability} = \sqrt{C^2 + R^2} \)
- \( C^2 = C_{\text{inv}}^2 + 4C_{\text{inv}}^2 S_{11}^2 + C_{\text{inv}}^2 S_{11}^2 S_{12}^2 \)
- \( R^2 = R_{11}^2 (1 + S_{11}^2) + 4R_{11}^2 S_{11}^2 + R_{12}^2 S_{21}^2 S_{11}^2 \)
- \( \text{Noise}^2 = (N_p S_{11})^2 + N_p^2 \)

Equation 7: Forward Transmission Magnitude Uncertainty (RSS Computation)
\[
\Delta S_{21(\text{med})} = \sqrt{\text{Systematic}^2 + \text{Stability}^2 + \text{Noise}^2}
\]

where:

\[
\text{Systematic}^2 = E_{\text{ff}}^2 + S_{21}^2 \left( B_{21}^2 + E_{\text{ff}}^2 S_{11}^2 + E_{\text{ff}}^2 S_{22}^2 + E_{\text{ff}}^2 E_{\text{ff}}^2 \left( S_{11}^2 S_{22}^2 + S_{11}^2 S_{22}^2 \right) + A_{\text{ff}}^2 \right)
\]

\[
\text{Stability}^2 = C^2 + R^2
\]

\[
C^2 = S_{21}^2 \left( C_{\text{ff}}^2 + C_{\text{ff}}^2 + C_{\text{ff}}^2 S_{11}^2 + C_{\text{ff}}^2 S_{22}^2 \right)
\]

\[
R^2 = S_{21}^2 \left( R_{\text{ff}}^2 + R_{\text{ff}}^2 S_{11}^2 + R_{\text{ff}}^2 S_{22}^2 \right)
\]

\[
\text{Noise}^2 = (N_T S_{21})^2 + N_T^2
\]

Equation 8: Forward Transmission Phase Uncertainty (RSS Computation)

\[
\Delta S_{21(\text{med})} = \sqrt{\sin^2 \left( \sqrt{\text{Systematic}^2 + \text{Stability}^2 + \text{Noise}^2} \right) + \frac{C^2}{S_{21}} + \frac{R^2}{S_{21}}}
\]

where:

\[
\text{Systematic}^2 = E_{\text{ff}}^2 + S_{21}^2 \left( B_{21}^2 + E_{\text{ff}}^2 S_{11}^2 + E_{\text{ff}}^2 S_{22}^2 + E_{\text{ff}}^2 E_{\text{ff}}^2 \left( S_{11}^2 S_{22}^2 + S_{11}^2 S_{22}^2 \right) + \sin^2 (A_{\text{ff}}) \right)
\]

\[
\text{Stability}^2 = C^2 + R^2
\]

\[
C^2 = S_{21}^2 \left( C_{\text{ff}}^2 + C_{\text{ff}}^2 + C_{\text{ff}}^2 S_{11}^2 + C_{\text{ff}}^2 S_{22}^2 \right)
\]

\[
R^2 = S_{21}^2 \left( R_{\text{ff}}^2 + R_{\text{ff}}^2 S_{11}^2 + R_{\text{ff}}^2 S_{22}^2 \right)
\]

\[
\text{Noise}^2 = (N_T S_{21})^2 + N_T^2
\]

Reverse Transmission Uncertainty

Equation 9: Reverse Transmission Magnitude Uncertainty (Worst Case Computation)

\[
\Delta S_{21(\text{wsc})} = \sqrt{\text{Systematic}^2 + \text{Stability}^2 + \text{Noise}^2}
\]

where:

\[
\text{Systematic} = E_{\text{rr}}^2 + S_{11}^2 \left( B_{21}^2 + E_{\text{rr}}^2 S_{22}^2 + E_{\text{rr}}^2 S_{12}^2 + E_{\text{rr}}^2 E_{\text{rr}}^2 \left( S_{21}^2 S_{22}^2 + S_{11}^2 S_{22}^2 \right) + A_{\text{rr}}^2 \right)
\]

\[
\text{Stability} = \sqrt{C^2 + R^2}
\]

\[
C^2 = S_{11}^2 \left( C_{\text{rr}}^2 + C_{\text{rr}}^2 + C_{\text{rr}}^2 S_{22}^2 + C_{\text{rr}}^2 S_{12}^2 \right)
\]

\[
R^2 = S_{11}^2 \left( R_{\text{rr}}^2 + R_{\text{rr}}^2 S_{22}^2 + R_{\text{rr}}^2 S_{12}^2 \right)
\]

\[
\text{Noise}^2 = (N_T S_{11})^2 + N_T^2
\]

Equation 10: Reverse Transmission Phase Uncertainty (Worst Case Computation)
\[ \Delta \xi_{\text{pop}} = \sin^{-1} \left( \frac{\sqrt{\text{Systematic} + \text{Stability}^2 + \text{Noise}^2}}{S_{12}} \right) + C_{\tau_1} + C_{\tau_2} \]

where:

\[ \text{Systematic} = E_{p}S_{12} + R_{12} + E_{s}S_{22} + E_{s}E_{p}S_{11} + E_{s}S_{12} \left( S_{21}S_{12} + S_{11}S_{22} \right) + \sin \left( A_{p} \right) \]

\[ \text{Stability} = \sqrt{C^2 + R^2} \]

\[ C^2 = S_{21}^2 \left( C_{\tau_1}^2 + C_{\tau_2}^2 + C_{\eta_1}^2 + C_{\eta_2}^2 \right) \]

\[ R^2 = S_{21}^2 \left( R_{12}^2 + R_{21}^2 \right) \]

\[ \text{Noise}^2 = \left( N_r S_{12} \right)^2 + N_f^2 \]

Equation 11: Reverse Transmission Magnitude Uncertainty (RSS Computation)

\[ \Delta \xi_{\text{pop}} = \sqrt{\text{Systematic}^2 + \text{Stability}^2 + \text{Noise}^2} \]

where:

\[ \text{Systematic}^2 = E_{p}^2S_{12}^2 + S_{12}^2 \left( E_{s}^2 + E_{s}^2 + S_{11}^2 + E_{s}^2 \right) \left( S_{21}^2 + S_{22}^2 \right) + \sin^2 \left( A_{p} \right) \]

\[ \text{Stability}^2 = C^2 + R^2 \]

\[ C^2 = S_{21}^2 \left( C_{\tau_1}^2 + C_{\eta_1}^2 + C_{\eta_2}^2 \right) \]

\[ R^2 = S_{21}^2 \left( R_{12}^2 + R_{21}^2 \right) \]

\[ \text{Noise}^2 = \left( N_r S_{12} \right)^2 + N_f^2 \]

Equation 12: Reverse Transmission Phase Uncertainty (RSS Computation)

\[ \Delta \xi_{\text{pop}} = \sin^{-1} \left( \frac{\sqrt{\text{Systematic}^2 + \text{Stability}^2 + \text{Noise}^2}}{S_{12}} \right) + C_{\tau_1} + C_{\tau_2} \]

where:

\[ \text{Systematic}^2 = E_{p}^2S_{12}^2 + S_{12}^2 \left( E_{s}^2 + E_{s}^2 + S_{11}^2 + E_{s}^2 \right) \left( S_{21}^2 + S_{22}^2 \right) + \sin^2 \left( A_{p} \right) \]

\[ \text{Stability}^2 = C^2 + R^2 \]

\[ C^2 = S_{21}^2 \left( C_{\tau_1}^2 + C_{\eta_1}^2 + C_{\eta_2}^2 \right) \]

\[ R^2 = S_{21}^2 \left( R_{12}^2 + R_{21}^2 \right) \]

\[ \text{Noise}^2 = \left( N_r S_{12} \right)^2 + N_f^2 \]

Reverse Reflection Uncertainty

Equation 13: Reverse Reflection Magnitude Uncertainty (Worst Case Computation)
Equation 14: Reverse Reflection Phase Uncertainty (Worst Case Computation)

$$\Delta S_{21(\text{wac})} = \sin^{-1}\left(\frac{\sqrt{\text{Systematic}^2 + \text{Stability}^2 + \text{Noise}^2}}{S_{22}}\right) + 2C_{\pi/2}$$

where:

- **Systematic** = $E_{23} + E_{32}S_{22} + E_{32}^2S_{22}^2 + E_{23}^2S_{22} + R_{21}S_{22} (E_{23} + 2E_{32}E_{12}S_{22} + E_{32}^2S_{11}) + A_{34}S_{22}$
- **Stability** = $\sqrt{C^2 + R^2}$
- $C^2 = C_{\text{kkz}} (1 + S_{22}^2) + 4C_{\text{mc}}^2S_{22} + C_{\text{mc}}^2S_{21}^2S_{12}^2$
- $R^2 = (R_{23} (1 + S_{22}^2) + 2R_{22}S_{22})^2 + (R_{21}S_{21}S_{12})^2$
- **Noise** = $(N_xS_{22})^2 + N_y^2$

Equation 15: Reverse Reflection Magnitude Uncertainty (RSS Computation)

$$\Delta S_{21(\text{rss})} = \sqrt{\text{Systematic}^2 + \text{Stability}^2 + \text{Noise}^2}$$

where:

- **Systematic** = $E_{23} + E_{32}S_{22} + E_{32}^2S_{22}^2 + E_{23}S_{22} + R_{21}S_{22} (E_{23} + 2E_{32}E_{12}S_{22} + E_{32}^2S_{11}) + \sin(A_{3})S_{22}$
- **Stability** = $\sqrt{C^2 + R^2}$
- $C^2 = C_{\text{kkz}} (1 + S_{22}^2) + 4C_{\text{mc}}^2S_{22} + C_{\text{mc}}^2S_{21}^2S_{12}^2$
- $R^2 = (R_{23} (1 + S_{22}^2) + 2R_{22}S_{22})^2 + (R_{21}S_{21}S_{12})^2$
- **Noise** = $(N_xS_{22})^2 + N_y^2$

Equation 16: Reverse Reflection Phase Uncertainty (RSS Computation)
Sources of Systematic Errors

The residual (after measurement calibration) systematic errors result from imperfections in the calibration standards. For reflection measurements, the associated residual errors are:

- residual directivity
- residual source match
- residual load match
- residual reflection tracking

For transmission measurements, the additional residual errors are:

- residual crosstalk
- residual load match
- residual transmission tracking

The listing below shows the abbreviations used for residual systematic errors that are in the uncertainty equations.

<table>
<thead>
<tr>
<th>Abbreviation</th>

</tbody>
</table>

All measurements are affected by dynamic accuracy. Dynamic accuracy includes: errors during internal self-calibration routines, gain compression in the microwave frequency converter (sampler) at high signal levels, errors generated in the synchronous detectors, localized non-linearities in the IF filter system, and from LO leakage into the IF signal paths.

Sources of Random Errors

The random error sources are:

- noise
- connector repeatability
- interconnecting cable stability

There are two types of noise in any measurement system:

- low level noise (noise floor)
- high level noise (trace noise)

\[
\Delta S_{\text{sys}}(\text{phase}) = \sqrt{\sin^2 \left( \frac{\text{Systematic}^2 + \text{Stability}^2 + \text{Noise}^2}{S_{22}} \right)^2 + 4 \frac{C^2}{\eta_0}}
\]

where:

\[
\text{Systematic}^2 = E_{D1}^2 + E_{D2}^2 + E_{S1}^2 + E_{S2}^2 + E_{R1}^2 + E_{R2}^2 + E_{L1}^2 + E_{L2}^2 + E_{T1}^2 + E_{T2}^2 + \sin^2 \left( A_p \right) S_{22}^2
\]

\[
\text{Stability}^2 = C^2 + R^2
\]

\[
C^2 = C_{\text{erb}}^2 \left( 1 + S_{22}^4 \right) + 4 C_{\text{erb}}^2 S_{22}^2 + C_{\text{erb}}^2 S_{21}^4 S_{12}^2
\]

\[
R^2 = \left( R_{\text{sr}} \left( 1 + S_{22}^2 \right) + 2 R_{\text{pr}} S_{22} \right) + \left( R_{\text{rl}} S_{21} S_{12} \right) \cdot 2
\]

\[
\text{Noise}^2 = \left( N_{S} S_{22} \right) + N_{f}^2
\]
Low level noise is the broadband noise floor of the receiver which can be reduced through averaging or by changing the IF bandwidth.

High level noise or trace noise is due to the noise floor of the receiver, and the phase noise of the LO source inside the test set. It is worsened by reducing the IF bandwidth. Using a high stability 10 MHz time base can reduce high level noise.

Connector repeatability is the random variation encountered when connecting a pair of RF connectors. Variations in both reflection and transmission can be observed.

Cable stability is dependent on the cable used and the amount of cable movement between calibration and measurement. The listing below shows the abbreviations used for random errors in the error models and uncertainty equations.

\[
\begin{align*}
NF &= \text{noise floor} \\
NT &= \text{trace noise} \\
CR1 &= \text{port 1 cable reflection stability} \\
CTM1 &= \text{port 1 cable magnitude transmission stability} \\
CTP1 &= \text{port 1 cable phase transmission stability} \\
CR2 &= \text{port 2 cable reflection stability} \\
CTM2 &= \text{port 2 cable magnitude transmission stability} \\
CTP2 &= \text{port 2 cable phase transmission stability} \\
RR1 &= \text{port 1 connector reflection repeatability} \\
RT1 &= \text{port 1 connector transmission repeatability} \\
RR2 &= \text{port 2 connector reflection repeatability} \\
RT2 &= \text{port 2 connector transmission repeatability}
\end{align*}
\]

Determining Expected System Performance

Improper connection techniques and contact surfaces can degrade measurement accuracy.

Proper connection techniques include using a torque wrench with proper torque limits, ensuring that the connector pin depths meet specifications, ensuring that the center conductor of sliding loads is properly set, and observing proper handling procedures for beadless airlines.

Contact surface errors are caused by improper cleaning procedures, scratches, worn plating, and rough seating. View more information on connector care.

If proper connection techniques and connector care is observed, the following table provides an indication of connector repeatability.

Determining Cable Stability Terms
(CR1, CR2, CTM1, CTM2, CTP1, CTP2)

Cable stability is dependent on the cable used and the amount of cable movement between calibration and measurement. Values for cable reflection stability are determined by connecting a fixed load to the free end of the cable and measuring the change in reflection coefficient after flexing the cable through the normal range of cable movement for a particular setup. Cable transmission stability is determined by connecting a short to the free end of the cable and measuring the change in reflection coefficient due to changes in cable position.

Graphics 1-3 demonstrate concepts useful in determining cable stability. In each case, a cable (part number 8120-4779) was connected to port 1, with a fixed load connected to the free end. A reference trace is obtained by measuring S11 with the free end held close to port 2 and storing the results in memory. Two additional S11 measurements are made; one with the cable flexed out to its straight position and the other with the cable positioned back to the same location as reference trace. As shown in Graphic 1, the flexed position demonstrates the effect of moving the cable after calibration. The repeatability trace demonstrates the stability of the cable when moved to its original position.

Graphic 1

Graphic 1 demonstrates the concepts useful in determining cable reflection stability. A fixed load is connected to the free end. The DATA-MEM feature provides an indication of the cable reflection stability. A 60-dB peak on the chart yields a reflection stability estimated as 10(−60/20) or 0.001.

Graphic 2
Graphic 2 and Graphic 3 demonstrate the concepts useful in determining cable transmission stability. A short is connected to the free end. The DATA/MEM feature provides an indication of the two-way cable transmission stability. The one-way transmission magnitude stability is determined by dividing the two-way magnitude measurement by two before it is converted to linear. A $0.013\text{ dB}$ peak on the chart yields transmission magnitude stability estimated as $10(0.013/40) - 1$ or $0.00075$. The one-way transmission phase stability is determined by dividing the two-way phase measurement by two.

Cable movement often has a much larger effect on phase measurements than magnitude measurements.

Measurement Errors

What is Measurement Calibration?

Why is Calibration Necessary?
Default EE Data

EE Default Adjustment

This program must be run whenever an assembly is replaced. This program sets correction DAC values for each assembly for each band so that the assembly outputs the proper power level at all frequencies.

Equipment needed

Power Meter and Sensor, GPIB cable (or LAN, or USB cable depending upon connection method to Power Meter), Adapters as needed.

Procedure

Note: You must be logged onto the VNA as an Administrator to perform an adjustment. Learn more.

Press System > Service > Adjustment Routines....

At the Adjustments selection, click EE Default Adjustment

This program is a combination of up to 9 different adjustments. The number of applicable adjustments varies with model number and options. The above image shows all available adjustments for a 50GHz PNA-X with Option 029. Assemblies with “NF” or “Noise” are only applicable to VNAs with Option 029 or H29 (Noise Figure). Only valid assemblies for each particular VNA will be available.

Select the appropriate assembly, then click Initialize. This presets all values to some known (default) condition. This only takes a few seconds. In general, Initializing is usually the only process that needs to be performed for all Synthesizers.

For other assemblies, click Adjustment / Verify. This will improve upon the default initialization and will result in better performance. Performing an adjustment or verification will require one or more power sensors to measure the actual output power. Connect the power sensor at the appropriate measurement point. Follow the prompts in the program. For assemblies where the connection point is not obvious, click Setup to see a picture of the actual connection point.

Selecting Verify will plot the difference between its current output power level and the specified level.
Note: The maximum measured frequency for these adjustments is only 26.5GHz, even for VNA models with a maximum frequency of 50GHz and higher.

Data Storage

The correction data for the Synth LO, Synth Src1, and Synth Src2 adjustments are stored in the EEPROM on the selected assembly.

The correction data for the remaining adjustments are stored in flash memory on the Test Set Motherboard.
System Default Calibration

The Default System Calibration creates a system cal for TDR, GDM, and other uses. This adjustment is for service only; not for measurement calibration.

Required Equipment

DC ECal or Mechanical Calibration Kit
See VNA Accessories

Notes

You must be logged onto the VNA as an Administrator to perform an adjustment. Learn more.

Procedure

Click Utility, then System, then Service, then Adjustment Routines...

At the Adjustments selection, click System Default Calibration. The System Default Calibration dialog is displayed as shown below.

Select the calibration method (ECal or Mechanical Standards).

Click on the Begin Cal button to begin the calibration.

Follow the instructions displayed in the program.

Data Storage

The correction data is stored in the hard drive.
IF Gain Adj for mm Mode

This program adjusts the gain of the IF mux in the N5290A/91A system.

This adjustment is for service only; not for measurement calibration.

**Required Equipment**

See list of supported power meters and sensors.

See VNA Accessories

**Notes**

You must be logged onto the VNA as an Administrator to perform an adjustment. [Learn more.](#)

**Procedure**

Click **Utility**, then **System**, then **Service**, then **Adjustment Routines...**

At the Adjustments selection, click **IF Gain Adj for mm Mode**. The PNA IF Gain Adjustment for Wideband dialog is displayed as shown below.

Select the first port to adjust. Each port with a frequency extender connected must be adjusted.

Click on the **Begin** button and follow the instructions displayed in the program.

Set up the power sensors then click **OK**. Up to three different power sensor configurations can be saved and recalled.
Follow the instructions displayed in the program.

**Data Storage**

The correction data is stored in the flash memory.
IF Response Adj for mm Mode

This program adjusts IF correction for the frequency extenders from the N5292A, N5261A, or N5262A test set. This adjustment is for service only; not for measurement calibration.

Required Equipment

See VNA Accessories

Notes

You must be logged onto the VNA as an Administrator to perform an adjustment. Learn more.

Procedure

Click Utility, then System, then Service, then Adjustment Routines...

At the Adjustments selection, click IF Response Adj. for mm Mode. The PNA IF Response for Millimeter Systems dialog is displayed as shown below.

Select the ports to adjust that have frequency extenders (mm heads) attached.

Connect either a short or open to the ports.

Click on the Begin button.

Follow the instructions displayed in the program.

Data Storage

8559
The correction data is stored in the flash memory.
IF Response Adjustment

This adjustment is required when upgrading. Adjustments are made to the IF amplitude, phase, and offsets.

Note: For phase adjustment, the U9391C 10 MHz to 26.5 GHz comb generator is recommended for best results instead of the higher frequency comb generator models.

When to perform

IF response adjustment is required when upgrading to Option S93090x A/B, S93093/A/B, or S93094/A/B. In addition, this adjustment must be performed each time a new configuration is set up or if cables are changed.

Requirements

Latest firmware
For Broadband systems (Option S93093/A/B):

- Leave ports open
- Connect a thru

For Banded systems (Option S93094/A/B):

- Apply a short to the waveguide ports
- U9391x comb generator (phase adjustment only)
- U9391-60009 sine to square wave converter (phase adjustment only)
- +15 VDC power supply (phase adjustment only)
- USB cables (2) (phase adjustment only)
- RF cable
- Adapters as needed

Procedure

Click Utility, then System, then Service, then Adjustment Routines....

At the Adjustments selection, click IF Response Adjustment.
Select the desired adjustments then click Begin.
Follow the instructions displayed in the program.

Data Storage

The correction data is stored in the flash memory on the Test Set Mother Board.
IF Response Adjustment_6021 and above

Note: This procedure applies ONLY to instruments with serial prefix 6021 and above with A.14.00.xx firmware and above (new DDS source).

This adjustment is required when upgrading. Adjustments are made to the IF amplitude, phase, and offsets.

When to perform

IF response adjustment is required when upgrading to Option S93090xA/B, S93093A/B, or S93094A/B. In addition, this adjustment must be performed each time a new configuration is set up or if cables are changed.

Requirements

Latest firmware
For Broadband systems (Option S93093A/B):

- Leave ports open
- Connect a thru

For Banded systems (Option S93094A/B):

- Apply a short to the waveguide ports
- RF cable
- Adapters as needed

Procedure

Click Utility, then System, then Service, then Adjustment Routines....

At the Adjustments selection, click IF Response Adjustment.
Select the desired adjustments then click Begin.
Follow the instructions displayed in the program.

Data Storage

The correction data is stored in the flash memory on the Test Set Mother Board.
LFE Receiver Adjustment mm

This program adjusts the Option 205 (2-port) or Option 425 (4-port) Low Frequency Extension (LFE) receivers in the N5293AX03/N5295AX03 Frequency Extenders for a flat response across the full frequency range. The range of this adjustment is 500 Hz to 210 MHz. Learn more about LFE.

This adjustment is for service only; not for measurement calibration.

Required Equipment

See list of supported power meters and sensors.
See VNA Accessories

Notes

- The recommended power sensor is the U8485A with Option 200 (DC - 33 GHz).
- The ECal module must function down to DC.
- You must be logged onto the VNA as an Administrator to perform an adjustment. Learn more.

Procedure

Click Utility, then System, then Service, then Adjustment Routines...

At the Adjustments selection, click LFE Receiver Adj. The LFE Head Mixer Cal Adjustment dialog is displayed as shown below.

Select the first port to adjust. Each port with a frequency extender connected must be adjusted.

Select the calibration method (ECal or Mechanical Standards).
Click on the **Begin** button and follow the instructions displayed in the program.

Follow the instructions displayed in the program.

**Data Storage**

The correction data is stored in the flash memory.
LFE Receiver Adjustment - Standard

This program adjusts the Option 205 (2-port) or Option 425 (4-port) Low Frequency Extension (LFE) receivers for a flat response across the full frequency range. The range of this adjustment is 500 Hz to 210 MHz. Learn more about LFE.

This adjustment is for service only; not for measurement calibration.

Required Equipment

See list of supported power meters and sensors.
See VNA Accessories

Notes

The recommended power sensor is the U8485A with Option 200 (DC - 33 GHz).
The ECal module must function down to DC.
You must be logged onto the VNA as an Administrator to perform an adjustment. Learn more.

Procedure

Click Utility, then System, then Service, then Adjustment Routines...

At the Adjustments selection, click LFE Receiver Adjustment. The LFE Mixer Cal Adjustment dialog is displayed as shown below.

Select the calibration method (ECal or Mechanical Standards).
Select the power sensor.
Click on the Begin button and follow the instructions displayed in the program.
Follow the instructions displayed in the program.

**Data Storage**

The correction data is stored in the flash memory.
LO Adjustment for mm Mode

This program adjusts the LO power to the frequency extenders from the N5292A, N5261A, or N5262A test set.

This adjustment is for service only; not for measurement calibration.

Required Equipment

See list of supported power meters and sensors.
See VNA Accessories

Notes

The recommended power sensor is the U8485A with Option 200 (DC - 33 GHz).

You must be logged onto the VNA as an Administrator to perform an adjustment. Learn more.

Procedure

Click Utility, then System, then Service, then Adjustment Routines...

At the Adjustments selection, click LO Adjustment for mm Mode. The PNA LO Adjustment for Wideband Systems dialog is displayed as shown below.

Select the port to adjust. Only one port needs to be adjusted since the same data is used for all ports.

Click on the Begin button.
Set up the power sensors then click **OK**. Up to three different power sensor configurations can be saved and recalled.

Follow the instructions displayed in the program.

**Data Storage**

The correction data is stored in the flash memory.
N522xB Block Diagrams

2-Port Models with Option 219 and the following:

- Opt 020 - Rear-panel IF Inputs
- Opt 021 - Pulse Modulator on Source 1
- Opt S93025A/B - Four internal pulse generators

See all options

Legend

- Bias Tee
- Source and Receiver Attenuators
- Front-panel Jumper
- Receiver

4-Port Models with Option 419 and the following:

- Opt 020 - Rear-panel IF Inputs
- Opt 021 - Pulse Modulator on Source 1
- Opt 022 - Pulse Modulator on Source 2
- Opt 025 - Four internal pulse generators
Noise Figure Adjustment

This adjustment is ONLY for the following 13.5 or 26.5 GHz models with Noise Figure:

- N5241B Opt 029
- N5242B Opt 029

See Adjustment procedure for 43.5 GHz, 50 GHz, and 67 GHz models.

This procedure does the following:

- Sets warning level for overpower conditions at the noise receiver. (Noise compression test)
- Sets IF Gain flatness for the noise receiver. (IF Gain Cal)
- Overwrites the factory noise receiver calibration. (Noise correction test).

Perform this procedure after replacing any component in the noise figure circuitry, or if the VNA fails the noise IF gain portion of the OP check.

To launch the adjustment program:

- Click Utility, then System, then Service, then Adjustment Routines....
- Click Noise Adjustment. Available only with Opt 029 or Opt H29 installed.

Equipment Required

- Compatible ECal module (N4691A recommended)
Compatible Noise source (346C recommended)
High quality RF Cable

Note: On a 50 GHz Option H29 VNA, noise figure adjustments and measurements are limited to 26.5 GHz.

Advanced  For Service personnel only.

Select Adjustments  Leave all three checked, unless otherwise instructed.

Procedure

This adjustment is made without the Noise Tuner connected. Connect the original jumper cable to the VNA front panel.

This adjustment requires a compatible ECal module. Make sure the ECal USB cable is connected to the VNA before beginning. Also required is a 26.5 GHz noise source such as the 346C.

Ignore any beeps or warnings as the adjustment program is running.

The adjustment program prompts you through the following steps:

Select the ENR file for the Noise Source you will be using. This adjustment will automatically remember, and use, the last file selected. These files should normally reside in the C:\Program Files(x86)\Keysight\Network Analyzer\Noise directory, but they can also exist elsewhere. If the proper file does not already exist, click Create New to enter data for the noise source you will be using.

Click Begin

Connect a high-quality cable between port 1 and port 2.

When prompted, connect the Noise Source to port 2, either directly or with a short, low-loss adapter.

You will be prompted to reconnect the high-quality cable between ports 1 and 2.

When prompted, disconnect the cable at port 2 and insert the ECal module between port 2 and the free end of the cable. Connect the ECal module directly to port 2 without using any adapters if possible.

The entire procedure takes about 15-30 minutes.

Noise Figure Adjustment

This adjustment is ONLY for the following 43.5, 50, and 67 GHz models with Noise Figure:

N5244A Opt 029
N5245 Opt 029
N5247A Opt 029

This procedure does the following:

Sets warning level for overpower conditions at the noise receiver. (Noise compression test)
Sets IF Gain flatness for the noise receiver. (IF Gain Cal)
Sets the proper offset to compensate for Noise Bandwidth offset variations
Overwrites the factory noise receiver calibration. (Noise correction test).
Perform this procedure after replacing any component in the noise figure circuitry, or if the VNA fails the noise IF gain portion of the OP check.

To launch the adjustment program:

Click Utility, then System, then Service, then Adjustment Routines....
Click Noise Adjustment  Available only with Opt 029 installed.

Equipment Required

Compatible ECal module (N4693A or N4694A recommended)
Power Meter with compatible Sensor (8487A, N8487A, or N8488A required)
High quality RF Cable

Note: On a 67 GHz VNA, noise figure adjustments and measurements are limited to 50 GHz.
Advanced  For Service personnel only.

Select Adjustments  Leave all four checked, unless otherwise instructed.
This adjustment requires a compatible 50 or 67 GHz ECal module. Make sure the ECal USB cable is connected to the VNA before beginning. Ignore any beeps or warnings as the adjustment program is running.

The adjustment program prompts you through the following steps:
Select the GPIB address of the power meter you will be using. If using a dual power meter, select the input channel that the sensor is connected to.

Click Begin

Follow all prompts.

When prompted for the ECal module, disconnect the cable at port 2 and insert the ECal module between port 2 and the free end of the cable. Connect the ECal module directly to port 2 without using any adapters if possible.

The entire procedure takes about 30-45 minutes.

**Noise Figure Adjustment Data Storage for all VNA models**

The correction data is stored in the flash memory on the Test Set Mother Board.
VNAX Block Diagrams

2-Port Models with Option 224 and the following:

- Opt 021 - Pulse Modulator on Source 1
- Opt 022 - Pulse Modulator on Source 2
- Opt S93025A/B - Four internal pulse generators

See all options

Block Diagrams for other configurations are available in the last pages of each specifications document.

4-Port Models with Option 423 and the following:

- Opt 021 - Pulse Modulator on Source 1
- Opt 022 - Pulse Modulator on Source 2
Opt S93025A/B - Four internal pulse generators
See all options
Preventing VNA SSD Problems

The leading cause of PNA failures is problems with the VNA Solid State Drive (SSD). These problems are usually preventable, and in many cases, recoverable (see Recovering from VNA SSD Problems). The following could save you weeks of downtime and the cost of replacing your VNA SSD.

Do NOT Modify or Reconfigure the Operating System

The Microsoft Windows operating system has been modified and optimized by Keysight to improve the performance of the VNA.

- Do NOT install a standard version of the Windows operating system on the VNA.
- Do NOT change advanced performance settings or group policies.
- Do NOT add or delete any hard disk drive partitions on the VNA.
- Do NOT modify any of the Keysight software registry entries.

Install Antivirus Protection

The VNA does NOT have antivirus protection when shipped. Use of an antivirus program is strongly recommended if you connect the VNA to the Internet.

In addition, the use of a firewall could help to protect the VNA from viruses. However, some firewalls could limit DCOM connectivity of the VNA.

Install Windows Critical Updates

The VNA is always shipped with the latest service packs and critical updates that were available at the time that the VNA is produced. We recommend that you maintain the latest available protection for your VNA by automatically accepting and installing the latest critical security patches from the Microsoft Windows Update website: http://windowsupdate.microsoft.com

Use Firmware Update

If your VNA is connected to the Internet, use the Firmware Update to obtain the latest firmware. On the VNA, click System, Service, Firmware Update to automatically update your firmware to the current revision.

If your VNA is NOT connected to the Internet, you must update firmware using a CDROM or pen drive. When updating, NEVER skip a major VNA firmware revision. For example, to update from A.02.xx to A.04.xx, first install any version of A.03.xx, then update to A.04.xx.

Remove Power from the VNA ONLY when the Power Button is Yellow

Unplugging the power cord, or otherwise removing power when the power button is green, can damage the VNA SSD. Learn more about powering the VNA ON and OFF.

Having VNA SSD Problems?

If you are experiencing problems which may be caused by a faulty VNA SSD, please see Recovering from VNA SSD Problems.
Receiver Characterization

**Equipment needed:**

The cables and adapters listed in the dialog box.

**Procedure**

*Note: You must be logged onto the VNA as an Administrator to perform an adjustment.* Learn more.

Click **Utility, then System, then Service, then Adjustment Routines....**

At the **Adjustments selection**, click **Receiver Characterization**.

Follow prompts in the program.

![Receiver Characterization](image)

Select the receivers to be characterized, or click **Select All**.

**Data Storage**

The correction data is stored in the flash memory on the Test Set Mother Board.
Receiver Characterization mm Mode

This program adjusts the high level amplitude response of the N5290A/91A system.

**Required Equipment**

See list of supported power meters and sensors.
See VNA Accessories

**Notes**

You must be logged onto the VNA as an Administrator to perform an adjustment. Learn more.

**Procedure**

Click **Utility**, then **System**, then **Service**, then **Adjustment Routines**...

At the Adjustments selection, click **Receiver Characterization**. The **Receiver Characterization** dialog is displayed as shown below.

Select the receivers to be characterized, or click **Select All**.

Follow the instructions displayed in the program.

**Data Storage**

The correction data is stored in the flash memory.
Source and Receiver Adj

This program adjusts the source and receiver of the N5293AX03/N5295AX03 Frequency Extenders.

This adjustment is for service only; not for measurement calibration.

Required Equipment

See list of supported power meters and sensors.
See VNA Accessories

Notes

You must be logged onto the VNA as an Administrator to perform an adjustment. Learn more.

Procedure

Click Utility, then System, then Service, then Adjustment Routines...

At the Adjustments selection, click Source and Receiver Adj. The PNA Src/Rcvr Adjustment dialog is displayed as shown below.

Select the first port to adjust. Each port with a frequency extender connected must be adjusted.

Click on the Begin button and follow the instructions displayed in the program.

Follow the instructions displayed in the program.
Data Storage

The correction data is stored in the flash memory.
Support Overview

Learn about your Analyzer

Tip: Use Move App to Back to cause the PNA application to move behind these support applications on the screen.

Caution: Avoid expensive repairs to your analyzer. Read Electrostatic Discharge Protection.
Synthesizer Bandwidth Adjustment

The Synth Bandwidth adjusts the loop bandwidth of the synthesizer by measuring the sideband amplitude difference of the IF signal from the main signal. The program aims for a difference of 7dB.

**Equipment needed:**

Compatible Spectrum Analyzer, GPIB cable, RF cable. An Keysight spectrum analyzer (SA) that covers 3.7 GHz is required. The SA must be controlled via GPIB.

**Procedure**

*Note: You must be logged onto the VNA as an Administrator to perform an adjustment. [Learn more.]*

Click Utility, then System, then Service, then Adjustment Routines....

At the **Adjustments selection**, click **Synthesizer Bandwidth Adjustment**.

Follow prompts in the program.

Connect the SA to the VNA.

The adjustment program will display the proper connection point. In most cases the connection point is either on the front or rear panel of the VNA, so no internal connection is needed.

For PNA-L models (N5231A-N5239A) the connection point is internal to the chassis, so the VNA must be opened.
There are either one, two, or three synthesizers depending upon model and option. Only the synthesizers valid for the particular instrument will be enabled and selectable. All should be adjusted since the actual adjustment takes less than 1 minute.

**Data Storage**

The correction data is stored in the EEPROM on the selected Synthesizer assembly.
Synthesizer DAC Adj.

The synthesizer DACs are adjusted for best phase noise. This adjustment is only required on option UNY instruments.

**Note:** Performing this adjustment on instruments that do not have option UNY can be done but will not improve phase noise. That is, it will have no effect.

**Equipment needed:**

Compatible Spectrum Analyzer, GPIB cable (or LAN cable), RF cable. An Keysight spectrum analyzer (SA) that covers 6 GHz is required. The Spectrum Analyzer must be controlled via GPIB or LAN.

**Procedure**

**Note:** You must be logged onto the VNA as an Administrator to perform an adjustment. [Learn more.]

Click **Utility**, then **System**, then **Service**, then **Adjustment Routines**...

At the **Adjustments selection**, click **Synthesizer DAC Adj**.

Follow prompts in the program.

The program will prompt for the proper connections.

Ensure that the Spectrum Analyzer is connected to the VNA via GPIB or LAN.
Click on the Begin Cal button.

**Data Storage**

The correction data is temporarily stored on the hard drive but it is then immediately uploaded to the synthesizer flash memory.
Install VDI PM5 Driver

VDI’s ‘PM5’ power meter MAY work with the VNA. However, because there are many factors out of our control, we can not guarantee the functionality or performance.

**Note:** The minimum required firmware version of the VDI PM5 power sensor is VC1501.

**Note:** VNA firmware between A.11.00.xx and A.13.20.xx do NOT include this capability. Ideally, the VNA should have the most recent VNA Firmware that is supported by your VNA.

To enable the use of the PM5 power meter with the VNA Source Power Cal and Power Meter-As-Receiver (PMAR) features, you must first install on your VNA the software that VDI supplies on a USB stick with the PM5. The procedure for installing that software on the VNA is the same as installing it on a PC, which is detailed in the manual for the PM5 which can be found here: http://www.vadiodes.com/images/Products/PowerMeter/PM5manual/VDI-724-PM5-Manual.pdf

Once that software is installed on the VNA, the PM5 is accessed via Source Power Cal and PMAR by the VISA resource string “ASRL3::INSTR”. The following dialogs illustrate how to specify that in the VNA’s Power Meter Settings dialog for Source Power Cal and the VNA’s External Devices dialog for PMAR.

![Power Meter Settings dialog](image)

For more information, refer to the Power Meter Settings dialog description.
For more information, refer to the External Device Configuration dialog description.

Connectivity Guide
Rear-Panel Tour

Caution: Avoid expensive repairs to your analyzer. Read Electrostatic Discharge Protection.
A 'Hot' S22 measurement is a normal S22 measurement of a power amplifier with drive power applied to the amplifier input. This situation more closely resembles the output match characteristics of an amplifier under normal operating conditions.

**Note:** Refer also to Active (Hot) Parameters for the latest Hot S22 measurement technique.

**Procedure**

On the PNA-X:

1. Press **Meas > S-Param > Meas Class...**, select Standard, then click OK.
2. Press **Meas > S-Param > S22**.
3. Press **Freq**, then set the Start and Stop frequencies for the measurement.
4. Press **Freq > Main > Frequency Offset...**. Enable Frequency Offset and set the Source(2) frequencies with a positive or negative offset of at least (100 * IFBW). This will be the Hot (Input) signal and must be far enough away from the S-parameter frequencies to avoid interference.
5. Press **Sweep > Sweep Timing > Sweep Mode** to STEPPED.
6. Press **Setup > Internal Hardware > RF Path Config...**.

For PNA-X models N5241B, N5242B, and N5249B: Under Configuration select Hot S-Parameters. This is necessary because these models have different path loss between J9 to Port1 and J10 to Port1 due to the bridge used as a combiner. The ‘Hot’ (input) signal coming from Source 2 is routed through the coupled arm of the combiner to port 1 and the DUT input. Configure the rear-panel cables as shown in the above Path Configuration diagram:

On the rear panel, connect 'SRC2 SW SRC OUT (J8)' to Port 1 'COMB THRU IN (J10)'
Connect Port 1 'SW SRC OUT (J11)' to Port 1 'COMB THRU IN (J9)'.
Connect DUT input port to VNA port 1
Connect DUT output port to VNA port 2.
For PNA-X models N5244B, N5245B, and N5247B: These models use a splitter as a combiner. Set both the Port 1 and Port 3 Bypass Switch to Combiner Path.

Press **Power > Main > Power and Attenuators...** See [Power and Attenuator](#) for more information.

For Port 2 (DUT output) select at least 10 dB of source attenuation on the Source 1 path.
For Port 1 (DUT input) select the S-parameter port power level.
Click Receiver Attenuator... Considering the gain of the DUT and the Source 2 input power, select the appropriate attenuation for the B receiver.

Perform a 2-port Calibration.
Press Power, then Power and Attenuator, and set Port 1 Src2 to ON.
Connect the DUT and measure S22. To ensure the DUT is being driven and the desired power level, perform a Source Power cal for Port 1 Src2.

In the Power and Attenuators dialog, adjust the Port 1 Src 2 power level and notice the change in S22.
The following image shows a Hot S22 measurement of a Hittite HMC452ST89 Power Amp tuned for 900 MHz.

The Red circled measurement is Hot S22.
The other is with the Hot signal OFF.
If the Hot signal is too close to the measurement signal, ripples appear on the out-of-band region of the trace.

Wide Power Sweep with Receiver Leveling

The following procedure illustrates how to use the Receiver Leveling feature to extend the power sweep range of the VNA, sometimes to 60 dB. Your actual sweep range may vary depending on the power offset setting and maximum available power at each frequency.

With VNA internal leveling, the power sweep range is limited to the range of the internal VNA source which is about 30 to 40 dB depending on the frequency range. See Power Sweep Range in the specs.

Note: You may not be able to achieve 60 dB of power sweep on your VNA. This is NOT specified.

With the use of source attenuation, the low power setting can be adjusted down to -95 dBm.

Without source attenuation, receiver leveling extends the low power setting to about -60 dBm. This is done by measuring and adjusting the source power at every data point. Because power levels are very low, noise must be reduced using IFBW or Averaging.

Press Sweep > Main > Sweep Setup....
In the Sweep Setup dialog select Power Sweep.
Set Start Power to -60 dBm.
Set Stop Power to 0 dBm.
Set CW Freq of the measurement. Click OK.
Press Power > Main > Power and Attenuators....
Click Leveling Mode then Receiver-R1.
Click Receiver Leveling... button.
Clear Enable source ALC hardware circuit checkbox.
When the measured power level falls below some level, the message appears: Power set to min power level.
Press Avg BW > Main > IF Bandwidth to reduce the amount of noise on the measurement.
Adjust the scale.
For troubleshooting purposes, display R1 trace to view the power level at test port 1.
