U.S. Government Rights

U.S. Government Rights. The Software is “commercial computer software,” as defined by Federal Acquisition Regulation (“FAR”) 2.101. Pursuant to FAR 12.212 and 27.405-3 and Department of Defense FAR Supplement (“DFARS”) 227.7202, the U.S. government acquires commercial computer software under the same terms by which the software is customarily provided to the public. Accordingly, Keysight provides the Software to U.S. government customers under its standard commercial license, which is embodied in its End User License Agreement (EULA), a copy of which can be found at http://www.keysight.com/find/sweula. The license set forth in the EULA represents the exclusive authority by which the U.S. government may use, modify, distribute, or disclose the Software. The EULA and the license set forth therein, does not require or permit, among other things, that Keysight: (1) Furnish technical information related to commercial computer software or commercial computer software documentation that is not customarily provided to the public; or (2) Relinquish to, or otherwise provide, the government rights in excess of these rights customarily provided to the public to use, modify, reproduce, release, perform, display, or disclose commercial computer software or commercial computer software documentation. No additional government requirements beyond those set forth in the EULA shall apply, except to the extent that those terms, rights, or licenses are explicitly required from all providers of commercial computer software pursuant to the FAR and the DFARS and are set forth specifically in writing elsewhere in the EULA. Keysight shall be under no obligation to update, revise or otherwise modify the Software. With respect to any technical data as defined by FAR 2.101, pursuant to FAR 12.211 and 27.404.2 and DFARS 227.7102, the U.S. government acquires no greater than Limited Rights as defined in FAR 27.401 or DFAR 227.7103-5 (c), as applicable in any technical data.

What's New

Notes

- The latest version includes changes from all previous versions.
- See New Programming Commands
- To see the code version that is currently installed on the VNA, click Help, then About NA...

- Save/Load mixer files in CSV format
- Smart Cal Ports
  - Use existing SrcCal when measuring cal standards
- Pulse Setup Primary Clock
- Support for U1832A/B/C/D and U1833A/B/C/D Noise Sources

What's New in VNA Code Version A.15.30.xx

- Software Support Licensing
- Updates to Fixture Simulator
- Compensate Only For De-Embeds (Fixture Generator)
- Modulation Distortion: Select font size of the Distortion Table

What's New in VNA Code Version A.15.05.xx

- SA Phase Stitching
- Added function to **Phase functions** for Gain Compression / Gain Compression for Converters applications

**What's New in VNA Code Version A.15.00.xx**

- Support for CPU 3.5
- Added 20 MHz Reference
- Added **PathWave Calibration Advisor**
- **IF Response Adjustment** (applies ONLY to instruments with new DDS source)

- **IF BW Shape**
- Enhance the **Fixture Simulator**
- **LO Feedthru Monitor**
- **Simulator** (Option S94050B and S94051B)
- **Residual Noise**
- Option S93072B Arbitrary Waveform Generation on XSB Port
- Added **Ext. Source Port** to Phase Control
- Added **Phase Control functions** to Differential I/Q application
- Added **Phase functions** to Gain Compression / Gain Compression for Converters applications
- Support for **P9336a + PSG external driver** (P9336A USB I/Q Arbitrary Waveform Generator with E8267D PSG Vector Signal Generator)
- Support for Waveguide Cal Kits

**What's New in VNA Code Version A.14.60.xx**

- **Multiline TRL Calibration**
- Support for **P9336A USB I/Q Arbitrary Waveform Generator**
• Support for USB Noise Source
• Connecting with PathWave Vector Signal Analysis (89600 VSA)
• Edit Multitone

• Phase Noise application (Option S93031xB)
• Modulation Distortion application enhancements:
  • Power Sweep
  • LO Feedthru Cal
• Global Source
• TMSA Enhancements
• Drivers for External Compound Sources

• Support for 64 bit 835x application
• Option XSB 3rd RF Source (can be enabled by firmware license and requires Option 422 or 423)
• Option UNY Enhanced Phase Noise (can be enabled by firmware license)
• Point leveling mode for receiver leveling
• Up to 500 Windows
• Up to 100 Traces per Window
• Enhancements to Correction Methods
• Enhancements to Balanced Setup
• Enhancements to Integrated True Mode Stimulus Application (iTMSA)
What's New in VNA Code Version A.13.95.xx

- Modulation Distortion Converters
- AM Distortion
- Trace deviation

- Modulation Distortion application enhancements (Option S93070xB)
- Receiver IF Cal for Modulation Distortion measurements
- Modulation Distortion Swept Cal Power
- Cal All - Split Cal and Independent Calibration Channels

What's New in VNA Code Version A.13.60.xx

- Modulation Distortion application (Option S93070xB)
- DC limits added to SMART Sweep Safe Mode
- Spectrum Analysis enhancements - dual-band configuration
- Device Expert (DE)
- Mechanical Counter

- TDR mode frequency limits
- Noise Figure Option S93027B (directly control mechanical tuners)
- Support for U205xXA/U206xXA Series USB Power Sensors

What's New in VNA Code Version A.13.50.xx
- Noise Power Ratio measurements
- Support for new Low Frequency Extension options
- Banded millimeter wave installation calibration
- Calibration with power meter uncertainties
- New SA Analysis Markers
- TDR mode frequency limits
- Support for Windows 10

- 1-port balanced measurements for iTMSA
- Support for external DC meter for SA channel measurements
- Active Hot Parameters application (Option S93110A/B, S93111A/B)
- Support for VDI PM5 power meter

- Enhanced Time Domain Analysis (Option S93011A/B)

**What's New in VNA Code Version A.13.00.xx**

- Support for Windows 10 operating system

**What's New in VNA Code Version A.12.90.xx**

- Multi-dimensional sweep on a spectrum analyzer channel
  
  - SCPI
  
  - COM
- CalPod temperature correction
- *ESR? sweep complete programming example

- Independent Power Calibration
- Automatic Fixture Removal (AFR) SCPI commands
- Maximum channels increased to 500
- Added ISegment3 and ISegments6 interface commands

What's New in VNA Code Version A.12.80.xx

- N5290A/N5291A Broadband Network Analyzer
- Low Frequency Extension (Option 205/425)
- Spectrum Analyzer Coherence and Data export features

What's New in VNA Code Version A.12.70.xx

- Modernized Graphical User Interface
  - Icons for adding or deleting trace/channel
  - Tabbed soft panel enabling quick access to desired functions
  - Access popup menus with long press or right click
  - Drag & drop trace/channel/window with finger or mouse
  - Easily make complex setups and calibrations using Wizards
  - Customize the icons to display in the top and bottom areas
  - Register frequently-used softkeys to Favorite menu
  - Group windows into Sheets
  - Magnify (zoom) a portion of the display
• Copy setups and user calibration data to other channels
• Improved Segment sweep
• Marker Search
  • Peak Search
  • Multi-Peak Search
  • Target Search
  • Multi-Target Search
  • Bandwidth Search
  • Notch Search
• Unique limit test functions
  • Ripple limit
  • Bandwidth limit
  • Point limit
• SCPI Parser Console for monitoring remote interface
• Port subset correction (devolve calibration)
• Spectrum Analyzer enhanced features
• Power Range SCPI and COM commands

What’s New in PNA Code Version A.10.49.09

• Cal All Channels SCPI programming examples
• Apply to all channels button in Calibrate All Selected Channels dialog

What’s New in PNA Code Version A.10.49.07

• Support for N755xA ECAl modules
What’s New in PNA Code Version A.10.49.05

- Read DC at Compression Point in Smart Sweep
- Memory Interpolation
- CalPod options (301, 302, and 304) are now standard
- CalPod - OSL Averages
- CalPod - VNA CalPod Utilities

What’s New in PNA Code Version A.10.49

- SA Power Sweep
- DC Source Sweep
- SA Gated Measurement Quick Setup

What’s New in PNA Code Version A.10.45

- Gated SA
- SA broadband and banded millimeter-wave measurements
- Support for Spectrum Analyzer measurements on PNA-L
- Cal All for millimeter wave measurement classes
- Support for UXG signal generators

What’s New in PNA Code Version A.10.40

- Spectrum Analyzer Application
- Dynamic Uncertainty for S-Parameters
- Frequency Step Setting
- 15 General-Purpose Markers per Trace
- Marker Symbols Above Trace
- Noise Marker Format
- Coupled Markers Method
- Limit Line Pass/Fail Indicator Positioning
- Trace Hold

Preferences

- Treat Marker 10 as Reference Marker
- Draw Limit Lines in Red
- Coupled Markers (3 preferences)

What's New in PNA Code Version A.10.25

- Differential IQ
- Narrowband Compensation to Noise Figure measurements
- CPM Direct Receiver Calibration

What's New in PNA Code Version A.10.20.03

- Cal All for External Sources
- Narrowband Compensation for Noise Figure

What's New in PNA Code Version A.10.20

- Cal Plane Manager
- Auto Fixture Removal

What's New in PNA Code Version A.10.15

- New N5249A PNA-X model (Configuration | Specs)
What's New in PNA Code Version A.10.00

- Windows® Embedded Standard 7
- HiSLiP
- Integrated CalKit Editor
- Increased Number of Points to 100K
- Cal Kits saved and recalled using *.xkt format
- U8480 Power Sensors Supported
- Mechanical Devices: Copy Active Channel
- Search Within (for Markers)
- Dialog Transparency
- Move App to Back
- System time on PNA Status Bar
- Right-click menus on Status Bar
- Elimination of 3 Toolbars
- Enhanced MATLAB® functionality

What's New in PNA Code Version A.09.90

- SMC Phase Reference Cal from 10 MHz
- CalPod as ECal
- External SMU Device
- Equation Editor enhancements
  - New marker functions
  - Use Short Names

What's New in PNA Code Version A.09.85
- Support for U2020 X-Series USB Power Sensors
- Delta Match Calibration required on ALL N5231A, N5232A, and N5239A models.
- Unguided TRL Cal allowed on all PNA 4-port models
- Noise Parameters

**What's New in PNA Code Version A.09.80**

- **Standard Measurements**
  - Calibrate All Channels
  - SE => Balanced Topology
  - Increased Segments in Power Sensor Loss Table
  - EXG Sources supported
  - CalPod

- **Application Enhancements**
  - SMC with Phase Reference
  - Noise Receiver Cal with Power Sensor
  - PNA models with 50 GHz Noise Receivers

**What's New in PNA Code Version A.09.60**

- New N523xA models

**What's New in PNA Code Version A.09.50**

**Standard Measurements**

- Unguided Cals can access 95 Cal Kits
- Preference setting to list Recall files
- YouTube Videos
• Display Menu changes
• Undo/Redo
• Quick Start
• Quickly change Scale, Reference Level, and Position
• Redesigned Receiver Leveling dialog
• New External Device configuration:
  • Pulse Generators
  • DC Sources and Meters
  • DC Source Control dialog

Application Enhancements

• External Pulse Generator in Integrated Pulse App
• IMSpectrum in mmWave

What’s New in PNA Code Version A.09.42

May 2013: Support for U2020X Power Sensors

• New N522x Models

Standard Measurements - available on all Models / Options

• Drag a trace to another window

Application Enhancements

• Copy Channels on all Applications
• "Src 2 out Port 2" factory configuration on PNA-X Opt 423.
• IMD f2 Tone using External Source / Combiner
• IMD and IM Spectrum Tone Power Leveling settings
- IMD, IMDx, and IM Spectrum "Min" and "Max" parameters
- Use a Power Table with mmWave SMC Measurements
- mmWave; Mixer mode - 2-port test set on 4-port PNA
- Guided Power Cal for SMC
- ESG and PSG Sources for Phase Control

What's New in PNA Code Version A.09.33

New Options

- Source Phase Control - Opt 088

Application Enhancements

- FCA Update - Opt 082, and 083

Standard Measurements - available on all Models / Options

- Security for External Sources
- 2-Port and 4-Port Fixture Extrapolation and Reverse Ports.
- Phase Coherent "R over R" measurements
- Use Multiple Power Sensors for Guided Power Cal
- Perform Source Power Cal with PMAR Device

Tip - Do you access the same PNA dialog often?

Your Favorites are always two keystrokes away.

What's New in PNA Code Version A.09.31

- Support for N1913A and N1914A Power Meters

What's New in PNA Code Version A.09.30
Application Enhancements

- Gain Compression on Converters (GCX)
- Support for Dual-Stage Converters in all Apps

Standard Measurements - available on all Models / Options

- Enhanced S-parameter Power Cal
- Marker Display enhancements
- Perform Source Power Cal at multiple power levels
- IF Gain Setting
- Receiver Overload/Compression Warning and Power OFF Preferences
- Confirm changes on Meas Class dialog
- DSP Version 5

What's New in PNA Code Version A.09.22

- Use any PNA-X Ports with Noise Figure Opt 028.

What's New in PNA Code Version A.09.20

Application Enhancements

- Integrated Pulse Measurements (Opt 008)
- Noise Figure using Standard PNA Receiver (Opt 028)
- Noise Figure on N5244A/45A (Opt H29)
- Edge and Level Trigger in Pulse
- Exclude SC12 Sweep for SMC (Opt 082/083)
- Include Phase with SMC (PNA-X with Opt 083)
• Fixturing in Apps
• Max Output Power for GCA (Opt 086)

**Standard Measurements - available on all Models / Options**

• Mechanical Device conflicts cause Channel Block (NOT Channel Hold)
• PSAT Marker and Power Normal Operating Point Marker
• Group Delay Aperture Setting
• Active Background Display Color
• Solid or Dotted Grid Lines
• Point Sweep on PNA "C" Models
• Fixture Power Compensation
• Sweep Delay
• Uncertainty equations using RSS Computations
• Preset Power Preference Setting
• Use Last Receiver Leveling Correction for SPC

**Data Save Enhancements**

• Recall .SNP files to view as trace
• "Save Data As" Dialog
• Save Balanced Data as SNP files

• Characterize Adaptor Macro Rev. A.02.10

  • Reverse S2P
  • Load the PNA Power Loss Table from an existing S2P file

---

**What's New in PNA Code Version A.09.10**

• Noise Figure on Converters (NFX)
• AgileUpdate for Customer Releases
What’s New in PNA Code Version A.09.00

- External Device Configuration
- Power Meter as Receiver (PMAR)
- Power Offsets and Limits
- Display and Print Colors
- Scale Coupling
- Mechanical Device Settings
- Device side USB
- Increased Number of Channels to 200
- ECal User Chars Saved to PNA Disk Memory

Application Enhancements

- GCA Compression Analysis
- GCA Compression from Saturation
- Receiver Leveling on IMD, FCA, and GCA
- Embedded LO on SMC and IMDx
- Limited Port Mapping on IMD
- Point Averaging on FCA and IMD
- SMC Measurements with mmWave Modules
- mmWave Measurements with no Test Set

What’s New in PNA Code Version A.08.60
- New 40 GHz and 50 GHz PNA-X Models

### What's New in PNA Code Version A.08.55

- IMDx (Swept and Spectrum) for Converters
- ADC Measurements in a Gain Compression channel.
- New 13.5 GHz PNA-X Model

### What's New in PNA Code Version A.08.50

- Fast Antenna Features for the PNA-X
- Receiver Leveling
- Phase Sweep in iTMSA
- Up to 25 User Macros
- Gain Compression Marker
- Port Extensions enhancements
- Electrical Delay enhancements
- Extra Security enhancement
- Save *.CSV and *.MDF File Types
- Noise Figure App enhancements:
  - Scalar Noise Figure measurement
  - Incident Noise Power parameters
- MM Module enhancements:
  - Power Level Control
  - Supports iTMSA
- Max point count to 32,001
- Faster Power Sweeps
What's New in PNA Code Version A.08.35

- New N5264A model

What's New in PNA Code Version A.08.33

- IMD Application (Opt 087)
- Fast Sweep Mode
- New Equation Editor functions
- 20001 Segments in Power Loss Table
- Data Format Units
- Marker=>CW Freq Function
- Up to 12 User Characterizations
- Characterize Adaptor Macro 2.0

What's New in PNA Code Version A.08.20

- iTMSA
- User Preferences dialog
- Uncoupled Power Sweep
- Equation Editor Import Functions
- Wider Traces Preference
- 24 Traces per Window
- LXI Compliance
- GCA Enhancements
- FCA - selectable ports
- Support for N5261A and N5262A MM test sets
What's New in PNA Code Version A.08.00

- Noise Figure Application (Opt 029)
- Gain Compression Application (Opt 086)
- 'Sweep' Trigger Mode
- Custom Cal Window settings (remote only)
- New Equation Editor Functions
- Minimum Number of Points = 1
KEYSIGHT SOFTWARE END-USER LICENSE AGREEMENT

ATTENTION: THIS SOFTWARE IS SUBJECT TO THE END-USER LICENSE AGREEMENT ("EULA") SET FORTH BELOW.

TO INSTALL OR USE THE SOFTWARE, YOU MUST FIRST AGREE TO THE EULA BELOW. IF THE EULA IS PRESENTED TO YOU ELECTRONICALLY AND IF YOU HAVE READ, UNDERSTAND AND AGREE TO BE BOUND BY THE TERMS OF THE EULA, CLICK "AGREE". IF THE EULA IS PRESENTED TO YOU IN A HARD COPY FORMAT, BY POWERING ON AND USING THE INSTRUMENT OR MACHINE, YOU AGREE THAT YOU HAVE READ, UNDERSTAND AND AGREE TO BE BOUND BY THE TERMS OF THE EULA.

1. Translations. Translations of this EULA are found at: www.keysight.com/find/sweula.

2. Software. "Software" means a single copy of one or more computer programs, whether stand-alone or bundled with other products, and related documentation, including any online or electronic documentation, data and license files.

3. License Grant. Keysight Technologies, Inc. ("Keysight") grants you a limited, non-exclusive license to use, in accordance with one of the license types listed below, the Software, for the Term (as defined below), subject to the terms and conditions herein:

3.1 Node Locked ("fixed") license. If you have obtained a Node Locked license, you may install one copy of the Software on one instrument or machine and use the Software only on that instrument or machine for your internal business use.

3.2 Transportable license. If you have obtained a Transportable license, you may use one copy of the Software on any single instrument or machine at one time for your internal business use. You may move such Software to a different instrument or machine for your internal business use provided only one copy is in use at any one time.

3.3 Floating ("concurrent use") license. If you have obtained a Floating license, you may install one or more copies of the Software on any instrument or machine within your internal computer network for your internal business use provided the total number of users who are accessing and/or using any of the Software at the same time does not exceed the maximum number of licensed users.

You may find the type of license you obtained, the Term of your license, and the licensed number of users (if applicable) in documentation associated with the Software. "Term" means either a set amount of time (an expiring license) or a Perpetual license. "Perpetual" means the lifetime of the instrument or machine. In the absence of documentation specifying the applicable license, you have a fixed license with a Perpetual Term.
4. License Restrictions.

4.1 No Copies. You may not make copies or adaptations of the Software except for backup and archival purposes or when copying or adaptation is an essential step in the licensed use of the Software including correction of errors. You must reproduce all copyright and other legal notices in the original Software on all permitted copies or adaptations. You may not copy the Software onto any public or distributed network.

4.2 No Reverse Engineering. You may not decompile, reverse engineer, disassemble, attempt to derive the source code of, decrypt, modify, or create derivative works of the Software (except to the extent any foregoing restriction is prohibited by applicable mandatory law or by licensing terms governing the use of open source components that may be included with the Software).

4.3 No Circumvention. The Software may include technological measures, whether in the Software or in bundled hardware or both, that are designed to prevent or detect unlicensed use of the Software. Circumvention of these technological measures is prohibited, except as expressly permitted by applicable law. Any attempt to circumvent technological measures may render the Software or certain features unusable or unstable, and may prevent you from updating or upgrading the Software.

4.4 Limited Use. Notwithstanding anything to the contrary herein, you may not use Software to make or distribute your own or a third party’s application, a principal purpose of which, as reasonably determined by Keysight, is to perform the same or similar functions as the Software or which replaces any component of the Software.

5. Third Party Software.

5.1 General. The Software may contain third party software subject to third party notices and/or additional terms and conditions. Such required third party software notices and/or additional terms and conditions can be found in the documentation associated with the Software. You have all rights necessary to use the Software as permitted in Sections 3 and 4. To the extent your use exceeds the grants and restrictions in Sections 3 and 4, third party license terms take precedence and will apply.

5.2 Separation of Components. Except as required by included open source software licenses, the Software is licensed as a single product and its component parts may not be separated for any other use except to the extent expressly otherwise licensed.

5.3 Additional Terms for Microsoft Windows Embedded Software. Microsoft Windows for Embedded Systems may be included with the instrument or machine. If so, your grant under this license prohibits accessing or using any Desktop Functions other than through, in support of and operating as part of the software and/or functions that provide the primary functionality of the instrument or machine. “Desktop Functions” means consumer or business tasks or processes, including word processing, spreadsheets, database, scheduling and personal finance.

6. Upgrades. This EULA does not entitle you to receive upgrades, updates or technical support. Upgrades, updates and technical support services may be purchased separately. The terms of this EULA govern any software updates or upgrades provided by Keysight unless replaced and/or supplement Software is accompanied by a separate license agreement in which case the terms of that license agreement will govern. Any comments, suggestions, improvements or other communications from you to Keysight regarding the Software (“Feedback”) may be used by Keysight without compensation or attribution.

7. Ownership. The Software and all copies thereof are licensed and not sold to you. The Software and all copies thereof are owned and copyrighted by Keysight or its third party suppliers and protected by copyright laws and other intellectual property laws and treaties. Keysight and its third party suppliers retain all right, title and interest in the Software. Keysight and its third party suppliers may protect their respective rights in the Software in the event of any violation of this EULA.

8. High Risk Activities. The Software is not specifically written, designed, manufactured or intended for use in the planning, construction, maintenance or direct operation of a nuclear facility, nor for use in on line control or fail safe operation of aircraft navigation, control or communication systems, weapon systems or direct life support systems.
9. Transfer. You may not sell or otherwise transfer the Software except as expressly specified below. Licensed users are Licensee’s employees, authorized agents, representatives, and subcontractors acting on behalf of Licensee for Licensee’s internal business use. You may not rent, lease, lend, allow for commercial time sharing, or otherwise permit access to the Software to any unlicensed third party or entity. You may not transfer the license granted to you here unless you obtain Keysight’s prior written authorization, deliver all copies of the Software to the transferee along with this EULA, and pay any applicable fees. For all transfers, the transferee must accept this EULA as a condition to any transfer and your license to use the Software will terminate upon transfer. Entitlement to receive technical support services for the Software may be transferred provided that you obtain Keysight’s prior written consent and pay any applicable fees. This section regarding transfer applies only to the extent permissible under applicable mandatory laws.

10. Term and Termination. This EULA shall continue for the Term unless terminated by Keysight as provided herein. Keysight may terminate this license upon notice for breach of this EULA. Upon expiration or termination, you must immediately destroy all copies of the Software.

11. Export Requirements. If you export, re-export or import Software, technology or technical data licensed hereunder, you assume responsibility for complying with applicable laws and regulations and for obtaining required export and import authorizations. Keysight may terminate this license immediately if you are in violation of any applicable laws or regulations.

12. Audit and Security Mechanisms. You agree that Keysight may restrict the number of copies you are using by security servers, security keys/modules, a hardware lock device, license administration software, a license authorization key to control access to the Software or other security mechanism and you consent to such use. You may not take any steps to avoid or defeat the purpose of any such measures. Use of the Software without the lock device or authorization key provided by Keysight is prohibited. Keysight may take all legal steps to eliminate unlicensed use and piracy of their Software. In this context, the Software may include a security mechanism to detect installation or use of unlicensed copies of the Software, and collect and transmit data about suspected unlicensed copies. Data collected does not include any customer data created with the Software. By using the Software, you consent to such detection and collection of data, as well as its transmission and use if suspected unlicensed copies are detected. Upon reasonable notice and reasonable suspicion of unlicensed use, Keysight may conduct during normal business hours (with the auditor’s costs being at Keysight’s expense) an audit of your compliance with this EULA. If an audit reveals underpayments then you will pay to Keysight such underpayments. If underpayments discovered exceed five (5) percent of the contract price, you will reimburse Keysight for the auditor costs.

13. U.S. Government Rights. The Software is “commercial computer software,” as defined by Federal Acquisition Regulation (“FAR”) 2.101. Pursuant to FAR 12.212 and 27.405-3 and Department of Defense FAR Supplement (“DFARS”) 227.7202, the U.S. government acquires commercial computer software under the same terms by which the software is customarily provided to the public. Accordingly, Keysight provides the Software to U.S. government customers under its standard commercial license, which is embodied in this EULA. The license set forth in this EULA represents the exclusive authority by which the U.S. government may use, modify, distribute, or disclose the Software. This EULA and the license set forth herein, does not require or permit, among other things, that Keysight: (1) Furnish technical information related to commercial computer software or commercial computer software documentation that is not customarily provided to the public; or (2) Relinquish to, or otherwise provide, the government rights in excess of these rights customarily provided to the public to use, modify, reproduce, release, perform, display, or disclose commercial computer software or commercial computer software documentation. If you are a U.S. government customer, you acknowledge that you have reviewed the Software and the terms of this EULA and agree that the license provided for herein is consistent with Federal law and otherwise satisfies the U.S. government needs. In addition, if you are a U.S. government customer you agree that this EULA reflects the entirety of the terms of Keysight’s customary commercial license applicable to U.S. government customers. No additional government requirements beyond those set forth in this EULA shall apply, except to the extent that those terms, rights, or licenses are explicitly required from all providers of commercial computer software pursuant to the FAR and the DFARS and are set forth specifically in writing elsewhere in this EULA. Keysight shall be under no obligation to update, revise or otherwise modify the Software.

14. WARRANTY. TO THE EXTENT ALLOWED BY APPLICABLE MANDATORY LAW, AND EXCEPT TO THE EXTENT KEYSIGHT HAS PROVIDED A SPECIFIC WRITTEN WARRANTY APPLICABLE TO THIS SOFTWARE, THIS SOFTWARE IS PROVIDED TO YOU "AS IS" WITHOUT WARRANTIES OR CONDITIONS OF ANY KIND, WHETHER ORAL OR WRITTEN, EXPRESS OR IMPLIED. KEYSIGHT, ON BEHALF OF ITSELF ITS SUBSIDIARIES, AFFILIATES AND
SUPPLIERS SPECIFICALLY DISCLAIMS ANY IMPLIED WARRANTIES OR CONDITIONS OF MERCHANTABILITY,
SATISFACTORY QUALITY, NON-INFRINGEMENT AND FITNESS FOR A PARTICULAR PURPOSE. SHOULD THE
SOFTWARE PROVE DEFECTIVE, YOU ASSUME THE ENTIRE RISK AND COST RESULTING FROM OR RELATING TO
THE DEFECT. SOME JURISDICTIONS DO NOT ALLOW EXCLUSIONS OF IMPLIED WARRANTIES OR CONDITIONS,
SO THE ABOVE EXCLUSION MAY NOT APPLY TO YOU. YOU MAY HAVE OTHER RIGHTS THAT VARY ACCORDING
TO APPLICABLE MANDATORY LAW.

15. LIMITATION OF LIABILITY. TO THE EXTENT ALLOWED BY APPLICABLE MANDATORY LAW, IN NO EVENT WILL
KEYSIGHT OR ITS SUBSIDIARIES, AFFILIATES OR SUPPLIERS BE LIABLE FOR ANY SPECIAL, INCIDENTAL,
CONSEQUENTIAL OR OTHER DAMAGES (INCLUDING DOWNTIME COSTS, LOSS OF DATA, RESTORATION COSTS
OR LOST PROFITS) REGARDLESS OF WHETHER SUCH CLAIMS ARE BASED ON CONTRACT, TORT, WARRANTY
OR ANY OTHER LEGAL THEORY, EVEN IF ADVISED OF THE POSSIBILITY OF SUCH DAMAGES. YOUR USE OF THE
SOFTWARE IS ENTIRELY AT YOUR OWN RISK. NOTWITHSTANDING THE FOREGOING, IN THE EVENT THE
SOFTWARE IS PROVIDED TO YOU AT NO CHARGE, KEYSIGHT OR ITS SUBSIDIARIES, AFFILIATES OR SUPPLIERS
SHALL HAVE NO LIABILITY FOR DIRECT DAMAGES. SOME JURISDICTIONS DO NOT ALLOW THE EXCLUSION OR
LIMITATION OF LIABILITY FOR DAMAGES, SO THE ABOVE LIMITATION MAY NOT APPLY TO YOU.

16. Applicable Law. Disputes arising in connection with this EULA will be governed by the laws of the United States and of
the State of California, without regard to choice of law provisions. The United Nations Convention for Contracts for the
International Sale of Goods will not apply to this EULA.

17. Unenforceability. To the extent that any provision of this EULA is determined to be illegal or unenforceable, the
remainder of this EULA will remain in full force and effect.

18. Entire Agreement. Certain program, data and license files in the Software may be subject to supplemental license
terms found in the documentation associated with the Software or directly in the files to which the supplemental terms apply.
This EULA constitutes the entire agreement between you and Keysight with respect to the Software, and supersedes any
previous communications, representations or agreements between the parties, whether oral or written, except if you have a
separate written, valid agreement that is executed by both parties and the terms of such agreement conflict with the terms
contained herein, in which case the terms of such agreement apply. This EULA may not be changed except by an
amendment signed by an authorized representative of each party.
VNA User Accounts and Passwords

**Important:** When the VNA power is switched on, it AUTOMATICALLY logs into Windows using the default user name and password. You do NOT need to log on. This gives anyone full access to the analyzer. The following steps can be taken to increase security of your VNA.

- Require users to logon when the VNA computer is turned ON - Learn how.
- Setup individual accounts on the VNA with varying level of access - Learn how.

See Also: User-Specific VNA Settings

Please read about Anti-virus protection for your VNA

Existing User Accounts

The following user accounts already exist on new VNAs.

**Important:** For the highest security, it is recommended to change the passwords on your device from these defaults.

<table>
<thead>
<tr>
<th>User Name</th>
<th>Password</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Instrument</td>
<td>measure4u</td>
<td>Administrator</td>
<td>Auto Log On is activated by default.</td>
</tr>
<tr>
<td>Administrator</td>
<td>Keysight4u!</td>
<td>Built-in Administrator</td>
<td>For user maintenance purpose.</td>
</tr>
</tbody>
</table>

**Note:** The user name is not case sensitive. The password is case sensitive.

**Note:** The VNA local policies are set so that, if logon is required, you must retype the user name (and password) every time. Do not change the local policies on the VNA.

Add or Change User Accounts, Passwords, and require Logon

If the analyzer is in a secure environment, you can setup VNA users by name and grant various levels of access.

You can designate a person as the administrator and then configure the VNA to allow others to use it with reduced permissions. That is, other people can be signed on to use the analyzer but they will not have the ability to perform all of the administrative functions that you can as the administrator.
The following are examples of some of the functions that can be performed with these account types:

- **Administrator** - Can download and install firmware. The administrator can modify system-wide settings in the operating system.

- **Standard User** - Can fully use the VNA to make measurements and save state and data files. Standard Users can NOT install firmware.

### How to add a user account and require logon

<table>
<thead>
<tr>
<th>Windows 7</th>
</tr>
</thead>
<tbody>
<tr>
<td>Click <strong>Start</strong>, then <strong>Control Panel</strong></td>
</tr>
<tr>
<td>Click <strong>User Accounts</strong></td>
</tr>
<tr>
<td>Click <strong>Manage another account.</strong></td>
</tr>
</tbody>
</table>

**CAUTION:** Although allowed by Windows, do NOT allow an Administrator account without a password. Internet viruses look for, and exploit, this condition.

Click **Create a new account.**

Enter an account name.

Select an account type.

Click **Create Account.**

**Optional:** Click **Create a password** to require the user to enter a password when logging on.
Windows 10

To add a new account:

- Click Start > Settings > Accounts > Other people > Add someone else to this PC.
- Enter the requested information then select Next.

To change an existing account:

- Click on the user account.
- Click Change account type.
- Under Account type, select Standard User or Administrator.
- Click OK.

User-Specific VNA Settings

Almost all persistent settings in the VNA are global (apply to all users).

The following exceptions reset to their defaults when a new user account is setup:

- Global PassFail Display State
- Recently used files list
- Global Power Limits
- Equation Editor – most recently used import dlls
- Preferences:
  - Power Sweep Retrace Mode
  - Is Power On During Retrace
VNA Computer Properties

The VNA uses a personal computer and a Windows operating system. The following are common tasks that you may need to perform on the VNA computer.

- View or change Full Computer Name
- Check IP Address
- Check the amount of RAM
- Check CPU Speed
- Check SSD Capacity
- Set Time and Date
- Internal and External Speakers (N52xxB only)
- Windows 10 Updates

Other Administrative Task Topics

View or change Full Computer Name

Your VNA has a unique computer name that identifies it on a network. To view or change the computer name, you must first minimize the VNA application.

<table>
<thead>
<tr>
<th>Windows 7</th>
</tr>
</thead>
<tbody>
<tr>
<td>On the desktop, click <strong>Start</strong>.</td>
</tr>
<tr>
<td>Right-click on <strong>Computer</strong> then select <strong>Properties</strong>.</td>
</tr>
<tr>
<td>Scroll down to <strong>Computer name, domain, and workgroup settings</strong>.</td>
</tr>
<tr>
<td>To make changes, click <strong>Change Settings</strong>.</td>
</tr>
</tbody>
</table>
Windows 10
Click **Start > Settings** then go to **System > About**.
Click **Rename PC** button.
Type the new name for your computer.
Click **Next**.
A dialog is displayed prompting you to restart your computer now or later. If you want to change to the new name now, click the **Restart now** button to restart your computer. If you don't want to restart your computer now, click the **Restart later button**. Your computer's name will be updated the next time you restart it.

**Note:** To add your computer to a domain, or to set up the networking configuration, contact your company's I.T. department. This setup is custom for each company.

To restore the VNA application, click **Network Analyzer** in the task bar at the bottom of the screen.

**Check IP Address**
If your VNA is connected to a LAN, you can view the IP address and other networking information.

Windows 7
**Minimize the VNA** application
On the desktop, click **Start**.
In the Search field, type **cmd**, then click **OK**.
At a DOS prompt, type **ipconfig /all**.

Windows 10
Click **Start > Settings**.
Click on the **Network & Internet** icon.
Click the **View your network properties** link.
Check the amount of RAM

Random Access Memory (RAM) is the amount of working memory in your computer.

The amount of RAM in your VNA may limit your ability to upgrade firmware. See
http://na.support.keysight.com/pna/firmware/PNA_support_matrix.doc

To view the amount of VNA RAM, you must first minimize the VNA application.

<table>
<thead>
<tr>
<th>Windows 7</th>
</tr>
</thead>
<tbody>
<tr>
<td>On the desktop, click <strong>Start</strong>.</td>
</tr>
<tr>
<td>Right-click on <strong>Computer</strong> then select <strong>Properties</strong>.</td>
</tr>
<tr>
<td>The amount of RAM appears under <strong>System</strong></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Windows 10</th>
</tr>
</thead>
<tbody>
<tr>
<td>Click <strong>Start &gt; Settings</strong>.</td>
</tr>
<tr>
<td>Click <strong>System</strong> then select <strong>About</strong></td>
</tr>
</tbody>
</table>

To restore the VNA application, click **Network Analyzer** in the task bar at the bottom of the screen.

Check CPU Speed

The speed of the VNA processor (CPU) is a factor in determining how quickly the VNA processes data. Also, the CPU speed in your VNA may limit your ability to upgrade firmware. See

You can see which CPU is in your VNA by comparing your VNA rear-panel with the images at

Or, on the VNA click **Help**, then **About Network Analyzer**. Learn more.

Or, you can do the following to check your VNA CPU speed:

1. Minimize the VNA application.
2. Then do the following:
To restore the VNA application, click Network Analyzer in the task bar at the bottom of the screen.

Check Solid State Drive (SSD) Capacity

To view the capacity of drive space, you must first minimize the VNA application.

Then do the following:

**Windows 7**

On the desktop, click Start. —> Computer.

The amount of free drive space and capacity for each of the partitions appears.

**Windows 10**

Click Start > Settings.

Click System then select About

Learn how to determine your HDD part number (Internet connection required).

Set Time and Date

To set the time and date on your VNA, you must first minimize the VNA application.
### Windows 7

Move the cursor to the lower corner of the screen.

When the taskbar appears, click on the displayed time.

Select **Change data and time settings**. This opens the **Date and Time** dialog box.

Change the date, time, and time zone as appropriate.

### Windows 10

Click **Start** > **Settings**.

Click **Time & language**.

Click **Date & time**.

Ensure that **Set time automatically** is switched **Off**.

Click on the **Change** button to change the time, date, and time zone as appropriate.

To restore the VNA application, click **Network Analyzer** in the task bar at the bottom of the screen.

### Internal Speaker (N52xxB only)

There is an internal sound card and speaker in the VNA. However, there is no audio output jack.

There may be times when you might want to control the speaker volume or turn the speaker OFF, such as when the VNA is generating errors. [Learn more about errors.](#)

To control the VNA speaker volume:

1. On the VNA press **System** -> **System Setup** -> **Sound**, then click on the keypad icon.
2. Enter a value between 0 (speaker OFF) and 100 (highest volume).

Windows 10 Updates

Windows 10 updates cannot be turned off. There are two ways to control updates:

- Notify
- Automatically download and install

The VNA is set to Notify before downloading. When Windows finds updates that apply to this computer, users are notified that updates are ready to be downloaded. After going to Windows Update, users can download and install any available updates.
Run Error Check and Disk Defragmenter

When the VNA is shutdown unexpectedly or power is removed without first shutting down, large amounts of Hard Disk Drive space is rendered unusable. If shutdown in this manner enough times, the VNA could become unstable and no longer work.

This Hard Disk Drive space can be recovered by first running Windows Error-checking to find and correct errors on the disk, and then the Disk Defragmenter to recover Hard Disk Drive space. These programs should be run routinely, about every 1 to 4 weeks, depending on how often the VNA is unexpectedly shutdown.

To learn more about Disk Defragmenter, see the Windows Help file.

Follow this procedure to run these programs:

### Windows 7

1. On the desktop, click **Start -> Computer**
2. In the upper pane, click **System properties**
3. In the left pane, click **Performance Information and Tools**.
4. In the left pane, click **Advanced Tools**.
5. Click **Open Disk Defragmenter**.

### Windows 10

1. On the desktop, click **Start -> Windows Administrative Tools**.
2. Click **Defragment and Optimize Drives**.

**Error-checking**

- Click **Analyze disk**.

- Once Windows is finished analyzing the disk, you can check the percentage of fragmentation on the disk in the Last Run column. If the number is above 10%, you should defragment the disk.

**Defragmentation**

- Click **Defragment Disk**.
- Disk Defragmenter might take from several minutes to a few hours to finish, depending on the size and degree of fragmentation of your hard disk.
The leading cause of VNA failures is problems with the VNA Solid State Drive (SSD). These problems are usually preventable (see Preventing VNA SSD Problems), and in many cases, recoverable. The following could save you weeks of downtime and the cost of replacing your VNA SSD.

This document is now on the Keysight VNA Support Website:

If your VNA does experience a Solid State Drive problem, you will not be able to access this Help file, but you may be able to access the Internet from another computer.
Microsoft Windows Considerations

In this topic:

- Microsoft Windows on the VNA
- Using USB
- LAN Connections
- Mouse Configuration
- Windows Theme
- Printing

Your Programs on Windows
Microsoft EULA

Microsoft Windows on the VNA

The VNA is shipped from the factory with Windows® Embedded Standard 7 or Windows® 10 operating system. This OS supports both 32-bit and 64-bit applications.

**VERY IMPORTANT  Protect your hard drive!**

The leading cause of VNA failures is problems with the VNA Solid State Drive (SSD). These problems are usually preventable, and in many cases, recoverable. Learn more about protecting your VNA.

Using USB

The VNA has USB ports on the front panel and on the rear panel. The main advantages of USB are “hot” connects and disconnects and fast data transfer speeds. Electronic Calibration modules are also available with USB connections.

The first time you plug a device into a USB port there is some wait time. Windows reports it is identifying the hardware, then searching for the correct driver, then installing the driver (if it was found).
Connecting that same device back into that same port later is quick and easy, but if you move the device to a different USB port, you will have to wait through the hardware ID and driver search again.

Learn about USB limitations.

LAN Connections

Windows supports DHCP and fixed IP addressing. Also, “Hot” connect and disconnect of the LAN cable, as well as a visual indicator of LAN status in system tray area, makes LAN connections more intuitive. In addition, the Hardware Wizard helps users with system hardware configuration.

Mouse Configuration

By default, Windows does not allow you to select to make the button on the right the one you use for primary functions such as selecting and dragging. To change any mouse properties, click **Start > Control Panel > Mouse**. In the Mouse Properties dialog box, select any settings that you would like to change, click **Apply** and then click **OK**.

Windows Themes

The VNA application is designed for, and best viewed in, **Keysight Technologies** theme. To change the theme:

1. Minimize the VNA application.
2. Right-click on the Desktop, then click **Personalize**
3. Use the scrollbar, then select a Theme.

Printing

Adding a printer should be done outside of the VNA application. Learn more.
Windows File Locations

With Windows 7 or Windows 10, data file locations have been changed from previous Windows Operating Systems.

**State files and most data file storage locations:**

- Windows 7 or Windows 10: D: \n
**Firmware executable file locations:**

- Windows 7 or Windows 10: c:\program files\Keysight\network analyzer

**Support file locations**

- Windows 7 or Windows 10: c:\programdata\Keysight\network analyzer

These file locations can be queried remotely.

SCPI Command: SYSTem:CONFigure:DIRectory?

COM Command: DirectoryPath Property

Your Programs on Windows
Simulator (S94050B, S94051B)

All the features of the standard class are enabled by the simulator license. Without the license, the firmware enters Viewer Mode in which many of the features are disabled.

To install the VNA simulator, user has to

1. Download and install the IO library if it is not installed. https://www.keysight.com/find/iolibs

2. Download Firmware from Keysight web (Drivers, Firmwares & Software Tab on http://www.keysight.com/support/m9800a ). The firmware supports the simulator capability for all models including PNA and ENA.

3. Install the firmware to the PC. Follow the instructions for the installation.

4. Execute the Keysight License Manager from Start Menu in Windows to install the license. Click “What if I have a license file to install”, then follow the instruction to install the license file. Learn more on option enable.

5. For PXIe/USB VNA, you can open the Simulator setup dialog thru VNA SFP Launcher.

- Simulator Mode
- Dummy DUT

VNA Simulator Setup Dialog (for PXIe/USB VNA only)
Model Type  Select the series for simulator mode.

Model Number  Pulldown menu to select the model for simulator mode. It will change depending on the selected Model Type.

Number of Ports  To change the number of ports with the Up/Down button or edit that value using keyboard. Acceptable number as the number of ports is even number from 2 to 66. The maximum number of ports will change depending on the selected model.

Run  Start the firmware as Simulator mode with the selected setup. The selected Model Type, Model Number and Number of ports will be saved as new default values and these new default values will be used when the dialog will open next time.

Cancel  Does not apply any changes and close the simulator setup dialog.

Help  Open Help.

VNA Simulator License

One of the licenses below is required to enable VNA Simulator.

- S94050B – Standard Simulator
- S94051B – Advanced Simulator

When no simulator license exists, VNA Simulator starts with Data Viewer Mode.

Simulator Mode

There are three simulator modes as below:

1. Data Viewer

Data Viewer is a free version of VNA Simulator and supports STD Channel with restrictions. Advanced functions including applications and remote-control capability are disabled.

2. Standard Simulator

All the features of the standard class are enabled by the simulator base license. The option for the standard simulator is S94050B.

Standard Simulator supports STD Channel and remote-control capability. Applications are not supported.
3. Advanced Simulator

Option S94051B is needed to enable advanced simulator.

Advanced Simulator supports Standard Simulator features + Applications (SW options) listed below.

</tbody>
</table>

The following options are not supported.

- S9x007B Automatic Fixture Removal for all models
- S96041B Impedance Analysis
- S95552B Multiport Calibration Assistant
- S95553B Multiport calibrated measurements with switch instruments

Hardware options:

- Software options include required hardware options (For M980xA/P50xxA/E5080B, option 021 is supported for S9x025A/B, option 090 is also supported for S9x090.)
- 2nd source (option 022) is enabled for N524xB, 4-port N522xB, 4-port E5080B and P502xA only
- N source is enabled for M980xA but supported N*2-port configurations only
- LFE option is enabled for N5222/27B (option 205) and N5242/45/47B (option 425)
- Analog Input (option 175) is enabled for E5080B
- Multi-port (unit) configuration in USB VNA is not supported
ECal and external devices such as source, power sensor are not supported. PXI internal devices such as the switch and M9341A/B Digital IO supports GUI only.

**Dummy DUT**

Dummy DUT capability provides measurement data manipulation for VNA simulator using sNp format files.

VNA Simulator automatically loads a “default” dummy DUT put under VNA installed folder (C:\Program Files\Keysight\Network Analyzer\simulations\DummyDUT.s6p)

Users can set their own default dummy DUT under user VNA document folder (C:\Users\Public\Documents\Network Analyzer\UserDummyDUT.s*p)

When there are multiple “UserDummyDUT.s*p” files, VNA simulator loads the first found one.

Dummy DUT Tool provides GUI for dummy DUT handling. The tool is Installed under VNA Macro softkey.

### How to create Dummy DUT snp file

Use one of the following methods to make a dummy DUT snp file

#### Using Hardkey /SoftTab /Softkey

1. Press Mac**ro** > **Mac**ro1 > Dummy D**UT** tool

#### Using a mouse

1. Click **Utility** > **Macro** > **Dummy DUT tool**

**Current DUT**  Show sNp file currently used as dummy DUT

**Load...**  Load user specific sNp file as current dummy DUT
**Clear**  Clear current dummy DUT

**Noise**  Set noise state ON/OFF

**Save Current As User Default**  Save current dummy DUT as user default
Connector Care

Proper connector care is critical for accurate and repeatable measurements. The following information will help you preserve the precision and extend the life of your connectors - saving both time and money.

- Connector Care Quick Reference Guide
- Connector Cleaning Supplies
- Safety Reminders
- About Connectors
- Gaging Fundamentals
- Connector Care Procedures

Important Note

All of the copper N5247A front-panel loops are EXTREMELY FRAGILE.

A maximum 8 inch/lbs of torque should be applied to these connectors.

If more torque is applied, damage to the copper semi-rigid cables WILL occur, causing measurement inaccuracy.

Preventing Test Port Connector Damage
## Handling and Storing Connectors

## Safety Reminders

### When cleaning connectors:

- Always use protective eyewear when using compressed air or nitrogen.
- Keep isopropyl alcohol away from heat, sparks and flame. Use with adequate ventilation. Avoid contact with eyes, skin and clothing.
- Avoid electrostatic discharge (ESD). Wear a grounded wrist strap (having a 1 MΩ series resistor) when cleaning device, cable or test port connectors.
- Cleaning connectors with alcohol shall only be done with the instruments power cord removed, and in a well-ventilated area. Allow all residual alcohol moisture to evaporate, and the fumes to dissipate prior to energizing the instrument.

## About Connectors

- Connector Service Life
- Connector Grades and Performance
- Adapters as Connector Savers
- Connector Mating Plane Surfaces

### Connector Service Life

Even though calibration standards, cables, and test set connectors are designed and manufactured to the highest standards, all connectors have a limited service life. This means that connectors can become defective due to wear during normal use. For best results, all connectors should be inspected and maintained to maximize their service life.

**Visual Inspection** should be performed each time a connection is made. Metal particles from connector threads often find their way onto the mating surface when a connection is made or disconnected. See Inspection procedure.
Cleaning the dirt and contamination from the connector mating plane surfaces and threads can extend the service life of the connector and improve the quality of your calibration and measurements. See Cleaning procedure.

Gaging connectors not only provides assurance of proper mechanical tolerances, and thus connector performance, but also indicate situations where the potential for damage to another connector may exist. See Gaging procedure.

Proper connector care and connection techniques yield:

- Longer Service Life
- Higher Performance
- Better Repeatability

Connector Grades and Performance

The three connector grades (levels of quality) for the popular connector families are listed below. Some specialized types may not have all three grades.

- **Production** grade connectors are the lowest grade and the least expensive. It is the connector grade most commonly used on the typical device under test (DUT). It has the lowest performance of all connectors due to its loose tolerances. This means that production grade connectors should always be carefully inspected before making a connection to the analyzer. Some production grade connectors are not intended to mate with metrology grade connectors.

- **Instrument** grade is the middle grade of connectors. It is mainly used in and with test instruments, most cables and adapters, and some calibration standards. It provides long life with good performance and tighter tolerances. It may have a dielectric supported interface and therefore may not exhibit the excellent match of a metrology grade connector.

- **Metrology** grade connectors have the highest performance and the highest cost of all connector grades. This grade is used on calibration standards, verification standards, and precision adapters. Because it is a high precision connector, it can withstand many connections and disconnections and, thus, has the longest life of all connector grades. This connector grade has the closest material and geometric specifications. Pin diameter and pin depth are very closely specified. Metrology grade uses an air dielectric interface and a slotless female contact which provide the highest performance and traceability.

**Note:** In general, Metrology grade connectors should not be mated with Production grade connectors.

Adapters as Connector Savers

Make sure to use a high quality (Instrument grade or better) adapter when adapting a different connector type to the analyzer test ports. It is a good idea to use an adapter even when the device under test is the same connector type as the analyzer test ports. In both cases, it will help extend service life, and protect the test ports from damage and costly repair.

The adapter must be fully inspected before connecting it to the analyzer test port and inspected and cleaned frequently thereafter. Because calibration standards are connected to the adapter, the adapter...
should be the highest quality to provide acceptable RF performance and minimize the effects of mismatch.

**Connector Mating Plane Surfaces**

An important concept in RF and microwave measurements is the reference plane. For a network analyzer, this is the surface that all measurements are referenced to. At calibration, the reference plane is defined as the plane where the mating plane surfaces of the measurement port and the calibration standards meet. Good connections (and calibrations) depend on perfectly flat contact between connectors at all points on the mating plane surfaces (as shown in the following graphic).

![Mating Plane Surfaces](image)

**Gaging Fundamentals**

Connector gages are important tools used to measure center conductor pin depth in connectors. Connector pin depth, measured in terms of recession or protrusion, is generally the distance between the mating plane and the end of the center conductor, or the shoulder of the center conductor for a stepped male pin.

**Typical Connector Gage**

<table>
<thead>
<tr>
<th>RECESSION</th>
<th>PROTRUSION</th>
</tr>
</thead>
</table>

Recession and Protrusion

Pin depth is negative (recession) if the center conductor is recessed below the outer conductor mating plane, usually referred to as the "reference plane". Pin depth is positive (protrusion) if the center conductor projects forward from the connector reference plane.

Pin Depth

1. Recession of female contact
2. Recession of male pin shoulder

Difference with Type-N Connectors
Type-N connectors have the mating plane of the center conductors offset from the connector reference plane. In this case the zero setting "gage primarys" generally offset the nominal distance between the center conductor mating plane and the connector reference plane.

### When to Gage Connectors

- Before using a connector or adapter the first time.
- When visual inspection or electrical performance suggests the connector interface may be out of range.
- After every 100 connections, depending on use.

### Connector Gage Accuracy

Connector gages (those included with calibration and verification kits), are capable of performing coarse measurements only. This is due to the repeatability uncertainties associated with the measurement. It is important to recognize that test port connectors and calibration standards have mechanical specifications that are extremely precise. Only special gaging processes and electrical testing (performed in a calibration lab) can accurately verify the mechanical characteristics of these devices. The pin depth specifications in the Keysight calibration kit manuals provide a compromise between the pin depth accuracy required, and the accuracy of the gages. The gages shipped with calibration and verification kits allow you to measure connector pin depth and avoid damage from out-of-specification connectors.

**Note:** Before gaging any connector, the mechanical specifications provided with that connector or device should be checked.

### To Gage Connectors

1. Wear a grounded wrist strap (having a 1 MΩ series resistor).
2. Select proper gage for device under test (DUT).
3. Inspect and clean gage, gage primary, and DUT.
4. Zero the connector gage.
   
   a. While holding gage by the barrel, carefully connect gage primary to gage. Finger-tighten connector nut only.
   
   b. Use proper torque wrench to make final connection. If needed, use additional wrench to prevent gage primary (body) from turning. Gently tap the barrel to settle the gage.
   
   c. The gage pointer should line up exactly with the zero mark on gage. If not, adjust "zero set" knob until gage pointer reads zero. On gages having a dial lock screw and a movable dial, loosen the dial lock.
screw and move the dial until the gage pointer reads zero. Gages should be zeroed before each set of measurements to make sure zero setting has not changed.

d. Remove gage primary.

5. Gage the device under test.

   a. While holding gage by the barrel, carefully connect DUT to gage. Finger-tighten connector nut only.

   b. Use proper torque wrench to make final connection and, if needed, use additional wrench to prevent DUT (body) from turning. Gently tap the barrel to settle the gage.

   c. Read gage indicator dial for recession or protrusion and compare reading with device specifications.

**Caution:** If the gage indicates excessive protrusion or recession, the connector should be marked for disposal or sent out for repair.

6. For maximum accuracy, measure the device a minimum of three times and take an average of the readings. After each measurement, rotate the gage a quarter-turn to reduce measurement variations.

7. If there is doubt about measurement accuracy, be sure the temperatures of the parts have stabilized. Then perform the cleaning, zeroing, and measuring procedure again.

**Connector Care Procedures**

- Inspecting Connectors
- Cleaning Connectors
- Making Connections
- Using a Torque Wrench
- Handling and Storing Connectors

**To Inspect Connectors**

Wear a grounded wrist strap (having a 1 MΩ series resistor).

Use a magnifying glass (≥10X) and inspect connector for the following:

- Badly worn plating or deep scratches
- Deformed threads
Metal particles on threads and mating plane surfaces

Bent, broken, or mis-aligned center conductors

Poor connector nut rotation

Caution: A damaged or out-of-specification device can destroy a good connector attached to it even on the first connection. Any connector with an obvious defect should be marked for disposal or sent out for repair.

To Clean Connectors

1. Wear a grounded wrist strap (having a 1 MΩ series resistor).

2. Use clean, low-pressure air to remove loose particles from mating plane surfaces and threads. Inspect connector thoroughly. If additional cleaning is required, continue with the following steps.

4. Clean contamination and debris from mating plane surfaces and threads. When cleaning interior surfaces, avoid exerting pressure on center conductor and keep swab fibers from getting trapped in the female center conductor.

5. Let alcohol evaporate–then use compressed air to blow surfaces clean.

6. Inspect connector. Make sure no particles or residue remains.

7. If defects are still visible after cleaning, the connector itself may be damaged and should not be used. Determine the cause of damage before making further connections.

To Make Connections
1. Wear a grounded wrist strap (having a 1 MΩ series resistor).

2. Inspect, clean, and gage connectors. All connectors must be undamaged, clean, and within mechanical specification.

3. Carefully align center axis of both devices. The center conductor pin—from the male connector—must slip concentrically into the contact finger of the female connector.

4. Carefully push the connectors straight together so they can engage smoothly. Rotate the connector nut (not the device itself) until finger-tight, being careful not to cross the threads.

5. Use a torque wrench to make final connection. Tighten until the "break" point of the torque wrench is reached. Do not push beyond initial break point. Use additional wrench, if needed, to prevent device body from turning.

To Separate a Connection

1. Support the devices to avoid any twisting, rocking or bending force on either connector.

2. Use an open-end wrench to prevent the device body from turning.
3. Use another open-end wrench to loosen the connector nut.

4. Complete the disconnection by hand, turning only the connector nut.

5. Pull the connectors straight apart.

**To Use a Torque Wrench**

1. Make sure torque wrench is set to the correct torque setting.

2. Position torque wrench and a second wrench (to hold device or cable) within 90° of each other before applying force. Make sure to support the devices to avoid putting stress on the connectors.

3. Hold torque wrench lightly at the end of handle—then apply force perpendicular to the torque wrench handle. Tighten until the "break" point of the torque wrench is reached. Do not push beyond initial break point.

**To Handle and Store Connectors**

- Install protective end caps when connectors are not in use.

- Never store connectors, airlines, or calibration standards loose in a box. This is a common cause of connector damage.

- Keep connector temperature the same as analyzer. Holding the connector in your hand or cleaning connector with compressed air can significantly change the temperature. Wait for connector temperature to stabilize before using in calibration or measurements.

- Do not touch mating plane surfaces. Natural skin oils and microscopic particles of dirt are difficult to remove from these surfaces.
- Do not set connectors contact-end down on a hard surface. The plating and mating plane surfaces can be damaged if the interface comes in contact with any hard surface.

- Wear a grounded wrist strap and work on a grounded, conductive table mat. This helps protect the analyzer and devices from electrostatic discharge (ESD).

**Power Switch**

Used for choosing between power-on ( | ) and standby (O) state.

Learn to power ON and OFF the VNA.

**LCD Touchscreen**

VNA is equipped with a 12.1-inch TFT color, touch-sensitive LCD screen for displaying traces, scales, settings, softkeys and other measurement related information. The touchscreen LCD allows to manipulate softkeys by touching the LCD screen directly. For more on the LCD touchscreen, see Screen Display Tour.

**Note:**

Do not press the surface of the LCD touchscreen with a sharp object (e.g., a nail, pen, or screwdriver). Pressing the surface with a sharp-pointed object will damage the LCD screen surface or cause the screen to fail.

Valid pixels are 99.998% and more. Below 0.002% of fixed points of black, blue, green or red are not regarded as failure.

**Test Ports**

The models are available with 2 or 4 test ports.

See Specs for more information about the Test port connectors and Input damage levels.

The LED of each test port shows the source output status. When the signal comes from the port, its LED is lighted.

**Front panel Access Jumpers**

These connectors provide direct access to the VNA source and receivers. This allows you to make a wide variety of measurements and improve dynamic range.

See front panel jumpers specifications
Port 1 and Port 3 SW SRC OUT - COMB IN jumpers moved from rear-panel (J8 through J11) to front-panel to minimize path loss.

**Important:** All of the N5247B front-panel jumpers are EXTREMELY FRAGILE. Learn more.

**USB Hub**

This USB hub contains four USB ports to power your VNA peripherals. There are also four USB ports on the rear panel.

**Limitation:** The total power consumption for all eight USB ports is limited to 4.0 amps. If this limit is exceeded, all USB ports are disabled until a device is removed and power consumption falls below the limit. When first connected, Keysight ECal modules 8509x and N4431 draw significantly more current than other modules.
Note:

The **FIRST TIME** each USB device (ECal module, power sensor, and so forth) by serial number is connected to a specific VNA USB port, you must be logged in to the VNA with an **Administrator** account. Learn how.

When a **New Hardware Found** dialog appears, click **OK** to install the device.

After being installed, when that same USB device is connected to that same USB port, you can be logged in to the VNA with a Limited/User account.

**Ground terminal**

Connect a banana-type plug to this terminal for grounding to the VNA chassis.

**No probe power**

Probe power is NOT provided on VNA models. Learn more about Active Probing

**Hardkeys**

**INSTRUMENT Keys**

Manages the Traces and Channels on the VNA display.

10 MHz Reference IN/OUT

10 MHz Reference Input  When a 10 MHz external reference signal is detected at this port, it will be used as the instrument frequency reference instead of the internal frequency reference.

10 MHz Reference Output  This BNC(f) connector outputs a frequency reference signal for use by other test equipment.

- Press Setup > Internal Hardware > Reference... to switch external/internal reference.
- From SCPI, use SENS:ROSC:SOUR
USB Hub

This USB hub contains two SuperSpeed USB ports to power your VNA peripherals. There is also one USB port below the LAN connector, on USB device port, and four USB ports on the front panel.

**Limitation:** The total current limit for all rear panel USB ports is 2.3 amps. The total current limit for all front panel USB ports is 2 amps. When first connected, Keysight ECal modules 8509x and N4431 draw significantly more current than other modules. See Specifications.

See Important First-time USB connection note.

USB Device

LAN Connector

This 10/100/1000 BaseT Ethernet connection has a standard 8-pin configuration and auto selects between the data rates.

Mini DisplayPort Connector

The Mini DisplayPort is a miniature DisplayPort connector for connection to external displays.

Line Power

SRC3 Connector

Provides a synthesizer output from 10 MHz to 13.5 GHz (Option XSB) and also requires Option 422 or 423.

GPIB Controller and Talker/Listener Ports

The PNA-X can be a GPIB Controller and Talker/Listener. Learn more.
**PCIe X4 Connector**

The PCIe X4 connector is a 4-lane slot for future enhancements.

---

**RF Path Access**

These connectors are NOT available on the N522x and N5264B models.

These connectors allow RF Path Configuration.

Ports 3 and 4 are not available on 2-port models.

N5247A - J8 thru J11 are moved to the front-panel.

---

**RF and LO OUT**

The RF OUT connector is NOT available on the N5264B

For the N5247B and N5227B:
- Added RF2 OUT (J12) for 4-port 110 GHz single sweep VNA. Enables driving two mmWave modules simultaneously. [Learn more.](#)

---

**Caution:** LO OUT has more power than previous VNA models.

[See specifications](#)

---

**IF Path Inputs**

Option 020 adds these connectors, which allow access to the VNA Receiver / IF paths.
These are labeled A, B, C/R1, D/R2, R.

- For 2-port models, use A, B, R1, R2.
- For 4-port models, use A, B, C, D, R.

See IF Path Configuration settings and block diagram.

**Power I/O**
See Details

**+28 VDC (BNC output)**

![28V output](image)

Used to power a noise source for the Noise Figure App.

- Maximum steady-state current = 300 mA.
- Maximum in-rush current = 500 mA.
- This output is protected with a self-healing fuse.

**External and AUX Trigger I/O**

![Trigger connectors](image)

**MEAS TRIG IN** - When enabled, VNA is triggered by signals on this connector. Learn more.

**MEAS TRIG RDY** - When enabled, VNA outputs a 'READY' signal on this connector to other devices. Learn more.

**AUX TRIG 1&2 IN** - When enabled, VNA accepts signals on these connectors which indicates that the external devices are ready to be triggered. Learn more.

**AUX TRIG 1&2 OUT** - When enabled, VNA outputs signals on these connectors either before or after a measurement. Learn more.
Test Set I/O
See Details

Bias IN and Fuses

Connect your DC Power Supply to apply Bias to the VNA ports through these BNC connectors.

- The bias fuses are rated for 0.5A. You are responsible to ensure that devices connected to the test port do NOT draw more current than 0.5A. This will occur, for example, if a calibration SHORT is connected to the test port with bias power ON. The fuse Keysight part number for the PNA-X is 2110-0824.

- The VNA will meet all of its RF specifications with bias up to 200 ma. As the DC bias is increased, corrected source match and directivity will degrade at low RF frequencies.

Change VNA Display Settings

The VNA display is controlled by a third-party display driver. This driver is capable of producing many display effects which are beyond the basic needs of the VNA measurement environment. Keysight does not specify or warrant these display settings.

**WARNING:** The VNA display must remain in the 16 bit color setting in order to comply with international emissions regulations.

Restore VNA Display Settings

When using external programs to control the VNA, it is possible that the display settings may become
corrupt. When this occurs, the following will restore the VNA display settings:

- Press **System > Main > Minimize Application**.
- Right-click on the desktop, then click **Personalize**.
- On the Themes tab, select **Keysight Theme**.

See Also

- About the Touchscreen
- Front Panel Tour
- Marker Drag
- Expanded Mouse capabilities
- Learn how to Customize the Screen
- Learn to test the display screen.

---

About the Touchscreen

The VNA is equipped with a 12.1-inch Hi resolution, color, touch-sensitive LCD screen for displaying traces, softkeys, and other measurement related information. The touch screen LCD allows you to make measurement settings by touching the LCD screen directly with a finger.

**Important**

- Do not press the surface of the LCD screen with a sharp object such as a pen. This will damage the LCD screen surface or cause the screen to fail.
- Occasionally, a few pixels may appear on the screen as a fixed point of blue, green or red. This is not a failure of the LCD screen and does not affect the performance of your product.
- Because of the LCD screen, burn-in is not likely. In addition, we do not recommend using a screen-saver on the VNA.

---

**How to Calibrate or turn ON | OFF the Touchscreen**

Using **Hardkey /SoftTab /Softkey**
To turn Touchscreen ON or OFF:

1. Press Display > Display Setup.

2. Click Touchscreen to turn ON/OFF.

To calibrate Touchscreen:

Note: The Touchscreen is self calibrating and should not require calibration. However, if the touch locations are not accurate, perform the following procedure to calibrate the Touchscreen.

1. For Windows 7, perform the following procedure.
   
   a. In the PNA application, press System > Main > Control Panel.
   
   b. In the Control Panel, select Hardware and Sound > Tablet PC Settings > Calibrate the screen for pen or touch input.

2. For Windows 10, perform the following procedure.
   
   a. Close the PNA application.
   
   b. Press or select the Windows key on an external keyboard, or click on the Windows Start icon in the lower-left corner.
   
   c. Select Settings to access the Settings dialog.
   
   d. In the search field of the Settings dialog, type calibrate then select Calibrate the screen for pen or touch input.
e. The **Tablet PC Settings** dialog is displayed:

![Tablet PC Settings Dialog](image)

f. Select the **Display** tab.
g. Click on the **Calibrate**... button.

h. In the **User Account Control** dialog, click **Yes**.

i. Follow the instructions displayed on the screen.

**To calibrate Touchscreen when external monitor is connected to PNA:**

When a second monitor is added to a Windows PC where the primary monitor has a touchscreen, Windows may associate touch inputs with the window shown on the extended monitor rather than on the monitor that has the touchscreen. Since the computer in a PNA runs on the Windows operating system, the PNA can exhibit this condition.

**Note:** The Touchscreen is self calibrating and should not require calibration. However, if the touch locations are not accurate, perform the following procedure to calibrate the Touchscreen.

1. Minimize the PNA application window by selecting **File** then **Minimize Application**.

2. Press or select the Windows key on an external keyboard, or click on the Windows Start icon in the lower-left corner.

3. Select **Settings** to access the Settings dialog.

4. In the search field of the Settings dialog, type **calibrate** then select **Calibrate the screen for pen or touch input**.
5. The **Tablet PC Settings** dialog is displayed:

6. Select the **Display** tab.
6. Click on the **Setup...** button. At this point, both the PNA screen and the external monitor will display a white background. Only one screen will also display the following message:

   *Touch the screen to identify it as the touchscreen.*
   *If this is not the Tablet PC Screen, press Enter to move to the next screen. To close tool, press Esc.*

7. If the message is on the PNA screen, touch the screen. The calibration is now finished and the **Calibrate touch** dialog will reappear. Press **OK**.

8. If the message is not on the PNA screen, press **Enter** on the external keyboard until the message is displayed on the PNA screen. Touch the PNA screen, then press **OK** on the **Calibrate touch** dialog.

9. **Note:** If the calibration makes the touch operation worse, click on the **Reset** button in the **Tablet PC Settings** dialog to reset the calibration data.

The touchscreen ON | OFF setting remains until changed again from this menu, the Preferences dialog, or remotely.

**Active Entry**

Allows you easily select the tools. Learn more.

**Trace Status**

Provides details of each trace in the window. Highlighted trace indicates the active trace. Learn more.

**Entry Toolbar**

Along with the softkeys, allows numeric values to be entered for settings. Learn about all toolbars.

**Marker Readout**

Provides stimulus and response information for markers. Learn about customizing the marker readout area. See also Marker Drag.

**Softkeys**

The combination of hardkeys and softkeys allows easy access to all VNA features without a mouse.

**SoftTabs**

Pressing these tabs will display corresponding softkeys.

**Hardkeys**

Performs interface operations that are equivalent to those of keys in the INSTRUMENT keys, RESPONSE keys, STIMULUS keys and UTILITY keys on the front panel of VNA. Learn more.
Window Number

Provides window identification which is useful for remote programmers.

Status Bar

Provides detail about all aspects of the status of the analyzer. Learn more.

Stimulus Range

Displays the start and stop values of the sweep range.

Softkey Toolbar

These icons provide shortcuts to quickly select the softkey tools. Learn more.

Marker Drag

Drag a displayed marker across the trace using a finger (with touchscreen ON) or a mouse. Learn more.

Expanded Mouse Capabilities

- Cursor changes to a “hand” when hovering over a clickable object.
- Right-click on the Entry toolbar to launch a mouse-compatible numeric pad.

Windows

- Right-click or long press on a window area to make selections pertaining to that window.
- Double-click on a window area to maximize the window. To return to original window configuration, right-click on window area, then click Tile.
- Left-click on X-axis annotation to select the active channel/trace.
- Right-click on X-axis annotation and click Start/Stop/Center to change stimulus properties. Applications are not fully supported.
- Quickly change Scale, Reference Level, and Position. Learn how.
- Right-click on Y-axis annotation and click Scale to change Scale.
- Drag a trace from one window to another. Click or touch either the trace or the Trace Status. Drag the trace to another window, then release the mouse or lift your finger.

Traces
• Left-click a trace or Trace Status to make it the selected trace.

• Double-click on a trace or Trace Status to maximize the trace. Double-click again to return to the original trace configuration.

• Set a preference to **always** widen the active trace.

• Set a preference to **briefly** widen the active trace.

• Drag a trace from one window to another. Click or touch either the trace or the Trace Status. Drag the trace to another window, then release the mouse or lift your finger.

### Markers

• Right-click on a trace or Trace Status to add a marker.

• Right-click a marker to make selections pertaining to that marker, such as Marker Search or Function.

### Softkeys

• Use the Touchscreen or adjacent buttons to select from eight dynamic softkey menu choices.

• To Show the softkeys, press any front-panel hardkey and the corresponding softkey menu will be launched.

### Softkey Annotations

Powering the VNA ON and OFF

The following is described in this topic:

- How to Log Off, Shut Down, or Restart the VNA
- ON Mode
- Turn OFF Autostart
- Shutdown

**Notes:** During boot up of Windows or of the Network Analyzer application program, do **NOT** press keys on the front panel, rotate the RPG knob, or connect a USB device. Doing so MAY lead to a front panel lockup state.

If the VNA front-panel keypad or USB ports are not responding, SHUTDOWN or RESTART the VNA.

---

### How to Log Off, Shut Down or Restart the VNA.

1. Minimize the VNA application

2. Click **Window Start**.

3. Choose from the following:

   - Shut down
   - Log off (closes programs)
   - Restart (shutdown and start)

   **OR**

1. Press the front-panel VNA power button (only for Shutdown).

**Note:** ONLY if the VNA is locked and you cannot operate the mouse or keypad - Press and hold the power button for at least four seconds. **This practice should be avoided!** Repeated shutdowns in this manner WILL damage the solid state drive. [Learn more about damaging the VNA solid state drive](#).
ON Mode

- To turn ON the VNA press the power button.
- The power indicator will change to green when power is ON.

Turn OFF VNA Autostart

The VNA application (835x.exe) always starts automatically when power is turned ON. To cause the VNA to NOT Autostart, do the following:

1. Minimize the VNA application.
2. From Windows Explorer, navigate to and double-click the following file: C:\Program Files(x86)\Keysight\Network Analyzer\Service\Toggle_PNA_Autostart.exe

The script toggles the VNA Autostart mode ON and OFF.

Shutdown Mode

- In shut down mode the current instrument VNA is NOT automatically saved before the VNA is powered OFF.
- When the VNA is again powered ON, a full system boot-up is performed and the VNA powers-up in the preset settings.
- A password may be required to resume VNA operation after being in Shutdown mode. Learn more.
- To guarantee that your measurements meet the VNA specified performance, allow the VNA to warm-up for 90 minutes after the power indicator has turned green.
- The power indicator will change to yellow when power is OFF.

Note: If the VNA is locked and you cannot operate the mouse or keypad, shut down the VNA by pressing and holding the power button for at least four seconds. This practice should be avoided! Repeated shutdowns in this manner WILL damage the solid state drive. Learn more about damaging the VNA solid state drive.

Unplugging the VNA
- Remove the power cord from the VNA ONLY when the power indicator is yellow, in either Hibernate or Shutdown mode. If the power cord is removed while the power indicator is green (VNA ON), damage to the solid state drive is possible.

- The indicator will remain yellow for several seconds after the power cord has been removed.
Traces, Channels, Windows, and Sheets on the Analyzer

It is critical to understand the meaning of the following terms as they are used on the analyzer.

- Traces - Managing (Trace Manager)
- Channels - Managing
- Windows - Managing
- Sheets - Managing

Other Quick Start topics

Traces

Traces are a series of measured data points. There is no theoretical limit to the number of traces. However, the practical limit is the maximum number of windows times the maximum number of traces per window (100).

In addition, one memory trace can be stored and displayed for every data trace. Learn more about Math / Memory traces.

Trace settings affect the presentation and mathematical operations of the measured data.

The following are Trace settings:

- Parameter
- Format and Scale
- Smoothing
- Correction ON / OFF
- Electrical Delay
- Phase Offset
- Trace Math
- Markers
Managing Traces

- How to Add a trace
- How to Select a trace
- How to Delete a trace
- How to Move a trace
- How to Maximize a trace
- How to perform Trace Hold (Max or Min)
- How to Create a new trace
- How to Change the trace parameter
- How to display a custom trace title (separate topic)
- How to display a wide active trace (separate topic)

How to Add a trace

The only measurements that can be selected are those in the same measurement class as is currently assigned to the channel. To select a measurement other than these, first select the appropriate measurement class to a new or existing channel. Learn how.

A trace must be selected (active) before its trace settings can be changed.

How to know which trace is Active?

**Using Hardkey/SofTab/Softkey**

1. For Traces 1-7, press Trace > Trace 1-7 > click left side Trace 1-7 small button

**Using a mouse**

1. Right click in the grid box and then select
(Example: Click on left side Trace 1 small button and Trace 1 is active when it turns green, so Trace 1 added).

2. For Traces 8-15, press Trace > Trace 8-15 > click left side Trace 8-15 small button

New Trace...
(Example: Click on left side Trace 9 small button and Trace 9 is active when it turns green, so Trace 1 is added).

3. Another method of adding traces is by pressing Trace > Trace 1-7 > New Traces....

4. For other traces numbers, press Trace > Trace Setup > Add Trace, then select New Trace, New Trace + Channel, New Trace + Window, New trace + Channel + Window, or New Traces....

How to Select a Trace

The only measurements that can be selected are those in the same measurement class as is currently assigned to the channel. To select a measurement other than these, first select the appropriate measurement class to a new or existing channel. Learn how.

A trace must be selected (active) before its trace settings can be changed.

How to know which trace is Active?

**Using Hardkey/SoftTab/Softkey**

1. Press Trace > Trace Setup > Select.
2. Select a trace number which corresponds to the desired measurement parameter.

**Using a mouse**

1. Click on Trace Status label of any trace above the grid box.
How to Delete a Trace

Using **Hardkey/SoftTab/Softkey**

1. For Traces 1-7, press **Trace > Trace 1-7** > click left side **Trace 1-7** small button

Using a mouse

1. Right-click the **Trace Status** label above the grid box, then click **Delete**
(Example: Click on left side Trace 1 small button and Trace 1 is inactive when it is not green).

2. For Traces 9-16, press **Trace** > **Trace 8-15** > click left side **Trace 8-15** small button
(Example: Click on left side Trace 9 small button and Trace 9 is inactive when it is not green).

3. For other traces numbers, press **Trace > Trace Setup > Delete Trace**, then select a trace number.

---

**How to Move a trace to a different Window**

You can **DRAG** a trace from one window to another, or...

**Using Hardkey/SoftTab/Softkey**

1. Press **Trace > Trace Setup > Trace Manager...**

2. Under the Window Column, reassign the active trace to another window number at the pulldown then click OK.

For some models

1. Press **Trace > Trace Setup > Move Trace....**

2. Select a window number in the following dialog, and then click OK.

**Using a mouse**

1. Right-click the **Trace Status** label above the grid box, then click **Trace Manager...**

2. Under the Window Column, reassign the active trace to another window number at the pulldown then click OK.

For some models,

1. Right-click the **Trace Status** label above the grid box, then click **Move Trace....**

2. Select a window number in the following dialog, and then click **OK**.

---

**Trace Manager** dialog box help
Trace Manager allows the user to see and modify all traces/channels/windows/sheets/formats in one table. The changes are updated immediately.

There is one row for each trace. By Clicking on a column heading will display the rows in ascending or descending order as defined by that column.

A row is selected by clicking on any cell in the row and the popup menu for the cell will appear. Multiple rows can be selected by click-drag-release. All selected rows will be highlighted and popup menu for the column will appear.

**Undo**  Reverse back to the previous settings

**Redo**  Change the settings again.

**Trace Column**
User is not able to edit trace numbers. User may select multiple rows; this allows user to delete multiple traces using the popup menu.

There is a special case where the trace entry in the row is empty. This is used to show when there is an empty window. If the users select this row and choose "Delete Trace", it will delete the empty window; this is a convenient feature; it is deleting a null trace.

New Trace  To add a new trace. Selecting the cell will open the "Meas" dialog.

Delete Trace  The selected trace will be deleted.

Table Columns  A pop up dialog is opened which allows user to define the columns visible in the table. The default table column is: Meas/Class/Channel/Windows/Sheet.

Meas Column

Selecting the cell will open the "Meas" dialog. User cannot select multiple rows from a Meas cell.

Class Column
Selecting the cell will open the "Measurement Class" dialog. User cannot select multiple rows from a Class cell.

When the measurement class is changed, all traces numbers on the currently active channel will be assigned to the new measurement class. The window and sheet settings will be the same, but the "Meas" setting will be changed to default values for the selected class.

Channel Column

Selecting the cell will open a pulldown, and will select the row. User can click and drag to select multiple rows.

User may use the pulldown to reassign the active trace to another channel and delete the active channel.

When the channel for a trace is changed, the "Meas" setting will likely be changed.
Window Column

Selecting the cell will open a pulldown, and will select the row. User can click and drag to select multiple rows.

User may use the pulldown to reassign the active trace to another window, delete the active window and all traces on that window and change the layout of the windows.

If the active row has no trace assigned, then the window pulldown will not allow user to change the window number.

Sheet Column

Selecting the cell will open a pulldown, and will select the row. User can click and drag to select multiple rows.

User may use the pulldown to reassign the active trace to another sheet, delete the active sheet and
all traces on that sheet and change the layout of the sheets.

If the active row has no trace assigned, then the sheet pulldown will not allow user to change the sheet number.

**Format Column**

Selecting the cell will open a pulldown, and will select the row.

User may use the pulldown to select the trace formats. When the measurement class is SA, the selectable formats are only LinM and LogM.
**Move Trace** dialog box help (E5080A only)

![Move Trace dialog box](image)

**Note:** Only ONE trace can be moved at a time.

1. Click the **Trace Status** label to select the trace to move.

2. **Move Trace N to window** - Transfer the selected trace to any Window listed or to a New Window.

---

**Trace Max**

How to maximize the active trace - the active trace is the ONLY trace on the screen display. All other traces are hidden.

**Using Hardkey/SoftTab/Softkey**

1. Press **Trace > Trace Setup > Trace Maximize (ON)**. With Trace Max (ON), select a different trace to make that trace visible.

2. To make all traces visible again, select **Trace Maximize (OFF)**.

**Using a mouse**

1. Right-click the **Trace Status** label above the grid box, then click **Trace Maximize**.

2. Double click on the active trace to make all traces visible again.
Trace Hold

How to hold the active trace at the maximum or minimum points.

Using **Hardkey/SoftTab/Softkey**

1. **Trace** > **Trace Setup** > **Trace Hold** > **OFF | Max | Min.**
2. **Restart** resets the trace.

Using a **mouse**

Not available

Maximum/Minimum trace hold can be applied with several conditions:

- Feature is applicable to any data trace, but NOT to memory traces.
- When the stimulus or any data post processing setting is changed, the trace hold data will be reset. These settings include:
  - Smoothing on/off.
  - Smoothing Aperture.
  - Gating on/off.
  - Transform on/off.
  - Conversion state change, conversion type change.
  - Data Math Function (Data/Mem) change.
  - Equation Editor state change, formula change.
  - Parameter change.
  - Formatting change.
- Minimum/maximum comparison is done with formatted data. For Smith and Polar formats, absolute data is used and not phase.
- Trace hold data can be recalled.
- Data save files formats
  - SnP does NOT save trace hold data
  - Citifile, CSV, MDF, PRN DOES save trace hold data
Note: Citifiles can be recalled and viewed in the VNA.

- Use SCPI commands to get trace hold data. If trace hold is active, then the data returned from the remote interfaces will be the trace hold data.

Channels

Channels contain traces. The analyzer can have up to maximum 500 independent channels.

Note: Actual maximum number of channel depends on the setup. A large number of NOPs and traces limit the maximum number of channel.

Channel settings determine how the trace data is measured. All traces that are assigned to a channel share the same channel settings. A channel must be selected (active) to modify its settings. To select a channel, click the Trace Status button of a Trace in that channel. The following are channel settings:

- Frequency range
- Power level
- Calibration
- IF Bandwidth
- Number of Points
- Sweep Settings
- Average
- Trigger (some settings are global)

Managing Channels

How to Select a Channel

A channel must be selected (active) before its settings can be changed.

To make a channel active, select a trace in that channel or click the Trace Status button of a Trace in that channel.
### How to Add a channel

#### Using Hardkey/SoftTab/Softkey

1. Press **Channel** > **Channel 1-8** > click left side **Channel 1-8** small button

#### Using a mouse

Not available
(Example: Click on left side Channel 1 small button and Channel 1 is active when it turns green, so Channel 1 is added).

2. For other channel numbers, press **Channel** > **Channel Setup** > **Add Channel**, then select **New Trace + Channel** or **New Trace + Channel + Window**.

    No programming commands are available for this feature

### How to Delete a channel

**Using Hardkey/SoftTab/Softkey**

1. Press **Channel** > **Channel 1-8** > click left side **Channel 1-8** small button

**Using a mouse**

Not available
2. For other channel numbers, press Channel > Channel Setup > Delete Channel, then select a channel.

---

**Windows**

Windows are used for viewing traces.

- The analyzer can show between 1 and 500 windows on the screen with the following limitations:
  - The COM property MaximumNumberOfWindows returns 500.
  - The SCPI status register can track the status of up to 576 traces.
- Each window can contain up to 100 traces.
- Windows are completely independent of channels.
- See Customize the analyzer screen to learn how to make other window settings.

The following is a window containing two traces. Both traces use the same channel 1 settings as indicated by the annotation at the bottom of the window.

![Image of a window containing two traces](image)

The window number shows in the lower-left corner of the window. The following shows window 5.
## Managing Windows

### How to Add a window

<table>
<thead>
<tr>
<th>Using Hardkey/SofTab/Softkey</th>
<th>Using a mouse</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. Press <strong>Display &gt; Window 1-8</strong> &gt; click left side <strong>Channel 1-8</strong> small button</td>
<td>1. Right-click any area of grid box and then select <strong>New</strong></td>
</tr>
</tbody>
</table>
(Example: Click on left side Window 1 small button and Window 1 is active when it turns green, so Window 1 is added).

2. For other windows, press Display > Window Setup > Add Window, then select New Window, New Trace + Window, or New Trace + Channel + Window.

---

**How to Delete a Window**

**Using Hardkey/SoftTab/Softkey**

1. Press Display > Window 1-8 > click left side Channel 1-8 small button

**Using a mouse**

1. Right-click any area of grid box and then select Close Window.
(Example: Click on left side Window 1 small button and Window 1 is inactive when it is not green).

2. For other windows, press **Display > Window Setup > Delete Window**, then select a window.

### How to Move a Window to a different Sheet

**Note:** This feature is NOT available on M948xA and E5080A.

**Using Hardkey/SoftTab/Softkey**

1. Select a Window to move.

2. Press **Display > Window Setup > Move Window...**

3. Select a sheet number in the following dialog, and then click OK.

**Move Window dialog box help**

**Note:** Only ONE window can be moved at a time.

1. **Move Window N to Sheet N** - Transfer the selected window to any sheet listed or to a New Sheet.
How to Change Window Layout

**Note:** This feature is NOT available on M948xA and E5080A.

This is a window auto-layout option, for quicker selection instead of selecting the trace, channel, window and sheet separately. 7 auto-layout options are available.

**Using Hardkey/SoftTab/Softkey**

1. Press **Display > Window Setup > Window Layout**.
2. Select 1 Window, 2 Windows, 3 Windows, 4 Windows, 1 Trace per Window, 1 Channel per Window, or Tile Windows.

---

How to maximize the active window - the active window is the ONLY window on the screen display. All other windows are hidden.

**Using Hardkey/SoftTab/Softkey**

1. Press **Display > Window Setup > Window Max (ON)**. With Window Max (ON), select a different window to make that window visible.
2. To make all windows visible again, select **Window Max (OFF)**.

**Using a mouse**

1. Right-click in any area of the grid box and then select **Maximize**.

---

Sheet

Sheets are used to group VNA windows. The sheet tabs provide an easy way to switch multiple display settings quickly.

Features and actions that can performed with tabbed sheets:

- Add/Delete/Select sheet
- Move window to sheet
- Measurement can be performed on traces/channels in inactive sheets
- Easy setup for channel per window
- Easy setup for channel per sheet

## Managing Sheet

### How to Add Sheet

<table>
<thead>
<tr>
<th>Using Hardkey/SoftTab/Softkey</th>
<th>Using a mouse</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. Press <strong>Display &gt; Sheet Setup &gt; Add Sheet</strong>.</td>
<td>1. Click on the sheet tab.</td>
</tr>
<tr>
<td>2. The select one a <strong>New Sheet, New Trace + Sheet</strong> or <strong>New Trace + Channel + Sheet</strong>.</td>
<td></td>
</tr>
</tbody>
</table>

### How to Delete a Sheet

<table>
<thead>
<tr>
<th>Using Hardkey/SoftTab/Softkey</th>
<th>Using a mouse</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. Press <strong>Display &gt; Sheet Setup &gt; Delete Sheet</strong>.</td>
<td>1. Click on the sheet tab.</td>
</tr>
<tr>
<td>2. Then select a sheet.</td>
<td></td>
</tr>
</tbody>
</table>

### How to View a Sheet

<table>
<thead>
<tr>
<th>Using Hardkey/SoftTab/Softkey</th>
<th>Using a mouse</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. Press <strong>Display &gt; Sheet Setup &gt; Select</strong>.</td>
<td>1. Click on the sheet tab.</td>
</tr>
<tr>
<td>2. Then select a sheet.</td>
<td></td>
</tr>
</tbody>
</table>

### How to Change Sheet Title

<table>
<thead>
<tr>
<th>Using Hardkey/SoftTab/Softkey</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. Press <strong>Display &gt; Sheet Setup &gt; Sheet Title</strong>.</td>
</tr>
<tr>
<td>2. In the pop up Sheet title box, enter the title and click OK.</td>
</tr>
</tbody>
</table>
How to Change Sheet Layout

This is a sheet auto-layout option, for quicker selection instead of selecting the trace, channel, window and sheet separately. 4 auto-layout options are available.

Using Hardkey/SoftTab/Softkey

1. Press Display > Sheet Setup > Sheet Layout.

2. Select 1 Sheet, 1 Trace per Sheet, 1 Channel per Sheet, or 1 Window per Sheet.
Quick Start Dialog

Quick start is a simple wizard which helps to setup the settings for typical measurements. This feature allows users to select from a set of pre-configured measurement layouts.

How to Open Quick Start Dialog Box

Using Hardkey/SoftTab/Softkey

1. Press Setup > Main > Quick Start...

The measurement comprises the following THREE steps.

Step 1: Layout Templates

You are able to select a layout template for typical measurements.

If "Create in new channel" checkbox is enabled, a new channel and window(s) will be created.
If "Create in new channel" checkbox is disabled, when a template is selected then the active channel will be used for the new measurements. If the active trace is displayed in a window with traces on other channels, then the trace will be deleted and a new window(s) will be opened for the new measurements.

If "Display Smith Chart" checkbox is enabled, the active trace in a window will turn to display Smith Chart.

If "Display Smith Chart" checkbox is disabled, no changes on the active trace in a window.

### Step 2: Stimulus Settings Dialogs

This step is used to set stimulus for the measurement.

![Frequency Sweep Settings](image)

**S-Parameters**

Option Required: None

Enter:

- Start/Stop frequency
- Center Frequency
- Span Frequency
- Sweep Type: Lin or Log Frequency
- Power

Creates S11 and S21 measurements in a single channel and window.
**Differential (Balanced)**

Option Required: None

Create Sdd11 and Sdd21 measurements in a single channel and window.

Enter:

- Start/Stop frequency
- Center Frequency
- Span Frequency
- Sweep Type: Lin or Log Frequency
- Power
- IF Bandwidth
- Number of Points

Learn more about **Differential (Balanced) measurements.**

Create R1 and B receiver measurements in a single channel and window. This allows you to view the DUT input power (R1) and output (B) power.
**Power Frequency Sweep**

Option Required: None

Enter:

- Start/Stop Frequency
- Center Frequency
- Span Frequency
- **Sweep Type:** Lin or Log Frequency
- Power
- IF Bandwidth
- Number of Points

Learn more about Power Sweep measurements.

Creates a power sweep while viewing R1, B, and S21 measurements in a single channel and window. This allows you to view the DUT input power (R1), output power (B), and DUT gain (S21).
**Power**

**Power Sweep**

Option Required: None

Enter:

- Start/Stop Power
- CW Frequency
- IF Bandwidth
- Number of Points

Learn more about Power Sweep measurements.

**Receiver Frequency Offset**

Option Required: S93080A

Enter

- Source Start

Creates Frequency Offset Measurement while viewing R1 and B receivers in a single channel and window.

- Source Stop
- Receiver Start
- Receiver Stop
- Power Level
- IF Bandwidth
- Number of Points

Learn more about FOM.

Creates an S11 measurement and enables Time Domain.

Enter:

- Start/Stop Time
- Transform Mode (Time Domain Settings dialog auto-select the start frequency if a LPF transform mode is selected.)
- Start/Stop Frequency
- Power
- IF Bandwidth
- Number of Points

Learn more about Time Domain measurements.

If any one of the SMC Measurements is selected in Step 1, the Mixer...
Quick Settings dialog will appear.

Enter:

- Input, LO, and Output Frequencies and configuration.

Learn more about SMC Measurements

Steps 3: Cal Wizard Dialog (Optional)

- If "Calibrate this setup" checkbox is enabled, the Cal Wizard Dialog will appear when Stimulus Settings Dialog is dismissed with the "OK" button.

- If "Calibrate this setup" checkbox is disabled, the Cal Wizard Dialog will NOT appear.
Basic Measurement Sequence

The following process can be used to setup all analyzer measurements:

**Step 1. Set Up Measurements**
Reset the analyzer, create a measurement state, and adjust the display.

**Step 2. Optimize Measurements**
Improve measurement accuracy and throughput using techniques and functions.

**Step 3. Perform a Measurement Calibration**
Reduce the measurement errors by performing a calibration.

**Step 4. Analyze Data**
Analyze the measurement results using markers, math operations, and limit tests.

**Step 5. Print, Save or Recall Data**
Save or print the measurement data.
**Frequency Blanking**

For security reasons, you can prevent frequency information from appearing on the screen and printouts.

**How to set Frequency Blanking**

**Using Hardkey/SoftTab/Softkey**

1. Press **System > Main > Security**.

**Using a mouse**

1. Click **Utility**.
2. Select **System**.
3. Select **Security**.

---

**Security Setting** dialog box help

![Security Setting dialog box](image)

**Notes**

- To learn how to erase memory before moving your analyzer out of a secure area, see [http://na.support.keysight.com/pna/security.html](http://na.support.keysight.com/pna/security.html).
- VNA 'Undo' is disabled with **High** and **Extra** security levels. [Learn more](http://na.support.keysight.com/pna/security.html).

**Security Levels**

**None** - All frequency information is displayed on the screen and printouts.

**Low** security level - Frequency information is blanked from the following:
- Display annotation
- Calibration properties
- All tables
- All toolbars
- All printouts

**External sources** - See Also: Preference to Deactivate External Devices on Preset. **Note:** Frequency Blanking is fully supported ONLY on Keysight MXG sources with option 006. On MXG models without option 006 and all PSG models, the window state is turned OFF. When the "local" button is clicked on the source, then frequency is re-displayed.

**High** security level - Low security level settings PLUS:

- GPIB console is inactive

**Extra** security level - High security level settings PLUS:

- All ASCII data saving capability (.snp, .prn, .cti) is saved without frequency information. The X-axis information is replaced with data point numbers. Before A.08.50, saving these file types was NOT allowed.

- Mixer setup files (*.mxr) can NOT be saved.

**For ALL security levels:**

Frequency information is **NOT** blanked from the following:

- Service Adjustment Programs
- Your COM or SCPI programs.

**Instrument State and Cal Sets**

The security level is always saved and recalled with an instrument state. However, the instrument state may contain a Cal Set or link to a Cal Set. Learn more. This may influence the security level when the instrument state is recalled. Here is how.

- When a new Cal Set is created at the end of a calibration, the current system security level is stored with it.
- The only way to change an existing Cal Set’s security level is by writing a new calibration into the Cal Set.

- When later applied to a channel, if the Cal Set has a **higher** security level than the current system security level, the system security level will become upgraded to that of the Cal Set.

- When saving an instrument state to either a *.csa or *.cst file, the security levels of the system and Cal Set are saved separately. When recalled, the higher security level of the two is applied.

- To view the security level of a Cal Set, see **Cal Set Properties**.

<table>
<thead>
<tr>
<th>Re-displaying frequency information</th>
</tr>
</thead>
<tbody>
<tr>
<td>- When in <strong>Low</strong> security level, do any of the following:</td>
</tr>
<tr>
<td>- Revisit this dialog box and select <strong>None</strong></td>
</tr>
<tr>
<td>- Perform an <strong>instrument preset</strong></td>
</tr>
<tr>
<td>- Recall an Instrument State/Cal Set with security level of <strong>None</strong>.</td>
</tr>
<tr>
<td>- When in <strong>High</strong> or <strong>Extra</strong> security level, do any of the following:</td>
</tr>
<tr>
<td>- Perform an <strong>instrument preset</strong></td>
</tr>
<tr>
<td>- Recall an Instrument State/Cal Set with security level of <strong>None</strong>.</td>
</tr>
</tbody>
</table>
**Internal Second Source**

The following VNA models include an internal second source.

<table>
<thead>
<tr>
<th>Model</th>
<th>Total # of Ports</th>
</tr>
</thead>
<tbody>
<tr>
<td>PNA-X Opt 224</td>
<td>2</td>
</tr>
<tr>
<td>ALL PNA-X models</td>
<td>4</td>
</tr>
<tr>
<td>N522xA Opt 400's</td>
<td></td>
</tr>
</tbody>
</table>

**How to use the second source**

- Set frequency using the **Frequency Offset Opt S93080A dialog**.
- Set power using the **Advanced Power dialog**.
- **Source power calibration** of the second source is performed as usual.
- Using FCA, **click the LO button** to set frequency and power.
- The **specifications** of the second source are the same as source 1.

**Benefits / Uses of the second source**

- Up to five times faster than stepping an external source.
- Measure Mixers with internal swept or fixed LO.
- Measure TOI or Intermodulation distortion.

**Internal Second Source Restrictions**

Source 1 and Source 2 are available at specific ports as follows:

**4-port models**

- Source 1 power is available at Port 1 OR Port 2; NOT at both ports simultaneously.
- Source 2 power is available at Port 3 AND Port 4; BOTH ports simultaneously. (Although it is possible, the VNA firmware typically prevents both ports from sweeping simultaneously for measurement integrity.)
purposes.)

- Other routing configurations are possible using the RF Path Configurator.

**PNA-X Opt 224 (PNA-X 2-port model):**

- Source 1 power is available at **Port 1** OR **Port 2**; NOT at both ports simultaneously.
- Source 2 (**SRC 2**) power is available at **Out 1** AND **Out 2**; BOTH ports simultaneously.
- Other routing configurations are possible using the RF Path Configurator.

**Remotely Accessing the Internal Second Source**

See **Remotely Specifying a Source Port.**
Networking and Connecting the VNA

- TestSetIO Connector
- Handler IO Connector
Preferences

Preferences are settings that survive a Preset or Shutdown. Preferences are listed on this page with links to locations that provide more information.

### How to set Preferences

<table>
<thead>
<tr>
<th>Using Hardkey/SoftTab/Softkey</th>
<th>Using a mouse</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. Press <strong>System &gt; System Setup &gt; Preferences</strong>...</td>
<td>1. Click <strong>Utility</strong>.</td>
</tr>
<tr>
<td></td>
<td>2. Select <strong>System</strong>.</td>
</tr>
<tr>
<td></td>
<td>3. Select <strong>System Setup</strong>.</td>
</tr>
<tr>
<td></td>
<td>4. Select <strong>Preferences</strong>.</td>
</tr>
</tbody>
</table>

Preferences dialog box help
Preferences survive a Preset and a Shutdown.

A checked box makes the following statements true unless stated otherwise.

- **Avg: On PRESET set two-point group delay aperture** (Default) - Group delay aperture is set to 11 points.

- **Avg: On PRESET set two-point group delay aperture** - Group delay aperture set to 2 points. Learn more.

- **Avg: Calculate Group Delay using legacy PNA Math** (Default) - Do not use legacy group delay aperture computation methods.

- **Avg: Calculate Group Delay using legacy PNA Math** - Use legacy group delay aperture computation methods.

- **Cal: Always use Internal Trigger during cal** - Only use Internal Trigger source

- **Cal: Always use Internal Trigger during cal** (default) - use the other Trigger source

- **Cal: ECAl Extrapolation for IMD** (default)

- **Cal: ECAl Extrapolation for IMD** - Allows Swept IMD and IMDx channels to be calibrated beyond the stop frequency of the ECAl module by extrapolating the error terms. Learn more.
Cal: For Frequency Offset, use Primary Frequencies (default)

☑ Cal: For Frequency Offset, use Primary Frequencies - Use when making mmWave measurements without a test set. [Learn more.]

This setting only affects calibrations performed using SCPI. Cals performed from the User Interface ALWAYS offer a choice to save to a named Cal Set.

☐ Cal: (SCPI only) Auto-generate a User Cal Set (default) - Completed calibrations are automatically saved to Cal Registers; NOT to User Cal Sets.

☑ Cal: (SCPI only) Auto-generate a User Cal Set - Completed calibrations are automatically saved to an auto-named User Cal Set. Caution: this can cause a lot of saved User Cal Sets. [Learn more.]

The following message appears when both the Cal Set choices above and below are selected:

"Cal: Auto-save preferences conflict "

Cal: (SCPI) Auto-save to User Cal Set (above)- or - Cal: (SCPI) Auto-save to current Cal Set (below)

Uncheck one of these.

This setting only affects calibrations performed using SCPI. Cals performed from the User Interface ALWAYS offer a choice to save to a named Cal Set.

☑ Cal: (SCPI) Auto-save to current Cal Set - Always automatically save a completed Cal to the Cal Set that is currently selected on the specified channel, which could be the channel Cal Register. If the channel does not yet have a selected Cal Set, the Cal will be saved to a new User Cal Set with an automatically-generated name.

☐ Cal: (SCPI) Auto-save to current Cal Set (default)- Do NOT automatically save a completed Cal to the Cal Set that is currently selected on the specified channel.

☑ Cal: Use legacy behavior for Series-C & Shunt-L fixtures - Legacy operation provided as a user-convenience for backward compatibility.

☐ Cal: Use legacy behavior for Series-C & Shunt-L fixtures (default) - Do NOT use legacy operation.

☐ Display: Selected trace changes width briefly. (default) - The selected trace does NOT change width briefly in order to improve visibility.

☑ Display: Selected trace changes width briefly.

☐ Display: Selected Trace is wider. (default) - The selected trace is the narrow, default size.

☑ Display: Selected Trace is wider. The active (selected) trace is always wider.
Display: Touchscreen ON (default) - Selections can be made by touching the screen.

Display: Touchscreen ON - Selections can NOT be made by touching the screen.

Ext Device: De-activate on PRESET and recall. External devices are de-activated when the VNA is Preset or when a Instrument State is recalled.

Ext Device: De-activate on PRESET and recall. External devices remain active when the VNA is Preset or when a Instrument State is recalled.

Learn more about External Devices.

Ext Reference: Modify Settings on Preset and Recall - External Reference settings will be affected by Recall/Preset.

Ext Reference: Modify Settings on Preset and Recall - External Reference settings will be maintained until changed.

Limit: Draw failed trace segments in red Failed segments are drawn in red. Learn more.

Limit: Draw failed trace segments in red Failed data points (dots) are drawn in red.

Limit: Draw Limit Lines in Red Limit lines are drawn in the same color as the trace.

Limit: Draw Limit Lines in Red All Limit lines are drawn in Red.

Limit: Test the nearest measurement point - When the stimulus of measurement point is not the same as the limit test point, the nearest limit test point is used for pass/fail judgement.

Limit: Test the nearest measurement point - The pass/fail is judged at only the stimulus of limit test point.

Markers: Coupling controls on/off state of markers - Turning a marker on or off will have no effect on the markers on other traces.

Markers: Coupling controls on/off state of markers - With Coupled Markers ON, when a marker is turned on, the same-numbered marker on all coupled traces will also be turned on. Likewise, turning off a marker will turn it off on all coupled traces.

Markers: On Preset, Coupled Markers is ON - Coupled Markers is OFF after Preset

Markers: On Preset, Coupled Markers is ON - Coupled Markers is ON after Preset

Markers: On Preset, Coupling Method is Channel - Marker Coupling Method is set to ALL after Preset.

Markers: On Preset, Coupling Method is Channel - Marker Coupling Method is set to Channel after Preset.
Marker: On Preset, set BW/Notch search reference to Peak - BW/Notch marker search reference is set to current marker position after Preset.

Marker: On Preset, set BW/Notch search reference to Peak - BW/Notch marker search reference is set to peak after Preset.

Marker: Programming treats Mkr 10 as Reference A marker programming command that includes 10 as its marker number argument will operate on the Reference Marker (NOT the general-purpose Marker 10). See Marker commands.

Marker: Programming treats Mkr 10 as Reference A marker programming command that includes 10 as its marker number argument will operate on the general-purpose Marker 10 (NOT the Reference marker).

Marker: Use single marker for marker search (default) - Use one marker for marker search. Sub Marker is displayed and used for Bandwidth, Notch searches.

Marker: Use single marker for marker search - Use multi marker for marker search.

Meas: Mathematical offset for receiver attenuation The reported test port receiver power is mathematically offset by the amount of receiver attenuation. Default for all models.

Meas: Mathematical offset for receiver attenuation The reported test port receiver power is NOT mathematically offset by the amount of receiver attenuation.

Learn more.

Meas: Mathematical offset for source attenuation The reported reference receiver power is mathematically offset by the amount of source attenuation.

Meas: Mathematical offset for source attenuation The reported reference receiver power is NOT mathematically offset by the amount of source attenuation.

Learn more.

Memory: Data Math 8510 Mode Standard data processing chain.

Memory: Data Math 8510 Mode Simulate the Keysight 8510 data processing chain as it pertains to Trace Math and Memory. Learn more.

Memory: Interpolate ON is default condition Set memory interpolation to OFF as the default.

Memory: Interpolate ON is default condition Set memory interpolation to ON as the default. Learn more.

Power: On Preset turn power on Instrument Preset always turns source power ON.

Power: On Preset turn power on When the current source power setting is OFF, source power remains OFF after Preset. When the current power setting is ON, source power is turned ON after Preset. Learn more.

For SCPI behavior only. Learn more.

Power: Report source unleveled events as errors Source unleveled events are reported as
errors.

- **Power: Report source unlevelled events as errors** Source unlevelled events are NOT reported as errors.

- **Power: Report when receiver is overloaded** A warning message is displayed on the VNA screen indicating that a receiver is overloaded or in compression. The displayed data is probably not accurate. One error per sweep appears and is reported in the Error Log.

- **Power: Report when receiver is overloaded** Do NOT show overload warnings on the screen or report these errors in the error log.

- **Power: Force RF power Off at end of sweep** - Turn RF power Off during a retrace of single-band frequency or segment sweeps.

- **Power: Force RF power Off at end of sweep** (default) - Leave RF power On during a retrace of single-band frequency or segment sweeps. Learn more.

- **Power: Turn Source Power Off when receiver is overloaded.** (Default) - Power remains ON when a receiver is overloaded.

- **Power: Turn Source Power Off when receiver is overloaded.** Turn OFF power to ALL ports when a receiver is overloaded. A notification dialog appears. Click OK, then lower the power level, then turn power ON. (Click Stimulus, then Power)

- **Power: Use Start Power during Power Sweep retrace** At the end of a power sweep, while waiting to trigger the next sweep, the VNA maintains source power at the start power level.

- **Power: Use Start Power during Power Sweep retrace** Maintain source power at the STOP power level. Learn more.

- **Preset: Confirm preset** - When Preset hardkey button is pressed, VNA firmware immediately presets (Hardkey is required only).

- **Preset: Confirm preset** (default) - When Preset > Preset is pressed, VNA firmware immediately presets (Hardkey and Softkey are required).

- **Preset: On Preset enable TDR**. Enable TDR on preset and power-up.

- **Preset: On Preset enable TDR**. Do not enable TDR on preset and power-up.

- **Preset: On Preset show Quick Start dialog** - Open Quick Start dialog on Preset.

- **Preset: On Preset show Quick Start dialog** - Do not open Quick Start dialog on Preset.

- **Recall: Softkey order is most recently used** - Recall softkey order which is most recently used.

- **Recall: Softkey order is most recently used (default)** - Do NOT recall softkey order which is most recently used.

Using VNC to Control the VNA User Interface

VNC (Virtual Network Computing) allows you to control the User Interface of a VNA from any PC. The VNA display appears on the connected PC display. Mouse and keyboard control can occur from both the VNA and PC, although not simultaneously.

**Note:** For similar functionality, use Windows Remote Desktop. A display setting of 1280X800 pixels is recommended. See the Windows help file for more information.

Both the VNA and PC must be connected to the same network. The responsiveness of the VNA while using VNC is dependent of the speed of your internet connection.

Every VNA is shipped with VNC installed. However, you must download and install the VNC software onto the PC.

The following procedures can help you configure VNC to view and control the VNA application from your PC.

**On the VNA, run VNC Server**

To do this:

1. Click View, then Minimize Application.
2. Click **Start**, then **All Programs**, then **TightVNC**, then **Tight VNC Server (Application Mode)**, then **Launch VNC Server**.

   * When the server is running, the icon is visible in the lower right corner of the display. If not visible, click the up arrow to expand the list of icons.
   * The first time you run VNC Server, you must first set a password to control access from remote PCs.

**On the PC, run VNC Viewer**

To do this:

2. From the PC Desktop, click **Start**, then **Programs**, then **TightVNC**, then **TightVNC Viewer**
3. When prompted for the Hostname, type the full computer name or IP address of the VNA.
4. When prompted for the password, type the password you set when configuring VNC on the VNA.
LXI-1.1 and VXI-11.3 Compliance

PNA-X, N522x, and VNA-C models are LXI-1.1 and VXI-11.3 compliant.

LXI-1.1 Compliance

A VNA is LXI-1.1 compliant if the logo appears on the dialog box shown below.

Learn more about LXI at http://www.lxistandard.org/

VXI-11.3 Compliance

To be compliant with VXI-11.3, the VNA must have been either:

- Shipped from the factory with VNA version A.08.20 or higher, or
- Had the Hard Disk Drive (HDD) upgraded since about June 2008 when A.08.20 was released and using VNA Rev. A.08.20 or higher.

Learn more about VXI at http://www.vxi.org/

LAN Status

When a LAN connection is used with the VNA, the LAN Status dialog allows you to see the IP address and other LAN connection properties.

How to view LAN Status

Using Hardkey/SoftTab/Softkey

1. System > System Setup > Lan Status....

Using Menus

1. Click Utility.
2. Select System.
4. Select LAN Status.

LAN Status dialog box help
Indicator  Shows the current status of the LAN connection.

NORMAL - Indicates that the VNA LAN is ready for communication.

IDENTIFY - Indicates that a remote computer has invoked an LXI identification operation on the VNA using the web-based interface or LXIDeviceIDState COM property.

FAULT - Indicates that the VNA LAN interface is not connected to the Internet.

IP Address  Shows the current IP address of the VNA.

IPv6 Link-Local Address  Shows the current IPv6 address of the VNA.

Computer Name  Shows the full computer name of the VNA. Learn how to change this. If you see the IP address listed here, that means there is no DNS server specified in the network setup.

MAC Address  Shows the unique address of the VNA computer. Also known as HostID.

LAN Reset  Provides a LAN Configuration Initialize (LCI) mechanism. Press to return the following settings to factory default conditions:

- IP Address Configuration (DHCP): Enabled
- ICMP Ping Responder: Enabled
- Web Password for configuration: Resets the password to 'Keysight'.

Web Server Software
If your VNA is LXI Class C compliant (see above), you can connect to the VNA using a web browser over an internet connection.

To do this, when the above dialog indicates a **NORMAL** condition:

1. From a web browser, type `http://<your_VNA_computer_name>`.
   For example, to connect to the fictitious VNA in the dialog above, type: `http://vna1-22`

2. Type the log on User Name and Password

3. You will see the welcome screen with connection links.
Dialog Transparency

Most VNA dialogs can be made to appear with various amounts of transparency. This allows you to view the VNA traces through the dialog as you make dialog settings.

How to set Transparency Level

There are three ways to make the transparency level setting:

1. Right-click in any non-control area of a dialog that allows transparency to see the following selections:

   ![Transparent levels selection]

2. In tabbed dialogs, cycle through the above transparency settings by pressing multiple times.

   ![Tabbed dialog]

3. Launch the Transparency dialog (below) from the Preferences dialog.

   ![Preferences dialog]

This setting is not programmable
Dialog Transparency dialog box help

Note: This single Transparency setting applies to ALL supported VNA dialogs.

- Opaque (NOT Transparent) - Default setting
- 8% Transparency
- 25% Transparency
- 50% Transparency

Double-click changes transparency - When checked, cycle through the above transparency settings by double-clicking in any non-control area of a dialog that allows transparency.

Notes

- The transparency setting is stored as a VNA Preference.
- The setting survives a VNA Shutdown and Preset.
- It is NOT saved and recalled with instrument state.

Using Help

This topic discusses the following:

- Documentation
- Printing Help
- Copying Help to your PC
- Launching Help
- Searching Help
- GUI Reference Help
  - Accessing GUI Reference Help with Help Hardkey
  - Accessing GUI Reference Help from Table of Contents
- Help Languages
- Documentation Warranty

See Also

- Programming Guide (for finding SCPI/COM commands for remote programming)
- Help, About Network Analyzer

Other Quick Start Topics

Help Documentation

This Help file, which is embedded in the analyzer, is the Users Guide and Programming Manual for the VNA. The help file is automatically updated on the VNA when firmware is updated. Only the VNA Installation and Quick Start Guide is shipped with new VNA instruments.

Hardcopy manuals are no longer available for purchase with the VNA.

All VNA documentation, including the latest online Web Help version of this Help file, and a printable .PDF version of the Help file, are available at http://na.support.keysight.com/pna/help/index.html.
Printing Help

A printable .PDF version of this Help file is available at http://na.support.keysight.com/pna/help/index.html.

Copying Help to your PC

With the Help system on your PC, you can read about the analyzer while away from it. You can also Copy and Paste programming code from this Help system directly into your programming environment.

The Help file is located on your analyzer hard-drive at C:\Program Files (x86)\Keysight\Network Analyzer\Help\<filename>.chm. If both the analyzer and PC are connected to LAN, you can map a drive and copy the file directly.

The Help file can also be downloaded from http://na.support.keysight.com/pna/help/index.html.

Launching Help

The Help system can be launched in the following ways:

1. From the front panel Help button.
2. From the Help drop-down menu.
3. From Dialog Box Help buttons.

Search Tab

TIP: To Search any topic for a keyword, press Ctrl and F.

The following rules apply for using full-text search:

- Searches are not case-sensitive.
- You can search for any combination of letters (a-z) and numbers (0-9).
- Punctuation marks (period, colon, semicolon, comma, and hyphen) are ignored during a search.
- You can group the words of your search using double quotes or parentheses. Examples: "response calibration" or (response calibration). This requirement makes it impossible to search for quotation marks.
Use Wildcard expressions:

- To search for one undefined character use a question mark (?). For example, searching for cal? will find calc and calf.

- To search for more than one undefined character use an asterisk (*). Searching for Cal* will find calibration and calculate.

Use Boolean operators to define a relationship between two or more search words.

<table>
<thead>
<tr>
<th>Search for</th>
<th>Example</th>
<th>Results will show topics containing:</th>
</tr>
</thead>
<tbody>
<tr>
<td>Two words in the same topic</td>
<td>response AND calibration</td>
<td>Both the words &quot;response&quot; and &quot;calibration&quot;.</td>
</tr>
<tr>
<td>Either of two words in a topic</td>
<td>response OR calibration</td>
<td>Either the word &quot;response&quot; or the word &quot;calibration&quot; or both.</td>
</tr>
<tr>
<td>The first word without the second word in a topic</td>
<td>response NOT calibration</td>
<td>The word &quot;response&quot; but not the word &quot;calibration&quot;.</td>
</tr>
<tr>
<td>Both words in the same topic, close together.</td>
<td>response NEAR calibration</td>
<td>The word &quot;response&quot; within eight words of the word &quot;calibration&quot;.</td>
</tr>
</tbody>
</table>

GUI Reference Help

Accessing GUI Reference Help with Help Hardkey

The GUI Reference help can be accessed at any time by clicking on the Help hardkey:
The GUI Reference help accessed by clicking on the Help hardkey corresponds to the currently active Measurement Class, currently selected Hardkey, and currently selected Soft Tab to provide context sensitive help.

The following procedure is a typical example of how to find GUI Reference help using the Help hardkey. This example assumes the Standard Measurement class is currently active, the Sweep hardkey is selected, and the Main Soft Tab is selected.
1. Click on the Help hardkey. The following is displayed:

[Image of a help window]

2. Click on a link for information. The links correspond to the Softkeys.

**Accessing GUI Reference Help from Table of Contents**

The GUI Reference topics displayed in the table of contents are arranged in alphabetical order:
The GUI Reference corresponds to the GUI Hardkeys to help find information quickly:
The following procedure is a typical example of how to find information using the GUI Reference. This example shows how to search for the Avg BW Hardkey information with the Standard Measurement class selected.

1. Under GUI Reference in the table of contents, select the Avg BW topic. The following is displayed:
The links shown on this page correspond to Measurement Class names because some menus change with Measurement Class.

2. Click on the Standard link. The following is displayed:
Main, Smoothing, and Delay Aperture correspond to the soft tab labels. The links correspond to the softkey labels.

3. Click on a link for information. The links correspond to the Softkeys.

Help Languages
This help file is offered in English ONLY.

**Glossary**

The Glossary holds definitions of words, in alphabetical order.

![Glossary Image]

- Options (Learn how to install software options)
- Application Code (firmware) Version
• Solid State Drive Version

• System CPU Version - Learn more

• DSP (Digital Signal Processor.) Version. Contact Keysight to upgrade the DSP.

• Computer Name - Learn more. This is also reported on the LAN Status / LXI Compliance dialog.
Preset the Analyzer

When you Preset the analyzer, it is set to known, or preset conditions. You can use the factory default preset conditions, or define your own User Preset conditions.

Note: Presetting the analyzer will not remove the calibration data in the Channel default CALREG calset.

- Preset (Default) Conditions
- User Preset Conditions

See other ‘Setup Measurements’ topics

Preset Default Conditions

How to Preset the Analyzer

Using Hardkey/SoftTab/Softkey

1. Press Preset > Main > Preset.

When Confirm Preset is Off,

1. Press Preset.

Tip: Press the Preset button to start the VNA application if it is not already running.

User Preset Conditions

The analyzer can be preset to either factory default conditions or User Preset conditions.
How to set User Preset

Using Hardkey/SoftTab/Softkey

1. Press **Preset > Main > User Preset**.

User Preset dialog box help

With a User Preset saved and enabled, when the VNA is Preset, the User Preset settings are recalled instead of the factory default settings. Calibration data is NOT recalled with a User Preset. Learn more about instrument state settings.

**User Preset Enable**
Check - The VNA is preset to **User Preset** conditions when the Preset button is pressed.
Clear - The VNA is preset to **Default** conditions when the Preset button is pressed.

**Save current state as User Preset** Click to store the current instrument state as the User Preset conditions. File is stored as d:\users\public\documents\network analyzer\UserPreset.sta.
Note: If the "D:" drive is not found, the "C:" drive will be used.

**Load existing file as User Preset**  Click to retrieve an instrument state to be used as the User Preset conditions.
Measurement Classes

Measurement Classes are categories of measurements that can coexist on a channel.

- What are Measurement Classes
- How to assign a Measurement Class to a Channel
- Measurement Class Dialog Box Help

See other 'Setup Measurements' topics

What are Measurement Classes

**Note:** Measurement classes vary according to the VNA model and options installed.

The dialog below is an example showing the Measurement Classes currently available for a VNA. Within each of these classes there are a number of measurements.

Measurement Classes are categories of measurements that can coexist on a channel. A measurement from one class can NOT reside in a channel with a measurement from another class. For example, a Noise Figure measurement can NOT reside in a channel that is currently hosting Scalar Mixer Measurements.

The Measurement Class dialog is accessed in the following ways:

**How to assign a Measurement Class to a Channel**

**Using Hardkey/SoftTab/Softkey**

1. Press **Meas > S-Param > Meas Class...**

**Using a mouse**

1. Click **Instrument.**
2. Select **Meas Class...**

Measurement Class dialog box help
Measurement class dialog box shows the supported classes for your unit. The supported classes depends on the product and installed options. The above dialog box shows an example of PNA.

Measurements in a measurement class can NOT coexist in a channel with a measurement of a different measurement class.

Select a measurement class for the active channel or new measurement channel.

- The **Standard** measurement class contains S-Parameters. Balanced parameters, and Receiver measurements.
  
- All other measurement classes are commonly called "Applications".

**Title Bar** Indicates the active channel to which the measurement class will be assigned.

**Show setup dialog**

- Check to launch the selected Measurement Class dialog.
- Clear (default setting) to not launch the selected Measurement Class dialog. This setting survives a Preset and VNA Shutdown.

**Confirm changes**

- Check (default setting) to launch the Confirm Measurement Class Change dialog.
- Clear to perform the ‘OK’ actions without confirmation. This setting survives a Preset and VNA Shutdown.

**New Channel** Click to create the measurement class in a new channel and new window. A default measurement for that class is created in the channel.

To change the measurement, click **Trace**, then select a new measurement.
Choose to do the following:

- **OK** - Delete the existing measurements in the active channel. Create the new measurement class, and default measurement, in that channel.

- **Cancel** - Do not create the new measurement class. Leave the old measurements (and class) in that channel and return to the Measurement Class dialog box.
Measurement Parameters

This topic contains the following information:

- **S-Parameters** (pre-selected ratios)
- **Ratioed** (choose your own ratio)
- **Unratioed Power** (absolute power)
- **New / Change Measurement dialog box help**
- **How to Select a Measurement Parameter**
- **Option Sx090A/B Spectrum Analyzer Measurement Parameters** (separate topic)
- **Option S93070xB Modulation Distortion Measurement Parameters** (separate topic)
- **Option S93031xB Phase Noise Measurement Parameters** (separate topic)
- **Auxiliary**

Learn about Balanced Measurements

See other 'Setup Measurements' topics

---

S-Parameters

S-parameters (scattering parameters) are used to describe the way a device modifies a signal. For a 2-port device, there are **four S-Parameters**. The syntax for each parameter is described by the following:

\[
S_{out - in} \]

- **out** = analyzer port number where the device signal output is measured (receiver)
- **in** = analyzer port number where the signal is applied (incident) to the device (source)

**Move the mouse over each S-parameter to see the signal flow:**
For two-port devices:

- When the source goes into port 1, the measurement is said to be in the **forward** direction.
- When the source goes into port 2, the measurement is said to be in the **reverse** direction.

The analyzer automatically switches the source and receiver to make a forward or reverse measurement. Therefore, the analyzer can measure all four S-parameters for a two-port device with a single connection.

See the **block diagram** (including receivers) of your VNA.

**Common Measurements with S-Parameters**

</tr>
</tbody>
</table>
Receiver Measurements

All analyzer models have test port receivers and reference receivers. See the block diagram of your VNA.

For 4-port models...

- R1, R2, R3, and R4 are reference receivers. They measure the signal as it leaves the analyzer source.
  - R1 measures the signal out of Port 1
  - ...
  - R4 measures the signal out of Port 4
- A, B, C, and D are test port receivers. They measure the signal out (or reflecting off) of the DUT.
  - A measures the signal into VNA Port 1
  - B measures the signal into VNA Port 2
  - C measures the signal into VNA Port 3
  - D measures the signal into VNA Port 4

Models with more than 4 ports must specify receivers using Logical Receiver Notation. Learn more.

Ratioed Measurements

Ratioed measurements allow you to choose your own ratio of any two receivers that are available in your analyzer. S-parameters are actually predefined ratio measurements. For example S11 is A/R1.

The following are common uses of ratioed measurements:

- Comparing the phase between two paths of a device. An example could be something simple like a power splitter or more complicated like a dual-channel receiver.
- Measurements that require a higher dynamic range than the analyzer provides with S-parameters.

Your VNA MAY have front-panel jumper cables that go directly to measurement receivers. Learn about the front-panel jumpers on your VNA.

Unratioed (Absolute Power) Measurements

The unratioed power parameter measures the absolute power going into any of the receivers that are available on your analyzer.
The reference receivers are internally configured to measure the source power for a specific analyzer port. Performing an absolute power measurement of a reference receiver using a different source port will measure very little power unless the front panel jumpers are removed and signal is applied directly to the receiver. An example of this would be an R1 measurement using port 2 as the source.

- **Measuring phase** using a single receiver yields meaningless data. Phase measurements must be a comparison of two signals.

- Averaging for Unratioed parameters is computed differently from ratioed parameters. [Learn more.](#)

- To calibrate ratioed or unratioed receiver (power) parameters, the recommended method is the [Guided Power Calibration](#). The [Unguided Response Calibration](#) can also be used to calibrate a single unratioed or ratioed parameter at a time.

---

### New / Change Measurement dialog box help

**Note:** The only measurements that are available are those in the measurement class currently assigned to the active channel. Other measurements are NOT compatible.

To create a measurement other than these, first assign the appropriate measurement class to a new or existing channel. [Learn how.](#)

Click a tab to create or change measurements.

- When creating NEW measurements, you can choose more than one.

- When changing an EXISTING measurement, you can choose ONLY one.

### Tabs

**S-Parameter** Select a predefined ratioed measurements. [Learn more about S-parameters.](#)

For Setup:<= 4-Port

---
**Balanced**  Select a balanced measurement type.

**Topology**  Click to invoke the Balanced DUT Topology / Logical Port mappings dialog box. Learn more about Balanced Measurements.

For Setup: \( \leq 4\)-Port

**Select All**  Will only select the parameters shown and will not select the check box of the Receiver selector at the bottom.
**Receivers** Select receivers to make Ratioed and Unratioed (absolute power) measurements. [Learn more about receiver measurements.](#)

![Receiver Selection](image)

**Ratioed** Click on the check box to select the parameters and create measurement. Receiver selector at the bottom allow you to define ratios. Select a receiver for the Numerator, select another receiver for the Denominator, then select a source port for the measurement.

The **Source port** is ALWAYS interpreted as a logical port number.

For convenience, the table is populated with common choices.

- **Select All** Will only select the parameters shown and will not select the check box of the Receiver selector at the bottom.

  - [Learn about External Test Sets and Ratioed Measurements](#)
  - [Learn more about Ratioed Measurements.](#)

**Unratioed** Same as Ratioed, but select 1 as the Denominator.

  - [Learn More about Unratioed Measurements.](#)
  - [See the block diagram of receivers in YOUR VNA.](#)
  - The internal ADCs (Analog-Digital Converters) can be used as measurement receivers. [Learn more.](#)
Waves  Select receiver notation to make ratioed and unratioed measurements.

Click on the check box to select the parameters and create measurement. Wave selector at the bottom allow you to define ratio.

**Select All**  Will only select the parameters shown and will not select the check box of the Wave selector at the bottom.

**Receiver Notation**

Receivers can be also selected using logical receiver notation. This "8510-style" notation makes it easy to refer to multi-port receivers.

- **aN** - Reference receiver for logical port N
- **bN** - Test port receiver for logical port N

For example:

- For **Ratioed** measurements: "b12/a1" refers to the logical test port 12 receiver / the logical port 1 reference receiver.
- For **Unratioed** measurements: "b10" refers to the logical test port 10 receiver.

The VNA-style notation (A, B, R1 and so forth) can still be used to refer to **physical** receivers in less than 4 ports. [Learn more.](#)
However, ratioed measurements MUST use the same notation to refer to both receivers; either the physical receiver notation (A, R1) or the logical receiver notation (aN, bN). For example, the following mixed notation is NOT allowed: A/b3 and a5/R2.

**Programming**

When entering receiver letters using programming commands, neither logical or physical receiver notation are case sensitive.

**AUX**  Select input of Auxiliary on the rear panel to make DC measurement.

Click on the check box to select the input of auxiliary and create measurement. Auxiliary selector at the bottom allow you to define auxiliary and other parameters such as PMAR and DVMs.

**Select All**  Will only select the parameters shown and will not select the check box of the Auxiliary selector at the bottom.

**Channel / Window Selections**

These selections are NOT AVAILABLE when changing an EXISTING measurement. Learn how to
change a measurement.

**Channel Number**  Select the channel for the new traces.

**Create in New Window**

- Check to create new traces in a new window.
- Clear to create new traces in the active window. When the *traces per window limitation* has been reached, no more traces are added.

*About Measurement Parameters* (top of page)

---

**Balanced Source / Topology** dialog box help

**Topology Tab**

![Balanced Setup](image)

See the dialog for *Integrated True Mode Stimulus Application* (iTMSA).
Create or edit DUT Topology and Logical Port Mapping.

A Logical Port is a term used to describe a physical analyzer test port that has been remapped to a new port number. You can assign logical single-ended ports to logical balanced ports.

**Note:** These selections apply to ALL measurements in the channel. If the device topology is changed, any existing measurements in the channel that are incompatible with the new topology will be automatically changed to one that is compatible.

**Topology:** Describes your DUT as you would like it tested. The following device topologies can be measured by a multiport analyzer.

- **BAL** DUT has a single balanced port.
- **BAL-BAL** DUT has two balanced ports.
- **BAL-SE** DUT has one balanced port and one single-ended port.
- **BAL-SE-SE** DUT has one balanced port and two single-ended ports.
- **SE-BAL** DUT has one single-ended port and one balanced port.
- **SE-SE-BAL** DUT has two single-ended ports and one balanced port.

- **All SE**
  (Changes all entries to Single-ended)

- **All BAL**
  (Changes all entries to Balanced)

- **All Unused**
  (Changes all entries to Unused) This is a convenience feature to help set up custom topologies, but it is not possible to have only Unused ports. If the OK button is clicked and all ports are listed as Unused, the topology will be set up to have 1 SE Port.

- **Custom**
  (Maps the physical VNA ports to a device of balanced and single-ended logical ports for multi-port systems with greater than 4 ports.)

These topologies can be used in the reverse (⇐⇒) direction to measure:

- **Balanced / Single-ended** topology
- **Balanced / Single-ended - Single-ended** topology

For example, to measure a **Balanced / Single-ended** topology, measure the S12 (reverse direction) of a **Single-ended / Balanced** topology.

A balanced port can be any one of four physical port combinations:
Balanced Port  Number of rows equals number of VNA ports. User may select each port as SE or BAL or Unused. Unused ports are always forced to the bottom of the list and some Unused port selectors may be grayed-out when all the VNA ports are used.

VNA Port  Displays physical port numbers. But will display logical port numbers if logical ports are used. Balanced port requires (+) and (-) VNA port definitions; SE port only requires a single VNA port definition.

True Mode  Define true mode independently for each BAL port. SE ports cannot be defined as true mode. See this dialog for Integrated True Mode Stimulus Application (iTMSA).

Port Z Tab
Provide an enable for both Common and Differential Conversion and SE Port Z Conversion.

**Balanced Port** Shows all ports defined on the balanced topology page.

**Default Z** Shows the default impedances that will be applied if the port Z conversions are not enabled. The SE Default Z always equals the System Zo defined for the VNA. The Differential and Common Default Z will display values calculated from the single-ended port impedances.

**Converted Z** User may enter the real or imaginary component of the impedance.

**Power Waves** (default) This was legacy method used. If a load is the complex conjugate of the system impedance, then it will be displayed as a perfect match.

**Traveling Waves** This is newly added. If a load equals the complex system impedance, then it will be displayed as a perfect match.
Warning Dialog  The dialog is displayed if "Conversion" is enabled and "Apply Fixtures" is currently disabled.

Frequency Range

Frequency range is the span of frequencies you specify for making a device measurement.

- How to Set Frequency Range
- Zoom
- CW Frequencies
- Frequency Resolution
- Frequency Band Crossings
- Auto Tune (Option S9x09xxA/B, S9x090A/B only)
- Span All Meas Bands (Option S93070xB, S9x070A/B Modulation Distortion only)

See other ‘Setup Measurements’ topics

How to set Frequency Range

You can also make these settings and more from the Sweep Type dialog.

See the frequency ranges of all analyzer models.

Using Hardkey/SoftTab/Softkey

1. Press Freq> Main > Start, Stop, Center, or Span.
2. Enter desired frequency value.

Using a mouse

1. Right click on the X-axis label or stimulus range area under grid line.
2. Click on Start/Stop/Center....
Either of the following pairs of settings determine the frequency range. The last value that you enter determines the X-Axis labels. For example, if you enter the Start and Span values, the X-Axis will show Center and Span labels.

**Start /Stop** - Specifies the beginning and end frequency of the swept measurement range.

*Note:* The start frequency at preset is not the minimum value in full range.

**Center /Span** - Specifies the value at the center and frequency range.

Either of the following settings determine the number of evenly-spaced data points across the frequency range.

**Points** - Specifies the number of evenly-spaced data points across the frequency range. Learn more about Data Points.

**Step** - Available ONLY in Linear sweep type. Specifies the frequency step size between evenly-spaced data points. Changes to this setting will cause the Points setting to adjust to the closest integer. Any 'remainder' will adjust either the Stop value or Span value depending on which is displayed on the X-Axis label.

**Zoom**

Zoom allows you to easily change the start and stop frequencies or start and stop power levels in a power sweep.

Zoom operates on the Active Trace and all traces in the same channel as the active trace, regardless of the window in which they appear.
# How to Zoom in a measurement window

1. Left-click the mouse or use a finger, then drag across a portion of a trace.
2. Release the mouse or lift the finger and the following menu appears:
3. Select from the following:
   - **Zoom** - changes the channel stimulus settings to the left and right border values of the Zoom selection
   - **Zoom xy** - changes the channel stimulus settings as above. In addition, the Y-axis scale of the active trace changes to the approximate scale of the Zoom selection.
   - **Zoom Full Out** - changes the channel stimulus settings to the full span of the current calibration. If no calibration is ON, then the stimulus settings are changed to the full span of the VNA model.

## Notes

- The stimulus settings are changed for **ALL** traces in the active channel, regardless of the window in which they appear.
- If markers are in the selected area, they remain in place.
- If markers are in the unselected area, they are moved to the right or left edge of the new span. When Zoom Full Out is selected, the markers are moved back to their original location.

Zoom is NOT available for the following:

- Smith Chart or Polar display formats
- CW Time and Segment sweep type
- Frequency Offset Measurements
- FCA Opt S93083A/B Measurements

## CW Frequencies

Measurements with a **CW Time sweep** or **Power sweep** are made at a single frequency rather than over a range of frequencies.
How to set CW Frequency

Using Hardkey/SoftTab/Softkey

1. Set Sweep Type to CW Time or Power Sweep.
2. Press Freq > Main > CW.
3. Enter desired CW frequency.

Using a mouse

1. Set Sweep Type to CW Time or Power Sweep.
2. Right click on the stimulus range area under grid box.
3. Click on CW....

Frequency Resolution

The resolution for setting frequency is 1 Hz.

Frequency Band Crossings

The frequency range of the VNA covers several internal frequency bands. The higher the frequency range of the VNA, the larger the number of bands. The source power to your DUT turns off as the stimulus frequency is swept through these band crossings. To learn more, see Power ON and OFF during Sweep and Retrace.

The listed frequencies in the following tables are the stop frequency of the specified band, and the start frequency of the following band.

You can download a VNA Band Structure Readout utility that lists the band crossings for your VNA.

Frequency band crossings are different for the following models:
- PNA-X Models (with synthesizer revision greater than 6)
- PNA-X Models (with synthesizer revision 6 or earlier)
- N522xB Models (with synthesizer revision greater than 6)
- N522xB Models (with synthesizer revision 6 or earlier)
- N523xA Models

**PNA-X Models Band Stop Frequencies (with synthesizer revision greater than 6)**

**Auto Tune**

The **Auto Tune** softkey is a feature of the Spectrum Analyzer measurement class (Option S9x09xxA/B, S9x090A/B). Each time this softkey is pressed, all defined distortion measurement bands for the modulation channel are automatically tuned.

**Span All Meas Bands**

The **Span All Meas Bands** softkey is a feature of the Modulation Distortion measurement class (Option S93070xB, S9x070A/B only). Each time this softkey is pressed, all defined distortion measurement bands for the modulation channel are automatically tuned.
Power Level

Power level is the power of the source at the test ports.

- How to make Power Settings
- Power Dialog
- Power and Attenuator Dialog
- Source Unleveled
- Setting Independent Port Power
- Optimum Attenuation Value
- Receiver Attenuation
- Power ON and OFF during Save / Recall and Preset
- Power ON and OFF during Sweep and Retrace

See other ‘Setup Measurements’ topics

Power Settings

The test port output power is specified over frequency.

See the Power Range specifications for your analyzer.
How to make Power settings

Use one of the following methods to set port power.

Using Hardkey/SoftTab/Softkey

1. Press **Power** > **Main** > **Power Level / Start Power / Stop Power** to enter desired power level.
2. Press **Power** > **Main** > **RF Power** to turn ON or OFF the RF power.
3. Press **Power** > **Leveling & Offsets** > click left side **Slope** small button to turn ON or OFF the slope (Green color means the slope is turned ON; Grey color means the slope is turned OFF).

Using a mouse

1. Right click on the X-axis label or stimulus range area under grid line.
2. Click **Power....** and then **Power: Channel N** dialog box appears.

**Power** dialog box help

![Power dialog box](image)

This dialog provides basic control of source power for a specific port.

See [Power and Attenuators dialog box](#).

**Power On (All Channels)** Check to enable source power for all channels. Only turns power ON if channel power setting is ON or Auto.

**Port 'n’** Active source port for which power is being set.
**Port Power**  Sets the power level for the specified port.

To accurately set the power level at any point after the test port, perform a Source Power Calibration.

**Power Sweep**

**Start / Stop Power**  Set the start and stop power values of a power sweep.

- These settings are only available when Sweep Type is set to Power Sweep.
- Uncoupled power sweep power can be set from the Advanced Power dialog.
- You can Zoom to easily change the start and stop power levels in a power sweep. Learn how.
- Learn more about Power Sweep.

**Power Slope**

Helps compensate for cable and test fixture power losses at increased frequency.

**Slope**  Select to set the power slope. Clear to set power slope OFF. Learn more about power slope.

---

**How to make Power settings**

Use one of the following methods to set port power.

**Using Hardkey/SoftTab/Softkey**

1. Press **Power > Main > Power and Attenuators** and then the **Power and Attenuators** dialog box appears.

**Detailed settings for Power and Attenuators:**

1. Press **Power > Main > RF Power** to turn ON or OFF the RF power.

2. Press **Power > Port Power > Select Port x** to active the selected port.

3. Press **Power > Port Power > Power Level / Start Power / Stop Power** to enter desired power level for selected port.

4. Press **Power > Port Power > Source State** to choose the source state either Auto, On or Off.

5. Press **Power > Port Power > Coupling** to turn ON or OFF Power Coupling.

6. Press **Power > Leveling & Offsets** > click left side Slope small button to turn ON or OFF the slope (Green color means the slope is turned ON; Grey color means the slope is turned OFF).
**Power and Attenuators** dialog box help

Defines and controls the source power and attenuation for the active channel.

**Note:** External sources can be controlled from this dialog. Learn more.

**Power On (All Channels)** Check to enable source power for all channels (same function as **RF Power**). Only turns power ON if channel power setting is ON or Auto.

**Port Powers Coupled**

- **Coupled** (checked) The power levels are the same at each test port. Set power at any test port and all test ports change to the same power level.

- **Uncoupled** (cleared) The power levels are set independently for each test port. Uncouple power, for example, if you want to measure the gain and reverse-isolation of a high-gain amplifier. The power required for the input port of the amplifier is much lower than the power required for the output port. A power sweep can also be performed with uncoupled power. Learn more about Setting Independent Port Power

**Name** Lists the analyzer test ports.

**State**

- **Auto** Source power is turned ON at the specified test port when required by the measurement. This is the most common (default) setting. See also Power ON and OFF during Save / Recall, User Preset, and Preset.

- **ON** Source power is ALWAYS ON, regardless of measurements that are in process. Use this setting to
supply source power to a DUT port that always requires power, such as an LO port. This could turn OFF power at another test port. Learn about internal second source restrictions. See also Setting Port Power On/Off for the Second source and Multi Module/Unit configuration.

- **OFF** Source power is never ON, regardless of the measurement requirements. Use this setting to prevent damage to a sensitive DUT test port.

**Port Power** Sets the power level at the output of the source.

- To accurately set the power level at any point after the test port, perform a Source Power Calibration.
- See specified power range of VNA model.
- See ECal Module Compression Level

**Start / Stop Power** Available ONLY when sweep type is set to Power Sweep. Set the start and stop power values of a power sweep. Learn how to set Power Sweep.

- You can specify whether to maintain source power at either the start power or stop power level at the end of a power sweep. Learn more.
- A power sweep can be performed with uncoupled power. Different power ranges can be swept in the forward and reverse directions.

**Auto Range** Check to allow the analyzer to select the optimum attenuation value to achieve the specified test port power.

Clear to manually set the attenuation for each port. Type or select the attenuation value in the adjacent Attenuator Control box.

When using manual attenuation (Auto Range cleared), Port Power can be set within a 60 dB range. For example:

- With 0 dB of manual attenuation, Port Power can be set from -30 dBm to +30 dBm.
- With 10 dB of manual attenuation, Port Power can be set from -40 dBm to +20 dBm, and so forth.

**Important Note:** The available power range can also be adjusted AUTOMATICALLY by a Source Power Calibration, Guided Power Cal, or Power Compensation. If you are NOT seeing the range that you expect, or the correct power level at your DUT, view the Power Offset column in the Power Limits and Offsets dialog.

**Source Attenuator** When Port Powers are Uncoupled, manual attenuator control allows you to
set a wide range of power levels by setting the attenuation. See Setting Independent Port Power. Also use manual attenuation control when a measurement requires a very good impedance match with the source, such as with oscillators or conditionally unstable amplifiers. Choose an attenuation level of 10 dB or more to ensure the best source match.

- Attenuators or other mechanical switches are NOT allowed to switch continuously. Learn more.

- When Port Powers are Coupled, changing one port Attenuation Control value changes all port values.

**Note:** Because the reference receiver is not in the attenuation path, there is more power at the reference receiver than at the test port by the amount of source attenuation.

By default, ALL VNA models mathematically offset the reported power at the reference receivers by the amount of source attenuation. See Block diagram.

A preference can be set to NOT mathematically offset the reported power of the reference receiver by the amount of source attenuation.

Learn how to set the preference.

**Leveling Mode (ALC Hardware Softkey)**- Refer to the following diagram:

- **Internal** - ALC leveling. Power level within an attenuator setting is limited to the ALC Range. See Source Unleveled.

- **Open Loop** - No ALC and NO Receiver Leveling. (Used during pulse conditions with the internal source modulators). NOT available on N523x models. No leveling is used in setting the source power. The lowest settable power, without attenuation, is limited to -30dBm. The source power level accuracy is very compromised. Use a source power calibration to make the source power somewhat more accurate.

- **Receiver Rx** - Receiver Leveling. Select a receiver to use for leveling the source. Learn more.
Note: Receiver Leveling can be used with EITHER Internal ALC or Open Loop. See Enable ALC Hardware on the Receiver Leveling dialog.

Channel Power Slope

Helps compensate for cable and test fixture power losses at increased frequency. With power slope enabled, the port output power increases (enter positive value) or decreases (enter negative value) as the sweep frequency increases.

Slope  Select to set the power slope. Clear to set power slope OFF.

Power slope is computed and applied from 0 GHz – not from the measurement start frequency.

For example, with the following measurement settings:

- Start / Stop Freq: 10 GHz to 20 GHz
- Power level: 0 dBm
- Slope: 1 dB/GHz

The power into the DUT from 10 GHz to 20 GHz is 10 dBm sloping to 20 dBm

Offset and Limits  Launches the Power Offset and Limits dialog.

Receiver Leveling  Launches the Receiver Leveling dialog.

Receiver Attenuator  Launches the Receiver Attenuator dialog.

Path Configurator  Launches the Path Configurator dialog.

Source Unleveled

When the power level that is required at a test port is higher than can be supplied, a Source Unleveled error message appears on the screen and the letters LVL appear on the status bar.

To perform a power sweep, the range of power is usually limited to the range of the Automatic Leveling Control (ALC) loop. (The PNA-X allows a very wide power range using Open Loop).

Specifications guarantee the ALC power range over which power can be supplied without an unleveled indication. However, the actual achievable power range on your analyzer is probably greater than the specified range.

How to calculate the specified achievable power range
From the specifications for a frequency span from 15 GHz to 20 GHz:

- Max Leveled Power = -8 dBm
- Power Sweep Range (ALC) = -17 dB

For this frequency range the specified power range is calculated as:

- Max = -8 dBm
- Min = (-8)-(17) = -25 dBm

When using Source Attenuators:

- with 10dB of attenuation, this becomes -18 dBm to -35 dBm
- with 20dB of attenuation, this becomes -28 dBm to -45 dBm, and so forth.

To resolve an unleveled condition, change either the Test Port Power or Attenuator setting.

**Important Note:** The available power range can also be adjusted AUTOMATICALLY by a Source Power Calibration, Guided Power Cal, or Power Compensation. If you are NOT seeing the range that you expect, or the correct power level at your DUT, view the Power Offset column in the Power Limits and Offsets dialog.

Setting Independent Port Power

You can uncouple port power and specify different power levels at each test port. There are a few things to consider when setting independent port powers.

- Does your required high and low power levels fall within the specified Min and Max power range of the analyzer? See Unleveled Indicator. If they do not, you may need to use the internal Source Attenuators.

- Does the analyzer have source attenuators? If so, how many source attenuators? Some VNA models have one attenuator for each port. In most multiport VNA systems, the attenuators are shared by at least two test ports. See VNA Options to see the availability and range of source attenuation on your VNA.
Note: To prevent premature wear, attenuators or other mechanical switches are NOT allowed to switch continuously.

These mechanical devices are set for the entire channel. When more than one channel is used, and a mechanical device setting is NOT the same for all channels, only the ACTIVE channel is allowed to sweep. All other channels are NOT allowed to sweep (Blocked).

Learn how to view the settings of all mechanical devices.

Setting Port Power On/Off for the Second source and Multi Module/Unit configuration

When the unit has the second source capability or multi module/unit configuration in PXI/USB VNA, Source power ALWAYS ON can be applied for each source group.

The following dialog shows an example of three module configuration of six, four and two port PXI VNAs. In this case, there are three independent source group, port 1 to 6, 7 to 10 and 11 to 12. You can set one port in each group at ON state.

Optimum Attenuation Value

The attenuator has different positions, allowing a wide range of power levels. The number of power ranges available is determined by the source attenuation installed in your VNA. See VNA Options to see the availability and range of source attenuation on your VNA.

- Each range has a total specified span (50 dB in the following Attenuation Values graphic).
- The optimum setting is the middle of the range. This range provides the best accuracy and performance of the source leveling system. The optimum ranges are the blue regions in the following graphic.
- An attenuator setting can be selected manually or automatically. If automatic is selected, the blue optimum ranges (shown in the following graphic) are used.
**Note:** Error correction is fully accurate only for the power level at which a measurement calibration was performed. However, when changing power within the same attenuator range at which the measurement calibration was performed, ratioed measurements can be made with nearly full accuracy (non-ratioed measurements with less accuracy).

**Receiver Attenuators** dialog box help

Receiver Attenuators are offered as an option. Learn more.

Type or select independent attenuation values for each receiver.
Receiver A is at Test Port 1
Receiver B is at Test Port 2
Receiver C is at Test Port 3
Receiver D is at Test Port 4

Receiver Attenuation is used to protect the VNA test port receivers from damage or compression. Receiver attenuation causes the reported power at the receiver to be less than the power at the test port by the specified amount of attenuation.

When an external test set is connected, Receiver Attenuation control is only available for the physical receivers in the VNA. Switching receiver attenuation using logical receiver notation is NOT allowed.

Note: A preference can be set to mathematically offset (or NOT) the reported power at the test port receivers by the amount of receiver attenuation. By default, All VNA models offset the display.

Learn how to set the preference.

CAUTION! You can damage the analyzer receivers if the power levels exceed the maximum values.

- See Technical Specifications for the maximum input power to a receiver and receiver compression.
- See Receiver attenuation values for your VNA model.

Power ON and OFF during Save / Recall, User Preset, and Preset

To protect your DUT from being inadvertently powered ON, the following RF Power ON/OFF settings occur:

**Instrument State Save/Recall**

If power is OFF when an instrument state is saved, then power will always be OFF after the instrument state is recalled.

If power is ON when an instrument state is saved, and the current power setting is OFF, then power will be OFF after the instrument state is recalled.
User Preset

If power is OFF when a User Preset is saved, then power will always be OFF after a User Preset.

If power is ON when a User Preset is saved, and the current power setting is OFF, then power will be OFF after a User Preset.

Preset

Instrument Preset sets power ON by default.

This can be changed with a Preference setting so that, if the current power setting is OFF, then power will be OFF after Preset.

Power ON and OFF during Sweep and Retrace

The frequency range of the VNA covers several internal frequency bands. The higher the frequency range of the VNA, the larger the number of bands. For example, a 9 GHz VNA has 6 frequency bands, a 50 GHz VNA has 25 frequency bands. See the frequency band crossings.

Power to the DUT is turned OFF during band changes to avoid causing power spikes to the DUT.

Retrace occurs when the source gets to the end of your selected frequency span and moves back to the start frequency. Power to the DUT is again turned OFF when retracing across frequency bands.

The following power ON/OFF states occur for various stimulus settings:

1. **Single band sweep** - The power ON/OFF state to the DUT during retrace is determined by a preference setting.

2. **Multi-band sweep** - The power to the DUT is turned OFF while sweeping across a band crossing. It is turned OFF again during retrace.

3. **Power sweep** - Power sweep is always done at a single frequency, Therefore, like item 1, the power ON/OFF state to the DUT during retrace is determined by a preference setting

4. **Single sweep**:

   - Manual trigger mode - At the end of a multiband sweep, power is turned OFF during retrace, and then power is turned back ON before arming for the next trigger.

   - Hold mode - Power can be ON or OFF depending on when and how Hold mode is entered. However, power can be immediately turned OFF manually or remotely.

**Caution**: Avoid expensive repairs to your analyzer. Read Electrostatic Discharge Protection.
Receiver Leveling

**Note:** The M937xA/P937xA does not support this function.

Receiver Leveling adjusts the source power until the measured receiver power is equal to the Port Power.

In this topic:

- Overview
- Receiver Leveling Process
- Features and Limitations
- How to make Receiver Leveling settings
  - Support for Pre-Sweep Mode, Point Mode, and Prior Sweep Mode
  - Receiver Leveling dialog box help
  - Initial Power Selection

**See other 'Setup Measurements' topics**

**Overview**

Receiver Leveling uses receiver measurements to adjust the source power level across a frequency or power sweep. There are three receiver leveling modes: pre-sweep mode, point mode, and prior sweep mode.

**Note:** Enabling Safe Mode when using receiver leveling may be necessary to ensure stable results.

**Receiver Leveling Process**

**Pre-Sweep Mode**

Before each measurement sweep, a variable number of background sweeps are performed to measure and adjust power at the target port. Those power adjustments are then used to achieve greater source power level accuracy on the final sweep.
This is similar to a Source Power Calibration but because Receiver Leveling is updated for every measurement sweep, it provides more accurate source power levels, but also takes longer to perform each measurement sweep.

1. For each leveling pre-sweep, port power is measured by the specified receiver. Learn how the initial power level is selected.
2. The deviation is calculated between the measured power and the port power setting.
3. The deviation is applied as a power offset on the final sweep.
4. This pre-sweep process continues until the receiver power at each data point has achieved the port power within the specified tolerance value, or until the specified number of leveling sweeps (iterations) has been reached.

**Point Mode (if supported by the hardware)**

This mode does not use a pre-sweep. Instead, leveling is performed at the same time each point is acquired.

1. When the sweep starts, the source is set to the first point and power is read.
2. If the power is outside the target power tolerance, the source power is adjusted and the point is read again.
3. If max iterations is reached or the target power is within the tolerance, display the point and move to the next point.
4. This process repeats for each point.

**Prior Sweep Mode**

This mode avoids any extra data acquisition. There is no pre-sweep or extra point acquisitions.

This mode uses the data acquired during the prior sweep to compute a power offset for the following sweep. The power continues to be adjusted in this way until the tolerance is met.

1. Acquire data from the prior sweep.
2. The deviation is calculated between the measured power and the port power.
3. The deviation is applied as a power offset on the final sweep.
4. This process repeats for each successive sweep until the tolerance is reached.

**Features and Limitations**
Receiver Leveling can be used with most sweep types, including Segment sweep and Power sweep. See Wide Power Sweep with Receiver Leveling.

Receiver Leveling is ALWAYS enabled for the controlled source when Phase Control (Opt S93088A/B) is enabled.

Receiver Leveling is available for standard S-parameter measurements and with FCA, GCA, and IMD applications.

Turn ON Receiver Leveling before or after doing a Calibration. When turned ON before calibrating, it is turned OFF during the calibration, then back ON after calibration.

Power Offset on the Offsets and Limits dialog can be used when there exists an additional attenuator or booster amplifier in the source path. An offset should be set to improve the leveling speed. This power offset is automatically used to set the port power.

Use Receiver Leveling for the following:

- Correcting for short term drift when using an external component, such as a booster amplifier. The booster amplifier must be connected to the front-panel jumpers, in front of the reference receiver. See the Block diagram for your VNA, located at the end of every Specifications document.
- Extending the accuracy of power leveling at very low powers where the internal detector may be too noisy.
- Providing controlled power during Pulsed measurements in an open loop mode.
- Controlling the power at the outputs of MM-Wave heads.

**Note:** Increase the sweep delay if output power is not accurate when Receiver Leveling is applied to two or more ports.

### How to make Receiver Leveling settings

Start the Power and Attenuators dialog box as follows:

<table>
<thead>
<tr>
<th><strong>Using Hardkey/SoftTab/Softkey</strong></th>
<th><strong>Using a mouse</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>1. Press <strong>Power &gt; Main &gt; Power and Attenuators</strong>...</td>
<td></td>
</tr>
<tr>
<td>2. On the Power and Attenuators dialog, click <strong>Receiver Leveling</strong> button.</td>
<td></td>
</tr>
<tr>
<td>1. Click <strong>Stimulus</strong>, <strong>Power</strong>, then <strong>Power and Attenuators</strong>.</td>
<td></td>
</tr>
<tr>
<td>2. On the Power and Attenuators dialog, click <strong>Receiver Leveling</strong> button.</td>
<td></td>
</tr>
</tbody>
</table>
**Receiver Leveling** dialog box help

Learn about Receiver Leveling (scroll up).

**Support for Pre-Sweep Mode, Point Mode, and Prior Sweep Mode**

The following dialog and descriptions apply to VNAs that support pre-sweep mode, point mode, and prior sweep mode receiver leveling.

![Receiver Leveling Setup: Channel 1](image-url)

**Controlled Source (Port)**

Each source port to be leveled is configured individually. Select a source to be configured for receiver leveling. Choose from: Port 1, Port 2, Port 3, Port 4, or any active external source. Learn more about External Devices.
**Note:** A Modulation Distortion channel only allows one modulated source. Therefore, only one row will be displayed showing the name of the modulated source.

**Enable Leveling** - Checkbox enables/disables receiver leveling. The default is disabled (unchecked).

**Leveling Receiver** - Select a receiver to be used to level the specified source by clicking on the **Leveling Receiver** pull down menu. Choose from a VNA Receiver or Ext. Device (PMAR).

![Leveling Receiver](image)

For a VNA Receiver, choose from any VNA receiver using standard or receiver notation.

To level power at the source output or DUT input choose the reference receiver for the source port. For example, to level the source power at port 1, then choose "R1". To level power at the DUT output, choose the receiver that is used to measure the DUT output. If the DUT output is connected to port 2, then select "B" or 'b2'. [Learn about Receiver Notation](#).

When **Phase Control** is enabled, the ratioed receivers used in Phase Control are selected and can NOT be changed. However, the Reference Source CAN also be selected for Receiver Leveling.

For Ext Device type, choose a configured PMAR device.

**Leveling Type - Sets the receiver leveling type:**

- **Pre-Sweep** - Leveling sweeps are performed in the background (not visible) before every measurement sweep to measure and apply source correction data.

- **Point** - Leveling is performed per point. If the point is outside the tolerance, the source power is adjusted and the point is read again. This process is repeated until the leveling receiver reports that the target power is within tolerance (or the maximum iteration setting is reached). When the iteration is done, it moves immediately to the next point.

- **Prior Sweep** - Disables the receiver leveling search function. After the first sweep, receiver leveling reads the data and computes the correction for each point in an attempt to reach the target power level. The calculated offset is used for the next sweep. This process is repeated
to improve receiver leveling for successive sweeps.

**Controlled Source Setup**

**Max Power** Always limits the maximum power out of the source to this value. The message: **Power set to Max Power** appears when this limit is reached.

If the maximum port power out of the VNA is reached at any time during the leveling sweeps, the following message appears: **Power set to user power limit.**

**Min Power** Always limits the minimum power out of the source to this value. The message: **Power set to Min Power** appears when this limit is reached. When Safe Mode is enabled, this value is used as the initial power level for the leveling loop process.

**Note:** The MAX/MIN limit is always used regardless of the safe mode state. In addition, the MAX/MIN limit is for port power and related to power offset. If the power offset is not set correctly, the MAX/MIN limit is not correct and it may impact the leveling. Ensure that the power offset in the channel is the same as power offset during calibration. If the exact power offset is not known, choose a limit for source and then it will not be related to power offset.

**Enable Safe Mode Leveling Using Max Step Size**

To protect your DUT and ensure stable results, these settings control the extent to which the source power will be changed to achieve the port power as measured at the reference receiver. These settings could be necessary when using external components with a large variation in frequency response (flatness).

When checked:

- The Min source output is used as the initial power level for the leveling loop process.
- The controlled source is never stepped more than the Max source step size.

When cleared:

- The initial power for the leveling loop may be determined by the Min source output, the Max source output, the last setting of the leveling loop, or the target value of the leveling loop.  **See Initial Power below.**
- The Max source step size is ignored.

**Max source step size**

When Safe Mode is enabled, the change in source power at each data point from one sweep to the
next is limited to this value. For example, assume Safe Mode is enabled, and Max Power Step is set to 1 dB. On the first leveling sweep, the first data point measures 3 dB lower than the port power, then source power for data point 1 will be increased by 1 dB for the next sweep, and likely for the following two sweeps.

**Update Source Power Calibration with Leveling Data**  Available only when using an RF Source and VNA receiver.

- When checked, the latest correction data is copied to the Source Power Cal correction array. When Leveling Mode is switched back to Internal (on the Power and Attenuators dialog), Source Power Cal is automatically turned ON using this correction data.
- When cleared, Source Power Cal is NOT turned ON when Leveling Mode is switched back to Internal.

**Source ALC Hardware**

NOT available with External sources.

- **Internal** - Internal ALC leveling and Receiver Leveling (Recommended).
- **Open Loop** - NO ALC leveling; Receiver Leveling ONLY. NOT available on N523x models.

**Leveling Receiver Setup**

**Leveling Tolerance**  The source is considered leveled when each stimulus data point has achieved the power level +/- (plus or minus) this tolerance value.

**Leveling Max Iterations**  If every stimulus data point does NOT achieve the port power after this number of leveling sweeps, the measurement sweep occurs using the correction values obtained from the last leveling sweep. The message: **Not settled, noisy trace** appears when the Max Iterations is reached. If you see this message, you can increase the Max Iterations, reduce the IFBW, or increase the Tolerance setting.

**Note:** Max Iterations can no longer be set to zero. Instead, select Prior Sweep mode to disable the receiver leveling search function. In this way, there will be no pre-sweep for the receiver
leveling, but the value of the receiver data will be used to correct the next sweep. This provides a post sweep correction and can be useful for correcting slow drift in a system where a booster amplifier or open loop ALC is used, without adding pre-sweeps to the sweep-acquisitions.

**Leveling Receiver Frequency** - Available ONLY when the selected receiver is a VNA Receiver or power meter. This setting determines which receiver frequencies are measured. Choose from:

- **Auto** - always uses the frequency range that is assigned to the measurement receiver.
- **FOM Receiver** - FOM Receiver frequency range. Learn more about Frequency Offset Mode.
- **FOM Source** - FOM Source frequency range.
- **DUT Input** - Mixer/Converter input frequency range.
- **DUT Output** - Mixer/Converter output frequency range.
- **FOM Primary** - Current Active Channel settings.

**Leveling IFBW**  Available only for VNA receivers. By default, the IFBW for the leveling sweeps is set to 100 kHz. Learn more about IFBW.

- Increase this value to make faster, but noisier leveling sweeps.
- Decrease this value to make slower, more repeatable leveling sweeps.
- Uncheck the box to use the same IFBW as the measurement sweeps.

**Leveling Noise BW** - (SA multitone and Modulation Distortion channel only) Sets the receiver noise bandwidth value for leveling at pre-sweep. Noise bandwidth is equal to the Resolution bandwidth divided by the Vector Average factor.

**Carrier Aperture Span/Offset** - (SA multitone Modulation Distortion channel only) Enabling the aperture settings will measure the power more quickly by reducing the span of the measurement during the pre-sweep. Enter the span and offset of the frequency aperture used to measure the signal power. Since the ideal modulation signal is known, the total power is calculated from this value.

**Initial Power Selection**

For each displayed data point, the leveling algorithm must select an initial power to begin the
iteration process. This value is chosen as follows:

Where:

\( P_{\text{Init}} \) = the initial power for the iteration process.

\( P_{\text{Final}} \) = the final power setting from the previous leveled sweep.

\( P_{\text{Min}} \) = the minimum controlled source output level as specified in the Receiver leveling setup.

\( P_{\text{Max}} \) = the maximum controlled source output level as specified in the Receiver leveling setup.

\( P_{\text{Target}} \) = the target power level for the selected leveling receiver.
A sweep is a series of consecutive data point measurements taken over a specified sequence of stimulus values. You can make the following sweep settings:

- **Number of Points** *(Separate topic)*

- **Sweep Type**
  - Linear / Log
  - Power Sweep
  - CW Time
  - Segment Sweep
  - Phase

- **Frequency Range**: Start/Stop *(Separate topic)*

- **Power Sweep**

- **Segment Sweep**
  - How to make segment sweep settings
  - Segment Table dialog

- **X-Axis Point Spacing - Segment Sweep ONLY**

- **Arbitrary Segment Sweep**

- **Sweep Time**

- **Sweep Setup**
  - Fast Sweep
  - Auto vs Stepped
  - Dwell and Delay
  - Standard vs Point Sweep
See Triggering and other 'Setup Measurements' topics

How to set Sweep Type

Using Hardkey/SoftTab/Softkey

1. Press **Sweep > Main > Sweep Type**.

Using a mouse

1. Right click on the **stimulus range** area under grid box.
2. Click **Sweep Setup....**
3. Select **Sweep Type** tab and select type.
4. Click **Apply** to implement the setting changes.

**Sweep Type** dialog box help

![Sweep Type dialog box](image)

**Note:** Sweep Settings are not applied until either **OK** or **Apply** is pressed.

**Channel**  The active channel when Sweep Type was selected. Sweep settings will be applied to this channel.

**Sweep Type**

**Linear Frequency**  Sets a linear frequency sweep that is displayed on a standard grid with ten equal horizontal divisions.
- **Start**  Sets the beginning value of the frequency sweep.
- **Stop**  Sets the end value of the frequency sweep.
- **Points**  Sets the number of data points that the analyzer measures during a sweep (Default is 201). Learn more.
- **Power** - Sets the power level or the source. Learn more.
- **IF Bandwidth** - Sets the IF (Receiver) bandwidth. Learn more.

**Log Frequency**  The source is stepped in logarithmic increments and the data is displayed on a logarithmic x-axis. This is usually slower than a continuous sweep with the same number of points.

- **Start**  Sets the beginning value of the frequency sweep.
- **Stop**  Sets the end value of the frequency sweep.
- **Points**  Sets the number of data points that the analyzer measures during a sweep (Default is 201). Learn more.
- **Power** - Sets the power level or the source. Learn more.
- **IF Bandwidth** - Sets the IF (Receiver) bandwidth. Learn more.

**Power Sweep**  Activates a power sweep at a single frequency that you specify. Learn about power sweep

- **Start Power**  Sets the beginning value of the power sweep.
- **Stop Power**  Sets the end value of the power sweep.
- **CW Freq**  Sets the single frequency where the analyzer remains during the measurement sweep.
- **Points**  Sets the number of data points that the analyzer measures during a sweep (Default is 201). Learn more.
- **IF Bandwidth** - Sets the IF (Receiver) bandwidth. Learn more.

**CW Time**  Sets the analyzer to a single frequency, and the data is displayed versus time. Learn more.

- **CW Freq**  Sets the frequency where the analyzer remains during the measurement.
- **Power** - Sets the power level or the source. Learn more.
- **Sweep Time**  Sets the duration of the measurement, which is displayed on the X-axis.
- **Points**  Sets the number of data points that the analyzer measures during a sweep (Default is 201). [Learn more.](#)
- **IF Bandwidth**  Sets the IF (Receiver) bandwidth. [Learn more.](#)

**Segment Sweep**  Sets the analyzer to sweep through user-defined sweep segments. [Learn how to make these settings.](#)

**Phase Sweep**  Sweeps the phase of one or more sources relative to another source. Choose values between -360° and +360°. [Learn more.](#)

  - **Start Phase**  Sets the beginning value of the phase sweep.
  - **Stop Phase**  Sets the end value of the phase sweep.
  - **CW Freq**  Sets the single frequency where the analyzer remains during the sweep.

**OK**  Applies setting changes and closes the dialog box.

**Apply**  Applies setting changes and leaves the dialog box open to make more setting changes.

**Cancel**  Closes the dialog. Setting changes that have been made since the last Apply button click are NOT applied.

**Help** - Display the **Sweep Type** dialog box help.

---

**Power Sweep**

A power sweep either increases or decreases source power in discrete steps. Power sweep is used to characterize power-sensitive circuits, with measurements such as gain compression.

In the Sweep Type dialog, specify Start power, Stop power, and CW Frequency. Power can be swept over any attainable range within the analyzer ALC range.

**Note:** If the VNA has source attenuators, and the attenuation must be changed in order to achieve the requested start and stop power, click **Stimulus**, then **Power** then **Power and Attenuators**.

The VNA does NOT allow power to sweep over a range that requires attenuator switching. However, two power sweeps can be performed in different channels. The attenuators will not be allowed to switch continuously, but triggering can be performed using single or group triggering. [Learn more.](#)

The remaining power settings apply in power sweep mode:
- Test Port Power setting is not available.
- Port Power can be coupled or uncoupled.
- Attenuator Control is always Manual.
- Power Slope (dB/GHz) is ignored (output frequency is CW).
- Press **Sweep > Main > Number of Points** to change the step size of the power sweep.

**Notes:**

- Using a **preference setting**, you can specify whether to maintain source power at either the start power or stop power level at the end of a power sweep.
- Power Sweep is optimized for speed. For highest measurement accuracy during a power sweep, it may be necessary to increase the **Dwell Time** to allow the source more time to settle.
- You may be able to perform a **60 dB power sweep** with Receiver Leveling. Learn how.

### Segment Sweep

Segment Sweep activates a sweep which consists of frequency sub-sweeps, called segments. For each segment you can define independent power levels, IF bandwidth, and sweep time.

Once a measurement calibration is performed on the entire sweep or across all segments, you can make calibrated measurements for one or more segments.

In segment sweep type, the analyzer does the following:

- Sorts all the defined segments in order of increasing frequency
- Measures each point
- Displays a single trace that is a composite of all data taken

Restrictions for segment sweep:

- The frequency range of a segment is not allowed to overlap the frequency range of any other segment.

**Note:** Segment sweeps can be overlapped for converter measurement types.
The number of segments is limited only by the combined number of data points for all segments in a sweep.

The combined number of data points for all segments in a sweep cannot exceed the max number of data points per trace.

All segments are FORCED to have power levels within the same attenuator range to avoid premature wear of the mechanical step attenuator. See Power Level.

### How to make segment sweep settings

#### Using Hardkey/SoftTab/Softkey

1. Press **Sweep > Segment Table > Segment Table...**

#### Using a mouse

1. Right click on the X-axis label or stimulus display area under grid line.

2. Click **Sweep Setup...** then select **Segment Sweep** under sweep type.

3. Click **Segment Table...**.

### Segment Table dialog box help

**Segment Table Softkeys**

- **Add Segment** - adds a sweep segment at last segment.
- **Insert Segment** - adds a sweep segment before the selected segment. You can also click the "down" arrow on your keyboard to quickly add many segments.
- **Delete Segment** - removes the selected segment.
- **Delete All Segments** - removes all segments.

**Note:** At least ONE segment must be ON or **Sweep Type** is automatically set to **Linear**.

### Segment Table dialog box

**X-Axis Point Spacing** - Check to scale the X-axis to include only the segments. [Learn more.](#)

**Allow Arbitrary Segments** - Check to allow arbitrary frequencies (overlapped or reverse sweep). [Learn more.](#)

**Display Center/Span Freq** - Check to display the center/span frequency.
Independent Setting Per Segment

Power Level - Sets the Power level for the segment. Also, the test port power can UNCOUPLE. See Power Coupling.

IF Bandwidth - Sets the IF Bandwidth for the segment.

IF Bandwidth Per Port - Sets the different bandwidth with different port for the segment.

Sweep Time - Sets the Sweep time for the segment.

Dwell Time - Specifies the time the source stays at each measurement point before the analyzer takes the data.

Vector Averaging - Enables SA vector average for the segment.

Video Bandwidth - Enables SA video bandwidth for the segment.

Delay - Sets the time to wait just before acquisition begins for each segment.

Sweep Mode - Sets the sweep mode to auto or stepped.

Shift LO - Sets the state of Shift LO.

Receiver Atten Per Port - Enables receiver attenuation per port for the segment.

Reference Tone - Enables SA multitone reference for the segment.

SA Data Threshold - Enables SA data threshold for the segment.

Save Table - Saves the setting changes in segment table.

Load Table - Apply the setting changes in segment table.

To Modify an Existing Segment

To make the following menu settings available, the segment table must be displayed first. (Press Sweep > Segment Table).

State - Click the box on the segment to be modified. Then, use the up/down arrow to turn the segment ON or OFF.

Start - Sets start frequency for the segment. Click the box and type a value and the first letter of a suffix (KHz, Mhz, GHz). Or double-click the box to select a value.
**Stop** - Sets stop frequency for the segment. Click the box and type a value and the first letter of a suffix (KHz, Mhz, GHz). Or double-click the box to select a value.

**Note:** The segment table truncates the frequency resolution. To verify the frequency resolution that you input, create a marker at the start or stop frequency settings.

**Points** - Sets number of data points for this segment. Insert a value or double-click the box to select a value.

To set **Power Level, IF Bandwidth/IF Bandwidth Per Port, Sweep Time, Delay, Receiver Attenuator Per Port, Sweep Mode** and **Shift LO** independently for each segment:

1. Press **Sweep > Main > Sweep Type > Segment Sweep.**
2. Click on **Segment Table > Segment Table...**
3. Check the box corresponding to the segment setting to set then click **OK.**
4. Click in the box at the bottom of the display and use the up/down arrows to enter a value or double-click the box and select a value with the numeric keypad.

**Note:** If the following are NOT set, the entire sweep uses the channel IFBW, Power, and Time settings.

**X-Axis Point Spacing - Segment Sweep ONLY**

This feature affects how a segment trace is drawn on the screen.

**How to select X-Axis Point Spacing**

**Using Hardkey/SoftTab/Softkey**

1. Press **Sweep > Segment Table. > Segment Table....**
2. Check **X-Axis Point Spacing.**

**Using a mouse**

1. Right click on the X-axis label or stimulus display area under grid line.
2. Click **Sweep Setup...** then select **Segment Sweep** under sweep type.
3. Click **Segment Table....**
4. Check **X-Axis Point Spacing.**

**Without X-axis point spacing**, a multi-segment sweep trace can sometimes result in squeezing many measurement points into a narrow portion of the x-axis.
- **With X-axis point spacing**, the x-axis position of each point is chosen so that all measurement points are evenly spaced along the x-axis.

For example, given the following two segments:

<table>
<thead>
<tr>
<th>STATE</th>
<th>START</th>
<th>STOP</th>
<th>POINTS</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>ON</td>
<td>45.000000 MHz</td>
<td>50.000000 MHz</td>
</tr>
<tr>
<td>2</td>
<td>ON</td>
<td>170.000000 MHz</td>
<td>180.000000 MHz</td>
</tr>
</tbody>
</table>

**Without X-Axis Point Spacing**

**With X-Axis Point Spacing**

**Arbitrary Segment Sweep**

This feature allows arbitrary frequencies to be entered into the segment sweep table. With this capability, segments can have:
- overlapping frequencies.
- the stop frequency less than the start frequency (reverse sweep).

However, there are several limitations:

- Sweep mode: Stepped only.
- Sweep time: When reverse sweep is performed, the sweep time and the wait time before the measurement point becomes longer.

### How to enable Arbitrary Segment Sweep

**Using Hardkey/SoftTab/Softkey**

1. Press **Sweep > Segment Table. > Segment Table...**
2. Check **Allow Arbitrary Segments**.

**Using a mouse**

1. Right click on the X-axis label or stimulus display area under grid line.
2. Click **Sweep Setup...** then select **Segment Sweep** under sweep type.
3. Click **Segment Table...**
4. Check **Allow Arbitrary Segments**.

#### Notes:

- Unusual results may occur when using arbitrary sweep segments with markers, display settings, limit lines, formatting, and some calibration features.
- When **Allow Arbitrary Segments** is checked, a dialog is displayed indicating that X-axis point spacing is recommended.
- When the segment table has both forward and reverse frequency sweep, the correction interpolation may not work properly. Use the same segment table setting for both correction and measurement. (Make a measurement at the condition where "Cor" is displayed.)
- When the measurement data size of segment table exceeds its limitation, an error occurs. In this case, reduce the measurement data size (i.e., NOP, number of channels).

#### Sweep Time

The analyzer automatically maintains the fastest sweep time possible with the selected measurement settings. However, you can increase the sweep time to perform a slower sweep.
How to set Sweep Time

Using Hardkey/SoftTab/Softkey

1. Press **Sweep > Sweep Timing > Sweep Time**.
2. Input the desired sweep time.

Using a mouse

1. Right click on the X-axis label or stimulus range area under grid line.
2. Click on **Sweep Setup**....
3. Select **Timing** tab.
4. Deselect the **Auto Sweep Time** box.
5. Input the desired sweep time.

**Sweep Time** dialog box help

*Sweep Time* Specifies the time the analyzer takes to acquire RF data for a sweep. The maximum sweep time of the analyzer is 86400 seconds or 1 day. Learn about other settings that affect sweep speed.

**Note:** When a channel has an Aux In or SMU trace, the measurement time for DC voltage/current will be added.

**Note:** If sweep time accuracy is critical, use ONLY the up and down arrows next to the *Sweep Time* entry box in the *Sweep Setup* dialog to select a value that has been calculated by the analyzer. Do NOT type a sweep time value as it will probably be rounded up to the closest calculated value. This rounded value will not be updated in the dialog box.

- The actual sweep time includes this acquisition time plus some "overhead" time.
- The analyzer automatically maintains the fastest sweep time possible with the selected measurement settings. However, you can increase the sweep time using this setting.
- Enter 0 seconds to return the analyzer to the fastest possible sweep time.
- The Sweep Time setting is applied to the active channel.
- The sweep time is per sweep. A full 2-port cal requires two sweeps, both using the specified sweep time. Learn more.
- **A Sweep Indicator** appears on the data trace when the Sweep Time is 0.3 seconds or greater, or if trigger is set to **Point**. The indicator is located on the last data point that was measured by the receiver. If the indicator is stopped (point sweep mode) the source has already stepped to the next data point.
Sweep Setup

How to make Sweep Setup settings

Using Hardkey/SoftTab/Softkey

1. Press Sweep > Sweep Timing.

Using a mouse

1. Right click on the X-axis label or stimulus range area under grid line.
2. Click on Sweep Setup....

Sweep Setup dialog box help

Time

Sweep Time - same as Sweep Time Softtab Help.

Dwell Time - Specifies the time the source stays at each measurement point before the analyzer takes the data. Only applies to stepped sweep. The maximum dwell time is 20 seconds. See also Electrically Long Devices.

Sweep Delay - Specifies the time to wait just before acquisition begins for each sweep. This delay is in addition to Dwell Time (per point) and External Trigger delay if enabled.

Fast Sweep - NOT available on N5264B and N523xB models. When checked, in Analog Sweep mode the analyzer source settling times are shortened in both frequency and power-control (ALC) circuits. In Stepped Sweep mode, the settling time at ALL data points are shortened. This nearly doubles the sweep speed at preset conditions, but at the expense of frequency accuracy and a few dB of amplitude variation. For ratioed measurements, such as S-Parameters, these errors substantially ratio out.

- By default, Fast Sweep is always OFF to provide maximum accuracy and stability.
- Fast Sweep is NOT allowed with Power Limit enabled.
- Note: Performance specifications do NOT apply in Fast Sweep.

Sweep Mode

Auto - Automatic adjusts the sweep time and dwell time. When "Auto Sweep Time" is checked,
the sweep time and dwell time will disable to edit.

**Stepped** When checked (Stepped Sweep) the analyzer source is tuned, then waits the specified Dwell time, then takes response data, then tunes the source to the next frequency point. This is slower than Analog Sweep, but is more accurate when testing electrically-long devices.

When cleared (Analog Sweep) the analyzer takes response data AS the source is sweeping. The sweep time is faster than Stepped, but could cause measurement errors when testing electrically-long devices.

When the dialog check box is cleared, the analyzer could be in either Analog or Step mode. The mode can change from sweep to sweep. There is **NO way** to determine whether the analyzer is in Analog or Stepped Sweep. If you want to be sure what the current sweep mode is, then switch it to Stepped.

Stepped sweep is automatically selected for a number of reasons. Here are some of the reasons:

- **IF Bandwidth** is at, or below, 1 kHz.
- **Source Power Correction** is ON unless doing CW measurement.
- When more than one source is turned ON (multisource VNA models).
- When step mode is a faster way to take the data.
- For all **FOM and FCA** measurements.
- For all **ADC** measurements.
- For all **MMwave** measurements.

**Sweep Sequence**

**Standard Sweep** When checked, the analyzer sweeps all data points for each source port in turn. For a 2-port analyzer, this means that all data points are swept in the forward direction, then all data points are swept in the reverse direction. Even when NO reverse parameters are displayed (S22 or S12), reverse measurements are necessary when a full 2-port calibration is correcting the channel. This is the default behavior.

**Point Sweep** Available ONLY on standard S-parameter channels. When checked, the analyzer measures all parameters at each frequency point before stepping to the next frequency. The display trace is updated as each data point is measured.

- Point sweep usually results in slower sweeps and is useful only in rare circumstances.
- Point sweep is the same as stepped sweep mode on the 8510 and 8530.
- **PMAR** is not compatible with Point Sweep mode.
A trigger is a signal that causes the analyzer to make a measurement sweep. The analyzer offers great flexibility in configuring the trigger function.

View the interactive Trigger Model animation to see how triggering works.

How to set Triggering

<table>
<thead>
<tr>
<th>Using Hardkey/SoftTab/Softkey</th>
<th>Using a mouse</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. Press Trigger &gt; Main &gt; Trigger....</td>
<td>1. Right click on the Trig or Meas icons on the status bar.</td>
</tr>
<tr>
<td></td>
<td>2. Select Trigger....</td>
</tr>
</tbody>
</table>

Note: The Continuous, Single, and Hold settings apply ONLY to the active channel. These settings are available from the Trigger menu, Active Entry keys, and softkeys.

Trigger Setup dialog box help
View the interactive Trigger Model animation to see how triggering works.

**Trigger Source**

These settings determine where the trigger signals originate for all existing channels. A valid trigger signal can be generated only when the analyzer is not sweeping.

**Internal** Continuous trigger signals are sent by the analyzer as soon as the previous measurement is complete.

**Manual** One trigger signal is sent when invoked by the Trigger button, the active tool bar, or a programming command.

**External** Trigger signals received from the trigger source. The trigger source can be defined in External and AUX Triggering.

**Pulse3** Trigger signal using internal Pulse3 to Meas Trig In bypass. Pulse3 can be defined in the Pulse Generators Setup dialog.

**Manual Trigger!** - Manually sends one trigger signal to the analyzer. Available ONLY when
Manual trigger is selected.

**Trigger Scope**

These settings determine what is triggered.

**Global**  All channels not in Hold receive the trigger signal [Default setting]

**Channel**  Only the next channel that is not in Hold receives the trigger signal. This is not obvious or useful unless Trigger Source is set to Manual. This setting enables Point Sweep mode.

**Active Channel** - Trigger are sent only to the active channel. The active channel does not change.

**Channel Trigger State**

These settings determine how many trigger signals the channel will accept.

**Continuous**  The channel accepts an infinite number of trigger signals.

**Groups**  The channel accepts only the number of trigger signals that is specified in the Number of Groups text box, then goes into Hold. Before selecting groups you must first increment the Number of Groups text box to greater than one.

**Number of Groups**  Specify the number of triggers the channel accepts before going into Hold. If in Point Sweep, an entire sweep is considered one group.

First increment to desired number, then select 'Groups'.

**Single**  The channel accepts ONE trigger signal, then goes into Hold.

Another way to trigger a single measurement is to set Trigger Source to Manual, then send a Manual trigger. However, ALL channels are single triggered.

**Hold**  The channel accepts NO trigger signals.

**Trigger Mode**

These settings determine what EACH signal will trigger.

Sweep and Point modes are available ONLY when both Trigger Source = MANUAL or EXTERNAL AND Trigger Scope = CHANNEL.

- **Channel**  Each trigger signal causes ALL traces in that channel to be swept in the order specified below.

- **Point**  Each Manual or External trigger signal causes one data point to be measured.
Subsequent triggers go to the same trace until it is complete, then other traces in the same channel are swept in the order specified below. When in Groups or Single trigger, the count is decremented by one after ALL data points on ALL traces in the channel are measured. See Also, the (point) Sweep Indicator and SCPI Triggering example for use with External.

For gated SA measurements, **Point** does not refer to a data point. Instead, it refers to the next LO acquisition. For SA, each time the LO is shifted an acquisition is captured. The time for each LO acquisition is based on the ADC Record Size and time per ADC sample (10 nsec).

- **Trace** Available ONLY when **Point Sweep** is selected. Each trigger signal causes two identical measurements to be triggered separately - one trigger signal is required for each measurement. Other trigger mode settings cause two identical parameters to be measured simultaneously. Trace triggering is NOT permitted when a channel is using a 2 port (or more) S-Parameter calibration.

- **Sweep** Each Manual or External trigger signal causes **ALL traces that share a source port** to be swept in the order specified below. When in Groups or Single trigger, the count is decremented by one after ALL traces in ALL directions are swept.

  When multiport correction is ON, which requires sweeps in more than one direction, traces on the screen will not update until all of the relevant directions have been swept. For example, with all four 2-port S-Parameters displayed:

  - When Full 2-port correction is ON, trigger 1 causes NO traces to update; trigger 2 causes ALL S-Parameters to update. Learn more about sweeps with correction ON.
  - When correction is OFF, trigger 1 causes S11 and S21 to update; trigger 2 causes S22 and S12 to update.
Trace Sweep Order

For ALL Trigger Modes, trigger signals continue in the same channel until all traces in that channel are complete. Triggering then continues to the next channel that is not in HOLD.

Traces within each channel are always swept in the following order:

- Traces are swept sequentially in source-port order. For example, in a channel with all four 2-port S-parameters, first the source port 1 traces (S11 and S21) are swept simultaneously. Then the source port 2 traces (S22 and S12) are swept simultaneously.

- In addition, when Alternate sweep is selected, traces are swept sequentially in source-port / receiver-port order. In the above example, first the S11 trace is swept, then S21, then S12, then S22.

Restart  (Available only from the Trigger menu) Restart stops the currently sweeping Channel, and continues on to the next Channel that can sweep.

Examples:

1. Single channel in Continuous Trigger mode: The current sweep on the channel is stopped, and the channel starts sweeping the first sweep of the Channel.

2. Single channel in Hold mode: The Restart softkey does not do anything.

3. Multiple Channels in Continuous mode: The current sweep on the current channel is stopped, and the next channel that can sweep is started.

Overview

**Ready Signals versus Trigger Signals**

A 'Ready for Trigger' signal is different from a Trigger signal. The ready signal indicates that the instrument sending the signal is ready for measurement. The instrument receiving the ready signal would then send a trigger signal, indicating that the measurement will be, or has been, made. Usually the slower instrument sends the trigger signal.

Learn more about each type of triggering signal:

- Meas Trig RDY and Meas Trig IN - This pair of signals is easy to use and limited in ability to configure.
• **AUX TRIG OUT** and **AUX TRIG IN** - These two pair of connectors and signals are highly configurable. Use them to synchronize with any number of devices and equipment.

**Meas (External) Trigger** dialog box help

![Trigger Dialog](image)

**Meas Trig RDY and Meas Trig IN**

The **MEAS TRIG** connectors are located on the VNA rear-panel.

These signals can be used when the VNA is communicating with a slow mechanical device. A material handler is very mechanical and takes a relatively long time to load and discharge parts. Here is how these signals work together to communicate:

1. The VNA sends a 'Ready' signal when it is ready to make a measurement.
2. The external device sends a trigger signal to the VNA when it is ready for a measurement.
3. Additional signals are available on the VNA Handler I/O to indicate that the VNA sweep has ended, and that the handler can setup for the next measurement. See Material Handler I/O description Material Handler I/O description

**See how to access the Trigger Dialog**

**Trigger Ready and Trigger IN**
The Trigger connectors are located on the rear-panel.

These signals can be used when the VNA is communicating with a slow mechanical device. A material handler is very mechanical and takes a relatively long time to load and discharge parts. Here is how these signals work together to communicate:

1. The VNA sends a 'Ready' signal when it is ready to make a measurement.
2. The external device sends a trigger signal to the VNA when it is ready for a measurement.
3. Additional signals are available on the VNA Handler I/O to indicate that the VNA sweep has ended, and that the handler can setup for the next measurement. See Material Handler I/O description.

**Dialog Settings**

To cause the VNA to respond to Meas Trig IN or Handler I/O signals, select **External** on the Trigger Setup tab, Source setting.

**Note:** You must select **External** when you use any external triggers.

Also on the Trigger Setup tab, Scope setting, choose whether one external trigger signal will apply to ALL channels (Global) or one trigger signal per Channel. The following settings apply accordingly.

**Main Trigger Input**

**Global / Channel Trigger Delay** After an external trigger is received, the start of the sweep is held off for this specified amount of time plus any inherent latency.

- When Trigger Scope = Channel, the delay value is applied to the specified channel.
- When Trigger Scope = Global, the same delay value is applied to ALL channels.

**Source** The VNA accepts Trigger IN signals through the following connectors:

- Meas Trig IN BNC
- Handler I/O Pin 18
- Pulse3

**Level / Edge**
**High Level**  The VNA is triggered when it is armed (ready for trigger) and the TTL signal at the select input is HIGH.

**Low Level**  The VNA is triggered when it is armed (ready for trigger) and the TTL signal at the select input is LOW.

**Positive Edge**  After the VNA arms, it will trigger on the next positive edge. If is set, the VNA will trigger as soon as it arms if a positive edge was received since the last data was taken.

**Negative Edge**  After the VNA arms, it will trigger on the next negative edge. If is set, the VNA will trigger as soon as it arms if a negative edge was received since the last data was taken.

**Accept Trigger Before Armed**  When checked, as the VNA becomes armed (ready to be triggered), the VNA will immediately trigger if any triggers were received since the last taking of data. The VNA remembers only one trigger signal. All others are ignored.

- When this checkbox is cleared, any trigger signal received before VNA is armed is ignored.
- This feature is only available when positive or negative EDGE triggering is selected.
- Configure this setting remotely using CONTrol:SIGNal (SCPI) or ExternalTriggerConnectionBehavior (COM).

**Ready for Trigger Indicator (Trigger Ready)**

On the VNA, when External is selected on the Trigger Setup tab, then both Meas Trig IN and Meas Trig Ready are enabled.

**Note:** The Ready for trigger is available only when the trigger source is set at External.

Choose a connector to send the VNA Ready OUT signal:

- **Meas Trig RDY**
- **Handler I/O p21**

Choose Polarity of the 'Ready OUT' signal.

- **Ready High** - TTL High indicates the VNA is ready for trigger.
- **Ready Low** - TTL Low indicates the VNA is ready for trigger (default setting).

Pulse Trigger Tab

Learn how to External Trigger during Calibration

**Aux Trig 1 - Aux Trig 2 dialog box help**

![Trigger dialog box](image)

See how to access the Trigger Dialog

Note: When an External Source is configured as an External Device, the VNA automatically controls all trigger settings. Do NOT make additional trigger settings. Learn more.

**AUX TRIG OUT and AUX TRIG IN**

See the AUX TRIG (1&2) connectors on the VNA rear-panel.

These signals are highly configurable. They can be used with all types of external devices to send and receive signals. However, it is important to note that either Aux Trig INPUT does NOT trigger the VNA. That signal must be selected. See step 2 in the following procedure.
1. An external source sends a 'Ready' signal to the VNA (at the Aux Trig IN connector) when it is settled at a frequency.

2. After receiving the Ready signal, the VNA begins the measurement when it receives a Trigger signal from the specified Trigger Source:

   - **Internal** - Measurement begins immediately.
   - **Manual** - Measurement begins when the VNA Trigger button is pressed.
   - **External** - Measurement begins when Meas Trig In signal is received from an external device. This must be configured independently.

   - The Aux Trig OUT signal can be configured to be sent either just BEFORE the measurement is made or AFTER the measurement is complete. When communicating ONLY with an external source, the Aux Trig OUT signal should be sent AFTER the measurement is complete to indicate that the external source can setup for the next measurement.

**Dialog Settings**

The Aux Trig 1 and Aux Trig 2 tabs are identical. Two pair of connectors are available to allow two external devices to be controlled simultaneously.

**Enable** Check to use the Aux1 or Aux2 connectors to output signals to an external device.

**Channel:** This setting is controlled by a VNA Preference setting.

   - **Global** - ALL Aux Trig settings apply to ALL channels. The Per Point setting (see below) is made on the Trigger Setup tab which also applies to ALL channels.
   - **Channel** - ALL Aux Trig settings apply to the specified channel. Each channel can be configured independently.

**AUX TRIG OUT (To Device)**

The following settings control the properties of the signals sent out the rear panel AUX TRIG OUT (1&2) connectors:

**Polarity**

   - **Positive Pulse**  Outgoing pulse is positive.
   - **Negative Pulse**  Outgoing pulse is negative.

**Position**
**Before Acquisition**  Pulse is sent immediately before data acquisition begins.

**After Acquisition**  Pulse is sent immediately after data acquisition is complete.

**Per Point**  Check to cause a trigger output to be sent for each data point. Clear to send a trigger output for each sweep.

When the Aux Trig - "Global" VNA Preference is selected, then the Point setting is made on the Trigger Setup tab. It then applies to ALL channels. When more than one channel is present, the channel setting that was made last is used.

**Pulse Duration**  Specifies the duration of the positive or negative output trigger pulse.

**Backplane**: (M980xA, M937xA, P937xA) Select PXI backplane trigger No.

**Rear SMB**: (USB VNAs except P937xA) Select the trigger port number on rear panel. None: Neither port 1 nor 2 is selected.

**Enable Wait-for-Device Handshake**

When checked, the VNA waits indefinitely for the input line at the rear panel AUX TRIG IN (1&2) connectors to change to the specified level before acquiring data. This signal indicates that the external device is ready for VNA data acquisition. If the signal arrives before the VNA is ready to acquire data, it is latched (remembered).

When NOT checked, the VNA does not wait, but outputs trigger signals when the VNA is ready. This signal does NOT trigger the VNA. The trigger signal is generated from Trigger Sources: Internal, Manual, or External.

**IN (READY)**

**Positive Edge**  VNA responds to the leading edge of a pulse on the Aux1 or Aux2 In connector.

**Negative Edge**  VNA responds to the trailing edge of a pulse on the Aux1 or Aux2 In connector.

**Delay**  Time that the VNA waits after receiving the Handshake input before data acquisition begins.

**See Also**

- See how to use these connectors to synchronize with External Sources.
- Pulse Triggering
Note: Guided and Unguided Calibration CAN be performed in External Trigger mode. With this optional behavior, while Trigger Source is set to External, trigger signals must be sent for Calibration sweeps. This behavior does not apply to FCA calibrations.

You can set a Preference to calibrate using Internal trigger signals while Trigger Source is set to External.

The following dialog box appears on the screen while waiting for an External trigger signal.

Click Abort to cancel the wait for a trigger signal.
Reference

Note: This feature applies ONLY to instruments with serial prefix 6021 and above with A.14.00.xx firmware and above.

The frequency reference can be set to use the internal reference in the VNA or use an external reference connected to the 10 MHz REF IN connector on the rear panel.

The 10 MHz REF IN on the rear panel accepts an external frequency reference of 10 MHz, 20 MHz, or 100 MHz. The 10 MHz REF OUT connector on the rear panel is used to connect the frequency reference to other test equipment.

Accessing Reference Settings

Using Hardkey/SoftTab/Softkey

1. Press Setup > Internal Hardware > Reference...

Using a mouse

1. Click Instrument.
2. Select Setup.
3. Select Internal Hardware.
4. Select Reference.
Auto-select Reference (10 MHz Only) - When selected (default), the frequency reference selects between the internal 10 MHz reference or external 10 MHz reference automatically. The external reference will be selected if a signal is detected at the 10 MHz REF IN connector on the rear panel.

Reference In

- **Internal** - Selects the 10 MHz internal frequency reference.
- **External 10 MHz** - Selects an external 10 MHz frequency reference connected to the 10 MHz REF IN connector on the rear panel.
- **External 100 MHz** - Selects an external 100 MHz frequency reference connected to the 10 MHz REF IN connector on the rear panel.
- **External 20 MHz** - Selects an external 20 MHz frequency reference connected to the 10 MHz REF IN connector on the rear panel.

Reference Out

- **10 MHz** - Selects 10 MHz frequency reference.
- **100 MHz** - Selects 100 MHz frequency reference.
About the trigger model

Read Text description of triggering behaviors.

This model does not include Sweep trigger mode.
Data Format

A data format is the way the analyzer presents measurement data graphically. Pick a data format appropriate to the information you want to learn about the test device.

- How to set Format
- Rectangular (Cartesian) Display Formats
- Polar
- Smith Chart
- Temperature

See other 'Setup Measurements' topics

How to set the Display Format

Using **Hardkey/SoftTab/Softkey**

1. Press **Format > Format 1 or Format 2.**

Using a mouse

1. Right-click on the trace status area above the grid box.
2. Click **Format.**
3. Select the desired format.
Format dialog box help

Click a link to learn about that format:

<table>
<thead>
<tr>
<th>Log Mag</th>
<th>Polar</th>
<th>Complex</th>
</tr>
</thead>
<tbody>
<tr>
<td>Phase / Unwrapped Phase</td>
<td>Linear Mag</td>
<td>Temperature</td>
</tr>
<tr>
<td>Group Delay</td>
<td>SWR</td>
<td>Kelvin</td>
</tr>
<tr>
<td>Smith / Inverse Smith Chart</td>
<td>Real</td>
<td>°F</td>
</tr>
<tr>
<td>Positive Phase</td>
<td>Imaginary</td>
<td>°C</td>
</tr>
</tbody>
</table>

Format Unit

Only the following Formats allow a Unit selections:

**Log Mag** - Choose from:

- dB (Decibel)
- dBm (Power)
- dBmV (dB milli Volts) - used for unratioed receiver measurements.
- dBuV (dB micro Volts) - used for unratioed receiver measurements.
- dBmA (dB milli Amps) - used for unratioed receiver measurements.

**Lin Mag** - Choose from:

- U (no units), W (Watts), V, (volts), A (amps)

Rectangular Display Formats

Seven of the nine available data formats use a rectangular display to present measurement data. This display is also known as Cartesian, X/Y, or rectilinear. The rectangular display is especially useful for clearly displaying frequency response information of your test device.

- Stimulus data (frequency, power, or time) appears on the X-axis, scaled linearly
- Measured data appears on the Y-Axis.

**Log Mag (Logarithmic Magnitude) Format**

- Displays Magnitude (no phase)
- Y-axis: dB
- Typical measurements:
  - Return Loss
  - Insertion Loss or Gain

**Phase Format**

Measures the phase of a signal relative to the calibration reference plane with a range of +/- 180 degrees.

- Displays Phase (no magnitude)
- Y-axis: Phase (degrees)
- The trace 'wraps' every 180 degrees for easier scaling.
- Typical Measurements:
  - Deviation from Linear Phase

**Unwrapped Phase**

- Same as Phase, but without 180 degree wrapping.

**Note:** Phase is unwrapped by comparing the phase from one data point to the next. If the phase difference between two points is greater than 180 degrees, or if the phase of the first data point is greater than 180 degrees from DC, than the phase measurement is probably NOT accurate.

**Positive Phase**

Displays the phase wrapped between 0 to +360 degrees.

**Group Delay Format**

- Displays signal transmission (propagation) time through a device
- Y-axis: Time (seconds)
- Typical Measurements:
  - Group Delay
See Also:

- Group Delay (Measurement)
- Comparing the analyzer Delay Functions.
- Phase Measurement Accuracy

**Linear Magnitude Format**

- Displays positive values only

- Y-axis: Unitless (U) for ratioed measurements
  Watts (W) for unratioed measurements.

- Typical Measurements:
  - reflection and transmission coefficients (magnitude)
  - time domain transfer

**SWR Format**

- Displays reflection measurement data calculated from the formula \((1+\rho)/(1-\rho)\) where \(\rho\) is reflection coefficient.

- Valid only for reflection measurements.

- Y axis: Unitless

- Typical Measurements:
  - SWR

**Real Format**

- Displays only the real (resistive) portion of the measured complex data.

- Can show both positive and negative values.

- Y axis: Unitless

- Typical Measurements:
  - time domain
  - auxiliary input voltage signal for service purposes
**Imaginary Format**

- Displays only the imaginary (reactive) portion of the measured data.
- Y-axis: Unitless
- Typical Measurements:
  - impedance for designing matching network

**Polar Format**

Polar format is used to view the magnitude and phase of the reflection coefficient ($\Gamma$) from your $S_{11}$ or $S_{22}$ measurement.

You can use Markers to display the following:

- Linear magnitude (in units) or log magnitude (in dB)
- Phase (in degrees)

- The dashed circles represent reflection coefficient. The outermost circle represents a reflection coefficient ($\Gamma$) of 1, or total reflected signal. The center of the circle represents a reflection coefficient ($\Gamma$) of 0, or no reflected signal.
- The radial lines show the phase angle of reflected signal. The right-most position corresponds to zero phase angle, (that is, the reflected signal is at the same phase as the incident signal). Phase differences of $90^\circ$, $\pm 180^\circ$, and $-90^\circ$ correspond to the top, left-most, and bottom positions on the polar display, respectively.
Smith Chart Format

The Smith chart is a tool that maps the complex reflection coefficient ($\Gamma$) to the test device's impedance.

In a Smith chart, the rectilinear impedance plane is reshaped to form a circular grid, from which the series resistance and reactance can be read ($R + jX$).

You can use Markers to display the following:

- Resistance (in units of ohms)
- Reactance as an equivalent capacitance (in units of farads) or inductance (in units of henrys)

Inverse Smith Chart (also known as Admittance)

Same as standard Smith Chart, except:

- The plot graticule is reversed right-to-left.
- Admittance (in units of siemens) instead of resistance.
Interpreting the Smith Chart

- Every point on the Smith Chart represents a complex impedance made up of a real resistance (r) and an imaginary reactance (r+jX).

- The horizontal axis (the solid line) is the real portion of the impedance - the resistance. The center of the horizontal axis always represents the system impedance. To the far right, the value is infinite ohms (open). To the far left, the value is zero ohms (short).

- The dashed circles that intersect the horizontal axis represent constant resistance.

- The dashed arcs that are tangent to the horizontal axis represent constant reactance.

- The upper half of the Smith chart is the area where the reactive component is positive and therefore inductive.

- The lower half is the area where the reactive component is negative and therefore capacitive.

Complex

- Displays the real (resistive) portion of the measured complex data on the X axis and the imaginary (reactive) portion of the measured complex data on the Y axis.

X axis annotation
There is X-axis annotation for 2-D plot, and it takes window area for all traces in the window. The X-axis annotation area is reserved when there is at least one trace that the format is complex.

The annotation area can be turned off with the SCPI command :DISPlay:WINDow:ANNotation:X:STATe.

When the rectangular trace is selected, the X axis annotation area gets blank, while the complex trace still showing.
When there is no trace with complex format, the X axis annotation area is collapsed.

When :DISPlay:WINDow:ANNotation:X:STATe is set to off, the X axis annotation area is also collapsed even if there are some traces with complex format.

**Kelvin, °F, and °C**

Used to display temperature, primarily with the Noise Figure application. [Learn more.](#)
The Scale, Reference Level and Reference Position settings (along with Format) determine how the data trace appears on the VNA screen.

- Scale, Reference Level and Position
- Scale Coupling
- Magnify Mode and Zoom Preference
- Electrical Delay (Separate topic)
- Magnitude Offset & Magnitude Slope
- Y-Axis Graph (Lin/Log Scale), Top, Bottom, Ref X/Y Level, Ref X/Y Position
- Phase Offset (Separate topic)

See other ‘Setup Measurements’ topics

Scale, Reference Level and Position

The Scale, Reference Level and Reference Position settings (along with format) determine how the data trace appears on the VNA screen.

How to set Scale, Reference Level, and Position

Using Hardkey/SoftTab/Softkey

1. Press Scale > Main > Scale / Reference Level / Reference Position.
2. Input the desired value.

Using a mouse

1. Right-click on Y-axis annotation or the trace status label above the grid box.
2. Select Scale....

Scale dialog box help
Note: The scale settings are set to couple with other traces in each window. The following settings assume that Scale Coupling is set to OFF. [Learn more about Scale Coupling.]

**Scale**

**Per Division** Sets the value of the vertical divisions of a rectangular display format. In Polar and Smith Chart formats, scale sets the value of the outer circumference. Range: 0.001dB/div to 500 dB/div.

**Tip:** Click on the Y-axis labels, then use a mouse scroll wheel to change scale in preset increments. Or Right-click on **Y-axis** annotation to change Scale.

**Autoscale** - Automatically sets value of the vertical divisions and reference value to fit the ACTIVE data trace within the grid area of the screen. The stimulus values and reference position are not affected.

The analyzer determines the smallest possible scale factor that will allow all the displayed data to fit onto 80 percent of the vertical grid.

The reference value is chosen to center the trace on the screen.

**Tip:** Double click on the Y-axis labels to autoscale the active trace.

**Autoscale All**  Automatically scales ALL data traces in the ACTIVE WINDOW to fit vertically within the grid area of the screen.

**Reference**

**Level** In rectangular formats, sets the value of the reference line, denoted by 0.00 dB on the
screen. Range: -500 dB to 500 dB.

In Polar and Smith chart formats, reference level is not applicable.

**Tip:** Click on the Y-axis labels, then drag up or down to change the reference level in preset increments.

**Position** In rectangular formats, sets the position of the reference line. Zero is the bottom line of the screen and ten is the top line. Default position is five (middle).

In Polar and Smith chart formats, reference position is not applicable.

**Tip:** Click on the triangle, then drag up or down to change the reference position in preset increments.

---

**Scale Coupling**

With Scale Coupling enabled, traces that have the same format will have the same Scale, Reference Level, and Reference Position. You can choose to couple the scale of traces that are in the same window, couple the scale of all traces in all windows, or to have NO coupling.

**How to set Scale Coupling**

**Using Hardkey/SofTab/Softkey**

1. Press **Scale > Main > Scale Coupling...**

**Using a mouse**

1. Right-click on **Y-axis** annotation.
2. Select **Scale Coupling...**

---

**Scale Coupling** dialog box help
Allows traces that share the same format to have the same Scale, Reference Level and Reference Position.

**Coupling Method**

- **Off** - No coupling. Traces are scaled individually. Default setting.
- **Window** - All traces with the same format in each selected window share the same scale settings.
- **All** - All traces in ALL selected windows with the same format share the same scale settings.

- When **Window** or **All** coupling is enabled, the scale settings for the active trace are assumed by other coupled traces with the same format.
- When there are traces with a different format present, all traces with that format assume the trace settings of the lowest-numbered trace of that format.
- Once enabled, scale settings for all coupled traces with the same format can be changed with any coupled trace being active.

**Selected Windows**

Available when either the **Window** or **All** method is selected. Selected windows will participate in scale coupling. All windows are selected by default. Clear a checkbox to 'Opt-out' of scale coupling for that window.
About Autoscale and Scale Coupling

**Autoscale** (not Autoscale All) affects the active trace in the active window. All traces that are coupled to this trace assume the new scale settings of the active trace. This could cause some traces to NOT show on the screen.

**Autoscale All** with Coupling Method...

- **Off** - All traces in the active window are autoscaled independently.
- **Window** - All traces in each selected window are autoscaled to fit within a common set of scaling factors.
- **All** - All traces in all selected windows are autoscaled to fit within a common set of scaling factors.

Y-Axis Graph (Lin/Log Scale), Top, Bottom, Ref X/Y Level, Ref X/Y Position

**How to set Y-Axis Spacing**

Using **Hardkey/SoftTab/Softkey**

1. Press **Scale > Main > Y-Axis Spacing / Top / Bottom / Ref Y Level / Ref Y Position / Ref X Level / Ref X Position**.

**Y Axis Spacing** - Selects either a linear or log scale Y-axis format.

**Top** - Sets the maximum scale value for the Log Y-axis.

**Bottom** - Sets the minimum scale value for the Log Y-axis.

**Ref Y Level** - Sets the Y axis Reference Level of the specified trace in the specified window.

**Ref Y Position** - Sets the Y axis Reference Position of the specified trace in the specified window.

**Ref X Level** - Sets the X axis Reference Level of the specified trace in the specified window.

**Ref X Position** - Sets the X axis Reference Position of the specified trace in the specified window.
**Graph Area Graticules**

In the graph area, multiple traces can be drawn overlaid. Different graticule is drawn based on the active trace.

The following is an example of a case that these 3 traces are shown:

Trace 1 = Log (10k to 1M)

Trace 2 = Log (5k to 500k)

Trace 3 = Linear

When trace 1 is active.
When Trace 2 is active (graticule is still log, but different from Trace 1)

When Trace 3 is active.

**Magnify Mode and Zoom Preference**

The magnify feature allows to magnify all traces in the active window. It allows to zoom into a portion of the display to see the response in detail.
How to magnify the trace

Using Hardkey/SoftTab/Softkey
None

Using a mouse

1. Left-click and select the area you want to magnify
2. Select Magnify from the pop-up menu.

Other methods to set the magnify mode includes:

- When the Zoom Preference is set to Magnify, a 2-finger spread gesture will turn ON the Magnify mode
- Click on the Magnify icon at the top of the screen
- Enable the zoom box select mode and drag the zoom box to select an area, and then choose the Magnify option in the popup menu.

When the Magnify Mode is turned on:
2-finger pinch on the display changes the x and y magnification. If magnification is pinched down to 1:1 scaling, the magnify mode will be turned off.

1-finger drag across display changes the reference of the magnified x and y.

Zoom Preference Dialog Box Help
Zoom Preference allows you to decide the default operation of the 2-finger pinch gesture, from these 4 choices:

2-finger pinch automatically turns on magnify mode so that x and y-axis can be magnified/ This is the default setting.

2-finger pinch changes y-axis scale.

2-finger pinch changes y-axis scale and x-axis stimulus.

2-finger pinch does nothing.
Magnitude Offset allows you to offset the magnitude (not phase) data by a fixed and / or sloped value in dB. If the display format is Linear Magnitude or Real (unitless), the conversion from dB is performed and the correct amount of offset is implemented.

How to set Magnitude Offset

Using Hardkey/SoftTab/Softkey

1. Press Scale > Constants > Mag Offset / Mag Slope.

Magnitude Offset dialog box help

Magnitude Offset allows you to offset the magnitude (not phase) data by a fixed and / or sloped value in dB. If the display format is Linear Magnitude or Real (unitless), the conversion from dB is performed and the correct amount of offset is implemented.

The Magnitude offset setting affects only the active trace.

**Mag Offset** Offsets the entire data trace by the specified value.

**Mag Slope** Offsets the data trace by a value that changes with frequency. The offset slope begins at 0 Hz.

For your convenience, the offset value at the start frequency is calculated and displayed.

See where this operation is performed in the data processing chain.
PNA-X RF Path Configurator

Allows you to configure hardware components that are available with selected PNA-X options.

N522xB and N523x models do NOT have the RF Path Configurator.

How to access Path Configurator

Using Hardkey/SoftTab/Softkey

1. Press Setup > Internal Hardware > RF Path Config....

Using Menus:

1. Click Instrument.
2. Select Setup.
3. Select Internal Hardware.
4. Select RF Path Config.

The following image shows configuration with PNA-X Opt 423 (4-port, internal 2nd source, combiner, and mechanical switches). Your PNA-X may not include these options.

See Also

IF Path Configuration

PNA-X specs for block diagrams

Internal Second Source limitations

VNA Configurations and Options
**Path Configuration** dialog box help

See Noise Figure tab of the Path Configuration.

**Note:** With selected PNA-X options, pulse modulation is available ONLY on OUT1 of Src 1 and Src 2. See block diagram.

Different paths can be configured for each channel.

**Configuration**

Select, store, and delete factory configurations or user-defined configurations. Configurations are stored on the VNA hard drive.

Any configuration can be saved, and later recalled, from this dialog. Click **Store**, type a configuration name, then click **OK**.

**Text area** Displays text describing the physical connections required to complete the configuration. The text for factory configurations can NOT be edited. Text is saved as part of the configuration.

**Cancel** Closes the dialog and returns the configuration settings to the state they were in when the dialog was opened. Cancel does NOT undo **Store** and **Delete** actions that were performed while the dialog was open.
Notes

- Click or touch anywhere within a box on the screen to cycle through the available settings.
- Some switch settings alter graphics in areas other that where the switch is thrown.

- **If you don’t hear switches clicking**, this could be why:
  - Electronic switches are **orange** on the path configuration dialog. These switches do not make noise when being thrown. Mechanical switches are **blue**.
  - The channel is not sweeping.
  - The following selections do NOT throw switches, but simply indicate how to connect jumper cables by drawing red lines on the dialog:
    - Combiner (Normal/Reversed)
    - Port 2 Source (Src2 OUT1/Src1 OUT2)

**Note:** To prevent premature wear, the VNA does not allow attenuators or other mechanical switches to switch continuously.

These mechanical devices are set for the entire channel. When more than one channel is used, and a mechanical device setting is NOT the same for all channels, only the ACTIVE channel is allowed to sweep. All other channels are NOT allowed to sweep (Blocked).

Learn how to view the settings of all mechanical devices in the VNA.

- Red lines are jumpers on the front or rear panel.

- **Src1 / Src2 Settings:**
  - **Low Bnd Filtered** (default setting) reduces harmonics below 3.2 GHz on OUT1 of both **Src1** and **Src2**.
  - **Low Bnd Hi Pwr** setting does not use the filtering which causes higher power below 3.2 GHz. See Max Leveled Power in the specifications for your PNA-X model.
  - Each source optionally has pulse modulation capability.

**Note:** Pulse modulation is available ONLY on OUT1 of Src 1 and Src 2. See block diagram. Your VNA must also have Pulse options. Learn more.
- Copy channel feature also copies path configuration settings.

- Path Configuration is saved and recalled as part of an instrument state.

**Factory Configurations**

**Note:** Recalling a stored configuration will over-write MANY RF and IF path configuration settings. Make your measurement settings AFTER recalling a stored configuration, NOT before.

**Port 1 2-tone** Routes Source 2 through the internal combiner to create a two-tone signal out port 1. The standard jumper configuration is used. This is the configuration that is used to make IMD measurements.

**Src 2 Out Port 2** (Option 423 ONLY) Routes Source 2 (OUT1) to port 2 using an external cable attached to the rear-panel J8 to J1. This allows source power at port 1 AND port 2 simultaneously. Source power is NOT available at port 3. Learn more about Internal Second Source capability.

**2 port Dual Source** (Option 224 ONLY) Routes Source 2 (OUT1) to port 2 using an external cable attached to the rear-panel J8 to J1. This allows source power at port 1 AND port 2 simultaneously. This also allows pulsed measurements to be performed on both ports 1 and 2.

**Hot S-parameters** The rear panel jumpers must be manually reconfigured to allow the source 2 signal to be routed through the thru path of the internal combiner. Source 2 is used to drive the AUT into compression, so the highest possible output power is required. Source 1, routed through the coupled path of the combiner, is used for S-parameter measurements, so a small signal is sufficient. These two signals are combined but the frequencies are usually offset.

- Configuration for High-power measurements
Source Phase Control (Opt S9x088A/B)

Option S9x088A/B allows you to control the phase of a VNA source or an external source. Two sources are required.

- Overview
- Features and Limitations
- Phase Control Use-Cases
- How to make Phase Settings
- Calibration and Phase Control
- Active Load Pull Examples
- Phase Control with N Sources

See other 'Setup Measurements' topics

Overview

The Source Phase Control feature provides a specific phase difference between two sources. The phase difference can be fixed (for example, at 90 degrees), or swept between two arbitrary phase values (for example, from 0 to 360 degrees).

This feature is allowed on ALL PNA-X models, any N522x, E5080B, M980xA and P50xxA model with either two internal sources or an external source and configurable test set.

Any combination of VNA internal or external sources may be used. One source is selected as the controlled source and the other source is the reference source. You select the two sources by selecting the ports at which the sources are available. The choice of ports is limited for you on the Phase Control dialog. Learn about these limitations.

In addition to selecting source ports, you also select the receivers to be used to measure the phase for the sources. This can be test port receivers or the reference receivers for the specified source ports. The receivers measure the relative phase of the sources, then adjust the phase of the controlled source, then remeasure until the phase difference is within the tolerance that you specify.

Phase can also be set without using any receivers. This is called 'Open Loop' mode. In this mode, the phase of the controlled source is set once, and iterations are not done, resulting in phase that is less
accurate and stable compared to using receivers to measure and set phase. Use Open Loop mode when you need to use the receivers to measure other parameters.

The phase of the controlled source can be swept relative to the reference source. The phase difference between the controlled and reference source is incremented and iterated on consecutive data points. Before starting the Phase Control dialog, select Sweep Type = Phase Sweep. Learn how.

When the phase of a source is controlled, the power of that source is also controlled using Receiver Leveling. Instead of the normal receiver-leveling mode where only one receiver is used, when phase control is active the ratio of two receivers is used to level the power of the controlled source. This is useful for making active load-pull measurements as described below. In Open Loop mode, neither the phase nor the power of the source is controlled.

Features and Limitations

- Phase Control is allowed ONLY in a standard S-parameter channel.
- Phase Control can be used with Wideband pulse measurements - NOT in narrow-band pulse mode.
- Point Averaging is NOT allowed.
- External sources are supported. Learn how to Configure an External Device. Phase can be controlled on Keysight MXG, PSG, ESG and EXG sources. The external source must be routed through the rear panel so that a reference receiver can measure its phase. Use the Path Configuration dialog to make switch settings and enable FOM mode.
- Remote commands are available that allow the phase and power of each point to be set individually, much like in source power calibration. Use these commands if you need to create a specific pattern of amplitude/phase states, such as characterizing the load-pull of an amplifier.

Phase Control Use-Cases

Phase control and phase sweep is useful in the following applications:

Active load control

Provide a controlled, electronically-settable impedance to the output port of a DUT under fixed or swept-frequency conditions. Some examples are: measuring the gain and output power of an amplifier with a known load, and measuring the output from a directional detector with a known load.

The reference source is applied to the DUT input port, and the controlled source is applied to the DUT output port as a reverse input wave. The phase and power level of the controlled source is set relative to the forward output wave of the DUT (which is determined by the reference source), so that any arbitrary load impedance (gamma) can be set.
Optionally, the phase of the controlled source can be swept with a constant frequency, so that the phase of gamma rotates while the magnitude of gamma remains constant. The ratio of reverse input wave and forward output wave as viewed on a Smith chart or polar display would appear as a circle. This capability can be combined with external load-pull software to create traditional load-pull power contours.

**Phase-controlled sources**

Set the phase and magnitude of one source relative to a reference source, to provide differential, quadrature, or arbitrary phase-offset signals at a fixed or swept frequency. Typically, another instrument, receiver, or detector would be required to measure the response of the DUT.

**How to make Phase Control settings:**

<table>
<thead>
<tr>
<th>Using Hardkey/SoftTab/Softkey</th>
<th>Using a mouse</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. Press <strong>Sweep &gt; Main &gt; Sweep Setup...</strong></td>
<td>1. Click <strong>Stimulus</strong>.</td>
</tr>
<tr>
<td>2. In the Sweep Setup dialog select <strong>Phase Sweep</strong>.</td>
<td>2. Select <strong>Sweep</strong>.</td>
</tr>
<tr>
<td></td>
<td>3. Select <strong>Sweep Setup...</strong>.</td>
</tr>
<tr>
<td></td>
<td>4. In the Sweep Setup dialog select <strong>Phase Sweep</strong>.</td>
</tr>
</tbody>
</table>

**To perform a Phase Sweep:**

| 1. Press **Sweep > Main > Sweep Type**. | 1. Click **Stimulus**. |
| 2. Select **Phase Sweep**. | 2. Select **Sweep**. |

**To select (view) a Phase format: (Learn more)**

| 1. Press **Format > Format 1 > Phase**. | 1. Click **Response**. |
| | 2. Select **Format**. |
| | 3. Select **Phase, Unwrapped Phase**, or **Smith**. |

**To access the Phase Control dialog:**

| 1. Press **Sweep > Source Control > Phase Control**. | 1. Click **Stimulus**. |
| | 2. Select **Sweep**. |
3. Select **Source Control**.
4. Select **Phase Control**.

**Phase Control** dialog box help

**Sweep Type**  See **Sweep Type** for information.

**Port N**  Select a port to set its phase control configuration. This is the 'controlled' port.

**Phase**  Specify any Fixed Phase setting.

**Start / Stop Phase**  Available when Sweep Type is set to Phase Sweep. **Learn how**. Enter the Start and Stop phase values in degrees.

**Phase Control**  Click in the port cell to be controlled, then choose from the following:
- **Off** - Phase is NOT set or controlled.

- **Open Loop** - Phase is set, but receivers are NOT used to measure and iterate the phase or power of the source. Therefore, the setting of phase is not as accurate or stable. Open Loop mode can be used with phase sweep (for example, from 0 to 360 degrees). However, each sweep may not start at an absolute phase of 0 degrees. Settings made for phase control do not apply to an open loop sweep.

  **Note:** Open loop mode works in AUTO mode using the [Power and Attenuators dialog](#). Therefore, the source does not have to be set to ON.

- **<rec/rec>, reference port (Controlled)** - Phase and power is measured and iterated to within the specified tolerance. The receivers, reference port, and iteration properties are specified below.

- **Reference** is displayed to indicate the specified reference port. You can also perform receiver leveling on the reference source. [Learn how](#).

**Reference Port**  Select a source port to be used as a phase reference for the controlled port.

The two internal VNA sources are available ONLY at specific ports. These choices are limited for you on the Phase Control dialog. For example on a 4-port PNA-X, the possible port pairings are: 1/3, 1/4, 2/3, or 2/4. Port 1 can NOT be paired with Port 2, and Port 3 can NOT be paired with Port 4. [Learn more about these limitations](#).

**Ext Source Port**  Selects the source port that the external source is routed through. Displayed when an external source is selected as the active port.

**Control Parameter**  Select the receivers to be used to measure the phase and power of the sources.

The swept phase or phase offset will be the difference between these two receivers. Use either standard notation (R1, A) or logical receiver notation (a1,b1). [Learn more](#).

Select the receivers based on your application. You are responsible to make sure that your DUT configuration routes the signals of interest to the correct receivers. Otherwise, the phase will not be properly controlled. For example, if you select a configuration where Port 4 is the controlled source (measured by a4) and Port 1 is the reference source (measured by b4), both Port 4 and Port 1 must be connected and measured by the Port 4 (a4 and b4) receivers. This would typically be at your DUT output. See the [Active Load Pull Example](#) below.

**Phase Leveling Tolerance**  When consecutive phase measurements of the same data point are within this value of each other, then the phase measurement is considered settled.

**Leveling Max Iterations**  Sets the maximum number of background phase measurements to perform in order to achieve settling. If the phase is not sufficiently settled after these measurements, then the closest value is used.
**Power Leveling Tolerance** The source is considered leveled when each stimulus data point has achieved the power level +/- (plus or minus) this tolerance value.

**Leveling IFBW** Available only for VNA receivers. By default, the IFBW for the leveling sweeps is set to 100 kHz. [Learn more about IFBW.](#)

**Power Ratio** Power ratio value. This is the power offset between the two receivers in the control parameter. Displayed for all sweep types except **Power Sweep**.

**Start/Stop Power** Sets the start and stop power ratio values during a power sweep. Displayed when the **Sweep Type** is set to **Power Sweep**. This is the power offset between the two receivers in the control parameter.

---

**Phase Control Setup** dialog box help

![Phase Control Setup dialog box](image)

**Select a port to set its phase control configuration** This is the 'controlled' port.

**Referenced to** Select a source port to be used as a phase reference for the controlled port.

The two internal VNA sources are available ONLY at specific ports. These choices are limited for you on the Phase Control dialog. For example on a 4-port PNA-X, the possible port pairings are: 1/3, 1/4, 2/3, or 2/4. Port 1 can NOT be paired with Port 2, and Port 3 can NOT be paired with Port 4. [Learn more about these limitations.](#)

**Control Parameter** Select the receivers to be used to measure the phase and power of the sources.

- The LEFT receiver (a1 in the above image) measures the controlled source.
- The RIGHT receiver (a3 in the above image) measures the reference source.
The swept phase or phase offset will be the difference between these two receivers. Use either standard notation (R1, A) or logical receiver notation (a1,b1). Learn more.

Select the receivers based on your application. You are responsible to make sure that your DUT configuration routes the signals of interest to the correct receivers. Otherwise, the phase will not be properly controlled. For example, if you select a configuration where Port 4 is the controlled source (measured by a4) and Port 1 is the reference source (measured by b4), both Port 4 and Port 1 must be connected and measured by the Port 4 (a4 and b4) receivers. This would typically be at your DUT output. See the Active Load Pull Example below.

**Background Sweep Properties**

Background sweeps are phase and power measurements that are made, but the results are not displayed. For each data point, when subsequent measurements are within the specified tolerance, that point is considered settled. If consecutive phase or power measurements of the same data point are NOT within the specified tolerance before the Max Iterations is reached, then one of the following messages are displayed:

- Phase leveling warning: phase not settled.
- Phase leveling warning: power not settled.
- Phase leveling warning: phase and power not settled.

**Apply Settings to All Ports** When checked, the specified settings are used for all background sweeps for all phase-controlled ports. When cleared, the following three settings are specified independently for each port pair.

**Use Leveling IFBW** Available only for VNA receivers. By default, the IFBW for the leveling sweeps is set to 100 kHz. Learn more about IFBW.

**Tolerance** When consecutive phase measurements of the same data point are within this value of each other, then the phase measurement is considered settled.

**Max Iterations** Sets the maximum number of background phase measurements to perform in order to achieve settling. If the phase is not sufficiently settled after these measurements, then the closest value is used.

**Calibration and Phase Control**

Calibrate only those ports that are used for a phase control measurement. For example, if using ports 1 and 3 for phase control, then do NOT calibrate all four ports. If other ports are calibrated, then even ports 1 and 3 may not yield acceptable results.
Important

During the Guided Calibration, at the Select Ports dialog, check the Calibrate source and receiver power checkbox. Otherwise, the calibration may not be accurate.

After performing calibration, the phase is aligned and the power is accurate at the calibration plane.

Active Load Control Example (4-port PNA-X)

See setup using a 2-port 2-source PNA-X.

1. Select the Phase Control parameters in the above Phase Control and Phase Control Setup dialogs.

2. Setup a measurement with the same receivers that are selected on the Phase Control Setup dialog. In this example, on the 'Receivers' measurement tab, select \textit{a4/ b4} as in the following image:
3. Select **Format**, then either **Phase** or **Smith** Chart.

![Smith Chart](image)

4. If you continually see Phase leveling warning: **power** not settled, then on the **Power and Attenuators dialog**, clear Port Powers Coupled (independent port power), then add attenuation to the controlled port. This happens because of additional power being measured from both sources.

![Power and Attenuators dialog](image)

**Active Load Control with 2-Port 2-Source PNA-X Models**

1. Connect a rear-panel jumpers cable from J8 to J1.

2. On the Phase Control Setup dialog, select **Port 2** as the controlled source and **Port1 Src 2** as the reference source.

3. On the **Path Configuration dialog**, on the Configuration box, select **2-port dual source**.

4. Select the Control Parameter (receivers) **a2 / b2**.
Phase-Coherent Measurements

Coherent phase means that the measurement does NOT have random phase. Coherent-phase measurements require the comparison of phase between two sources that are sweeping simultaneously. It also requires that two receivers are measuring the two sources simultaneously.

This capability is available in the PNA-X using several applications:

- iTMSA (Opt S93460A/B) provides phase-coherent Balanced measurements.
- Phase Control (Opt S93088A/B) provides phase-coherent CW or Phase Sweep measurements.
- **R/R measurements** can provide simple phase-coherent measurements.

**How to make phase-coherent R/R (R over R) measurements**

To make a phase-coherent R/R measurements, both sources must be ON simultaneously, and the receiver measurements must be made on the same sweep. On a 4-port PNA-X, the two sources are NOT available at all VNA ports simultaneously. It is important to **learn these restrictions**. Also, both receiver measurements must be made on the same sweep.

1. Create a ratioed receiver measurement using two reference receivers. **Learn how**. For example, you might create an R1/R3 measurement, specifying the source port as either 1 or 3.

2. The source port that is selected above is turned on automatically. The other source port (port 3 in this case) must be turned ON manually using the **Power and Attenuators dialog**.

3. Select a phase format. **Learn how**.
Customize the Analyzer Screen

You can customize your analyzer screen by showing or hiding the following display elements. All of these selections are made from the **Response > Display** menu.

- Windows (Separate topic)
- Display Labels
  - Trace Status
  - Y-axis Labels
  - X-axis Labels
  - Trace Annotation for All Traces
- Marker Display (Separate topic)
- Tables
- Toolbars
  - Softkey
  - Hardkey
  - Port Extension
  - Transform
  - Marker
  - Cal Set Viewer
  - Title Bars
  - Active Entry
  - Status bars
  - System Date and Time
- Display Colors (Separate topic)
- Grid: SOLID | Dotted
Labels

You can display different labels for traces status, Y-axis and X-axis labels.

**How to display labels**

**Using Hardkey /SoftTab /Softkey**

1. Press **Display > Display Setup > Customize Display...**

2. Select **Labels** tab.

OR

1. Press **Marker > Marker Setup > Marker Display...**

2. Select **Labels** tab.

**Using a mouse**

1. Right click on any window area.

2. Click **Customize Display...**

3. Select **Labels** tab.
Show Labels

Trace Status

Trace status is annotated at the top of each window.

The highlighted trace number indicates **Active Trace**.

Click the title to select a trace.

Trace Status shows the following:

- Trace number (Tr x). This is the trace number of the channel; NOT the window trace number which is used in many programming commands.
- Measurement parameter. This can be replaced with a custom Trace Title.
- Format
- Scaling factor
- Reference level

How to show/hide Trace Status.

**Y-axis Labels**

"**Y-axis Labels**" - allows user to show or hide the y-axis labels.

How to show/hide Y-axis Labels.

**X-axis Labels**

"**X-axis Freq Resolution**" - allows user to choose the resolution of the frequency display. The pull down selects: 6-digit, GHz, MHz, kHz, Hz. It shows 1Hz resolution, but only shows significant digits.
How to show/hide X-axis Labels.

Trace Annotation for All Traces
Select to display trace annotation for all traces.

Grid & Tables

How to set VNA Grid and display tables.
Each window can display only one table at a time.

Using Hardkey / SoftTab / Softkey

1. Press Display > Display Setup > Customize Display...
2. Select Grid tab.

OR

1. Press Marker > Marker Setup > Marker Display...
2. Select Grid tab.

Using a mouse

1. Right click on any window area.
2. Click Customize Display...
3. Select Grid tab.
Grid Lines: Solid | Dotted - Set whether to display ALL open window grid lines in solid or dotted lines. The selected setting is shown in CAPS. Once set, new windows are created using this setting. Grid lines return to SOLID when the VNA is Preset.

Set the color of the grid using Display Colors.

How to display grid settings

Y-axis Divisions - Set the desired rows of Y-axis, it can shows 2 to 30.

Show Table

None - Turn OFF the table.
Marker Table

You can display a table of marker settings. These settings include the:

- Marker number
- Marker reference (for delta measurements)
- Frequency
- Time and Distance (for Time Domain measurements)
- Response

Learn more about Markers

Limit Line Table

You can display, set up, and modify a table of limit test settings. These include:

- Type (MIN, MAX, or OFF)
- Beginning and ending stimulus values
- Beginning and ending response values

Learn more about Limit Lines.

Ripple Table

You can display, set up, and modify a table of maximum ripple limit over frequency range settings. These include:

- Type (ON or OFF)
- Beginning stimulus value
- Ending stimulus value
- Maximum ripple

Learn more about Ripple limits.
Segment Sweep Table

You can display, set up, and modify a table of segment sweep settings. These include:

- State (On/Off)
- Start and Stop frequencies
- Number of Points
- IF Bandwidth (if independent levels)
- Power Level (if independent levels)
- Sweep Time (if independent levels)

Learn more about Segment Sweep.

Distortion Table

You can display, set up, and modify a table of modulation distortion measurement parameters. Each row represents a measurement band. Each column represents a measurement parameter.

Learn more about the Distortion Table.

Spurious, Integrated Noise, Spot Noise Tables

You can display, set up, and modify a table of phase noise measurement parameters.

Learn more about the Phase Noise.
### Toolbars

You can display different toolbars to allow you to easily set up and modify measurements.

#### How to display Toolbars

**Using Hardkey /SoftTab /Softkey**

1. Press **Display > Display Setup > Customize Display...**
2. Select **Toolbars** tab.

**OR**

1. Press **Marker > Marker Setup > Marker Display...**
2. Select **Toolbars** tab.

#### Using a mouse

1. Right click on any window area.
2. Click **Customize Display...**
3. Select **Toolbars** tab.
Show Toolbar

Note: There is also a Cal Set toolbar available for Monitoring Error Terms

Softkey
Softkey is a combination of softkeys and SoftTabs. Softkeys are automatically turned ON when one of the 'function' hardkeys is pressed. This setting allows you to turn the softkeys OFF to show more measurement space on the screen. The softkeys will reappear when another function hardkey is pressed.

**Hardkey**
These keys also known as Front Keys, perform interface operations that are equivalent to those of keys in the INSTRUMENT keys, RESPONSE keys, STIMULUS keys and UTILITY keys on the front panel of VNA. Learn more.

**Port Extensions Toolbar**
The Port Extension toolbar allows you to set Port Extensions while viewing the measurement trace. Learn more about Port Extensions.

**Transform (Time Domain) Toolbar**

The Time Domain toolbar allows you to do the following:

- Turn **Transform** and **Gating** ON/OFF.
- Change the Start/Stop times for both Transform and Gating.
- **More...** - Launches the Time Domain Transform dialog box.
- ? - Display the help file.
- X - Closes the toolbar.

**Markers Toolbar**

The markers toolbar allows you to set up and modify markers. It shows:

- Marker number
- Stimulation value
- Marker functions:
  - Delta
  - Max/Min
  - Start/Stop
  - Center/Span
Tip: To use the Front Panel Knob to change marker position, first click the Stimulus field of the marker toolbar and then turn the knob.

Learn more about Markers

Cal Set Viewer Toolbar

Learn more about Cal Set Viewer.

All Off (NOT on softkeys)

This allows you to hide all toolbars with a single selection. NOT available on sofkeys.

Other Bars

Main Title

The Main Title shows the title of VNA window and Minimize / Maximize icons.

- Checked - Title bars for all VNA window are shown.
- Cleared - Title bars for all VNA window are hidden. This allows more room to display measurement results.

Active Entry Toolbar

When used with softkeys, this area allows numeric values to be entered for settings. From the keyboard, enter G for Giga, M for Mega or milli, K for kilo and so forth.

Status Bar

2 Bars
When enabled, the status bar is displayed along the bottom of the VNA screen. The primary status bar shows the following:

**Tip:** Right-click on many of these items in the status bar for quick access to settings.

- Active trace
- Active channel
- Trigger source
- Channel Trigger State (Hold, Single, Continuous)
- IF Bandwidth
- Error correction for the active trace to the Basic cal, Smart cal and Calibrate All Channels.
  - F: Full Port Calibration, R: Response Calibration, -: Nothing
- Reference (Internal/ External )
- Source Power Calibration
- Service (shows when the measurement result is not guaranteed such as hardware failure. The advance mode in TDR also indicates the Service.)
- RF power
- Display Update
- Error messages
- GPIB status : Local (LCL), Remote Talker Listener (RMT), or System Controller (CTL).
- System Date and Time - Can be set ON or OFF. How to show/hide the VNA clock.
- Trace Deviation

**Note:** A second level status bar appears when using External Test Set Control or Interface control.

The status bar state (ON or OFF) will not change when the VNA is Preset.

**Clock (System Date and Time)**
The VNA system date and time can be shown in the far right corner of the status bar. The format is: year-month-day hr:min and can NOT be changed.

To hide the clock, right click the mouse on the clock and then click **Hide Clock**.

Learn how to set the VNA time settings.

**Display Sheet Tabs**

**Top** - Display sheet tabs above display.

**Bottom** - Display sheet tabs below display.

---

**Tools**

**How to set Tools settings**

<td>2. Click <strong>Customize Display</strong>... .</td>
</tr>
</tbody>
</table>

OR

1. Press **Marker > Marker Setup > Marker Display**... .

2. Select **Tools** tab.

---

**Programming Commands**

**Tools** Dialog Box Help
Tools function to create a shortcut icon to display on Active Entry or Softkey Toolbar. The maximum icons can display on Active Entry is 9, while Softkey Toolbar is 12.

**New Window** - Create a new window.

**New Channel** - Create a new channel on active window.

**New Channel + Window** - Create a new trace and channel to a new window.

**New Trace** - Create a new trace on active window.
New Trace + Window - Create a new trace to a new window, but the channel is remain.

New Sheet - Create a new sheet.

New Trace + Sheet - Create a new trace to a new sheet, but the channel is remain.

New Channel + Sheet - Create a new trace and channel to a new sheet.

Home - Display VNA Home softkeys.

Favorite - Set favorite application. To Add a Favorite, press and hold any softkey for three seconds and select the desired Favorite number (Favorite 1 to 3).

Help - Shows Help file.

Show Task Bar - Shows Window bar.

Preference - Display preference dialog box.
Tile Windows

Manages Files - Use to manage the saved files in the "D:" drive folder. Learn more.

Minimize Application - Restore VNA screen. Learn more.

About Network Analyzer - Display About Network Analyzer dialog box.

Undo - Recover to previous version. Learn more.

Redo - Set to latest version. Learn more.

Screenshot - Save screen figure to "D:" drive (D:\).

Delete - Delete the active window.
Colors

How to set colors

Using Hardkey / SoftTab / Softkey

1. Press Display > Display Setup > Customize Display...
2. Select Colors tab.

Using a mouse

1. Right click on any window area.
2. Click Customize Display...
3. Select Colors tab.

Colors Dialog Box Help

Menu Color Theme - Select color theme

Display Colors... - See Display Colors

Print Colors... - See Print Preview
**Window Title**

You can create and display a title for each **window**.

- The limit is set by the number of windows that are displayed.
- The title (My Window) is annotated in the upper-left of the window as follows:

```
Tr 1  S11 LogM 10.00dB/ 0.00dB
   Window 1
```

**How to enter a Window Title**

**Using Hardkey /SoftTab /Softkey**

1. Press **Display > Window Setup > Window Title...**

**Using a mouse**

1. Move a cursor in the grid and then right click.
2. Select **Title...**

**Window Title Dialog Box Help**

1. Click **Enable**, then type the window title. Click **Keyboard** to type with a mouse.
2. To remove the window title, clear the **Enable** checkbox or delete the text from the dialog entry.

**Trace Title**

A Trace Title overwrites the Measurement Parameter in the Trace Status area, the Status Bar and hardcopy prints.

- This title has priority over Equation Editor titles.
The practical limit is about 70 characters if there is only one trace.

Spaces are accepted but not displayed; use underscores.

The title is annotated as follows:

![Trace Title Example](image)

**How to enter a Trace Title**

**Using Hardkey / SoftTab / Softkey**

1. Press Trace > Trace Setup > Trace Title...

**Using a mouse**

1. Move a cursor in the grid and then right click.
   
   2. Select Trace Title...

**Trace Title Dialog Box Help**

1. Click **Enable**, then type the window title. Click **Keyboard** to type with a mouse.

2. To remove the window title, clear the **Enable** checkbox or delete the text from the dialog entry.

**Frequency/Stimulus**

![Frequency/Stimulus Example](image)

Frequency/stimulus information is displayed at the bottom of each window on the screen. It shows:

- Channel number
- Start value
- Stop value
Minimize Application

The Network Analyzer application can be minimized to show the desktop and Windows taskbar.

1. Click **System > Main > Minimize Application**.

To restore the VNA application, double-click the VNA application on the desktop.
Copy Channels

Copy channels allows you to make a duplicate channel of the same Measurement Class and with the same stimulus conditions as an existing channel.

- Why Copy Channels
- How to Copy Channels
- List of Channel Settings

Note: Copy Channels CAN be used with PNA Applications, such as FCA, Gain Compression, or Noise Figure.

Other Setup Measurements Topics

Why Copy Channels

Copy channel settings if you need to create several channels that have slightly different settings.

For example, if you have an amplifier that you want to characterize over a frequency span with several different input power levels.

Follow these steps:

1. Create one measurement with your optimized channel settings.
2. Copy that channel to new channels.
3. Change the power level on the new channels.

The alternative to using Copy Channels is to create new default measurements on new channels. Then change every channel setting to your new requirement. This is very time consuming and thus shows the benefit of the Copy Channels feature.
How to Copy Channels

Using Hardkey/SoftTab/Softkey

1. Press **Channel > Channel Setup > Copy Channel.**

2. Click **Copy to Active Window/Copy to New Window/Copy Channel...**

![Programming Commands](image)

**Copy Channel** dialog box help

Copies an existing channel's settings to another channel. Measurement traces from the source channel are **NOT** copied.

**Copy channel** (also known as 'Source' channel): Select a channel to copy.

**to** (also known as 'Destination' channel): Scroll to select a channel to copy settings to. Compatible channel numbers that are currently being used are highlighted. They can be selected and overwritten.

The following are compatible destination channels:

- A channel that does not yet exist. The new channel is created with the channel's default measurement.

- A channel of the **same Measurement Class** as the source. The existing measurements remain on the destination channel.

- A channel of any Measurement Class that contains no measurements. Again, the destination channel is created with the channel's default measurement.

**Notes:**

- You can copy channel settings to ONLY one new or existing channel. Repeat this operation to copy to more than one channel.
The source channel is ALWAYS copied to the Active window. If you want the destination channel in a separate window, first create a compatible new measurement in a new window. Then make sure it is the Active window before you copy the channel into it.

The measurement in the destination channel becomes the active measurement.

For example:

1. **Source** channel 1: Standard S21 measurement
2. **Destination** NEW channel 2
3. **Result**: Source channel 1, S21 Measurement AND channel 2, S11 measurement. Both with same stimulus settings and in the same window. Channel 2, S11 measurement is the active measurement.

For more information see [Traces, Channels, and Windows](#)

**List of Channel Settings**

- Frequency Span
- Power
- Cal Set usage
- Source Power Cal data
- IF Bandwidth
- Number of Points
- Sweep Settings
- Average
- Trigger (some settings)
DC Source Control

When a DC Source (power supply) is configured as an external device, the new DC source can be controlled from the VNA using this dialog. Internal DC Sources are also controlled from this dialog.

- How to start the DC Source Control dialog
- The DC Source Control dialog box
- The DC Limits dialog box

See Also

Configure the DC Source as an External Device
Internal DC Sources - ADC Measurements

Other Setup Measurements Topics

How to start the DC Source Control dialog

Using Hardkey/SoftTab/Softkey

1. Press **Sweep > Source Control > DC Source**....

Using a mouse

1. Click **Stimulus**.
2. Select **Sweep**.
3. Select **Source Control**.
4. Select **DC Source**.

DC Source Control dialog box help
Note: The 9-pin PWR I/O (Power I/O) D connector on the rear-panel replaces much of the functionality of the AUX I/O connector on older VNA models. The Power I/O voltages can be set using the following methods:

- CONTrol:AUXiliary:OUTPut:VOLTage or put_OutputVoltage Method (no GUI equivalent, global scoped, and settings not saved as part of the instrument state)
- SOURce:DC:START and SOURce:DC:STOP (DC Source dialog is the GUI equivalent, channel scoped, and settings saved as part of the instrument state)
- Interface Control dialog (no remote equivalent, channel scoped, and settings saved as part of the instrument state)

To avoid unexpected behavior, choose one method only to set the Power I/O voltages.

Name  Lists the names of the configured DC Sources. In the above image:

- **AuxOut1** and **AuxOut2** are internal VNA DC sources that are available
  - Rear-panel Power I/O connector (Pins 3 and 4). Learn more.
- **MyDCSupply** is the name of an external DC Source. Learn how to setup and configure an External DC Source and DC Meter.

State  Set the state of the DC source.

- **ON**  DC Source is always ON.
- **OFF**  DC source is always OFF.
- **Per Port**  The Name selection for that DC source expands to allow an Port <n> / N/A setting for each
When the RF source for that port is ON, then the DC source for port is also ON. Select 'N/A' to turn the DC Source OFF for that port.

**Start / Stop DC**  Set the start and stop voltages of the DC source. The VNA will step the voltage of the DC source from Start to Stop in increments = (Stop - Start)/Number of data points.

**Buttons**

**Limits**  Click to start the DC Limits dialog.

**Receiver Leveling**  For future use.

---

**DC Limits dialog box help**

Select the Minimum and Maximum voltages to which the specified DC sources can be set by the VNA. When the DC source level exceeds the limit, DC source is turned off and the measurement sweep stops.
ADC Measurements

The PNA is equipped with two ADC (Analog to Digital Converter) inputs on the rear-panel Power I/O connector (Pins 7 and 8). These ADC inputs can be used as measurement receivers and display measurements on the VNA screen.

- Analog Inputs (AI1 and AI2) can be used for measuring from -10V to +10V. These inputs can be considered auxiliary receivers and used in a similar way as S-Parameter receivers.
- Analog Output Sense inputs (AOS1 and AOS2) can be used to measure the corresponding DAC outputs.
- Analog Ground input (AIG) can be used to measure the instruments analog ground (PNA-X only).

Two DAC outputs are supplied on the Power I/O connector (Pins 3 and 4). These DAC outputs are controlled from the DC Source Control dialog.

Learn how to configure an external DC Source or DC Meter.

**New Trace (ADC) dialog box help**

**Note:** Sweep speed slows dramatically when measuring more than two ADC receivers.

On the **New Trace dialog**, click the **Receivers** tab.

**Activate** - check any empty line to create a trace.

**Numerator** - select from the following:

- **AIx** - Input x:  x is Input No.
- **AOSx** - Output sense x:  x is Output No.
- **AIG** - Analog ground  (PNA-X only)

**Denominator** - NOT available (ONLY unratioed measurements)

**Source Port** - The ADC receiver is measured when the specified source port is sweeping. Select None to always measure the ADC receiver.
ADC receiver traces are labeled as shown in the following images:

- The ADC1 input is being measured, with 2 as the source port.
- The Y axis is U (unitless).
- The default trace format is Real (linear).

ADC Traces and other useful VNA functions

Although most VNA functions work with ADC traces, the following may be especially useful.

- **Equation Editor** can be used with the trace data. Although the VNA ADC is measuring voltage (-10V to +10V range in 14 bits), by using a trace formula, this voltage can represent other types of measurement parameters (such as current, temperature, or a scaled voltage). See PAE example.

- **Trace averaging** and **Trace Smoothing** can be used to remove trace noise.

- **Dwell time** can be used to allow for settling.

VNA Functions Not Supported

- Calibration for ADC receivers is NOT supported.

- Not supported in **Noise Figure application**
Integrated Pulse Measurements

The Pulse Setup dialogs shown in this topic are now integrated in the VNA firmware and are available with S9x026A/B or Opt H08.

**Note:** For information about pulsed measurements using a PNA-X, refer to Active-Device Characterization in Pulsed Operation Using the PNA-X.

Previously, setup was performed with the Narrowband or Wideband pulse programs. With the appropriate hardware/software options (Opt 021, 022, S93025A/B) these commands are still available without Opt S93026A/B or H08. Learn more about VNA Options.

External pulse generators can be used along with the VNA internal pulse generators. Learn more.

How to start the Pulse Setup dialog

Using Hardkey /SoftTab/Softkey

1. Press **Sweep > Source Control > Pulse Setup...**

Using a mouse

1. Click **Stimulus**
2. Select **Sweep**
3. Select **Sweep Control**
4. Select **Pulse Setup...**

Pulse Setup dialog box help

Note: The M937xA does not support this function.

The Basic controls allow simple pulse measurements using the default (Autoselect) settings in the Advanced section of the dialog.

Pulsed measurements are performed in a Standard channel. See Measurement Class. However, several VNA measurement settings are controlled by the Pulse setup, such as sweep type, number of points, and so forth.
**Pulse Measurement**

**Off** - Source and Receivers are NOT pulsed

**Standard Pulse** - With pulsed RF, the VNA can be configured to sweep in frequency, power sweep, and CW time.

- To make 'Point-in-Pulse' measurements, narrow the receiver pulse width and enter delay.
- To make 'Pulse-to-Pulse' measurements, disable **Autoselect Pulse Detection Method**, then select **Wideband**. select **Stimulus**, then **Sweep**, then **Sweep type = CW** in the VNA menu.

**Pulse Profile** - Pulse profile measurements provides a time domain (CW frequency) view of the pulse envelope. Profiling is performed using a measurement technique that "walks" a narrow receiver "snapshot" across the width of the pulse. This is analogous to using a camera to take many small snapshots of a wide image, then piecing them together to form a single, panoramic view.

![Pulse Profile measurement using default settings and R1 receiver.](image)

- Pulse Profiling can be performed using ratioed or unratioed measurements. You can preview the pulse on port 1 by using an R1 receiver measurement.
- Pulse Profiling is performed at a single CW frequency in either Narrowband or Wideband mode.
- To select the CW Frequency, click **Stimulus**, then **Sweep Type**.
- In **Narrowband** mode, the delay increment value, which is responsible for "walking" the receiver snapshot across the pulse, is selected by the VNA and is accessible only with a programming command.
- In **Wideband** mode, the receiver is walked across the pulse by making a sequence of closely-spaced measurements in real-time.
In SW Gating mode, software gating sensitivity is improved. When unchecked, all data outside the measurement band is zeroed. SW Gating mode is used for troubleshooting purposes.

**Pulse Timing**

**Pulse Width** - Sets the width of the source pulse. See measurement timing to learn how to control the receiver width and delay.

**Pulse Period**  The time to make one complete pulse.

**Pulse Frequency (PRF)** The reciprocal of Period (1/Period). See Internal Pulse Generators to learn more.

By default, these settings configure Pulse Gen 1 to drive Source Modulators 1 and 2. This can be changed from the Advanced Settings Pulse Generator Setup dialog.

------- Advanced Settings -------

The following settings allow maximum control of a Pulse measurement.

**Note:** When the "Auto" check boxes are cleared, it is possible to configure settings to make an invalid measurement.

**Properties**

**Autoselect pulse detection method** - check to automatically switch between Narrowband and Wideband based on the Pulse Width.

In Standard Pulse:

- **Wideband** - used when the (source) Pulse Width is WIDER than the fastest receiver acquisition time. This allows the receiver to measure all pulse ON time - no pulse OFF time. The VNA will select Wideband whenever possible.

- **Narrowband** - used when the (source) Pulse Width is NARROWER than the fastest receiver acquisition time (267 ns). This measurement requires a spectral nulling technique to measure the pulse response through the DUT.

In Pulse Profile:

- **Wideband** - used when the (source) Pulse Width is greater than 1.600 us. This allows the receiver make several sequential measurements to measure the entire pulse.

- **Narrowband** - used when the (source) Pulse Width is less than or equal to 1.600 us.

**Autoselect IF Path Gain and Loss** - For future use.
**IF Path** - Click to launch the IF Path dialog.

**Optimize Pulse Frequency** - Automatically selects the Pulse Frequency and Pulse Period.

- In Narrowband, the pulse frequency is adjusted slightly to get the best spectral-nulling filtering possible.
- In Wideband, this checkbox is ignored.

**Autoselect Profile Sweep Time** - In Pulse Profile mode, adjusts the default X-axis start time to zero and the stop time double the Pulse Width. This allows you to see one complete pulse. If unchecked, the Sweep Time will not be changed.

To adjust the X-axis manually, click OK to close the dialog. Then press Sweep > Main, then change the Start Time and Stop Time.

**Sweep Time** - Sets the time the analyzer takes to complete one sweep.

**Number of Points** - Sets the number of data points for the measurement.

**IFBW** - Select the IFBW for the measurement.

- In Narrowband, an IFBW as close as possible to the entered value will be used.
- In Wideband, this setting determines the receiver acquisition time - approximately 1/IFBW.

**Measurement Timing**

**Port n, Rcvr** - Used as RF Source Modulation Drive.

- **Width** - source pulse width.
- **Delay** - source pulse delay relative to the pulse generator clock.
- **Pulse Gen** - Pulse generator used to modulate the source. Select CW to have NO source modulation.

The receiver settings in this table change depending on whether the VNA is in Narrowband or Wideband mode.

- In Narrowband, for each IF receiver path, configure the Pulse Width, Delay, and Pulse Generator to be used to drive the receiver gate.
- In Wideband, all receiver paths are the same.
**Pulse Trigger Source**  Refer to Block Diagram  Choose from:

- **Internal** - Default setting. The pulse generator is triggered by an internal pulse clock.
- **External** - An external pulse generator is selected but not controlled by the VNA. Use this setting to make manual pulse measurements.
- **<External Pulse Gen name>** - Available when a 81110A is configured as an External Device and **Master Mode** is checked on the pulse generator properties dialog. See how to make this setting using SCPI and COM.

**Primary Clock**

The Primary Clock is controlled by the internal or external pulse generator and is the primary pulse clock. The **Internal** and **External** selections are not the same as the Trigger Source **Internal** and **External** selections found in the Pulse Trigger tab of the Trigger dialog. However, they are inter-related as follows:

<table>
<thead>
<tr>
<th>Primary Clock</th>
<th>Trigger Source (from Pulse Trigger tab of Trigger dialog)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary pulse clock controlled by selected pulse generator.</td>
<td>Trigger source for the internal pulse generator.</td>
</tr>
<tr>
<td><strong>Internal</strong></td>
<td></td>
</tr>
<tr>
<td>- Primary pulse clock is controlled by the internal pulse generator.</td>
<td>- Trigger is self-generated in the internal pulse generator.</td>
</tr>
<tr>
<td>- PRF setting is applied to the internal pulse generator.</td>
<td>- The trigger source for the internal pulse generator trigger is set to Internal and is reflected in the Trigger Source selection in the Pulse Trigger tab of the Trigger dialog.</td>
</tr>
<tr>
<td><strong>External</strong></td>
<td></td>
</tr>
<tr>
<td>- The primary pulse clock is an uncontrolled external pulse generator.</td>
<td>- Trigger comes from the PULSE I/O connector (PulseSyncIn) on the rear panel.</td>
</tr>
<tr>
<td>- PRF settings are determined by the external pulse generator, which the VNA firmware does not control. The user must set up the external system clock. Entries</td>
<td>- The trigger source for the internal pulse generator</td>
</tr>
</tbody>
</table>
Autoselect Width and Delay - When checked, for Wideband mode and Pulse Gen = Pulse Trigger, the default setting for the receiver is adjusted to approximately 75% of the source pulse width, with 20% delay. This leaves approximately 5% of the source pulse ON after acquisition is complete.

When checked for Narrowband mode and Pulse Gen <> CW, then Delay and Width matches the RF Source.

Autoselect Pulse Generators - When checked:

- Pulse1 is selected for Modulator Drive.
- Pulse2 is CW (OFF).
- For Wideband, Pulse Trigger is selected to gate the ADC.
- For Narrowband, Pulse2 is selected.

Pulse Generators... Click to launch the Pulse Generators Setup dialog.
Pulse Measurement

**Off** - Source and Receivers are NOT pulsed

**Standard Pulse** - With pulsed RF, the VNA can be configured to sweep in frequency, power sweep, and CW time.

Pulse Timing

**RF Pulse Width** - Sets the width of the RF Source pulse.

**Pulse Period** pulldown- Allows the selection of the following:

- **Pulse Period** - The time to make one complete pulse.
- **Pulse Frequency** - The reciprocal of Period (1/Period).
- **Pulse Duty Cycle** - **Pulse Width** divided by the **Pulse Period**.

Labels

- **Sweep** - Complete cycle time of measurement including background sweeps.
- **Acquire** - The ADC acquisition time required to measure the data for a single FFT.
- **Pulse/Swp** - Number of pulses which will occur during the sweep, including pulses used for background sweeps.
Pulse Details

**Generator** - Pulse generator outputs in numerical order.

**Device** - Indicates the device being controlled by the pulse generator output.

- **Pulse0** - Always set to **Receiver**. Sets the amount of time to wait before triggering the ADC to begin acquisition and is always selected for Pulse0 and cannot be changed. Pulse0 adds (ADC Delay) + (Modulator Delay). The ADC will begin measuring data 250 ns before the rising edge of Pulse0. This delay is indicated in the **Fixed ADC Delay = 250 ns** annotation.

- **Pulse1** through **Pulse4** - Pulse outputs can be set to the following:
  - **RF** - Selecting **RF** indicates that the pulse signal is used to drive the RF modulator. Only one pulse generator output can be used to drive an RF source. If you try to set more than one pulse generator output to **RF**, then the other one will be set to **User N** (where "N" is the pulse generator number).
  - **User 1, User 2, User 3, User 4** - Labels for user convenience. These labels do not connect the pulse generator to any specific hardware. These selections may be used to control a DUT, DC biases, or other signals.
  - **Pulse4 ADC Activity** - (Pulse4 only) Pulse4 can also be set to ADC. This selection outputs a signal on Pulse4 when the ADC is active. This is the same as Pulse4 Output Indicates ADC Activity on the Pulse Generators Setup dialog. If ADC is selected for Pulse4, then the pulse width and delay entries are grayed out because Pulse4 is no longer a pulse output.

**Width** - RF Source pulse width. This setting is the same as **Pulse Width** under RF Pulse.

**Delay** - If the **Offset Pulses using ADC Delay** check box is disabled, then the delays are the pulse delays relative to the trigger. If the **Offset Pulses using ADC Delay** check box is enabled, then the delays are defined for the pulses relative to each other. In this case, you can enter negative delays, and the delay from the trigger will be adjusted to correct for these values.

**Invert** - Check to cause the pulse ON time to be active low and OFF be active high.

**Enable** Check to enable individual pulse generators.

**Autoselect Receiver Timing** - Computes the width to 80% of the RF Source Width and the delay will be 10% of the RF Source Width. With this setting selected, the Width and Delay columns in the table are grayed out.

**Offset Pulses using ADC Delay Check Box**
If checked (default), adds delays to the Pulse Generator:

- Pulse0 adds (ADC Delay) + (Modulator Delay).
- Pulse Output used as the Modulator Drive adds no delay.
- All other Pulse Outputs add Modulator Delay.

**RF Modulator Delay**

- Defines the RF delay of the source modulator. This is the time lag between the pulse drive signal and the actual RF output. This may indicate the lag for either an internal or external source.
- The default is 40 ns, which is the average delay of the internal RF modulators. The internal modulator below 3.2 GHz is slower than the internal modulator above 3.2 GHz. Therefore, the average value is chosen.

**ADC Delay**

- The ADC starts on the rising edge of Pulse0. Due to the data pipeline, the ADC begins measuring data 210 ns before the rising edge of Pulse0 occurred. Since the ADC measurement leads Pulse0, Pulse0 is delayed by this amount of time. This value cannot be changed.

**Timing Example**

Assume Pulse1 is used to modulate the RF signal, all Pulse outputs are enabled, all are set to zero delay, and all are set to the same width. The first timing diagram below is with offset off and the second timing diagram is with offset on.
Buttons

Plot Pulse Timing - Accesses pulse timing display to evaluate the pulse timing setup.

Right-click in the display area to access the following menu:
**Autoscale** - Automatically scales the data to fit vertically within the display grid area.

**Display marker annotation** - Select to display marker annotation in the top-right of the display.

**Show graticule** - Select to display graticules.

**Add marker to:** - Select to add a marker to a displayed pulse trace. When a selection is made, the mouse pointer changes to a "+ ". Click in the display area and the marker will appear. Drag the marker to the desired position. Each time this selection is made, a new marker will be added.

**Copy to Clipboard** - Copies a bitmap of the trace control (Display) to the clipboard. It can then be pasted into any document that accepts bitmaps.

**Print...** - Prints the displayed data.

**Scale properties...** - Accesses the following dialog:
Stimulus - Sets the Begin and End displayed on the X-axis in seconds.

Response - Sets the Reference level in the center of the Y-axis and sets the scale per division.

Pulse Generators - Accesses the Pulse Generators Setup dialog. See below.

**Pulse Generators Setup** dialog box help

This dialog is available with Option S9x025A/B (pulse generators).

To see this dialog, press **Pulse Generators...** on the Pulse Setup dialog.

**Pulse Generators**

Configure the Pulse Generators to be used for your measurement. The pulse 0 is for the receiver. The pulse 1 is for source and P1 output and pulse 2 to 4 are for P2 to P4 output signal, respectively.

- **D** = Delay; the time before each pulse begins
- **W** = Width; the time the pulse is ON
Duty Cycle = W/P

P = Period; one complete pulse cycle

Pulse Frequency (PRF) = 1 / Period

**Important:** If D + W is greater than P, then undefined VNA behavior results. There is NO error message or warning.

**Invert**  Check to cause the pulse ON time to be active low and OFF be active high.

**Enable**  Check to enable individual pulse generators.

**Trigger**  Choose from: (When ONE of these is changed, they ALL change. The internal Pulse Generators can NOT be triggered individually).

- Internal - Pulse generators are triggered by the internal pulse clock.
- External - Pulse generators are triggered by an external pulse generator though Pulse Sync IN.

**Frequency**  - Set the pulse frequency of each generator.

- Pulse Frequency (PRF) = 1 / Period
- P = Period; one complete pulse cycle

**Period**  - Set the period of each generator.

Learn more about the Pulse Generators.

**Pulsed Sources**

Check to enable the required internal source ports.

These are switches 8 and 9 in the Block Diagram

**Important**: When internally modulating the sources, source leveling is automatically set to Open-loop (**ALC Open Loop** box will be checked automatically).

**Modulator Drive**  - Choose the pulse generator to modulate the specified source. Choose from CW (NO pulse), Pulse 1, 2, 3, 4, External.  This is switch 7 Block Diagram.

**Offset Pulses**

**Offset Pulses using ADC Delay Check Box**
If checked (default), adds delays to the Pulse Generator:

- Pulse0 adds (ADC Delay) + (Modulator Delay).
- Pulse Output used as the Modulator Drive adds no delay.
- All other Pulse Outputs add Modulator Delay.

RF Modulator Delay

- Defines the RF delay of the source modulator. This is the time lag between the pulse drive signal and the actual RF output. This may indicate the lag for either an internal or external source.
- The default is 40 ns, which is the average delay of the internal RF modulators. The internal modulator below 3.2 GHz is slower than the internal modulator above 3.2 GHz. Therefore, the average value is chosen.

ADC Delay

- The ADC starts on the rising edge of Pulse0. Due to the data pipeline, the ADC begins measuring data 210 ns before the rising edge of Pulse0 occurred. Since the ADC measurement leads Pulse0, Pulse0 is delayed by this amount of time. This value cannot be changed.

Offset Pulse Example

Assume Pulse1 is used to modulate the RF signal, all Pulse outputs are enabled, all are set to zero delay, and all are set to the same width. The first timing diagram below is with offsets off and the second timing diagram is with offsets on.
**Pulsed Receivers**

**Synchronize ADCs using Pulse Trigger** - Check to enable triggering used to gate the ADC for wideband receiver measurements. This is the same as **Pulse0 Enable**. The Width can NOT be configured.

**Pulse4 Output Indicates** - Check to use an oscilloscope connected to the pulse 4 (pin 13 of the PULSE I/O connector on the rear panel of the VNA) to display when the ADC is making measurements. There are two selections:

- **All ADC Activity** - When selected, all ADC activity can be monitored, including ADC activity that may not be displayed on a trace. An example is background measurements that are used for receiver leveling, but are not actually displayed on a trace.

- **Trace ADC Activity** - When selected, Pulse4 will be active only during measurements that will be displayed on a trace.

**Pulse Trigger...** - Click to start the Pulse Trigger dialog.

**Trigger...** - Accesses the Trigger dialog for setting up triggering. Learn more.

---

**Pulse Trigger Tab** - Trigger dialog box help
To see this dialog, press **Pulse Trigger** on the Pulse Generator Setup dialog or select **Stimulus**, then **Trigger** from the VNA Menu.

**Trigger Source**

Select **Internal** or **External** to provide sync capability for the internal pulse generators.

- **Internal** - The pulse generator is internally triggered and puts out a periodic pulse train with a period defined by the Pulse Generator Setup dialog.

- **External** - The internal pulse generator puts out one set of pulses (P0-P4) per external trigger (Pulse Sync In). All five pulse outputs have unique delay and pulse width settings.

The external trigger input is on the Pulse I/O connector pin 7 (PulseSyncIn). The PulseSyncIn line provides a configurable trigger signal into the Pulse Generators. If the trigger mode is set to "level", and if the trigger is still valid when the first pulse set is finished, another set will be generated. Only one set of pulses is emitted when edge triggering is used.

**Trigger Level/Edge**

Sets the edge or level of the trigger signal to which the internal pulse generators will respond when being externally triggered at the PulseSyncIn pin.
Positive = rising edge; Negative = falling edge.

These selections are available ONLY with DSP version: 4.0 FPGA: 34 or higher. Learn more. Otherwise, the pulse generators respond only to positive, level input trigger signals.

**Receiver synchronization**

**Synchronize ADCs using pulse trigger** - Check to enable triggering used to gate the ADC for wideband receiver measurements. The Width can NOT be configured.

**ADC trigger delay** - Set the amount of time to wait before triggering the ADC to begin acquisition.

**Pulse Trigger Block Diagram**

See complete description at IF Path Configuration

See also Using External Pulse Generators

**Using External Pulse Generators**

Setup the External Pulse Generator as an External Device.

**Calibration in Pulse Mode**
To perform a calibration in pulse mode, first configure and apply the pulse parameters (PRF, Pulse Width, Delays, IF gating, and so forth) **before** calibrating the system. This will ensure the VNA is configured properly during the calibration and measurement.
Global Source

Global Source allows any internal or external source to be set globally and retain its settings even after an instrument preset.

How to access the Global Source dialog

Using Hardkey/SoftTab/Softkey

1. Press **Sweep > Source Control > Global Source...**
   
   or

2. Press **System > System Setup > Preferences...**

3. Press **Global Sources...** button.

Using a mouse

1. Click **Stimulus**.

2. Select **Sweep**.

3. Select **Source Control**.

4. Select **Global Source**.

Global Source dialog box help

**Power On (All Channels)** - Check to enable source power for all channels.

**Global Sources Ignore "Power ON" Setting** - This setting is a preference. Sources set to Global
are not turned off when **Power On (All Channels)** is checked. Users of high power systems often turn off the RF Power to avoid damaging the system or the DUT. However, they may not want to turn off Global Sources being used as the clock signal for synthesizers.

**Name** - Lists the names of the sources.

**Global** - Set the state of the source.

- **OFF**  Do not set as a global source.

- **Global**  Set as a global source and set to a fixed frequency and power level defined in this dialog. Once a source is set to Global, it becomes "locked" and its settings cannot be controlled by any channel settings (frequency, power, RF on/off): It will be unaffected even if sweeps are disabled and if there are no channels defined for the VNA. The Recall feature will not change the Global Source setting. If Global Source is ON and a state saved with Global Source OFF is recalled, then Global Source will remain ON and the state will not be completely recalled and the VNA displays the warning message: **The Recall is incomplete because Global Source is ON.** When the GUI is exited, the Global Sources will be turned OFF.

The following shows Source3 has been set to Global.
**State** - Turns source power on and off.

**Frequency** - Sets source frequency.

**Power** - Sets the power level at the output of the source.
Amplifiers, Mixers, and Band pass filters are common DUTs that are characterized with VNAs. In some cases the setup of these devices can be time consuming due to the measurements needed and, in the case of mixers and band pass filters, multiple frequencies that need to be entered to characterize the DUT. Device Expert allows you to quickly set up common measurements for these DUTs and save the DUT configuration.

In this topic:

- Features
- Select Device page help
- Select DUT Ports page help
- Define DUT Frequencies page help
- Define DUT Power page help
- Select and Apply Measurements page help
- Edit Channel Parameters and Properties dialog help
- External Source Error Messages

### Features

- Intuitive user interface for the setup of measurements common for Amplifiers, Mixers, and Band Pass Filter devices.
- Apply selected measurements to VNA.
- Append DE Wizard configured measurements to existing VNA setup, without disturbing any of your already configured window arrangements.
- Save and recall DUT configurations and mixer frequency ranges.

### Accessing DMX Settings

**Using Hardkey/SoftTab/Softkey**

1. Press **Setup** > **Main** > **Device Expert**....

**Using a mouse**

1. Click **Instrument**.
2. Select **Setup**.
3. Select the **Device Expert**....
Choose from the following selections, the wizard will automatically advance.

**Amplifier** – Set up a selection of common measurements for 2-port amplifier devices with gain.

**Converter** – Set up a selection of common measurements for frequency translating devices such as mixers, including up- or down-converters.

**Band Pass Filter** – Set up a selection of common measurements for a 2-port band pass filter device. This will setup measurements in 3 channels, corresponding to the upper and lower rejection band and the pass band, to optimize measurement speed.

**Save...** – Saves a DUT configuration.

**Recall...** - Recalls a DUT configuration. Clicking on the down arrow in the **Recall...** button accesses the following:

- **Recall auto-saved configuration** - Recalls the previous session whether it was manually saved or not.
- **Delete auto-saved configuration** - Deleted the auto-saved configuration.
Select DUT Ports page help

Amplifier

Converter
Band Pass Filter
Using the pull-down selection menus on the side of the DUT graphic the ports that the DUT will be connected to on the VNA can be selected. If the VNA supports IMD style measurements a check box will be visible to enable or disable the setup of IMD measurements by the Wizard. If IMD measurements are enabled the port selection for the input port will be disabled and automatically set to port 1 to take advantage of the internal combiner and second source on the VNA, if available.

For mixer/converter devices the LO port source can be selected from the pull-down menu of available sources. If external sources are configured those will also be present in the list as possible external sources. If the mixer/converter device has an embedded LO or is a 2-stage converter device those DUT properties can be selected on this page.

**Save...** – Saves a DUT configuration.

**Recall...** - Recalls a DUT configuration. Clicking on the down arrow in the **Recall...** button accesses the following:

- **Recall auto-saved configuration** - Recalls the previous session whether it was manually saved or not.
- **Delete auto-saved configuration** - Deleted the auto-saved configuration.
Define DUT Frequencies page help

The following images show the define DUT frequency pages available in the wizard. The start/stop or center/span frequencies for the measurements can be specified. In addition, the number of points for the measurement can be set on this page.

Amplifier

Converter
Band Pass Filter
For the converter device, two additional options are available to save and load defined mixer setups. **Save Mixer**… and **Load Mixer**… are different from the Wizard **Save**…/**Recall**… function as the mixer file only contains information regarding the mixer frequencies and high-/low-side selection without the additional information of the measurement configuration and VNA setup.

- **Save Mixer**… saves the mixer definition file including frequencies, the high-/low-side setting, and fixed/swept input settings.

- **Load Mixer**… loads the mixer frequency range definition file.

For BPF DUTs, there are three sets of frequency range inputs that you can use to specify the frequency ranges of the lower and upper rejection band as well as the pass band. Also available is a **Band Name** field that allows you to name the frequency range for easier recognition when the channels are set up on the VNA using the Wizard.

**Save**… – Saves a DUT configuration.

**Recall**… - Recalls a DUT configuration. Clicking on the down arrow in the **Recall**… button accesses the following:

- **Recall auto-saved configuration** - Recalls the previous session whether it was manually saved or not.
Delete auto-saved configuration - Deleted the auto-saved configuration.

**Define DUT Power page help**  
The DUT power stimulus conditions can specified in the pages shown below.

**Amplifier**

![Amplifier diagram]

**Converter**
Band Pass Filter
**Amplifier Gain** and **Conversion Gain** – Provide an estimate of the gain of the device. This is used by the Wizard to compute optimal input power levels to the DUT to prevent compression of the VNA receivers.

**Linear Input Power** – Nominal input power level to achieve linear DUT operation.

**Max Input Power** – The maximum input power level to apply to the DUT. For measurements requiring the power to be swept, for example gain compression measurement class, this sets the maximum power level supplied to the DUT during power sweeps.

**Caution!** Setting this to a high value on devices with gain could result in output powers that could damage the VNS receivers.

**LO1 Power** and **LO2 Power** – The power level to use for LO1 and, if applicable, LO2 for converter devices.

**Nominal Insertion Loss** – An estimate of the nominal insertion loss in the pass band region of a band pass filter. This value is used by the Wizard to estimate an optimal IFBW to achieve the target trace noise (described below).
Rejection Target – An estimate of the rejection level desired in the rejection regions of the band pass filter DUT.

Trace Noise Target – A value of the target trace noise, in dB(rms), the Wizard should attempt to optimize the VNA to achieve for pass band measurements on a band pass filter DUT.

Save... – Saves a DUT configuration.

Recall... - Recalls a DUT configuration. Clicking on the down arrow in the Recall... button accesses the following:

Recall auto-saved configuration - Recalls the previous session whether it was manually saved or not.

Delete auto-saved configuration - Deleted the auto-saved configuration.

Select and Apply Measurements page help

Measurements and parameters to be created using the wizard can be enabled or disabled in pages shown below.

Amplifier
Converter
Band Pass Filter
The check box next to each item can be used to enable or disable that item’s creation by the wizard.

Clicking the pencil icon next to each measurement will open the Edit Channel Parameters and Properties dialog where additional measurement parameters can be added and the settings for that measurement can be manually adjusted, if desired.

The parameters that will be measured for each of the measurement types can be displayed by clicking on the Parameters expander. Individual parameters can be enabled or disabled from this page.

Clicking the Finish button will apply the selected measurements and parameters to the VNA. Once completed the wizard will automatically exit.

**Delete All Currently Existing Measurements** – Enabling this option will delete all measurements that are currently configured on the VNA when the Finish button is clicked in the wizard.

**Calibrate All Measurements**… - Enabling this option will launch the VNA’s Calibrate All Channels wizard after the Device Expert wizard completes the setup of the selected measurements.

**Sweep after Applying Setup** - Enabling this option (default) applies the setup to the VNA and
performs a single sweep afterwards. Disabling this option applies the setup to the VNA but does not perform a single sweep afterwards.

**Save...** – Saves a DUT configuration.

**Recall...** - Recalls a DUT configuration. Clicking on the down arrow in the **Recall...** button accesses the following:

- **Recall auto-saved configuration** - Recalls the previous session whether it was manually saved or not.
- **Delete auto-saved configuration** - Deleted the auto-saved configuration.

---

**Edit Channel Parameters and Properties**

An example of the edit channel parameters and properties dialog is shown in the image below.

---

**Add** – Add a new parameter to the measurement.
**Change Format** – Change format of the selected parameter in the list of parameters

**Remove** – Delete parameter from the measurement

**Ok** – Save and apply changes to the measurement

**Cancel** – Abandons changes made in this dialog to the measurement.

---

**External Source Error Messages**

If an external source has been set up as an external device but is turned off, then Device Expert may cause errors to appear in the PNA firmware status bar when it loads. Device Expert attempts to activate these external sources. These errors can be safely ignored:

- **VI_ERROR_CONN_LOST**: The IO connection for the session has been lost
- **[SCPI: 1073]**: Unexpected error
Undo/Redo Settings

If you make an incorrect setting, you can quickly recover by selecting Undo. If you then incorrectly Undo a setting, you can Redo the undone setting.

- Undo and Redo applies ONLY to selected settings.
- The Undo stack remembers 16 levels of Undo-able settings.

How to Undo or Redo a setting

Tips:

- Click or touch the Undo and Redo Icons:

  ![Undo Redo Icons]

- With a mouse, right-click on the Softkeys or on the Entry toolbar.
- With a keyboard:
  - Undo....Ctrl+Z
  - Redo....Ctrl+Y

Using **Hardkey/SoftTab/Softkey**

1. Press **Undo > Main**.
2. Click **Undo** or **Redo**.

SCPI and COM programming and Undo/Redo:

- There are NO Programming commands to invoke Undo/Redo
- Programing commands are NOT Undo-able.
- The Undo stack is cleared when programming commands are sent to the VNA.

Using **a mouse**

1. Click **Undo** and **Redo** Icons on Active Entry or Softkey Toolbar.

Return To Task
To return to the previous task, press **Undo > Main > Return To Task**.

**Clear Undo History**

To clear the Undo stack, press **Undo > Main > Clear Undo History**.

**Undo and Security**

- Undo/Redo is disabled with **High** and **Extra** security levels. [Learn more.](#)
- State files that are saved for Undo/Redo purposes (for example: Preset) are deleted when any of the following occur:
  - The Security level is changed
  - The Network Analyzer App is started or closed.

**Selected Undo-able settings**

You can Undo or Redo the following **settings**:

**Note:** There are several settings that are NOT Undo-able. Because of this, when you attempt to Undo a long sequence of operations, it is unlikely that the original state can be recreated exactly.

- **Preset**
- **File Recall**
- **Frequency Settings**
  - For Standard Class, Gain Compression, and NF: Start, Stop, Center, Span, CW
  - For SMC, VMC: Mixer Setup dialog Apply
  - For Swept IMD: Freq softkeys, setup dialog Apply
  - IM Spectrum: Freq softkeys, setup dialog Apply
  - Noise Figure: Freq softkeys, setup dialog Apply
  - GCX, IMDX, NFX: setup dialog Apply
- **Turn off Marker** and **Marker All OFF**

Optimize Measurements

A measurement has many interdependent settings. You can modify the settings to achieve the goals of your measurement application: faster throughput or greater measurement accuracy.

**Increase Measurement Throughput**

- Achieve Fastest Sweep
- Switch Between Multiple Measurements
- Data Transfer Speed
- Using Macros

**Improve Measurement Accuracy**

- Increase Dynamic Range
- Reduce Noise
  - Averaging
  - IFBW
  - Smoothing
- Group Delay (Separate Topic)
- Improve Phase Measurement Accuracy
- Improve Accuracy for Electrically Long Devices
- Improve Reflection Accuracy on Low-Loss 2-Port Devices
- Increase Measurement Stability
- Decrease Receiver Crosstalk
- Reduce the Effects of Test Accessories

**Caution:** Avoid expensive repairs to your analyzer. Read Electrostatic Discharge Protection.
Dynamic Range

Dynamic range is the difference between the analyzer receiver's maximum input power and the minimum measurable power (noise floor). For a measurement to be valid, input signals must be within these boundaries.

Increasing dynamic range is important if you need to measure very large variations in signal amplitude, such as filter bandpass and rejection. The dynamic range is shown below for an example measurement.

To help reduce measurement uncertainty, the analyzer dynamic range should be greater than the response that the DUT exhibits. For example, measurement accuracy is increased when the DUT response is at least 10 dB above the noise floor. The following methods can help you increase the dynamic range.

- Increase the Device Input Power
- Reduce the Receiver Noise Floor
- Improving Dynamic Range using the Front-Panel Jumpers

Other topics about Optimizing Measurements

Increase Device Input Power

Increase the DUT input power so that the analyzer can more accurately detect and measure the DUT output power. However, use caution - too much power can damage the analyzer receiver or cause compression distortion.

**Caution! Receiver input damage level: +15 dBm.**

See how to increase input power to the device

**Tip:** You can further increase dynamic range by using an external booster amplifier to increase the input
power to the DUT. See High Power Amplifier Measurements.

Reduce the Receiver Noise Floor

You can use the following techniques to lower the noise floor and increase the analyzer's dynamic range.

- Reduce crosstalk between the VNA receivers when measuring signals close to the noise floor. See Receiver Crosstalk.)

- Use **Sweep Averaging** - learn more about Sweep Average

- Reduce the **IF Bandwidth** - learn more about IF Bandwidth.

- In **Segment sweep** mode each segment can have its own IF bandwidth. For example, when measuring a filter:
  
  - In the passband, the IF bandwidth can be set wider for a fast sweep rate, as long as high-level trace noise is kept sufficiently small.

  - In the reject band, where noise floor contributes significantly to measurement error, the IF bandwidth can be set low enough to achieve the desired reduction in average noise level.

Improving Dynamic Range using the Front-Panel Jumpers

**Direct Access**

The simplest method to improve dynamic range is to remove a RCVR 'n' IN front-panel jumper and route the DUT output directly into that VNA receiver. This bypasses the directional coupler and limits the ability to provide Full Error Correction because the signal can not be applied in the reverse direction.

Refer to the VNA specifications to learn the dynamic range that is available with direct receiver access.

**Reverse the directional coupler**

Another method to improve dynamic range is to reverse the signal path in the test-port coupler and bypass the loss typically associated with the coupled arm.

As shown in the following graphic, the signal is applied to Port 2. The signal bypasses the coupled arm via the jumper cable connected to the Coupler Thru (or Coupler In) and the Receiver B In (or B In) ports.

When making measurements in reverse direction, the system dynamic range is degraded by 15 dB.

**Note:** Your analyzer's block diagram may contain different components than shown below. To see the block diagram for your VNA model, see the bottom of the specs/data sheet.

Using the Front Panel Jumpers

Specifications
Number of Points

A data point is a sample of data representing a measurement at a single stimulus value. You can specify the number of data points that the analyzer measures across a sweep. (A "sweep" is a series of consecutive data point measurements, taken over a sequence of stimulus values.)

The analyzer sweep time changes proportionally with the number of points. However, the overall measurement cycle time does not. See Technical Specifications for more information on how the number of points, and other settings, affect the sweep time.

How to change the number of data points

Select a number or click Custom to invoke a dialog box

Using Hardkey/SoftTab/Softkey

1. Press Sweep > Main > Number of Points.

Number of Points dialog box help

Specifies the number of data points that the analyzer gathers during a measurement sweep. You can specify any number from 1 to 100,003. The default value is 201.

Note: Some measurement classes (such as GCA and Swept IMD) may have different maximum points limitations.

Two data points are required for Time Domain.

Tips:

- To achieve the greatest trace resolution, use the maximum number of data points.
- For faster throughput use the smallest number of data points that will give you acceptable resolution.
- To find an optimized number of points, look for a value where there is not a significant difference in the measurement when you increase the number of points.
- To ensure an accurate measurement calibration, perform the calibration with the same number of points that will be used for the measurement.

The number of points is the number of data items collected in one sweep. It can be set for each...
channel independently.

- To obtain a higher trace resolution against the stimulus value, choose a larger value for number of points.
- To obtain higher throughput, keep the number of points to a smaller value within an allowable trace resolution.
- To obtain higher measurement accuracy after calibration, perform calibration using the same number of points as in actual measurements.
Phase Measurement Accuracy

You can increase the accuracy of phase measurements by using the following features:

- **Electrical Delay**
- **Phase Offset**
- **Spacing Between Frequency Points (Aliasing)**

**See Also**

- Port Extensions
- Comparing the Delay Functions
- Phase Control
- Phase Coherent Measurements

**Learn more about Phase measurements**

**Electrical Delay**

Electrical delay is a mathematical function that simulates a variable length of lossless transmission line.

Use the electrical delay feature to compensate for the linear phase shift through a device. This feature allows you to look at only the deviation from linear phase of the device.

You can set the electrical delay independently for each measurement trace.

**How to set Electrical Delay**

**Using** Hardkey/SoftTab/Softkey

1. Press Scale > Electrical Delay.
### Electrical Delay dialog box help

**Electrical Delay** Specifies the value of delay added or removed, in Time or Distance. This compensates for the linear phase shift through a device. You can set the electrical delay independently for each measurement trace.

**Velocity Factor** Specifies the velocity factor that applies to the medium of the device that was inserted after the measurement calibration. The value for a polyethylene dielectric cable is 0.66 and 0.7 for PTFE dielectric. 1.0 corresponds to the speed of light in a vacuum.

Velocity factor can also be set from the Port Extensions dialog and Time Domain Distance Marker Settings.

**Softkey Display** Allows you to enter delay in either Time or Distance using the softkeys and Active Entry toolbar.

**Delay Distance** Changes the value when the Delay Time or Delay Distance values are changed.

**Distance Units** Select from Meters, Inches, or Feet. The step size will not change automatically when this value is changed.

**Media**

- **Coax** Select if the added length is coax. Also specify the velocity factor of the coax.

- **Waveguide** Select if the added length is waveguide. Also specify the low frequency cutoff of the waveguide.

- **Cutoff Freq** Low frequency cutoff of the waveguide.

Learn about Electrical Delay (scroll up)

### Phase Offset

Phase offset mathematically adjusts the phase measurement by a specified amount, up to 360°. Use this feature in the following ways:

- **Improve the display of a phase measurement.** This is similar to the way you would change the reference level in an amplitude measurement. Change the phase response to center or align the response on the screen.

- **Emulate a projected phase shift in your measurement.** For example, if you know that you need to add a cable and that the length of that cable will add a certain phase shift to your measurement, you can use phase offset to add that amount and simulate the complete device measurement.
How to set Phase Offset

Using Hardkey/SoftTab/Softkey

1. Press **Scale > Constants > Phase Offset.**

---

**Phase Offset** dialog box help

**Phase Offset** Type a value or use the up and down arrows to select any value up to 360 degrees.

Learn about **Phase Offset** (scroll up)

---

**Spacing Between Frequency Points (Aliasing)**

The analyzer samples data at discrete frequency points, then connects the points, creating a trace on the screen.

If the phase shift through a device is >180° between adjacent frequency points, the display can look like the phase slope is reversed. This is because the data is undersampled and aliasing is occurring.

If you are measuring group delay and the slope of the phase is reversed, then the group delay will change sign. For example, the following graphic shows a measurement of a SAW bandpass filter.

- The left measurement has 51 points and indicates the group delay is negative, which is a physical impossibility. That is, the response is below 0 seconds reference line.

- The right measurement shows an increase to 201 points which indicates the group delay is positive. That is, the response is above the 0 seconds reference line.
**Tip:** To check if aliasing might be occurring in a measurement, either increase the number of points or reduce the frequency span.
Electrically-Long Device Measurements

A signal coming out of a device under test may not be exactly the same frequency as the signal going in to a device at a given instant in time. This can sometimes lead to inaccurate measurement results. You can choose between two techniques to eliminate this situation and increase measurement accuracy.

- Why Device Delay May Create Inaccurate Results
- Solutions to Increase Measurement Accuracy
  - Slow the Sweep Speed
  - Add Electrical Length to the R Channel

Other topics about Optimizing Measurements

Why Device Delay May Create Inaccurate Results

The following graphic shows an example of this situation:

- In the network analyzer, the source and receiver are phase locked together and sweep simultaneously through a span of frequencies.
- The signal flow through the Device Under Test (DUT) is shown as different colors for different frequencies.
- You can see as a stimulus frequency travels through the DUT, the analyzer tunes to a new frequency just before the signal arrives at the receiver. This causes inaccurate measurement results.

If the analyzer is measuring a long cable, the signal frequency at the end of the cable will lag behind the network analyzer source frequency. If the frequency shift is appreciable compared to the network analyzer's IF detection bandwidth (typically a few kHz), then the measured result will be in error by the rolloff of the IF filter.

Note: There is no fixed electrical length of a device where this becomes an issue. This is because there
are many variables that lead to measurement speed. When high measurement accuracy is critical, lower the sweep speed until measurement results no longer change.

### Solutions to Increase Measurement Accuracy

Choose from the following methods to compensate for the time delay of an electrically long device.

#### Slow the Sweep Speed

The following methods will slow the sweep speed.

- Increase the Sweep Time
- Increase the Number of Points
- Use Stepped Sweep
- Set Dwell Time

#### Add Electrical Length to the R Channel

**Note**: This method applies to VNA models with front panel loops.

Instead of slowing the sweep, you can compensate for the electrical length of a cable or fixture.

a. Remove the R-channel jumper on the front panel of the analyzer.

b. Replace the jumper with a cable of about the same length as the device under test.

1. Add the cable on the R1 channel for $S_{11}$ and $S_{21}$ measurements.
2. Add the cable on the R2 channels for $S_{22}$ and $S_{12}$ measurements.

c. Set the analyzer for a fast sweep.

#### Configuration for $S_{22}$ and $S_{12}$ Measurements

This method balances the delays in the reference and test paths, so that the network analyzer's ratioed transmission measurement does not have a frequency-shift error.
Note: This method works well if the delay is in a cable or fixture. For devices with long delays, this method is only suitable for uncalibrated measurements.
Reflection Accuracy on Low-Loss 2-Port Devices

To make accurate reflection measurements that have a 1-port calibration, you should terminate the unmeasured port.

- Why Terminate the Unmeasured Port
- How to Terminate the Unmeasured Port
- Resulting Measurement Uncertainty

Other topics about Optimizing Measurements

Why Terminate the Unmeasured Port

A 2-port calibration corrects for all 12 twelve error terms. A 1-port calibration corrects for directivity, source match and frequency response, but not load match. Therefore, for highest accuracy, you must make the load match error as small as possible. This especially applies for low-loss, bi-directional devices such as filter passbands and cables. You do not need to be concerned with load match when you are measuring a device with high reverse isolation, such as an amplifier.

How to Terminate the Unmeasured Port

Use one of the following methods:

- Connect a high-quality termination load (from a calibration kit, for example) to the unmeasured port of your device. This technique yields measurement accuracy close to that of a Full SOLT 2-port calibration.

- Connect the unmeasured port of your device directly to the analyzer, inserting a 10 dB precision attenuator between the device output and the analyzer. This improves the effective load match of the analyzer by approximately twice the value of the attenuator, or 20 dB.
Resulting Measurement Uncertainty

The following graph illustrates the measurement uncertainty that results from terminating with and without a precision 10 dB attenuator on the output of the test device.

Legend

- Filter Reflection
- Uncertainty with attenuator
- Uncertainty without attenuator

The calculations below show how adding a high-quality 10 dB attenuator improves the load match of the analyzer.

Note: The corresponding linear value is shown in parentheses.
**Network Analyzer:**

| Load match (NALM) | 18 dB (.126) |
| Directivity (NAD) | 40 db (.010) |

**Filter:**

| Insertion loss (FIL) | 1dB (.891) |
| Return loss (FRL) | 16 dB (.158) |

**Attenuator:**

| Insertion loss (AIL) | 10 dB (.316) |
| SWR (ASWR) | 1.05 (.024) |

32.26 dB Return Loss

**Calculations:**

Measurement Stability

There are several situations that can cause unstable measurements. To ensure that you are making repeatable measurements, you can use various methods to create a stable measurement environment.

- Frequency Drift
- Temperature Drift
- Inaccurate Measurement Calibrations
- Device Connections

Other topics about Optimizing Measurements

Frequency Drift

The analyzer frequency accuracy is based on an internal 10 MHz frequency oscillator. See Technical Specifications for stability and aging specifications.

If your measurement application requires better frequency accuracy and stability, you can override the internal frequency standard and provide your own high-stability external frequency source through the 10 MHz Reference Input connector on the rear panel.

Temperature Drift

Thermal expansion and contraction changes the electrical characteristics of the following components:

- Devices within the analyzer
- Calibration kit standards
- Test devices
- Cables
- Adapters

To reduce the effects of temperature drift on your measurements, do the following.

- Switch on the analyzer 1/2 hour before performing a measurement calibration or making a device measurement.
• One hour before you perform a measurement calibration, open the case of the calibration kit and take the standards out of the protective foam.

• Use a temperature-controlled environment. All specifications and characteristics apply over a 25 °C ±5 °C range (unless otherwise stated).

• Ensure the temperature stability of the calibration kit devices.

• Avoid handling the calibration kit devices unnecessarily during the calibration procedure.

• Ensure the ambient temperature is ±1°C of the measurement calibration temperature.

**Inaccurate Measurement Calibrations**

If a measurement calibration is inaccurate, you will not measure the true response of a device under test. To ensure that your calibration is accurate, you should consider the following practices:

• Perform a measurement calibration at the points where you connect the device under test, that is, the reference plane.

• If you insert any additional accessory (cable, adapter, attenuator) to the test setup after you have performed a measurement calibration, use the port extensions function to compensate for the added electrical length and delay.

• Use calibration standards that match the definitions used in the calibration process.

• Inspect, clean, and gage connectors. See Connector Care.

See Accurate Measurement Calibrations for more detailed information.

**Device Connections**

Good connections are necessary for repeatable measurements. To help make good connections, do the following:

• Inspect and clean the connectors for all of the components in the measurement setup.

• Use proper connection techniques.

• Avoid moving the cables during a measurement.
Noise Reduction Techniques

Random electrical noise which shows up in the analyzer receiver chain can reduce measurement accuracy. The following features help reduce trace noise and the noise floor which can lead to better dynamic range and more accurate measurements.

**Note:** The trace noise in microwave VNAs becomes worse below 748 MHz and is especially obvious between 10 MHz and 45 MHz. See [Reduce IFBW](#).

- Averaging
- IF Bandwidth
- Modulation Distortion Bandwidth Settings *(Option S93070xB,A9x070A/B Modulation Distortion only)*
- LF Auto BW
- Trace Smoothing

- VNA data processing map.

### Other topics about Optimizing Measurements

**Averaging**

Averaging is a feature that reduces the effects of random noise on a measurement. There are two types of averaging: Point or Sweep.

The Point averaging type computes averaging on each data point before stepping to the next data point. You determine the number of measurements by setting the averaging factor (enabled by clicking the Averaging button). The higher the averaging factor, the greater the amount of noise reduction.

The Sweep averaging type computes averaging on subsequent sweeps until the required number of averaging sweeps are performed.

**Effects of Sweep Average**
Both Averaging and IF Bandwidth can be used for the same benefit of general noise reduction. For minimizing very low noise, Averaging is more effective than reducing IF bandwidth. Generally, Averaging takes slightly longer than IF bandwidth reduction to lower noise, especially if many averages are required. Also, changing the IF bandwidth after calibration results in uncertain accuracy.

**How to Set Averaging**

**Using Hardkey/SoftTab/Softkey**

1. Press **Avg BW > Main > Averaging**.
2. Enter the Averaging number.

**Using a mouse**

1. Click **Response**.
2. Select **Avg BW**.
3. Select **Averaging...**

**Average dialog box help**

**Average ON** Check to enable Averaging.

**Average Factor** Specifies the number of measurements that are averaged. Range of 1 to 65536 ($2^{16}$).

**Average Type**

- **Sweep** Each data point is based on the average of the same data point measured over consecutive sweeps. When the number of sweeps = Average Factor, the averaging continues following the Sweep Averaging formula.

- **(Sweep) Restart** Begins a new set of measurements that are used for the average. Applies only to Sweep averaging - NOT Point.
**Point** Each data point is measured the number of times specified by the Average Factor, and then averaged, before going to the next data point.

- On subsequent sweeps, averaging is automatically restarted by measuring each data point again the number of times specified by the Average Factor.
- Because measurements occur quickly in the background, the Average Counter is NOT updated.
- Point averaging is NOT available in **Gain Compression**, or **Noise Figure** Apps.

**Notes**

- An **Average Counter** appears on the screen when Sweep averaging is selected, displaying the number of sweeps that has been averaged. The effect on the signal trace can be viewed as the Average Factor increases. This can assist in the selection of the optimum number of sweep averages. The Average Counter is NOT updated for **Point** averaging.

- **Channel-wide scope** - Averaging is enabled and the factor is set for all measurements in a channel. The Average counter is displayed for each channel.

- **Calibration** - Because averaging is a mathematical process that occurs after the raw measurement is made, averaging can be turned ON before or after calibration without invalidating the error correction terms. If averaging is ON before calibration, the measurement of calibration standards are averaged measurements. More time is needed to perform the calibration, but there will be less noise in the resulting error correction terms. Subsequent corrected measurements will also have less noise error. In addition, noise is further reduced by turning Averaging ON after calibration.

- **Triggering** is implemented separately from Averaging. For example, setting averaging factor to 4 has NO effect on the number of triggers that are required to achieve 4 sweeps or 4 data points.

- **Unratioed** measurements - Although averaging unratioed (single receiver) measurements is allowed, you may see unexpected results.

  - The noise floor does not drop when averaging unratioed measurements as on ratioed measurements.
  - Phase results may tend toward 0. This is because phase measurements are relative by nature. Measuring absolute phase with a single receiver appears random. Averaging random positive and negative numbers will tend toward 0.

**Sweep Averaging Formula**

\[
\text{NewAvg} = \left( \frac{\text{NewData}}{n} \right) + \left( \frac{\text{OldAvg} \times (n-1/n)}{n} \right) \quad \text{where } n = \text{average factor}
\]

From the formula, you can see that data from the first \(n\) sweeps continues to be included in the results of subsequent sweeps. Its effect is increasingly smaller but never diminishes to zero. For example, with \(n = 5\), the average of the 5 sweeps is displayed. On the 6th sweep, you see 4/5 the
average of the first 5 sweeps plus 1/5 the new sweep.

The effects of older data can be eliminated by clicking **Restart**.

Learn more about Averaging (scroll up)

**IF Bandwidth**

The received signal is converted from its source frequency to a lower intermediate frequency (IF). The bandwidth of the IF bandpass filter is adjustable down to a minimum of 1 Hz. The maximum IF varies depending on the VNA model.

Reducing the IF receiver bandwidth reduces the effect of random noise on a measurement. Each tenfold reduction in IF bandwidth lowers the noise floor by 10 dB. However, narrower IF bandwidths cause longer sweep times.

- **Channel** - IF bandwidth can be set independently for each channel
- **Segment sweep** - IF bandwidth can be set independently for each segment of segment sweep.
- **Calibration** - Changing the IF bandwidth after calibration will cause a 'C-delta' correction level, which means that calibration accuracy is uncertain.

**Effect of Reducing IF Bandwidth**

![IF Bandwidth comparison](image)

**How to set IF Bandwidth**

**Using Hardkey/SoftTab/Softkey**

1. Press **Avg BW > Main > IF Bandwidth**.
2. Enter the IF Bandwidth value.

**Using a mouse**

1. Right click on the BW icons on the status bar.
2. Select an **IF Bandwidth**...

**IF Bandwidth** dialog box help

Right click on the BW icons on the status bar then select **IF Bandwidth**... to display the IF Bandwidth dialog:
IF Bandwidth  Specifies the IF (receiver) bandwidth. The value of IF bandwidth is selected by scrolling through the values available in the IF bandwidth text box. The IF BW is set independently for each channel.

The following IFBW values are common to all models:

1 | 2 | 3 | 5 | 7 | 10 | 15 | 20 | 30 | 50 | 70 | 100 | 150 | 200 | 300 | 500 | 700 | 1k | 1.5k | 2k | 3k | 5k | 7k | 10k | 15k | 20k | 30k | 50k | 70k | 100k | 150k | 200k | 280k | 360k | 600k | 1M | 1.5M | 2M | 3M | 5M | 7M | 10M | 15M

For the highlighted IFBW settings (1 MHz and above):

- 7 MHz to 15 MHz settings are available ONLY with DSP version 5.0 and above.
- The primary use for IFBW > 600 kHz is for wideband pulsed and pulse profile measurements. They do NOT provide faster sweep speeds for non-pulsed measurements.
- A slight shift (1dB or more) in Log Mag traces may be seen when switching in and out of these bandwidths.
- Available in Step sweep mode only - NOT available in Analog sweep.

Note: The IFBW is limited to 600 kHz when performing Swept IMD measurements even if the Wide IF path is selected.

IFBW Shape  Selects the digital filter (window) to apply to the time domain IF signal. The filter effectively "shapes" the signal before application of the DFT to help avoid discontinuities which add unwanted frequency content to the spectrum. Each filter has its own advantages and disadvantages.

Gaussian filter shapes have much lower side lobe levels than the standard VNA filters, and so measurements with them will be less sensitive to closely spaced signals. Normally, in standard S-parameters this is not important and these filters show no benefit. But in cases such as mixer measurements, they may reduce spurious responses when spurious signals are close to the main
signal to be measured. They have already been implemented in the spectrum analyzer mode.

**Standard** - Legacy filter. This filter is the fastest, but has side lobes that rise to ~-32 dBC.

**Gaussian** - This filter takes longer to acquire a point but has no side lobes.

The following shows the Standard and Gaussian 100 kHz filters:

![Filter Comparison](image)

---

**Reduce IF BW at Low Frequencies**

On VNA models with a maximum frequency of 20 GHz and higher, the trace noise becomes worse below about 400 MHz. This is especially obvious between 10 MHz and 45 MHz and also when Time Domain is ON. [See VNA models / maximum frequencies.](#)

When this box is checked, the VNA uses a smaller IF Bandwidth than the selected value at frequencies indicated below.

This setting:

- can be made for each channel.
- is ON (checked) by default.
Use the following calculations to determine the actual IF Bandwidth that is used. If the result is NOT a selectable IF BW, the next higher selectable value is used.

In the following table and example, the next band starts at .01 Hz above the Stop Frequency. This is indicated with '+'.

<table>
<thead>
<tr>
<th>Stop Frequency</th>
<th>VNA Model</th>
</tr>
</thead>
<tbody>
<tr>
<td>14 MHz</td>
<td>0.05</td>
</tr>
<tr>
<td>19 MHz</td>
<td>0.05</td>
</tr>
<tr>
<td>27 MHz</td>
<td>0.05</td>
</tr>
<tr>
<td>38 MHz</td>
<td>0.05</td>
</tr>
<tr>
<td>53 MHz</td>
<td>0.05</td>
</tr>
<tr>
<td>75 MHz</td>
<td>0.1</td>
</tr>
<tr>
<td>105 MHz</td>
<td>0.1</td>
</tr>
<tr>
<td>146 MHz</td>
<td>0.14</td>
</tr>
<tr>
<td>175 MHz</td>
<td>0.14</td>
</tr>
<tr>
<td>205 MHz</td>
<td>0.29</td>
</tr>
<tr>
<td>250 MHz</td>
<td>0.5</td>
</tr>
<tr>
<td>396 MHz</td>
<td>1</td>
</tr>
<tr>
<td>396+ MHz and above</td>
<td>1</td>
</tr>
</tbody>
</table>

Example:

On a N5224B, the selected IF BW is 30 KHz.

With Reduce IF BW at Low Frequencies checked, the actual IF Bandwidths used are:

- From 53+ MHz to 175 MHz: 30,000 Hz * .025 = 750 Hz (next higher selectable value: 1 kHz)
- From 175+ MHz to 250 MHz: 30,000 Hz * .15 = 4.5 kHz (next higher selectable value: 5 kHz)
- From 250+ MHz to 396 MHz: 30,000 Hz * .5 = 15 kHz
- From 396+ MHz to stop sweep = 30 kHz
**OK**  Selects the IF BW value shown in the text box.

Learn about IF Bandwidth (scroll up)

Modulation Distortion Bandwidth Settings (Option S9x070xB, S9x070A/B Modulation Distortion only)

**How to access Bandwidth settings**

**Using Hardkey/SoftTab/Softkey**

1. Press **Avg BW > Main**

**Using a mouse**

1. Click **Response**.
2. Select **Avg BW**.
3. Select **Bandwidth**.

**Bandwidth dialog box help**

**Noise BW** is equal to the Resolution BW divided by the Vector Average factor. You cannot directly set the Resolution BW or Vector Average in a Modulation Distortion channel. Resolution BW is always set to its maximum value for the given signal chosen. Vector Average is automatically set depending on the Noise BW setting.

**Auto** - Check to set the Noise BW to its maximum possible value. This results in the fastest possible sweep but increases the noise floor. If Auto is checked, then the Vector Average is set to 1, resulting in the widest Noise BW.

The Noise BW is displayed in the Softkey and in the middle of the display x-axis annotation.
**LF Auto BW**

When **LF Auto BW** is ON (default), the VNA uses a smaller IF Bandwidth than the selected value at low frequencies. This is the same as the **Reduce IF BW at Low Frequencies** selection in the IF Bandwidth dialog. Learn about IF Bandwidth (scroll up).

LFE (**Low Frequency Extension**) also uses a smaller IF Bandwidth than the selected value at low frequencies but does not use the same tables. Instead, LFE selects the IF Bandwidth based on the following:

1. User set IF Bandwidth.
2. Closest IF Bandwidth below Receiver Frequency / 4.

For example:

User set IF Bandwidth - 100 kHz

Receiver Frequency = 180 kHz

\[ \frac{180 \text{ kHz}}{4} = 45 \text{ kHz} \]

Next lower IF Bandwidth is 30 kHz

**How to enable/disable LF Auto BW**

**Using Hardkey/SoftTab/Softkey**

1. Press **Avg BW > Main > LF Auto BW**.
2. ON enables and OFF disables **LF Auto BW**.

**Trace Smoothing**

Trace smoothing averages a number of adjacent data points to smooth the displayed trace. The number of adjacent data points that get averaged together is also known as the smoothing aperture. You can specify aperture as either the number of data points or the percentage of the x-axis span.

Trace Smoothing reduces the peak-to-peak noise values on broadband measured data. It smooths trace noise and does not increase measurement time significantly.

Because Trace Smoothing follows Format in the data processing map, the formatted data is smoothed. Smoothing is automatically turned off if the format is Polar or Smith Chart.

Learn more about Data Format Types.
See the data processing map.

Tips:

- Start with a high number of display points and reduce until you are confident that the trace is not giving misleading results.

- Do not use smoothing for high-resonance devices, or devices with wide trace variations. It may introduce misleading information.

- Smoothing is set independently for each trace.

Effects of Smoothing on a Trace

<table>
<thead>
<tr>
<th>Without Smoothing</th>
<th>With Smoothing</th>
</tr>
</thead>
<tbody>
<tr>
<td>[Graph]</td>
<td>[Graph]</td>
</tr>
</tbody>
</table>

How to set Trace Smoothing

Using Hardkey/SoftTab/Softkey

1. Press Avg BW > **Smoothing** > Smoothing ON|OFF.

Smoothing ON  When checked, applies smoothing to the displayed trace.

Percent of Span  Specify percent of the swept stimulus span to smooth. For example, for a trace that contains 100 data points, and specify a percent of span = 11%, then the number of data points that are averaged is 11.

Points  Specify the number of adjacent data points to average.

Learn about Trace Smoothing (scroll up)
Crosstalk

Crosstalk is energy leakage between analyzer signal paths. This can be a problem with high-loss transmission measurements. Although the crosstalk specification of the analyzer is exceptional, you can reduce the effects of crosstalk by doing the following:

- Set the Sweep to Alternate
- Perform an Isolation Calibration

Other topics about Optimizing Measurements

Set the Sweep to Alternate

This selection is no longer available from the user interface. Learn more.

Perform an Isolation Calibration

For transmission measurements, a response and isolation measurement calibration helps reduce crosstalk because the analyzer measures and then subtracts the leakage signal during the measurement calibration. The calibration improves isolation so that it is limited only by the noise floor.

Note: Isolation is never performed on a Smart (Guided) Calibration. Learn more.

Generally, the isolation error falls below the noise floor. So when you are performing an isolation calibration you should use a noise reduction technique such as sweep averages or reducing the IF bandwidth.
Effects of Accessories

Accessories in a configuration may affect the results of a device measurement. You can choose between these analyzer features that reduce or remove the effects of accessories:

- **Power Slope to Compensate for Cable Loss**
- **Gating to Selectively Remove Responses**
- **De-embedding a 2-port device** (separate topic)

**Power Slope to Compensate for Cable Loss**

If you have a long cable or other accessory in a measurement configuration where a power loss occurs over frequency, apply the power slope function. This function increases the analyzer source power by a rate that you define (dB/GHz).

1. Press **Power > Leveling & Offsets**.
2. If the slope function is not already switched on, click the button beside **Slope**.
3. In the **Slope** box, enter the rate that you want the source power to increase over the frequency sweep.

**Gating to Selectively Remove Responses**

Gating is a feature in the time domain (option S93010A/B) that allows the analyzer to mathematically remove responses. You can set the gate for either a reflection or transmission response, but you will see different results.

- **Gating a reflection response** isolates a desired response (such as a filter’s return loss), from unwanted responses (such as adapter reflections or connector mismatches).
- **Gating a transmission response** isolates a specific path in a multipath device that has long electrical lengths.

See **Time Domain Gating** for more information.
Achieve Fastest Sweep

You can achieve the fastest measurement sweep by adjusting the following:

- **Sweep Settings**
- **Noise Reduction Settings**
- **Measurement Calibration Choice**
- **Unnecessary Functions**

### Other topics about Optimizing Measurements

### Sweep Settings

Consider changing each of the following settings as suggested.

- **Frequency Span** - Measure only the frequencies that are necessary for your device.
- **Segment Sweep** - Use segments to focus test data only where you need it.
- **Switch Off Stepped Sweep** - Use linear swept mode to minimize sweep time when possible.
- **Auto Sweep Time** - Use this default to sweep as quickly as possible for the current settings.
- **Number of Points** - Use the minimum number of points required for the measurement.

For more information on how number of points and other settings affect sweep cycle time, see Technical Specifications.

### Noise Reduction Settings

Using a combination of these settings, you can decrease the sweep time while still achieving an acceptable measurement.

- **IF Bandwidth.** Use the widest IF bandwidth that will produce acceptable trace noise and dynamic range.
- **Average.** Reduce the average factor, or switch Average off.
Measurement Calibration Choice

Choose the appropriate type of calibration for the required level of accuracy.

When full 2-port error correction is applied, the analyzer takes both forward and reverse sweeps to gather all 12 error correction terms. This occurs even with a single S11 measurement displayed. All displayed measurements are updated as the second sweep is performed. Both sweeps are performed using the specified sweep time.

When calibrating greater than 2 ports, the following formula is used to determine the number of sweeps required:

- \( N \times (N-1) \) where \( N \) = the number of ports.

When full 3-port calibration is applied, 6 sweeps are required; forward and reverse for each port pair. With full 4-port correction, 12 sweeps are required, and so forth.

To limit the measurement time, perform ONLY the level of calibration that your measurements require. For example, if making only an S11 measurement, perform a 1-port calibration on that port.

Sweep speed is about the same for uncorrected measurements and measurements done using a response calibration, or one-port calibration. For more information see Select a Calibration.

Unnecessary Functions

The analyzer must update information for all active functions. To achieve an additional increase in sweep speed, switch off all of the analyzer functions that are not necessary for your measurement application.

- **Delete Unwanted Traces**
- **Switch Off Unwanted Markers**
- **Switch Off Smoothing**
- **Switch Off Limit Testing**
- **Switch Off Math Functions**

Analyzer sweep speed is dependent on various measurement settings. Experiment with the settings to get the fastest sweep and the measurement results that you need.
If you need to make multiple measurements to characterize a device, you can use various methods to increase throughput. Experiment with these methods to find what is best for your measurement application needs.

- Set Up Measurements for Increased Throughput
  - Arrange Measurements in Sets
  - Use Segment Sweep
  - Trigger Measurements Selectively
- Automate Changes Between Measurements
- Recall Measurements Quickly

**Other topics about Optimizing Measurements**

### Set Up Measurements for Increased Throughput

To achieve optimum throughput of devices that require multiple measurements, it is helpful to know the operation of the analyzer. This knowledge allows you to set up the measurement scenarios that are best for your applications.

Learn more about Traces, Channels, and Windows

### Arrange Measurements in Sets

If you arrange measurements to keep the complete set of device measurements in one instrument state, you can save them so that you can later recall a number of measurements with one recall function.

See Pre-configured Measurement Setups for more information.

### Use Segment Sweep

Segment sweep is helpful if you need to change the following settings to characterize a device under test.
The segment sweep allows you to define a set of frequency ranges that have independent attributes. This allows you to use one measurement sweep to measure a device that has varying characteristics.

See Segment Sweep for more information.

Trigger Measurements Selectively

You can use the measurement trigger to make measurements as follows:

- Continuously update only the measurements that have rapidly changing data.
- Occasionally update measurements that have infrequently changing data.

For example, if you had four channels set up as follows:

- Two channels measuring the data that is used to tune a filter
- Two channels measuring the data for the out-of-band responses of the filter

You would want to constantly monitor only the measurement data that you use for tuning the filter. If you continuously update all of the channels, this could slow the response of the analyzer so that you would not be able to tune the filter as effectively.

Note: You must either trigger the infrequent measurement manually or with remote interface commands.

To trigger measurements selectively:
This procedure shows you how to set up two different measurements with the following behavior:

- Channel 1 measurement will continuously update the data.
- Channel 2 measurement will occasionally update the data.

1. Press **Setup > Quick Start**.
2. At the **Quick Start** dialog box, click **Create in new channel**.
3. **Frequency Sweep** dialog box shows. Enter the preferred sweep setting.

**Set Up a Measurement Trigger for Continuous Updates**

1. Press **Trigger > Trigger Source** and select **Internal**.
2. Press **Trigger > Trigger...**.
3. At the **Trigger** dialog box under **Channel Trigger State**, select **Channel 1**, and click **Continuous**.

**Set Up a Measurement Trigger for Occasional Updates**

1. At the **Trigger** dialog box under **Channel Trigger State**, select **Channel 2**, and click **Single, OK**.
2. Press **Trigger > Restart**.

**Update the Measurement**

1. Click on the lower window to make Channel 2 the .
2. On the active entry toolbar, click the type of trigger you set up.
   - Click **Single** if you set up the analyzer for a single sweep per trigger.
   - Click **Groups** if you set up the multiple sweeps per trigger.

**Note:** A trace must be active for you to initiate a trigger for that measurement.

**Automate Changes Between Measurements**

If there are slight differences between the various measurements that you need to characterize a device, you may find that it is faster to change the measurement settings using programming.
Recall Measurements Quickly

The most efficient way to recall measurements is to recall them as a set of measurements (instrument state).

- It only takes a short time longer to recall an instrument state that includes multiple measurements, than it does to recall an instrument state with only one measurement.

- Each recall function has time associated with it. You can eliminate that time by setting up the measurements as a set so you can recall them as a set.

See Save and Recall Files for more information.
Data Transfer Speed

When testing devices remotely using COM or SCPI, the following techniques can be used to transfer data quickly between the analyzer and remote computer, helping you achieve the best measurement throughput.

- **Use single sweep (trigger) mode** to ensure that a measurement is complete before starting a data transfer.
- **Transfer the minimum amount of data** needed. For example, a trace with a few points, using segment sweep rather than a full trace with many linearly spaced points. Also, use markers instead of trace transfers.
- **Choose the REAL data format** to provide the fastest transfer speed when using SCPI programs for automated applications.
- **Use SCPI over LAN** for applications that are automated with SCPI programs.
- **Use COM programs** to provide the fastest transfer speed when using an automated application. See Data Transfer Time specifications.

**Note:** The following data is obsolete, but still serves to illustrate the relative speed between COM and SCPI.

![Data Transfer Speed Comparison](chart.png)
Using Macros

Macros are executable programs that you write, load into the analyzer, and then run from the analyzer. You can have up to 25 macros set up to run on the analyzer.

- How to Setup Macros
- How to Run Macros
- Macro Example

How to Setup Macros

Using Hardkey/SoftTab/Softkey

1. Press Macro > Key Setup > Macro Setup....

In the Macro Setup dialog box:

1. Create an executable program and save it on the VNA hard drive. See SCPI or COM example programs in VBscript.

2. Use a mouse or the front-panel 'down-arrow' to select a blank line below the last entry. (There may be NO entry.)

3. Click Edit to start the Edit Macro Setup dialog.

4. In the Macro Title box, type a descriptive title for your macro.

5. Click Browse.

6. Change Files of Type.

7. Find and select your executable file. Change Files of Type if necessary.

8. Click OK on the Edit Macro Setup dialog.

9. Click OK on the Macro Setup dialog.

10. Press MACRO to run. It may be necessary to first Preset the VNA to see your macro in the menu.
### Macro Setup dialog box help

Macro setup allows you to create up to 25 macros that can be launched from the VNA application.

An external keyboard is required to enter the Macro Title and the Run string parameters.

**To add a Macro**, use a mouse or the front-panel 'down arrow' (NOT the 'Down' key) to select a blank line. Then click **Edit**.

**Macro Title**  Shows the titles that appear in the softkeys and menu when you press the Macro key. These titles are associated with the executable files and should be descriptive so you can easily identify them.

**Macro Executable**  Lists the complete path to the executable file. To follow the example of launching the Keysight VNA Series Home Page, the path to the executable could be "C:\Program Files(x86)\Internet Explorer\iexplore.exe.

**Macro Runstring Parameters**  Lists the parameters that get passed to the program that is referenced in the executable file. Again following the example of launching the VNA Series Home Page, you could assign the runstring parameters "http://www.Keysight.com/find/pna".

**Edit**  Invokes the Macro Edit dialog box.

**Delete**  Deletes the selected macro.

**Up**  Allows you to reorder the macros, moving the selected macro up one line. This order determines how they appear in the VNA Menu and in the softkeys and when you press the Macro front-panel key.

**Down**  Moves the selection down one line in the list of macros.
Macro Edit dialog box help

Macro Title  Add a title that appears in the softkeys and menu.

Macro Executable  Set the complete path to the macro executable file. Click Browse to navigate to the macro executable file and establish the complete path to the file.

Macro run string parameters  Optionally add parameters that are passed to the program referenced in the executable file.

See Macro Setup dialog box

How to Run Macros

Using Hardkey/SoftTab/Softkey

1. Press Macro > Macro<#>.

Macro Example

The following is an example Visual Basic Scripting (vbs) program that you can copy, install, and run on your VNA.

Note: Print these instructions if viewing in the analyzer. This topic will be covered by the Macro Setup dialog box.

1. Copy the following code into a Notepad file.
2. Save the file on the analyzer hard drive in the C:/Documents folder. Name the file FilterTest.vbs.
4. Setup the macro in the VNA
5. Run the macro

' Start copying here
'This program creates a S21 measurement
'It is written in VBscript using SCPI commands

Dim app
Dim scpi
'Create / Get the VNA application

Learn how to select a default Cal Type.

Other Cal Types (Separate Topic)

- Source and Receiver Power Cals

See other Calibration Topics

TRL Family

Application: Used to accurately calibrate any pair of ports when calibration standards are not readily available.

Note: A Delta Match Cal may be required.

- Learn more about TRL family cal
- For more information on modifying standards, see Calibration Standards.

Calibration Method: Basic Cal, SmartCal, Cal All

General Accuracy: Very High

Standards Required: THRU, REFLECT, LINE or similar combination

Systematic Errors Corrected:
- Directivity
- Source match
- Isolation (see exceptions)
- Load match
- Frequency response transmission tracking
- Frequency response reflection tracking
SOLT

Application: Used to accurately calibrate any number of ports.

General Accuracy: High

Calibration Method: Basic Cal, SmartCal, Cal All, ECal

Standards Required: (SHORT, OPEN, LOAD, THRU) or ECal module

Systematic Errors Corrected (on all ports):
- Directivity
- Source match
- Isolation (see exceptions)
- Load match
- Frequency response transmission tracking
- Frequency response reflection tracking

SOLR

Application: Used to accurately calibrate any two ports.

General Accuracy: High

Calibration Method: Basic Cal, SmartCal, Cal All, ECal

Standards Required: (SHORT, OPEN, LOAD, Reciprocal THRU) or ECal module

Systematic Errors Corrected (on all ports):
- Directivity
- Source match
- Isolation (see exceptions)
- Load match
- Frequency response transmission tracking
- Frequency response reflection tracking
Enhanced Response

Application: Used to calibrate two ports when only measurements in one direction (forward OR reverse) are required. Measurements are faster because a second sweep is NOT required.

- Reflection Standards (OPEN, SHORT, LOAD) are connected to the source port to be calibrated.
- Defined THRU or Flush THRU standard is connected between port pairs.
- Much quicker than SOLT when using a mechanical cal kit. ECal can also be used.

To select Enhanced Response:

For a standard S-parameter Cal, select Cal > Main > Basic Cal...

Then, In the Basic Cal dialog box:

1. Under 'Cal Type', select Enh Response 1-> 2 Enh or Response 2-> 1.

General Accuracy: High
Calibration Method: Basic Cal, SmartCal, ECal
Standards Required: (SHORT, OPEN, LOAD, Defined THRU or Flush THRU)
Systematic Errors Corrected:
- Directivity (source port)
- Source match (source port)
- Isolation (see exceptions)
- Load match (receiver port) - used only to produce transmission tracking term.
- Frequency response transmission tracking (receiver port).
- Frequency response reflection tracking (source port).

QSOLT (Quick SOLT)

Application: Used to quickly calibrate any number of ports. Developed specifically for use with external multiport test sets.

Note: A Delta Match Cal is required to cal test ports that do not have a dedicated reference receiver.

- Reflection Standards (OPEN, SHORT, LOAD) are connected to only ONE of the ports to be calibrated. The lower port number of the ports to be calibrated is selected by default. This can be changed through the Modify Cal / Cal Type setting.
- Defined THRU or Flush THRU standards are connected from the reflection standard port to the remaining ports to be calibrated.
- Much quicker than SOLT when using a mechanical cal kit.
- Based on TRL math.

General Accuracy: Not as high as SOLT
Calibration Method: Basic Cal, SmartCal, ECal
Standards Required: (SHORT, OPEN, LOAD, Defined THRU or Flush THRU)

Systematic Errors Corrected:
- Directivity
- Source match
- Isolation (see exceptions)
- Load match
- Frequency response transmission tracking
- Frequency response reflection tracking

1-Port (Reflection)

Application: Used to accurately calibrate any single test port for reflection measurements only.

Calibration Method: Basic Cal, SmartCal, Cal All, ECal

General Accuracy: High

Standards Required: (SHORT, OPEN, LOAD) or ECal module

Systematic Errors Corrected:
- Directivity
- Source match
- Frequency response reflection tracking

Open / Short Response

Application: Used to quickly calibrate any single test port for reflection measurements only.

Calibration Method: Basic Cal, Response Cal

General Accuracy: Low

Standards Required: OPEN or SHORT

Systematic Errors Corrected:
Frequency response reflection tracking
Thru / Transmission Response (Isolation Optional)

Application: Used to quickly calibrate any pair of test ports for transmission measurements only. Isolation is not usually recommended. Learn more about Isolation

Calibration Method: Basic Cal, Response Cal, and Guided Cal from the ‘Select DUT Connectors page’, check Modify Cal, then click Next.

General Accuracy: Low

Standards Required: THRU

Isolation: One LOAD for each VNA test port.

Systematic Errors Corrected:
- Frequency response transmission tracking
- Isolation
Calibration Thru Methods

- What is a Non-Insertable Device
- Choosing a Thru Method
- Flush Thru
- Adapter Removal
- Swap Adapters and Offset Delay (separate topic)
- Defined Thru
- Unknown Thru
- ECal Thru Method Choices

Other Cal Topics

What is a Non-Insertable Device

To understand the Thru method choices, you must first understand what is meant by "Non-Insertable device". These definitions also apply to ECal modules. Substitute "ECal module" for "device". Then see ECal Thru Method Choices.

A non-insertable device is one whose connectors could NOT mate together. They either do not have the same type of connector or they have the same gender. This also means that the test port cables would not mate together, as in the following diagram.
An **insertable** device is one whose connectors could mate together. They have the same type of connector and opposite, or no, gender. This also means that the test port cables would mate together, as in the following diagram.

Choosing a Thru Method of Calibration

The Thru method is selected from the Cal Wizard. Select the **Modify** checkbox in the **Select DUT Connectors and Cal Kits** dialog box.

**Notes:**

For ECal, the following choices have different meanings. See [THRU methods for ECal](#).

For 4-port calibration, see [How can we measure only 3 THRU connections?](#)

**Choice for Insertable Devices: FLUSH Thru** *(also known as Zero-length Thru)*

When calibrating for an insertable device, the test ports at your measurement reference plane connect directly together. This is called a zero-length THRU, or Flush THRU meaning that the THRU standard has zero-length: no delay, no loss, no capacitance, and no inductance. Your calibration kit may not have a physical THRU standard because it is assumed you have an insertable device and will be using a zero-length THRU.

**Choices for Non-Insertable Devices**

The following methods calibrate for a non-insertable device:

- **Adapter Removal** Accurate, but least convenient.
- **Defined Thru**
- **Unknown Thru Cal** Preferred method.
### Adapter Removal Calibration

The accuracy of the Adapter Removal calibration is very similar to the accuracy of the Unknown Thru calibration. However, the Unknown Thru calibration has fewer connections and therefore has the potential of being more accurate than the Adapter Removal calibration.

Two full 2-port calibrations are performed: one with the adapter connected at port 1, and the other with the adapter connected to port 2. The result of the two calibrations is a single full 2-port calibration that includes accurate characterization and removal of the mismatch caused by the adapter.

Performing an Adapter Removal Cal requires:

- a THRU adapter with connectors that match those on the DUT.
- calibration standards for both DUT connectors.

To select Adapter Removal during a SmartCal, select the **Modify** checkbox in the **Select DUT Connectors and Cal Kits** dialog box. The Cal Wizard will guide you through the steps.

Learn how to perform an **Adapter Removal Cal using ECal**.

### Defined Thru (also known as Known Thru, Cal Kit Thru, ECal Thru, Characterized Thru)

Defined Thru uses the THRU definition that is stored in the Cal Kit file or ECal module. The THRU standard may have worn over time, making it not as accurate as when it was new. Defined Thru is usually more accurate than Adapter Removal, but not as accurate as **Unknown Thru** method.

---

**Notes**

- If performing an ECal, this is the THRU standard in the ECal Module.
- If Defined Thru appears as a potential THRU method in the **SmartCal Wizard**, this means that there is a defined THRU standard in the selected Cal Kit. This could be a **Zero-length Thru**. The SmartCal Wizard will prompt you to connect the required standard when appropriate.

To define a THRU standard in a Cal Kit (not ECal module):

1. Click **Cal > Cal Sets & Cal Kits**.
2. Click **Cal Kit**....
3. Select the Cal Kit from the list.
4. Click **Edit**....
5. Select the Standards tab.

6. Click Add....

7. Select THRU.

8. Complete the dialog box.

The next time you perform a Guided Cal, this Defined THRU standard will be available if the DUT connector types match the THRU standard.

**Known Thru Cal**

Unknown Thru Cal is the preferred THRU method of calibrating the analyzer to measure a non-insertable device.

The Unknown Thru calibration is also known as Short-Open-Load-Reciprocal Thru (SOLR) calibration.

- Very easy to perform.
- Better accuracy than Defined Thru and usually better than Adapter Removal.
- Does not rely on existing standard definitions that may no longer be accurate.
- Causes minimal cable movement if the THRU standard has the same footprint as the DUT. In fact, the DUT can often BE the THRU standard.
- NOT recommended when there is 40 dB or more of combined loss in the Unknown Thru and calibration path. This would NOT allow enough signal to accurately measure at the receiver.

**About the Unknown Thru Process**

SmartCal guides you through the process. Although the following process describes ports 1 and 2, Unknown Thru can be performed on any two ports when using a multiport analyzer.

1. Perform 1-port cal on port 1.

2. Perform 1-port cal on port 2.

3. Connect Unknown Thru between ports 1 and 2.

4. Measure Unknown Thru.

5. Confirm Estimated Delay. This estimate may be wrong if there are too few frequency points over the given frequency span. You can measure the delay value independently and enter that value in the dialog box.
The Unknown Thru Standard

- Can have up to 40 dB of combined loss in the Unknown Thru and calibration path.
- Must be reciprocal: $S_{21}=S_{12}$.
- Must know the phase response to within 1/4 wavelength (see step 5 above).
- Can be the DUT if it meets these conditions.

Unknown Thru Limitations

- Unknown Thru is NOT supported during a TRL calibration from the GUI.
- Unknown Thru CAN be performed using a 4-port PNA-L that does NOT have a reference receiver for each test port. However, a Delta Match Calibration is usually required before the Unknown Thru is measured.
- Cable movement introduces measurement errors.

ECal Thru Method Choices

When the ECal module connectors exactly match the DUT connectors, choose from the following THRU methods:

**ECal Thru as Unknown Thru**  Learn more about Unknown Thru.

- Measures the THRU state of the ECal module as an Unknown Thru.
- The default method when the ECal module connectors match the DUT.
- Very accurate and easy.
- May require a Delta Match Cal.

**Flush Thru (zero-length Thru)**  Learn more about Flush Thru

- Requires an insertable ECal module / DUT.
- Remove the ECal module and connect the two reference planes directly together for a zero-length thru.
- Accurate, but not as easy as ‘ECal Thru as Unknown Thru’.

**ECal (Defined Thru)**
- Measures the THRU state of the ECal module.
- Very easy, but not as accurate as ‘ECal Thru as Unknown Thru’

### Unknown Thru

- Remove the ECal module.
- Then connect a Thru adapter to be measured as Unknown Thru.
- May require a Delta Match Cal.

When the ECal module connectors do NOT exactly match the DUT connectors, choose from the following two methods:

### Adapter Removal

- Can be used with ECal when your DUT is NON-insertable. However, the ECal module MUST be insertable, and the adapter connectors must exactly match the connectors of the DUT as in the following diagram.
- Adapter removal performs 2-port measurements on both sides of the adapter.

### ECal User Characterization

In cases when adapter removal cannot be performed, ECal User Characterization is ALWAYS possible if you have the right adapters. A User Characterization is performed once and stored in the ECal module. However, accuracy is compromised every time you remove, then reconnect, the adapter with the ECal module.
Calibration Wizard

The Calibration Wizard allows you to choose a Calibration method and then perform the calibration.

- How to Start Calibration Wizard
- SmartCal (Guided Calibration)
- Basic Calibration
- Unguided Calibration
- Saving a Calibration

Other Cal Topics

How to start Calibration Wizard

Using Hardkey/SoftTab/Softkey

1. Press Cal > Other Cals > Smart Cal....

The Calibration Window / Channel

During a Guided Calibration, a 'Cal Window' is created for you to view the connection of calibration standards before standards are measured. This Cal Window uses a new Cal channel that is created and duplicates the settings in the channel being calibrated. Correction is ALWAYS OFF for the displayed calibration channel. At the completion of the calibration, the calibration channel and window are deleted.

The measurement of calibration standards can be performed while viewing any VNA window configuration you choose. The Cal Window is appended to your Custom Cal Window setting, and all windows are visible and sweeping below the Cal Wizard before the Measure (cal standard) button is pressed. The windows to be viewed and channels to be swept during the cal process are specified using Remote commands. See an example.

SmartCal (Guided Calibration)
A Guided Calibration automatically determines the calibration type and suggests a calibration kit that matches your DUT connectors.

Guided Calibration can perform the following Cal Types:

- **ALL Cals EXCEPT Open, Short, and Thru Response Cals.**
- **ECal on one or more ports.**
- **TRL - Learn how to do TRL cals**

**Note:** SmartCal DOES allow you to measure calibration standards in any order. However, you must click **Next** and **Back** without measuring standards until you get to the standard you want to measure.

The following dialog boxes appear when performing a Guided calibration on standard channels.

To learn about Calibrations for Application channels, refer to the help topic for the **Application**.

**Select Ports for Guided Calibration** dialog box help

Allows you to select ports to calibrate.

**Select Ports**  All ports are selected by default. User can select which port to calibrate.

**Calibrate Power**  Disabled by default. Learn more.

**Calibrate Uncertainty**  Include measurement uncertainties from calibration.

**Perform Guided Cal**  Check to perform a Guided Power Calibration. Learn more.

**Display Smith Chart During Cal**  When enabled, reflection measurements will be displayed on Smith Chart during calibration.
**Use existing SrcCal when measuring cal standards**  When enabled, and the following conditions are met, the user's existing source power calibration array will be used when acquiring calibration standard data:

- The user is performing a vector calibration only (no power).
- A valid source cal is present in the channel being calibrated.
- The user has elected to enable this feature (via GUI or SCPI).

For greater than 4-port cals, see [External Test Set calibration - Select Cal Type](#).

---

**Select DUT Connectors and Cal Kits** dialog box help

![Select DUT Connectors and Cal Kits](image)

Allows you to select the connector type and Cal Kit for each DUT port to be calibrated.

**Connectors**  To change selection, click the connector field for each DUT port.

If your DUT connectors are **not listed**, you can create your own connector type and calibration kit file. The VNA includes the following example cal kits that can be used as a template. See [Calibration kits](#) for more information.

- If using a gendered (male and female) connector type, select **Type A** as the connector type.
- If using a connectorless device such as on-wafer probes, select **Type B** as the connector type.

**One Connector**  If enabled, then all connectors will be set the same and changing any one of them will change the others.

**DUT Gender**  To select gender of the connector. If the connector has no gender, the pulldown
displays "None".

One Gender  If enabled, then all genders will be set the same, and changing any one of them will change the others.

Cal Kit  Select the Cal Kit to be used to calibrate each test port. The list for each DUT Port displays kits having the same connector type as the DUT.

One Cal Kit  If enabled, then all Cal Kits will be set the same, and changing any one of them will change the others.

Identical ECal models connected?  ECal modules can be distinguished by serial number. This can have implications on your remote SCPI programs.

<table>
<thead>
<tr>
<th>Cal Kit Notes</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>85056K</strong></td>
</tr>
</tbody>
</table>

The 85056K definitions in the analyzer are for 2.92mm standards (2.4mm plus 2.92 adapters). To calibrate 2.4 mm connectors using the 85056K cal kit, select 85056A as the cal kit when you need the sliding load. Otherwise, select 85056D as the cal kit. Both the 85056A and the 85056D kits contain exactly the same standards as the 85056K cal kit WITHOUT the adapters.

TRL

- To perform a TRL Cal, assign a TRL Cal Kit to the lowest port number of each port pair.

- When selecting a TRL Cal Kit on a PNA-L model that requires a Delta Match Cal, and a Global Delta Match Cal is not available, the Cal type will be set to SOLT and a "Could not find a Global Delta Match Cal." message is displayed on the dialog box. If the selected Cal Kit will not support SOLT, the Next button will not be available. Then you must select a different Cal Kit to proceed or Cancel and perform a Global Delta Match Cal.

Modify Cal Type  Check, then click Next, to Modify Cal (Standards AND Thru Method).

For greater than 4-port cals, see External Test Set calibration - Select DUT Connectors.
The current cal kit does not cover the current frequency range of the measurement. Do one of the following to correct the problem:

**Cal Kit Class Category**  Choose from SOLT and TRL. Not available with ECal modules. Click **Edit** to modify the appropriate class assignments.

**Frequency**  Change the frequency range of the active channel.

**Edit**  Modify the class assignments so that a different standard is selected.

**Back**  Select a different Cal Kit that covers the required frequency range.

**Cancel**  Exit the Cal Wizard

**Modify Cal** dialog box help

**Thru #n**  Lists the proposed Thru connections to be made during the calibration process. You can change these Thru connections to better suit your test setup.
- The proposed Thru connections are listed automatically.

- Additional Thru connections can be selected for higher accuracy. Learn more.

### Add Thru

Click to add a Thru connection. Learn more

### Remove Thru

Select a Thru by clicking the "Thru #N" field or the "1st Port / 2nd Port" field. Then click "Remove Thru". This selection is NOT available if the selected Thru is required for the calibration.

### 1st Port / 2nd Port

Click to select the two ports to be included in the Thru connection. The order of the port numbers is not critical.

### Thru Cal Method

Lists the available Thru Cal methods for the specified port pairs.

Learn about the Thru Cal Method choices.

### Cal Type/ Stds

Click to invoke the View / Modify Properties of Cal dialog box

### Do orientation - Appears ONLY if an ECal module is selected for use.

When this box is checked (default) the analyzer automatically senses the model and direction in which an ECal module port is connected to the test ports. If power to the ECal module is too low, it will appear as if there is no ECal module connected. If you use low power and are having this problem, clear this check box to provide the orientation manually.

Orientation occurs first at the middle of the frequency range that you are calibrating. If a signal is not detected, it tries again at the lowest frequency in the range.

### Choose delta match - Available when a Delta Match Cal is required.

- Check, then click Next to invoke the Select Cal Set for Delta Match dialog box.
- Clear - The Cal Wizard uses the Global Delta Match Cal if available.

### View/Detect ECal Characterizations - Appears ONLY if an ECal module is selected for use.

Click to invoke the View ECal Modules and Characterizations dialog box. Displays a list of connected
ECal modules.

**View/Modify Properties of Cal for Ports... dialog box help**

Select calibration type

Another chance to change the Thru method.

Learn about the Thru Cal Method choices.

Advanced

Select the cal method for each connector of the Thru pair.

- **TRL** - Available ONLY when a TRL cal kit was selected for the lowest port number of the port pair.

- **QSOLT**  Available ONLY when "Defined Thru" or "Flush Thru" is selected. "QSOLT 2 <= 1" refers to the receive port 2 and source port 1 (where reflection standards are connected).

- **Enhanced Response** Available ONLY when "Defined Thru" or "Flush Thru" is selected. "EnhResp 2 <= 1" refers to the receive port 2 and source port 1.

- **Transmission Response**  Available ONLY when "Defined Thru" or "Flush Thru" is selected, when Mechanical Cal is selected, and when 2 ports are being calibrated. "TransResp 2 <= 1" refers to the receive port 2 and source port 1.

**View Modify** Click to invoke the Preview and Modify Calibration Selections dialog box.

**Note:** Changes made to the Cal Kit through this dialog are **temporary** that last only for this calibration. To make permanent changes to the Cal Kit, perform Advanced Modify Cal Kits.
Select Cal Set for Delta Match dialog box help

This dialog box appears when a Delta Match Cal is required and Choose delta match was selected.
Learn more.

Displays the Cal Sets that meet the requirements of the Delta Match Cal.

Select either a User Cal Set or Global Delta Match Cal.

If there is no suitable choice for a Delta Match Cal:

1. Click Cancel, then Cancel again to quit the Cal Wizard.
2. Perform either a Global Delta Match Cal or a SOLT cal and save the result in a User Cal Set.
3. Start the Cal Wizard to re-initiate this calibration.
4. Select the Global Delta Match Cal or User Cal Set.

Calibration Steps dialog box help

Note: Calibration can be performed with External triggers. Learn more.

As each new cal step prompt appears, the traces are setup for the next standard measurement. Also, sweeps are triggered continuously until the Measure button is pressed. This way you can view the
integrity of the standard connection.

Prompts for standards to be measured.

**Measure**  Click to measure the standard.

**Done**  Click *after* a standard is re-measured and all measurements for the calibration are complete.

**Next**  Click to continue to the next calibration step. Does **NOT** measure the standard.

If a standard is **NOT** measured, a warning appears and **Done** will not be available after the last Cal step.

**Note:** Smart (Guided) Cal allows you to measure calibration standards in any order. However, you must click **Next** and **Back** without measuring standards until you get to the standard you want to measure.

---

**Sliding Load Measurement** dialog box help

Allows you to measure the sliding load standard.

**To Measure a Sliding Load:**

1. Connect the sliding load to the measurement port following the procedure described in the Calibration Kit User’s and Service Guide.

   **Note:** Do **NOT** set the center conductor to be an interference fit with the center conductor of the testport.

2. Position the sliding element, then click **Measure**. Do not move the sliding element until
measurement is complete.

**Note:** The direction in which the slide moves is NOT important. You can start with the slide at the front and move it backward or start at the back and move it forward. To minimize stability errors it is important to start at one end and move it in the same direction for each of the measurement steps.

3. Measure the sliding load for at least **five** positions for best accuracy.

**Note:** The positions of the sliding element should cover the full length of the slide, but be unequally spaced to reduce the possibility of overlapping data points. Most sliding loads have marks for each slide position.

4. Click **Done** after the final measurement.

5. Disengage sliding load lock (if available), and remove sliding load from the measurement port.

6. Measure the remaining standards.

**How to Verify Sliding Load Calibration Measurements**

Once the calibration is completed, the sliding load can be measured again. The magnitude of the return loss should remain nearly constant as the slide is moved. If the slide spacing was not adequate due to slide position selections, there will be frequency ranges where the magnitude will not remain nearly constant.
Specify delay dialog box help

This dialog appears ONLY when Adapter Removal or Unknown Thru calibrations are performed.

The following values were estimated from the measurement. Most of the time, they are adequate. However, for CW sweep or frequency sweep with large step sizes, the accuracy of the values may be improved.

**Adapter delay** To improve this value, measure and record the delay of the adapter with a dense step size. Enter that value here. The required precision value is the accuracy that is required to characterize the delay value.

**Nominal phase offset** (Waveguide ONLY). To improve this value, measure and record the phase offset of the Waveguide adapter with dense step size. Enter that value here.

When one connector is coax and the other connector is waveguide, the phase offset has an ambiguity of 180 degrees. For consistency, the estimate provided here is always between 0 and 180 degrees. You can change this estimate to any value between -180 degrees and +180 degrees.

**For FCA/Mixer calibrations**, this dialog box appears twice: once for the input frequencies and once for the output frequencies. The values can be slightly different.

Unguided Cal dialog box help

When the **Perform Guided Cal** is unchecked, this dialog box is displayed.

Connect the each standard one by one and click the corresponding standard button.
Save As Calset... Its grayed out when calibration is incomplete. Once the calibration is completed, press this button to save the calibration.

The Calibration Complete dialog box appears after all standards are measured.

**Basic Calibration**

**Using Hardkey/SoftTab/Softkey**

1. Press **Cal > Main > Basic Cal...**

It provides basic calibration. The limitations of basic calibration are:

- one connector type
- one cal kit
- one cal type
- no isolation cal
- no power calibration
**Basic Cal dialog box help**

**Connector Type** Allows user to select single connector type.

**Cal Kit** Allows users to select single Cal Kit. The displayed selection options are according to the selected connector type.

**Port** Allows users to select the port gender. *No Connect* indicates that no port is connected to the VNA.

**Cal Type** Allows users to select calibration type. The displayed selection options are according to the selected cal kit, connector type and gender.

**Save As Calset...** Its grayed out when calibration is incomplete. Once the calibration is completed, press this button to save the calibration.

**Unguided Calibration (Response Cal)**
Unguided Calibration

Using Hardkey/SoftTab/Softkey

1. Press Cal > Main > Other Cals > Response Cal....

The following dialog boxes appear when performing an Unguided calibration:

**Select Calibration Type for Mechanical Standards** dialog box help

Unguided calibration does NOT support cals greater than 2 ports or ECal calibrations.

**Calibration Type Selection**

- 2-Port SOLT
- 1-Port SOL
- TRL - Learn more about TRL
- **Response** - Reflection and Thru (if the active measurement is transmission)

**Cal Configuration**  If not calibrating all test ports, specify which ports to calibrate.

**Back**  Return to Cal Wizard Begin dialog.

**View/Select Cal Kit**  Click to invoke the Select Cal Kit dialog box.

**Note:** When selecting a Cal Kit with an impedance other than 50 ohms (Waveguide = 1 ohm), it is NO LONGER NECESSARY to change the System Impedance setting before performing a calibration. The impedance for the calibration is now derived from the Cal Kit impedance.
Next  Click to continue to Measure Mechanical Standards dialog box.

**Select Cal Type** dialog box help

This dialog box appears ONLY when the selected Cal Type is TRL in the previous dialog box.

**TRL Reference Plane**  Select which standard to use to establish the position of the measurement reference plane.

- **THRU Standard**  Select if the THRU standard is zero-length or very short.

- **REFLECT Standard**  Select if the THRU standard is not appropriate AND the delay of the REFLECT standard is well defined.

**TRL Impedance**

- **LINE Standard**  Specifies that the characteristic impedance of the LINE standard should be used as the system impedance. This ignores any difference between Offset Z0, Offset Loss, and System Z0.

- **SYSTEM Impedance**  Transforms the LINE standard impedance and loss to that of the system impedance for use with the calibration error terms. The TRL calibration will first compute the error terms assuming the LINE standard impedance is the system's characteristic impedance (same as previous LINE selection), then modify the error terms to include the impedance transformation. This should only be used with coax since the skin effect model used is a coaxial model.

Learn how to change System Z0.

To learn to substitute other calibration kits, see Advanced Modify Cal Kits
Select Cal Kit dialog box help

Displays the calibration kit files available for Unguided calibration. Select the desired calibration kit file and click OK.

Choose class type

Edit Class Assignments Allows modification of the selected Cal Kit class assignments.

- To learn to substitute other calibration kits, see Advanced Modify Cal Kits
- Unguided Cal can access only mechanical cal kits #1 through #95, although more cal kits can imported. Learn how.

Note: When selecting a Cal Kit with an impedance other than 50 ohms (Waveguide = 1 ohm), it is NO LONGER NECESSARY to change the System Impedance setting before performing a calibration. The impedance for the calibration is now derived from the Cal Kit impedance.

Measure Mechanical Standards dialog box help

Note: Calibration can be performed with External triggers. Learn more.

Displays the calibration kit file and standards required for the calibration.
Standards may be connected and measured in any order.

Connect the standard to the measurement port and click its associated green button. A check mark indicates the standard has been measured.

If a standard type contains multiple standards, the Multiple Standards dialog box opens to display the multiple standards included in the calibration kit file.

If a sliding load is included in the calibration kit file, the Sliding Load dialog box opens to perform the measurement with the standard.

**Reflection Response** Select EITHER Open or Short standard, then click **Next**.

**Isolation** Requires one load for each test port. Learn more about Isolation. Use when your measurement requires maximum dynamic range (> 90 dB). See also Isolation Portion of 2-Port Calibration.

**Normalize** Available when performing a response cal for any measurement. After Normalize is pressed and the Cal is complete, the data trace is flat when the same physical connections are present on the port. This is similar to Data/Memory, except that the response cal is saved with Cal data and can be applied to other like measurements. Data/Memory is still available after using Normalize. You would usually connect a THRU standard when calibrating a transmission measurement, and a SHORT standard when calibrating a reflection measurement.

**Show Prompts** Check to provide a reminder for the required connection when you click on the standard.

---

**Multiple Standards** dialog box help

Select the standards to be measured.

**Note:** You may see both male and female standards. The Unguided cal has no knowledge of the gender of your connector types. **Choose the gender of your DUT connector**; NOT the test port. Then click OK.

To modify this calibration class to show only one standard, on the Calibration menu, click **Advanced Modify Cal Kits**. Select the Cal kit and click **Edit Kit**. In **Class Assignment**, click **Edit**. Learn more about **Modify Calibration Class Assignments**.
Connect the standard to the measurement port and click its associated button. A check mark in the Acquired box indicates the standard has been measured.

To cover the entire frequency range, you may need to measure more than one standard. The order in which the standards are measured is important. The last standard that is measured will override the others in respect to the frequency range of the standard definition. **Example:** In the case of measuring both a broadband load and a sliding load, you would measure the sliding load last. This is because the frequency range of the sliding load is a subset of the broadband load.

**Saving a Calibration**

SmartCal, ECal, and Unguided Calibrations end with the following dialog box:

**Calibration Completed**

Finish  Save to the channel's calibration register.

Save As User Cal Set  Invokes the Save as User Cal Set dialog box AND save to the channel's calibration register.

Cancel  Calibration is NOT applied or saved.

Learn about Calibration Registers.

Learn about User Cal Sets
Copy Cal Set dialog box help

**Existing Cal Sets** - Lists the previously-saved Cal Set names.

**to** Specify a name for the new Cal Set. Either accept the suggested new name, type a new name, or select a name from the list to overwrite an existing name.

**OK** Saves the Cal Set to the new Cal Set name and exit the dialog message.

Learn about User Cal Sets
Source and Receiver Power Calibration can be performed during a standard S-parameter Guided Calibration. This power cal provides the following enhancements over the standard source and receiver power calibration:

- A source and receiver power cal can be performed for all PNA ports with a single power sensor connection.
- Multiple power sensors can be used to cover wide frequency ranges.
- The receivers are corrected automatically.
- Optionally compensates for an adapter that may be used to connect the power sensor.
- Provides optional match-corrected power measurements.
- Source and Receiver power correction is stored to the Cal Set along with S-parameter correction.

**Note:** A Guided Power Calibration is not accurate when Frequency Offset Mode is enabled.

Learn more about the standard Source and Receiver Power Cals.

In this topic:

- How to perform a Guided Power Cal
- Power Cal Settings dialog box
- Power Cal Settings - Use Multiple Sensors dialog box
- Power Sensor Connection step dialog box
- Correction Methods dialog box
  - Port Subset Correction (Devolve Calibration) - (separate topic)
How to perform a Guided Power Cal

1. In a Standard (S-parameter) channel, setup your measurements (sweep type, frequency range, IFBW, and so forth). A special version of this feature is available on mmWave SMC measurements. Learn more.

2. Connect the Power Meter / Sensor the same as a standard Source Power Cal. Learn more.
   - See Supported Power Meters
   - See Important first-time USB connection note.

3. Start the Cal Wizard, then select Guided (Smart) Cal. Learn how.

On the following Select Ports dialog, check Calibrate source and receiver power, then click Next.

Two Cal Wizard pages later, complete the following dialog.

Power Cal Settings dialog box help
Note: A Use Power Table checkbox (not shown) is available when a mmWave SMC measurement is active. Learn more.

**Power Cal at:** Select the source port for which a Power Calibration will be performed. The source and receiver correction will be transferred to all other sources and receivers involved in the S-parameter measurements.

**Use Multiple Sensors** NOT available with SMC measurements.

Check this box to use one or more power sensors that are configured as PMAR devices. This dialog is replaced with the Multiple Sensors dialog. See following image.

When "Use Multiple Sensors" is cleared (default setting), click Power Meter Settings to configure the power meter.

**De-embed (power sensor) adapter** When the power sensor connector is NOT the same type and gender as the DUT connector for the specified port, then for optimum accuracy, extra cal steps are required to measure and correct for the adapter that is used to connect the power sensor to the reference plane.

Clear this box to NOT compensate for the added adapter.

Check this box to perform extra calibration steps to measure and correct for the adapter.

Then select the **Power Sensor Connector** type and gender of the power sensor. "Ignored" does NOT compensate for the added adapter, just as if the checkbox were cleared.

When this connector matches the DUT connector for the same port, then the PNA assumes that there is no adapter. Extra cal steps are NOT required and the Cal Kit selection is not available.

Otherwise, select the **Cal Kit** to be used to calibrate at the adapter.

See Accuracy Settings below.
"Multiple sensors" are allowed ONLY on standard channels and during a Cal All calibration.

The power sensors that are used as "multiple sensors" MUST be configured PMAR devices.

**Power Cal at:** Select the source port for which a Power Calibration will be performed. The source and receiver correction will be transferred to all other sources and receivers involved in the S-parameter measurements.

**Sensor Settings** Click to start the Sensor Settings dialog, used to **ADD** / Configure an External Device.

**Sensor Grid**

- **Sensor** Select the power sensor and the associated **Start** and **Stop** frequency range.

- **Adapter** When the power sensor connector is NOT the same type and gender as the DUT connector for the specified port, then for optimum accuracy, extra cal steps are required to measure and correct for the adapter that is used to connect the power sensor to the reference plane.
  
  **Clear** this box to NOT compensate for the added adapter.
  
  **Check** this box to perform extra calibration steps to measure and correct for the adapter. Then specify the **Power Sensor Connector** type and gender of the power sensor. When this connector matches the DUT connector for the same port, then extra cal steps are NOT required, and the Cal Kit selection is not available. Otherwise, select the **Cal Kit** to be used to calibrate at the adapter.

- **Remove** Click to remove the power sensor from the list.

- **Add Sensor** Click to add a new line, then click the down-arrow to select a sensor. If a power
sensor does NOT appear in the list, click the **Sensor Settings** button to configure a power sensor.

### Accuracy

**Tolerance** When consecutive power sensor readings are within this value of each other, then the reading is considered settled.

**Max Readings** Sets the maximum number of readings the power sensor will take to achieve settling. Each power reading is "settled" when either:

- Two consecutive readings are within this **Tolerance** value or
- When the **Max Number of Readings** has been met.

The readings that were taken are averaged together to become the "settled" reading.

**Set Power For Best Accuracy** Select to use the power level associated with the best uncertainty for a specific power meter.

### Power Sensor Connection step dialog box help

**Power Level** Set the power level at which the Source Power Cal is to be performed.

It is usually best to perform the Source Power Cal at 0 dBm because the power sensor is calibrated at that level. If 0 dBm is not achievable for your measurement, then set to the power level with the lowest level of measurement noise.

### Correction Methods
Accessing Correction Methods

Using **Hardkey /SoftTab /Softkey**

1. Press **Cal > Main > Correction Methods...**

Using a mouse

1. Click **Response**.
2. Select **Cal**.
3. Select **Correction Methods...**.

Turn OFF Match Correction

During a Guided Power Cal, the match between the power sensor and the VNA source port is measured. The source power correction array is compensated to account for the measured mismatch. In addition, the reference receiver measurement is also compensated to account for the mismatch of the DUT.

**How to turn OFF match correction:**

Click **Cal > Main > Correction Methods...** then click on the **Exclude all ports** button.
The following dialog applies to the Spectrum Analyzer, Modulation Distortion, and Modulation Distortion Converters applications only.

**Power Wave Correction Type**

**Match Corrected** - These waves are calculated from the actual waves and the S-parameters of the DUT to determine the waves if the VNA test ports were perfectly matched. However, you may not want match correction in the following cases:

- When making non-traditional measurements, such as high-power or multiport configurations. Because of added components or reconfigurations, the mismatch measurement may not be valid.
- When you have a remote program that already accounts for the match effects of the sensor.

**Actual Waves** - These are the full error corrected actual waves at device reference planes.

**Response Corrected** - These are raw measurements scaled with the response terms and do not include any match correction.

**Selected Ports Will Correct Power Using Actual Waves** (Spectrum Analyzer, Modulation Distortion, and Modulation Distortion Converters applications only) - This is the same as **Match Corrected**. See description above.

### 8-term Error Correction Model

**Enable 8-term Error Correction Model** - Check to enable the 8-term error correction model for measurement calibration.

The VNA may correct S-Parameters by using either the 12-term or the 8-term error correction model. (The 12-term model is also known as the 10-Term model if the two crosstalk terms are ignored.) Changing the model will affect the S-Parameter and wave measurements.

When measuring a DUT, the VNA will stimulate the DUT in the forward and reverse direction, measure the waves, then calculate the S-Parameters of the DUT. A 2-port VNA forward flow diagram is shown below and will be used to compare the two correction models.

**Forward Direction Block Diagram**

For an 8-term model, the forward direction state will measure the waves \((a_0, b_0, a_3, b_3)\) and will calculate the corrected waves \((a_1, b_1, a_2, b_2)\) at the DUT test ports. For a 12-term model, the VNA will measure the waves \((a_0, b_0, b_3)\) and will calculate the corrected waves \((a_1, b_1, a_2, b_2)\) at the DUT test ports. The 12-term model does not need to measure the \(a_3\) wave because its value is calculated from the \(b_3\) wave and the Port 2 load match characterized during calibration.

The following table describes the tradeoffs between the 8-term and 12-term models:
<table>
<thead>
<tr>
<th>Model</th>
<th>Advantages</th>
<th>Disadvantages</th>
</tr>
</thead>
<tbody>
<tr>
<td>12-Term</td>
<td>Measures fewer waves so it may be faster and have lower noise.</td>
<td>VNA load match changes after calibration will result in errors.</td>
</tr>
<tr>
<td>8-Term</td>
<td>VNA load match changes after calibration will not result in errors.</td>
<td>Measures more waves so it may be slower and have higher noise.</td>
</tr>
</tbody>
</table>

The VNA uses the 12-term model by default because it is fast, low noise, and typically the VNA load match is very stable. However, there are several cases where the 8-term model is a good choice:

- Load Pull measurements vary the load match to determine its effect on the DUT's S-parameters. The 8-term error model is immune to these intentional changes in VNA load match.

- High power test setups often include external couplers, preamps, and attenuators. During calibration the preamps and attenuators may be removed to avoid damaging the cal standards and to optimize signal levels. These components are reattached following calibration. If the components are removed and added on the VNA-side of the couplers, the 8-term model will correct for any changes.

- A preamp may be added behind the couplers of one port to increase the output power. When that port is used as the load-side of the measurement, the load match presented by the output of the preamp may not be very stable over time. The 8-term error model will correct for this load match instability.

Port subset correction

**Enable Port Subset Correction** - Enabling port subset correction to reduce the number of corrected ports.

**Select Ports in Subset** - Selects which ports should be included in a full N-port correction. Unselected ports will be corrected on a “best effort” basis: In other words, these ports will be corrected with an enhanced response calibration if the error terms are available in the calset.

**Clear All** button - De-selects all ports from correction. The button will change to **Select All** to include all ports for correction.

To learn more about Port subset correction, go to Port Subset Correction (Devolve Calibration).

**Correction Results**

Correction results are displayed in this table. This is the same table displayed when the user right-clicks on the Cal pane of the status bar at the bottom of the screen. The following indicate the correction applied:

- **F1** - 1-port calibration.
**eR** - Enhanced response.

**Blank** - No correction applied.

**F** - Multiport calibration.
"Cal All" allows you to calibrate multiple channels in a single calibration session. This not only reduces the number of connections that need to be made, but also the number of cal standard measurements that must be performed.

**Note:** Beginning with the A.12.80 release, Cal All has been extended in order to deal with the new Low Frequency Extension option. If a user has a mixture of LFE and non-LFE channels and they would like to use Calibrate All to calibrate them at the same time, two calibration channels are created to account for the hardware differences between the two situations. When using the GUI or COM to set calibration and stimulus conditions, the settings are applied to both calibration channels. With SCPI, the user can query the primary guided calibration channel using SYST:CAL:ALL:GUID:CHAN:VAL?. This will return the primary calibration channel. When subsequent Guided Cal commands are used, settings will be transferred to the second calibration channel. If there is a desire to set these settings separately, the user should query for all Cal All Calibration channels with SYST:CAL:ALL:GUID:CHAN:LIST?. The user should set values for the primary calibration first, and then secondary calibrations. When initializing the calibration and acquiring steps, use the primary cal all channel number.

Features

Cal All offers a single, optimized calibration procedure for all channels (with some limitations, see below). The optimizations include:

- Minimizing the number of physical connection of standards.
- Minimizing the number of power meter calibration sweeps.
- User-settable power levels for S-Parameter as well as power calibration steps.
- Accounting for different switch and attenuator settings among different channels. This reduces the number of measurements required to characterize different switch/attenuator settings (channel setup differences).
- Cal All will produce the same number and format of Cal Sets (error terms) that would be realized had the calibrations been performed one at a time.
- Calibrate External Sources that are connected to the analyzer using Configure an External Source.
- ECal Extrapolation is supported on Swept IMD and IMDx channels.
- mm Wave measurements are supported.

Limitations

- VMC channels are NOT supported.
- SMC+ Phase with phase enabled is supported using a known delay mixer or a phase reference cal set. S2P file characterized mixers are NOT supported.
- For non-IMD channels, the wideband IF path is used during Cal All. Therefore, non-IMD channels that use the narrowband IF path (for Narrow band pulse measurements for example) or have manually-selected IF frequencies will not be properly calibrated.
- Starting the VNA in Multiport mode is NOT supported.
- Cal All is performed at one IFBW.
All channels that are calibrated are forced into stepped sweep mode.

All channels to be calibrated MUST have the same cal reference plane. In other words, Cal All cannot compensate for any path changes that occur external to the analyzer.

Cal All cannot be used for the following configurations with Swept IMD and IM Spectrum (for these configurations use the Cal Wizard instead):

- Port 3 as input and port 4 as output using an external combiner.

- Using an N5242B with external combiner that has a large path loss difference from the internal combiner.

Cal All nominally uses preset conditions for path configuration switches and attenuators during the calibration (unless you change them via the Cal All Wizard pages). The benefit of the Cal All approach is that it measures all the switch path differences between channels and compensates the error terms appropriately for each channel. However, the “Port 2 Source” configuration setting is not something that Cal All can automatically remove. Therefore, if you are attempting to calibrate a channel with an alternate Port 2 Source configuration, you will need to modify the Cal All settings as follows:

If the Configuration is set to **Src2 out Port 2**, the Cal All settings must be changed to match the RF Path configuration settings for the channel. Use the Mechanical Devices dialog in the Cal All Wizard for this purpose. The dialog on the left shows the default Cal All settings at Preset and the channel settings when Configuration is set to **Src2 out Port 2**. The dialog on the right shows the edited (highlighted) Cal All settings to match the channel settings.
Cal All power offsets must match the power offsets of the client channels. If not, the Source Power Correction may not be correct.

How to perform a Cal All Channels Calibration

Using Hardkey / SoftTab / Softkey

1. Press **Cal > Other Cals > Cal All...**

Selected Channels dialog box help

1. Check the channels to be calibrated.

2. Check the ports to be calibrated. Click on the **Apply to all channels** button to apply the port selections to all channels.
3. Click **Next>**

**Note:** To perform an LO power cal for a mixer channel, set the LO port to a VNA or external source in the Mixer Setup dialog. Then select that port in this dialog.

### Measurement Class Cal Properties dialog box help

Confirm or change the following unique cal properties for each channel to be calibrated. Click a link to learn about these properties.

The properties with *(NOT available in Cal All)* are NOT available in a Cal All calibration as they are in a stand-alone calibration.

The power cal is optional only if none of the selected channels require a power cal.

### Setting Up an Independent Power Calibration

#### Independent Power Calibration

Several applications control internal and external sources in a mode that is often decoupled from the span over which the receivers are swept. This includes, for instance, Differential IQ, and Spectrum Analyzer. Cal All can add a power calibration for any port (including external sources) over an arbitrary frequency span defined by the user.

For all ports selected for an independent power calibration (except for Port 1 Src 2, see below), a power sensor calibration measurement is performed. The resulting source match correction terms are added to the calsets for ALL channels selected for the Cal All calibration. The power calibrations used in Cal All have all the same features as typical power calibrations. These include the ability to specify power offsets, the power at which the calibration is completed, and the ability to use multiple power sensors (note that using multiple power sensors is a feature only available on regular PNA ports – that is, not external sources or auxiliary ports).

#### Port 1 Src2 Calibration

The Port 1 Src2 calibration is a special case: In this case, a calibration is requested for situations where the Port 1 Bypass Switch is in “Combiner Path” mode and either the “Port 3 Bypass Switch” (4-port PNA-X) or the “Source 2 out 1 Bypass Switch” (2-port 2-source PNA-X) is also in “Combiner Path”. Therefore, if a user requests a calibration of this port:
1. Port 1 will also be calibrated at the same frequencies in the combiner path (*note: The user can still elect to add more Port 1 independent cal ranges, but this will be done in “Bypass” mode, not “Combiner mode.”

2. The calibrations for both Port 1 and Port 1 Src2 will be done with both sources on, but offset by 10MHz (to more accurately characterize the behavior during use).

3. These calibrations will ONLY be applied to user channels in which both the Port 1 Bypass Switch and either the Port 3 or Source 2 Out 1 Bypass Switches are set to “Combiner Path.”

Important Notes:

- If a user selects an independent power calibration on a port also used for the typical S-parameter calibration, then the frequencies calibrated will be in addition to those frequencies used via the typical calibration (a separate measurement will be completed at the time).

- Previously a user could select a similar calibration of “LO” ports for application channels (for instance, in a GCX measurement with Port 3 used for LO1, a user can select (via GUI or remote) to do an “LO1” calibration. This will do a power sensor calibration of LO1 (port 3) at the frequencies specified by the channel. This is still available, but if the user selects to do an Independent Power Calibration instead, this will override the selection by the channel.

- If the user has a mixture of LFE (Low Frequency Extension ) and non-LFE channels the calibration will be done by default in the NON-LFE configuration (this is because most applications do not support LFE and external sources and sources like Src2 Out 1 do not have LFE paths). Instead, if it’s desired to do these calibrations in LFE mode, the user must select only LFE channels over which to do the cal all calibration.

- If setting up the calibration remotely, it is not necessary to set the power cal state for the extra power calibrations (for example, “SENS200:CORR:COLL:GUID:PSEN2 ON”). These state commands should only be used to specify the power cal port for the main calibration.

Independent Power Calibration for Cal All Setup

1. Start the **Cal All Wizard**.
2. In the **Measurement Class Cal Properties** dialog, enable Independent Power Calibration by selecting the port(s) to cal then clicking **OK**.
3. If Port 1 Scr2 is a selected port, the Port 1 Src2 Cal Power level is displayed allowing a calibration power level to be entered.

4. To enter the Port 1 Src2 Cal Power level, click in the field then enter a valid calibration power level.

5. In the Power Cal Settings for Port<n> dialog, select the port from the Power cal at dropdown.
6. To add a new Cal range, click the New button.
7. Specify a frequency range for each Range Name by clicking in the corresponding Settings field then clicking on the Edit button that appears.
8. Enter the **Start** and **Stop** frequency and the number of **Points** then click **OK**.
9. Continue the Cal All process by clicking on the **Next** button.

---

### Split Cal and Independent Calibration Channels

Beginning with firmware revision A.13.67.xx, there are two new attributes called **Split Cal** and **Independent Calibration Channels** that allow channels to perform their own calibrations.

#### Split Cal

The Split Cal applies to SMC and GCX channels. If selected, these channels will perform their own calibrations, performing two 1-port calibrations (no thru).

#### Independent Calibration Channels

The Independent Calibration Channels is a comma-separated channel list. Any selected channels will perform their own SmartCal instead of importing the calibration from the SmartCal performed on the special Cal All channel (typically Channel 200).

**Note:** Channels that do not support their own SmartCal cannot be Independent Calibration Channels. They will be filtered out if selected as Independent Calibration Channels.

### Example of Cal All Process

The following is an example showing the typical Cal All process using three standard channels:

- **Ch 1:** 1-2 GHz, 101 points
- **Ch 2:** 2-3 GHz, 101 points
- **Ch 3:** 3-4 GHz, 101 points

Cal All process without Independent Calibration Channel selections:

1. Creates a Cal All channel (typically Channel 200), which goes from 1-4 GHz, 303 points.
2. Cal All tells the Cal All channel to perform a SmartCal.

3. When the calibration is done, the SmartCal on the Cal All channel computes the error terms, and passes them to Ch1, Ch2, and Ch3.

Cal All process with channel 3 selected as an Independent Calibration Channel:

1. Creates a Cal All channel (typically Channel 200), which goes from 1-3 GHz, 202 points.

2. Cal All tells the Cal All channel to perform a SmartCal.

3. Cal All tells Ch 3 to perform its own SmartCal.

4. When the calibration is done:
   a. Channel 200 SmartCal computes error terms, and passes them to Ch1 and Ch2.
   b. Ch 3 computes its own error terms (since it performed its own SmartCal).

Split Cal and Independent Calibration Channels Setup

1. Start the Cal All Wizard.

2. In the Measurement Class Cal Properties dialog, enable Split Cal by selecting True from the drop-down menu:

   ![Measurement Class Cal Properties](image)

3. Select the channels for Independent Calibration Channels as shown below:
3. For any channels that are 1) Split Cal (SMC/GCX), 2) Cal Receiver Port Only at Low Frequency (banded noise only), or 3) Independent Calibration Channels, note the following:

   a. These channels will be performing their own SmartCal calibrations and will NOT inherit a calest from the Cal All calibration.

   b. Connection lists will be organized such that even if several channels are performing the same connection as part of their calibration the user will be prompted only once. For example, if channels 2, 3, and 200 (CalAll channel) will be needing a power sensor on port one, then the user will be prompted once for this connection, and channels 2, 3, and 200 will take power sweeps consecutively.

   c. Settings made from the GUI apply to all active calibrations. If a user wants to set different calibration settings, use the remote UI (with the appropriate channel number). The only exception is that the user may choose specific calibration powers (if allowed) for each channel performing its own Calibration. This is accomplished using the SENSE:CORR:COLL:GUID:PSEN:POW:LEVEL SCPI command and the PowerCalibration:PowerLevel COM command. From the GUI, this is accomplished in the following Power Cal Page:

4. For any channels that are 1) Split Cal (SMC/GCX), 2) Cal Receiver Port Only at Low Frequency (banded noise only), or 3) Independent Calibration Channels, note the following:

   a. These channels will be performing their own SmartCal calibrations and will NOT inherit a calest from the Cal All calibration.

   b. Connection lists will be organized such that even if several channels are performing the same connection as part of their calibration the user will be prompted only once. For example, if channels 2, 3, and 200 (CalAll channel) will be needing a power sensor on port one, then the user will be prompted once for this connection, and channels 2, 3, and 200 will take power sweeps consecutively.

   c. Settings made from the GUI apply to all active calibrations. If a user wants to set different calibration settings, use the remote UI (with the appropriate channel number). The only exception is that the user may choose specific calibration powers (if allowed) for each channel performing its own Calibration. This is accomplished using the SENSE:CORR:COLL:GUID:PSEN:POW:LEVEL SCPI command and the PowerCalibration:PowerLevel COM command. From the GUI, this is accomplished in the following Power Cal Page:

**Note:** Some channels do not support setting the cal power level. If this is the case, then
the field will be disabled.

5. On the last **Cal All Wizard** page, the **Description** column specifies whether the channel is being calibrated by Cal All or performing its own calibration: If it is being calibrated by Cal All, it displays which Cal All channel is performing the calibration.

**Note:** If a user chooses to **Enable Extra Power Cals**, then the only client channels that are participating in Cal All as normal will inherit the corresponding power calibration terms (this is most often used with SA, which cannot be an Independent Calibration Channel).
This dialog shows the Power, Attenuator, and IFBW settings for the Cal All calibration. The default values for the Cal All session are the preset values of a standard S-parameter channel. These values are not necessarily the same as those of the channels that are selected for calibration. When there are differences in measurement path (switch) settings between the Cal All channel and the selected channels, these differences are detected by Cal All and additional measurements are made for each path condition. These additional measurements allow Cal All to produce error terms appropriate for each of the selected channels. In general, the Cal All session should be performed at a power level that is high enough to prevent noise in the error terms. However, an increase in power could cause compression or damage to the analyzer receivers. The following settings allow you to increase the power level ONLY during the Cal All session.

**Power Limit (Disable)**

Cal All shows you when power limits are enabled. This setting provides you a convenient way to TEMPORARILY disable these limits in order to take advantage of the power settings available in Cal All. If power limits are on, your DUT is probably a high-gain device and the attenuator settings in your channels are high resulting in lower power at the cal reference plane. This lower signal can result in noisier measurements during the acquisition of cal. This situation is precisely what Cal All is intended to improve. Cal All allows you to configure the calibration conditions for better signal-to-noise performance during the cal while leaving your DUT conditions alone. You can elect to clear the “Disable Power Limits during cal” checkbox when you prefer to calibrate at a higher power level than is allowed by your limit. The limit is restored after the Cal All session.

**Source / Receiver Attenuator**

By default, the Cal All calibration is performed with Source and Receiver attenuators set to 0. Change the Source or Receiver attenuator settings when external hardware (such as a booster amplifier) would cause the analyzer receivers to be compressed or damaged.

You may also want to change the attenuator or path configuration settings to force the cal channel to match settings of the selected channels. If all of the selected channels are set to identical hardware settings, it may be better to apply these settings to the cal channel. For example, if your channels all use a 5 or 10 dB attenuator step at port 1, you might elect to change the Cal All
channels to use the same low attenuator settings. This will result in the cal measurements being made under the same path conditions as the channel and it will eliminate the need to mathematically compensate for the difference. However, if large attenuator values are used, the default Cal All settings will likely improve your results.

**S-Parameter Cal Port Power**

Set the power level at which the S-Parameter cal is performed.

**Power Offsets**

Power Offsets are channel-scoped. Consequently, offsets that you already set are NOT automatically copied to the Cal All session. This setting allows you to also apply a Power Offset during the Cal All session. Learn about Power Offsets.

**Noise Reduction**

This button accesses the following dialog for settings that help reduce trace noise and the noise floor which can lead to better dynamic range and more accurate measurements. Learn more.

![Noise Reduction](image)

**IF Bandwidth**

Set the IFBW used to perform the Cal All calibration. The default IFBW setting of 1 kHz is a good nominal setting for most measurements. Lowering the IFBW removes noise from the calibration measurement, but also causes slower sweeps.

**Always ON**

Check to enable averaging.

**Average Factor**

Specifies the number of measurements that are averaged. Range of 1 to 65536 (2^16).
Average Type

Sweep  Each data point is based on the average of the same data point measured over consecutive sweeps.

(Sweep) Restart  Begins a new set of measurements that are used for the average. Applies only to Sweep averaging - NOT Point.

Point  Each data point is measured the number of times specified by the Average Factor, and then averaged, before going to the next data point.

Reduce IF BW at Low Frequencies

When this box is checked, the VNA uses a smaller IF Bandwidth than the selected value. Learn more .

Mechanical Devices

This button accesses a dialog that shows the settings for all active channels. These settings are shown side-by-side for easy comparison. Learn more .

Select DUT Connectors and Cal Kits dialog box help

For each DUT port:

- Select the connector at the calibration reference plane (where the cal standards will be connected).
- Select the cal kit to be used.

Check Modify Cal to change the Thru method. An Unknown Thru cal is performed by default. Learn about THRU methods .

Learn more about this dialog .
**Power Cal Settings** dialog box help

A guided power cal is performed on the source ports for the Cal All calibration.

This dialog is displayed for each source port to receive a power cal.

To perform an LO power cal for a mixer channel, set the LO port to a VNA or external source in the Mixer Setup dialog. Then select that port in the Selected Channels dialog.

- To use the **same** power sensor for all power cals, do **NOT** check Use Multiple Sensors.
- To use **different** power sensors, check **Use Multiple Sensors**. The sensor must be configured as a PMAR device. Learn how.

Learn about this dialog box.

---

**Cal All Summary** dialog box help

This page is a summary of the Cal All settings. Confirm the settings, then click **Next >** or **< Back** to change settings.
**Cal Steps**  dialog box help

Follow the prompts to connect each standard. Then click **Measure**.

Click **Re-measure** if necessary.

Then click **Next >**

**Finish Cal**  dialog box help

Click **Finish** to save the Cal All session results to Cal Registers.

Or click **Save As User CalSet**, then enter a prefix title. The Meas Class and channel number are appended to this prefix to save to a User Cal Set for each calibrated channel.

What are Cal Sets

At the completion of a calibration, all calibration data is stored to a Cal Set. The Cal Set can be applied later to any channel that has the same stimulus settings as the Cal Set, thereby saving the time it takes to perform another calibration. The following data is saved to a Cal Set:

- Name
- Cal Set Description
- Cal Set Attributes - stimulus settings, cal type, port association
- Standards data - The “Standards data” container in the Cal Set is intended for internal use only. External access is provided for use in diagnosing calibration problems. Users should not form any expectations as to the presence of the data or the naming conventions used.
- Error term data
- GUID (Globally Unique IDentifier)
Cal Registers and User Cal Sets

There are two types of Cal Sets:

- **Cal Registers** (channel specific)
- **User Cal Sets**

Calibration data is automatically saved to a Cal Register at the end of every calibration. You can also choose to save the cal data to a User Cal Set.

Preset clears all PNA settings but the data inside a Cal Set is not volatile until, for example, another calibration is performed. Also, preset will disassociate all Cal Sets from any channel. But the process of calibration will reestablish that association.

**Calibration Registers**

Calibration Registers are designed to simplify calibrations for most users. When a calibration is complete, the data is automatically saved to the channel's Cal Register, overwriting (or appended to) the previous cal data stored in that register. This concept is similar to 'legacy' Vector Network Analyzers.

- Every channel has ONE dedicated Cal Register. They are named CHn_CALREG, where n is the channel number. The name cannot be changed.
- Data in Cal Registers are less permanent than User Cal Sets because they are the default container for a new calibration. However, preset never clears the contents of any Cal Set.
- Cal Registers can be applied to other measurements, but ONLY on the same channel as the Cal Register.

**User Cal Sets**

At the end of a calibration, you can choose to also save cal data to an existing or new User Cal Set.

- User Cal Sets can be applied to any number of channels simultaneously.
- User Cal Sets are named by you for easy identification.
- You can have an unlimited number of User Cal Sets.
- At any time, you can copy Cal Register data to create a User Cal Set. See Cal Set Properties.
- User Cal Sets are never cleared unless the user deletes them or uses them in a new calibration.

**Appending Data in a Cal Set**

---

530
At the end of a calibration, data is saved to the channel's Cal Register and, if you choose, to a User Cal Set. When you choose to save to an existing User Cal Set, the analyzer attempts to append the new error terms to the existing User Cal Set. The existing Cal Set data is completely overwritten UNLESS the new data can coexist with the existing data according to the following two rules:

- The stimulus settings between the two Cal Sets must be identical. Otherwise, the new cal will overwrite the old cal and one will not be able to append to the existing calibration. The comparison is strict, and includes the leveling mode and the source power state (including AUTO vs ON). In addition, frequencies, IFBW, source and receiver attenuators, source power value, power slope, IF Path, Shift LO mode, and any path settings are also compared. Therefore, it is highly recommended that immediately before starting the second calibration, recall the first calibration and choose to change the stimulus to match the Cal Set. Once you have a complete Cal Set, you can perform normal operations such as turning on receiver leveling, etc.

- The new cal must involve different ports from the existing cal.

**Note:** The reason for this behavior is that the S-parameter channel, unlike most of the applications, supports multiport. Therefore, it is possible that a user may need to accumulate separate calibrations for different subsets of ports

For example:

**Case 1** - An existing Cal Set contains a full 2-port cal between ports 1 and 2. Using the same stimulus settings, you perform a 1-port cal on port 3. At the end of the cal, you click *Save As User Cal Set* and select the existing full 2-port User Cal Set.

**Result:** The 1-port cal is appended to the 2-port User Cal Set. There is NO overlap between them.

**Case 2** - Same situation as Case 1, except the 1-port cal is performed on port 1.

**Result:** The Cal Set will contain a 1 port cal on port 1 and a 1 port cal on port 2. The overlapping tracking terms are removed rendering the original full 2 port cal invalid.

### How to Manage and Apply Cal Sets and Cal Types

The analyzer attempts to apply a Cal Set and turn error correction ON for ALL of the measurements on the active channel. This may not always be possible. For example, suppose a channel contains both S11 (reflection) and S21 (transmission) measurements. If a Cal Set that contains only an S11 Cal Type is applied to that channel, the Cal Set does not contain the error terms to correct the S21 measurement. Error correction is turned ON for the S11 measurement and NOT turned on for the S21 measurement.

There are two ways to apply an existing Cal Set (Cal Register or User Cal Set) to a measurement:

1. Recalling an Instrument State with Cal data (.cst file) - A .cst file contains an Instrument State with all measurement attributes AND a ‘pointer’ to the Cal Set that was used to calibrate the measurement. Before
saving a .cst file, be sure that a User Cal Set (NOT a Cal Register) is being used for the measurement. Because Cal Registers are automatically overwritten when a new calibration is performed, it is likely that the Cal Register data will change before the .cst file is recalled.

2. Create a new measurement and select a Cal Set to apply to the active channel.

**Note:** NEVER copy or modify Cal Sets from Windows Explorer or other applications. Cal Sets should only be accessed through the VNA Application.

**How to select and apply a Cal Set to the active channel**

**Using Hardkey/SoftTab/Softkey**

1. Press **Cal > Cal Sets & Cal Kits > Cal Set...**

**Cal Set Selection** dialog box help

This dialog allows you to manage and apply Cal Sets

Since the number of Cal Sets you can have is limited by the amount of analyzer memory, old Cal Sets (with 'stale' data) should be deleted or overwritten.

- Learn about Cal Registers.
- Learn how to View the Error Terms of a Cal Set.
To apply a Cal Set to the active channel, click a row to select that Cal Set, then click OK. The Cal Set used by the currently active channel is indicated with dotted outline. Currently selected Cal Set is indicated with blue highlight.

Note: A Cal Set must have been generated from the same measurement class as the active channel in order for it to be applied.

Columns: click a heading to sort by that column

**Cal Set Name** Name to identify the Cal Set.

**Class** Indicates the type of channel that created the calset.

**Active Channels** Channel numbers that are currently using this Cal Set. A blank entry means it is not currently in use.

**CalType / Ports** Type of Cal contained in the Cal Set. Learn about applying appropriate Cal Types.

**Cal Type Abbreviations:**

1P, 2P, 3P, 4P... Port list indicating which ports were calibrated.

+ - Indicates source and receiver Power Correction is included for the ports that are listed. So 2P+(2,3) means that the test and reference receivers on ports 2 and 3 are power calibrated.

R - Response (parameter).

ER/x-y Enhanced Response, where x is the receive port; y is the source port. ER/2-3, therefore, corrects S23.

ER+/x-y Enhanced response plus power. Also contains tracking terms for bx and ay.

**VMC** Vector Mixer Cal

**SMC** Scalar Mixer Cal

**Date** Date and time the Cal Set was last modified.

Buttons

**Select** Applies the selected Cal Set to the active channel. If the stimulus settings of the Cal Set and channel are different, a choice must be made. This button is greyed-out if the highlighted Cal Set is not compatible with the active channel.

**Unselect** Available ONLY if the selected Cal Set is being used by the active channel. Click 'Unselect', then click OK to exit with the Cal Set un-applied.
**Close**  Exit the dialog box. Performs no further action.

**Drop-Down Selector**

**Channel**  To choose the active channel.

**Edit**  This includes Properties, Copy, Delete and Delete All.

**Properties**  Starts the Cal Set Properties dialog box. This allows you to view all of the Cal Set properties.

**Copy**  Invokes the Copy Cal Set dialog box. Type a name for the copy of the selected Cal Set data.

**Delete**  Permanently deletes the Cal Set after you choose OK to a warning prompt.

**Delete All**  Permanently deletes ALL listed Cal Sets and Cal Registers after you choose OK to a warning prompt.

---

**Cal Set Properties** dialog box help

![Cal Set Properties dialog box](image)

Allows you to view all of the Cal Set properties.
**Drop-Down Selector**

**Edit**  This includes Cal Set Name and Description.

- **Cal Set Name**  Edit name of the User Cal Set. You CANNOT change the name of a Cal Register.

- **Description**  Descriptive text to further identify the Cal Set.

**Buttons**

- **OK**  Applies the changes on Cal Set name or description if any and then closes the dialog box.

- **Cancel**  Discard changes made to the Cal Set name or description.

Learn how to [View the Error Terms of a Cal Set](#).

**Note:** Only temperature compensated calibrations show the temperature in the Calset Properties dialog.

---

**Correction Properties** dialog box help

**Tabs**

**Summary**
Allow you to view summary of correction properties including Correction, Receiver Power, Source Power and Correction Level.

**Channel Selector** Select the channel that you want to view the summary of correction properties.

**Cal Set**
Allow you to view the Cal Set properties. Shows the same data as shown in the Cal Set Properties dialog accessed from the Cal Set Selection dialog.

**Channel Selector** Select the channel that you want to view the Cal Set properties.

**Stimulus Setting Different between Cal Set and Measurement**

**Select Cal Set -- Choose Stimulus Settings** dialog box help
The Cal Set contains the channel stimulus settings that were in place when the Cal Set was saved. This dialog appears when the Cal Set channel settings are different than those of the channel to which the Cal Set is being applied. Choose between the following options. (See above image).

- A. Keep the Active Channel Stimulus settings. Interpolate if possible.
  - If the Cal Set frequency range is greater the active channel, then Interpolation will be turned ON. Learn more about Interpolation Accuracy
  - If the Cal Set frequency range is less than the active channel, then this option is not available.

- B. Keep the Cal Set Stimulus settings. The Active Channel stimulus setting are changed.

OK  Make the change.

Cancel  Cal Set will NOT be applied.

Examples of Cal Set Usage

The following examples show how Cal Sets increase flexibility and speed in making analyzer measurements.

- Using one User Cal Set with many Channels
  - Using one Measurement with many Cal Sets

Using one User Cal Set with many Channels

It is possible to do one calibration, then apply it to several channels.

An example:

During a manufacturing process, you may have many calibrated channels. You may wish to continuously cycle through the measurements and examine them individually. Occasionally, you may wish to refresh the calibration without having to recreate all the measurement state files.

Here is how: Examine the stimulus settings for each channel. Then make the User Cal Set stimulus range a super-set of the whole group. Each channel can then use the same User Cal Set. Some calibrations will be interpolated. Note: Make sure that interpolation is turned on.
Notice in the following image, Cal Set 78 is used on more than one channel, in this case Channel 5 and 16.

<table>

Using one Measurement with many Cal Sets

The drawback with having one very large User Cal Set associated with many instrument states could be a loss of accuracy due to interpolation. In such cases, consider using one User Cal Set for each stimulus setting. The stimulus conditions can then be changed for a channel by applying different User Cal Sets. Other settings (window setups, measurement definitions, scaling, limits, markers) will not change. This may result in faster state changes than if you saved and recalled *.cst files for each set of stimulus conditions.

**Example #1:** An amplifier needs to be measured at several input power levels. Calibrate at several power levels and save each calibration in a separate User Cal Set. Then, apply the User Cal Sets to the single measurement consecutively.

**Example #2:** Making an S21 Measurement, you need to measure both wide span and narrow span characteristics of the device. One Cal Set covers the wide span setup; another the narrow span setup.

Archiving Cal Sets using .cal or .csa files

Because User Cal Sets can easily be deleted, provide extra backup by also saving your calibration as a .cal or .csa file (see saving a .cal file).
Example:

One person performs a calibration, names and saves it as a User Cal Set. This Cal Set is available for any other person to use. A second user could accidentally delete or modify the User Cal Set requiring the originator to repeat the calibration.

Security can be provided for calibration data by saving the Cal Set to a .cal file or .csa file. At a later time, the file could be recalled and the original calibration restored.
Error Correction and Interpolation

Error Correction and Interpolation settings work together to provide you with the highest level of calibration accuracy possible.

- How to set Error Correction
- Error Correction
- Viewing Correction Levels
- How to set Interpolation
- Interpolation Accuracy

See other Calibration Topics

How to set Error Correction

Using Hardkey/SoftTab/Softkey

1. Press Cal > Main > Correction > Channel Correction On|Channel Correction Off.

Error Correction

The Error Correction ON setting means that the calibration error terms are applied to the measurement. Error Correction is automatically turned ON when a calibration is performed or if a Cal Set is applied to a measurement. The VNA attempts to turn error correction ON for ALL of the measurements on the active channel. This may not always be possible when applying Cal Sets. For more information, see Applying Cal Sets.

When full 2-port error correction is ON, both forward and reverse sweeps are required to gather all 12 error terms, even if only one reflection measurement is displayed. This may result in a higher measurement speed than expected. Learn more.

You can always turn Error Correction OFF for the active measurement by clicking Correction OFF. The VNA will turn Error Correction OFF automatically when making stimulus changes under some conditions. To turn correction back ON, click Correction ON. Then:
If Interpolation can NOT be performed, a dialog box will ask if you would like to change the stimulus settings to those of the applied calibration. Click OK or Cancel.

If Interpolation can be performed, the stimulus setting will change and correction turned ON.

### How to set Factory Error Correction

**Using Hardkey/SoftTab/Softkey**

1. Press Cal > Main > Factory Cal On | Off

---

**Factory Calibration**

The factory calibration is a calibration which is done at the factory shipment or service centers for periodical calibration.

**Viewing Correction Level**

The correction level provides information about the accuracy of the active measurement. Correction level notation is displayed on the status bar for different calibration types like response, full 2-port, TRL, or power calibration.

#### To View Correction Levels:

Right-click in the display, select Customize Display, select Toolbars tab, then select Status Bar. The status bar appears and displays the following items:

<table>
<thead>
<tr>
<th>Correction Level</th>
<th>Accuracy</th>
</tr>
</thead>
<tbody>
<tr>
<td>C N-Port</td>
<td>Highest</td>
</tr>
<tr>
<td>C Enh Resp</td>
<td></td>
</tr>
<tr>
<td>Enhanced Response</td>
<td></td>
</tr>
<tr>
<td>Response</td>
<td></td>
</tr>
<tr>
<td>Factory</td>
<td>Lowest</td>
</tr>
<tr>
<td>Factory calibration at test port</td>
<td></td>
</tr>
<tr>
<td>No Cor</td>
<td></td>
</tr>
<tr>
<td>No Correction</td>
<td></td>
</tr>
<tr>
<td>C*</td>
<td>Uncertain</td>
</tr>
<tr>
<td>Interpolated</td>
<td></td>
</tr>
<tr>
<td>CΔ</td>
<td>Uncertain</td>
</tr>
<tr>
<td>Changed</td>
<td></td>
</tr>
</tbody>
</table>
**C N-Port**

Full N Port correction, where N is the number of fully calibrated ports.

This correction is applied to SParameters.

If the calibration was performed with a receiver power cal, this correction can be applied to receiver measurements. (eg: a1, b1, A, R1, b1/a1). (See Correction Methods for the ability to control the level of calibration applied to receiver measurements).

**C Enh Resp**

Enhanced response cal is an aggregate of a 1 Port calibration and a transmission response cal.

This correction is applied to reflection and transmission parameters in either the forward direction (S11, S21) or the reverse direction (S12, S22) depending on how the calibration was performed.

For reflection measurements, Enhanced Response correction is equivalent to C 1-Port correction. For transmission measurements, the correction is equivalent to a match-corrected transmission response cal.

**C Resp**

Response calibrations are one term calibrations that correct for the frequency response of the measurement. It does not correct for impedance mismatches.

**No Corr  No Correction**

The following will cause the VNA to turn Error Correction OFF for the channel:

- Decrease the start frequency
- Increase the stop frequency
- Change start frequency, stop frequency, or number of points with Interpolation OFF.
- Change sweep type

The correction pop up pane, accessed by right-clicking on the Correction item in the status bar, indicates port by port correction methods for a VNA with 12 or less test ports. This table is updated when the port subset correction is turned on to reflect the correction methods being applied. In the image below, the pane indicates a full 4-port calibration. On the right, the table indicates the methods after the correction was devolved to ports 1, 2, and 3.
The $F^+$ indicates that the port had the full error correction applied. The $e^+$ indicates that the enhanced response correction method was applied to the port.

**Note:** For more information about port sub-setting, refer to Port Sub-Setting Examples.

**C* Interpolated Correction**

"C star" appears in the status bar when a measurement is being interpolated. See Interpolation (above) and Interpolation Accuracy.

**CΔ Changed Settings**

"C-delta" appears in the status bar when one or more of the following stimulus settings change. The resulting measurement accuracy depends on which parameter has changed and how much it has changed. For optimum accuracy, recalibrate using the new settings.

- Sweep time
- IF Bandwidth
- Port power
- Stepped sweep enabled/disabled
How to set Interpolation

Using Hardkey/SoftTab/Softkey

1. Press Cal > Main > Interpolation ON|OFF.

Interpolation

Calibration interpolation adjusts calibration error terms to match changes to the following settings that you make AFTER a calibration is performed or a Cal Set applied.

The Interpolation ON setting means that interpolation is **enabled** for the active measurement. This does not necessarily mean that the measurement is interpolated. When enabled (ON), if interpolation becomes necessary because you change any of the following stimulus settings, **then** interpolation will be applied. When stimulus settings change while interpolation is OFF, interpolation is NOT applied but instead, error correction is turned OFF.

Interpolation occurs (if enabled) when you change any of the following settings:

- Start frequency increased
- Stop frequency decreased
- Number of points

**Note:** Decreasing the start frequency, or increasing the stop frequency will always turn correction OFF. (Exception: Power Calibration DOES extrapolate to the start and stop frequencies.)

Interpolation Accuracy

When a measurement is interpolated, the accuracy of the measurements cannot be predicted. It may be affected significantly or not at all. Identifying measurement errors in these cases must be determined on a case-by-case basis. In general, the magnitude and phase stimulus from the VNA and the response from the DUT need to be smooth and continuous for measurement interpolation to give accurate results.

Significant measurement inaccuracy WILL occur when the phase shift response between measurement points increases changes more than 180 degrees. The VNA will incorrectly interpolate the new phase data. For more information, see phase accuracy.

In general, the chances of significant inaccuracy increases when interpolating measurements under the
following conditions:

- when frequency span between measurement points becomes much greater.
- when measurement frequencies are above 10 GHz where phase changes happen more rapidly.
- when interpolating across frequency band crossings. Learn more about band crossings.

**Note:** When the interpolation algorithm encounters an abrupt or large change in the response magnitude or phase, such as can occur at band crossings, large interpolation errors can be included in the displayed data. These errors can be seen as steps or spikes. If this occurs, consider turning off interpolation, changing the measurement parameters, or creating sweep segments that skip over the band crossings.
Using ECal

This topic discusses all aspects of performing an ECal:

- ECal Overview
- Connect ECal Module to the Analyzer
- How to Perform a Calibration Using ECal

See Also:

ECal User-Characterization
Perform a 4-Port Cal with ONE 2-Port ECal Module
Restore ECal Module Memory

See other Calibration Topics

ECal Overview

ECal is a complete solid-state calibration solution. Every ECal module contains electronic standards that are automatically switched into position during a measurement calibration. These electronic standards have been measured at the factory and the data stored within the memory of the ECal module. The analyzer uses this stored data, along with the measured data, to calculate the error terms for a measurement calibration.

ECal modules are available in 2-port and 4-port models and a variety of connector types, covering many frequency ranges. See Analyzer Accessories for more about available ECal modules and ordering information.

You can perform the following calibrations with ECal:

- 1-Port Reflection calibration
- Full 2-Port calibration
- Full 3-Port calibration
- And so forth...

Verify the validity of a mechanical or ECal calibration with ECal confidence check.
Care and Handling of ECal Modules

You can improve accuracy, repeatability, and avoid costly repair of equipment in the following ways.

- Practice proper connector care. See Connector Care.
- Protect equipment against ESD damage. Read Electrostatic Discharge Protection.

Power Level into an ECal module

- NEVER exceed the following Damage levels to the ECal module.
- For highest accuracy, do not exceed the following ECal Compression levels when calibrating:

<table>
<thead>
<tr>
<th>Model</th>
<th>Compression level</th>
<th>Damage level</th>
</tr>
</thead>
<tbody>
<tr>
<td>N469x series</td>
<td>-5 dBm</td>
<td>+10 dBm</td>
</tr>
<tr>
<td>N4432x series</td>
<td>-7 dBm</td>
<td>+20 dBm</td>
</tr>
<tr>
<td>N4433x series</td>
<td>+7 dBm</td>
<td>+20 dBm</td>
</tr>
<tr>
<td>N4431x series</td>
<td>+7 dBm</td>
<td>+20 dBm</td>
</tr>
<tr>
<td>N755xA series</td>
<td>-15 dBm</td>
<td>+10 dBm</td>
</tr>
<tr>
<td>8509x series</td>
<td>+9 dBm</td>
<td>+20 dBm</td>
</tr>
</tbody>
</table>

The power level can be increased after calibration with minimal impact on measurement accuracy.

Connect ECal Module to the Analyzer

ECal modules are controlled and powered through a USB connection. When you connect the module, the type of module, frequency range, and connector type are automatically recognized.

Important Note: DO NOT connect/disconnect USB devices during ECal calibrations. Doing so may cause problems with the calibration.

See Important First-time USB connection note.

ECal modules connect to the USB port on the front or rear panel of the VNA.
1. Wear a grounded wrist strap when making connections.

2. Connect the USB cable **Type B** connector to the ECal module and the USB cable **Type A** connector to the USB connector of the analyzer, as shown in the following graphics.

![ECal Module USB Port](image1) ![Analyzer Front Panel USB Port](image2)

**Notes:**

- Unused ECal modules that have completed a calibration may remain connected to the USB port.
- You can connect and disconnect the ECal module while the analyzer is operating. However, DO NOT connect or disconnect the module while data transfer is in progress. This can result in damage or at least corrupted data.

---

**How to Perform a Calibration Using ECal**

Select an ECal module that has connectors of the same type and gender as the DUT. If such an ECal module is not available, a module with connectors different from the DUT can be used by using Advanced Settings or User Characterization. See Also: Perform a 4-Port Cal with ONE 2-Port ECal Module

Connect the ECal module ports to the analyzer ports. During the calibration process the analyzer can either automatically detect how the ECal module is connected, or the orientation can be performed manually.

1. Connect the ECal module USB cable to the analyzer USB. See Connect ECal Module to USB.

2. Allow the module to warm up until it indicates READY.
3. Enter the analyzer settings. See Set Up Measurements.

4. Do one of the following to start the Calibration Wizard

Using **Hardkey/SoftTab/Softkey**

1. Press **Cal > Main > Other Cals > Ecal...**

2. In the Guided Calibration Wizard dialog box (step 2), select ECal option from the Cal Kits combo box.

---

**Select Calibration Ports and ECal Module** dialog box help

Allows you to select calibration type and settings.

**Cal Type Selection / Configuration** Select the number of ports to calibrate. Then select the port number configuration.

- **4 Port ECal**
- **3 Port ECal**
- **2 Port ECal**
- **1 Port ECal- (Reflection)** Advanced Settings are not available.

**View/Select ECal Module** Click to Select the ECal module if more than one ECal module is connected to the USB. Also, Select the User Characterization within the module. Learn more about User Characterization.

**Show Advanced Settings** Check to display the Advanced Settings when Next is clicked.

**Calibrate source and receiver power** Check to perform a Guided Power Calibration. Learn more.
**Note:** ECal isolation is not performed. The inherent isolation of the analyzer is better than that attained with correction using an ECal module.

**Note:** Terminate any unused ECal ports with a 50 ohm load. Refer to [Determining Effects of Not Terminating Unused ECal Ports](#).

**Note:** Do not connect any USB memory during ECal calibration.

---

**ECal module not found** dialog box help

When this dialog appears, the ECal module is not connected or has not been recognized by the network analyzer.

**Retry**  Check the USB connections and click to continue.

**Notes:**

- If your ECal module is not detected, try to unplug, then reconnect to the USB.

- When the ECal module is connected to the network analyzer for the first time, it may take approximately 30 seconds for the analyzer to recognize the module and make it available for calibration.

- For best accuracy, allow the ECal module to warm-up until it indicates READY.

- Keysight 8509x and N4431 ECal modules, when first connected, draw significantly more current than other modules. This could cause the USB to stop working in certain situations. [See USB limitations](#).

- See [Connect ECal Module to USB](#).

---

**Select Module and Characterization** dialog box help
Note: User Characterizations listed in the dialog below that have no temperature shown cannot be temperature-compensated during calibrations. Also, this is true of CalPod as ECal characterizations that were performed prior to this temperature capability in the VNA firmware, because temperature was not measured-and-recorded. However, the firmware will still recognize those and allow them to be used for cals.

**ECal Module** Select one of the ECal modules that are connected to the analyzer.
Detect Connected ECals  Click to rescan the USB for ECal modules.

Available Characterizations

**ECal Module Memory** - Displays the factory and [user characterizations](#) that are stored in the ECal module.

**Instrument Disk Memory** - Displays the user characterizations that are stored in Disk Memory. [Learn more User Characterizations in Disk Memory](#).

**Temperature** - Displays the temperature reading at the time a characterization was performed.

The information in the Calset Properties dialog confirms which of those characterizations were temperature-compensated during calibration. The *(compensated)* notation for a CalPod indicates that the CalPod’s characterization was temperature-compensated when that cal’s error terms were computed (it also implies the factory thermal data for that CalPod must be present on the VNA). Whereas the *(uncompensated)* notation indicates that temperature-compensation could not be done for that characterization during the cal, which could mean either that one is an older characterization that didn’t record its temperature, or else factory thermal data for that CalPod serial # was not installed on the VNA.

Select the characterization data to use for the calibration. Once selected, that characterization becomes the default selection until the analyzer is turned OFF and restarted. When restarted, **Factory** again becomes the default selection.

---

### Error: Frequency Range dialog box help

When this dialog appears, the current cal standards (or ECAL module) does not cover the current frequency range of the measurement. Do one of the following to correct the problem:

**Cal Kit Class Category**  Not available with ECal modules.

**Frequency**  Change the frequency range of the active channel.

**Edit**  Not available with ECal modules.
Back  Select a different characterization that covers the required frequency range.

Cancel  Re-characterize the module with an increased frequency range.

**Select DUT Connectors and Cal Kits** dialog box help

If the ECal module or selected User Characterization has more than one connector type, then the following dialog box is presented which allows you to describe the DUT connector type. Otherwise, click next to proceed to **Advanced Settings** (if checked) or **ECal Steps**.

**Connectors**

The available connectors are listed for each DUT port.

**Advanced Settings** dialog box help

**Thru #n**

Lists the proposed Thru connections to be made during the calibration process. You can change these Thru connections to better suit your test setup.

- The proposed Thru connections are listed automatically.
- Additional Thru connections can be selected for higher accuracy. Learn more.
For Balanced measurements, learn which Thru paths to select.

Add Thru

Click to add a Thru connection. Learn more

Remove Thru

Select a Thru by clicking the "Thru #N" field or the "1st Port / 2nd Port" field. Then click "Remove Thru". This selection is NOT available if the selected Thru is required for the calibration.

1st Port / 2nd Port

Click to change the two ports to be included in the Thru connection. The order of the port numbers (1st or 2nd) is not critical.

Thru Cal Method

Lists the available Thru Cal methods for the specified port pairs.

Learn about ECal Thru Methods

Cal Type/ Stds

Click to invoke the View / Modify Properties of Cal dialog box

Do orientation

When this box is checked (the default setting) the VNA automatically senses the model and direction in which an ECal module port is connected to the VNA ports. If power to the ECal module is too low, it will appear as if there is no ECal module connected. If you use low power and are having this problem, clear this check box to provide the orientation manually.

Orientation occurs first at the middle of the frequency range that you are calibrating. If a signal is not detected, it tries again at the lowest frequency in the range.

Choose delta match

Available only when a Delta Match Cal is required.

- Check, then click Next to invoke the Select Cal Set for Delta Match dialog box.
- Clear - The Cal Wizard uses the Global Delta Match Cal if available.
Specify how the ECal module is connected dialog box help

This dialog box appears when the Do orientation checkbox in the previous dialog box is cleared. Click the ECal Port that is connected to each VNA port.

Electronic Calibration Steps dialog box help

Note: Beginning in VNA Rev. 6.0, ECal can be performed with External triggers. Learn more.

Displays the instructions for each measurement required for calibration.

Measure  Measures the ECal standards.

Done   Click when last standard has been measured.

Saving an ECal Calibration

When complete, you can save the new calibration. Learn how.
## ECal User Characterization

- **Overview**
- **How to Perform a User Characterization**
- **Manage Disk Memory**
- **Restore ECal Module Memory**

### See Also

Using ECal
- Perform a 4-Port Cal with a 2-Port ECal Module

### Other Calibration Topics

#### Overview

A user-characterized ECal module allows you to add adapters to the ECal module, re-measure the standards in the ECal module, INCLUDING the adapters, then add that data to ECal memory or save it to disk memory. This extends the reference plane from the module test ports to the adapters.

Compared to legacy ECal modules, the new N755xA ECal modules have greater flash memory.

**Important Note:** DO NOT connect/disconnect USB devices during ECal calibrations. Doing so may cause problems with the calibration.

#### Why perform a User Characterization?

- If you need to use adapters with your ECal module, you could characterize your ECal module with the adapters attached and perform subsequent ECals in a single step.

- If you have a 4-port ECal module, you could configure the module with adapters of different connector types, then perform a User Characterization of the module. When you need to test a DUT with a pair of the connector types on your module, calibrate the analyzer with a 1-step ECal using the same two connectors on the User-characterized module.
If you test devices in a fixture, you could embed the characterization of the fixture in the characterization of the module. To do this, during the mechanical calibration portion of the User Characterization, calibrate at the reference plane of the device as you would normally calibrate. Then remove the fixturing to be embedded and insert the ECal module to be characterized. When measuring the ECal module, the analyzer removes the effects of the fixturing and stores the measurement results in the user characterized ECal module. Subsequent calibrations with that user-characterized module will also remove the fixture effects.

Notes:

- Both 2-port and 4-port ECal modules support User Characterization.

- User Characterization does not delete the factory characterization data. The factory data is saved in the ECal module in addition to the User Characterization data.

- The ECal Data Wipe Utility is the only way that data can be deleted from the module. Learn more at http://na.support.keysight.com/pna/apps/applications.htm.

- A User Characterization can be performed beyond the frequency range of the ECal module. Although this practice is allowed, calibration accuracy with the extended User Characterization is likely to be degraded. To determine the level of degradation, compare measurements of a variety of devices with a mechanical cal kit calibration versus an ECal extended User Characterization calibration.

- You can save up to 12 User Characterizations in a single ECal module. Previous releases allowed up to 5. There are memory limitations. The analyzer will determine if the contents of a User Characterization will fit inside the module before it is performed.

- A User Characterization can be performed remotely. See programming commands.

User Characterizations can be saved to **Disk Memory**. Learn how.

This feature provides the following benefits:

- A User Characterization using connectors that are NOT included in the supported connector table can NOT be stored to the ECal module. But when stored to disk memory, ANY connector type is allowed by firmware using a description of any length for the User Characterization.

- There is NO limit to the number of data points allowed in a User Characterization stored to disk memory. When stored in the ECal module, the number of data points is limited to a maximum of 65535 per characterization, or less as dictated by the remaining free memory in the module.

- The number of User Characterizations that can be stored to disk memory is limited only by available disk space.

- User Characterizations stored to disk memory can be freely shared between analyzers.

Learn how to Manage User Characterization in Disk Memory.
### How to Perform a User Characterization

**SUMMARY** (A detailed procedure follows.)

1. Select adapters for the module to match the connector configuration of the DUT.

2. Either calibrate the analyzer using mechanical standards or recall an existing Cal Set.

3. Measure the ECal module, including adapters, as though it were a DUT.

4. The measurement results are the characterization data that then gets stored inside the module or to disk.
Note

A 2-port analyzer can be used to perform a User Characterization on a 4-port ECal module. However, a 4-port ECal module has SIX different port pairs. The analyzer must be recalibrated for each port pair that uses unique connector types or gender.

- If all 4 ECal module ports have the same connector type and gender, then only one calibration is required to measure all six port pairs.
- If all 4 ECal module ports have different connector types or gender, then 6 calibrations are required.

When more than one calibration is required during a User Characterization, then ALL calibrations must be performed using the standard Cal Wizard, saved to Cal Sets, and then recalled from Cal Sets DURING the User Characterization.

Detailed steps to Perform a User Characterization

1. Connect the ECal module to the network analyzer with the USB cable. See Connect ECal Module USB to the analyzer USB.
2. Allow the module to warm up until it indicates READY.
3. Preset the analyzer.
4. Set up the measurement. For best accuracy, the IF bandwidth should be set to 1 kHz or less.
5. Start and complete the Characterize ECal Module Wizard:

Using Hardkey/SoftTab/Softkey

1. Press Cal > Cal Sets & Cal Kits > ECal > Characterize ECal....

Programming Commands
Select Module and Location dialog box help

**ECal Module**  Select one of the ECal modules that are connected to the analyzer.

**Detect Connected ECals**  Click to rescan the USB for ECal modules.

**Location**

- **ECal Module Memory**  Click Next to see the following dialog.

- **Disk Memory**  Enter a Characterization Name. This name appears when selecting a User Characterization to be used with subsequent calibrations.
  
  - Learn how to manage characterizations that are stored to disk memory.
  
  - See the benefits of storing the User Characterization to disk Memory.

**Keyboard**  Launches a keypad that can be used to type a characterization name from the analyzer front panel.

**Next**  Click to continue to the Select Connectors for the Characterization dialog box.

See note regarding extended frequency use.
Select User Number for new characterization dialog box help

Scroll to view all of the parameters of the stored characterizations. Select an empty location or select to overwrite an existing characterization.

Next  Click to continue to the Select Connectors for the Characterization dialog box.

See note regarding extended frequency use.

Select Connectors for the Characterization dialog box help

Connector Notes

When performing an ECal User Characterization, do NOT use a custom connector name that you added to this list. If you need to use a custom-defined connector type, select "Type B", or one of the "Type A" variations from the list of connectors for each port.

A User Characterization using connectors that are NOT included in the supported connector table can NOT be stored to the ECal module. But when stored to disk memory, ANY connector type is allowed. Learn more about storing to Disk Memory.

Select the adapters for the ECal module test ports. Select No adapter if no adapter is used on a port.

PORT A  Lists the connector types available for Port A.

PORT B  Lists the connector types available for Port B.
PORT C  Lists the connector types available for Port C (available with a 4-port ECal module).

PORT D  Lists the connector types available for Port D (available with a 4-port ECal module).

Next  Click to continue to the **Calibrations to perform or recall** dialog box.

---

**Calibrations to perform or recall** dialog box help

The analyzer must be calibrated before measuring the ECal module and necessary adapters. This dialog box displays the number and types of mechanical calibrations required for the characterization.

**Guide me through this cal now**  Click to perform a Guided calibration. A calibration kit is required for each connector type.

**Note:** Some PNA-L models cannot perform TRL calibration during the calibration portion of a User Characterization. However, this type of Cal can be performed using the Cal Wizard, saved to a Cal Set, then recalled at this point in the User Characterization.

If more than one calibration is required, the following selection is not available. See Note.

**Let me recall this cal from a cal set**  Click to select an existing Cal Set. You cannot select a Cal Set that is currently in use. Learn more about **Using Cal Sets**.

Next  Click to continue to either the **Select Cal Kits** or the **Select Cal Set** dialog box.
**Select Cal Kits** dialog box help

Provides a list of calibration kits to perform the calibration. Select the Cal Kit you will use for each port.

**Enable Unknown Thru for characterizing the module**  Check to enable. This reduces the number of steps required to characterize the THRU standard. This setting is available only on VNA models with one reference receiver per test port.

**Next**  Click to continue to the **Select Cal Set** dialog box.

---

**Select Cal Set** dialog box help

The calibration that you perform will be written to a Cal Set. This dialog box allows you to select a Cal Set to overwrite, or to write to a new Cal Set. The current choice is visible below the **Select Cal Set** button.

**Select Cal Set**  Click to open the **Select A Cal Set** dialog box.

**Create new Cal Set**  Check to create a new Cal Set to store the calibration. Clear to select and overwrite a stored Cal Set.

**Next**  Click to continue to the **Guided Calibration Steps** dialog box.

**Note:** Remember the Cal Set name for future reference.
Guided Calibration Steps dialog box help

Instructs you to connect each calibration standard to the measurement port.

**Measure**  Click to measure the standard.

**Back**  Click to repeat one or more calibration steps.

**Done**  Click **after** a standard is re-measured and all measurements for the calibration are complete.

**Next**  Click to continue to the next calibration step. (Does **not** measure the standard.)

**Cancel**  Exits Calibration Wizard.

The **Specify nominal delay** or **Guided Calibration completed** dialog box appears when the steps are completed.

Specify nominal delay dialog box help

This dialog ONLY appears when **Adapter Removal** or **Unknown Thru** calibrations are performed.

The following values were estimated from the measurement. Most of the time, they are adequate. However, for CW sweep or frequency sweep with large step sizes, the accuracy of the values may be improved.

**Nominal adapter delay**  To improve this value, measure and record the delay of the adapter with a dense step size. Enter that value here.
**Nominal phase offset** (Waveguide ONLY). To improve this value, measure and record the phase offset of the Waveguide adapter with dense step size. Enter that value here.

When one connector is coax and the other connector is waveguide, the phase offset has an ambiguity of 180 degrees. For consistency, the estimate provided here is always between 0 and 180 degrees. You can change this estimate to any value between -180 degrees and +180 degrees.

---

**Guided Calibration completed** dialog box help

Allows you to finish the calibration and continue to the next characterization steps.

**No. Finish now** Select to save Cal Set data.

**Yes** Allows selection of Save options.

**Next** Click to continue to the [Exit to Inspect Quality of Calibration](#) dialog box.

---

**Exit to Inspect Quality of Calibration** dialog box help

Allows you to exit User Characterization to validate the calibration before proceeding with the characterization.

**Back** Allows you to repeat calibration.

**Next** Click to continue to the [Characterization Steps](#) dialog box.
**Cancel** Exits the Calibration.

To return to the current step:

2. In the **Select user number for new characterization** dialog box, click Next.
3. In the **Select Connectors for Characterization** dialog box, click Next. (Previous entry is stored in memory.)
4. In the **Calibrations to perform or recall** dialog box, recall the Cal Set that you just performed.

### Characterization Steps dialog box help

Describes the instructions for each measurement required for characterization.

**Measure** Measures the ECal module.

**Next** Click to continue to the **Information for the New Characterization** dialog box when measurements are complete.

### Information for the New Characterization dialog box help

Allows you to describe the properties of the User Characterization.
Suggestions for connector abbreviations

To minimize the number of characters, we suggest using the following 3-character codes to describe the connectors listed.

A User Characterization using connectors that are NOT included on this list can NOT be stored to the ECAL module. But when stored to disk memory, ANY connector type is allowed. Learn more about storing to Disk Memory.

Next  Click to continue to the Write Characterized Data to the ECal module dialog box.

**Write Characterized Data** dialog box help

User Characterization and factory characterization data is written to either the disk memory or the ECal module memory.

**Write**  Click to write data.

The **Summary of new User Characterization** dialog box opens after data is saved to module.

- Existing data will be overwritten is you selected a User Characterization number that already has data. Learn more
- For more information, see **Restore ECal module memory**.
- The ECal Data Wipe Utility is the only way that data can be deleted from the module. Learn more at [http://na.support.keysight.com/pna/apps/applications.htm](http://na.support.keysight.com/pna/apps/applications.htm).

**Summary of new User Characterization** dialog box help

Verify the status of the ECal User Characterization.
- ECal module model number
- summary from User Characterization

**Cancel**  Click to exit (characterization complete).

**Finish**  Click to exit (characterization complete).

### Manage ECal User Characterizations in Disk Memory

Normally, User Characterizations that are stored in disk memory can be used indefinitely without needing them to be managed. However, this dialog allows you to backup the characterizations in case they are accidentally erased, or to save them to a file that can be moved to another analyzer.

### How to Manage ECal User Characterizations in Disk Memory

**Using** Hardkey/SoftTab/Softkey

1. Press **Cal > Cal Sets & Cal Kits > ECal > Manage ECal Disk Memory...**
This dialog allows you to do either of the following:

- Save an existing User Characterization in disk memory to an *.euc file.
- Load a previously saved *.euc file for use on the analyzer with the specified ECal module.

Learn more about User Characterizations stored to Disk Memory.

**ECal Module** Select an ECal Module from the list for which User Characterizations are currently stored in disk memory.

**Save As** Saves a User Characterization that is currently in disk memory to a *.euc file. This file can be used as a backup in case the archive file is accidentally deleted, or allows you to move the file to another analyzer to be used with the selected ECal Module.

**Import** Loads a previously saved *.euc file for use on the analyzer with the specified ECal module.

**Delete** Removes a User Characterization from disk memory.

**Note:** If a temperature is shown in the Temperature column, then the temperature during characterization was measured and recorded. For VNA ports on which a CalPodAsECal user characterization is used during a calibration, the cal error terms for those ports in the CalSet will have been computed with compensation for temperature at the time of calibration if the following two conditions are true: 1) The user characterization must show a temperature value in the Temperature column in this dialog box, and 2) the CalPod must be a Thermal or TVAC CalPod whose factory temperature data has been installed on the VNA by the installer package that was provided with the CalPod.

**Restore ECal Module Memory**

When user-characterized data is written to the ECal module, the entire contents of ECal memory is also written to the disk memory, including the factory ECal data. In the unlikely event that your ECal
module memory is lost, you can restore all ECal data to ECal memory.

Caution: If a new factory cal was performed after the ECal memory was written to disk memory, the new factory cal data will also be overwritten.

Note: An ECal Data Wipe Utility destroys all user data per US DoD 5220.22-M. Learn more at http://na.support.keysight.com/pna/apps/applications.htm

How to Restore ECal Module Memory
Using Hardkey/SoftTab/Softkey

1. Press Cal > Cal Sets & Cal Kits > ECal > Restore ECal Memory....

Module to be restored dialog box help

Verify the serial number of the module to be restored. If two modules are connected, choose the one to have data restored.

Next  Click to write data to the module.
Perform a 4-Port Cal with One 2-Port ECAl Module

You can perform a 4-port calibration with a 2-Port ECAl Module. When all four DUT connectors are the same type and gender, the calibration can occur with only four connections, the same number of connections you would make with a 4-port ECAl module.

- The ECAl module must span the frequency range of the measurement.
- The ECAl module must have connectors that match the DUT connectors. Because we are using a 2-port ECAl module, this means that the DUT must have only TWO unique connector types and gender. When the DUT has more than two connector types/genders, you can select a different cal kit for each port using SmartCal.

**Important Note:** DO NOT connect/disconnect USB devices during ECAl calibrations. Doing so may cause problems with the calibration.

**Procedure**

1. Connect the 2-port ECAl module to a VNA USB port.
2. Press **Cal > Main > Other Cals > Smart Cal...**
3. Select **4 Port Cal**, then click **Next** to see the following dialog:

4. Select the DUT Connectors for each port. In this example, all four DUT connectors are Type N, female.
5. Select the attached ECAl module. We are using a **85092-60007 ECAl** module.
6. Select **Modify Cal (Show Advanced Settings for ECAl)** then click **Next** to see the following dialog:

7. For the fewest number of physical connections, select the default port assignments.
● The 1st Port selection for each port pair is 1.

● For single-ended (standard) measurements, THREE is the minimum number of Thru connections. For Balanced measurements, FOUR Thru connections should be made. Learn more.

● For higher accuracy, select Add Thru. The Cal Wizard will add another port pair which results in more physical connections.

8. Select **ECal Thru as Unknown**. This is the most accurate and easiest Thru Cal Method. Learn more.

9. You may need to clear **Do Orientation** when calibrating at low power levels. Learn more. This will add additional connection steps.

10. Follow the prompts to complete the calibration:

   1. Connect ECal to ports 1 and 2. Click **Measure**.

   2. Connect ECal to ports 1 and 3. Click **Measure**.

   3. Connect ECal to ports 1 and 4. Click **Measure**.

11. At the **Specify Delay** dialogs, click **OK**. This is the measured delay for each of the Thru connections in the ECal module. Learn more.

12. Click either **Save As User Cal Set**, or **Finish**.
TRL (Thru, Reflect, Line) represents a family of calibration techniques that measure two transmission standards and one reflection standard to determine the 2-port 12-term error coefficients. For example, TRM (Thru, Reflect, Match), LRL (Line, Reflect, Line), LRM (Line, Reflect, Match) are all included in this family.

The traditional SOLT calibration measures one transmission standard (T) and three reflection standards (SOL) to determine the same error coefficients.

- Why Perform a TRL Cal?
- The TRL Calibration Process
- TRL Cal Kits
- Cal Standards Used in TRL
- TRL on 4-port PNA-L and ALL Models with an External Test Set

Why Perform a TRL Cal?

TRL calibration is extremely accurate, in most cases more accurate than an SOLT cal. However, very few calibration kits contain TRL standards. TRL Cal is most often performed when you require a high level of accuracy and do not have calibration standards in the same connector type as your DUT. This is usually the case when using test fixtures, or making on-wafer measurements with probes. Therefore, in some cases you must construct and characterize standards in the same media type as your DUT configuration. It is easier to manufacture and characterize three TRL standards than the four SOLT standards.

Another advantage of TRL calibration is that the TRL standards need not be defined as completely and accurately as the SOLT standards. While SOLT standards are completely characterized and stored as the standard definition, TRL standards are modeled, and not completely characterized. However, TRL cal accuracy is directly proportional to the quality and repeatability of the TRL standards. Physical discontinuities, such as bends in the transmission lines and beads in coaxial structures, will degrade the TRL calibration. The connectors must be clean and allow repeatable connections.

To learn more about Cal Standard requirements, see Cal Standards Used in TRL.
Note: Virtual Device describes a non-physical (connect the two test port reference planes together) type of connection description during the calibration. So, in a cal kit definition, you should not define more than one Thru standard with the same connector/gender pairing to each Virtual Device. This could cause those Thru standards to all be treated as the same physical connection step during a calibration, which would especially be a problem for TRL calibrations if a Thru standard and Line standard were measured as the same connection step.

The TRL Cal Process

Although TRL can be performed using the Cal Wizard Unguided Cal selection, the following process uses the easier SmartCal selection. Both selections require that you already have TRL calibration standards defined and included in a VNA cal kit.

1. Preset the VNA
2. Set up a measurement and the desired stimulus settings.
3. Press Cal > Main > Other Cals > Smart Cal....
4. Select the DUT connectors and Cal Kit for each port. The LOWEST port number of each port pair MUST include TRL standards. TRL appears as the Cal Method.
5. Check Modify Cal, Next, then View/Modify to change default TRL options if necessary.
6. Follow the prompts to complete the calibration.
7. Check the accuracy of the calibration

TRL Cal Kits

Keysight Technologies offers two cal kits that include the required standards to perform a TRL calibration: 85050C (APC 7mm) and 85052C (3.5mm). Both kits include the traditional Short, Open, and Load standards. (The Thru standard, not actually supplied, assumes a zero-length Thru). In addition, the kits include an airline which is used as the LINE standard. To use the airline, the kits include an airline body, center conductor, and insertion / extraction tools. The APC 7 kit includes an adapter to connect the airline to the APC connector.

Cal Standards Used in TRL

These standards must be defined in your TRL cal kit:

THRU
Note: All **THRU calibration methods** are supported in a TRL Cal **EXCEPT** Unknown Thru.

- The THRU standard can be either a zero-length or non-zero length. However, a zero-length THRU is more accurate because it has zero loss and no reflections, by definition.

- The THRU standard cannot be the same electrical length as the LINE standard.

- If the insertion phase and electrical length are well-defined, the THRU standard may be used to set the reference plane.

- Characteristic impedance of the THRU and LINE standards defines the reference impedance of the calibration.

- If a THRU standard with the correct connectors is NOT available, an adapter removal cal can be performed.

**REFLECT**

- The REFLECT standard can be anything with a high reflection, as long as it is the same when connected to both VNA ports.

- The actual magnitude of the reflection need not be known.

- The phase of the reflection standard must be known within 1/4 wavelength.

- If the magnitude and phase of the reflection standard are well-defined, the standard may be used to set the reference plane.

**LINE**

The LINE and THRU standards establish the reference impedance for the measurement after the calibration is completed. TRL calibration is limited by the following restrictions of the LINE standard:

- Must be of the same impedance and propagation constant as the THRU standard.

- The electrical length need only be specified within 1/4 wavelength.

- Cannot be the same length as the THRU standard.

- A TRL cal with broad frequency coverage requires multiple LINE standards. For example, a span from 2 GHz to 26 GHz requires two line standards.

- Must be an appropriate electrical length for the frequency range: at each frequency, the phase difference between the THRU and the LINE should be greater than 20 degrees and less than 160 degrees. This means in practice that a single LINE standard is only usable over an 8:1 frequency range (Frequency Span / Start Frequency). Therefore, for broad frequency coverage, multiple lines are required.

- At low frequencies, the LINE standard can become too long for practical use. The optimal length of the LINE
standard is 1/4 wavelength at the geometric mean of the frequency span (square root of f1 x f2).

**Note:** The TRL LINE standard must have a delay that is greater than 0 (zero) ps. Otherwise, calibration correction calculations will contain unpredictable results.

**MATCH**

If the LINE standard of appropriate length or loss cannot be fabricated, a MATCH standard may be used instead of the LINE.

- The MATCH standard is a low-reflection termination connected to both Port 1 and Port 2.
- The MATCH standard may be defined as an infinite length transmission line OR as a 1-port low reflect termination, such as a load.
- When defined as an infinite length transmission line, both test ports must be terminated by a MATCH standard at the same time. When defined as a 1-port load standard, the loads are measured separately. The loads are assumed to have the same characteristics.
- The impedance of the MATCH standard becomes the reference impedance for the measurement. For best results, use the same load on both ports. The load may be defined using the data-based definition, the arbitrary impedance definition, or the fixed load definition.

**TRL on a 4-port PNA-L and ALL VNA Models with an External Test Set**

Beginning with the VNA code revision 5.25, TRL CAN be performed on a 4-port PNA-L and ALL VNA Models with an External Test Set enabled. Previously, a TRL calibration required a VNA with a reference receiver for each test port. With the new TRL method, a Delta Match Calibration is first performed and applied.

**Note:** See Delta Match Calibration to learn which models require this.

The accuracy of this TRL cal greatly depends on the accuracy of the Delta Match Calibration. With an accurate Delta Match Calibration, the difference in accuracy between a traditional TRL cal and this TRL cal is negligible.

**How to Perform a TRL Cal in these cases**
1. Press **Cal > Main > Other Cals > Smart Cal...**

2. Select a TRL cal kit for the ports to be calibrated.

3. During the calibration, the Cal Wizard prompts you for a valid Delta Match Cal.
CalPod is a system that simplifies the process of recalibrating the VNA without requiring the removal of the DUT or the physical connection of standards. This allows recalibration from a remote location such as when the DUT is in a temperature chamber.

**Note:** This feature is available to GCA, GCX, IMS, IMD, NF, NFX, SMC + Phase, and standard (S-Parameter) channels.

**Note:** Before using a CalPod module, ensure that Factory Cal is set to OFF (Cal > Main > Factory Cal OFF).

CalPod as ECal

**Other Calibration topics**

**Sweep Averaging Versus CalPod Averaging**

Averaging helps to find the mean of an incoherent variation, but the source and “coherence time” of the variation are important.

There are three sources of variation in a CalPod corrected measurement:

1. Noise due to receiver noise floor. This tends to be fast variation and IFBW reduction (IFBW reduction is really just more averaging of the ADC readings, and point averaging, since it occurs in a similar time scale, is very similar to IFBW reduction) will reduce this to a mean value.
2. Variation due to instability in the cables, connectors, etc. This can be due to things like vibrational stability due to fans, air currents moving past, ringing from cars, trucks, and people moving about. These tend to be longer in time scale (a few seconds) and so sweep-to-sweep averaging will remove this long-time-scale variation.

3. Variation due to slight imperfections in the setting of the CalPod states, due to changes in line-voltage, regulation, and timing. This is helpful in the reduction of these imperfections (plus it also has a longer time scale than sweep-to-sweep averaging) as it accounts for very minor random variations in the setting of the states of the CalPod. By averaging several states (each state containing an average of the sweeps, each sweep contains an average of the IFBW acquisitions, each IFBW acquisition contains an average of the ADC readings, each ADC reading being independent), another source of variation is removed. Generally sweep averaging is not needed with CalPod averaging. But sweep averaging during calibration can help remove stability variation during calibration; so turn on sweep-averaging during calibration; but turn off sweep averaging during Initialization and Recorrection, and use CalPod averaging instead. Since initialization is done only once, double its averaging factor relative to that used for Recorrection.

Process Overview

**Note:** The following overview assumes the CalPod system has been installed and configured. See the CalPod Operations and Service Guide for installation instructions at: [http://na.support.keysight.com/calpod/85523-90005](http://na.support.keysight.com/calpod/85523-90005).

The following process assumes a 2-port DUT connected to the VNA ports 1 and 2 through CalPod modules as follows:

![Diagram of CalPod setup](image)

*The Blue boxes represent CalPod modules with internal Thru and Reflection states.*

1. After configuring and assigning CalPod modules to VNA ports 1 and 2, connect the CalPod modules to the VNA, directly or using short cables. Learn how to configure CalPod.

2. Setup measurements on a channel.
Note: CalPod does not support measurements at frequencies below 100 MHz.

3. An IFBW of 1 kHz or lower with eight averages is recommended.

4. Press Avg BW > Main > Averaging and set averaging as follows:
   - Averaging Factor: 8
   - Average Type: SWEEP
   - IF Bandwidth: 1 kHz
   - Turn sweep averaging on

5. Perform a full 2-port calibration for the channel with the CalPod outputs as the reference plane.

   Note: Be sure to save the calibration to a user calset.

6. Turn off sweep averaging. It will not need to be used during Initialize Channel nor Recorrect Channel because the OSL Averages will be used for those.

7. Set OSL Averages number to 2x the value that was used for sweep averaging. This will provide a more-than-adequate averaging for the Initialize Channel, which is only performed once for each calibration.

8. Click Initialize Channel to automatically perform the following steps:
   a. The Reflection states of both Calpod modules are switched in and S11/S22 are measured.
   b. The resulting measurements are stored in the channel’s Cal Set as additional standard measurements. These measurements are used to characterize the Calpod states - they are NOT used at this time to change the error correction.

   Notes:
   - Because the Reflection states in the CalPods are measured, it is not important what is connected to the CalPod when Initialize is pressed. Therefore, for highest accuracy, click Initialize IMMEDIATELY and ONLY ONCE after performing the calibration - before causing ANY cable movement.
   - If an adapter is required to connect the DUT to a CalPod, use a high-quality adapter. Any temperature drift due to the adapter is NOT recorrected.
   - Always connect the DUT as close as possible to the CalPod modules.

9. Connect the DUT to the CalPod outputs.
10. **Set OSL Averages** number to the value that was used for sweep averaging. Use this value for all subsequent Recorrections of this calibration.

11. Click **Recorrect Channel** or **Recorrect All Channels** whenever necessary. Any of the following actions will cause the current calibration to become invalid and require recorrection:

   a. Moving the CalPod modules to the ends of long cables.
   
   b. Changing the cables.
   
   c. Extreme temperature variations.
   
   d. Measurement drift over long time periods.

The following steps occur automatically during recorrection for the active channel:

   a. The Reflection states of both CalPod modules are switched in and S11/S22 are measured.
   
   b. Additional (de-embedded) error terms are computed to compensate for changed conditions from the Initialize measurements.
   
   c. Another Cal Set is created using the original name with the CalPod number appended. The modified error terms are saved to that Cal Set and applied to the channel. The measurements are now fully corrected.

**Note:** Re-correction is not supported with a descending list of frequencies, such as the output from a frequency-down converter with LO frequency higher than input frequency.

### How to start the CalPod dialog

**Using Hardkey / SoftTab / Softkey**

1. Press **Cal > Cal Sets & Cal Kits > Cal Pod...**

**CalPod** dialog box help

Learn all about the CalPod process. (Scroll up)
**Initialize Channel**  Calibrated measurements of the CalPod states are performed as initial reference data points for the active channel.

**Initialize All Channels**  Calibrated measurements of the CalPod states are performed as initial reference data points for all current channels. This command is not recommended, it is generally preferable to initialize each channel immediately following calibration.

**Recorrect Channel**  Recorrects the active channel Cal Set to match the initial reference.

**Recorrect All Channels**  Recorrects the Cal Sets on ALL channels that were initialized.

**Correct Power**

This checkbox causes power to be recorrected ONLY when source power correction data is stored as error terms in the CalSet. This occurs only when a Guided Power Cal is performed (on the standard channel) OR when an app channel is calibrated such as a FCA, GCA, IMD, and Noise Figure channel. This checkbox has NO effect when a S-parameter (only) Cal or a standard Source Power Cal has been performed, because source power correction data is not stored in the CalSet. To see if the source power cal can be modified, examine the Calset for "SourcePowerCorrection(n)" terms where "n" is the port number.

When any of the above power cals have been performed, and when this box is checked, the power output at the VNA port is adjusted to compensate for any change in path loss when Recorrect is performed. For example, if the path loss between the VNA port and the CalPod was increased by two dB following initialization, then the VNA output power will be increased by two dB upon recorrection. Do this when you add a significant amount of loss in the calibration path, or when the power level at the DUT is important.

When a significant amount of loss is introduced in the calibration path, it may not be possible to increase the source power enough to overcome the loss. In this case, an **Unleveled source** message may appear on the VNA screen.

When the checkbox is cleared, the source power level is not corrected.
**OSL Averages** Controls the number of sweeps worth of raw measurements to be measured and averaged together for the recorrection computations for each state of each CalPod.

**Assignment of CalPods to VNA Ports**

For each VNA port, select a CalPod module.

**Note:** A CalPod can be assigned up to 16 test ports in each measurement channel in multiport PNA mode.

**CalPod Setup** Starts the CalPod Setup dialog

**Delete All CalPod Cal Sets** Deletes all recorrection Cal Sets and reinstates the Initialization Cal Set.

---

**CalPod Setup dialog box help**

To start this dialog, click **CalPod Setup** in the CalPod dialog box.
**CalPod Serial Number**  Type the CalPod module (without 'sn'), then click **Add CalPod**. The new module is added to the list of available CalPod modules.

**Serial # and CalPod Types**

Shows the list of available CalPod modules. A CalPod module type may be STANDARD or THERMAL (include temperature correction). A CalPod module will be listed as a STANDARD type unless the thermal characterization data was previously loaded into the PNA from the USB flash drive that came with the CalPod. Once thermal characterization data has been loaded into the PNA, the CalPod is automatically listed in the CalPod Setup dialog.

**Note:** Loading thermal characterization data from the USB flash drive is the only method of setting up a THERMAL CalPod. Simply entering the serial number in the CalPod Setup dialog will set the **CalPod Type** to be **STANDARD**.

STANDARD and THERMAL data files are stored in **C:\e-trak\adapters**.

**Buttons**

**Utilities**  Launches the VNA CalPod Utilities used to configure the CalPod Controller and VNA over LAN.

**Note:** Before using a CalPod Controller, the LAN MUST be set up using the CalPod Utilities or an error message will be displayed indicating that the VNA is unable to communicate with the CalPod Controller.

---

**USB Ethernet Adapter Driver Install**  Installs the USB 2.0 to 10/100 Ethernet Adapter driver on the VNA.
USB Ethernet Adapter set to Static IP  Sets the USB 2.0 Ethernet Adapter to a static IP address of 192.168.0.101. This sets the VNA secondary LAN to the same subnet as the CalPod Controller.

VNA Primary LAN to Static  Sets the Primary (built in) LAN adapter to a Static IP address of 192.168.0.102.

VNA Primary LAN to DHCP  Returns the Primary (built in) LAN adapter to DHCP. This option is used when the CalPod Controller is connected directly to the VNA's LAN adapter using an RJ-45 LAN crossover cable. CalPod Controllers do not support DHCP networking.

Test  Click to test the connection between the controller and the selected CalPod module. The message box displays the connection status and temperature for both Ambient and Thermal modules. Only the Thermal module will apply test temperature for recorrection.

IP Setup  Starts the IPSetup dialog box to confirm the CalPod controller settings.

Delete  Removes the selected STANDARD CalPod module from the list.

To delete a THERMAL CalPod from the list:

1. Navigate to the c:/e-trak/adapters/itm directory.
2. Delete the .xml file associated with the CalPod serial number.
3. Exit all CalPod dialog boxes and restart the CalPod dialog.
4. The CalPod may now be removed using the Delete button.

About  Shows the CalPod software version information.

Controller Addresses

Each controller can support 4 modules directly, and up to 48 modules using external splitters. Additional controllers may be required if more than 48 CalPod modules are needed.

IP Address  Enter the IP Address of the Controller, then click Add. The IP address is configured using the IPSetup Utility. The default IP=192.168.0.100, but different static network settings can be configured if required.

Delete  Select the Controller Address, then click Delete to remove the address from the list.
CalPod Operator’s Check

This program is provided as a convenience to help determine the operational status of each 855xxA Series CalPod and its associated CalPod Controller. While this check is not intended to be a complete test, it does check each unit enough to provide greater than 95% confidence that the CalPod is functioning properly.

- When the max frequency of the CalPod is higher than the max frequency of the VNA, the full frequency range of the CalPod is not tested.
- Up to four CalPod modules may be checked at once. All four devices must be of the same frequency range.
- The software revision for the Operator’s Check code is displayed in the upper left-hand corner of the window.

Before running Op Check

The CalPod system must be installed and configured on the VNA.

Required equipment:

- An appropriate ECal or mechanical Cal Kit.
- A high-quality cable.
- A female-female adapter of the calibration connector type.
- A fixed attenuator up to 10 dB (3 dB preferred) or other frequency insensitive device with similar loss.

How to perform CalPod Operators Check

Click Utility, then System, then Service, then Verification, then Operator's Check.
Click **Setup Info** to learn more about this dialog.

Also, click **Cal Method** or **Connector** for additional explanation for these areas.

**Configure**

1. Enter information in the “Configure” area.

2. Each time a 2-port cal is performed, the results are saved in a file. The “Use Prior” selection uses the saved calibration.

3. When the calibration connector type does not mate with the CalPod connectors, perform the calibration and then use adapters to connect to the CalPod module.

4. Click **Begin** to start the Op Check.

5. Follow the prompts in the gray box.

**Op Check Results**

- The Results area shows Op Check progress.
- Click a test label for test information.
- When the check has finished, the results are saved to a text file. The default path and filename is: C:\Program Files(x86)\Keysight\Network Analyzer\Service\calpodopchklog.txt. To save multiple results, rename the file or save it to a different location.
- For assistance in troubleshooting CalPod Operator's Check failures or for additional information, see the appropriate FAQ at the CalPod web site: http://na.support.keysight.com/calpod

589
A CalPod module can be used as 1-port ECal module to calibrate channels for all measurement classes. In addition, the CalPod module can be left in place during measurements in order to refresh calibrations.

**Note:** Before using a CalPod module, ensure that Factory Cal is set to OFF (Cal > Main > Factory Cal OFF).

In this topic:

- Overview
- Characterizing the CalPod module
  - Summary
  - Detailed Steps
- Calibrating with CalPod

**More Calibration topics**

**Overview**

To use a CalPod module as a calibration device:

1. The CalPod module must be configured using the CalPod software. Learn how.

2. Unlike an ECal module, a CalPod module has no internal memory and therefore, no internal characterization data. Before a CalPod can be used as an ECal module, its internal standards must first be characterized using the ECal User Characterization wizard. In addition, the characterization data can ONLY be stored in VNA disk memory.

3. After these steps have been performed, connect the CalPod modules to the controller to perform a VNA calibration. The CalPod modules will appear in Cal Wizard dialogs just like an ECal module.
This image shows TWO CalPod modules after both have been characterized. An additional thru connection is required to complete a 2-port calibration. Subsequent ‘refresh’ calibrations can occur without making additional connections.

**Characterizing the CalPod module - Summary**

When performing a User Characterization for a CalPod module, you can establish the Calibration reference plane at the input connector, or at the output connector, depending on how you plan to use CalPod.

1. Initially calibrate the VNA.
2. After the calibration, the internal CalPod OPEN, SHORT, and LOAD standards are measured.
3. The measurements are saved to VNA disk memory. They are used when performing calibrations using the CalPod module.
Detailed steps to Perform a User Characterization

**Note:** If you have more than one CalPod module, each module must be characterized separately.

1. Perform a one-time CalPod configuration. [Learn how.](#)
2. Connect the CalPod module to the CalPod controller.
3. **Preset** the analyzer.
4. **Set up the measurement.** For best accuracy, the IF bandwidth should be set to 1 kHz or less.
5. Start the User Characterization Wizard as follows:

**Using Hardkey/SoftTab/Softkey**

**Select Module and Location** dialog box help

**ECal Module** Select a CalPod from list of connected modules and registered CalPods.

**Detect Connected ECals** Click to rescan CalPod/ECal modules.

**Location**

- **ECal Module Memory** NOT available for CalPod modules.
- **VNA Disk Memory** Enter a Characterization Name. This name appears when selecting a User Characterization to be used with subsequent calibrations.
  - Learn how to manage characterizations that are stored to VNA disk memory.
  - See the benefits of storing the User Characterization to VNA Disk Memory.
**Keyboard** Launches a keypad that can be used to type a characterization name from the VNA front panel.

**Next** Click to continue to the **Select Connectors for the Characterization** dialog box.

See note regarding extended frequency use.

---

**Select Connectors for the Characterization** dialog box help

![Select Connectors for the Characterization dialog box](image)

**In situ characterization**

When Checked:

- This initial calibration, and all DUT measurements are performed WITH the CalPod module THRU path in place (In Situ).

- Only the port with the switchable states is characterized (open, short, load, and offset short). The THRU state is not characterized.

- Select the RF2 (output) connector type and Cal Kit.

- The Cal Kit standards are connected to the RF2 Output connector, making it the reference plane. This calibration removes everything in front of the output connector from subsequent measurements.

- The User Char description will show "In Situ".

- The CalPod's states physically switch in at its RF1 port, but for an in-situ characterization the calibration used for measuring the characterized data for those states has its reference plane at-or-beyond the CalPod's RF2 port. So, for all calibrations subsequently performed using the in-situ CalPodAsECal user characterization, those calibrations also establish the reference plane at that same connector interface at-or-beyond that CalPod's RF2 output port.

When Cleared:

- This initial calibration, and all DUT measurements are performed WITHOUT the CalPod module in place. This is similar to an ECal calibration.

- Select the RF1 (input) connector type and Cal Kit. The Cal Kit standards are connected at this location,
making it the reference plane.

Next  Click to continue to the Calibrations to perform or recall dialog box.

Calibrations to perform or recall dialog box help

Perform or load a 1-port cal.

Guide me through this cal now  Click to perform a Guided calibration. A calibration kit is required for each connector type.

Note: Some PNA-L models cannot perform TRL calibration during the calibration portion of a User Characterization. However, this type of Cal can be performed using the Cal Wizard, saved to a Cal Set, then recalled at this point in the User Characterization.

Let me recall this cal from a cal set  Click to select an existing Cal Set. You cannot select a Cal Set that is currently in use. Learn more about Using Cal Sets.

Next  Click to continue to either the Select Cal Kits (Perform Cal) or Select Cal Set (Recall Calset).
When 'In situ' is selected, a cal kit is selected for port "RF2", as this will be the calibration reference plane (where standards are connected).

Provides a list of calibration kits to perform the calibration. Select the Cal Kit you will use for the port.

**Next**  Click to continue to the Select Cal Set dialog box.

The calibration that you perform will be written to a Cal Set. This dialog box allows you to select a Cal Set to overwrite, or to write to a new Cal Set. The current choice is visible below the Select Cal Set button.

**Select Cal Set**  Click to open the Select A Cal Set dialog box.

**Create new Cal Set**  Check to create a new Cal Set to store the calibration. Clear to select and overwrite a stored Cal Set.

**Next**  Click to continue to the Guided Calibration Steps dialog box.

**Note:** Remember the Cal Set name for future reference.
Guided Calibration Steps dialog box help

The first Measure page.

Connect each calibration standard to the location in the prompt.

**Measure**  Click to measure the standard.

**Back**  Click to repeat one or more calibration steps.

**Done**  Click **after** a standard is re-measured and all measurements for the calibration are complete.

**Next**  Click to continue to the next calibration step. (Does not measure the standard.)

**Cancel**  Exits Calibration Wizard.

Guided Calibration completed dialog box help

Allows you to finish the calibration and continue to the next characterization steps.

**No. Finish now**  Select to save Cal Set data.

**Yes**  Allows selection of Save options.

**Next**  Click to continue to the Exit to Inspect Quality of Calibration dialog box.
Exit to Inspect Quality of Calibration dialog box help

Allows you to exit User Characterization to validate the calibration before proceeding with the characterization.

**Back**  Allows you to repeat calibration.

**Next**  Click to continue to the Characterization Steps dialog box.

**Cancel**  Exits the Calibration.

To return to the current step:

2. In the Select Connectors for Characterization dialog box, click Next. (Previous entry is stored in memory.)
3. In the Calibrations to perform or recall dialog box, recall the Cal Set that you just performed.

Characterization Steps dialog box help

After the initial VNA calibration, the CalPod internal states are measured.

Connect the CalPod if not already connected.

**Measure**  Measures the CalPod module.
Next  Click to continue to the **Information for the New Characterization** dialog box when measurements are complete.

**Information for the New Characterization** dialog box help

Enter descriptive information that will be stored in the characterization file. This description will be viewable in the several VNA dialogs when the CalPod is selected.

Next  Click to continue to the **Write Characterized Data** dialog box.

**Write Characterized Data** dialog box help

The VNA writes User Characterization data to the VNA disk memory.

Write  Click to write data.
Summary of new User Characterization dialog box help

Summary page of characterization wizard after characterization is complete.

**Cancel**  Click to exit (characterization complete).

**Finish**  Click to exit (characterization complete).

---

**Calibrating with CalPod**

The CalPod module is now characterized and ready to be used in a VNA calibration.

When CalPod modules are selected for ALL ports of an N-port cal, Unknown Thru is the only selectable Thru method for all paths. [Learn more about Unknown Thru.](#)

The above image is the **Connectors and Cal Kits** page as seen during a SmartCal on a standard channel. A similar version of this page is shown in the Calibration Wizard for all Application channels (FCA, GCA, NFA and so forth).
Calibration Preferences

Cal type preferences are set from this dialog.

How to change Cal Preferences

Programming commands are NOT available for the preference settings discussed in this topic, although there are other Cal Preferences that can be set remotely.

Using a mouse

1. Click Response
2. Select Cal
3. Select Cal Sets & Cal Kits
4. Select Cal Preferences...

Cal Type Preferences dialog box help

This dialog is used to set which Cal Types are available, and the order in which they are selected as the default choice, during a SmartCal with Mechanical Standards. This setting is also used to set the default Cal Type for Guided calibrations using SCPI or COM.

Note: Your Cal Type settings are saved only until the NA application is closed. When re-opened, the factory default settings are restored.

The specified Cal Type order should allow you to make fewer changes to the Cal Type during a SmartCal with Mechanical Standards.

For example, in the above image, the first Cal Type on the list is TRL. When doing a SmartCal with Mechanical Standards:
If a TRL Cal Kit is available for the specified DUT connectors, then TRL becomes the default Cal Type.

If a TRL Cal Kit is NOT available, then the second Cal Type on the list (SOLT) is evaluated for compatibility with the available Cal Kits, and so forth with the Cal Types that remain on the list.

If TRL is removed from the list, that Cal Type is NOT available for selection during a SmartCal with Mechanical Standards.

Learn more about Cal Types.

See where you choose Cal Type during a SmartCal

Prioritized list of choices for default Cal Type  Shows the current list of Cal Types and the order in which they will be selected for Mechanical calibrations.

Change  Click to invoke the Modify list of default Cal Types dialog.

Restore factory defaults  Returns the list to the original selections and order. The factory defaults are in order of accuracy from highest (TRL) to lowest (QSOLT).

Cancel  Closes the dialog without making changes.

Modify list of default Cal Types dialog box help

Use this dialog to Add, Remove, and re-order the available Cal Types. There must be at least ONE selected Cal Type to perform a SmartCal with Mechanical Standards.

Unselected Cal Types  Cal Types in this list will not be presented as a choice during a Calibration.
**Selected Cal Types**  Cal Types in this list will be presented, in order, as the default choice during a Calibration. Click a Cal Type to select it, then click the following buttons to perform that operation.

**Add / Remove buttons**  Click to Add and Remove the selected Cal Types from the Selected Cal Types list.

**Move Up / Down**  Click to re-order the Selected Cal Types list.
Adapters, fixtures, and probes are often used for DUTs that have non-coaxial interfaces. This could make it difficult to calibrate with traditional cal standards. Cal Plane Manager (CPM) allows you to mathematically remove (de-embed), a characterized adapter, test fixture, or probe head from measurements.

In this topic:

- Features
- Using Cal Plan Manager
  - Cal Plane Manager
  - Characterize Adapter/Fixture and Apply
  - Calset Selection
  - Port Selection
  - Phase Pivot
  - Select Files
  - Apply De-embedding
  - Select Channels to De-embed
  - Select Calsets to De-embed
- Direct Receiver Calibration (separate topic)
- Other Actions
  - Reverse Port Order
  - Create a Transmission Only S2P File
  - Cascade Two S2P Files
  - Cascade an ENR file with an S2P file

Other Cal Topics
Features

- Characterizes adapters and fixtures in SnP files.
- Applies the characterizations to existing Cal Sets and channels.
- Writes to VNA power loss table using the S2P files of fixtures/adapters.
- Reverses the port order of an existing S2P file.
- Creates a forward-only S2P file from an existing S2P file.
- Cascades two S2P files.

Important Notes

- **Adapter/fixture** definition: Any physical 2-port device or component that is to be mathematically removed from channel measurements or Cal Sets.
- The adapter/fixture to be characterized MUST be reciprocal (S21 = S12).
- Two Tier-1 cals must be performed and saved to Cal Sets BEFORE performing the CPM characterization.

Using Cal Plan Manager

**How to start Cal Plane Manager**

**Using** **Hardkey / SoftTab / Softkey**

1. Press **Cal > Fixtures > Cal Plane Manager...**

**Using a mouse**

1. Click **Response**
2. Select **Cal**
3. Select **Fixtures**
4. Select **Cal Plane Manager**
Choose from the following, then click **Next >**:

- **Characterize Adapter/Fixture and Apply** - Given that you have already performed calibrations both before and after the adapter/fixture, SNP files are generated which characterize the adapter/fixture. These files are then used to de-embed the fixture from the channel and a new calset. Learn how.

- **Apply Adapter/Fixture** - The *.SNP files are already saved. Use these files to de-embed the fixture from the channel and a new Cal Set.

- **Direct Receiver Calibration** (separate topic)

- **Other Actions**

**Requirements**

- You must have already performed a Tier 1 calibration at the input of the fixture/adapter(s) AND a Tier 2
calibration at the output of the fixture/adapter(s) as in the above image.

- In addition, the calibrations must have been saved to Cal Sets on the analyzer.

**Note:** The mechanical switch / attenuator settings of the Tier 1 and Tier 2 cals for CPM MUST be the same settings. Also, when the span or number of points are different between the two cal tiers, there must be sufficient data points to ensure that phase wrapping does NOT occur. This is accomplished when the delta frequency for either calset is less than 12/combined length of the test port cables in meters.

**Applications**

The following images show the calibration planes of the Tier 1 and Tier 2 calibrations:

<table>
<thead>
<tr>
<th>Probe Head on Wafer</th>
<th>Probe Head on Fixture</th>
<th>Waveguide Adapter</th>
</tr>
</thead>
<tbody>
<tr>
<td><img src="image1" alt="Probe Head on Wafer" /></td>
<td><img src="image2" alt="Probe Head on Fixture" /></td>
<td><img src="image3" alt="Waveguide Adapter" /></td>
</tr>
</tbody>
</table>

**Procedure**

**Configuration**  Select the number of adapter/fixtures to be characterized and de-embedded.

- Choose **One fixture** when you have a single fixture/adapter on either the input or output of the DUT.
- Choose **Two fixtures** when you have a fixture/adapter on BOTH the input AND output of the DUT.

**Browse** - Starts the following Calset Selection dialog.

**DC Phase** - Starts the Phase Pivot dialog.

Click **Next >**
Calset Selection dialog box help

Choose from the listed Cal Sets on the analyzer to use for the Tier 1 and Tier 2 calibrations.

- The Tier-1 calset MUST be from a calibration that was performed at the input to the adapter/fixture.
- The Tier-2 calset MUST be from a calibration that was performed at the DUT reference plane.

Click **Filter Calsets** to start the following dialog.
Check Enable Filter, then provide advanced filter requirements to narrow the search for appropriate Cal Sets.

**Filter Options**

**Measurement Class** - The classes listed are those that are enabled on the analyzer.

**Cal Type** - Filter for 1P (one-port) or 2P (two-port) Cal Sets.

**Calset Name Includes** - Filter to include any text that appears in the calset name.

**Calset Description Includes** - Filter to include any text that appears in the calset description.

**Cal Ports** - Filter to include only the analyzer ports to be de-embedded.

**Active Cals** - Filter to include only the Cal Sets that are currently in use on the analyzer.

**Last Modified Between** - Filter to include only the Cal Sets that were last modified between the two specified dates.

---

**Port Selection** dialog box help

In the previous dialog, when a multiport calset is selected for a characterization that involves fewer ports, then select the port in the calset that is used to characterize the fixture/adapter.
**Phase Pivot dialog box help**

![Phase Pivot dialog box](image)

For most devices, the projected phase of S21 at DC crosses the X-axis between 0° and -180°.

The phase pivot point specifies the center of the phase window. It is normally 1 Pi wide. The default value of 0° should be adequate for the majority of adapters.

However, when characterizing electrically long cables, cables with significant mismatch, or high noise in the measurements, it is possible that the projection of phase goes above 0°. This results in a 180° phase difference between the results computed by CPM versus the results you might get by measuring the same adapter with a 2-port calibration.

In these cases, you may have to change the default value to capture the projected phase of S21 at DC.

---

**Select Files dialog box help**

For each Fixture (A and B):

- Click **Browse**, then navigate to the folder to where the S2P files are to be saved.
- Enter a filename, then click **S2P Format**, then choose the format in which the data is to be saved:
Click **Apply** to continue to de-embed the fixture.

Click **Finish** to end with the characterization and close the dialog.

---

### Apply De-embedding dialog box help

Given one S2P file for each fixture/adapter, this dialog will remove the effects of the fixture/adapter from either:

- one or more Calsets
- or one or more channels.

**For each Fixture (A and B)**

1. Check to enable fixturing.

2. Select the VNA port the fixture is connected to.

3. Click **Browse** , then navigate to the S2P file that represents the fixture/adapter.

4. **Reverse Ports** - S2P files that are created using CPM ALWAYS reference port 1 of the fixture/adapter on the side closest to the analyzer and port 2 of the fixture/adapter ALWAYS on the DUT side of the device as in the following image. The application of the S2P file (this dialog) assumes this same orientation. If your S2P files were created using a different (external) application, check the orientation and check **Reverse Port Order** if necessary.
5. Choose one of the following De-embed Options

- **De-embed from Calsets** - Starts the Select Calsets to De-embed dialog box.
- **De-embed from Channels** - Starts the following Select Channels to De-embed dialog.

**Select Channels to De-embed** dialog box help

De-embedding is performed and applied to specified channels on the analyzer.
Select one more channels currently displayed on the analyzer from which to de-embed the adapter/fixture.

**Select Calsets to De-embed** dialog box help
This dialog appears when **De-embed from Calsets** is selected in the previous dialog.

De-embedding is performed and applied to specified Cal Sets. This allows you to easily apply de-embedding in the future by simply applying the de-embedded calset to any channel.

**Select Calsets**: Select the Cal Sets to which de-embedding will be applied.

**Properties**: View information about the corresponding calset.

- **Overwrite Selected Calsets** - The selected Cal Sets are overwritten with the adapter/fixture de-embedded.

- **Create New Calsets** - Select the Cal Sets from which new Cal Sets will be created.

Click **Options** to start the following dialog.
**Auto Name** - By default, a new calset will be created using the old calset name with the specified text ("CPM" by default) appended to the beginning of the name. You can change the specified text.

**Ask me for each name** - Starts the following dialog when **OK** is pressed.

**Preserve Active Cal and Channel associations** - When checked (default) the new de-embedded Cal Sets will be used to correct the same displayed channels as the current Cal Sets.

The Existing Calsets that you selected for de-embedding appear in the left column.

The proposed New Calset names appear in the right column.

To change the new Calset name, select, then edit the name.

When finished, click **OK**.
Select one of the actions:

- Reverse the Port Order of an S2P File.
- Create a Transmission Only S2P File.
- Cascade two S2P files.
- Cascade an ENR file with an S2P file

**Write to VNA power sensor loss table.** Loads the S2P Frequency / Loss pairs into the VNA Power Loss Compensation table to compensate for losses that occur when using the device to connect a power sensor to the measurement port during a Source Power Cal.

- **Enable Power Sensor Loss Table**

  Then choose from the following:

  - **Compute fixture from Calsets.** Computes the transmission loss of the fixture based on the selected Cal Sets. This choice is NOT available until two valid Cal Sets are selected.

  - **Use an S2P file.** Uses the S21 data in an existing S2P file to build the VNA’s power loss table. Select, then click **Browse**, then navigate to the S2P file, then click **Next >**.

  **Note:** In the VNA Power Loss Compensation table, loss is expressed as a positive number. CPM assumes that any negative S21 value in the S2P file is a loss and therefore multiplies the S21 values in the file by -1 to express that value as a positive number. This ensures proper handling of the offset during a source power cal.
S2P files that are created using CPM ALWAYS reference port 1 of the fixture/adapter on the side closest to the analyzer and port 2 of the fixture/adapter ALWAYS on the DUT side of the device as in the following image.

This action causes ports to be reversed on an existing S2P file.

- The data for S11 becomes the data for S22 and vice versa.
- The data for S21 becomes the data for S12 and vice versa.

The resulting file is written in the standard S2P file format.

1. **Original** - Navigate to the S2P file to be reversed.

2. **Reversed** - Navigate to the folder where the new reversed S2P file will be saved. Enter a filename. By default, the file is saved to the same folder using the filename: `<old filename>_Reversed.s2p`

3. Click **Finish**. The Reversed file is saved to the specified location.
From an existing S2P file, this feature allows you to zero the S11, S22, or both data columns. The original S21 and S12 data are preserved. This is useful for Enhanced Response calibration / de-embedding.

**Original** - Click **Browse**, then navigate to the file to be modified.

**Modified** - Click **Browse**, then navigate to the folder and enter or change the filename of the resulting S2P file. The file select dialog allows you to change the format of the data. Click **Format**, then choose from the following:

- Log Magnitude & Angle (default)
- Lin Magnitude & Angle
- Real & Imaginary

**Modifications**

Choose to Zero the S11, S22, or both data columns.

Click **Finish**. The transmission only file is saved to the specified location.
Cascade Two S2P Files dialog box help

This dialog combines the losses and phase shift of two S2P files into a single S2P file.

The stimulus settings of the two input S2P files need not be identical. The frequency range of the cascaded S2P file will be the frequency range that is common between the two input files. In addition, the cascaded S2P file will use the data points of the input file with the denser data points.

For example:

**S2P #1**: Frequency range = 1 GHz to 5 GHz; 201 pts.

**S2P #2**: Frequency range = 2 GHz to 6 GHz; 1001 pts.

**Cascaded S2P**: Frequency range = 2 GHz to 5 GHz using the data points of S2P #2.

**S2P #1** - Click **Browse**, then navigate to one of the S2P files to be cascaded.

**S2P #2** - Click **Browse**, then navigate to the other S2P file to be cascaded.

**Cascaded S2P** - Click **Browse**, then navigate to a folder and enter the filename of the resulting S2P file.

Click **Finish**. The cascaded file is saved to the specified location.
This dialog generates a new ENR file by embedding an adapter to an existing ENR file.

**Input ENR** - Click **Browse**, then navigate to ENR files to be cascaded.

**Input S2P** - Click **Browse**, then navigate to the S2P file to be cascaded.

**Output ENR** - Click **Browse**, then navigate to a folder and enter the filename of the resulting ENR file.

Click **Finish**. The cascaded file is saved to the specified location.
Port Sub-Setting Examples

S-Parameter error correction is described by the number of ports contributing to the measurement: 1, 2, 3 or 4 port corrections are common. They can be represented in a visual shorthand like the matrix below.

Source ports occupy each column. Receiver ports occupy each row.

**Example 1:** this table shows four independent 1 port calibrations. (F1) All reflection measurements S11, S22, S33, S44 will all be Full 1 Port corrected.

<table>
<thead>
<tr>
<th>Source Port</th>
<th>1</th>
<th>2</th>
<th>3</th>
<th>4</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>F1</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>2</td>

<tr>
<td>4</td>
<td>F</td>
<td>F</td>
<td>F</td>
<td>F</td>
</tr>
</tbody>
</table>

Calibrating all ports of the network analyzer allows measurement flexibility but it may not be appropriate for all test conditions. Port Subsetting can be used to devolve a multi-port to fewer ports as needed. This is useful in the following situations:

- when a calibration includes ports that are not connected to the DUT.
- When it is safer or more accurate to only acquire data in one direction which can be the case with high power amplifiers and when there is substantial loss at the DUT output port.

By default, Port Subsetting is disabled and all ports are selected as denoted by the “X” in the port indicators. Enabling port subsetting with all ports included is the same as turning port subsetting OFF. Below we show some examples of subsetting a full 4P correction.
Example: Active 4-Port Calibration

The following examples assume there is an active 4 Port calibration.

An active 4 Port calibration:

<table>
<thead>
<tr>
<th>Source Port</th>
<th>1</th>
<th>2</th>
<th>3</th>
<th>4</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>F</td>
<td>F</td>
<td>F</td>
<td>F</td>
</tr>
<tr>
<td>2</td>
<td>F</td>
<td>F</td>
<td>F</td>
<td>F</td>
</tr>
<tr>
<td>3</td>
<td>F</td>
<td>F</td>
<td>F</td>
<td>F</td>
</tr>
<tr>
<td>4</td>
<td>F</td>
<td>F</td>
<td>F</td>
<td>F</td>
</tr>
</tbody>
</table>

Example 5: To subset the calibration to ports 1, 3 and 4, de-select port 2 and Enable port subsetting.

This yields a correction grid like Example 3 above, except the shaded cells are no longer empty.

The multiport correction is devolved from 4 ports to 3. But what happens when measurements involving port 2 are created?

<table>
<thead>
<tr>
<th>Source Port</th>
<th>1</th>
<th>2</th>
<th>3</th>
<th>4</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>F</td>
<td>eR</td>
<td>F</td>
<td>F</td>
</tr>
<tr>
<td>2</td>
<td>eR</td>
<td>F</td>
<td>eR</td>
<td>eR</td>
</tr>
<tr>
<td>3</td>
<td>F</td>
<td>eR</td>
<td>F</td>
<td>F</td>
</tr>
<tr>
<td>4</td>
<td>F</td>
<td>eR</td>
<td>F</td>
<td>F</td>
</tr>
</tbody>
</table>

Because the calset already contains error terms for port 2, the best result for port 2 measurements is as follows:
• Enhanced Response (eR) correction to transmission terms (S21, S32, S42, S12, S32, S42)

• 1 Port correction (F1) to S22.

These corrections give a much better result than leaving the parameter uncorrected while not requiring any extra acquisition time. This is sometimes referred to as “Best Effort”.

Example: Subsetting by De-Selecting All Ports

This is a convenient way to reduce a multiport correction to a set of single port corrections.

This example yields the following correction grid.

**Example 6:** Our original 4 port correction has been devolved to a set of one port and enhanced response corrections. Again, because we have the error terms this grid produces the best measurement results without sweeping multiple source ports. (Best effort).

<table>
<thead>
<tr>
<th>Source Port</th>
<th>1</th>
<th>2</th>
<th>3</th>
<th>4</th>
</tr>
</thead>
<tbody>
<tr>
<td>Receive Port</td>
<td>1</td>
<td>F1</td>
<td>eR</td>
<td>eR</td>
</tr>
<tr>
<td>2</td>
<td>eR</td>
<td>F1</td>
<td>eR</td>
<td>eR</td>
</tr>
<tr>
<td>3</td>
<td>eR</td>
<td>eR</td>
<td>F1</td>
<td>eR</td>
</tr>
<tr>
<td>4</td>
<td>eR</td>
<td>eR</td>
<td>eR</td>
<td>F1</td>
</tr>
</tbody>
</table>

Port Sub-Setting SCPI Commands

**Note:** With SCPI you have more control over the grid.

SENS:CORR:METHod:PORT:SUBSet:FULL:VALue
This command sets the ports that are included in the subsetting.

This command sets which ports are included the "best effort" treatment.

**Note:** The ports lists for these two commands must be mutually exclusive.

**SCPI Example: Assuming a 4 port calset, port subset to a 3 port cal on ports 1,3,4**

This set of commands yields the following grid.

SENS:CORR:METH:PORT:SUBSet:FULL:VAL 1,3,4

SENS:CORR:METH:PORT:SUBSet:RESP:VAL 0

<table>
<thead>
<tr>
<th>Source Port</th>
</tr>
</thead>
<tbody>
<tr>
<td>1 2 3 4</td>
</tr>
<tr>
<td>1 F F F</td>
</tr>
<tr>
<td>2</td>
</tr>
<tr>
<td>3 F F F</td>
</tr>
<tr>
<td>4 F F F</td>
</tr>
</tbody>
</table>

This set of commands yields the following grid.

The same result occurs when you subset to ports 1,3,4 from the dialog.

SENS:CORR:METH:PORT:SUBSet:FULL:VAL 1,3,4

<table>
<thead>
<tr>
<th>Source Port</th>
</tr>
</thead>
<tbody>
<tr>
<td>1 2 3 4</td>
</tr>
<tr>
<td>1 F eR F F</td>
</tr>
<tr>
<td>2 eR F1 eR</td>
</tr>
<tr>
<td>3 F eR F F</td>
</tr>
<tr>
<td>4 F eR F F</td>
</tr>
</tbody>
</table>
Use this selection to modify an existing Cal Set with a calibration path through the front-panel jumper loops (direct access receiver configuration).

For example, this might occur on a Differential IQ channel when using more than four ports. If only the source is being used for the measurement, the receiver can be accessed and calibrated using the front-panel jumper cables.

**Note:** Only corrected scalar magnitude measurements are possible at the direct-access receiver. The original phase data is preserved in the Cal Set and is NOT modified by the Direct Access Receiver Cal.

See the Cal Plane Manager main help page.

Choose Direct Receiver Calibration, then click Next >
Select a Cal Set to modify. By default, the Cal Set for the active channel is selected.

A valid Cal Set has the following attributes:

- The Cal Set has at least one reference receiver Response Tracking error term AND the test port receiver Response Tracking error term in it. These must cover the same frequency range. The Differential IQ Cal All Cal Set will meet this requirement.

- If the active Cal Set does not meet the above criteria the Next button is NOT available.

Select a Source Port to be used for Direct Receiver Calibration.

The ports that are listed have a calibrated reference receiver in the selected Cal Set.

Select (one or more) Receivers to be calibrated through a front-panel access port.

The Receivers that listed are have the same corrected frequency ranges as the selected Source Port.

For convenience, both standard and logical receiver notation are used in the list of receivers.
Using the same cable for this calibration that is used in the measurement, connect the cable as shown in the diagram.

If an additional adapter is used to connect the cable to the source port, the very small magnitude effects of that adapter will not be removed from the Cal Set.

**Power Level:** If needed, change the power level of the source for this measurement only.

The Cal Set that you selected in the first dialog appears.

You can modify that Cal Set, or enter a new Cal Set name to be created.

Click **Finish**. The following warning message appears.
Modify existing calset "2014-05-22_01-26:50"?
All VNA measurements have some level of uncertainty. The Keysight Uncertainty Calculator has always provided a method to calculate the uncertainty of your measurement based on measurement settings, connectors, and a specified Cal Kit. Now, with S9x015A/B, you can display the measurement uncertainty dynamically ('real-time') on the same screen as the measurement trace and get more reliable uncertainty estimates.

- **Overview**
  - Summary: How to show Uncertainties

  - Display Uncertainties
  - Save Uncertainty Measurement Data
  - Set Up Power Sensor Uncertainty (separate topic)

### Other Calibration Topics

#### Overview

The following three sources of uncertainty are characterized and accounted with Dynamic Uncertainty for S-Parameters:

- **Calibration Standards** - For select Keysight Cal Kits, the standards have already been characterized to a known degree of uncertainty. Alternatively, custom Cal Kits with custom uncertainty can be used. Learn more.
- **Noise** - The noise at each test port must first be characterized using LOAD and SHORT standards at measurement settings (frequencies, RF power, IF bandwidth, averaging factor) that are similar to the final uncertainty measurements. These characterization measurements are stored with workspace files and can be included in subsequent uncertainty measurements. [Learn more](#)

- **Cable and connector repeatability** - The repeatability of test port cables must first be characterized using LOAD and SHORT standards as terminations. These characterization measurements are stored with workspace files and can be included in subsequent uncertainty measurements. [Learn more](#).

**Summary: How to measure and display Uncertainties**

Highlighted steps are required ONLY for noise and repeatability characterizations. They are NOT required if already completed prior to calibration.

1. Setup the instrument for characterization.
2. In Uncertainty Manager, assign Cal Kits, ports, and cables for measurement.
3. Perform noise characterization.
4. Complete a standard calibration of the system.
5. Perform repeatability characterization.
6. Setup the VNA for the measurement.
7. Perform an uncertainty calibration using an Uncertainty Cal Kit. [Learn how](#).
8. Set Uncertainty Trace Properties to control what and how uncertainties are displayed. [Learn how](#).

**Note:** When recalling a Uncertainty Cal Set, it is also necessary to turn Correction ON.
**Filter S21 measurement with uncertainty bars.**

**Limitations**

- ONLY single-ended S-parameter and Power (Standard class) measurements are supported.
- SOLT calibrations are NOT supported. Instead, the preferred choices are SOLR (unknown THRU) and QSOLT.
- Multiple Cal Kits per calibration are NOT supported. For multiple Cal Kit scenarios, create a custom Cal Kit using existing standards. Learn how.
- ONLY the following ECal families are currently supported:
  - N4433A 3.5 mm 20 GHz 4-port
  - N4690C Type-N 300 kHz to 18 GHz 2-port
  - N4691B 3.5 mm 26.5 GHz 2-port
  - N4692A 2.92 mm 40 GHz 2-port
  - N4693A 2.4 mm 50 GHz 2-port
  - N4694A 1.85 mm 70 GHz 2-port
  - All N469xD ECal modules are supported, except all DC options (0DC)
- ECal User Characterizations are NOT supported.
- Sliding Load Cal standards are NOT supported, even though some Uncertainty Cal Kits contain sliding load standards.
- Multiport Testsets are NOT supported.
Cal All Channels is NOT supported.
This application does not support banded millimeter systems.

**When Programming Dynamic Uncertainty**

- Calibrations can be performed for ONLY ONE channel at a time.
- Putting Error Term data into Uncertainty Cal Sets using remote commands is NOT supported.

**Uncertainty Manager**

Uncertainty Manager is used to perform Noise and Cable Repeatability characterizations, to edit Uncertainty Cal Kits, and make settings that are used during a subsequent uncertainty calibration. Once completed, the characterizations and settings can be saved to a workspace file for future calibrations.

Uncertainty Manager is a separate application that runs at the same time as the VNA application. It is closed ONLY when the VNA application is closed.

**Important:** To return to the VNA from Uncertainty Manager, click **File**, then **Switch to VNA**.

**How to start Uncertainty Manager**

**Using Hardkey/SoftTab/Softkey**

1. Press **Cal > Cal Sets & Cal Kits > Uncertainty Setup...**

**Using a mouse**

1. Click **Response**
2. Select **Cal**
3. Select **Cal Sets & Cal Kits**
4. Select **Uncertainty Setup...**
Most Uncertainty Manager settings can be made both from the Menu and by right-clicking an item.

Uncertainty Manager Workspace

The Uncertainty Manager Workspace contains all of the settings and characterizations that are used in an Uncertainty Calibration.

- The title bar on the Uncertainty Manager dialog shows the current workspace (*.ml4) filename.
- When an uncertainty calibration is performed, the workspace is automatically saved. This file is automatically reloaded when Uncertainty Manager is started.
- To save the current workspace, click File, then Save, then enter a name. The factorydefault.ml4 (workspace) file can NOT be overwritten. If you do NOT change the filename while saving with factorydefault.ml4, then _copy is appended to the filename before it is saved.
- Plot settings are NOT saved to the workspace file.

Perform Port Noise Characterization

The Noise characterization measures the VNA source and receiver noise for a pair of test ports.

Measurement Settings

- When included in uncertainty analysis, the Noise Characterization is interpolated over frequency, but NOT
extrapolated. Therefore, the characterization should be performed over the entire frequency span of the VNA with a point spacing of about 1600 points for the entire span. Avoid very dense point spacing as this slows the characterization and puts a burden on VNA memory.

- The IFBW for the characterization should be within 10x of the IFBW of the uncertainty calibration. For example, a characterization performed at 10 kHz will allow the IFBW for the uncertainty calibration to be between 1 kHz to 100 kHz.

- The power level is generally tolerant of variation, so performing the characterization within +/- 10 dB of the power level of the uncertainty calibration is acceptable.

- The averaging factor of the characterization should be within a ratio of 1:100 of the uncertainty calibration. For example: an averaging factor of 100 for the characterization would allow an averaging factor of between 1 and 1000 for the uncertainty calibration.

**How to Perform Noise Characterization**

It is NOT necessary to perform or recall a VNA calibration before performing a noise characterization.

Start the noise characterization by doing either of the following:

- From the menu, select **Noise**, then **Measure Noise**
- Right-click a VNA Port, then select **Measure Noise**

If the current VNA settings (frequencies, RF power, IF bandwidth) are NOT the same as that with which the current noise data was measured, then the following dialog appears:

Select one of the following:

- **Clear noise data on all ports** - Use the current VNA settings to perform a new Noise characterization.
Switch to VNA (screen) - Manually change the VNA settings to match those with which the current noise data was measured. Do this to recharacterize the noise using the previous settings.

Click (Start) Measure. The VNA port noise characterization is performed using a 2-step measurement process involving two ports at the same time:

1. The noise floor is characterized with a LOAD (or low-reflective device) connected to each test port. If test cables will be used in your uncertainty measurement, connect them for the noise characterization to get a better noise estimate, especially when the cables are lossy.

2. Trace noise is characterized with a SHORT (or high-reflective device) connected to each test port.

Press OK when finished.

Save the Noise Characterization

The noise data can now be saved and later recalled for use with uncertainty measurements.

- To store the entire workspace which includes the noise characterization, click File, then Save.
- To store the JUST noise data, in the menu bar, click Noise, then Save Noise. Enter a descriptive filename. The noise data is saved to a *.ndf file. You would do this if you plan to share the data with another VNA. This ASCII (csv) file can be accessed using Windows Explorer.

Cable Repeatability Characterization

Uncertainty Manager comes preloaded with a database of uncharacterized cables. In addition, there are also some 'Example' cables which include repeatability characterization data. However, you should perform your own repeatability characterization for cables which you intend to include in the uncertainty analysis.

It is likely that you will need to add new cables to the list. For example:

- If the cable requires an adapter to connect your DUT, you should create a new cable entry and characterize it. Adapters do have an impact on how the repeatability propagates.
- To connect your DUT directly to the VNA front panel connector or connector saver, create and then assign a "zero-length Test Port" cable.
- Learn how to add new cables and connectors.

BEFORE performing the repeatability characterization

1. Assign the cable to at least one VNA port. This is done ONLY to perform the characterization. During uncertainty measurements, the cable can be assigned to any VNA port. The characterization is performed at the lowest port number to which it is assigned.

- To associate a single cable with all ports, select the cable. Then right-click, then select Assign Cable to All Ports.
To associate a single cable with a single port, select the port. Then in the **Properties** pane, select **Cable Name**, then click next to the current cable name, then select a cable.

- To perform an independent repeatability characterization for each port, ensure that the assigned cable or test port name is unique.

2. Perform or recall a valid calibration at the test port. To achieve the best characterization:

- Select the entire frequency span over which the cable is specified or the frequency span of the VNA if it is smaller. When performing the uncertainty calibration over a smaller span, it will be interpolated.
- Select a point spacing or about 1600 points. Avoid very dense point spacing as this slows the characterization and puts a burden on VNA memory.
- Select an IFBW of 1 kHz or less.
- Select a high power level without exceeding the VNA linearity specification.

**Perform the repeatability characterization**

1. Select the cable to characterize.

2. If there is already repeatability data associated with the cable, right-click the cable, then click **Clear Repeatability**.

3. At the bottom of the **Properties** pane, click **Measure Repeatability**. The following dialog appears:

![Repeatibility Characterization Dialog](image)

4. Choose **Number of Iterations** (20 is recommended). An Iteration is a measurement with each termination. A set of iterations are performed first with the LOAD (or low-reflective device), and then again with the SHORT (or high-reflective device). For 20 iterations, a total of 40 measurements are performed.

5. Connect the cable to the specified test port, connect the terminating LOAD, and click **Start Measurements**.

6. Between each measurement, either move the cable, or remove and reconnect the standard, or both
5. Do NOT remove and reconnect the cable from the VNA test port as this will impair the calibration. Use the same torque wrench as you use during ordinary calibrations and measurements.

6. Follow the prompts at the top of the dialog. When finished, press **OK**.

**Save the repeatability characterization**

The repeatability data can now be saved and later recalled for use in an uncertainty calibration. The repeatability data can be used over any subset of the characterized frequency range. When used in an uncertainty calibration, measurement settings such as power and IFBW are NOT relevant.

- To store the entire workspace which now includes the repeatability measurements, click File, then Save.
- To store JUST the repeatability data, click Save Repeatability and enter a descriptive filename. The repeatability data is saved to a *rep file. You would do this if you plan to share the data with another VNA. This file can be accessed using Windows Explorer.

**Add New Cables and Connectors**

- Click Cables, then New Cable. 'New Cable' appears in the list of connectors.
- Use the Properties pane to change the Name and assign a Connector Type and Gender.
- To add a new connector, add it using the Uncertainty Manager **CalKit Editor**.

---

**Uncertainty Cal Kit Editor**

From Uncertainty Manager, you can access the Uncertainty Cal Kit Editor by clicking the **CalKit Editor** tab. Also from the **VNA Cal Kits dialog**, click **Uncertainty Cal Kits** button.
**The Uncertainty Cal Kit Editor**

**Uncertainty Cal Kits and Standards**

To see Cal Kit uncertainty contributions in an Uncertainty calibration, the standards must include uncertainty data. This is best done with 'databased' standards. This means that the standard definitions include characterized data, not just polynomial values as in typical Keysight Cal Kits. Polynomial standards can include mechanical dimension uncertainties. Learn more.

As shown in the above image, three of the Keysight 8505x Cal Kits have already been 'databased' for use with Dynamic Uncertainty. In addition to being databased, the standards include uncertainty data.

- Keysight Uncertainty Cal Kits can NOT be edited.
- No Keysight Waveguide Cal Kits have been databased.
- If you own a Cal Kit other than those that have been databased, you can either:
  - Characterize your own uncertainty standards. Learn how (internet connection required).
  - Add uncertainty values to represent the mechanical uncertainties of your cal standard. Learn how.

All standards have properties as shown in the Properties pane above.

All standards have the General information shown, and Connector Type and Gender.

All standards have an icon preceding its Name in the Items list. This gives a hint as to the type of standard.

- Signifies a databased standard. The characterization data is stored in the workspace file. See How to
Characterize Uncertainty Standards.

- Signifies an adapter. Adapters are NOT databased. They include only nominal 'delay'. This delay value can be edited if it is in a custom Cal Kit.

- Signifies an OPEN. All other icons represent a specific type of polynomial-based standard.

Connectors

To add a new connector, right-click on **Connectors**, then **New Connector**. "New_Connector" appears in the list of connectors. Edit the name in the Properties pane. It will now appear in the Connector Type selector for a standard.

Create a Custom Cal Kit

You may need to create a custom Cal Kit for one or more of the following reasons:

- When performing an uncertainty calibration, only ONE Cal Kit can be selected for all ports. For multiple Cal Kit scenarios, create a custom (combined) Cal Kit which contains standards with different connector types using the uncertainty Cal Kit Editor.

- Create a Cal Kit to contain new standards.

Procedure

1. On the CalKit Editor tab, click **CalKits**, then **New CalKit**.
2. In the Properties pane, change the **Name** and **PartNumber**.
3. Fill the new Cal Kit with standards the following methods. There can be more than one connector type in a Cal Kit.

   a. **Copy standards from other Cal Kits.** Standards can simultaneously belong to different Cal Kits.
      i. Select the standard in a different Cal Kit to be copied.
      ii. Click **Edit**, then **Copy** (or Ctrl+C)
      iii. Select the new Cal Kit.
      iv. Click **Edit**, then **Paste** (or Ctrl+V)
      v. Make edits to the standard as necessary. You can not edit databased standards that have been copied from Keysight standards.

   b. **Create new databased or polynomial standards.**
      i. Click **CalKits**, then **New standard**
      ii. Select the standard type. Choose from: Short, Open, Load, Line, Thru (defined), Reciprocal (Unknown Thru), DatabaseStd.

         - **DatabaseStd** is the ONLY standard type for which you can upload uncertainty characterization data. These Database standards can be renamed and associated with a Equivalent Model. See the following section **Characterize Uncertainty Standards**.

         - All other standard types allow only polynomial data. These standards can include dimension
4. Click Edit **CalKits**, then **Edit Class**. Learn more about editing Cal Kit Classes from the VNA Cal Kit Editor.

**Characterize Uncertainty Standards**

To be used in an Uncertainty calibration, the standards must include uncertainty data. This is best done with a 'databased' standard. This means that the standard definitions include characterized data, not just polynomial values.

Select Keysight Cal Kits have already been characterized with uncertainty data. If you own one of these Cal Kits, shown by name in the Cal Kit editor, there is nothing more required.

If you do NOT own one of these Cal Kits, you can characterize your own uncertainty standards.

**Procedure**

1. Perform an uncertainty calibration using a Keysight Uncertainty Cal Kit.
2. Measure the device to be used as a standard.
3. Save the data as *.dsd file Learn how.
4. Import this file at the New Standard dialog.

**Mechanical Dimension Uncertainties**

For Cal Kits that include polynomial standards to be used for PCB, on wafer, or coaxial applications, you can describe the mechanical dimensions and tolerances. From these, Uncertainty Manager will calculate the electrical uncertainties. An example of this type of standard is provided in the Uncertainty Manager **Microstrip Example** Cal Kit.

**How to enter physical dimensions and tolerances**

1. Select the polynomial standard.
2. In the Properties pane, change **Type** any of the selections other than Ideal or Waveguide.
3. Enter the relevant physical dimensions accordingly to the manufacturer's specifications.
4. For each dimension, in the Uncertainty section, provide reasonable estimates of the standard parameters. By default, the uncertainty probability density function is assumed to be Gaussian. All uncertainty values are assumed to be standard deviations (1 sigma uncertainties).

**Calibration Options**
**Calibration Options** dialog box help

To start this dialog, in Uncertainty Manager, click **File**, then **Uncertainty Options**.

![Uncertainty Options dialog box]

Check each to include Noise, Cable Repeatability and Standard Definition in the uncertainty calibration. You can later decide to NOT include these in the measurements using the **Trace Properties** dialog.

**Max Uncertainty Pts** - Because of limited VNA memory, uncertainty is computed for a maximum of 501 equally-spaced data points. When applied to a measurement, the data points within each step is assumed to have the same uncertainty. To save VNA memory, reduce this number.

**Important Notes**

- These settings control the contributions used ONLY during the uncertainty calibration. They are independent from the trace properties settings, which control the contributions used during the DUT measurement.
- These settings are NOT saved with the workspace file, but to a hidden 'global' file.

**Service Mode** - When requested by Keysight service personnel, check this box before calibration to save uncertainty data for troubleshooting purposes.

**Perform an Uncertainty Calibration**
Important: BEFORE starting an uncertainty calibration, ensure that the current Uncertainty Manager workspace contains ALL of the settings that will be used for the uncertainty calibration. Here are the critical settings:

- For each port to be calibrated, select the **Connector Type** and **Port / Cable** assignment.
- To include Noise data and Cable Repeatability data in the calibration:
  - The data must be available in the current workspace.
  - Be sure that the data covers the frequency range of the calibration.
  - Check the appropriate 'include' boxes in Options dialog.

Start **Cal Wizard**, then select **Guided Cal**.

1. At the Select Ports for Guided Cal dialog, select the ports to be calibrated, then check **Use Uncertainties**, then **Next >**.

2. At the Select Cal Kit dialog:
   - The connectors that you chose from the Uncertainty Manager are selected automatically and can NOT be changed.
   - Select the (Uncertainty) Cal Kit if more than one exists.

3. Optionally, click **View/Modify Cal** to view / change the Cal Types and connection steps for the pending calibration. The following dialog appears:

   **Uncertainty Calibration Properties** dialog box help
The port configurations with selected Cal Types appear in a matrix.

- 1-port Cals appear at the intersection of the same port number. For example Port 1 and Port 1.
- 2-port 'Thru' Cal Types appear at all other intersections.
- The dark-shaded areas are a mirror image of the selectable 2-port intersections. They can NOT be edited.

**How to change Cal Types**

- Click in any white box, then make a selection.
- The Connection List (cal steps) change accordingly.
- **Invalid** appears when the Cal Types are NOT sufficient to perform a valid calibration. One or more of the Cal Types must be changed.
- **None** appears when no Cal Type is required at that port intersection.

**2-port (Thru) Cals** are selected by default based on the following (in order):

1. The standards in the selected Cal Kit. **ECal** always appears when a supported ECal module with the corrected connector type and gender is connected to USB. NOT all ECal modules have been databased. Learn more.
2. The most recent multiple-port calibrations.
3. If the most recent calibration is NOT possible, then priority is given to Cal Types in the following order:

   1. **LRM** (Line-Reflect-Match) The 'Line' (L) standard is used as a Thru by defining it in the Thru Class.
   2. **TRL** (Thru-Reflect-Match) - Learn more about TRL
   3. **SOLR** (Un-Thru) - Learn more about Unknown Thru
4. **QSOLT** (Quick SOLT) - Only ONE 1-port Cal is performed (on the lower port number by default). Then a Defined Thru. To perform the 1-port cal on the higher port number, select 'Thru' between the ports, then change the higher port number to 'One-port Cal'.

**1-port Cals**

- **One-port Cal** appears at the intersection of the same port numbers. The above image shows this for all four ports.

- **Automatic** indicates that the selection is flexible. The connection list reflects the port numbers on which to perform 1-port cals. However, any of the Automatic selections can be changed to 'One-port Cal'.

**Default Cals**

Select your Cal Type preference for the current calibration.

4. Follow the remaining connection prompts to complete the calibration.

5. Save the calibration and apply the resulting Cal Set with uncertainties as you would any Cal Set.

**Important:** Add a descriptive prefix to the Uncertainty Cal Set name such as "UNC<calset name>". This will help identify it as an Uncertainty Cal Set. This does not occur automatically.

**Set Uncertainty Trace Properties**

You have performed Noise and Cable Repeatability (optional).

You have performed a calibration using an Uncertainty Cal Kit.

Now, you want to show the uncertainties on the displayed trace.
Start the **Trace Uncertainty Properties** dialog by doing one of the following:

1. Right-click on the trace status above the grid, then click **Uncertainty**.

**Using Hardkey/SoftTab/Softkey**

1. Press **Math > Analysis > Uncertainty Analysis**...

**Using Menus**

1. Click **Response**
2. Select **Math**
3. Select **Uncertainty Analysis**...

---

**Uncertainty Trace Property** dialog box help

**Trace** - Choose the displayed trace to which the settings on this dialog will be applied. Or check **Apply to all traces** to override this selection.

**Trace Type**

ONLY Ellipse is supported in Smith Chart or Polar display format.

- **Normal** - Display the trace without uncertainties.
- **UMax** – Display the trace as the uncertainty maximum (measured or memory data PLUS upper limit uncertainty values).
- **UMin** - Display the trace as the uncertainty minimum (measured or memory data MINUS lower limit uncertainty values).
**UBars** – Display the uncertainties as “error bars” around the trace.

**Shade** – Display the uncertainties as a shaded region around the trace.

**Ellipse** – Display the uncertainties in ellipse form. Supported ONLY in Smith Chart or Polar display format.

**Settings**

**Coverage Factor** - Sets the level of confidence used in computing the specified measurement uncertainties. The higher the coverage factor, the higher the confidence that the computed uncertainty region includes the "true" measured data of the DUT.

To include **Noise** and Cable **Repeatability** uncertainties, the characterization must have already been performed. Learn how.

- **Noise** - Check to include characterized noise data contribution in the displayed uncertainties.
- **Repeatability** - Check to include cable and connector repeatability contribution in the displayed uncertainties.
- **Calibration** - Check to include Cal Standard uncertainty contribution in the displayed uncertainties.

**Apply to all traces** - Check to apply the above settings to ALL traces. Clear to use the 'Trace' selector to choose traces to which settings will be applied.

**Add Trace**

A trace is added to the channel. Choose from the following:

- **UMax** - The uncertainty maximum data (measured or memory PLUS upper limit uncertainty values).
- **UMin** - The uncertainty maximum data (measured or memory PLUS upper limit uncertainty values).

**Cancel** - Closes the dialog just like clicking **OK**. All changes are applied.

**Saving Uncertainty Data**

Once an Uncertainty Calibration has been performed and you are making measurements, you can then save Uncertainty data.

Before saving, an Uncertainty Calibration MUST be applied to the active measurement.

Click **File**, then **Save Data As**. (See the Save Data dialog).

Then choose from the following formats:

- **(*.u*p) S-parameter Uncertainty File** - Very similar to *.SnP files except this format includes uncertainty
Sample header:

!Coverage factor: \( k=1 \)

Freq(Hz), S1_1 mag (linear), S1_1 phase (deg), USl_1 mag (linear), USl_1 phase (deg)

- **(.dsd) S-parameter Data Standard Definition file** - Used by Dynamic Uncertainty (Opt S93015A/B) as the file type that is used to characterize standards.

- **(.sdatcv) METAS S-parameter Covariance File** - Used by Swiss Federal Institute of Metrology software for save/recall of measurement uncertainties.

- **(.unc) Uncertainty Parametric Data** - Contains the uncertainty contributions of the measured quantities (power and S-parameters).

Choose ports for Uncertainty Data dialog help

This dialog appears when any of the following conditions exist while attempting to save data to any of the Uncertainty data types:

- when requesting less data than is available.
- when requesting data for more than 4 ports.

**Number of ports** Select the number of ports for which data will be saved.
Notes

- When saving a *.dsd file, only data for 1-port or 2-ports per file are allowed. An error is returned when attempting to save data for more than 2 ports per file.

- When saving a *.up file, with Number of ports = 2, *.u2p data is saved; with Number of ports = 3, *.u3p data is saved, and so forth.

Arrow buttons  Click to Add or Remove ports from or to the following columns:

Available Ports  All test set ports are listed. There may NOT be valid data available for all of these ports. Learn more.

Chosen Ports  When OK is clicked, uncertainty data is saved for these ports.

OK  Becomes available when the number of Chosen ports = the Number of ports to save. Click to save the uncertainty file.
Power Calibration

Note: It is recommended that SmartCal be used instead of the following Power Calibration procedures. The procedures in this topic are for those who cannot change their existing test program/procedure with their installed-base PNAs.

Note: Source and Receiver Power Calibrations are NOT available in M937xA/P937xA PXI.

Source and Receiver Power Calibrations work together to provide very accurate power levels from the source, and very accurate power measurements from the VNA receivers.

- Source Power Calibration Overview
- Supported Power Meters and Sensors
- How to perform Source Power Calibration
- Setup
- Source Power Cal dialog
  - Source Power Calibration Options dialog
  - Power Meter Settings dialog
  - Power Loss Compensation dialog
  - Power Sensor Settings dialog (Zero / Calibrate)

- Copy a Source Power Calibration to other Channels
- Saving a Source Power Calibration
- Reducing Time to Complete a Source Power Calibration
- Receiver Power Calibration
- Saving Receiver Cals

Other Source Power Cal choices

- Guided Power Cal can be performed during an S-parameter Guided Calibration. Learn more.
- Receiver Leveling can be used to provide 'real-time' source power cal. Learn more.
See Also: Configure an Power Meter As a Receiver (PMAR)

See other Calibration Topics

Source Power Calibration Overview

Note: Source and Receiver Power Calibrations are NOT available in M937xA PXI.

Perform Source Power Calibration when you need accurate power levels at some point in the measurement path between the VNA test ports. For example, you need to characterize the gain of an amplifier across a frequency range at a specified input power. You would perform a source power cal at the input of the amplifier to ensure the exact power level into the amplifier across the frequency range.

Using a Source Power Cal, you can expect the power at the point of calibration to be within the range of the uncertainty of the power meter and sensor that is used.

Source Power Calibration...

- Is independent of measurement type. It corrects the VNA source regardless of which receivers are being used in a measurement. Therefore, it can be used with both ratio or non-ratio measurements.

- Applies ONLY to those measurements on the selected channel that use the test port that was specified as the Source for the calibration. For example, if you specify Channel 1 and Port 1 as the source to be calibrated, only those measurements on channel 1 that use port 1 as the source will be corrected.

- Can be used in conjunction with other measurement calibrations, such as a full 2-port calibration. For highest accuracy, perform the measurement calibration AFTER the source calibration.

- Can be used with Power Sweep type. Source Power Cal will correct the power at all power levels across the power sweep.

- Can be used with Port Power Uncoupled.

- Forces sweep mode to Stepped on measurements with source power correction turned ON.

- An external source can be calibrated using Source Power Cal.

Overview of How it works:

See Important First-time USB connection note.

Click to see the detailed procedure

1. Specify the measurement settings (frequency range, IFBW and so forth).

**Note:** When using an Keysight 848X power sensor (sensors that do NOT have built-in calibration factors), enter the Cal Factors using the *Power Sensor Settings* dialog, because the VNA instructs the power meter to NOT use the Cal Factor tables internal to the power meter.

3. Connect a power meter sensor to the point at which you want a known power level. This may be at the input or output of your device, or some other point between the test ports.

4. The VNA source is stepped through the specified frequency range, and power is measured with the power meter. At each data point, the source power is adjusted until the measured power is within your specified accuracy level.

5. When complete, the power meter is preset. The source power calibration can be saved as part of the instrument state.

6. The power meter is removed and the measurement path reconnected.

7. The calibration is automatically applied to the channel. All measurements on that channel using that source port benefit from the source power cal.

8. Perform an S-parameter calibration AFTER a Source Power Cal. The S-parameter cal is performed using the corrected stimulus power levels for the relevant ports.

**Verify** the source power calibration using the following procedure.

1. Connect the power meter as it was during the source power calibration.

2. Set the VNA to *Point Trigger* mode.

3. Trigger the VNA across the trace. Read about the behavior of the *sweep indicator*.

4. At each data point, the power meter should read the corrected power level within the specified tolerance.

**Supported Power Meters and Sensors**

See Keysight’s Power Meters and Sensors Webpage.

**USB Power Sensors**

- U848x Series USB Thermocouple Power Sensors (A.09.90.08 and later).
  - These include the following models: U8481A, U8485A, U8487A, U8488A, U8489A
  - External Calibration (connecting the sensor to the 1 mW ref port) is NOT supported.
• **IMPORTANT**: See http://na.support.keysight.com/pna/pseriesmeter.html

- U202x X-Series USB Peak and Average Power Sensors.
  - The VNA does NOT support peak mode in these sensors, but measures average power.

- U204x X-Series USB and LAN Power Sensors.

- U205xA/U206xA Series USB Power Sensors.

**USB Notes:**

- From a standard power cal (this topic), only one USB power sensor can be used to cover the entire frequency span. To use multiple power sensors, perform a Guided Power Cal. Learn how.

- To select a USB power sensor for a standard power cal:

  1. Connect the sensor directly to one of the VNA USB ports.
  2. From the Source Power Cal dialog, click **Power Meter Config**.
  3. On the Power Meter Settings dialog, select **USB**.

  - See Important First-time USB connection note.

  - See note about **Zeroing USB Power Sensors**.

  - See also: **Power Meters as Receivers (PMAR)**

**LAN Notes:**

- LAN power sensors can only be controlled via LAN.

- Typical LAN ports found on a PC or Keysight instrument are used for data transfer and communication only and will not power up a U2049XA LAN Power Sensor.

- LAN power sensors must connect to a PoE port (Power over Ethernet), which will supply DC power required to power up the sensor and to transfer data.
To select a LAN power sensor for a standard power cal:

1. Connect the sensor to a PoE/LAN connection.
2. From the Source Power Cal dialog, click Power Meter Config.
3. On the Power Meter Settings dialog, select LAN and enter the host name of the power sensor.

**Power Meters**

- P Series power meters (N1911A and N1912A) and all supported sensors.
- EPM Series power meters (N1913A and N1914A) and all supported sensors.
- EPM-P Series power meters (E4416A and E4417A) and all supported sensors.
- E Series power meters (E4418 and E4419) and all supported sensors.

**Power Meter Notes:**

- N1911A, 12A, 13A, and 14A power meters have a device-side USB connector and are controlled by the VNA exactly like a USB sensor. See USB Power Sensors (above). Although these meters may also have a front-panel USB port, USB power sensors must be connected directly to one of the VNA USB ports.

- Source Power Calibration operates slowly with the Keysight E930x and E932x power sensors.

- Some Keysight power meters have a mode that emulates the command set of the 437B or 438A power meter. The VNA does NOT support this emulation mode.

- The 82357A USB/GPIB Interface can be used to control power meters.

- Create a Custom Power Meter Driver for use with other power meters.

**Non-Keysight Power Sensors**

- Rohde and Schwarz NRP-Z power sensors (limited support). Learn how to install the drivers.

- VDI PM5 power meter (limited support). Learn how to install the driver and set up the power meter.

**How to perform Source Power Calibration**

**Note:** Guided Power Cal can be performed during an S-parameter Guided Calibration. Learn more.
1. Setup your measurement (sweep type, frequency range, IFBW, and so forth). By default, a Source Power Cal is performed on the source port of the active measurement.

2. Connect coax cable, GPIB cable, and power sensors to the VNA as shown in graphic below.

This image does NOT apply to USB power sensors, which are connected directly to a VNA USB port.

See Important First-time USB connection note.

3. Apply power to the power meter and allow 30 minutes warm-up time before beginning calibration.

4. Select Source Power Cal as follows:

Using Hardkey/SoftTab/Softkey

1. Press Cal > Main > Other Cals > Source Power Cal....

5. Complete the Source Power Cal dialog box (below), including Options, Loss Compensation and Power Sensor Settings, as needed.

   Note: When using an Keysight 848X power sensor (sensors that do NOT have built-in calibration factors), enter the Cal Factors using the Power Sensor Settings dialog, because the VNA instructs the power meter to NOT use the Cal Factor tables internal to the power meter.

6. When complete, click Take a Cal Sweep in the Source Power Cal dialog box.

7. Follow the prompts to connect the sensors as required.

8. At this time you can change the Source Port setting and perform a Source Power Cal on a different port.

9. When calibration is finished, click OK. Correction is then applied and turned ON for the relevant ports on
the active channel.

10. Remove sensor.

11. **SrcPwrCal** is displayed in the status bar when Source Power Correction is applied to the Active Measurement.

12. Perform a S-parameter calibration, which would use the corrected stimulus power levels for the relevant ports.

---

**To turn Source Power Correction OFF:**

- On the Calibration menu, then click Source Power Correction on/OFF.
- ONLY correction for the source port of the ACTIVE MEASUREMENT is turned OFF (regardless of port power coupling setting.)

---

**Interpolation or Extrapolation**

If the original stimulus settings are changed, Interpolation or EXTRAPOLATION is applied and **SrcPwrCal** is displayed in the status bar. This is different from measurement calibration interpolation. For example, if the frequency span is increased, the VNA will extrapolate new correction values rather than turn correction off. This is to protect your test device from being overpowered by the source. If the original settings are restored, then source power calibration returns to full correction.

---

**Source Power Cal** dialog box help
Note: Be sure that the frequency range of your power sensor covers the frequency range of your measurement. This does NOT occur automatically.

Cal with Frequency Extenders

If you are using a power sensor or power table to measure power over the frequency range of a frequency extender (mmWave module), the trace displays the measured power. This is done at the maximum RF input power setting for the frequency extender you are calibrating. This could be +10 dBm or +2 dBm depending on the power range you set during the source power calibration process. The default is +11 dBm to -30 dBm with a 0.5 dB step size. This can be changed as needed.

Though the displayed frequency range is the range of the RF input, it is actually calibrating over the frequency range of the frequency extender being used. For example, the display shows 12.5 GHz to 18.333 GHz (RF input) but it is being calibrated from 75 GHz to 110 GHz.

**Power**

**Cal Power** The calculated power (in dBm) at the calibration point. This value is the specified VNA source power plus the Power Offset value.

**Power Offset** Allows you to specify a gain or loss (in dB) to account for components you connect between the source and the reference plane of your measurement. These components will remain during a measurement. For example, specify 10 dB to account for a 10 dB amplifier in the path to your DUT. Following the calibration, the VNA power readouts are adjusted to this value.

To account for components that will be removed when the calibration is complete, use the Loss Compensation table.
Channel and Port Selection

**Channel**  Specifies the channel on which to perform the calibration. This setting defaults to the active channel.

**Source Port**  Specifies the source port to be corrected. This setting defaults to the source port for the active measurement.

**Note:** External sources can be calibrated using this dialog. Learn more.

Accuracy

At each data point, power is measured using the specified Power Meter **Settling Tolerance**, then adjusted until the reading is within this Accuracy **Tolerance** or the **Max Number of Readings** has been met. The last power reading is plotted on the screen against the Tolerance limit lines.

**Tolerance**  Sets the maximum desired deviation from the specified **Cal Power** level in 0.005 dB increments from 0 to 5 dB.

**Max Number of Readings**  Sets the maximum number of readings to take at each data point for iterating the source power. Enter a value between 1 and 1000.

Calibration Status

Allows you to turn Source Power Cal ON | OFF and view Cal data for each port, regardless of the active measurement. This feature allows the **Internal Second Source** to be calibrated and turned ON | OFF, even when being used as an incidental source in a measurement, such as an LO.

**Calibration ON**  Check to turn Source Power Calibration ON for the specified source port.

The displayed text indicates when interpolation is applied for the calibration.

Buttons

**Options**  Invokes the Source Power Cal Options dialog. Label to the left of the button displays the current 'Options' setting.

**Power Meter Config**  Invokes the Power Meter Settings dialog box

**Take Cal Sweep**  Begins source power calibration measurement.

**OK**  Applies calibration. This button is disabled until the Take Cal Sweep has been pressed.

**Cancel**  If a sweep is in progress, cancels the sweep. Press again to close the dialog.
Attention please: the power meter is operating in 200 r/s mode.

During a measurement, some Keysight power meters may display this message on the screen: It means that the meter is operating in 200 readings/sec which is the fastest speed setting for this meter. This is normal operation.

**Pass / Fail Limits**

Limit lines are drawn on the Source Power Cal measurement graticule area. These lines are at the Cal Power +/- the current setting of Accuracy Tolerance. A FAIL during the Source Power Cal sweep means that the VNA was unable to measure power to within the Accuracy Tolerance. Tight tolerances are more difficult to achieve at lower Cal Power levels. When a FAIL indication appears, increase the Max Number of Readings. If this does not cause a PASS condition, then decrease the Accuracy Tolerance value.

**See Also**

- Learn more about Source Power Cal
- Learn about External Testsets and Source Power Cal.

---

**Source Power Calibration Options** dialog box help

Provides options for measurement of the source power.

**Note:** At low power levels (less than -30 dBm) most power meters are not as accurate as a VNA receiver.
**Calibration Reference**  Choose power meter/VNA receiver to use to measure power.

- **Use a power meter.** Traditional source power calibration using only a power meter to measure the source power at each data point. Most accurate (at higher power levels) and slowest method.

  **Note:** Because the following two settings use VNA receivers to make power measurements, they do NOT work correctly when a Frequency Offset value is being used.

- **Use a power meter once, to calibrate receiver, then use receiver.** When checked, the first reading at each data point uses a power meter to calibrate the reference receiver. Subsequent readings, if necessary to meet your accuracy requirement, are measured using the reference receiver. This technique is much faster than using the power meter, and more accurate when measuring low power levels.

  **Note:** Do NOT use this setting if there is a component before the power sensor that exhibits non-linear behavior, such as a power amplifier in compression. Use a power meter and Calibrate the source at multiple power levels.

- **Use this receiver.** Select a VNA Receiver or a PMAR (Power Meter as Receiver).

  **VNA receiver** - For highest accuracy, first calibrate the receiver by performing a source power cal using a power meter, then a receiver cal. That receiver can then be used to quickly calibrate other VNA source ports, or used on another channel with different stimulus settings. This would be useful, for example, if the power level of the measurement was below the sensitivity of the power sensor. Calibrate the VNA receiver using a source power cal that is within the sensitivity of the sensor. Then, use the calibrated receiver to perform a second source power cal at the reduced power level.

  - The VNA receiver is specified using either standard receiver notation or logical receiver notation.

  - It is best to use the reference receiver for the source port to be calibrated. For example, if calibrating source port 2, specify "R2" or "a2" which is the same port 2 reference receiver using logical receiver notation.

  - To ensure an accurate source power cal, the frequency range over which the receiver was calibrated must be the same or larger than the "receiver only" source power calibration.

  - All accuracy and settling tolerance and number of reading settings apply just as they do with a power meter reading.

  **PMAR Device** - The power meter/sensor must first be configured. Learn how to Configure a PMAR device.
- **Use a power table and the analyzer reference receiver** Used to provide power leveling with mmWave test set and modules. Learn more.

**Calibrate the source at multiple power levels** Used primarily with mmWave measurements.

This feature can also be used with standard VNA measurements when a component is used in the source path such as a booster amp which does NOT have linear gain or loss over frequency. If this is not true for your setup but want to improve your source power accuracy, consider using the Receiver Leveling feature.

When checked, source power is measured using the specified 'Cal Reference' device (power meter/sensor or VNA receiver) and iterated on a sweep-to-sweep basis to construct a 2-dimensional power table: Power IN, Power OUT, over all frequencies.

- Click **Power Levels** to launch the Source Cal Power Levels dialog box to set the power levels at which source power is to be measured.

- The source power cal is saved, but the power table is NOT accessible.

**Calibrate the analyzer reference receiver** Check to calibrate the appropriate reference receiver to the power level that is measured at the calibration plane. Do this to make very accurate measurements using the calibrated reference receiver. This cal is done in addition to the standard source power cal using the any of the methods listed above. At the end of the source power cal measurement sweep, you can optionally save the reference receiver cal to a Cal Set to be recalled at a later time. The Cal is saved when the **OK** button is clicked to close the Source Power Cal dialog.

---

**Source Cal Power Levels** dialog box help

![Source Cal Power Levels dialog box](image)

This dialog appears when you click **Power Levels** on the Source Power Cal Options dialog.
Specify the power levels at which the Source Power will be calibrated. These values should be set to a few dB more or less than the measurement power levels.

**Max Power** - The highest power level at which to calibrate. This value should be a few dB higher than the highest power level of your measurement.

**Note:** Setting the **Max Power** will override power settings entered manually in a Power Table (InputPower). Therefore, when using a power table, set the **Max Power** value to the same value shown in the Power Table (InputPower).

**Min Power** - The lowest power level at which to calibrate. This value should be a few dB lower than the lowest power level of your measurement.

**Power Step** - Calibrate at every incremental power level, between the Max and Min Power settings.

---

**Power Meter Settings dialog box help**

This dialog appears when you click the **Power Meter Config** button on many dialog boxes.

**Communication**

- **GPIB / Address** Select GPIB power meter. Then select the address for the power meter. Default is 13. The VNA will search VISA interfaces that are configured in the Keysight IO Libraries on the VNA. **Note:** Use this selection when using a 82357A USB/GPIB Interface.
**USB** VNA scans for USB power sensors or N191x device-side USB power meters. Select a power sensor from the list. Only ONE USB power sensor can be configured to cover the entire frequency range of the calibration. To use multiple power sensors, perform a Guided Power Cal.

**LAN** Specify the Hostname or IP address of the Power Meter.

**Any** This can be used if you wish to spell out the exact VISA resource string/alias for your power meter’s I/O connection, for GPIB, USB, LAN or any other I/O protocol supported by VISA. For example, you must use this to use a VDI PM5 power meter, and the VISA resource string/alias in that case must be `ASRL3::INSTR`.

**Note:** The VDI PM5 driver software must be installed to use VDI power sensors. Refer to Install VDI PM5 Driver.

**Sensors** Invokes the power sensor settings dialog box.

**Settling**

These Settling settings do not apply when a VNA receiver is the power measurement device. Each power meter reading is "settled" when either:

- two consecutive meter readings are within this **Tolerance** value or
- when the **Max Number of Readings** has been met.

The readings that were taken are averaged together to become the "settled" reading. The settled reading is then compared to the Accuracy Tolerance requirements (tolerance and max readings) specified on the Source Power Cal dialog box.

**Tolerance** When consecutive power meter readings are within this value of each other, then the reading is considered settled.

**Max Number of Readings** Sets the maximum number of readings the power meter will take to achieve settling.

**Sensor Loss Compensation**

**Use Loss Table** Select this checkbox to apply loss data to Source Power calibration correction (such as for an adapter on the power sensor).

**Edit Table** Invokes the Power Loss Compensation dialog box.
To Add a Row to the table, click on a row in the table and press the down arrow on either the VNA front panel or keyboard.

To Edit a value, double-click in the cell to be edited.

Compensates for losses that occur when using an adapter or coupler to connect the power sensor to the measurement port. These components will be removed when the calibration is complete. To account for components that will remain during the measurement, use the Power Offset setting.

The Frequency / Loss pairs define the amount of loss for the entire frequency range. For example, using the entries in the above dialog image:

- 0.5 dB is used to compensate power sensor measurements up to 1 GHz.
- Each data point between 1 GHz to 2 GHz is linearly interpolated between 0.5 dB and 1 dB.
- 1 dB is used above 2 GHz.
- A single frequency/loss segment is applied to the entire frequency range.

Beginning with A.09.80, enter up to 9999 segments to achieve greater accuracy. Previously the limit was 100.

Note: Large segment counts with one or more power sensors can result in long load and close times for the VNA Application.

**Frequency**  Enter a frequency in Hz.

**Loss**  Enter a loss as a POSITIVE value in dB. To compensate for gain, use NEGATIVE values.

**Delete Table Segment**  Deletes row indicated in the field.
**Delete All** Deletes all data in the table.

The Power Loss Compensation table survives VNA Preset and Power OFF. To NOT use Loss compensation, clear the Use Loss table checkbox on the Power Meter Settings dialog.

---

**Power Sensor Settings** dialog box help

This dialog appears when you click the **Sensors** button on the Power Meter Settings dialog.

**Note:** Be sure that the frequency range of your power sensor covers the frequency range of your measurement. This does NOT occur automatically.

**Sensor A (B)** Displays one of the following messages depending on type of sensor.

- **Not connected** The VNA is not detecting a power sensor.

- **Cal factors are contained within this sensor** This message is displayed when the Internal Reference Cal Factor and Cal Factor data are contained in the sensor and automatically accessed.

**Sensor Data** Allows the following entries for power sensor data:

- **Reference Cal Factor** Specifies the sensor's Reference Cal Factor.

- **Cal Factor Table** Specifies the frequency and corresponding Cal Factor for the sensor.

- **Delete Cal Factor** Deletes the indicated row in the table.

- **Delete All** Deletes all data in the table.
• **To Add a Row** to the table, click on a row in the table and press the down arrow on either the VNA front panel or keyboard. A row is added to the bottom of the table. The table is automatically sorted by frequency when OK is pressed.

**Load Cal Factors** Click to load cal factors from a *.csv file that you create from the cal factors that appear on the sensor. The first line of the file MUST have the reference Cal Factor (typically 100), followed by Freq / Cal Factor pairs as shown in the following image:

![Cal Factor Table](image)

**Save Cal Factors** Click to save the cal factor table to a *.csv file.

**Use this sensor only** Check this box to use this sensor over the entire frequency span of the measurement, even if two sensors are connected to power meter.

Clear this box to allow entry of minimum and maximum frequencies for the sensor. Only ONE of the two sensors can have this box checked. You will be prompted to connect the appropriate sensor during the power calibration.

**Minimum Frequency** Specifies the minimum frequency range for the sensor when using dual sensors.

**Maximum Frequency** Specifies the maximum frequency range for the sensor when using dual sensors.

**Zero and Calibrate the Power Sensor**

For highest accuracy, Zero AND Calibrate the power sensor before measuring data. Follow prompts that may appear.

**Zero** - If the following settings are 'greyed', Internal or External zeroing is selected automatically based on the power meter/sensor model. Otherwise, select the appropriate type of zeroing to perform, then press Zero.

- **Internal Zero** - A switch inside the power sensor removes the sensor from the incident power.

- **External Zero** - Requires that you physically remove the sensor from incident power.
### Note: For the U2000 Series USB power sensors

Calibration is NOT available. Select External Zero ONLY when the power to be measured is *below* the specified level. Otherwise, the U2000 series performs internal zeroing automatically when needed. See your power sensor documentation for more details.

- U200xA - below -30 dBm
- U200xH - below -20 dBm
- U200xB - below 0 dBm

If your U2000 power sensor 'hangs' when external zeroing, upgrade the power sensor firmware to Rev. A.01.02.00 or higher to fix this problem.

### Note: For the U2020 X-Series USB power sensors

The U2020 X-Series support only internal zeroing. But like the U2000 series, they default to performing zeroing automatically when needed.

**Calibrate** - Available when the selected sensor has calibration capability. Calibration involves measuring an internal 1 mW source.

- Keysight P-Series sensors and U2020 X-Series USB sensors have an internal reference so you can calibrate them without connecting to a meter’s reference port.
- Keysight U2000 USB power sensors do not require calibrating.
- For other sensors, refer to the documentation to determine if it has calibration capability.

Press **Calibrate**, then follow the prompts.

### Copy a Source Power Calibration to other Channels

A macro application is now available that copies a Source Power Calibration to other channels. Once downloaded and installed on a VNA, the macro is automatically configured up. To learn more, click **Help** on the application main dialog. Get the application from [http://na.support.keysight.com/pna/apps/applications.htm](http://na.support.keysight.com/pna/apps/applications.htm).
Saving a Source Power Calibration

Because Source Power Cal calibrates source hardware, the calibration data is saved as part of the Instrument State, in either a .sta file or a .cst file. This correction is applied to all measurements on the channel that uses the calibrated source. See Save Instrument State.

Reducing Time to Complete a Source Power Calibration

The time required to perform a Source Power Calibration depends on source power, number of points, and number of readings taken. You can reduce this measurement time with the following methods:

- **Reduce number of points before calibration.** You can reduce the number of points before the measurement, then return the number of points to its original value after calibration is complete and correction is ON. The analyzer will perform a linear interpolation, although with some loss in accuracy.

- **Use an Keysight E-Series sensor.** You can obtain 40+ readings per second over GPIB with this type of sensor on the VNA.

- **Increase power to the sensor.** Lower power may have longer settling time with some sensors.

- **Check Use Reference Receiver for Iteration.**

Receiver Power Calibration

**Note:** Source and Receiver Power Calibrations are NOT available in M937xA PXI.

**Note:** A Guided Power Cal can be performed during an S-parameter Guided Calibration. [Learn more.](#)

Receiver power calibration mathematically removes frequency response errors in the specified VNA receiver, and adjusts readings to the same, or a value offset from, the source power calibration level. It is the same as doing a Response Cal or Data / Memory, (Normalization) but with the data shifted to the Cal Power value.

Use Receiver Power Calibration to make very accurate absolute power (amplitude) measurements.

**Receiver Power Calibration:**

- Is ONLY allowed when making absolute power (unratioed) measurements.
- Is most accurate when a source power calibration was performed first.
- Applies to all unratioed measurements in the active channel using that receiver.
- Can be saved in a Cal Set and later reapplied to a like measurement.
Interpolation

Like other calibration types, if the original stimulus settings are narrowed, interpolation is applied and \textbf{C* Rcvr Pwr} is displayed in the status bar. If the original stimulus settings are made wider, the VNA will turn Receiver Power Correction \textbf{OFF}.

If the original settings are restored, then receiver power calibration returns to full correction.

\textbf{How to perform a Receiver Power Calibration}

1. Perform a \textbf{Source Power Calibration}.
2. Set the active measurement to unratioed. \textbf{Learn How}.
3. Connect a THRU line from the source port to the receiver port.

   - When performing a receiver power cal on a reference receiver (source 1 and receiver R1), no connection is necessary as the receiver is internally connected to the source.
   - When the source port and receiver port are the same (receiver A, source port 1), then connect an open or short to get maximum power to the receiver. This practice is not recommended. It is best to use different ports for the source and receiver.

4. Ensure correction for Source Power Calibration is ON as indicated by \textbf{Src Pwr Cal} or \textbf{Src Pwr Cal*} in the status bar.
5. Start the \textbf{Calibration Wizard}

\textbf{Using Hardkey/SoftTab/Softkey}

1. Set the active measurement to unratioed. \textbf{Learn How}.
2. Press \textbf{Cal > Main > Other Cals > Receiver Power Cal}....
Cal Type Selection  Select Receiver Power

Receiver Power Configuration

**Cal Power**  Specifies the power level to be displayed on the measurement when complete. (Source Port Power + Power Offset).

**Source Port Power**  Test port Power set for the measurement. [Learn how to change Test Port Power](#)

**Power Offset**  Allows you to specify a gain or loss (in dB) to account for components you connect between the source and the reference plane of your measurement AFTER a source power cal has been performed. Following the calibration, the VNA power readouts are adjusted to the Cal Power value.

**Next**  Click to continue the Calibration Wizard.

**Notes:**

- When Receiver Power Cal is finished, 'Response' is displayed in the status bar and correction data is applied to subsequent sweeps. This is done because Receiver Power Cals are essentially Response Cals once they are stored and applied. See Saving a Receiver Power Cal below.

- To turn correction OFF, click Cal > Main > Correction > Channel Correction OFF.

Learn more about Receiver Power Cal (scroll up).

**Saving a Receiver Power Calibration**

Beginning with VNA Revision 5.0, Receiver Power Cal is saved to a Cal Register and optionally to a User Cal Set. It can be applied to measurements in the same way as other Cal Types. Previously, Receiver Power Cal data was saved as part of an Instrument State and was only applied to the measurement on which it was performed.

Learn more about Saving VNA files types.
Fixture Simulator

This features allow you to mathematically add (embed) or remove (de-embed) circuits to, or from, your measurements. The mathematical models are applied to specific ports for all measurements on the channel.

New fixture simulator provides more flexible and intuitive GUI for multi-port measurements. The multiple fixturing elements can be combined in any order, creating infinite combinations.

Notes

- The following features are available in GCA, GCX, Swept IMD, Swept IMDX, Noise Figure, NFX, Diff IQ, and Spectrum Analyzer Apps:
  - Port Extensions (Not available in Swept IMD, IMDX, Noise Figure, NFX, or Diff IQ)
  - SnP file Embedding/De-embedding
  - Port Matching
  - Port Z Conversion
  - Power Compensation

- All other Fixturing features are available ONLY in a standard channel.

- SNP files can be used in many fixture features, including SNP file deembedding, ground loop embedding/de-embedding, port matching, and differential port matching. The contents of any SNP files used for fixturing are read and stored in memory when the file is selected. After selection, the file is not locked and contents may be changed. In order to pick up any updated content, it is necessary to re-apply the file through these means:
  - GUI: Re-select the file in the dialog.
  - SCPI: Re-select the file and apply updates:
    ```scpi
    calc:fsim:draft:circ1:file "myFile.s2p"
    calc:fsim:apply
    ```
    - Legacy SCPI: Cycle the deembedding state for the feature using the file. For example:
See Also

- **Procedures: To Embed or De-embed?**
- "De-embedding and Embedding S-Parameter Networks Using a Vector Network Analyzer" App note for more conceptual information on Fixture Simulation.
- See an example of how these functions can be used to de-embed unwanted effects of a test fixture, and then mathematically embed the DUT in the circuit in which it is used.

Notes

- The fixturing operations are applied to the measurement results.
- In the Data processing chain, the Fixture Simulator functions occur at the same time as the **Apply Error Terms** block.
- When fixturing is enabled, all of the enabled fixturing features are applied when snp files are saved.
- **Source power compensation** is then optionally applied to compensate for the aggregate loss through all enabled fixturing operations.

How to select Fixturing Simulator

**About Fixturing ON/off**

**BOTH** of the following must occur to turn a fixturing selection **ON**.

**EITHER ONE** will turn a fixturing selection **OFF**.

1. Turn **Apply Fixtures ON/off**
   - Port Extensions is NOT affected by Fixturing ON/off.

2. Check **Enable** on the individual fixturing selection dialog box.

**Using** **Hardkey/SoftTab/Softkey**

1. Press **Cal > Fixtures > Apply Fixtures**.
**Fixture Generator** dialog box help

You can configure your virtual fixtures on GUI. The calculation order is from right to left.

**Note:** The calculation order was from left to right for A.14.70.01 to A.15.20.05.

---

**File:**

**Save Topology...** : Save the current setup into a topology setting file (.topo). You can recall it by Load Topology.

**Save Topology as SnP...** : Save the whole embedding, de-embedding, and port extension blocks as a SNP file. The portion of Port Z conversion is not included. The dimension N of the SNP file will be the total number of VNA's test ports. This saved SNP file can be used later in the Fixture Generator as a de-embedding block.

**Load Topology...** : Load the topology setting file (.topo). You can load the .totp file which was saved with the VNA of equal or less number of test ports.

**Load Default Topology** : Reset the topology setting.
**Edit:** Allow to enable/edit/cut/copy/paste/delete/add for a block.

**Active Channel:** Select the channel to apply the fixture simulator.

**Apply Fixtures:** Apply all fixture blocks and all impedance transforms that are enabled. It does not affect port extensions or balanced definitions.

**Add Block...** Opens the **Add Block** dialog to add and define a new block. See the [block types](#) below.

Right Click on each block shows a pop-up menu.

- **System Z0...**
- Port Z Conversion...
- Balanced Z Conversion...
- SnP file
- Ground Loop
- Port Matching
- Differential Matching
- Ideal Line
- Impedance Transformer

**Disable (Draft) State**

**Enable (Active) State**
Blue: Embedded, Green: De-embedded

SnP Embedding/De-embedding dialog box help
This function specifies a SnP file to embed (add) or de-embed (remove) from the measurement results. Computation takes place BEFORE Balanced conversion.

The SnP file S-Parameter data is normalized to a single File-Zo impedance as defined in the file. The VNA will re-normalize the S-Parameter data from File-Zo to the VNA System-Zo. The VNA will interpolate if the number of data points that are read is different from the current VNA setting.

**Note:** De-embedding a component with more than 20 dB of loss becomes impractical because of an inability to accurately measure the match of the DUT through such a device.

The de-embedding operation recalls an .s2p file (Touchstone format) which includes the electrical characteristics of a 2-port fixture or device. The file can be in any standard format (real-imaginary, magnitude-angle, dB-angle).

**Enable block as** Check to apply the settings to the measurement results. Must also enable *Fixturing ON/off*.

**De-Embed/Embed** Select the embed (adding the snp device virtually) or de-embedding (removing the snp device).

**Note:** Port Matching circuits can only be "embed".

**File Name:** Select the snp file for embeding or de-embeding

**Modify:**
If the block has high loss, then it may cause transmission measurement errors when full S-parameter correction is applied. The reason is that the DUT output match cannot be measured accurately through a high-loss path; if the fixture has a large mismatch then this error will cause errors in the transmission measurement. Zeroing the fixture reflection at the DUT will reduce this error. This problem is described in "Handbook of Microwave Component Measurements with Advanced VNA Techniques", Joel Dunsmore, John Wiley & Sons, page 592 in the First Edition and page 775 in the Second Edition.

- **None**: does not modify the block.
- **Set Snn=0 @ DUT** - will set all reflection parameters on the DUT-side to zero.
  
  - For the 4-terminal fixture shown above, it will set S33=s44=0.
- This is useful for fixtures that have low crosstalk between DUT-side ports.

- Set \( S_{nn} = X_{\text{Talk}} = 0 \) @ DUT - will set all reflection and crosstalk parameters on the DUT-side to zero.

- This selection is not available for a 2-terminal fixture.

- For the 4-terminal fixture shown above, it will set \( S_{33} = S_{44} = S_{43} = S_{34} = 0 \).

- This is useful for multiport fixtures which have a lot of crosstalk between the DUT-side ports.

**Enable Extrapolation** Check to apply a simple extrapolation when the SnP file has a narrower frequency range than the channel. The values for the first and last data points are extended in either direction to cover the frequency range of the measurement. The frequency ranges of the SnP file are displayed at the right of the dialog.

When extrapolation is necessary and enabled, a message is displayed showing the frequency range to be extrapolated. When extrapolation is necessary and disabled, a message is displayed offering to enable extrapolation.

**Note:** For IMD and IMDX channels, you will be prompted for extrapolation as described above if the S2P file does not meet the port frequency conditions. However, if the file is valid, extrapolation will be enabled automatically. This is for compatibility reasons with the IMD/IMDX calsets, which list all frequencies for all ports. This applies only for the SnP section, NOT the ground loop section. Ground loop is not for IMD/IMDX.

**General** (Right side of Dialog box)

**Block ID** Block ID. This is the same number as the circuit number in SCPI.

**F\text{max}** show the maximum frequency of imported snp file

**F\text{min}** show the minimum frequency of imported snp file.

**Number of Port** show the number of port of imported snp file

**Reverse Ports** Reverses the ports on an existing S2P file.

- The data for S11 becomes the data for S22 and vice versa.
- The data for S21 becomes the data for S12 and vice versa.
Ground loop de-embedding removes the effect of a non-ideal ground connection between the DUT’s ground and the analyzer’s ground reference. Typically, the non-ideal component is the parasitic inductance of the ground contacts.

Ground loop embedding adds the effect of a non-ideal component on the ground contacts. The Ground Loop De-embedding / Embedding can be specified by circuit model type or touchstone file.

**Enable block as** Check to apply the settings to the measurement results. Must also enable **Fixturing ON/off**.

**De-Embed/Embed** Select the embed (adding the snp device virtually) or de-embedding (removing the snp device)
Ground Loop (RL) or (GC)

**Circuit** (Right side of Dialog box)

- **Inductance (L), Resistance (R) / Conductance (G), Capacitance (C)** Values for the specific components of the circuit type that models your fixture.

**General** (Right side of Dialog box)

- **Block ID** Block ID. This is the same number as the circuit number in SCPI.
- **Fmax** Fixed at 9.9999 THz
- **Fmin** Fixed at 0 Hz
- **Number of Ports** Define the number of ports. Once the number of ports is set, it cannot be changed.
- **VNA Fmax** Maximum frequency of the VNA.
- **VNA Fmin** Minimum frequency of the VNA.

**Ground Loop (file)**

**Enable Extrapolation** Check to apply a simple extrapolation when the SnP file has a narrower frequency range than the channel. The values for the first and last data points are extended in either direction to cover the frequency range of the measurement. The frequency ranges of the SnP file are displayed at the right of the dialog.

When extrapolation is necessary and enabled, a message is displayed showing the frequency range to be extrapolated. When extrapolation is necessary and disabled, a message is displayed offering to enable extrapolation.

**General** (Right side of Dialog box)

- **Block ID** Block ID. This is the same number as the circuit number in SCPI.
- **Fmax** show the maximum frequency of imported snp file
- **Fmin** show the minimum frequency of imported snp file.
- **Number of Ports** Define the number of ports. Once the number of ports is set, it cannot be changed.
**Reverse Ports** Reverses the ports on an existing S2P file.

- The data for S11 becomes the data for S22 and vice versa.
- The data for S21 becomes the data for S12 and vice versa.

**Port Matching** dialog box help

This function specifies a circuit to embed (add) to the measurement results. See Order of Fixture Operations.

Enable block as  Check to apply the settings to the measurement results. Must also enable Fixturing ON/off.

De-Embed/Embed  Select the embed (adding the snp device virtually).

**Type:** Choose a circuit model that best emulates your fixture at the selected VNA port: The circuit diagram is shown in the dialog box.

**Circuit** (Right side of Dialog box)

**Capacitance (C), Inductance(L), Resistance(R), Conductance(G)**  Values for the specific components of the circuit type that models your fixture.
**General** (Right side of Dialog box)

- **Block ID**  Block ID. This is the same number as the circuit number in SCPI.
- **Fmax**  Fixed at 9.9999 THz
- **Fmin**  Fixed at 0 Hz
- **Number of Ports**  Fixed at 2.
- **VNA Fmax**  Maximum frequency of the VNA.
- **VNA Fmin**  Minimum frequency of the VNA.

**Differential Port Matching** dialog box help

This function allows the embedding/de-embedding of a differential matching circuit at a balanced port.

- **Enable block as**  Check to apply the settings to the measurement results. Must also enable Fixturing ON/off.
- **De-Embed/Embed**  Select the embed (adding the snp device virtually) or de-embedding (removing the snp device)

- **Differential Matching**  Predefined circuit.

![Differential Matching Circuit Diagram](image)

- **Circuit**  (Right side of Dialog box)  Define the values
  - **C**  Capacitance value
  - **G**  Conductance value
  - **L**  Inductance value
  - **R**  Resistance value
**General** (Right side of Dialog box)

**Block ID**  Block ID. This is the same number as the circuit number in SCPI.

**Fmax** Fixed at 9.9999 THz

**Fmin** Fixed at 0 Hz

**Number of Port** Fixed at 2

**VNA Fmax** Maximum frequency of the VNA.

**VNA Fmin** Minimum frequency of the VNA.

- **Diff. Matching (s2p)**  Select an *.S2P file that represents the matching circuit. Then click **Browse** to navigate to the *.S2P file.

  **Note:** For the *.S2P file:
  Port 1 of the circuit is assumed to be connected to the VNA
  Port 2 of the circuit is assumed to be connected to the DUT.

**Block ID**  Block ID. This is the same number as the circuit number in SCPI.

**Fmax** show the maximum frequency of imported snp file

**Fmin** show the minimum frequency of imported snp file.

**Number of Ports** Fixed at 2

**VNA Fmax** Maximum frequency of the VNA.

**VNA Fmin** Minimum frequency of the VNA.

---

**Ideal Line** dialog box help
This function allows the embedding/de-embedding of an ideal line.

**Enable block as** Check to apply the settings to the measurement results. Must also enable **Fixturing ON/off**.

**De-Embed/Embed** Select the embed (adding the snp device virtually) or de-embedding (removing the snp device)

- **Electrical Parameter**
  - **Delay** Delay in second
  - **Line Z0** Line Characteristic Impedance
  - **LineZ0_enable** Enable/Disable Line Z0
  - **Loss** Line Loss

- **Diff. Matching (.s2p)** Select an *.S2P file that represents the matching circuit. Then click **Browse** to navigate to the *.S2P file.
  - **Length** Length in meter
  - **Line Z0** Line Characteristic Impedance
- **LineZO_enable** Enable/Disable Line Z0
- **Loss** Line Loss
- **Vel_Fact** Velocity Factor

**General** (Right side of Dialog box)

**Block ID** Block ID. This is the same number as the circuit number in SCPI.

**Fmax** Fixed at 9.9999 THz

**Fmin** Fixed at 0 Hz

**Number of Port** Fixed at 2

**VNA Fmax** Maximum frequency of the VNA.

**VNA Fmin** Minimum frequency of the VNA.

---

**Impedance Transformer** dialog box help

This function allows the embedding/de-embedding of an impedance transformer.
Enable block as  Check to apply the settings to the measurement results. Must also enable Fixturing ON/off.

De-Embed/Embed  Select the embed (adding the snp device virtually) or de-embedding (removing the snp device)

- Circuit
  - Rin, Rout  Impedance for in and out

General  (Right side of Dialog box)

  Block ID  Block ID. This is the same number as the circuit number in SCPI.

  Fmax  Fixed at 9.9999 THz

  Fmin  Fixed at 0 Hz

  Number of Ports  Fixed at 2

  VNA Fmax  Maximum frequency of the VNA.

  VNA Fmin  Minimum frequency of the VNA.

---

**Power Compensation** dialog help

![Power Compensation Dialog](image)

**Note:** This feature is available in ALL measurement classes.
This function adjusts the source power at the specified port to compensate for the combined amount of gain or loss through specific fixturing operations. Use this function to set the power level at the DUT input.

Power Compensation adjusts the source power for the gain/loss through 2-port de-embedded fixture components.

- It does not compensate for any port matching networks.
  - To work around this limitation, compute the anti-network of the matching circuit and use that data to generate an S2P file. Change the fixture type from port matching to De-embed. This should result in the same measurement data but will also enable the port power compensation feature.
- It does not compensate for any fixture networks with more than 2 ports.
  - There is no work around for this limitation. There is a coarse adjustment for port power using Power Offsets. Calculate the loss through the fixture, use that number to set the power offset, and then set the desired power level at the port.

For example:

- Your DUT requires a fixture on the input port which is connected to VNA port 1.
- The fixture description (such as an S2P file at the De-embed function) indicates the fixture has approximately 2 dB of loss across the frequency span.
- You set source power to 0 dBm. But you want 0 dBm at the DUT input (the fixture output).
- Check Power Compensation on Port 1 and enable Fixturing.
- Power Compensation causes the source power to be increased by approximately 2 dB so that the power at the fixture output plane will remain at 0 dBm.

Power Compensation affects all measurements in the channel.

Enable Fixturing to use Power Compensation.

**Note:** Use caution when applying power compensation. Always test your setup without a DUT in a place. If you are using S2P files, Recall your S2P file into the VNA so you can verify that the device your S2P file describes is what you intended it to be. It is too easy to misalign data in S2P files if they are constructed by hand.

**Fixture Simulator Example**

The following example shows a DUT and the matching circuit with which the DUT will be used in its intended application. When the DUT is tested in a high-volume manufacturing environment, multiple
test fixtures are often required. The most accurate way to test the DUT and ensure measurement consistency between the different test fixtures is to use a simple, repeatable, test fixture without the actual matching elements.

To get the desired performance data, the parasitic effects of the fixture must first be removed (de-embedded) from the measured data. Then a perfect "virtual" matching circuit must be simulated and added mathematically (embedded) to the corrected, measured data. The result is an accurate display of the DUT as though it was actually tested with a physical matching circuit, but without the uncertainties of using real components.

Test Device and the circuit in which it will be used.

This diagram does NOT refer to the order in which operations are performed.

1. Create a balanced measurement using single-ended to balanced (SE-Bal) topology. Include all relevant measurement settings (IFBW, number of points, and so forth). Once the measurement is created and calibrated, the measurement parameter can be easily changed. For example, Sdd22 to Sds21.

2. Calibrate the measurement at the point where the simple test fixture is connected to the VNA. Use accurate calibration standards and definitions.
3. Remove the effects of the three uncalibrated transmission lines of the simple test fixture. This can be done in several different methods. The easiest is to use manual or automatic Port Extensions to move the calibration reference plane to the DUT. This removes the electrical length and loss of the fixture’s transmission lines, but does not account for fixture mismatch. Another method is to de-embed previously-created *.S2p files of the 3 transmission lines. The files can be created using external ADS modeling software. Another alternative is to create the *.S2P files by independently measuring all 3 ports of the test fixture and saving the results of each to an S2P file.

4. With the test fixture connected to the VNA and a DUT inserted, the measurement results now appear as though calibration was performed at the connections to the DUT, and the device was measured in a 50-ohm single-ended test environment. The following steps will cause the results to reflect the performance of the device as though the device is embedded in the circuit in which it will be used.

5. Port 1 of the device is a single-ended port and sees a source impedance the same as the VNA system impedance, so no change is required. However, if Rs were a value other than 50 ohms, Port 1 Impedance Conversion would be used to simulate the different impedance.

6. Port Matching is used to simulate L1 inductance. Select any of the Shunt L circuits to embed (add) to the measurement results. Enter the value of L and R. The C and G values can be entered as 0 (zero).

7. Port Matching is used to simulate C1 and C2 capacitance. For both port 2 and port 3, select any of the Series C circuits to embed (add) to the measurement results. Enter the value of C and G. The L and R values can be entered as 0 (zero).

8. Balanced Conversion mathematically simulates the measurement in balanced mode.

9. Differential Port Matching is used to simulate L2 inductance. Select Shunt L- Shunt C and enter the inductance / resistance value. The C and G values can be entered as 0 (zero).

10. Finally, Differential Z Conversion is used to simulate a circuit termination of 200 ohms. If you are making Common Mode measurements, specify Common Mode Z Conversion.
The following features allow you to mathematically add (embed) or remove (de-embed) circuits to, or from, your measurements. The mathematical models are applied to specific ports for all measurements on the channel.

### Notes

- The following features are available in GCA, GCX, Swept IMD, Swept IMDX, Noise Figure, NFX, Diff IQ, and Spectrum Analyzer Apps:
  - Port Extensions (Not available in Swept IMD, IMDX, Noise Figure, NFX, or Diff IQ)
  - 2 Port De-embedding
  - Port Matching
  - Port Z Conversion
  - Power Compensation
- All other Fixturing features are available ONLY in a standard channel.

### See Also

- **Procedures:** To Embed or De-embed?
  - "De-embedding and Embedding S-Parameter Networks Using a Vector Network Analyzer" App note for more conceptual information on Fixture Simulation.
  - See an example of how these functions can be used to de-embed unwanted effects of a test fixture, and then mathematically embed the DUT in the circuit in which it is used.

### Order of Fixture Operations

Click to learn more about each operation.

First, the following **Single-ended** measurement functions are processed in this order:

1. Port Extensions
2. 2-Port De-embedding
3. Ground loop de-embedding / embedding
4. Port Matching Circuit Embedding
5. Port Z (Impedance) Conversion
6. 4-Port Network (single-ended) Embed/De-embed

Note: The operation for ground loop embedding and ground loop de-embedding will always occur as the 3rd step. It cannot be moved. By default, this is after the 2-Port DeEmbedding operation.

Then, **Balanced** measurement functions are processed in this order:

7. Balanced Conversion
8. Differential / Common Mode Port Z Conversion
9. Differential Port Matching

- **Source power compensation** is then optionally applied to compensate for the aggregate loss through all enabled fixturing operations.

Notes

- The fixturing operations are applied to the measurement results.
- The order of operations 1 through 5 can be changed using the SCPI command: `CALC:FSIM:SEND:OORD`. Learn how to send this command from the GPIB Command Processor Console.
- The order of the operations 6 through 9 can NOT be changed.
- In the Data processing chain, the Fixture Simulator functions occur at the same time as the **Apply Error Terms** block.
- When fixturing is enabled, all of the enabled fixturing features are applied when snp files are saved.
How to select Fixturing Simulator

About Fixturing ON/off

BOTH of the following must occur to turn a fixturing selection ON.

EITHER ONE will turn a fixturing selection OFF.

1. Turn Apply Fixtures ON/off
   Port Extensions is NOT affected by Fixturing ON/off.

2. Check Enable on the individual fixturing selection dialog box.

Using Hardkey/SoftTab/Softkey

1. Press Cal > Fixtures > Apply Fixtures.

Port Matching dialog box help

Note: This feature is available in the following measurement classes: GCA, GCX, Swept IMD, Swept
IMDx, Noise Figure, NFX, Diff IQ, Spectrum Analyzer, and standard (S-Parameter) channels.

This function specifies a circuit to embed (add) to the measurement results. See Order of Fixture Operations.

**Enable Port Matching** Check to apply the settings to the measurement results. Must also enable Fixturing ON/off.

**Port** - Select Port in which to apply simulation.

**Circuit Model for Matching** - Choose one of the following that best emulates your fixture at the selected VNA port:
User Defined (S2P File)  Load a file that is specified with User S2P File button.
None  Use no circuit model.

User S2P File  Click to specify an S2P file of the circuit model to embed at the selected port. If the normalized impedance value in a recalled User .S2P file is different from the port reference impedance setting of the VNA, the VNA setting is used.

**Circuit Values**

**Capacitance (C), Inductance(L), Resistance(R), Conductance(G)**  Values for the specific components of the circuit type that models your fixture.

**Reset**  Restores the default values.

**2 Port De-embedding** dialog box help

**Note:** This feature is available in the following measurement classes: GCA, GCX, Swept IMD, Swept IMDx, Noise Figure, NFX, Diff IQ, Spectrum Analyzer, and standard (S-Parameter) channels.
De-Embed when you have performed a calibration and then added a fixture (an adapter, an attenuator, a longer cable, etc.) that connects between the Cal reference plane and your DUT. This function removes the effects of a component or test fixture from the measurement results.

**Note:** De-embedding a component with more than 20 dB of loss becomes impractical because of an inability to accurately measure the match of the DUT through such a device.

The de-embedding operation recalls an .s2p file (Touchstone format) which includes the electrical characteristics of a 2-port fixture or device. The file can be in any standard format (real-imaginary, magnitude-angle, dB-angle).

**Enable De-embedding** Check to apply the settings to the measurement results. Must also enable Fixturing ON/off.

**Enable Extrapolation** Check to apply a simple extrapolation when the S2P file has a narrower frequency range than the channel. The values for the first and last data points are extended in either direction to cover the frequency range of the measurement. The frequency ranges of both the channel and the S2P file are displayed at the bottom of the dialog.

When extrapolation is necessary and enabled, a message is displayed showing the frequency range to be extrapolated. When extrapolation is necessary and disabled, a message is displayed offering to enable extrapolation.

This setting also causes 4-port Extrapolation to be enabled and disabled.

**Port** The VNA port to which the recalled de-embedding file is applied.
From the drop-down menu, select **User Defined (S2P File)**.

**Reverse Adaptor Ports**  Check to cause the Fixture/Adapter to be configured with Port 2 connected to the VNA and Port 1 to be connected to the DUT. The image in the dialog reflects that change.

**User S2P File**  Click to specify an existing .S2P file. If the normalized impedance value in a recalled User .S2P file is different from the port reference impedance setting of the VNA, the VNA setting is used.

---

**Port Z (Impedance) Conversion dialog box help**

![Port Z Conversion dialog box](image)

**Note:** This feature is available in the following measurement classes: GCA, GCX, Swept IMD, Swept IMDx, Noise Figure, NFX, Diff IQ, Spectrum Analyzer, and standard (S-Parameter) channels.

This function corrects the measurement and displays the results as if the measurement had been made into the specified impedance value. However, the physical port termination is still approximately 50 ohms.

The specified impedance value is applied to all of the measurements on ONLY the active channel.

See **Order of Fixture Operations**.

**Enable Port Z Conversion**  Check to apply the settings to the measurement results. Must also enable **Fixturing ON/off**.

**R**  Real part of the impedance value.

**jX**  Imaginary part of the impedance value.

**Close**  Applies the entries and closes the dialog box.
Note: Port Z (Impedance) conversion uses values in the following prioritized order:

1. Balanced (Differential or Common Mode) - if enabled, these values are always used.
2. Single Port Impedance - if enabled, this value is used if Balanced is not enabled.
3. System Impedance - if neither balanced or single port is enabled, this value is used.

4/6/8-Port Embed/De-embed dialog box help

This function specifies a single-ended 4-port circuit (*.S4P file) to embed (add) or de-embed (remove) from the measurement results. Computation takes place BEFORE Balanced conversion. See Order of Fixture Operations.

There is a single normalized impedance value for each port in the *.S4P file. This impedance value must match the impedance of the previous Port Z setting, or the VNA port impedance.

The VNA will interpolate if the number of data points that are read is different from the current VNA setting.

Enable 4-Port Embed/De-embed Check to apply the settings to the measurement results. Must also enable Fixturing ON/off.

Enable Extrapolation Check to apply a simple extrapolation when the S4P file has a narrower
frequency range than the channel. The values for the first and last data points are extended in either
direction to cover the frequency range of the measurement. The frequency ranges of both the
channel and the S4P file are displayed at the bottom of the dialog.

When extrapolation is necessary and enabled, a message is displayed showing the frequency range
to be extrapolated. When extrapolation is necessary and disabled, a message is displayed offering to
enable extrapolation.

This setting also causes 2-port Extrapolation to be enabled and disabled.

**Topology**

Select a DUT topology. Refer to the images on the 4-port embed/De-embed dialog box.

- **A** - Network 1
- **B** - Network 1/3
- **C** - Network 1/2/4

**NA Ports** - Select the VNA Port that is connected to each circuit port.

**Network Ports** Select the network ports that represent the configuration of the S4P file. By default,
ports 1 and 2 are connected to the VNA and ports 3 and 4 are connected to the DUT.

**None, Embed, De-embed** For Network1 and Network2, select:

- **None** - The same as disabling.
- **Embed** - Add the specified network circuit to the measurement results. See 2-port Embed image.
- **De-embed** - Remove the specified network circuit from the measurement results. See 2-port De-embed
  image.

**Browse** For both Network1 and Network2, navigate to find the .S4P file to embed or de-embed.

**OK** Applies the changes and closes the dialog box.

**Cancel** Does NOT apply the changes and closes the dialog box.
Differential Impedance Conversion dialog box help

This function sets the Differential impedance value for each balanced port.

The default value for R: is the SUM of the impedance values for both ports that make the logical port. If Port Z Conversion is not enabled, then System Z0 values for both ports are summed.

See Order of Fixture Operations.

Enable Differential Z Conversion Check to apply the settings to the measurement results. Must also enable Fixturing ON/off.

Logical Port Select the logical (balanced) port to receive impedance value. To see logical port numbers, see the measurement topology.

R Real part of the impedance value.

jX Imaginary part of the impedance value.

Close Closes the dialog box.

See note about Port Impedance priority.

Common Mode Impedance Conversion dialog box help

This function sets Common Mode Impedance value for each balanced port.

The default value for R: is calculated as follows.

\[(Z1 \times Z2) / (Z1 + Z2)\]

Where ports 1 and 2 comprise the logical port:

Z1 = the Port Impedance values for port 1
Z2 = the Port Impedance values for port 2

If Port Z Conversion is not enabled, then System Z0 values for port 1 and 2 are used in the calculation.

See Order of Fixture Operations.

Enable Common Mode Z Conversion  Check to apply the settings to the measurement results. Must also enable Fixturing ON/off.

Logical Port  Select the logical (balanced) port to receive impedance value. To see logical port numbers, see the measurement topology.

R  Real part of the impedance value.

jX  Imaginary part of the impedance value.

Close  Closes the dialog box.

See note about Port Impedance priority.

---

**Differential Port Matching** dialog box help

This function allows the embedding of a differential matching circuit at a balanced port.

See Order of Fixture Operations.

Enable Differential Port Matching  Check to embed the selected matching circuit to the measurement results. Must also enable Fixturing ON/off.
**Logical Port**  Choose Logical DUT port to receive the selected matching circuit. To see logical port numbers, see the measurement topology.

**Select Circuit**  Select a matching circuit. Choose from:

- **Shunt L - Shunt C**  Predefined circuit.

![Diagram of Shunt L - Shunt C circuit](image)

**Circuit Values**  Choose from:

- **C**  Capacitance value
- **G**  Conductance value
- **L**  Inductance value
- **R**  Resistance value

- **User defined**  Select an *.S2P file that represents the matching circuit. Then click **Browse** to navigate to the *.S2P file.

**Note:** For the *.S2P file:
Port 1 of the circuit is assumed to be connected to the VNA
Port 2 of the circuit is assumed to be connected to the DUT.

- **None**  No embedded circuit on selected port.

**Close**  Closes the dialog box.
This function adjusts the source power at the specified port to compensate for the combined amount of gain or loss through specific fixturing operations. Use this function to set the power level at the DUT input.

Power Compensation adjusts the source power for the gain/loss through all fixture components.

- It compensates for all port matching (embedded) networks unless "Compensate Only For De-Embeds" is selected.

For example:

- Your DUT requires a fixture on the input port which is connected to VNA port 1.
- The fixture description (such as an S2P file at the 2-port De-embed function) indicates the fixture has approximately 2 dB of loss across the frequency span.
- You set source power to 0 dBm. But you want 0 dBm at the DUT input (the fixture output).
- Check Power Compensation on Port 1 and enable Fixturing.
- Power Compensation causes the source power to be increased by approximately 2 dB so that the power at the fixture output plane will remain at 0 dBm.

Power Compensation affects all measurements in the channel.

Enable Fixturing to use Power Compensation.

Note: Use caution when applying power compensation. Always test your setup without a DUT in a place. If you are using S2P files, Recall your S2P file into the VNA so you can verify that the device
your S2P file describes is what you intended it to be. It is too easy to misalign data in S2P files if they are constructed by hand.

**Ground Loop De-embedding / Embedding**

Ground loop de-embedding removes the effect of a non-ideal ground connection between the DUT’s ground and the analyzer's ground reference. Typically, the non-ideal component is the parasitic inductance of the ground contacts.

Ground loop embedding adds the effect of a non-ideal component on the ground contacts.

The Ground Loop De-embedding / Embedding can be specified by circuit model type or touchstone file.

Ground loop de-embedding / embedding is only available from SCPI remote interface.

**Fixture Simulator Example**

The following example shows a DUT and the matching circuit with which the DUT will be used in its intended application. When the DUT is tested in a high-volume manufacturing environment, multiple test fixtures are often required. The most accurate way to test the DUT and ensure measurement consistency between the different test fixtures is to use a simple, repeatable, test fixture without the actual matching elements.

To get the desired performance data, the parasitic effects of the fixture must first be removed (de-embedded) from the measured data. Then a perfect "virtual" matching circuit must be simulated and added mathematically (embedded) to the corrected, measured data. The result is an accurate display of the DUT as though it was actually tested with a physical matching circuit, but without the uncertainties of using real components.
This diagram does NOT refer to the order in which operations are performed.

See Order of Fixture Operations.

1. Create a balanced measurement using single-ended to balanced (SE-Bal) topology. Include all relevant measurement settings (IFBW, number of points, and so forth). Once the measurement is created and calibrated, the measurement parameter can be easily changed. For example, Sdd22 to Sds21.

2. Calibrate the measurement at the point where the simple test fixture is connected to the VNA. Use accurate calibration standards and definitions.

3. Remove the effects of the three uncalibrated transmission lines of the simple test fixture. This can be done in several different methods. The easiest is to use manual or automatic Port Extensions to move the calibration reference plane to the DUT. This removes the electrical length and loss of the fixture’s transmission lines, but does not account for fixture mismatch. Another method is to de-embed previously-created *.S2p files of the 3 transmission lines. The files can be created using external ADS modeling software. Another alternative is to create the *.S2P files by independently measuring all 3 ports of the test fixture and saving the results of each to an S2P file.

4. With the test fixture connected to the VNA and a DUT inserted, the measurement results now appear as
though calibration was performed at the connections to the DUT, and the device was measured in a 50-ohm single-ended test environment. The following steps will cause the results to reflect the performance of the device as though the device is embedded in the circuit in which it will be used.

5. Port 1 of the device is a single-ended port and sees a source impedance the same as the VNA system impedance, so no change is required. However, if Rs were a value other than 50 ohms, Port 1 Impedance Conversion would be used to simulate the different impedance.

6. **Port Matching** is used to simulate L1 inductance. Select any of the Shunt L circuits to embed (add) to the measurement results. Enter the value of L and R. The C and G values can be entered as 0 (zero).

7. **Port Matching** is used to simulate C1 and C2 capacitance. For both port 2 and port 3, select any of the **Series C** circuits to embed (add) to the measurement results. Enter the value of C and G. The L and R values can be entered as 0 (zero).

8. **Balanced Conversion** mathematically simulates the measurement in balanced mode.

9. **Differential Port Matching** is used to simulate L2 inductance. Select Shunt L- Shunt C and enter the inductance / resistance value. The C and G values can be entered as 0 (zero).

10. Finally, **Differential Z Conversion** is used to simulate a circuit termination of 200 ohms. If you are making Common Mode measurements, specify **Common Mode Z Conversion**.
Automatic Fixture Removal (AFR)

Note: This feature requires Option S9x007A or 007.

In this topic:

- Overview
- Requirements
- Automatic Fixture Removal Wizard

Overview

Fixtures are often used for DUTs that have non-coaxial interfaces. This feature allows you to mathematically remove, or de-embed, a characterized test fixture from displayed measurement results of the test fixture and DUT.

Before starting the AFR process, **Perform a calibration** at the connectors of the test fixture (red lines in images below).

The AFR Wizard will guide you through these steps:

1. Press Cal > Fixtures > Auto Fixture Removal...
2. Describe your fixturing situation.
3. Specify How the Thru fixture characterization will occur.
4. Do characterization.
5. Remove the effects of the test fixture. Leaves ONLY the displayed results of the DUT.
6. Touchstone files are saved that characterize the two halves of the test fixture.

Requirements

- Test fixture and either a complete Thru **OR** Left and Right Thru halves, all shown below.
- Both the Test fixture and Thru are made of the exact same medium; preferably fabricated ON the same piece of medium.

Single-ended Fixtures
Supports both 1-port (not shown) and 2-port single-ended DUT configurations.

When used with a 4-port DUT configuration, the trace coupling is not removed.

**Differential (Balanced) Fixtures**
Left and Right halves of Thru standard

Supports 4-port DUT configuration ONLY which includes removing the effects of coupling between the differential traces.

How to start the Automatic Fixture Removal Wizard

With a calibrated measurement of the DUT in the test fixture present:

Click Response, then Cal, then Fixtures, then Automatic Fixture Removal

Note: The dialogs below show images for a Single ended DUT, but Differential works exactly the same, only with Differential S4P files.

Automatic Fixture Removal Wizard

For best results, follow the AFR Wizard tabs from steps 1 through 5 by either clicking Next > or clicking the tabs.

In this section:

1. Describe Fixture
   - AFR Configuration Dialog
2. Specify Standards
3. Measure Standards
4. Remove Fixture
5. Save Fixture
1. Describe Fixture

The choices that you make in the dialog are reflected in the diagram and text (red box in following image).

My fixture inputs are:

- **Single Ended** - The fixture and DUT have single-ended inputs and outputs.
- **Differential** - The fixture and DUT have differential inputs and outputs.

My measurement is (Single Ended):

- **1-port** - such as S11
- **2-port** - such as S21

My measurement is (Differential):

- **Multiport / Use THRUs** - select up to 64 ports. Check **Use THRUs** to use THRU fixture.

My measurement is (Differential):

- **2-port** - such as SDD11
- **4-port** - such as SDD21

- **Multiport / Use THRU** - select up to 64 ports. Check **Use THRU** to use THRU fixture.

Advanced Settings (click ^ to show and hide)

After fixture removal set Calibration Reference Z0 to: (Choose one of these settings)

- **System Z0** - Sets impedance to the System Impedance setting. Learn how to set System Z0.

- **Measured Fixture Z0** - Sets impedance to the value that is measured during the AFR process. Not allowed when 'band limited' is selected below.

- **<nn> ohms** - Sets impedance to an arbitrary value.

- **Set 'System Z0' to Calibration Reference Z0** - When the impedance is measured or set to an arbitrary value, check to also set the System Z0 to the same value.

Select all that apply:
- Check if this is true: **I want to correct for when the match** (Return Loss) of Fixture A is NOT equal to the match of Fixture B.

- Check if this is true: **I want to correct for when the electrical length** of Fixture A is NOT equal to the electrical length of Fixture B.

- Check if this is true: **My fixture is band limited**. Bandpass mode will be used during the Time Domain measurement. If NOT checked, then **Lowpass** mode is used. Because Lowpass mode includes impedance in the calculation, it renders the best accuracy. Learn more about these settings.

**Note**

When using **Lowpass** mode and an error message appears ("**Measurement settings are not adequate...**"), change the start frequency and the number of points so that the frequency span between data points equals the start frequency. This can be done by selecting values using the following logic:

- **Start freq = 10 MHz**

  then either:

  - **Stop freq = 20 GHz**
  - **Number of points = 2000**

  or

  - **Stop freq = 50 GHz**
  - **Number of points = 5000**

  In either case, the frequency span between data points equals 10 MHz, the start frequency.

**AFR Configuration Dialog**

The AFR Configuration dialog can be launched by clicking on the **AFR Config** icon (shown below).
Access the following settings in the **General** tab of the AFR Configuration dialog.
Set manual time domain start and stop settings for corner cases shown under Time Domain Settings.

The Tolerance (in ohms) and Number of Iterations can be set under Wizard Tab 3, Edit Window, Measured Fixture Impedance Iteration. Check the Auto Iterate box to automatically iterate when Impedance Method Auto is checked.

AFR Mode Conversion - AFR mode conversion will turn on or off automatically to make the AFR result more precise with non-single ended data.

---

2. Specify Standards
Selecting 2 single-ended ports, or 4 differential ports allows a 2X Thru choice.

Checking **Use THRUs** in the **1. Describe Fixture** tab allows 2X Thru choice for a Multiport measurement.
If **My characterization fixture** \`DUT measurement fixture\` is checked in the **1. Describe Fixture** tab, the **Fixtured DUT** choice is displayed and checked.

Otherwise, the fixture MUST be characterized using 1-port fixture measurements using either **OPEN** or **SHORT** terminations.

**Note:** The term 'Standards' is used here because this process can be thought of as the second in a '2-tier' calibration. The first tier of the calibration must already be performed (the VNA calibrated) before starting the AFR process. Another way of describing this step would be:

"How will you be measuring or loading the characterization of the Thru standard?"

- **2X Thru** - Both halves together in one fixture.
- Both **1X Thru** halves separately (also known as 1-port AFR). Specify either **Open** and/or **Short** at the end of each half of the standard.
Notes:

- This image: appears as the 2X Thru when you select 1. Describe Fixture, My measurement is 1 port. This means the left and right fixtures are mirror images of each other and have the same S-parameters. The cascaded combination of the two fixtures are Fixture A + Reversed Fixture A, or A'.
- If both halves are identical and you do not have a 2X Thru, then only Fixture A measurements are necessary.

Advanced Settings

This setting is used to describe any ADDITIONAL length between the halves of the Thru or added to either of the individual halves.

If the electrical length of the Thru standard is identical to the test fixture, then make no changes to the default settings (Known length = 0).

My Thru fixture has:

- **Known thru length** - Enter the length in nanoseconds. See a simulated length in the diagram between the two halves of the Thru.
- **Unknown thru length computed using reflects**. This setting requires the two halves of the Thru fixture be characterized separately with a reflect standard.
- **Unknown thru length computed using fixtured DUT measurements**. This setting requires an additional characterization of the Fixture + DUT.

3. Measure Standards
The following dialog is for Multiport 2X Thru measurements when Use THRUs is checked in the 1. Describe Fixture tab.

This step characterizes the 1X or 2X Thru standards. This is done by either performing
measurements or by loading one or more *.snp files that describe the characterization of the fixtures.

**Note:** When loading standards from files, the typical system characterization impedance (Z0) value is used, which is 50 &.

Click **Measure** to see the following dialog:

For best results, the analyzer should be calibrated. Also, the measurement Start and Step frequencies should be equal. This is necessary for TDR measurements.

Connect the specified standard at the PNA port. Then click **Measure**.

![Measure dialog](image)

OR click **Load** and navigate to the *.snp file that describes the standard.

For 2X Thru standards, the following dialog allows you to optionally remap the fixture ports.

![Load dialog](image)

**Calculated Fixture Characteristics**
**Note:** The fixture length must be 4 times the rise time. If not, an error message will be displayed. For example, a measurement at 26.5 GHz has a rise time of 37.7 ps. Therefore, the fixture length must be $4 \times 37.7 \text{ ps} = 151 \text{ ps}$.

The loaded or measured Impedance and Electrical Length of the fixture are calculated and displayed here.

The preview button allows you to visualize the time domain characteristics of the fixture model that will be used for de-embedding. By using the editing features noted below, the output match, length, and impedance of the fixture model can be optimized. This allows flexibility for including or excluding physical characteristics such as excess inductance of plug fingers, excess capacitance of receptacle pads or any other anomalies not desired in the fixture model. This advanced feature should be used with care as misuse could cause passivity or causality errors in the resultant fixture model.

Click **Edit** to start the following, interactive **Measure Fixture Impedance TDR Data** dialog.
This dialog allows you to change the Impedance and/or Fixture Length of the saved *.snp data by moving a marker to the desired location on the TDR plot.

**Tips**

- The TDR X-axis shows the **1-way** electrical length of the fixture in time.
- Right-click the plot, then click **Autoscale**.
- Click and drag to zoom the display on specific details of the plot.

**Editing Mode.** (For 2X Thru, Fixture Length can NOT be changed.)

Choose one or more of the following to edit the data in resulting *.snp files:

- **Impedance** - move the M1 marker to edit the data as though the measurement was made in the specified characteristic impedance. The Z marker is used to measure the fixture impedance.
*Gate* - move the flag to 'gate out' a part of the fixture measurement, usually close to the transition. The Z marker automatically changes to the location of the gate. The gate flag cannot move further than the fixture length diamond marker.

*Fixture Length* - move the diamond marker to change only the electrical length of the fixture. The fixture length cannot be shortened to a value less than the current gate value. In this way, the gate value will never be greater than the electrical length.

**Impedance Editing Mode**

**Select Fixture Impedance** - Select the A or B fixture.

**Impedance Method** - Select *Auto* then click *Iterate* to measure the fixture Z0 automatically and return fixture impedance back to 50 ?. If more than one fixture impedance needs to be measured, check *All* to measure all impedances listed in *Select Fixture Impedance*. Select *Marker* to measure the fixture Z0 manually using the Z marker. The *Set At* field shows the X-axis position of the Z marker in ns. The *Set Marker At Default* returns the Z marker and fixture impedance to the default value.

**Measured Fixture Z0** - Shows the measured fixture impedance. When *Marker* is selected as the Impedance Method, this field displays the current Z marker value or a value can be entered directly in this field. When *Auto* is selected as the Impedance Method, this field displays the fixture impedance value that was found automatically after clicking the *Iterate* button. In *Auto*, moving the Z marker will not change this value.

**Diff: ZA:** - Enter the AFR fixture impedance manually using the text box.

**Fixture Length Editing Mode**

**Select Fixture Impedance** - Select the A or B fixture.

**Set Marker Position, Gate Position, or Fixture Length** depending on the selected Editing Mode. Move the marker (M1, Gate flag, or diamond) to the desired response on the trace.
Set At Default - PLTS chooses an appropriate length at which to set the initial impedance or length. Click to return the marker to this location.

Preview ON/off - Select Off, then ON to preview the new measurement. Click OK when finished. When saved, the new Impedance and Length results are copied to the *.snp files.

4. Remove Fixture

![Image of the PLTS software interface for removing fixtures]

**Note:** First choose Select correction method, then make other selections, then click Apply Correction.

Both operations can be performed, but only one at a time.

- **Turning on Fixturing/de-embedding for channels.** Usually only one channel is being used on the VNA, so only one channel will appear in the choices of channels to be corrected.
  
  - **Select the channels to be corrected.**
    
    Fixturing and de-embedding will be enabled for the selected channels in the VNA. If the new fixturing UI is used, these de-embedding blocks will place to the left of any existing circuit elements. See Using Fixture Simulator for more details.
• Advanced settings

  • **Enable Extrapolation** - When fixture data is loaded from a file and the frequency span of the data is not as wide as that of the channel, check this box to calculate and use linearly-extrapolated fixture data.

  • **Compensate for power** - When checked, test port power is increased to compensate for loss in the fixture.

• **Modifying the calset(s) used on the channels.** Usually only one calset is in use on the VNA, so only one choice would be available.

  • Advanced settings

  • **Enable Extrapolation** - When fixture data is loaded from a file and the frequency span of the data is not as wide as that of the measurement, check this box to calculate and use linearly-extrapolated fixture data.

  • **Compensate for power** - When checked, test port power is increased to compensate for loss in the fixture.

  • **Prompt for new calset name(s)** - When cleared, when you apply AFR to a calset, the calset is overwritten. Once done, this process is NOT reversible. When checked, you are prompted to enter a new calset name and the original is preserved. The new calset is written with AFR correction.

  • **Apply AFR to other selected Calsets** - When checked, allows you to apply AFR correction to other calsets not currently in use on the VNA. Click Browse, then navigate to the calsets to be corrected.

---

5. Save Fixture
Select File format to save fixture data:

- Touchstone (*.snp)
- Touchstone 2 (*.ts)
- Citifile (*.cti)

Choose port assignment for save fixture files:

The port assignments are interpreted differently when the file is opened in each program. Choose which program software you will be using to open the saved file: PLTS, VNA, ADS.

Choose the directory and base names for the saved files:

Click Browse to navigate to a directory folder.

With a base file name: The resulting filename will appear as follows (assuming a Touchstone format):

- `<base file name>_1.S4P` - The left half of a Differential fixture.
- `<base file name>_2.S4P` - The right half of a Differential fixture.
- `<base file name>_1.S2P` - The left half of a single-ended fixture.
- `<base file name>_2.S2P` - The right half of a single-ended fixture.
Click **Save Fixture Files** to save the files to the specified directory.
Port Extensions

Port extensions allow you to electrically move the measurement reference plane after you have performed a calibration.

**Note:** This feature is available in GCA, GCX, Spectrum Analyzer, and standard (S-Parameter) channels.

- Why and How to use Port Extensions
- Manual Port Extensions Procedure
- Port Extensions dialog and Toolbar
- Step Size dialog
- Automatic Port Extension dialog

**See Also**

Data Flow Map

Fixture Compensation features

Phase Accuracy

Comparing the VNA Delay Functions

**Other Calibration Topics**

**Why use Port Extensions**

1. You are unable to perform a calibration directly at your device because it is in a test fixture. Perform a calibration at a convenient place, then use port extensions to compensate for the time delay (phase shift), and optionally the loss, caused by the fixture.

2. You have already performed a calibration, and then decide that you need to add a length of transmission line in the measurement configuration. Use port extensions to “tell” the analyzer you have added the length to a specific port.
Important Note: Port Extensions and VNA Data Flow

See VNA Data Flow diagram

Normally, Port Extensions are applied to individual S-parameters in the **Phase Correction** process and only applies to displayed S-parameters.

However, when **Fixturing** is ON or when making a **Balanced Measurement**, Port Extension compensation is applied in the **Apply Error Terms** process which affects **ALL** S-parameters, whether displayed or not. This allows all underlying S-parameters to have proper extensions applied.

Therefore, when using Port Extensions with features that require more than a single S-parameter (such as k-factor in equation editor), do one of the following:

- Enable **Fixturing** - Individual Fixturing features are NOT required to be enabled.
- Use **8510 Mode Data Processing**.

When Port Extension compensation is applied in the **Apply Error Terms** process, after a **Data-to-Memory** operation has been performed, further changes to Port Extensions settings will NOT be applied to the Memory trace.

---

**How to use Port Extensions**

- If you know the **electrical length** of the fixture or additional transmission line, enter the value directly to the **Time** setting.

- If you know the **physical length** of the fixture or additional transmission line, enter the value directly to the **Distance** setting.

- If you do **NOT** know either the electrical or physical length of the fixture or additional transmission line, you must be able to connect an **OPEN** or **SHORT** to the new reference plane - in place of the DUT. In most cases, removing the DUT will leave a suitable **OPEN** at the new reference plane.

- Port Extensions can then be added manually (as follows), or by using **Automatic Port Extensions**.

**Manual Port Extensions Procedure**

1. Select a calibrated S11 measurement.

2. Select Phase format.
3. With an OPEN or SHORT at the calibration reference plane, verify that the phase across the frequency span is at or near zero.

4. Connect the fixture or added transmission line and attach an OPEN or SHORT in place of the DUT. In most cases, removing the DUT will leave a suitable OPEN at the new reference plane. On the Port Extension toolbar or dialog, increase either **Time** or **Distance** until the phase response is flat across the frequency span of interest.

5. If you know the loss of the additional transmission line, enter the **Loss Compensation** values using either one or two data points.

**Note:** Most OPEN and SHORT standards have delay. Therefore, adjusting delay with this method results in a delay equal to two times the delay of the OPEN or SHORT.

---

**How to set Port Extensions**

**Using Hardkey/SoftTab/Softkey**

1. Press **Cal > Port Extension > Port Extensions...**

---

**Port Extensions dialog and Toolbar help**

**Note:** This feature is available to **GCA, GCX, Spectrum Analyzer,** and standard (S-Parameter) channels.

Port extensions settings affect all measurements on the active channel that are associated with a particular port.

Learn Why and How to use Port Extensions (scroll up).
**Port**  Select a port for delay and loss values. Port Extensions settings affect ALL measurements on the active channel that are associated with a particular port.

**Port Extension**  Turns ON and OFF port extensions on all ports.

**Show Toolbar**  Check to show the Port Extensions toolbar. The toolbar allows you to make adjustments to the port extensions while showing more of the screen. This is the only way to show or hide the toolbar.

**Delay**

Enter delay in either Distance or Time by entering a value or clicking the up/down arrows. Click to start the Step Size dialog.

**Time**  The amount of port extension delay in time. Enter a positive value.

**Distance**  The amount of port extension delay in physical length. Enter a positive value.

**Distance Units**  (Dialog ONLY) Select from Meters, Inches, or Feet. The Step Size setting will not change automatically. Learn more.

**Loss**

The following settings allow the entire frequency span to be corrected for loss.

**Loss at DC**  Offsets the entire frequency span by this value. Loss1 or Use1 must also be checked. To compensate for loss at DC, enter a positive value which causes the trace to shift in the positive (up) direction.

**Loss @ Frequency**  Check the box, and enter values for Loss and Frequency.

When Loss1 or Loss1/Loss2 are used, a curved-fit algorithm is used as follows:

**Loss1 ONLY:**

\[ \text{Loss}(f) = \text{Loss1} \times \left(\frac{f}{\text{Freq1}}\right)^{0.5} \]

**Loss1 and Loss2:**

Set the lower frequency to Loss1, and the higher frequency to Loss2.

\[ \text{Loss}(f) = \text{Loss1} \times \left(\frac{f}{\text{Freq1}}\right)^{n} \]

Where:

\[ n = \log_{10} \left[ \frac{\text{abs} (\text{Loss1/Loss2})}{\text{Freq1/Freq2}} \right] \]

**Note:** abs = absolute value
**Velocity**

**Velocity Factor**  For each port, sets the velocity factor that applies to the medium of the device that was inserted after the measurement calibration. The value for a polyethylene dielectric cable is 0.66 and 0.7 for PTFE dielectric. 1.0 corresponds to the speed of light in a vacuum.

**Couple to system Velocity Factor**  When unchecked, the Velocity Factor is set for only the specified port and only for Port Extensions. When checked, sets the Velocity Factor for all ports. In addition, changing this value also changes this setting for the Electrical Delay and Time Domain Distance Marker features.

**Media**

For each port, select the media of the added transmission line or fixtures.

**Coax**  Select when the fixture or added transmission line is coax. Also specify the velocity factor of the coax.

**Waveguide / Cutoff Frequency**  Select when the fixture or added transmission line is waveguide. Also enter cutoff (minimum) frequency of the waveguide.

**Note:**  when using a Waveguide cal Kit, set System Z0 to 1 ohm before calibrating.

**Couple to system Media Definition.**  When unchecked, the Waveguide Cutoff Frequency is set for only the specified port and only for Port Extensions. When checked, sets the Waveguide Cutoff Frequency for all ports. In addition, changing this value also changes this setting for the Electrical Delay feature.

**Reset**  All port extensions settings are changed to preset values. The Port Extension ON / OFF state is NOT affected.

**Auto Ext.**  Starts the Automatic Port Extensions dialog box

**Note:**  Individual receiver port extensions (A,B, and so forth) cannot be set.
**Step Size dialog box help**

Changes the step size that occurs when the Time or Dist up/down arrows are pressed on the Port Extension toolbar. The Units for step size are changed on the Port Extension dialog.

**Auto**  Step Size is set to the default value.

**User Defined**  Enter a step size value, then click OK.

This value remains the same when the units are changed. For example if a step size of 12 is entered on this dialog, then you change the units from Inches to Feet, the step size of 12 inches becomes 12 feet, not 1 feet. Therefore, change the units first, then set the step size.

Learn about Port Extensions (scroll up)

---

**Automatic Port Extension dialog box help**

Automatic Port Extension AUTOMATICALLY performs the same operation as Manual Port Extension. By connecting a SHORT or OPEN, the reference plane is automatically moved to the point at which the standard is connected. In addition, Automatic Port Extension will optionally
measure and compensate for the loss of the additional transmission line.

Auto Port Extension is NOT available when:

- Sweep type is set to power sweep
- Frequency Offset is ON
- Media is set to Waveguide

**Note:** Turn OFF Equations that may exist on the active trace when using Automatic Port Extensions.

### Auto Port Extensions Procedure

1. Connect the added transmission line or fixture. Attach an OPEN or SHORT to all affected ports at the new reference plane. In most cases, removing the DUT will leave a suitable OPEN at the new reference plane.

2. On the Port Extension toolbar, click **Auto Port Ext**. Click **Show Configuration** to make additional settings.

3. Click **Measure** to perform the port extension calculations. The resulting delay and loss settings are entered into the port extension toolbar. These settings are saved with Instrument Save or you can manually record the values and enter them again when required.

### Settings

**Measure either OPEN, SHORT, or both** Press a button to make the measurement of the reflection standard.

Measure either OPEN or SHORT depending on which is most convenient. An ideal OPEN and SHORT, with zero loss and delay, is assumed. Therefore, accuracy is most affected by the quality of the standard. In most cases, removing the DUT will leave a suitable OPEN at the new reference plane. When measuring both OPEN and SHORT standards, the average of the two is used and will slightly improve accuracy.

**Selected Ports** Indicates the ports that currently have automatic port extension enabled. By default, ALL analyzer ports are enabled. To disable a port, see **Measure on Port Number** below.

**Note:** Port Extensions settings affect ALL measurements on the active channel that are associated with a particular port.

**Show/Hide Configuration** Press to either show or hide the following configuration settings in the dialog box.
### Measure on Port Number

Select port number to enable or disable automatic port extension.

**Enable** Check to enable the specified port. All enabled ports will have their reference plane automatically adjusted after performing Automatic Port Extension.

**Include Loss** Check to automatically measure the loss in the additional transmission line and apply compensation. To calculate loss compensation, frequencies at 1/4 and 3/4 through the frequency range are usually used as Freq1 and Freq2 values. [Learn more about Loss Compensation.](#)

**Adjust for Mismatch** Only available when **Include Loss** is checked. Mismatch adds ripple to the S11 and S22 traces. If the ripple is large, S11 and S22 can appear greater than 0 dB which leads to numeric instabilities in using the S-parameters. Adjust for mismatch increases the loss of the fixture so that the peak of the ripples is below 0 dB. While this adds more error (all the error is negative) it does allow the S-parameters to be used in simulators without numerical instabilities.

- **Check** - Offsets the trace to cause all of the data points to be at or below zero.
- **Clear** - Most accurate application of the curve-fit calculation, but allows positive responses.

**Prompt for Each Standard** Check to invoke a prompt when the Measure OPEN or SHORT button is pressed. The prompt will indicate which standard to connect to which port.

### Method

Select the span of data points which will be used to determine correction values for phase and loss (optional). If a portion of the current frequency span does not have flat or linear response, you can eliminate this portion from the calculations by using a reduced User Span.

To calculate loss compensation, Current Span and User Span methods usually use frequencies at 1/4 and 3/4 through the frequency range as Freq1 and Freq2 values. See [Loss Compensation](#) to learn more about how loss is calculated.

**Current Span** Use the entire frequency span to determine phase and loss values.

**Active Marker** Use only the frequency at the active marker, and one data point higher in frequency, to calculate phase and loss values. If a marker is not present, one will be created in the center of the frequency span.

**User Span** Use the following User Span settings to determine phase and loss values.

### User Span

**Start** Enter start frequency of the user span.
**Stop**  Enter stop frequency of the user span.

Learn about Port Extensions (scroll up).

See also Comparing Delay Functions
Swap Adapters and Offset Delay Calibration Methods

The Swap Adapters or Offset Delay calibration method is used when you do NOT have calibration standards with the same connector type as your DUT. In this case, the Offset Delay is the preferred calibration method over the Swap Adapters method.

The Swap Adapters calibration method (also known as Swap Equal Adapters and Equal Length Adapters) was used in the past as a quick alternative to the more tedious adapter removal method. This method requires that the adapters be of equal electrical length. There are two adapters for each port. The swap equal adapter method implicitly assumes the adapters have identical return loss. The finite return loss of each adapter on each port degrades both the residual directivity and residual match terms. The offset delay calibration only has one adapter. The return loss of this one adapter will degrade the residual directivity and residual match error terms.

**Note:** For any other reason, these calibration methods are **NOT** recommended because the Unknown Thru method is more convenient AND more accurate.

The Offset Delay calibration method uses the available standards for calibration then adds offset delay to the measurement plane to account for each adapter used. This eliminates the need for adapters with equal electrical length and is preferred over the Swap Adapters method.

**Swap Adapters Procedure**

The following is an example procedure showing how to perform a Swap Adapters 2-port calibration for a non-insertable DUT. The DUT has 2.92 mm connectors. You do NOT have 2.92 mm calibration standards, but you DO have 2.4 mm standards and adapters that have the same electrical delay as the 2.92 mm adapters.

Adapters A1 and A2 = test port to 2.4 mm adapters

Adapters B1 and B2 = test port to 2.92 mm adapters
1. Start the Cal Wizard and select Guided (Smart) Cal. **Note:** The VNA will NOT prompt you to connect the adapters by name or when to swap the adapters.

2. Specify the connector type and gender and Cal Kit of the adapter that you will be using (2.4 mm) - NOT the connector type of the DUT (2.92 mm). By specifying the connector gender, you are also specifying the Thru method (flush thru for insertable and Unknown Thru for non-insertable.) For example, when both DUT ports have female connectors, we will perform an Unknown Thru cal.

3. When prompted for reflection standards on port 1, connect the Open, Short, and Load standards to Adapter A1.

4. When prompted for reflection standards on port 2, connect the Open, Short, and Load standards to Adapter A2.

5. When prompted for a Thru connection, swap Adapter A1 and A2 for B1 and B2. Connect the Thru device. This could be any device that meets the requirements of the Unknown Thru standard. In the case of a non-insertable DUT, connect B1 and B2.

6. Make DUT measurements with Adapters B1 and B2 in place.

---

**Offset Delay Procedure**

The following is an example procedure showing how to perform a 2-port calibration for a non-insertable DUT using Offset Delay to account for the added delay of two adapters. The DUT has 2.92
mm connectors. You do NOT have 2.92 mm calibration standards, but you DO have 2.4 mm standards and adapters.

Adapters = test port to 2.4 mm (female)-to-2.92 mm (male) adapters

<table>

Delta Match Calibration

A TRL Cal, QSOLT, or Unknown Thru Cal requires simultaneous, valid measurements of the reference receivers for the test ports being calibrated. This is not possible for both the 2-port AND 4-port versions of the N5231B, N5232B, and N5239B PNA-L models.

This is also NOT possible with older N5230C 4-port models, nor for certain port pairs when an external test set is connected to ANY VNA model. With external test sets, some pairs of ports share the same receiver. In general these are the port pairs where one port is directly above the other. Therefore, TRL, QSOLT, and Unknown Thru are NOT possible in the context of a 2-port cal for any of those port pairs.

A Delta Match Calibration can be thought of as a software method used to overcome this hardware limitation. The Delta Match Calibration characterizes the source match and load match of the VNA test ports, and then calculates the differences, or "delta", of the two match terms. The delta term is combined with directivity and reflection tracking to compute a switch correction term. The switch correction error terms for each port are then used during subsequent TRL, QSOLT, or Unknown Thru calibrations.

There are several ways to acquire the Delta Match Calibration:

1. **From an existing User Cal Set** that meets the following Delta Match criteria:
   
   - Must have been performed using ECal or as a guided mechanical Cal (not Unguided).
   - Must have the same start frequency, stop frequency, and number of points as the channel being calibrated.
   - Must calibrate the ports that require the delta match terms.

2. **From a Global Delta Match Calibration.**

3. **From a 'Self Delta Match'** when other portions of the calibration fully characterize all ports using SOLT with Defined Thru or Flush Thru. For example, when calibrating all four ports of a PNA-L, perform a SOLT between ports 1 and 2, and also between ports 3 and 4, then Unknown Thru could be used between any combination of the remaining ports. This is allowed with an external test set.

**Which to use?** A Self Delta Match Cal will always be used when possible. Otherwise, the Cal Wizard will use a GDM Cal when available unless you select Choose Delta Match.

Global Delta Match (GDM) Cal
A GDM Cal is an "all-inclusive" calibration that can be applied whenever the delta match terms are required.

**Factory GDM Cal**

Beginning with A.09.80, a factory-performed GDM calibration is installed on 2-port PNA-L models. This GDM Cal is identical to one that you would perform, except that it is likely to be more accurate than a GDM Cal that would be performed by most PNA-L customers. The factory GDM is used when a Self Delta Match Cal is not possible, just like a user-performed GDM.

- If you choose to perform a GDM Cal, it will overwrite the Factory GDM Cal.
- A backup copy of the factory GDM Cal is saved on the PNA-L at D:\calfiles\ Global Delta Match Calset.pcs.
- To restore the original file, copy it to the original location at: C:\ProgramData\Agilent\Network Analyzer\UserCalSets\Global Delta Match Calset.pcs.
- If the original file is deleted, it will be restored automatically from the backup location.

**User GDM Cal**

When a GDM Cal is required, and your PNA-L model does NOT have a factory GDM, it must be performed at least once in order to use TRL, Unknown Thru, or QSOLT calibrations

- To attain the highest accuracy, the following settings are automatically used to perform a GDM Cal. When applied, it will likely be interpolated.
  - Performed over the entire frequency range of the VNA.
  - If using an external test set, perform GDM with the external test set connected. There will be a separate GDM calibration stored for different PNA configurations. It is possible to have a GDM for the standalone system side by side with GDM calibrations for each type of external test set used.
  - Uses very dense data points, particularly at low frequencies.
  - Uses 100 Hz IF Bandwidth.
- The measurement conditions (cabling or adapters) of the subsequent calibration do NOT have to match the conditions under which the GDM Cal was performed. Because the GDM Cal characterizes the switch correction at each VNA port, those terms are NOT affected by differences in cabling or adapters.
- For highest accuracy when using an ECal module to perform the GDM Cal, the test ports of the ECal module should permit an **insertable connection** (for example 3.5mm male on one port and 3.5 mm female on the other). The frequency range of the ECal module must cover the entire frequency range. When using mechanical standards, the GDM Cal will force an insertable connection.
- Upon completion, the GDM Cal is stored as a special type of Cal Set and should be used ONLY as a Delta
Match Cal. It provides Delta Match error terms, but does NOT provide all of the standard error correction terms.

- Experience has shown that a GDM Cal may require updating only once every year depending on environmental conditions and how heavily the instrument is used.

**How to perform a GDM Cal**

**Note:** 2-port PNA-L models have a Factory GDM Cal, which means it is NOT necessary to perform a GDM Cal. If you perform a GDM, the Factory GDM will be overwritten.

These selections will only be available if the VNA hardware requires a Delta Match Calibration.

**Using Hardkey/SoftTab/Softkey**

1. Press **Cal**
2. then **Start Cal**
3. then **Global Delta Match**

**Using Menus**

1. Click **Response**
2. then **Cal**
3. then **Start Cal**
4. then **Global Delta Match**

**Delta Match Calibration. Select DUT Connectors and Cal Kit** dialog box help

- Only one Cal Kit is specified and necessary to perform a Delta Match Cal. However, ALL of the VNA test ports are calibrated in a Delta Match Cal.

- You must configure ALL test ports to terminate in the specified connector / gender using the necessary adapters. The errors from adapters are removed during calibration, but when using mechanical standards, the GDM Cal will force an insertable connection.

- For highest accuracy when using an ECal module to perform the GDM Cal, the test ports of the ECal module should permit an insertable connection (for example 3.5mm male on one port and 3.5 mm female on the other). The frequency range of the ECal module must cover the entire frequency range. When using mechanical standards, the GDM Cal will force an insertable connection. If you select an ECal
module that does NOT cover the entire frequency range of the VNA your selection will change to a different Cal Kit.

**Guided Calibration Steps** dialog box help

Follow the prompts to connect standards to the calibration plane.

Then click **Measure**.

When all standards have been measured, click **Done** to complete the measurement steps.

**THRU Connections**

- ONLY 2 Thru connections are required for a 4-port Cal. This is less than the minimum number of Thrus of a standard 4-port Cal.

- GDM Cal is always performed using a **Flush Thru**, a **Known Thru**, or an **insertable ECal module**. You can NOT use an Unknown Thru in the calibration process. For highest accuracy, perform GDM Cal using an insertable ECal module and select Flush-thru as the Calibration Thru method. Learn about Calibration Thru methods.
Click **Finish** to store the GDM Calibration as a special type of Cal Set.

By default, it will be used when a Delta Match Calibration is required.

It can ONLY be used as a Delta Match Cal. It does NOT provide all of the standard error correction terms.
Calibration Overview

The following is discussed in this topic:

- What Is Measurement Calibration?
- Why Is Calibration Necessary?
- Conditions Where Calibration Is Suggested
- What Is ECal?

See other Calibration Topics

What Is Measurement Calibration?

Calibration removes one or more of the systematic errors using an equation called an error model. Measurement of high quality standards (for example, a short, open, load, and thru) allows the analyzer to solve for the error terms in the error model. See Measurement Errors.

You can choose from different calibration types, depending on the measurement you are making and the level of accuracy you need for the measurement. See Select a Calibration Type.

The accuracy of the calibrated measurements is dependent on the quality of the standards in the calibration kit and how accurately the standards are modeled (defined) in the calibration kit definition file. The calibration-kit definition file is stored in the analyzer. In order to make accurate measurements, the calibration-kit definition must match the actual calibration kit used. To learn more, see Accurate Calibrations.

Calibration Wizard provides the different calibration methods used in the VNA. See Calibration Wizard.

There are quick checks you can do to ensure your measurement calibration is accurate. To learn more see Validity of a Measurement Calibration.

If you make your own custom-built calibration standards (for example, during in-fixture measurements), then you must characterize the calibration standards and enter the definitions into a user modified calibration-kit file. For more information on modifying calibration kit files, see Calibration Standards.

Note: Instrument Calibration is ensuring the analyzer hardware is performing as specified. This is not the same as measurement calibration.
Why Is Calibration Necessary?

It is impossible to make perfect hardware that would not need any form of error correction. Even making the hardware good enough to eliminate the need for error correction for most devices would be extremely expensive.

The accuracy of network analysis is greatly influenced by factors external to the network analyzer. Components of the measurement setup, such as interconnecting cables and adapters, introduce variations in magnitude and phase that can mask the actual response of the device under test.

The best balance is to make the hardware as good as practically possible, balancing performance and cost. Calibration is then a very useful tool to improve measurement accuracy.

Conditions Where Calibration Is Suggested

Generally, you should calibrate for making a measurement under the following circumstances:

- You want the best accuracy possible.
- You are adapting to a different connector type or impedance.
- You are connecting a cable between the test device and an analyzer test port.
- You are measuring across a wide frequency span or an electrically long device.
- You are connecting an attenuator or other such device on the input or output of the test device.

If your test setup meets any of the conditions above, the following system characteristics may be affected:

- Amplitude at device input
- Frequency response accuracy
- Directivity
- Crosstalk (isolation)
- Source match
- Load match

What Is ECAL

ECal is a complete solid-state calibration solution. It makes one port (Reflection), full two and three-
port calibrations fast and easy. See Using ECal.

- It is less prone to operator error.
- The various standards (located inside the calibration module) never wear out because they are switched with PIN-diode or FET switches.
- The calibration modules are characterized using a TRL-calibrated network analyzer.
- ECal is not as accurate as a good TRL calibration.

For information about ordering ECal modules, see Analyzer Accessories or contact your Keysight Support Representative.
Measurement Errors

You can improve accuracy by knowing how errors occur and how to correct for them. This topic discusses the sources of measurement error and how to monitor error terms.

- Drift Errors
- Random Errors
- Systematic Errors
  - 3-Port Error Terms
  - 4-Port Error Terms
- Monitoring Error Terms

See other Calibration Topics

Drift Errors

Drift errors are due to the instrument or test-system performance changing after a calibration has been done.

Drift errors are primarily caused by thermal expansion characteristics of interconnecting cables within the test set and conversion stability of the microwave frequency converter and can be removed by re-calibrating.

The time frame over which a calibration remains accurate is dependent on the rate of drift that the test system undergoes in your test environment.

Providing a stable ambient temperature usually minimizes drift. For more information, see Measurement Stability.

Random Errors

Random errors are not predictable and cannot be removed through error correction. However, there are things that can be done to minimize their impact on measurement accuracy. The following explains the three main sources of random errors.

Instrument Noise Errors
Noise is unwanted electrical disturbances generated in the components of the analyzer. These disturbances include:

- Low level noise due to the broadband noise floor of the receiver.
- High level noise or jitter of the trace data due to the noise floor and the phase noise of the LO source inside the test set.

You can reduce noise errors by doing one or more of the following:

- Increase the source power to the device being measured - ONLY reduces low-level noise.
- Narrow the IF bandwidth.
- Apply several measurement sweep averages.

Switch Repeatability Errors

Mechanical RF switches are used in the analyzer to switch the source attenuator settings.

Sometimes when mechanical RF switches are activated, the contacts close differently from when they were previously activated. When this occurs, it can adversely affect the accuracy of a measurement.

You can reduce the effects of switch repeatability errors by avoiding switching attenuator settings during a critical measurement.

Connector Repeatability Errors

Connector wear causes changes in electrical performance. You can reduce connector repeatability errors by practicing good connector care methods. See Connector Care.

Systematic Errors

Systematic errors are caused by imperfections in the analyzer and test setup.

- They are repeatable (and therefore predictable), and are assumed to be time invariant.
- They can be characterized during the calibration process and mathematically reduced during measurements.
- They are never completely removed. There are always some residual errors due to limitations in the calibration process. The residual (after measurement calibration) systematic errors result from:
  - imperfections in the calibration standards
  - connector interface
Reflection measurements generate the following three systematic errors:

- Directivity
- Source Match
- Frequency Response Reflection Tracking

Transmission measurements generate the following three systematic errors:

- Isolation
- Load Match
- Frequency Response Transmission Tracking

Notes about the following Systematic Error descriptions:

- The figures for the following six systematic errors show the relevant hardware configured for a forward measurement. For reverse measurements, internal switching in the analyzer makes Port 2 the source and Port 1 the receiver. 'A' becomes the transmitted receiver, 'B' becomes the reflected receiver, and 'R2' becomes the reference receiver. These six systematic errors, times two directions, results in 12 systematic errors for a two port device.

- For simplicity, it may be stated that ONE standard is used to determine each systematic error. In reality, ALL standards are used to determine ALL of the systematic errors.

- The following describes an SOLT calibration. This does not apply to TRL or other types of calibration.

Directivity Error

All network analyzers make reflection measurements using directional couplers or bridges.

With an ideal coupler, only the reflected signal from the DUT appears at the 'A' receiver. In reality, a small amount of incident signal leaks through the forward path of the coupler and into the 'A' receiver. This leakage path, and any other path that allows energy to arrive at the 'A' receiver without reflecting off the DUT, contributes to directivity error.
How the Analyzer Measures and Reduces Directivity Error.

1. During calibration, a load standard is connected to Port 1. We assume no reflections from the load.

2. The signal measured at the 'A' receiver results from the incident signal leakage through the coupler and other paths.

3. Directivity error is mathematically removed from subsequent reflection measurements.

Isolation Error

Ideally, only signal transmitted through the DUT is measured at the 'B' receiver.

In reality, a small amount of signal leaks into the 'B' receiver through various paths in the analyzer.

The signal leakage, also known as crosstalk, is isolation error which can be characterized and reduced by the analyzer.

How the Analyzer Measures and Reduces Isolation Error
1. During calibration, load standards are connected to both Port 1 and Port 2.

2. The signal measured at the 'B' receiver is leakage through various paths in the analyzer.

3. This isolation error is mathematically removed from subsequent transmission measurements.

**Source Match Error**

Ideally in reflection measurements, all of the signal that is reflected off of the DUT is measured at the 'A' receiver.

In reality, some of the signal reflects off the DUT, and multiple internal reflections occur between the analyzer and the DUT. These reflections combine with the incident signal and are measured at the 'A' receiver, but not at the 'R' receiver.

This measurement error is called source match error which can be characterized and reduced by the analyzer.

**How the Analyzer Measures and Reduces Source Match Error**

1. During calibration, all reflection standards are connected to Port 1. Known reflections from the standards are measured at the 'A' receiver.

2. Complex math is used to calculate source match error.

3. Source match error is mathematically removed from subsequent reflection and transmission measurements.

**Load Match Error**

Ideally in transmission measurements, an incident signal is transmitted through the DUT and is measured at the 'B' receiver.

In reality, some of the signal is reflected off of Port 2 and other components and is not measured at the
'B' receiver.

This measurement error is called load match error which can be characterized and reduced by the analyzer.

**How the Analyzer Measures and Reduces Load Match Error**

1. The Port 1 and Port 2 test connectors are mated together for a perfect zero-length thru connection. If this is not possible, a characterized thru adapter is inserted. This allows a known amount of incident signal at Port 2.

2. The signal measured at the 'A' receiver is reflection signal off of Port 2.

3. The resulting load match error is mathematically removed from subsequent transmission and reflection measurements.

**Frequency Response Reflection Tracking Error**

Reflection measurements are made by comparing signal at the 'A' receiver to signal at the 'R1' receiver. This is called a ratio measurement or "A over R1" (A/R1).

For ideal reflection measurements, the frequency response of the 'A' and 'R1' receivers would be identical.

In reality, they are not, causing a frequency response reflection tracking error. This is the vector sum of all test variations in which magnitude and phase change as a function of frequency. This includes variations contributed by:

- signal-separation devices
- test cables
- adapters
- variations between the reference and test signal paths
Frequency response reflection tracking error can be characterized and reduced by the analyzer.

How the Analyzer Measures and Reduces Frequency Response Reflection Tracking Error.

1. During calibration, all reflection standards are used to determine reflection tracking.
2. The average 'A' receiver response is compared with the 'R1' receiver response.
3. Complex math is used to calculate Frequency Response Reflection Tracking Error (see the following diagram). This frequency response reflection tracking error is mathematically removed from subsequent DUT measurements.

Note: In reflection response calibrations, only a single calibration standard is measured (open or short) and thus only its contribution to the error correction is used.

Frequency Response Transmission Tracking Error

Transmission measurements are made by comparing signal at the 'B' receiver to signal at the 'R1' receiver. This is called a ratio measurement or "B over R1" (B/R1).

For ideal transmission measurements, the frequency response of the 'B' and 'R1' receivers would be
identical.

In reality, they are not, causing a frequency response transmission tracking error. This is the vector sum of all test variations in which magnitude and phase change as a function of frequency. This includes variations contributed by:

- signal-separation devices
- test cables
- adapters
- variations between the reference and test signal paths

Frequency response transmission tracking error can be characterized and reduced by the analyzer.

**How the Analyzer Measures and Reduces Frequency Response Transmission Tracking Error.**

1. During calibration, the Port 1 and Port 2 test connectors are mated together for a perfect zero-length thru connection. If this is not possible, a characterized thru adapter is inserted. This allows a known amount of incident signal to reach Port 2.

2. Measurements are made at the 'B' and 'R1' receivers.

3. Complex math is used to calculate Frequency Response Transmission Tracking Error (see the following diagram). This frequency response transmission tracking error is mathematically removed from subsequent DUT measurements.
3-Port Error Terms

The following flow diagram displays the 3-port error term model:

where:

E = error term
DIR = Directivity
MAT = Forward Source Match and Reverse Load Match
TRK = Forward Reflection Tracking and Reverse Transmission Tracking

4-Port error terms
A full 4-port calibration requires the following terms:

**Reflection terms**

- **DIR**: Directivity
How can we measure only 3 THRU connections?

On a 4-port VNA, a full 4-port cal can be performed while measuring only 3 THRU connections. Measuring more than 3 THRU connections on a VNA with four native ports can give higher accuracy under some conditions.

By measuring all of the reflection terms, and 3 transmission THRU connections, there is adequate information available to calculate the remaining transmission terms. The following is a high level explanation of the concept. The actual calculations are much more complex.

To simplify, let's substitute letters (A,B,C,D) for port numbers from the diagram above so that they can be combined without confusion. Also for simplicity, let's assume that the source match and directivity errors are zero.

<table>
<thead>
<tr>
<th></th>
<th>A</th>

</tbody>
</table>

- The reflection errors are all measured (AA, BB, CC, DD).
- Let's assume we measure a THRU between ports AB, AC, AD. The reverse direction for these THRUs are also measured at the same time (BA, CA, DA).
- The terms left to calculate are BC, CB, BD, DB, CD, DC.

The following shows how the BC term is calculated from BA and AC:

\[
\frac{BA \times AC}{AA} = \frac{B \times A \times C}{AA} = BC
\]
Similarly:

- CB is calculated from CA and AB
- BD is calculated from BA and AD
- DB is calculated from AB and DA
- CD is calculated from CA and AD
- DC is calculated from DA and AC

**Monitoring Error Terms using Cal Set Viewer**

You can use **Cal Set Viewer** to monitor the measured data and the calculated error term. This will help to determine the health of your VNA and the accuracy of your measurements.

By printing or saving the error terms, you can periodically compare current error terms with previously recorded error terms that have been generated by the same VNA, measurement setup, and calibration kit. If previously generated values are not available, refer to Typical Error Term Data in Appendix A, "Error Terms", of the Service Guide.

- A stable system should generate repeatable error terms over about six months.
- A sudden shift in error terms over the same frequency range, power, and receiver settings, may indicate the need for troubleshooting system components. For information on troubleshooting error terms, see Appendix A, "Error Terms", of the Service Guide.
- A subtle, long-term shift in error terms often reflects drift or connector and cable wear. The cure is often as simple as cleaning and gauging connectors or inspecting cables.

**Viewing Cal Set Data**

- Existing measurement traces are unaffected by the Cal Set Viewer.
- The Cal Set data trace is presented in the highest unused channel number (usually 32) in the active window.
- The Cal Set data trace is labeled as S11 in the status bar regardless of the type of error term or standard.
- Only one Cal Set error term or standard data can be viewed at a time. However, a data trace can be stored into memory and then compared to other data traces.

*See the error terms equations.*
How to access Cal Set Viewer

Using Hardkey/SoftTab/Softkey

1. Press *Cal > Cal Sets & Cal Kits > Cal Set Viewer ON|OFF*

How to use Cal Set Viewer

1. Use the down arrow to select a Cal Set. Then click either:
   - **Error Terms** - calculated data.
   - **Standards** - the raw measurement data of the Standard. **ONLY** available with Unguided Cal (not ECal or Guided Cal).

2. Use the down arrow to select an error term or standard to view.

3. Select the **Enable** check box to view the data on the VNA screen.

**Port numbering convention** for error terms is the same as for S-Parameters:

**E Term (Receiver, Source)** with the following exceptions:

- Load Match (2,1) - The match of port 2 which is measured by making an S11 measurement.
- Load Match (1,2) - The match of port 1 which is measured by making an S22 measurement.
- Transmission Tracking (2,1) - The port 2 receiver relative to the port 1 reference. (source=port 1).
- Transmission Tracking (1,2) - The port 1 receiver relative to the port 2 reference. (source=port 2).
- And so forth for multiport calibrations.
Calibration accuracy is affected by the type of calibration, quality of the calibration standards, and the care with which the calibration is performed. This section provides additional information about how to make accurate calibrations.

**See other Calibration Topics**

### Measurement Reference Plane

Most measurement setups will NOT allow you to connect a device under test (DUT) directly to the analyzer front panel test ports. More likely, you would connect your device to test fixtures, adapters, or cables that are connected to the analyzer.

A calibration takes place at the points where calibration standards are connected during the calibration process. This is called the measurement reference plane (see graphic). For the highest measurement accuracy, make the calibration reference plane the place where your DUT is connected. When this occurs, the errors associated with the test setup (cables, test fixtures, and adapters used between the analyzer ports and the reference plane) are measured and removed in the calibration process.
Effects of Using Wrong Calibration Standards

Normally, a calibration is performed using a calibration kit that contains standards with connectors of the same type and sex as your DUT.

However, your calibration kit may not always have the same connector type and gender as your device. For example, suppose your device has 3.5mm connectors, but you have a Type-N calibration kit. If you use an adapter to connect the Type-N standards to the 3.5mm test port, then the adapter becomes part of the calibration and NOT part of the test setup. This will result in significant errors in your reflection measurements.

Data-based versus Polynomial Calibration Kits

The Select DUT Connectors and Cal Kits dialog box offers a data-based model and a polynomial model for the newest high-frequency cal kits. See Analyzer Accessories. The data-based models provide higher accuracy for describing calibration standards than the polynomial models. It is RECOMMENDED that the data-based model be used if the most accurate results are desired.

Learn about the “Expanded Math” feature.

**Effects of Power Level**

To attain the most accurate error correction, do NOT change the power level after a calibration is performed. However, when changing power within the same attenuator range at which the measurement calibration was performed, S-parameter measurements can be made with only a small degradation of accuracy. If a different attenuator range is selected, the accuracy of error correction is further degraded.

A best practice is to calibrate so that the receiver power is the desired power you want to calibrate at when you are making a measurement. For example, if you are testing an amplifier with 20 dB of gain, and a max input of -20 dBm, then calibrate at 0 dBm (it is the power that will hit the receiver when you are testing). After the calibration, lower the source power to measure your amplifier. In this way you will have less noise in the calibration. The noise degradation by calibrating at a lower power will completely swamp the small dynamic accuracy error. For most of the time, the uncertainty calculator assumes 10 Hz BW which does effectively eliminate the noise from the uncertainty computation, but it is rarely used in practice. And, note the R receiver is more linear (by design, it has extra padding in it) compared to the test receivers so the dynamic accuracy or linearity error is more substantial on the test receivers (B receiver for example). Therefore, calibrating at near its target power will reduce the dynamic error at the test receiver. The reference receiver has almost no error at all. In fact, it is so small it cannot be measured, so the uncertainty calculator uses the specification value which is, in fact, limited by our linearity test system and not the receiver. The Reference channel linearity is less than 0.015 dB from -120 dBm to about 0 dBm, but the specification is probably 3 times higher.

To check the accuracy of a calibration, see [Validity of a Calibration](#).

**Using Port Extensions**

Use the port extensions feature after calibration to compensate for phase shift of an extended measurement reference plane due to additions such as cables, adapters, or fixtures.

Port extensions is the simplest method to compensate for phase shift, mismatch, and loss of the path between the calibration reference plane and the DUT.

Learn how to apply port extensions.

Learn about [characterizing a test fixture](#).
Isolation Portion of 2-Port Calibration

The isolation portion of a calibration corrects for crosstalk, the signal leakage between test ports when no device is present. When performing an UNGUIDED 2-port calibration, you have the option of omitting the isolation portion of the calibration.

**Note:** Isolation can be performed on a Smart (Guided) Calibration ONLY

**Note:** Isolation is supported only when the receiver gain are set at LOW for both ports.

The uncorrected isolation between the test ports of the analyzer is exceptional (typically >100 dB). Therefore, you should only perform the Isolation portion of a 2-port calibration when you require isolation that is better than 100 dB. Perform an isolation calibration when you are testing a device with high insertion loss, such as some filter stopbands or a switch in the open position.

The isolation calibration can add noise to the error model when the measurement is very close to the noise floor of the analyzer. To improve measurement accuracy, set a narrow IF Bandwidth.

**How to perform an Isolation Calibration**

Isolation is measured when the Load standards are connected to the analyzer test ports. For best accuracy, connect Load standards to BOTH test ports each time you are prompted to connect a load standard. If two Loads are not available, connect the untested analyzer port to any device that will present a good match.

**Important Notes:**

1. For best results, the average factor should be increased while measuring the isolation standards. Doing an isolation without increasing averaging you are generally adding noise to the measurement rather than correcting for isolation. This PNA automatically increases the average factor by 8 during the isolation steps of a calibration to minimize the noise degradation that would otherwise be present.
2. The PNA crosstalk is generally below the noise floor which means if you do an isolation calibration is usually not required.
3. SmartCal did not add the ability to do an isolation calibration from the GUI because it is usually only needed in special cases. The isolation calibration can be done using the following commands:
   - `SENSe<ch>:CORRection:COLLect:GUIDed:ISOLation:AVERage:INCRement` or `IsolationAveragingIncrement`
   - `SENSe<ch>:CORRection:COLLect:GUIDed:ISOLation:PATHs` or `GetIsolationPaths` and `SetIsolationPaths`
4. Doing an isolation calibration is generally only useful when crosstalk is an issue-this may happen if the fixture added contributes significant crosstalk.

**Choosing a Thru Method**

When calibrating for a non-insertable device, you must choose a method to calibrate for the THRU
error terms. This can have a significant effect on measurement accuracy. Learn more about choosing a thru method.
Validity of a Calibration

This section helps you determine if your calibration is valid and how the analyzer displays correction level information for your measurement.

- Frequency Response of Calibration Standards
- Validating a Calibration
- Quick Check
- ECal Confidence Check
- Determining Effects of Not Terminating Unused ECal Ports
- Verification Kit

See other Calibration Topics

Frequency Response of Calibration Standards

In order for the response of a calibration standard to show as a dot on the smith chart display format, it must have no phase delay with respect to frequency. The only standards that exhibit such "perfect" response are the following:

- 7-mm short (with no offset)
- Type-N male short (with no offset)

There are two reasons why other types of calibration standards show phase delay after calibration:

1. The reference plane of the standard is electrically offset from the mating plane of the test port. Such devices exhibit the properties of a small length of transmission line, including a certain amount of phase shift.

2. The standard is an open termination, which by definition exhibits a certain amount of fringe capacitance and therefore phase shift. Open terminations which are offset from the mating plane will exhibit a phase shift due to the offset in addition to the phase shift caused by the fringe capacitance.

The most important point to remember is that all standards are measured in order to remove systematic errors from subsequent device measurements. As a result, if calibration standards with
delay and fringe capacitance are measured as a device after a calibration, they will NOT appear to be "perfect". This is an indication that your analyzer is calibrated accurately and working properly.

Validating a Calibration

At the completion of a calibration or selection of a stored Cal Set, validation can accomplish the following:

**Improve Measurement Accuracy** – Once a measurement calibration has been performed, its performance should be checked before making device measurements. There are several sources of error that can invalidate a calibration: bad cables, dirty or worn calibration standards that no longer behave like the modeled standards, and operator error.

**Verify Accuracy of Interpolation** – You should validate the calibration if you are testing a device and the measurements are uncertain because of interpolation. For more information see Interpolation Accuracy.

**Verify Accuracy of Cal Standards** – To check accuracy, a device with a known magnitude and phase response should be measured.

Quick Check

For this test, all you need are a few calibration standards. The device used should not be one of the calibration standards; a measurement of one of these standards is merely a measure of repeatability.

The following reflection and transmission Quick Check tests can be applied to all test ports.

**To verify reflection measurements, perform the following steps:**

1. Connect either an OPEN or SHORT standard to port 1. The magnitude of S11 should be close to 0 dB (within a few tenths of a dB).

2. Connect a load calibration standard to port 1. The magnitude of S11 should be less than the specified calibrated directivity of the analyzer (typically less than -30 dB).

**To verify transmission measurements:**

1. Connect a THRU cable (or known device representative of your measurement) from port 1 to port 2. Verify the loss characteristics are equivalent to the known performance of the cable or device.

2. To verify S21 isolation, connect two loads: one on port 1 and one on port 2. Measure the magnitude of S21 and verify that it is less than the specified isolation (typically less than -80 dB).
**Note:** To get a more accurate range of expected values for these measurements, consult the analyzer's specifications.

**ECal Confidence Check**

ECal Confidence Check is a method to check the accuracy of a calibration performed with mechanical standards or an ECal module. The confidence check allows you to measure an impedance state in the ECal module (called the confidence state), and compare it with factory measured data stored in the module.

In order for this test to be valid, the test ports of the ECal module must connect directly to the calibration reference plane (without adapters).

**Note:** In the N469x series of 2-port ECal modules, from the module minimum frequency up to approximately 2 GHz, the confidence state has a very high amount of transmission loss. In this frequency range, calibrated measurements of transmission S-parameters for the confidence state may vary much more than expected from the Keysight-characterized data in the measurement memory trace. When comparing the measurement trace and memory trace you, ignore the data for frequencies up to 2 GHz.

**How to Perform ECal Confidence Check:**

1. Connect ECal module to the analyzer with the USB cable. See Connect ECal Module to the VNA. **Note:** Terminate any unused ECAL ports with a 50 ohm load. See below.

2. Allow the module to warm up for 15 minutes or until the module indicates READY.

   **Note:** N755xA series ECal modules do not require a warm-up period.

3. Do one of the following to start ECal Confidence Check

   **Using Hardkey/SoftTab/Softkey**

   1. Press Cal > Cal Sets & Cal Kits > ECal > ECal Confidence Check...

On the following **ECal Confidence Check dialog box**:

2. Click **Read Module Data**. The following occurs:

   - ECal module is set to "confidence state".
Analyzer reads and displays stored data.
Analyzer measures and displays "confidence state".

3. To view a different parameter, select Change Measurement and select the check box for the desired parameter. The default is the active channel parameter.

4. Select the viewing option in the Trace View Options block.

5. Compare the stored and measured data for each measurement parameter.

Notes:

- After exiting ECal Confidence Check, the ECal module remains in the same impedance state and the factory (or user-characterized) data is still stored in the memory trace. Therefore, you can save both the data and memory trace as a *.csv files and import them to a spreadsheet. Learn how.

- If the two traces show excessive difference, there may be a loose or dirty connection at the test ports or damage to the test cables. Carefully inspect the cables and connections. Then clean and gage each connector, and re-calibrate if needed.

- The User Characterization setting selects the user-characterization data instead of the factory characterization data (available when a User-Characterization is stored in the ECal module).

Determining Effects of Not Terminating Unused ECal Ports

The following procedure can be used to determine the calibration errors when unused ECal ports are not terminated.

1. Connect the ECal module to one VNA test port through an adapter (eliminates the possibility of cable movement errors being included) and leave the unconnected port(s) open.

2. Perform a 1-port cal (use 100 Hz IFBW) then save the calset.

3. Connect a load(s) to the unconnected port(s) of the ECal module.

4. Perform a 1-port cal then save the calset.

5. Compare the calset in step 2 with the calset in step 4 using Calset Viewer to evaluate the effect of leaving the unused ECal ports open.

ECal Confidence Check dialog box help
Compares the accuracy of corrected (calibrated) data with stored data in the ECal module. For the check to be valid, the module test ports must connect directly to the calibration reference plane (without an adapter). Learn more about ECal Confidence Check.

**Measurement**

**Change Measurement** Opens the Measure dialog box.

**Use ECal Module**

**Read Module Data**

- Copies stored data from the ECal module to Memory.
- Changes state of ECal module to confidence state.
- Measures and displays confidence state and Memory trace.
- Displays the factory and user characterizations data stored in the ECal module. Learn more.

**Scale** Opens the Scale dialog box.

**Show Prompts** Check to show a reminder for the connection (default).

**Trace View Options**

**Data and Memory Trace** Displays current measurement data and Memory trace.

**Data / Memory** Performs an operation where the current measurement data is divided by the data in memory.
**Data + Memory** Performs an operation where the current measurement data is added to the data in memory.

---

**Verification Kit**

Measuring known devices, other than calibration standards, is a straightforward way of verifying that the network analyzer system is operating properly. Verification kits use accurately known verification standards with well-defined magnitude and phase response. These kits include precision airlines, mismatch airlines, and precision fixed attenuators. Traceable measurement data is shipped with each kit on disk and verification kits may be re-certified by Keysight.

See Analyzer Accessories for a list of Keysight verification kits.
About Calibration Kits

A calibration kit contains a set of physical devices called standards. Each standard has a precisely known or predictable magnitude and phase response as a function of frequency. All Keysight Cal Kits and their standard definitions are stored in the analyzer. For a list of Keysight calibration kits, see Analyzer Accessories.

Calibration Standards

Calibration standards provide the reference for error-corrected measurements in the network analyzer. Each standard has a precisely known definition that includes electrical delay, impedance, and loss. The analyzer stores these definitions and uses them to calculate error correction terms.

During measurement calibration, the analyzer measures standards and mathematically compares the results with the definitions ("ideal models") of those standards. The differences are separated into error terms that are later removed from device measurements during error correction. See Systematic Errors.

Standard Type

A standard type is one of four basic types that define the form or structure of the model to be used with that standard. The following are the four basic standard types:
Standard Terminal Impedance

<table>
<thead>
<tr>
<th>Standard</th>
<th>Terminal Impedance</th>
</tr>
</thead>
<tbody>
<tr>
<td>SHORT</td>
<td>zero ohms</td>
</tr>
<tr>
<td>OPEN</td>
<td>infinite ohms</td>
</tr>
<tr>
<td>LOAD</td>
<td>system impedance, Z0</td>
</tr>
<tr>
<td>THRU/LINE</td>
<td>no terminal impedance</td>
</tr>
</tbody>
</table>

Learn about other Calibration Standards:

- Data-Based Standard
- Sliding Load
- Offset Load
- Arbitrary Impedance Load

Standard Definitions

Standard definitions describe the electrical characteristics of the standards and the frequencies they will be used. Standard definitions can be viewed from the Advanced Modify Cal Kit menu selection. Standard definitions include:

- **Minimum Frequency**  Specifies the minimum frequency the standard is used for calibration.
- **Maximum Frequency**  Specifies the maximum frequency the standard is used for calibration.
- **Z0**  Specifies the characteristic impedance of the standard (not the system characteristic impedance or the terminal impedance of the standard).
- **Delay**  Specifies a uniform length of transmission line between the standard being defined and the actual calibration plane.
- **Type**  Specifies type of standard (SHORT, OPEN, THRU/LINE, LOAD, ARBITRARY).
- **Loss**  Specifies energy loss, due to skin effect, along a one-way length of coaxial cable.

Loss model equation:

- The value of loss is entered as ohms/second at 1 GHz.
- To compute the loss of the standard, measure the delay in seconds and the loss in dB at 1 GHz. Then use the following formula:
Capacitance model equation:

**C0, C1, C2, C3.** Specifies the fringing capacitance for the open standard.

- $C = (C0) + (C1 \times F) + (C2 \times F^2) + (C3 \times F^3)$
- $(F$ is the measurement frequency).

  The terms in the equation are defined when specifying the open as follows:
  - **C0** term is the constant term of the third-order polynomial and is expressed in Farads.
  - **C1** term is expressed in F/Hz (Farads/Hz).
  - **C2** term is expressed in F/Hz².
  - **C3** term is expressed in F/Hz³.

Inductance model equation:

**L0, L1, L2, L3.** Specifies the residual inductance for the short standard.

- $L = (L0) + (L1 \times F) + (L2 \times F^2) + (L3 \times F^3)$
- $(F$ is the measurement frequency).

  The terms in the equation are defined when specifying the short as follows:
  - **L0** term is the constant term of the third-order polynomial and is expressed in Henries.
  - **L1** term is expressed in H/Hz (Henries/Hz)
  - **L2** term is expressed in H/Hz².
  - **L3** term is expressed in H/Hz³.

Class Assignments

Once a standard is characterized, it must be assigned to a standard "class". A standard class is a group of standards that are organized according to the calibration of the network analyzer error model.

The number of classes needed for a particular calibration type is equal to the number of error terms being corrected.
A class often consists of a single standard, but may be composed of multiple standards. These may be required for accuracy or to cover a wide frequency range.

**Example:** A response calibration requires only one class, and the standards for that class may include an OPEN, or SHORT, or THRU. A 1-port calibration requires three classes. A 2-port calibration requires 10 classes, not including two for isolation.

The number of standards assigned to a given class may vary from one to seven for unguided calibrations. Guided calibrations allow as many standards as needed.

Calibration Classes are assigned in the Advanced Modify Cal Kit menu, SOLT or TRL tab.

### The different classes used in the analyzer

**S11A, S11B, S11C (S22A, S22B, S22C and so forth)**

These are the three classes for port 1-reflection calibrations (three classes also for S22 and S33). They are used in the one-port calibrations and the full two-port calibration. They are required in removing the directivity, source match, and reflection tracking errors. Typically, these classes might consist of an open, a short and a load standard for each port.

**Transmission and Match (forward and reverse)**

These classes are used to perform a full two-port calibration. The transmission class relates primarily to the transmission tracking, while the match class refers to load match. For both of these classes, the typical standard is a thru or delay.

**Isolation**

The isolation classes are used to perform a full two-port and the TRL two-port calibrations. The isolation classes apply to the forward and reverse crosstalk terms in the network analyzer error model.

**TRL THRU**

These are used to perform a TRL two-port calibration. The TRL thru class should contain a thru standard or a short line. If it contains a non-zero length thru standard, then the calibration type is called LRL or LRM.

**TRL REFLECT**

This class is used to perform a TRL two-port calibration. The TRL reflect class should contain a standard with a high reflection coefficient, typically an open or short. The actual reflection coefficient need not be known, but its phase angle should be specified approximately correctly (± 90 deg). The exact same reflection standard must be used on both ports in the TRL calibration process.

**TRL LINE or MATCH**
These are used to perform a TRL two-port calibration. The TRL line or match class should contain line standards, load standards, or both. If a line standard is used, its phase shift must differ from that of the TRL THRU standard by 20° to 160°. This limits the useable frequency range to about 8 to 1. Two or more line standards of different lengths may be specified to get broader frequency coverage. It is also common to include a load standard for covering low frequencies, where the line's length would be impractically long. When a load is used, the calibration type is called TRM or LRM.

**Note:** For more information, read *Specifying Calibration Standards and Kits for Keysight Vector Network Analyzers (Application Note 1287-11)*
Modify Calibration Kits

The following topics discuss Modifying Calibration Kits:

In this Topic

- How to Modify Cal Kits
- Manage Cal Kits dialog
- Cal Kits and Firmware Upgrades
- Import Kit dialog

Using VNA CalKit Editor

- Connectors Tab
- Standards Tab
- SOLT Tab
- TRL Tab

Concepts

- Why Modify a Cal Kit
- VNA Cal Kit File Types

Procedures

- How to Create a New Cal Kit from an Existing Cal Kit
- Creating Custom Calibration Kits using a New Connector Family
- Noise Figure and TRL Cal (separate topic)
How to Modify Cal Kits

The series of dialog boxes that follow allow you to modify the standard definitions or class assignments of calibration kit files.

**Using Hardkey/SoftTab/Softkey**

1. Press Cal > Cal Sets & Cal Kits > Cal Kit...

**Using a mouse**

1. Click Response
2. Select Cal
3. Select Cal Sets & Cal Kits
4. Select Cal Kit...

Manage Cal Kits

The Manage Cal Kits dialog allows you to define the cal kits in the active workspace. These cal kits may be edited, created, or saved to a cal kit file.
Cal Kits and Firmware Upgrades

- If the firmware upgrade includes factory cal kits that are formatted differently than the factory cal kit files in the instrument, then:
  
  - The factory cal kit files will be overwritten.
  - The custom cal kit files will not be changed.
  - A backup of the active workspace will be saved.
  - A new active workspace will be created and will contain only the new factory cal kit definitions.
  - Under these conditions, if you want to use your custom cal kit definitions, you will need to import these files into the active workspace. Learn how to import cal kit files.

Uncertainty Cal Kits (Only for PNA)

Uncertainty Cal Kits... Opens the Uncertainty Cal Kit Manager (Option S93015A/B enabled). Learn more about Dynamic Uncertainty.

Standard Cal Kits

This group box lists all cal kits in the active workspace.

Edit... Starts the Connectors tab of the Edit Kit dialog box to modify selected calibration kit definitions.

Import... Starts the Import Kit dialog box to add a cal kit definition from a file into the active workspace.

Save... Saves the selected calibration kit definition into a cal kit file (using .xkt, .ckt, or .prn file type). See VNA Cal Kit File Types.

Insert... Starts a blank Edit Kit dialog box to create a new calibration kit.

Delete Deletes selected calibration kit from the active workspace.

Print... Prints the contents of the selected cal kit to a .prn file.

Cal Kit Workspace

The active cal kit workspace is a collection of standard cal kits that are accessible by the VNA for calibrations.
Save Workspace... Saves the active workspace to a workspace file (*.xkw or *.wks).

Recall Workspace... Recalls a workspace file into the active workspace.

Restore Defaults Restores the active workspace and the factory cal kit files (*.xkt) to their factory default definitions.

For more information see Creating Custom Calibration Kits using a New Connector Family.

**Import Cal Kit dialog box help**

**Open**

![Image of Import Cal Kit dialog box]

**Files of type** Select the file type of your Cal Kit. Learn more about VNA Cal Kit File Types

**File name** Navigate and select your cal kit file name.

**Open** Loads the selected file into the active cal kit workspace.

**Note:** There is no limit to the number of cal kits that can be imported. However, during an Unguided cal, you can access ONLY mechanical cal kits #1 through 95.

Imports a cal kit file into the active cal kit workspace.

**Importing Cal Kits from "legacy" network analyzers**

Cal kit files from "legacy" network analyzers (such as the 8510 or 8753) may not contain
information that this VNA requires. Therefore, this VNA may modify the cal kit name, description, standards, and class assignments. You may need to correct these modifications after importing your legacy cal kit to meet your specific requirements.

- "Legacy" cal kit files are referenced to the VNA test port gender while modern cal kit files are referenced to the Device Under Test (DUT) connector gender. Therefore, when a legacy cal kit is imported, the genders of the standards in the legacy cal kit will be automatically reversed in the new cal kit.

- Legacy cal kits do not contain connector definitions. If a coaxial legacy kit is imported, then male and female coax connector definitions will be added to the kit. If a waveguide legacy kit is imported, then a genderless waveguide connector definition will be added to the kit.
For most applications, the default calibration kit models provide sufficient accuracy for your calibration. However, several situations may exist that would require you to create a custom calibration kit:

- Using a connector interface different from those used in the predefined calibration kit models.
- Using standards (or combinations of standards) that are different from the predefined calibration kits. For example, using three offset SHORTs instead of an OPEN, SHORT, and LOAD to perform a 1-port calibration.
- Improving the accuracy of the models for predefined kits. When the model describes the actual performance of the standard, the calibration is more accurate. For example: A 7 mm LOAD is determined to be 50.4 \( \Omega \) instead of 50.0 \( \Omega \).
- Modifying the THRU definition when performing a calibration for a non-insertable device.
- Performing a TRL calibration.
Creating a New Connector Family

To create a custom calibration kit that uses a new connector type, you must first define the connector family. The connector family is the name of the connector-type of the calibration kit, such as:

- APC7
- 2.4 mm
- Type-N (50Ω)

Although more than one connector family is allowed, it is best to limit each calibration kit to only one connector family. One exception to this is if specific thru's are required on a per-port-pair basis (see the following note).

**Note:** One way to accomplish assigning specific thru’s to specific port pairs is to define connectors on a per-port basis. For example, if it is desired for THRU1 to be used between Ports 1 and 2, and THRU2 to be used, then you can set up connectors “2.4mm Port1”, “2.4mm Port2”, “2.4mm Port3”. And then in the standards definition, create THRU1 standard with connectors “2.4mm Port1” and “2.4mm Port2” and THRU2 standard with “2.4mm Port2” and “2.4mm Port3”.

If you are using a connector family that has male and female connectors, include definitions of both genders. If you are using a family with no gender, such as APC7, only one connector definition is required.

Use the following steps to create a custom calibration kit:

1. Press **Cal > Cal Sets & Cal Kits > Cal Kit....**
2. Click **Edit....**
3. In the **Connectors Tab**, click **Add** to name the new connector family.
4. Enter the Kit Description for the custom cal kit.
5. Click **Add** in the Connectors section of the dialog box.
6. Enter a Connector Family name.
7. Enter a Description of the connector.
8. Select the Gender of one of the connectors.
9. Enter the minimum and maximum Frequency Range.
10. Enter the Impedance.
11. Click the down-arrow to select the Media.
12. Enter the cut-off frequency
13. Click **Apply**.
14. Click **OK**.
15. If you need to add another connector gender, in the **Connectors Tab**, click **Add** in the Connectors section again for the next connector gender.
16. If you are adding another connector gender, repeat step 3.

**Note**: If you have male and female versions of the connector family, you probably do NOT also have a NO GENDER version.

### Enter Standards

Now that the connector family is added to the custom cal kit, you are ready to add new calibration standards.

1. In the **Standards Tab**, under the list of standards, click **Add**.
2. Select the type of standard (OPEN, SHORT, LOAD, or THRU), then click **OK**.
3. Complete the information in the dialog box for the standard you selected. Note that for banded standards, the start and stop frequency may be different than the frequency range of the specified connector. Edit the start and stop frequencies as needed. Click **OK** when all the settings are correct.
4. Repeat steps 2 - 3, as necessary, to add all standards and definitions to the new custom cal kit.
5. Assign each of the standards to a calibration class. This is done through the **TRL Tab** or **SOLT Tab**
6. Save the Cal Kit.
How to Create a New Cal Kit from an Existing Cal Kit

You can create a new custom Cal Kit using an existing Cal Kit as a starting point.

Here is how:

1. Press Cal > Cal Sets & Cal Kits > Cal Kit....
2. Immediately click Save... and change the file name. Select either *.*kt or *.ckt, *.prn file type. Learn more about these file types.
3. Make modifications to your new custom Cal Kit as required.
4. Routinely save your work by clicking Save.

About VNA Cal Kits and Firmware Upgrades
VNA Cal Kit File Types

The VNA Cal Kit editor can open the following types of Cal Kit files:

<table>
<thead>
<tr>
<th>VNA Families</th>
<th>File Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cal Kits supported by current firmware of these VNA models: PNA Series, E5080A/B, FieldFox, and PXI Series</td>
<td>* .xkt</td>
</tr>
<tr>
<td>Old PNA Series Cal Kits (PNA Firmware A.07.50 to A.09.90)</td>
<td>* .ckt</td>
</tr>
<tr>
<td>Old PNA Series Cal Kit (before A.07.50)</td>
<td>* .ck1</td>
</tr>
<tr>
<td>Previous FieldFox format Cal Kits</td>
<td>* .xml</td>
</tr>
<tr>
<td>Previous ENA format Cal Kits</td>
<td>* .ckx</td>
</tr>
<tr>
<td>8510 Cal Kit</td>
<td>.CK_ *</td>
</tr>
<tr>
<td>8753, 8752, 8719, 8720, or 8722 Cal Kit</td>
<td>* .ck</td>
</tr>
</tbody>
</table>

The current revision of Cal Kit files can be downloaded at
http://na.support.keysight.com/pna/caldefs/stddefs.html

File Save (As)

The VNA Cal Kit Editor can save Cal Kits in one of three file formats:

- * .xkt - Newer format that is based on xml and is shared among VNA families.
- * .ckt - VNA binary format, provided for backwards compatibility with older VNA firmware revisions and may not support future new cal kit capabilities, which is expected of the * .xkt format.
- * .prn - Cal kit print files. This is a text file format which can be read into spreadsheets, but the Cal Kit Editor does not read-in these files. These files are only produced as a form of documentation.

About Opening Legacy VNA Kits

Cal kit files from Keysight "legacy" network analyzers (listed above) may not contain information that the VNA requires. When loaded into the VNA Cal Kit Editor, the cal kit name and description, the cal standards, and the cal class assignments will be modified in a best effort manner. You may need to correct these modifications after importing your legacy cal kit to meet your specific requirements.

- "Legacy" cal kit files are based on the analyzer test port sex. Modern VNA cal kits are based on the Device
Under Test (DUT) connector sex. Therefore, when the kit is imported the standard's label and description are reversed and are noted as F- (female) and M- (male).

- When a Coaxial standard is detected in the kit file, a pair of male/female connectors is typically created.
- Waveguide standards that are created as connector have no gender.

**File Association**

With the exception of *.xml, the above file types are automatically associated with the CalKit Editor if they are not already associated with a different program. That means, after running CalKit Editor, double-clicking any of the above file types (except *.xml) will open the file using CalKit Editor.

If you have already associated one of these file types with a different program and would like to change it to CalKit Editor, do the following:

1. Right-click the file, then click **Open With**
2. Browse to the CalKitEditor install folder.
   - C:\Program Files (x86)\Agilent\VNA Cal Kit Editor
3. Check **Always use the selected program to open this kind of file.**
4. Select **CalKit Editor.**
**Connectors Tab**

- **Cal Kit Name**  Allows you to change the Name of the selected calibration kit.
- **Cal Kit Description**  Allows you to change the description of the selected calibration kit.

**Connector Family**  Click the down arrow to select the connector family associated with the Cal Kit.

**Add**  Starts the Add Connector dialog box which allows you to add new connector type to the calibration kit.

**Delete**  Deletes - WITHOUT WARNING - the selected connector family.

**Note:** To modify a connector family or name, Add a new connector, then delete the old connector.

The following is the list of Factory-defined connector type strings:
<table>
<thead>
<tr>
<th>Connector Family</th>

</tbody>
</table>

**Frequency Range**

**Min** Allows you to define the lowest frequency at which the standard is used for calibration.

**Max** Allows you to define the highest frequency at which the standard is used for calibration.

**Gender**

**Gendered** - The connector family contains both Male and Female connectors.

**Genderless** - The connector family does NOT contain Male and Female connectors. APC7 connectors are an example of this connector type.

**Impedance**

Specify the impedance of the standard.

**Media**

The medium (or 'geometry') of the connector (COAX or WAVEGUIDE).

**Cutoff Frequency** If Media is Waveguide, type the low-end cutoff frequency.

**Height/Width Ratio** Used to calculate waveguide loss. This value is usually on the data sheet for waveguide devices.

**About Waveguide Cal Kits**

If modifying or creating a waveguide cal kit, be sure to make the following settings. You can create a
custom waveguide cal kit using an existing factory waveguide Cal kit as a starting point. The factory cal kits already have these settings.

- Frequency Range: **Min. frequency = Cutoff frequency.**
- Gender: **No Gender**
- Impedance Z0: **1 ohm**
- Media: **Waveguide**

For waveguide, choose TRL (Thru-Reflect-Line) calibration type. These calibration types are more accurate and take fewer steps than SOLT.

**Add Connector Family**

Enter a name for the new connector family. Then click **OK**.

---

**Available at the bottom of every tab**

- **Save As** - Allows you to save the cal kit to a new file name and type.
- **Save** - Saves the cal kit to the same file name and type.
- **Close** - Closes the cal kit editing session. The file is NOT saved automatically.
Standards Tab

Allows you to Add, Edit or Delete cal standards in a cal kit.

**Add Standard (Open, Short, Load, Thru, or Data-based)**

Allows you to add standards to the calibration kit file.

Choose from:

- OPEN
- SHORT
- LOAD
- THRU
- DATA-BASED
- ISOLATION
Standards dialog box help

The following fields apply to ALL standard types:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Standard ID</td>
<td>Number in list of standards</td>
</tr>
<tr>
<td>Label</td>
<td>Type of standard. This usually appears in prompts for standards.</td>
</tr>
<tr>
<td>Description</td>
<td>Description of standard.</td>
</tr>
</tbody>
</table>

The other areas of the dialog change depending on the type of standard selected.

Identification

- **Standard ID** Number in list of standards
- **Label** Type of standard. This usually appears in prompts for standards.
- **Description** Description of standard.

The following fields apply to ALL standard types EXCEPT the Isolation type:

Connector

Indicates the type and gender (Male, Female, None) of the standard.

Thru and Isolation standards have two connectors.

Data-Based standards MAY have two connectors.

Frequency Range

- **Min** Defines the lowest frequency at which the standard is used for calibration.
- **Max** Defines the highest frequency at which the standard is used for calibration.
The Delay Characteristics fields apply to MOST standard types:

**Delay Characteristics**

**Delay** Defines the one-way travel time from the calibration plane to the standard in seconds.

**Z0** Defines the impedance of the standard.

**Loss** Defines energy loss in Ohms, due to skin effect, along a one-way length of coaxial cable.

---

**Other fields are unique to standard type**

Choose from:

- OPEN
- SHORT
- LOAD
- THRU
- DATA-BASED
- ISOLATION

---

**Open Standard**

**C0, C1, C2, C3** Specifies the fringing capacitance.

These are the unique fields of the dialog. See the areas that are common to all standards.
Short Standard

L0, L1, L2, L3  Specifies the residual inductance.

Load Standard

Choose from the following

Fixed Load  Specifies the load type as Fixed. The fixed load is assumed to be a perfect termination without reflection.

Sliding Load

A sliding load is defined by making multiple measurements of the device with the sliding load element positioned at various marked positions of a long transmission line. The transmission line is assumed to have zero reflections and the load element has a finite reflection that can be mathematically removed using a least squares circle fitting method.

A sliding load cal can be very accurate when performed perfectly. It can also be very inaccurate when not using proper technique. For accurate results, closely follow the users manual instructions for the sliding load.

Arbitrary Impedance
Specifies the load type that has an impedance value different from system Z0. An arbitrary impedance device is similar to a fixed load except that the load impedance is NOT perfect. Early firmware releases of the VNA series used a fixed resistance value. A complex terminating impedance has been added to allow for more accurate modeling of circuit board or on-wafer devices.

The following Complex Impedance settings are available ONLY when Arbitrary Impedance is selected.

- **Real**  The real portion of the impedance value.
- **Imaginary**  The imaginary portion of the impedance value.

**Offset Load**

![Offset Load Parameters](image)

Using an Offset Load standard results in a more accurate calibration than with a Broadband Load. Therefore, when performing a calibration using one of the modified Cal Kit definitions, you may be prompted to connect more standards than before this change. To revert to using the Broadband Load Standard without offset, do the following:

1. Press **Cal > Cal Sets & Cal Kits > Cal Kit...**
2. At the **Manage Cal Kit** dialog box, click **Edit...**
3. Select the **SOLT** tab.
4. Under the Calibration Kit Classes, select **SC (Loads)**
5. Under Selected Standards, select **Broadband Load**, then click **Move Up** until the standard is at the top of the list. This will ensure that the Broadband Load is used first.

**About Offset Load**

An offset load is a compound standard consisting of a load element and two known offset elements (transmission lines) of different length. The shorter offset element can be a zero-length (Flush-thru) offset. The load element is defined as a 1-port reflection standard. An offset load standard is used
when the response of the offset elements are more precisely known than the response of the load element. This is the case with waveguide. Measurement of an offset load standard consists of two measurements, one with each of the two offset elements terminated by the load element. The frequency range of the offset load standard should be set so that there will be at least a 20 degree separation between the expected response of each measurement.

To specify more than two offset elements, define multiple offset load standards. In cases where more than two offsets are used, the frequency range may be extended as the internal algorithm at each frequency will search through all of the possible combinations of offsets to find the pair with the widest expected separation to use in determining the actual response of the load element.

The following Offset Load settings are available ONLY when Offset Load is selected.

- First Offset Standard
- Second Offset Standard
- Load Standard

---

**Thru Standard**

**Connectors** - Defines connector type at both ends of the Thru standard.

**Virtual Device**

Most cal kits have only one Thru standard definition for SOLT calibrations. For these cases, use the default selections (checked for zero-length Thrus and cleared for non-zero-length Thrus).
This checkbox is used to make forward and reverse measurements of your Thru standard for the same pair of ports in two separate steps. This is NOT common for zero-length (Flush) Thru standards.

When checked, calibration prompts involving that Thru will omit the Description. For example “Connect port 1 to port 2”. This is the common prompt for Flush-Thru standards.

When cleared, calibration prompts for that Thru will include the Description. For example “Connect <standard description> between ports 1 and 2”.

To make forward and reverse measurements of your Thru standard for the same pair of ports as two separate steps, do the following:

1. Create separate definitions of the Thru standard(s) using the same settings, except for the Label and Description. Clear this checkbox for BOTH definitions.

2. For one Thru definition, in the label and description include the word ‘FORWARD’ to prompt the operator to use this standard for the forward measurement. Assign this standard to the SOLT “FWD TRANS” and “FWD MATCH” classes of the cal kit.

3. For the Thru definition, in the label and description include the word ‘REVERSE’ to prompt the operator to use this standard for the reverse measurement. Assign this standard to the SOLT “REV TRANS” and “REV MATCH” classes of the cal kit.

4. When you perform SOLT calibrations using this cal kit, the forward measurements of the Thru will be measured in one connection step, and the reverse measurements in another.

Data-Based Standard

---

![Data-Based Standard](image)
Learn about the relative accuracy of Databased versus Polynomial Cal Kits.

The modified file can then be uploaded into the VNA.

**Upload Data From File**

Click **Load Data File**, then navigate to the *.dat or *.dsd file which is provided with the data-based Cal Kit. Both Response data and Accuracy (Uncertainty) data is provided in a single *.dat or *.dsd file.

**For Advanced Users**

Response data can be loaded from a *.s2p or *.cti file.

Accuracy data can be loaded from a *.cti file. Starting with Option S93015A/B, you can also load data from a *.dsd (S-parameter Data Standard Definition) file. The *.dsd file contains both Response data and Accuracy (Uncertainty) data where the accuracy data is in covariant form. Learn more about Dynamic Uncertainty.

**Virtual Device**

This checkbox is displayed for a Data-Based cal standard when the standard has been defined to have 2 ports.

- When Cleared (default) calibration prompts for that standard will include its Description. For example “Connect <standard description> between ports 1 and 2”.

- When Checked, calibration prompts for that standard will NOT include its Description, so the prompt will be worded as if the data-based standard is a zero-length Thru connection. For example “Connect port 1 to port 2”.

**Isolation Standard**
The pair of loads are considered one standard.

Both loads are connected to the VNA and measured with the same prompt.

---

**Available at the bottom of every tab**

**Save As** - Allows you to save the cal kit to a new file name and type.

**Save** - Saves the cal kit to the same file name and type.

**Close** - Closes the cal kit editing session. The file is NOT saved automatically.
Note: This dialog looks similar to the dialog that appears after the Cal Wizard View / Modify dialog. However, setting changes in that dialog affect ONLY the calibration that is in progress. These settings, accessed through Modify Cal Kit, changes the cal kit for all future calibrations that use this cal kit.

Allows you to assign single or multiple standards to SOLT Calibration Classes.

Click the TRL tab to assign standards to TRL Calibration Classes.

1. For each Cal Kit Class, select Available Standards from the left list, then click >> to copy the standard to the Cal Kit.

2. Use MOVE UP and MOVE DOWN to change the ORDER of the standards. The order is used in guided calibrations to determine which standards in that class will be used in calibrations that involve the frequency ranges over which the standards are defined. Guided cals will include standards in the order in which they appear in this class list, and in the case where standards in the class list have frequency ranges that overlap,
the order also determines which standard is used for frequencies in the overlap range. For example, let’s assume that you define a broadband Short from Min Freq. = 0 Hz and Max Freq. = 999 GHz, and that standard is listed first in the SB or TRL REFLECT class. If you then list a frequency-banded Short with the same connector below the broadband short in those same classes, then guided calibrations would not use the frequency-banded Shorts because the broadband Shorts would always be given priority.

SOLT <cal class> Label

The cal standard category label that appears in the VNA’s user interface during unguided SOLT calibrations.

Calibration Kit Classes

For each calibration class, select Available Standards, then click >> to move to the Selected Standards list.

- **SA** - OPEN Standards (standards in the SA class are not always Opens)
- **SB** - SHORT Standards
- **SC** - LOAD Standards
- **FWD / REV Trans and Match** - THRU Standards. Most Cal Kits do NOT include a physical THRU standard, but assume that an Insertable Thru will be used.
- **UNKNOWN THRU** - Unknown Thru Cal is the preferred THRU method of calibrating the analyzer to measure a non-insertable device. The Unknown Thru calibration is also known as Short-Open-Load-Reciprocal Thru (SOLR) calibration. Learn more.
- **ISOLATION** - Isolation standard. For VNA analyzers, ISOLATION calibration is not usually recommended. It could be beneficial in some situations where custom user-supplied test set hardware is being used.

Link FWD TRANS, FWD MATCH, REV TRANS, and REV MATCH Check to automatically assign the standard definition for FWD TRANS to FWD MATCH, REV MATCH, and REV TRANS. Clear to separately assign FWD MATCH, REV MATCH and REV TRANS classes (SOLT calibrations only).

Expanded Calibration

The following two check boxes apply ONLY during Guided Calibrations. For Unguided Calibration, these check boxes are ignored, including the case where the multiple standards dialog box is presented.

Measure all mateable standards in class Check this box to attain the very highest accuracy possible. For example, if a cal kit contains several load standards, during the calibration process you
will be prompted to measure each of the standards. This could require a significant amount of calibration time. When checked, the "Use expanded math when possible" box is also checked automatically.

**Use expanded math when possible** Some kits contain multiple calibration standards of the same type that together cover a very wide frequency range. (For example: multiple shorts, or a lowband load and a sliding load.) If a calibration requires more than one standard to cover the calibration frequency range, there can be regions of overlapping measurements. When this checkbox is selected, the VNA automatically computes the most accurate measurement in the overlap regions using a "weighted least squares fit" algorithm. This function improves accuracy without slowing the calibration speed.

- Manually select this checkbox only when using a cal kit that contains multiple standards of the same type. (For example: multiple shorts, or a lowband load and a sliding load.)
- The checkbox is cleared by default when a polynomial model is selected from the cal kit menu.
- The checkbox is selected by default when the 85058B or 85058E data-based model is selected from the cal kit menu.

---

**Available at the bottom of every tab**

**Save As** - Allows you to save the cal kit to a new file name and type.

**Save** - Saves the cal kit to the same file name and type.

**Close** - Closes the cal kit editing session. The file is NOT saved automatically.
Allows you to assign single or multiple standards to Calibration Classes.

1. For each Cal Kit Class, select **Available Standards** from the left list, then click >> to copy the standard to the Cal Kit.

2. Use **MOVE UP** and **MOVE DOWN** to change the **ORDER** of the standards. The order is used in guided calibrations to determine which standards in that class will be used in calibrations that involve the frequency ranges over which the standards are defined. Guided cals will include standards in the order in which they appear in this class list, and in the case where standards in the class list have frequency ranges that overlap, the order also determines which standard is used for frequencies in the overlap range. For example, let's assume that you define a broadband Short from Min Freq. = 0 Hz and Max Freq. = 999 GHz, and that standard is listed first in the SB or TRL REFLECT class. If you then list a frequency-banded Short with the same connector below the broadband short in those same classes, then guided calibrations would not use the frequency-banded Shorts because the broadband Shorts would always be given priority.

**Note:** The TRL LINE/MATCH class has a slight exception to these prioritization behaviors. In
general, Line standards are given a higher priority than Match standards. So if a Line standard and a Match standard are defined to have the same frequency range and the Match standard is listed above the Line standard in the class order, a guided TRL cal will still prefer to use the Line standard rather than the Match standard.

**TRL <cal class> Label**

The cal standard category label that appears in the VNA’s user interface during unguided TRL calibrations.

**Cal Kit Classes**

- For VNA analyzers, ISOLATION calibration is not usually recommended. It could be beneficial in some situations where custom user-supplied test set hardware is being used.

**TRL THRU**

**Note:** All **THRU calibration methods** are supported in a TRL Cal **EXCEPT** Unknown Thru.

- The THRU standard can be either a zero-length or non-zero length. However, a zero-length THRU is more accurate because it has zero loss and no reflections, by definition.

- The THRU standard cannot be the same electrical length as the LINE standard.

- If the insertion phase and electrical length are well-defined, the THRU standard may be used to set the reference plane.

- The THRU standard and LINE standard have the same characteristic impedance and are perfectly matched. They define the reference impedance of the calibration.

- If a THRU standard with the correct connectors is NOT available, an adapter removal cal can be performed.

**TRL REFLECT**

- The REFLECT standard can be anything with a high reflection, as long as it is the same when connected to one or more VNA ports.

- The REFLECT standard on each port is identical.

- The actual magnitude of the reflection need not be known.

- The phase of the reflection standard must be known within 1/4 wavelength.

- If the magnitude and phase of the reflection standard are well-defined, the standard may be used to set the
The LINE and THRU standards establish the reference impedance for the measurement after the calibration is completed. TRL calibration is limited by the following restrictions of the LINE standard:

- Must be of the same impedance and propagation constant as the THRU standard.
- The electrical length need only be specified within 1/4 wavelength.
- Cannot be the same length as the THRU standard.
- A TRL cal with broad frequency coverage requires multiple LINE standards. For example, a span from 2 GHz to 26 GHz requires two line standards.
- Must be an appropriate electrical length for the frequency range: at each frequency, the phase difference between the THRU and the LINE should be greater than 20 degrees and less than 160 degrees. This means in practice that a single LINE standard is only usable over an 8:1 frequency range (Frequency Span / Start Frequency). Therefore, for broad frequency coverage, multiple lines are required.
- At low frequencies, the LINE standard can become too long for practical use. The optimal length of the LINE standard is 1/4 wavelength at the geometric mean of the frequency span (square root of \( f_1 \times f_2 \)).

**Note:** The TRL LINE standard must have a delay that is greater than 0 (zero) ps. Otherwise, calibration correction calculations will contain unpredictable results.

If the LINE standard of appropriate length or loss cannot be fabricated, a MATCH standard may be used instead of the LINE.

- The MATCH standard is a low-reflection termination connected to both Port 1 and Port 2.
- The MATCH standard may be defined as an infinite length transmission line OR as a 1-port low reflect termination, such as a load.
- When defined as an infinite length transmission line, both test ports must be terminated by a MATCH standard at the same time. When defined as a 1-port load standard, the loads are measured separately. The loads are assumed to have the same characteristics.
- The impedance of the MATCH standard becomes the reference impedance for the measurement. For best results, use the same load on both ports. The load may be defined using the data-based definition, the arbitrary impedance definition, or the fixed load definition.
**System Z0**  The system impedance is used as the reference impedance. Choose when the desired test port impedance differs from the impedance of the LINE standard. Also, choose when skin effect impedance correction is desired for coax lines.

**Line Z0**  The impedance of the line standard is used as the reference impedance, or center of the Smith Chart. Any reflection from the line standard is assumed to be part of the directivity error.

**Multiline TRL**

For information about setting up and using a calibration kit definition that will cause the VNA to do a Multiline TRL, refer to the Multiline TRL Calibration topic.

**Testport Reference Plane (TRL only)**

**Thru Standard**  The THRU standard definition is used to establish the measurement reference plane. Select if the THRU standard is zero-length or very short.

**Reflect Standard**  The REFLECT standard definition is used to establish the position of the measurement reference plane. Select if the THRU standard is not appropriate AND the delay of the REFLECT standard is well defined.

Also, select If a flush short is used for the REFLECT standard because a flush short provides a more accurate phase reference than a Thru standard.

**LRL line auto characterization**

**Note:** This setting ONLY applies if an LRL Cal Kit is being modified AND Testport Reference Plane is set to Thru Standard AND the TRL Thru class standard and the TRL Line/Match class standard both have the same values for Offset Z0 and Loss. Otherwise, this setting is ignored.

- Check the box to allow the VNA to automatically correct for line loss and dispersion characteristics.
- Clear the box if anomalies appear during a calibrated measurement which may indicate different loss and impedance values for the Line standards.

**Available at the bottom of every tab**

**Save As**  - Allows you to save the cal kit to a new file name and type.

**Save**  - Saves the cal kit to the same file name and type.

**Close**  - Closes the cal kit editing session. The file is NOT saved automatically.
Multiline TRL Calibration

This topic describes the Keysight vector network analyzers (VNA) implementation of the NIST Multiline Thru Reflect Line (TRL) calibration algorithm. The Keysight implementation also supports a Multiline Thru Short Delay (TSD) calibration algorithm. This topic describes how to set up and use a calibration kit definition that will cause the VNA to do a Multiline TRL. It also discusses the various options that can be specified and how they interact with the standards as defined in Keysight calibration kits.

In this topic:

- Multiline TRL
- TRL Kit Classes
  - TRL THRU
  - TRL LINE/MATCH
  - TRL REFLECT
- Calibration Standards
  - Relationship Between Delay and Physical Length
- Calibration Reference Z0
  - Line Z0
  - System Z0
- Testport Reference Plane
  - Legacy TRL
  - Multiline TRL
- Multiline TRL Diagnostic Traces
- Procedure to Define the Calibration Kit
- References

Multiline TRL

The Multiline TRL algorithm is based on the NIST Multiline TRL calibration algorithm called MultiCal[1][2]. It provides an over-determined solution when multiple LINE standards are used. The TRL algorithm (Legacy TRL) that existed prior to Multiline TRL being added is still available for use. If the Multiline TRL check box is selected, then the Multiline TRL algorithm will be used when the defined calibration kit is used for TRL calibration. The Legacy TRL algorithm allowed multiple LINE standards to be used, but for any given frequency only one LINE standard is used with the THRU and REFLECT standards.
The dialog shown below is the TRL tab that comes up when editing the class definitions of the calibration kit. Its purpose is to define which standards are to be used during the TRL calibration. Both Legacy TRL or Multiline TRL automatically use a Thru Reflect Match (TRM) calibration when the frequency is below the lowest start frequency of the LINE standards defined in the calibration kit if there are MATCH standards defined. The Multiline TSD algorithm differs from the Multiline TRL in how the algorithm uses the SHORT/REFLECT standard. The SHORT is assumed to be fully known and only connected to one port while the REFLECT only needs to be partially known but has to be connected to both ports; the LINE and DELAY standards are equivalent.

**TRL Kit Classes**

For TRL there are four categories of standards called Calibration Kit Classes. They are TRL THRU, TRL LINE/MATCH, TRL REFLECT and ISOLATION. The ISOLATION kit class is optional.

**TRL THRU**

---

808
The TRL THRU kit class should be set up so that only a single standard is defined for a given set of port connectors.

**Note:** Generally this means that for Multiline TRL calibrations there will only be one standard defined in the TRL THRU kit class that is intended to be used over the entire frequency range. Sometimes users define calibration kits to cover multiple different port pairs; for example, if a calibration kit is created to support an on-wafer TRL calibration the user might define different ports that correspond to the topology of the set of probes that are used to touch down on the standards. The kit may have multiple pairs of ports. Giving each port a unique name allows the user to restrict which port pairs can be automatically set up to do a TRL calibration. In this case, you would have multiple THRU standards in the TRL THRU kit class. But only one of them would be used for a given TRL calibration between a pair of testports. It should be noted that the legacy TRL algorithm still may benefit from using multiple THRU standards in order to provide the best phase margin over different frequency ranges.

**TRL LINE/MATCH**

This actually represents two kit classes that share a similar purpose during calibration. A *LINE* standard needs to have a distinct response from the *THRU* standard. Typically the *LINE* standard is chosen such that the phase of $S_{21\text{LINE}}$ is different from the phase response of $S_{21\text{THRU}}$ by at least 20 degrees. This becomes prohibitive at low frequencies so *MATCH* standards are used with a TRM calibration at frequencies where it is impractical to create *LINE* standards. Both the Legacy TRL and Multiline TRL calibrations use *MATCH* standards and TRM calibration to cover the low frequency portion as needed. In those cases, the calibration is actually a mix of TRM and TRL. The TRM portion of the calibration is not over-determined when Multiline TRL is selected. A fundamental assumption of the TRL algorithm is that the characteristic impedance of the *THRU* standard is the same as the characteristic impedance of each of the *LINE* standards. The match standard can be defined as an idealized fixed load standard or it can be defined as a databased standard which can be used to adjust for the actual reflection coefficient of the standard. Both Legacy TRL and Multiline TRL assume the databased standards have the same reflection coefficient applied to both ports.

**Note:** The NIST implementation does not permit having a calibration that mixes both TRM and TRL.

**TRL REFLECT**

The TRL REFLECT kit class contains standards to be used by both the Legacy TRL and Multiline TRL calibrations. When doing a TRL calibration there is a fundamental assumption that the *REFLECT* standard is the same on both ports. It doesn’t have to be fully known, but should be approximately known to permit the correct root selection during the calibration process. A single reflect will be used, but most of the time multiple *REFLECT* standards need to be created one for each connector gender.
The Multiline TRL algorithm has the option to do a TSD calibration instead of TRL calibration. In that case, only one reflect standard is required; but it has to be fully known. When doing a TSD calibration, one then has the option of deciding which reflect standard to be used. In general, the order of the calibration standards in a Calibration Kit Class is significant as the calibration algorithms step through the standards from top to bottom selecting standards until it accumulates enough standards to satisfy all of the frequency requirements for each port. In the case of TSD, the order of the REFLECT standards is significant because as the TSD portion of the algorithm steps through the standards listed in the TRL REFLECT kit class it will use the first REFLECT standard it finds that will mate with either of the test ports. The user specifies which algorithm to use Multiline TRL or Multiline TSD on a kit by kit basis by making the desired selection in the Multiline TRL Setup dialog as shown below.

A databased standard can be used for the reflect standard. In general there is no advantage to using a databased standard for Legacy TRL and Multiline TRL calibrations since only an approximate value for the reflect is required. There are a couple of instances where using a databased standard might provide benefit. In the Legacy TRL when the Reflect Standard is used to define the reference plane, the actual value of the reflect standard obtained from the standard model is used to set the reference planes.
In the Multiline TSD calibration, the actual value of the standard model is also used to compute the error terms.

**Calibration Standards**

Legacy TRL and Multiline TRL do not support the use of databased standards for THRU or LINE standards. Databased standards can be used for MATCH or REFLECT standards.

**Relationship Between Delay and Physical Length**

The NIST MultiCal software defines the calibration standards using physical lengths and relative permittivity. The Keysight implementation also defines the same standards but uses an offset delay term to be consistent with existing calibration standard definitions[3]. Traditionally, the offset delay model used by both *THRU* and *LINE* standards has the offset defined by a delay parameter.

Note: The delay specified for the standard offset is assumed to be equivalent to the delay a TEM mode would face for a given physical length.

The Keysight Multiline TRL algorithm assumes the physical length is constant and computes that value from the offset delay parameter defined in the standard’s model. The physical length is obtained using the real part of the relative permittivity estimate (see Multiline TRL Setup dialog above) and then held constant even while the Multiline TRL algorithm adjusts the relative permittivity during subsequent computations.

**Calibration Reference Z0**

Both Legacy TRL and Multiline TRL algorithms assume the characteristic impedance for the *THRU* and *LINE* standards is the same. The computations optimize the error terms for the characteristic impedance of the standards. There are multiple impedance terms that are used by both the Legacy TRL and Multiline TRL algorithms. There is an additional impedance term $Z_{\text{line}}$ that is not defined in the calibration kit but is computed by the TRL algorithms. It is inherently subject to the assumptions that all of the THRU and LINE standards have the same characteristic impedance. When Line Z0 is selected as the reference Z0 setting, the characteristic impedance of the measurement system after calibration is simply $Z_{\text{line}}$.

For Legacy TRL, when System Z0 is selected an impedance transformation is applied which assumes that the Offset Z0 of the LINE standard is equal to $Z_{\text{line}}$ and the math to transform from Offset Z0 of the LINE standard to Z0 of the Connector is applied. The following summarizes the effect of settings on the impedance computations:
If the user selects **System Z0** for **Calibration Reference Z0** then the following applies:

- If the user selects **Enable Zc Computation From C** then \( Z_{line} \) is computed from \( C_0 \) and \( S_{r_{computed}} \).
- If the user unchecks **Enable Zc Computation From C** then \( Z_{line} \) is set equal to Offset Z0 of the THRU standard.
- Regardless of whether **Enable Zc Computation From C** is checked or unchecked there is an additional impedance transform from \( Z_{line} \) to Connector Z0.

If the user selects **Line Z0** for **Calibration Reference Z0** then \( Z_{line} \) is set equal to Offset Z0 of the THRU standard. There is no additional impedance transform from \( Z_{line} \) to Connector Z0.

**Line Z0**

If the user selects Line Z0 in the **Calibration Reference Z0** section of the TRL tab, the computed error terms are used without any additional impedance transform. Additionally, when the user selects Line Z0, the **Define Zc** section in the Multiline TRL Setup dialog is disabled.

**System Z0**

There is a slight difference in behavior between Legacy TRL and Multiline TRL due to the additional Define Zc section in the Multiline TRL Setup dialog.

Legacy TRL uses the definition of Offset Z0 and Offset Loss specified in the **LINE** standard model. If this is not equal to the Connector Z0 specified on the Connectors tab (shown below) an impedance transform is applied to the error terms.
Multiline TRL uses the definition of Offset $Z_0$ specified in the $THRU$ standard model. If **Enable Zc computation from C** is checked in the Multiline TRL Setup dialog an additional impedance transform is done to account for the low frequency dispersion specified by C0.

**Note:** There are papers published to explain details for determining the low frequency dispersion from the characterization of the propagation constant and an estimate of C0[4][5][6]. This also uses the characterization of the relative permittivity which covers the full frequency range of the Multiline TRL algorithm. The transmission line capacitance can also be characterized by additional measurements[7]

If the Offset $Z_0$ specified in the $THRU$ standard model is different from the Connector Z0 specified on the Connectors tab the error terms are modified by an impedance transform. A default value for C0 is computed assuming a coaxial transmission structure using characteristic impedance specified by Offset $Z_0$ for the $THRU$ standard model. Inputting a negative value for C0 will cause the default value to be reinserted.

**Note:** There is also an interaction between $\varepsilon_r$ and C0. If C0 is equal to the default value changes to $\varepsilon_r$ will update C0. If a user has specified a different value for C0 no change to C0 will be made when changes to $\varepsilon_r$ are made.

**Testport Reference Plane**

The testport reference plane options differ between the Legacy TRL and Multiline TRL options. The
initial calibrations for both Legacy TRL and Multiline TRL both assume the reference plane is in the middle of the THRU standard. This becomes significant for the LRL case where the delay of the THRU standard is greater than zero.

**Legacy TRL**

Legacy TRL has the option to use either the THRU standard or the REFLECT standard to set the reference plane after calibration. If the THRU standard is selected the reference plane for each testport will be rotated towards the VNA testport by half the delay of the THRU standard. If LRL line auto characterization is checked, the propagation constant computed during the TRL calibration will be used to estimate the rotation based on the delays specified by the THRU and LINE standards; otherwise, the modeled behavior of the THRU standard will be used.

**Multiline TRL**

When Multiline TRL is selected the ability to select LRL line auto characterization is disabled because Multiline TRL only uses LRL line auto characterization. The ability to select the REFLECT standard to be used to define the testport is not an option with Multiline TRL; however, there is an additional option of defining an arbitrary reference plane. A negative number input for the reference plane shifts the testport towards the VNA testports.

The default behavior is to shift the testport reference plane to the edge of the THRU standard like with behavior similar to the Legacy TRL behavior with the testport reference plane set by the THRU standard and having LRL line auto characterization active.

**Multiline TRL Diagnostic Traces**

The diagnostic traces are available in the Cal Set viewer. The trace also shows the transition between the portion of the frequency range that did a TRM calibration and the portion that did a Multiline TRL calibration.

Multiline TRL has diagnostic traces that provide insight into the calibration as shown below.
The traces are the same as traces provided by the NIST MultiCal software. These traces can be accessed from the Cal Set Viewer under the Standards group.

**Note:** The default format for viewing the traces is log magnitude. The diagnostic traces make the most sense when viewed in real or imaginary format. The indicated units for each diagnostic trace is simply a number (U); when looking at the various diagnostic traces the screen doesn’t include units such as degrees or ohms.

The included diagnostic traces are:

- **CharImpedance** (Characteristic Impedance of line) is the estimate $Z_0$ of the transmission media. A fundamental assumption of both the Legacy TRL algorithm and the Multline TRL algorithm is that the characteristic impedance of the **THRU** and **LINE** standards are the same. If **Enable Zc computation from C** is selected for the calibration kit, CharImpedance will include the effects of low frequency dispersion and transmission line loss; otherwise it will show the Offset $Z_0$ term specified for the **THRU** standard.

- **EffPhase** (Effective Phase Delay (best pair)) provides an estimate of the effective phase delay difference between the best pair of standards taken from the collection of the **THRU** standard and all of the **LINE** standard. Note it will not always be the **THRU** standard with one of the **LINE** standards; often it is based on the combination of two **LINE** standards. Optimal phase difference is $90^\circ$.

- **RelPermittivityMean** (Effective dielectric constant (mean)) is an estimate of the complex relative permittivity ($\varepsilon_r$) given as $\varepsilon_r = \varepsilon'_r - j\varepsilon''_r$ where $\varepsilon'_r$ is the real part and $\varepsilon''_r$ is the imaginary part. Strictly speaking, this is not the mean of each of the **RelPermittivityPair(n)**; pairs of lines with the best effective phase delay have influence.

- **RelPermittivityPair(n)** (Effective dielectric constant ($n^{th}$ pair)) is an estimate of the complex relative permittivity ($\varepsilon_r$) between the **THRU** and multiple **LINE** standards paired with the **THRU** or **LINE** standard that
has the best effective phase difference with the rest of the THRU and/or LINE standards. These are the terms that are combined to give the estimate of RelPermittivityMean. The number of pairs is equal to the number of LINE standards.

- **RelPhaseConst&Atten** (Relative Phase Constant and Attenuation) provides information about the propagation constant given as \( \gamma = \alpha + j\beta \) where \( \alpha \) is the attenuation constant and \( \beta \) is the phase constant. The transmission through a line of length \( l \) in cm is given as \( e^{-\gamma l} \). The data is normalized to frequency such that the real part of RelPhaseConst&Atten represents \( \frac{\beta c}{2\pi f_{GHz}} \) and the imaginary part of RelPhaseConst&Atten represents \( \frac{\alpha c}{2\pi f_{GHz}} \) expressed in dB where \( c \) is the speed of light in a vacuum and \( f_{GHz} \) is the frequency in GHz.

- **RelStdDev** (Standard Deviation) provides a relative standard deviation for the calibration process. It is related to uncertainty of the calibration process with lower numbers indicating lower uncertainty. It is a normalized value and is not a numeric representation of the uncertainty. More details are provided in the paper by DeGroot, Jargon and Marks[2].

The diagnostic traces only have a non-zero value in the frequency range where the Multiline TRL algorithm is used. The transition between TRM and Multiline TRL is seen in the diagnostic trace above.

### Procedure to Define the Calibration Kit

The following steps are recommended when creating a new calibration kit to be used with Multiport TRL calibrations.

1. **Determine the nominal effective relative permittivity.** If using a substrate or PC board, this should account for both the effect of the substrate permittivity and air. This is the number that should be placed in the Relative Permittivity Estimate shown in the Multiline TRL Setup dialog. It will be used when estimating the Offset Delay of the calibration standards. All devices in the calibration kit are assumed to use the same relative permittivity estimate.

2. **Define the connectors.** It can be beneficial to define multiple connectors when the topology of the calibration kit is intended to have a particular standard be used only with a probe in a fixed location. In that case it could be beneficial to provide unique connector names to be associated with that probe. For example, you might end up with Probe A, Probe B, Probe C, etc.

3. **Define the characteristic impedance of the connectors.** This is the final system impedance desired after calibration. Generally, all of the connectors in the calibration kit would have the same characteristic impedance.

**Note:** This is not a fixed requirement when the calibration kit is used for multiport calibrations (more than 2 testports); what is required is that all connectors used to define the standards for a Multiline TRL calibration (or Legacy TRL calibration) must have the same characteristic impedance. For example, consider the case where TRL calibrations are intended between ports A and B and between ports C and D. Assume Probe A is intended to be connected to port A, Probe B to port B, Probe C to port C and Probe D to port D; the characteristic impedance defined for Probe A must be the same as Probe B and the characteristic impedance defined for Probe C must be the same as Probe D but the characteristic impedance defined for Probe A can be different than the characteristic impedance defined for Probe C.
4. Avoid using meander lines or bent lines for standards intended to be used as either the THRU standard or a LINE standard. It is possible to include bent lines needed during a multiport calibration but the bent lines would be included in the UNKNOWN THRU kit class under the SOLT tab in the Edit kit dialog. The SOLT tab is next to the TRL tab.

5. Measure the physical lengths of the standards in cm. This would include the standard to be used as a THRU. All of the THRU and LINE standards should be defined using the THRU standard model. Specify the parameters for each standard:
   - Specify the Label and Description.
   - Select the connectors.
   - Specify the frequency range. The THRU standard should be specified over the full frequency range of the calibration. The LINE standards should have a minimum frequency selected to ensure a minimum phase difference from the THRU standard of approximately 20 degrees.
   - The offset delay should be computed using the real part of the relative permittivity estimate ($\varepsilon''_r$) that will be defined on the Multiline TRL Setup dialog. The delay in picoseconds (psec) for the $i^{th}$ standard with length $L_i$ in cm is computed as:
     \[ D_i = \frac{L_i \sqrt{\varepsilon''_r}}{c} \]
     where
     \[ c = 2.99792458 \times 10^{-2} \text{ cm/psec} \]
   - The offset Z0 should be the nominal characteristic impedance of the THRU and LINE standards. They should all be set to the same value. In many cases, it will be the same value as the characteristic impedance defined for the connectors.
   - The offset loss can be specified. It is not critical to specify this accurately since the Multiline TRL calibration will estimate the loss of the propagation independent of this estimate.
   - If the Delay is specified as 0 psec it makes sense to check the Virtual Device box. This causes the calibration prompts to indicate connecting the testports directly to each other rather than including the device label and description.

6. Assign calibration kit class definitions by selecting the TRL tab.
   - A single THRU standard should be selected.

   **Note:** In the case where multiple TRL sets of calibration standards are defined, there should be a single THRU standard for each set. Using the previous example, there would be a THRU defined with Probe A and Probe B connectors and another THRU defined with Probe C and Probe D connectors.

   - Multiple LINE standards can be selected.
   - If the frequency range of usage is lower than the lowest frequency for the LINE standards add MATCH standards. There should be a single MATCH standard for each port connector. The model for each MATCH standard should be the same.
   - Add the REFLECT standards. There should be a REFLECT standard for each port connector. If the calibration kit is intended for Multiline TRL calibrations the REFLECT standards should all have the same model. If the calibration kit is intended for Multiline TSD the REFLECT standards do not have to have the same model. For Multiline TSD calibrations only the first standard listed that matches the connectors required during the calibration will be used.

7. Check the Multiline TRL checkbox.
8. Specify the calibration reference Z0. Usually System Z0 is selected which includes the impedance transform between the Offset Z0 defined and the Connector Z0. It also includes the transform for Zc defined in the
Multiline TRL Setup dialog.
9. Press **MLTRL Setup**... to open the Multiline TRL Setup dialog.
   - Define Zc. Check the Enable Zc Computation from C checkbox to account for low frequency
dispersion. When setting up a calibration kit for waveguide, uncheck the Check the Enable Zc
Computation from C checkbox since the cutoff frequency is used instead.
   - Specify C0. If defining a coaxial calibration kit, the default value is usually adequate. If the value has
been modified, the default value can be automatically re-entered by inputting a negative number in the
C0 field. Sometimes the value for C0 nees to be determined by an iterative process. There are papers
published that explain details for determining the low frequency dispersion from the characterization of
the propagation constant and an estimate of C0[4][5][6].
   - Make sure the values input for the relative permittivity estimate match the value used to estimate the
offset delay for the **THRU** and **LINE** standards.
   - Specify either TRL or TSD.
   - Specify the testport reference plane as desired.
10. If doing an multiport calibration, add additional THRU standards with offset delays specified. These standards
are usually loopback THRU standards or bent in order to connect ports that are not directly opposing each
other. Add these standards to the UNKNOWN THRU kit class.

Markers

Markers provide a numerical readout of measured data, a search capability for specific values, and can change stimulus settings. There are 15 regular markers and one Reference marker (used with Delta markers) available per trace. This topic discusses all aspects of markers.

Note: Marker Readout can be turned ON/OFF and customized from the Customize Display dialog box. Learn more.

Other Analyze Data topics

Creating and Moving Markers

How to Create Markers

Using Hardkey/SoftTab/Softkey

1. Press Marker > Marker 1-7 / Marker 8-15 / Reference.

2. Click left side Marker N or Reference small button.

Using a mouse

1. Move the cursor on a trace.

2. Right-click on the trace then select Add Marker....

Number of General Purpose and Reference Markers

There are 15 regular markers and one Reference marker (used with Delta markers) available per trace.

For Remote commands, there is a Preference setting to revert to the previous behavior. See the Preference.

When developing new programs, use the reference marker commands to control reference markers. Do NOT use general purpose marker commands to control reference markers.

Moving a Marker

To move a marker, make the marker active by selecting its number in any of the previous 3 methods. The active marker appears on the analyzer display as ∇. All of the other markers are inactive and are represented on the analyzer display as Δ. Then change the stimulus value using any of the following methods:
- Type a value.
- Scroll to a stimulus value using the up / down arrows. The resolution can not be changed.
- Click the stimulus box, then use the front-panel knob.
- Click and Drag Markers using a finger (touchscreen) or by left-clicking and holding a marker symbol. Then drag the marker to any point on the trace. This feature is NOT allowed in Smith Chart or Polar display formats or with a Fixed Marker type.
- Move the mouse Marker over the stimulus box, then use the mouse scroll wheel.

**Marker Setup**

**How to set the Marker Setup.**

**Using Hardkey/SoftTab/Softkey**

1. Press **Marker > Marker Setup.**
2. Set the value or select desired setting for each softkey.

**Using a mouse**

1. Move the cursor on a marker.
2. Right-click on the marker then select Marker....

**Marker dialog box help**

**Marker**  Specifies the current (active) marker number that you are defining.

**On**  Check to display the marker and corresponding data on the screen.

**Stimulus**  Specifies the X-axis value of the active marker. To change stimulus value, type a value, use the up and down arrows, click in the text box and use the front-panel knob, or drag the marker on the screen.

**Delta (and Reference) Markers**  Check to make the active marker display data that is relative to the reference (R) marker. There is only one reference marker per trace. All other markers can be regular markers or delta markers. When a delta marker is created, if not already displayed, the
A reference marker is displayed automatically. A delta marker can be activated from the Marker dialog box or the Marker Toolbar. See Also: Number of General Purpose and Reference Markers.

**Discrete Marker** Check to display values at only the discrete points where data is measured. Clear to display values that are interpolated from the data points. The interpolated marker will report y-axis data from ANY frequency value between the start and stop frequency.

**Fixed** Check to cause the marker to have a fixed X-axis and Y-axis position based on its placement on the trace when it was set to fixed. It does NOT move with trace data amplitude. It can be scrolled left and right on the X-axis by changing the marker stimulus value. Use this marker type to quickly monitor "before and after" changes to your test device. For example, you could use fixed markers to record the difference of test results before and after tuning a filter.

Clear the box to create a **Normal** marker, which has a fixed stimulus position (X-axis) and responds to changes in data amplitude (Y-axis). It can be scrolled left and right on the X-axis by changing the marker stimulus value. Use this marker type with one of the marker search types to locate the desired data.

**Marker Format** Displays the marker data in a format that you choose. The Trace Default setting has the same marker and grid formats. Choose from the following:

<table>
<thead>
<tr>
<th>Format</th>
<th>Options</th>
</tr>
</thead>
<tbody>
<tr>
<td>Log/Phase</td>
<td>Log, Real, Fahrenheit</td>
</tr>
<tr>
<td>Linear/Phase</td>
<td>Linear, Imaginary, Celsius</td>
</tr>
<tr>
<td>Real/Imag</td>
<td>Phase, Phase Unwrapped, Noise</td>
</tr>
<tr>
<td>R+jX (complex impedance)</td>
<td>SWR, Phase Positive</td>
</tr>
<tr>
<td>G+jB (complex admittance)</td>
<td>Delay, Kelvin</td>
</tr>
</tbody>
</table>

**Noise Marker Format** (IMSpectrum and SA Measurement Classes Only) - For comparison purposes, electronic noise measurements are often displayed as though the measurement was made in a 1 Hz Res BW. However, making an actual measurement at a 1 Hz Res BW is impossible, and at 10 Hz, extremely slow.

A Noise Marker mathematically calculates the noise measurement at that single data point as though it were made using a 1 Hz bandwidth.

To accurately measure noise, the Noise Marker should NOT be placed on, or too close to, a signal. The distance from a signal depends on several factors. To know if an accurate reading is being
made, move the Noise Marker until consistent measurements are displayed in adjacent data points.

**Noise Marker Format (Modulation Distortion measurement class only)** - In a Modulation Distortion channel, the noise is calculated from the current power reading divided by the tone spacing of the modulation being used: \[ P_{in}(W/Hz) = \frac{P_{in}(W)}{\text{Tone Spacing (Hz)}} \]. This provides a noise density readout with units compatible with the trace format. For example, if the trace is dBm, the noise is dBm/Hz.

**All Off**  Switches OFF all markers on the active trace.

**Coupled Markers**

The coupled markers feature causes markers on different traces to line up with the markers on the selected trace. Markers are coupled by marker number, 1 to 1, 2 to 2, 3 to 3, and so forth. If the x-axis domain is the same (such as frequency or time), coupling occurs. Trace markers in a different x-axis domain will not be coupled. If a trace marker has no marker to couple with on the selected trace, the marker remains independent.

**Coupling Method** - Determines the scope of coupling. Choose from the following:

- **All** - A marker on one trace is coupled to the same-numbered markers on all channels, all windows and all traces.

- **Channel** - A marker on one trace is coupled to the same numbered markers on traces which share the same channel number as the original trace.

**Coupled Markers Model**

This model simulates the use of coupled markers in the VNA:

1. **Click Trace A or Trace B**

2. **Click Coupled Markers**
3. Notice the following:

- Markers on the unselected trace move to the x-axis position of the selected trace.
- If a marker number on the unselected trace has no corresponding marker on the selected trace, no movement occurs for that marker.

4. Click **Reset** to run the model again. There is no Reset for coupled markers on the VNA.

**Searching with Markers**

You can use markers to search and return data for the following trace criteria:

- **Max and Min**: find the highest or lowest points on the trace
- **Peak**, then move to other peaks (left, right, next highest)
- **Multi Peak**
- **Target Value**: find a specific Y-axis value
- **Multi Target**:
- **Bandwidth** (Filters)
- **Notch** (Filters)
- **Compression Point** (Amplifiers)
- **About PSAT and PNOP Markers**
  - **Power Saturation** (Amplifiers)
  - **Power Normal Operating Point** (Amplifiers)
- **Search Domain**
- **Search Range Indicators**
# How to Search with Markers

## Using Hardkey/SoftTab/Softkey

1. Press **Search** > *Main / Peak / Target / Multi Peak & Target / Bandwidth & Notch / Compression & Saturation / Normal Op Pt. / Distortion / Spurious*

## Using a mouse

1. Move the cursor on a marker.
2. Right-click on the marker then select **Search**...to show the Marker Search Dialog box for define the search parameters.
3. From **Search Type** of Marker Search dialog box, select the desired search function.
4. Press **Execute** or check **Tracking**. Learn more.

## Marker Search dialog box help

**Marker** Specifies the marker that you are defining. Not available for search types that deploy specific markers.

**Search Range** Defines the area where the marker can move or search. For full span, the marker searches for specified values within the full measurement span. For user span, the marker searches for specified values within a measurement span that you define. Learn more about Search Range.

**Search Type**

**Note** You must either press **Target Search** or check **Tracking** to initiate all search types. If there is no valid data match for the search type, the marker will not move from its current position.

- **Target Search** Click to cause the marker to search for the specified criteria.
- **Tracking** Check to cause the marker to search for the specified criteria with each new sweep. The
searches begin with the first sweep after Tracking has been checked, based on the current search type and domain information. Therefore, make sure that the search criteria are in the desired state before using the data. You cannot manually change the stimulus setting for a marker if Tracking is selected for that marker.

**Maximum** Marker locates the maximum (highest) data value.

**Minimum** Marker locates the minimum (lowest) data value.

---

**Peak** - See below.

**Next Peak** - Marker locates the peak with the next lower amplitude value relative to its starting position.

**Peak Right** - The marker locates the next valid peak to the right of its starting position on the X-axis.

**Peak Left** - The marker locates the next valid peak to the left of its starting position on the X-axis.

**Multi Peak** - A function that search for peaks that match the multi-peak search excursion value and multi-peak polarity value. Learn more about Multi Peak Search.

- **Threshold** - Minimum amplitude (dB). To be considered valid, the peak must be above the threshold level. The valley on either side can be below the threshold level.

- **Excursion** The vertical distance (dB) between the peak and the valleys on both sides. To be considered a peak, data values must "fall off" from the peak on both sides by the excursion value.

---

**Target** - A function that searches for a target that matches the pre-defined target value and transition types (positive, negative or both (positive and negative)) and then moves the marker to that target. Learn more about Multi Target Search.

**Target Left** - A function executes the search from the current marker position to the smaller stimulus values and moves the marker to first target encountered.

**Target Right** - A function executes the search from the current marker position to the larger stimulus values and moves the marker to first target encountered.

**Multi Target** - A function that search for targets that are of the multi-target value and multi target transition value. Learn more about Multi Target Search.

- **Target** - Value in dB.
**Compression** - A function used the active marker to find the specified gain **Compression Level**. Learn more about Compression Search.

- Compression - Value in dB.

**Bandwidth** and **Notch** searches are accessed by pressing **Search > Bandwidth & Notch > BW Ref to** or **Search > Bandwidth & Notch > Notch Ref to**.

**Bandwidth** - A function for determining the bandwidth of the trace, center frequency, cut-off points (on the higher frequency and the lower frequency sides), Q and insertion loss based on the position of the active marker (if search mode set to Marker) or the peak marker (if search mode set to Peak). Learn more about Bandwidth Search.

- Bandwidth peak mode search
  - If level is negative, search is relative to the maximum peak.
  - If level is positive, search is relative to the minimum peak.
• Bandwidth level in dB.

**Notch**  -  A function is used to obtain the bandwidth, center frequency, cutoff points (high-frequency side and low-frequency side), Q and insertion loss of a trace based on the position of the active marker (if search mode set to Marker) or the peak (if search mode set to Peak). [Learn more about Notch Search.]

- Notch peak mode search
  - If level is negative, notch search is relative to the minimum peak.
  - If level is positive, notch search is relative to the maximum peak.
  - Notch level in dB.

The default behavior for searches based on the active marker or peak marker can be set using the Marker: On Preset, set BW/Notch search reference to Peak preference.

---

**Power Saturation**  -  [Learn more about PSAT Search.]

- PMax Back-off - Value in dB.

---

**Normal Operating Pt**  -  The output power where the input is offset from the back-off input power by the Pin Offset. [Learn more about PNOP Search.]

- Back-off - Value in dB.
- Pin Offset - X-axis value in dB.

---

**Distortion Search (Option S93070xB Modulation Distortion only)**

Modulation Distortion marker searches are accessed by pressing **Search** > **Distortion** or by selecting the search marker from the **Search Type** pulldown menu in the **Marker Search** dialog.

The Modulation Distortion application has marker search function types similar to a standard channel. In addition, it has marker search types specific to a Modulation Distortion channel.

**ACPR Search**  -  ACPR Search turns on the reference marker and 2 delta markers if the active trace is an ACP trace and there is an ACP measurement band defined in the setup. The reference marker covers the signal carrier range of the band, while the two delta markers cover the ACLo and ACUp ranges. The readouts of these markers are then ACPR values.

**NPR Search**  -  NPR Search turns on the reference marker and 1 delta marker if the active trace is a
NPR trace and there is a NPR measurement band defined. The reference marker covers the signal carrier range of the band, and the delta marker covers the notch range. The readout of the delta marker is then the NPR value.

---

**Spurious Search (Option S93031xB Phase Noise only)**

Phase Noise marker searches are accessed by pressing `Search > Spurious` or by selecting the search marker from the **Search Type** pulldown menu in the **Marker Search** dialog.

The Phase Noise application has marker search function types similar to a standard channel. In addition, it has marker search types specific to a Phase Noise channel. Spur analysis must be enabled to use the Spurious search functions. See [Enable Spur Analysis](#).

**Spurious Search** - Searches for spurious signals based on spurious settings.

**Spurious Right >> Search** - Searches for the next spurious signal to the right.

**<< Spurious Left Search** - Searches for the next spurious signal to the left.

**Multi Spurious Search** - Searches for multiple spurious signals.

**Spur Sensibility** - Sets the spurious sensibility number. [Learn more.](#)

---

**Maximum and Minimum Search**

**How to create Maximum and Minimum Search**

<table>
<thead>
<tr>
<th>Using Hardkey/SoftTab/Softkey</th>
<th>Using a mouse</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. Press <strong>Search &gt; Main</strong>.</td>
<td>1. Move a cursor on a marker.</td>
</tr>
<tr>
<td>2. Click <strong>Max Search</strong> or <strong>Min Search</strong>.</td>
<td>2. Right-click on the marker and then select <strong>Search</strong>...</td>
</tr>
<tr>
<td>3. Optionally click <strong>Tracking</strong> to search for the specified maximum or minimum level with each sweep. <a href="#">Learn more.</a></td>
<td>3. From <strong>Search Type</strong> of Marker Search dialog box, select <strong>Maximum / Minimum</strong>.</td>
</tr>
<tr>
<td></td>
<td>4. Press Execute or check Tracking. <a href="#">Learn more.</a></td>
</tr>
</tbody>
</table>

---

You can search for the maximum or minimum measured value on the trace and move a marker to that point.
Search for maximum (Max Search) Move active marker to point on trace where measured value is greatest.

Search for minimum (Min Search) Move active marker to point on trace where measured value is lowest.

**Note:** When the data format is in Smith chart or polar format, execute the search only for the main response value.

### Peak Search

**How to create Peak Search**

**Using Hardkey/SoftTab/Softkey**

1. Press **Search > Peak**.

2. Click **Peak Search** to show the markers on the peak.

3. Click **Peak Right >> Search, << Peak Left Search or Next Peak Search** to move the marker to the peak.

4. Click **Threshold** to enter the value of peak threshold.

5. Click **Excursion** to enter the lower limit value of peak excursion.

6. Click **Peak Polarity** to select a peak polarity.

7. Optionally click **Tracking** to search for the specified peak level with each sweep. Learn more.

**Using a mouse**

1. Move a cursor on a marker.

2. Right-click on the marker and then select **Search...**

3. From Search Type of Marker Search dialog box, select **Peak / Peak Left / Peak Right / Next Peak**.

4. Enter the value of **Threshold** and **Excursion**.

5. Press **Execute** or check **Tracking**. Learn more.
A peak is a measurement point whose value is greater or smaller than the adjoining measurement points on its right and left sides. Peaks are classified into the following two types depending on the difference in magnitude from the measurement points on either side of it.

**What Is a "Peak"?**

You define what the analyzer considers a "peak" by selecting the following two peak criteria settings:

- **Threshold** - Minimum amplitude (dB). To be considered valid, the peak must be above the threshold level. The valley on either side can be below the threshold level.

- **Excursion** - The vertical distance (dB) between the peak and the valleys on both sides. To be considered a peak, data values must "fall off" from the peak on both sides by the excursion value.

**Peak Polarity:**

<table>
<thead>
<tr>
<th>Definition</th>
<th>Detection</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Positive</strong> A peak whose measured value is greater than those of the measurement points on either side of it.</td>
<td>Detect positive peaks which are larger than Threshold.</td>
</tr>
<tr>
<td><strong>Negative</strong> A peak whose measured value is smaller than those of the measurement points on either side of it.</td>
<td>Detect negative peaks which are smaller than Threshold.</td>
</tr>
<tr>
<td><strong>Both</strong> A peak whose measured value is smaller and greater than those of the measurement points on either side of it.</td>
<td>Threshold value is not used when polarity is set to both.</td>
</tr>
</tbody>
</table>

**About Peak Excursion Value**

The peak excursion value is the smaller of the differences in measured values from the adjoining peaks of the opposite polarity.
Executing a Peak Search

The following 3 methods are available for executing the peak search:

Next Peak
Moves the marker to the maximum peak when peak polarity is Positive or Both.

Peak Left
Executes the search from current marker position to the smaller stimulus values and moves the marker to first peak encountered.

Peak Right
Executes the search from current marker position to the larger stimulus values and moves the marker to first peak encountered.
Note: Peak right, peak left and next peak may not be tracked. If these searches are selected and then tracking is turned on, the peak tracking is enabled.

When the data format is in Smith chart or polar format, execute the search for the main response value of the two marker response values.

Changing the settings of peak excursion value or peak polarity executes new search for multiple peak.

Example:

Threshold Setting: -10dB
Excursion Setting: 1dB
Scale = 1 dB / Division
Mouse over the graphic to find a valid peak.
- Peak A = Valid Peak (Above Threshold and Excursion Settings)
- Peak B = Invalid Peak (Below Excursion Setting)
- Peak C = Invalid Peak (Below Threshold Setting)

Multi Peak Search

How to create Multi Peak Search

Using Hardkey/SoftTab/Softkey

1. Press Search > Multi Peak & Target.
2. Click Multi Peak Search to show the markers on the multi peaks.
3. Click Peak Threshold to enter the value of peak threshold.
4. Click Peak Excursion to enter the lower limit value of peak excursion.
5. Click Peak Polarity to select a peak polarity.
6. Optionally click Tracking to search for the specified multi peak level with each sweep. Learn more.

Using a mouse

1. Move a cursor on a marker.
2. Right-click on the marker and then select Search....
3. From Search Type of Marker Search dialog box, select Multi Peak.
4. Enter the value of Threshold and Excursion.
5. Press Execute or check Tracking. Learn more.

The multi peak search function enables you to display markers on multiple peaks on traces. Depending on the number of detected peaks, markers 1 through 15 are displayed from the start frequency. The reference marker is not affected.
Multiple peak search has threshold, excursion and polarity as user defined values. This search may have tracking enabled.

When the multiple peak search is executed, previous markers search and tracking are disabled and the settings for the multiple peak search are used.

**Note:** Do not use individual marker settings or marker domain.

Put markers on each valid peak, using up to 15 markers.

**Target Search**

**How to create Target Search**

**Using Hardkey/SoftTab/Softkey**

1. Press **Search > Target**.
2. Click **Target Search** to enable the target search.
3. Click **Target Right >> Search** or **<< Target Left Search** to move the marker to the target.
4. Click **Target Value** to input the value of target search.
5. Click **Transition** to select a transition type.
6. Optionally click **Tracking** to search for the specified target level with each sweep. Learn more.

**Using a mouse**

1. Move a cursor on a marker.
2. Right-click on the marker and then select **Search**....
3. From **Search Type** of Marker Search dialog box, select Target/Target Left/Target Right.
4. Enter the value of the **Target**.
5. Press **Execute** or check **Tracking**. Learn more.

The target search is a function that searches for a target that matches the pre-defined target value and transition types (positive, negative or both positive and negative) and then moves the marker to that target.
Target Transition Types

A target is a point that has a specific measured value on the trace. Targets can be divided into the 3 groups shown below depending on their transition type.

<table>
<thead>
<tr>
<th>Transition Type</th>
<th>Function</th>
</tr>
</thead>
<tbody>
<tr>
<td>Positive</td>
<td>The target value is larger than the measured value immediately preceding it.</td>
</tr>
<tr>
<td>Negative</td>
<td>The target value is smaller than the measured value immediately preceding it.</td>
</tr>
<tr>
<td>Both</td>
<td>The conditions for either Positive or Negative transition are satisfied.</td>
</tr>
</tbody>
</table>

Executing a Target Search

The following 3 methods are available for executing the target search:

- **Target Left**: Executes the search from the current marker position to the smaller stimulus values and moves the marker to first target encountered.
- **Target Right**: Executes the search from the current marker position to the larger stimulus values and moves the marker to first target encountered.
- **Multi Target**: Executes the search for targets that are of the multi-target value and multi target transition value. See Multi Target Search.
**Note:** Target right and target left cannot have tracking enabled. If target left or target right is the selected search and then tracking is enabled, target tracking is enabled.

When the data format is in Smith chart or polar format, execute the search for the main response value of the 2 marker response values.

Changing the settings of target value or transition type executes new search for multiple target.

The marker moves to the first occurrence of the Target value to the right of its current position. Subsequent presses of the **Target Search** softkey cause the marker to move to the next value to the right that meets the Target value. When the marker reaches the upper end of the stimulus range, it will "wrap around" and continue the search from the lower end of the stimulus range (left side of the window).
If **Discrete Marker** is OFF, the marker locates the interpolated data point that equals the target value.

If **Discrete Marker** is ON and there are two data points on either side of the target value, the marker locates the data point closest to the Target value.

### Multi Target Search

#### How to create Peak Search

**Using Hardkey/SoftTab/Softkey**

1. Press **Search > Multi Peak & Target**.
2. Click **Multi Target Search** to show the markers on the multi target.
3. Click **Target Value** to enter the value of target.
4. Click **Transition** to select a transition type.
5. Optionally click **Tracking** to search for the specified multi target level with each sweep. Learn more.

**Using a mouse**

1. Move a cursor on a marker.
2. Right-click on the marker and then select **Search**....
3. From **Search Type** of Marker Search dialog box, select **Multi Target**.
4. Enter the value of the **Target**.
5. Press **Execute** or check **Tracking**. Learn more.

The multi target search is a function that searches for targets that match to pre-defined target value and transition types (positive, negative or both of positive and negative) and displays markers on the targets being searched.

Depending on the number of detected targets, markers 1 through 15 are displayed from the start frequency. The reference marker is not affected.

When the multi target search is executed, search and tracking settings for markers 1 through 15 are ignored and the settings for the multi target search are used.

**Note:** Put markers on each found target value, using up to fifteen markers. Reference marker is not affected. Do not use individual marker settings or marker domain. Search range is applied.

Multiple target search has **target** and **transition types** as user defined values. This search may have tracking enabled. When this search is executing, previous marker searches are disabled.

### Bandwidth and Notch Search
Bandwidth and notch search behavior depends on whether the preference called **Marker: Use single marker for marker search** is set or not. When set, only one marker is used for a marker search. Sub markers are displayed and used for Bandwidth and Notch searches. When cleared, multiple markers are used for a marker search. The default is cleared.

### How to create Bandwidth and Notch Search

**Using Hardkey/SoftTab/Softkey**

1. Press **Search > Bandwidth & Notch**.
2. Click left side **Bandwidth Search** or **Notch Search** small button to turn it ON/OFF.
3. For Bandwidth search, click **BW Ref To > Marker** or **Peak**.
4. For Notch search, click **Notch Ref To > Marker** or **Peak**.
5. Specify the **BW Level** or **Notch Level** in dB from the peak or valley where bandwidth / notch is measured.
6. Optionally click **Tracking** to search for the specified bandwidth or notch level with each sweep. Learn more.

**Using a mouse**

1. Move a cursor on a marker.
2. Right-click on the marker and then select **Search**....
3. From **Search Type** of Marker Search dialog, select **Bandwidth** or **Notch**.
4. Specify the **Level** in dB from the peak or valley where bandwidth / notch is measured.
5. Press **Execute** or check **Tracking**. Learn more.

### Bandwidth Search

The bandwidth search is a function for determining the bandwidth of the trace, center frequency, cut-off points (on the higher frequency and the lower frequency sides), Q and insertion loss based on the position of the active marker or peak marker. The definitions of the parameters determined through the bandwidth search are shown in below.
Notch Search

The notch search function is used to obtain the bandwidth, center frequency, cutoff points (high-frequency side and low-frequency side), Q and insertion loss of a trace based on the active marker or peak marker position. The notch search function starts from the left side of the active marker position and ends when points that meet the conditions are found.

The figure and the table below shows the definition of parameters obtained by notch search function. The notch value in figure below must be specified by the user.
The following values are displayed for Bandwidth and Notch Search:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bandwidth (BW)</td>
<td>The difference in frequency between the higher frequency cut-off and lower frequency cut-off points (High - Low).</td>
</tr>
<tr>
<td>Center frequency (cent)</td>
<td>Frequency at the middle point between the lower frequency cut-off and higher frequency cut-off points. (High + Low)/2.</td>
</tr>
<tr>
<td>Lower frequency cut-off point (Low)</td>
<td>Lower frequency of 2 measurement points, both separated by the defined bandwidth / notch value from the active marker position.</td>
</tr>
<tr>
<td>Higher frequency cut-off point (High)</td>
<td>Higher frequency of 2 measurement points, both separated by the defined bandwidth / notch value from the active marker position.</td>
</tr>
<tr>
<td>Q</td>
<td>Ratio of Center Frequency to Bandwidth (Center Frequency / Bandwidth).</td>
</tr>
<tr>
<td>Insertion loss (loss)</td>
<td>The measured value of the position of the center frequency at the time the bandwidth/notch search is executed.</td>
</tr>
</tbody>
</table>

- Bandwidth / Notch Search can be used ONLY with Log Mag display format.
To use Bandwidth Search on a peak or valley other than the maximum or minimum values, change the Search Domain.

Compression Search

Uses the active marker to find the specified gain Compression Level.

Note: Valid ONLY for S21 (Gain) measurements with a Power Sweep.

How to create Compression Search

Using Hardkey/SoftTab/Softkey

1. Press Search > Comp & Sat.
2. Click Compression Search to turn ON/OFF.
3. Specify the Comp Level in dB.
4. Optionally click Tracking to search for the specified compression level with each sweep. Learn more.

Using a mouse

1. Move a cursor on a marker.
2. Right-click on the maker and then select Search....
3. From Search Type of Marker Search dialog box, select Compression.
4. Enter the Y-axis (Power OUT) difference between the first point and the compression marker.
5. Press Execute or check Tracking. Learn more.

Linear gain is defined as the Y-axis value (gain) of the first data point of the Search Domain (Full Span by default).

Marker > N - X-axis value and Y-axis value.

Comp Pin - Input power (marker X-axis value).
Comp Pout - Output power (Pin + gain).

Comp Level - Compression level found.

- When Discrete is OFF (default setting), the marker finds the exact specified compression, interpolated between the two closest data points and calculates the Comp Pin and Comp Pout value for that point.

- The marker can move from one actual measurement point to another. Because it is interpolated, it can also move in the space between measurement points.

- When Discrete is ON (not interpolated), the marker resides on the closest data point to the requested compression level.

- A marker moves only between actual measurement points. When a specific marker stimulus value is specified as a numerical value, the marker is placed at the measurement point closest to the specified value. A marker that is placed between interpolated points with the discrete mode off automatically moves to the nearest measurement point when the discrete mode is turned on.

Comp. Not Found - Displayed when the requested compression level is not found.

About PSAT and PNOP Search

Compression measurements based on the Pout vs Pin curves are common in the satellite test industry. In the case of Travelling Wave Tube (TWT) amplifiers, PSAT markers identify the normal operating point near saturation, and the amplifiers are operated with the power slightly backed-off approximately 0.03 to 0.1 dB. For TWT amplifiers, the saturation curve always "folds over" and produces a maximum power out.

For Solid State Power Amplifiers (SSPA), the saturation is not as well defined. A common reference is the Normal Operating Point, which is a power backed-off by 8 to 10 dB from the maximum power. In this case, the normal operating point marker replaces the Psat with the PNOP values. Also, because the backoff is important, the backoff output and input powers are displayed (PBO Out), (PBO in) as well as gain at back off (PBO Gain).

Power Saturation (PSAT) Search

If the Marker: Use single marker for marker search preference is cleared, this search uses Markers 1, 2, and 3 to quickly identify output power saturation parameters of an amplifier. If the Marker: Use single marker for marker search preference is set, then only one marker is used for the search and 2 notational markers are displayed. The notational markers may not be moved. These markers are for
display purposes only.

Back-off is a point at which the output power is sufficiently lower than the saturated output power so that the device under test behaves in a more linear fashion.

**Note:** Valid ONLY for Power IN vs Power OUT measurements.

### How to make Power IN (X-axis) vs Power OUT (Y-axis) measurement

#### Using Hardkey/SoftTab/Softkey

1. Press **Preset**.
2. Press **Sweep > Main > Sweep Type**.
3. Select **Power Sweep**.
4. Press **Trace > Trace Setup > Measure...** and set **Trace Meas** to "B" Receiver.
5. Connect DUT input to port 1.
6. Connect DUT output to port 2.

### How to create PSAT Search

#### Using Hardkey/SoftTab/Softkey

1. Press **Search > Comp & Sat**.
2. Click left side **Saturation Search** small button to turn ON/OFF.
3. For **PMax Back-Off**, enter the Y-axis (Power OUT) difference between the Max Power marker (3) and the Back-off marker (2).
4. Optionally click **Tracking** to search for the specified power saturation level with each sweep. Learn more.

#### Using a mouse

1. Move a cursor on a marker.
2. Right-click on the marker and then select **Search > Search**....
3. From **Search Type** of Marker Search dialog box, select **Power Saturation**.
4. For **PMax Back-Off**, enter the Y-axis (Power OUT) difference between the Max Power marker (3) and the Back-off marker (2).
5. Press **Execute** or check **Tracking**. Learn more.
This setting uses three markers to calculate and display 10 values.

The three markers:

- Marker 1: Linear gain; the first data point in the sweep.
- Marker 2: Specified output power Back-off from max power.
- Marker 3: Max Power output; usually the last data point.

The 9 displayed values:

<table>
<thead>
<tr>
<th>Param</th>
<th>Description</th>
<th>Calculated from...</th>
</tr>
</thead>
<tbody>
<tr>
<td>PSat Out</td>
<td>Output power at the saturation point.</td>
<td>Marker 2 Y-axis value</td>
</tr>
<tr>
<td>PSat In</td>
<td>Input power at the saturation point.</td>
<td>Marker 2 X-axis value</td>
</tr>
<tr>
<td>Gain Sat</td>
<td>Gain at the saturation point.</td>
<td>Psat Out - Psat In</td>
</tr>
<tr>
<td>Comp Sat</td>
<td>Compression at the saturation point.</td>
<td>Gain Sat - Gain Linear</td>
</tr>
<tr>
<td>PMax Out</td>
<td>Maximum output power.</td>
<td>Marker 3 Y-axis value</td>
</tr>
<tr>
<td>PMax In</td>
<td>Input power at the maximum output power.</td>
<td>Marker 3 X-axis value</td>
</tr>
<tr>
<td>Gain Max</td>
<td>Gain at the maximum output power.</td>
<td>PMax Out - PMax In</td>
</tr>
<tr>
<td>Comp Max</td>
<td>Compression at the maximum output power.</td>
<td>Gain Max - Gain Linear</td>
</tr>
<tr>
<td>Gain Linear</td>
<td>Linear gain at the first data point.</td>
<td>Marker 1 - Y-axis value MINUS X-axis value</td>
</tr>
</tbody>
</table>

- **Comp. Not Found** is displayed when the requested Back-off point is not found.
When Discrete marker is NOT selected (the default setting), the three markers find an interpolated value between the two closest data points.

When Discrete marker is selected (NOT interpolated), the three markers reside on the closest data points.

Power Normal Operating Point (PNOP) Search

If the Marker: Use single marker for marker search preference is cleared, this search uses Markers 1, 2, 3, and 4 to quickly identify Normal Operating Point parameters of an amplifier. If the Marker: Use single marker for marker search preference is set, then only one marker is used for the search and 2 notational markers are displayed. The notational markers may not be moved. These markers are for display purposes only.

Back-off is a point at which the output power is sufficiently lower than the saturated output power so that the device under test behaves in a more linear fashion.

The power normal operating point is the output power where the input is offset from the back-off input power by the Pin Offset.

Note: Valid ONLY for Power IN vs Power OUT measurements.

See Power Saturation to learn how to make a Power IN (X-axis) vs Power OUT (Y-axis) measurement.

How to create PNOP Search

**Using Hardkey/SoftTab/Softkey**

2. Click left side Normal OP Search small button to turn ON/OFF.
3. For Back-Off, enter the Y-axis (Power OUT) difference between the Max Power marker (3) and the Back-off marker (2).
4. For Pin Offset, enter the X-axis (Power IN) difference between Back-off marker (2) and PNOP marker (4).
5. Optionally click Tracking to search for the specified power normal operating point level with each sweep. Learn more.

**Using a mouse**

1. Move a cursor on a marker.
2. Right-click on the marker and then select Search > Search....
3. From Search Type of Marker Search dialog box, select Normal Operating Pt.
4. For Back-Off, enter the Y-axis (Power OUT) difference between the Max Power marker (3) and the Back-off marker (2).
5. For Pin Offset, enter the X-axis (Power IN) difference between Back-off marker (2) and PNOP marker (4).
6. Press Execute or check Tracking. Learn more.
This setting uses **four** markers to calculate and display 12 values.

The **four** markers:

- Marker 1: Linear gain; the first data point in the sweep.
- Marker 2: Max Output Power MINUS the specified Output (Y-axis) **Back-off** value in dB.
- Marker 3: Max Output Power; usually the last data point in the sweep.
- Marker 4: X-axis value of Back-off (Marker 2) plus the **Pin Offset** (X-axis) value in dB.

The 11 displayed values:

<table>
<thead>
<tr>
<th>Param</th>
<th>Description</th>
<th>Calculated from...</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pnop Out</td>
<td>Output power at the power normal operating point.</td>
<td>Marker 4 Y-axis value</td>
</tr>
<tr>
<td>Pnop In</td>
<td>Input power at the power normal operating point.</td>
<td>Marker 4 X-axis value</td>
</tr>
<tr>
<td>Pnop Gain</td>
<td>Gain at the power normal operating point.</td>
<td>Pnop Out - Pnop In</td>
</tr>
<tr>
<td>Pnop Comp</td>
<td>Compression at the power normal operating point.</td>
<td>Pnop Gain - Linear Gain*</td>
</tr>
<tr>
<td>PMax Out</td>
<td>Maximum output power.</td>
<td>Marker 3 Y-axis value</td>
</tr>
<tr>
<td>PMax In</td>
<td>Input power at the maximum output power.</td>
<td>Marker 3 X-axis value</td>
</tr>
<tr>
<td>Gain Max</td>
<td>Gain at the maximum output power.</td>
<td>PMax Out - PMax In</td>
</tr>
<tr>
<td>Comp Max</td>
<td>Compression at the maximum output power.</td>
<td>Gain Max - Linear Gain*</td>
</tr>
<tr>
<td>PBO Out</td>
<td>Output power at the back-off point.</td>
<td>Marker 2 Y-axis</td>
</tr>
<tr>
<td>PBO In</td>
<td>Input power at the back-off point.</td>
<td>Marker 2 X-axis</td>
</tr>
<tr>
<td>PBO Gain</td>
<td>Gain at the back-off point.</td>
<td>PBO Out - PBO In</td>
</tr>
</tbody>
</table>
Linear Gain (not shown): Marker 1 - Y-axis value MINUS X-axis value

- PNOP Not Found is displayed when the requested back-off level is not found.
- When Discrete marker is NOT selected (the default setting), the four markers each find an interpolated value between the two closest data points.
- When Discrete marker is selected (NOT interpolated), the four markers each reside on the closest data point.

Search Range

Search domain settings restrict the stimulus values (X-axis for rectangular format) to a specified span. Set the User Start and User Stop stimulus settings of these User spans. If User Start is greater than User Stop, the marker will not move. Learn how to set Search Range.

- The default domain of each new marker is "full span".
- There are 16 user-defined domains for every channel.
- The user-defined domains can overlap.
- More than one marker can use a defined domain.
- Search Domain settings are shared with Trace Statistics User Ranges.

The graphic below shows examples of search domains.
A search range will be indicated with a pair of small, outlined triangles sitting on the X-axis. Although there can be multiple search ranges in use on various markers, only the current-selected search range for the active marker is displayed. This rule prevents the possibility of the X-axis being cluttered with many search range triangles. This rule applies even when there are multiple traces in a window.

Only one search range will be displayed on a grid at any time. The displayed search range will correspond to the active trace and active marker. The color of the range indicators will match that of the active trace.

Range indicators will appear automatically when appropriate and cannot be disabled. The mouse or touchscreen can't be used to “click-and-drag” the position of the range indicators which will alter the search range definition.

Search Within

The zoomed frequency range becomes the **User 16 Search Domain span**.

A marker is created if not already present on the trace. If markers are already present on the trace, the lowest marker is moved to the found value.

1. Left-click the mouse or use a finger, then drag across a portion of a trace.
2. Release the mouse or lift the finger.
3. Select **Search Within**.
4. Then choose from the following:

   - **Max** - A marker moves to the HIGHEST value within the zoomed range.
   - **Min** - A marker moves to the LOWEST value within the zoomed range.
- **Target** - A marker moves to the first value within the zoomed range that is currently set in the Marker Search 'Target' setting. The same Discrete Marker rules apply as those for the standard Target Marker Search.

**Marker Functions - Change Instrument Settings**

The following settings change the relevant VNA settings to the position of the active maker.

### How to change Instrument settings using markers

**Using Hardkey/SoftTab/Softkey**

1. Press **Marker -> Functions**.

**Using a mouse**

1. Move a cursor on a marker.
2. Right-click on the marker and then select **Functions**.
3. Select the desired search function.
4. Click **Function...** to show the Marker Function Dialog box.

### Marker Function dialog box help

![Marker Function Dialog Box]

**Note:** Marker Functions do not work with channels that are in **CW** or Segment Sweep mode.

- **Marker => Start**  Sets the start sweep setting to the value of the active marker.
- **Marker => Stop**   Sets the stop sweep setting to the value of the active marker.
- **Marker => Center** Sets the center of the sweep to the value of the active marker.
- **Marker => Ref Level** Sets the screen reference level to the value of the active marker.
- **Marker => Delay** The phase slope at the active marker stimulus position is used to adjust the line length to the receiver input. This effectively flattens the phase trace around the active marker. Additional Electrical Delay adjustments are required on devices without constant group delay over
the measured frequency span. You can use this to measure the electrical length or deviation from linear phase.

This feature adds phase delay to a variation in phase versus frequency; therefore, it is only applicable for ratioed measurements. See Measurement Parameters.

**Marker =>Span** Sets the sweep span to the span that is defined by the delta marker and the marker that it references. Unavailable if there is no delta marker.

**Marker =>CW Freq** Sets the CW frequency to the frequency of the active marker. NOT available when the channel is in CW or Power Sweep. Use this function to first set the CW Frequency to a value that is known to be within the current calibrated range, THEN set Sweep Type to Power or CW.

**Marker =>IM Spectrum** This feature is supported in Swept IMD/IMDX measurement classes (channels) ONLY. The generated IMD tones and 2 input tones are measured. This feature provides a plot of the fixed input tones and IMD tones across the receiver frequency.

**Marker =>SA** This feature is supported in Standard, SMC or Swept IMD measurement classes (channels) ONLY. In this section, these are called NA channels.

With a marker residing on a trace in an NA channel, Marker=>SA creates a new SA channel in full frequency span. A marker is created on the trace at the same frequency as the NA channel trace. This is a quick way to see the frequency spectrum of the NA channel at a specific frequency. Learn more.

**Note:** Some Marker Functions do not work with channels that are in certain Sweep Types.

**SA Analysis Markers**
The following markers are specific to Spectrum Analyzer measurement channels.

<table>
<thead>
<tr>
<th>Spectrum Analysis markers</th>
<th>Using a mouse</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Using Hardkey/SoftTab/Softkey</strong></td>
<td></td>
</tr>
<tr>
<td>1. Press <strong>Marker &gt; SA Analysis</strong></td>
<td>1. Click <strong>Response</strong>.</td>
</tr>
<tr>
<td><strong>Using a mouse</strong></td>
<td>2. Select <strong>Marker</strong>.</td>
</tr>
<tr>
<td>1. Click <strong>Response</strong>.</td>
<td>3. Select the desired marker.</td>
</tr>
</tbody>
</table>

**Programming Commands**
**Band Power** – Provides a readout of the total power obtained by integrating over the specified frequency range defined by Band Span, centered at the marker position.

The *Average* detector type makes the display more consistent with Band Power markers. With this detector type the marker readouts and the estimated power values or delta from the display have a good match. Many legacy spectrum analyzers need to set the detector type to average to do band power measurements. PNA-SA does not need to select the average detector to compute the right band power measurements, it’s only
useful to check the values between marker readouts and display estimates.

**Band Density** – Selections are **Off**, **Noise**, **Power**, **Tone**, **NPR**, or **ACPR**

- **Noise** – Provides a readout of the noise-power density (dBm/Hz) at the marker position, obtained by integrating over the specified frequency range defined by Band Span, and normalizing to the same frequency range.

- **Power** – Provides a readout of the power density (dBm/Hz) at the marker position, obtained by integrating over the specified frequency range defined by Band Span, and normalizing to the bandwidth defined by Equivalent Span.

- **Tone** – Provides a readout of the power density (dBm/tone) at the marker position, obtained by integrating over the specified frequency range defined by Band Span, and normalizing to the bandwidth defined by Density BW and Equivalent Span. When Density BW is set to the tone spacing of the multitone signal, and Equivalent Span is the same as Band Span, Tone Density gives dBm/tone. This feature is useful for measuring the power density of the signals inside and outside the notch for Noise Power Ratio (NPR) measurements. For example, for measuring a 10 MHz notch with -50 dBm band power and 100 kHz tone spacing (number of tones = 10 MHz/100 kHz = 100), setting the Band Span and Equivalent Span to 10 MHz and the Density BW to 100 kHz, the result shows that each tone would be -70 dBm (-50 dBm - 10\*Log10[100]). Tone band density can also be used to measure Adjacent-Channel-Power-Ratio (ACPR).

- **NPR** – Uses the same calculation method as **Tone**, but provides a simpler readout consisting only of marker frequency and NPR value.

- **ACPR** - Uses the same calculation method as **Tone**, but provides a simpler readout consisting only of marker frequency and ACPR value.

**Note:** The band-density markers can be set to Delta ON mode which is very useful for NPR and ACPR, which are defined as distortion power in a specified band divided by in-band power. For these ratioed measurements, the reference marker can be set to Tone Band Density, with a Band Span that covers the in-channel bandwidth (for NPR, see Equivalent Span below to account for the reduction in channel power due to the notch). The ACPR and NPR delta markers will have a Band Span defined by the adjacent-channel bandwidth or the notch bandwidth respectively.

**Band Span** – Sets the frequency range over which Band Power and Band Density measurements are calculated.

**Equivalent Span** – Sets the frequency range over which Power and Tone Band Density measurements are normalized. This feature is useful for calculating the power density of a wideband signal with a notch (or multiple notches), where the power in the notch(es) is significant and cannot be ignored. Adjusting the Equivalent Span is essential for calculating the correct tone powers of a noise-power-ratio (NPR) signal. For example, for a 100 MHz signal with a 10 MHz notch, the Equivalent Span would be 90 MHz. For measuring the power in the notch, the Equivalent Span and Band Span are the same (10 MHz in this example).
Density BW – Sets the frequency range over which Tone Band Density measurements are calculated.

Occupied BW – Enables/disables the frequency range that contains a defined percentage of the overall band power as specified by OBW Percent.

OBW Percent – Sets the percentage used to calculate Occupied BW.

NPR Measurement Example

Noise-Power-Ratio (NPR) measurements are displayed using a fixed reference marker (set to Tone Band Density) that calculates the power density of the main signal, and a delta marker (set to NPR Band Density) that calculates the power density of the distortion signals within the notch. The Equivalent Span of the main signal is set to the Band Span minus the notch bandwidth – for example, for a 100 MHz wide NPR signal with a 10 MHz notch, the Equivalent Span would be 100 MHz - 10 MHz = 90 MHz. For the notch in this same example, the Equivalent Span would be set to 10 MHz.

Calculations for Band Power and Density Markers

All the band-power and band-density markers are computed from Discrete Fourier Transform (DFT) data, before the data is processed into the display points shown on the screen as traces. As a result, these markers are not affected by the number of display points, or by the detection algorithm used (average, sample, peak, etc.). There are two ways to access the DFT data if a user wishes to do their own calculations of power, or to perform other mathematical processing:

1. Set the Detector Type to Bypass, which works if the number of DFT points is below 100,003 (the trace-size limit).

2. Use the SA Data feature (accessed via the Advanced tab of the SA Setup dialog). In general, the display points do not provide an accurate representation of band-power or band-density values.

There are many more DFT data points than display points, and the data reduction performed by the detection algorithm causes band-power accuracy to degrade at signal discontinuities, where there is a wide change in power values. In addition, when using peak detection, the algorithm takes the largest power value of the DFT data-set to produce a single display point, so the displayed value does not represent the average power of the band covered for that point. For these reasons, it is impossible to compute an accurate band-power or band-density value from display points using the peak detector. This is why the SA band-power and band-density markers are computed from the underlying DFT data.

SA Analysis Markers (Option S93070xB9x070B Modulation Distortion only)
The following markers are specific to Modulation Distortion measurement channels.

**Modulation Distortion markers**

*Using Hardkey/SoftTab/Softkey*

1. Press **Marker > SA Analysis**.
**Band Function** - Selections are **Off, Marker Noise, Band Power,** or **Band Density**.

**Marker Noise** - Noise integrated over the frequency span defined by **Band Span**.

**Band Power** - Power integrated over the frequency span defined by **Band Span**. This is the total power of the signal in dBm or Watts.

**Band Density** - Band power expressed in Watts divided by the integrating bandwidth specified by **Band Span**. The density value is constant as span is decreased.

**Band Span** - The Band Span is used to determine total signal power within a specified frequency span. For example, to calculate the total power of a signal composed of 100 tones spaced 1 MHz apart over a 100 MHz span, the signal power would be integrated over a span of 100 MHz.

**Occupied BW** – Enables/disables the frequency range that contains a defined percentage of the overall band power as specified by OBW Percent.

**OBW Percent** – Sets the percentage used to calculate Occupied BW.

---

**Marker Display**

The marker display dialog allows you to change how markers and the associated readout is displayed on the VNA screen. Several marker display features also apply to **Statistics** display.

---

### How to change Marker Display settings

#### Using Hardkey/SoftTab/Softkey

1. Press **Marker > Marker Setup > Marker Display**....

OR

1. Press **Display > Display Settings > Customize Display**....

2. Select **Markers** tab.

#### Using a mouse

1. Move a cursor to the marker data area on top right corner of grid box.

2. Right click on the marker data display area.

3. Select **Marker Display**....

OR

1. Right click on any window area.

2. Click **Customize Display**....

3. Select **Markers** tab.

---

857
The following settings apply to readouts of ALL currently-displayed marker, bandwidth, and trace statistics.

These settings revert to their defaults on Preset but ARE stored with Instrument State and User Preset.

**Marker Readout**

- Checked - Shows readout information.
- Cleared - Shows NO readout information.

**Large Readout**

- Checked - Shows the marker readout in large font size for easy reading. However, all readout lines may not be visible.
- Cleared - Shows the marker readout in normal font size.

**Active Trace Only**

- Checked - Shows the marker readout for the active trace only.
- Cleared - Shows all marker readouts.

**Readouts Per Trace**
Choose the quantity of marker readouts to show in the window for each trace. Choose to display up to 16 readouts per trace, up to 20 readouts per window. When more markers are present than the specified quantity of readouts, the marker numbers for which readouts are displayed can change depending on the marker number that is active. Readouts Per Trace can be set independently for each window.

**Symbol**

Choose from the following marker symbols.

<table>
<thead>
<tr>
<th>Symbol</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><img src="image" alt="Triangle" /></td>
<td>Triangle</td>
</tr>
<tr>
<td><img src="image" alt="Flag" /></td>
<td>Flag</td>
</tr>
<tr>
<td><img src="image" alt="Line" /></td>
<td>Line</td>
</tr>
</tbody>
</table>

Line symbols are NOT used on Smith or Polar display formats.

Symbols can be set independently for each window.

**Symbols Above Trace**

- Cleared - ONLY the active marker is displayed above the trace. Inactive markers are displayed below the trace.
- Checked - ALL marker symbols are displayed above the trace. The active marker is always filled solid.

**Decimal Places**

Choose the marker readout resolution to display. These values also apply to the readouts that are displayed in the marker table. Decimal Places can be set independently for each window.

- **Stimulus** (X-axis) - Choose from 2 to 6 places after the decimal point. Default is 3.
- **Response** (Y-axis) - choose from 1 to 4 places after the decimal point. Default is 2.

**Readout Position**

Choose where to place the marker readouts. Marker readouts are right-justified on the specified X-axis and Y-axis position. The default position (10.0, 10.0) is the upper-right corner of the grid. Position (1.0,1.0) is the lower-left corner. Readout position can also be set independently for each window.

**Note:** Readout Position can also be changed using a mouse by left-clicking on the top readout and...
Marker Table

You can display a table that provides a summary of marker data for the active trace. The marker data is displayed in the specified format for each marker.

**How to view the Marker Table**

Using **Hardkey/SoftTab/Softkey**

1. Press **Marker > Marker Setup > Marker Table.**
Using Math / Memory Operations

You can perform four types of math on the active trace versus a memory trace. In addition three statistics (Mean, Standard Deviation and Peak to Peak) can be calculated and displayed for the active data trace.

- Trace Math
- Trace Statistics
- AM Distortion
- Trace Deviation

**Note:** Trace Math (described here) allows you to quickly apply one of four math operations using memory traces. *Equation Editor* allows you to build custom equations using several types of traces from the same, or different channels.

**Other Analyze Data topics**

**Trace Math**

To perform any of the math operations, you must first store a trace to memory. You can display the memory trace using the *View* options.

Trace math is performed on the complex data before it is formatted for display. See the *VNA data processing map*.

Markers can be used while viewing a memory trace.

**How to select Trace Math**

<table>
<thead>
<tr>
<th>Using Hardkey/SoftTab/Softkey</th>
<th>Using a mouse</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. Press <strong>Math &gt; Memory</strong>.</td>
<td>1. Right click on any trace status area above the grid box.</td>
</tr>
<tr>
<td>2. <strong>Normalize</strong>, available only from the Memory menu, (not on the Math / Memory dialog), performs the same function as <strong>Data=&gt;Memory</strong>, then <strong>Data / Memory</strong>.</td>
<td>2. Select on <strong>Memory</strong>....</td>
</tr>
</tbody>
</table>
Normalize, available only from the Memory menu, (not on the Math / Memory dialog), performs the same function as Data=>Memory, then Data / Memory.

Data=>Memory Puts the active data trace into memory. You can store one memory trace for every displayed trace.

Note: Many VNA features are NOT allowed on Memory traces. For example, Memory traces can NOT be saved to any file type (PRN, SNP, CTI, CSV, MDF). However, you can restore a memory trace to a data trace using the Memory-to-Data utility at the http://na.support.keysight.com/pna/apps/applications.htm website.

Data Math

All math operations are performed on linear (real and imaginary) data before being formatted. See the VNA Data flow.

Data (or OFF) Does no mathematical operation.

Data / Memory - Current measurement data is divided by the data in memory. Use for ratio comparison of two traces, such as measurements of gain or attenuation. Learn more.

Data – Memory - Data in memory is subtracted from the current measurement data. For example, you can use this feature for storing a measured vector error, then subtracting this error from the DUT measurement. Learn more.
**Data + Memory** - Current measurement data is added to the data in memory. Learn more.

**Data * Memory** - Current measurement data is multiplied by the data in memory. Learn more.

<table>
<thead>
<tr>
<th>Trace View Options</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Data Trace</strong></td>
</tr>
<tr>
<td><strong>Memory Trace</strong></td>
</tr>
<tr>
<td><strong>Data and Memory Trace</strong></td>
</tr>
</tbody>
</table>

**Interpolate**

**Note:** The E5080A and M9485A do not support this function.

After performing a Data->Memory operation, memory interpolation controls whether the memory data is interpolated or not if the start frequency, stop frequency, or Number of Points is subsequently changed. Using the GUI control, interpolate applies to the currently active measurement. When using the remote interfaces (SCPI or COM), the commands apply to the specified measurement.

**Note:** Interpolate does not support the 8510 Mode.

The PNA will return to a default interpolation state after a Preset, creating a new trace, or closing the PNA application. The default interpolation state is set in the Preferences dialog by checking or unchecking the **Memory: Interpolate ON is the default condition** preference. The factory default is unchecked. The default can also be set using the remote interfaces (SCPI or COM).

- When unchecked, after a Data->Memory operation the memory trace's x-y positions will not change if the start or stop frequency is subsequently changed. In addition, if the Number of Points in the sweep is changed after a Data->Memory operation, the memory trace will be invalidated and disappear. If the Number of Points is changed while using Data Math, the Memory trace will be invalidated and Data Math will be forced to the "Off" condition.

- When checked, after a Data->Memory operation the memory trace's x-y positions will be interpolated if the start or stop frequency is subsequently changed. In addition, if the Number of Points in the sweep is changed after a Data->Memory operation, the memory trace will be interpolated.
Note: The PNA will not extrapolate to stimulus values beyond the range that was present at the time of the Data->Memory operation. Instead, the Memory data will be invalidated if the stimulus values exceed the original range.

Note: If Interpolate is checked (ON) and stimulus conditions are different than they were at the time of Data->Memory operation, unchecking (OFF) Interpolate will cause the Memory trace to be either updated (using both original and current stimulus settings) or invalidated (if Number of Points changed since Data->Memory operation). The Memory trace will remain disabled until either Interpolate is checked (ON) or the stimulus settings corresponding to the Data->Memory operation are restored.

(Data / Memory) and (Data - Memory)

(Data / Memory) and (Data - Memory) math operations are performed on linear data before it is formatted. Because data is often viewed in log format, it is not always clear which of the two math operations should be used. Remember: dividing linear data is the same as subtracting logarithmic data. The following illustrates, in general, when to use each operation.

Use **Data / Memory** for normalization purposes, such as when comparing S21 traces "before" and "after" a change is made or measurement of trace noise. In the following table, the Data/Mem values intuitively show the differences between traces. It is not obvious what Data-Mem is displaying.

<table>
<thead>
<tr>
<th>S21 values to compare</th>
<th>Data/Mem</th>
<th>Data-Mem</th>
</tr>
</thead>
<tbody>
<tr>
<td>0.5 dB and 0.6 dB</td>
<td>0.1 dB</td>
<td>-39 dB</td>
</tr>
<tr>
<td>0.5 dB and 0.7 dB</td>
<td>0.2 dB</td>
<td>-33 dB</td>
</tr>
</tbody>
</table>

Use **Data - Memory** to show the relative differences between two signals. Use for comparison of very small signals, such as the S11 match of two connectors.

In the following table, Data/Mem shows both pairs of connectors to have the same 2 dB difference. However, the second pair of connectors have much better S11 performance (-50 and -52) and the relative significance is shown in the Data-Mem values.

<table>
<thead>
<tr>
<th>S11 values to compare</th>
<th>Data/Mem</th>
<th>Data-Mem</th>
</tr>
</thead>
<tbody>
<tr>
<td>-10 dB and -12 dB</td>
<td>2 dB</td>
<td>-24 dB</td>
</tr>
<tr>
<td>-50 dB and -52 dB</td>
<td>2 dB</td>
<td>-64 dB</td>
</tr>
</tbody>
</table>

**Data * Memory and Data + Memory**
Use **Data * Memory and Data + Memory** to perform math on an active data trace using data from your own formulas or algorithms rather than data from a measurement. For example, if you want to simulate the gain of a theoretical amplifier placed in series before the DUT, you could do the following:

1. Create an algorithm that would characterize the frequency response of the theoretical amplifier.

2. Enter complex data pairs that correspond to the number of data points for your data trace.

3. Load the data pairs into memory with SCPI or COM commands. The analyzer maps the complex pairs to correspond to the stimulus values at the actual measurement points.

4. Use the **data + memory** or **data * memory** function to add or multiply the frequency response data to the measured data from the active data trace.

**Note:** The data trace must be configured before you attempt to load the memory.

### Trace Statistics

You can calculate and display statistics for the active data trace. These statistics are:

- Mean
- Standard deviation
- Peak-to-peak values

You can calculate statistics for the full stimulus span or for part of it by using User Ranges.

You can define up to 16 user ranges per channel. These user ranges are the same as the **Search Domain** specified for a marker search in that same channel. They use the same memory registers and thus share the same stimulus spans.

The user ranges for a channel can overlap each other.

A convenient use for trace statistics is to find the peak-to-peak value of passband ripple without searching separately for the minimum and maximum values.

The trace statistics are calculated based on the format used to display the data.

- **Rectangular data formats** are calculated from the scalar data represented in the display
- **Polar or Smith Chart** formats are calculated from the data as it would be displayed in Log Mag format
See how to make Trace Statistics display settings.

### How to activate Trace Statistics

Using Hardkey/SoftTab/Softkey

1. Press **Math > Analysis > Statistics...**

#### Trace Statistics dialog box help

![Trace Statistics dialog box](image)

See how to make Trace Statistics display settings.

**Statistics** Check to display mean, standard deviation, and peak to peak values for the active trace.

**Span** Specifies the span of the active trace where data is collected for a math operation. You can select Full Span, or define up to 16 user spans per channel with Start and Stop. You can also define the user spans from the Search Domain selector on the Marker Search dialog box.

**Start** Defines the start of a user span.

**Stop** Defines the stop of a user span.

Learn more about Trace Statistics (scroll up)

### AM Distortion

Calculate amplitude modulation or phase modulation per trace. This feature is supported on all standard channels and all application channels. This feature can be enabled on any sweep type, but should be applied to a power sweep for useful results. It operates on the underlying data of the trace and will ignore the current format of the trace. It will not perform additional sweeps or collect additional data. AM distortion is only applied to rectilinear formats (for example, Polar, Smith).
How to select AM Distortion

**Using Hardkey/SoftTab/Softkey**

1. Press **Math > Analysis > AM Distortion.**

**Using a mouse**

1. Click on **Response.**
2. Select **Math then AM Distortion.**
3. Select on **Setup....**

---

**AM Distortion** dialog box help

**AM Distortion**

**Off** - Turns off AM Distortion.

**AM-PM** - Displays the phase distortion in either degrees or deg/dB. If the **Y-axis = Slope Calculated Over Aperture** mode is enabled, then the unit is deg/dB. Otherwise, it is in degrees.

**AM-AM** - Displays the amplitude distortion in either dB or dB/dB. If the **Y-axis = Slope Calculated Over Aperture** mode is enabled, then the unit is dB/dB.

**Y-axis = Slope Calculated Over Aperture** Check to calculate the slope over the specified aperture. For AM-PM, the phase slope is shown in deg/dB. For AM-AM, the gain slope is shown in dB/dB. If this mode is not enabled, then the phase or power is normalized using the median linear gain of the first 30% of the trace.

**X-axis = Backoff For Compression Level** Check to calculate compression using the median gain from the first 30% of the trace as the linear gain. The compression point is determined based off this median linear gain value. The x-axis will be shifted but retain the same power range. The back-off from compression is 5 dB. The text field next to this setting specifies the compression level, not the back-off level. By default, the back-off level is 5 dB and cannot be changed.
If the compression point cannot be found, then a warning is displayed in the status bar. An approximate power level of the compression point is calculated with this formula:

\[
\text{Target compression power} = \text{input stop power} + 10\log\left(\frac{\text{compression level}}{\text{compression level at stop power}}\right).
\]

**Trace Deviation**

You can calculate deviation from a least-best fit line. The choices are:

- Off
- Linear - Fit to 1st order curve minimizing RSS deviation.
- Parabolic - Fit to 2nd order curve minimizing RSS deviation.
- Cubic - Fit to 3rd order curve minimizing RSS deviation.

**How to activate Trace Deviation**

**Using** Hardkey/SoftTab/Softkey

1. Press **Math > Analysis > Trace Deviation**
On the Trace Math dialog, check 8510 Mode to simulate the Keysight 8510 data processing chain as it pertains to Trace Math and Memory. This setting applies to all channels. When the box is checked or cleared, the analyzer performs an Instrument Preset and retains its setting through subsequent Instrument Presets.

This setting can be saved as part of an instrument state. However, when recalled, this setting is assumed only temporarily. When a subsequent analyzer Preset is performed, the analyzer reverts to the setting that was in effect before the state was recalled.

You can set a preference to always use 8510 mode.

This image represents the relevant portion of the data flow.

See the entire analyzer data processing chain.

A settings change in any of the operations that occur after the Memory operation on the above analyzer Data Flow diagram changes both the Data trace and the Memory trace. For example, after storing a data trace to memory, when you change the format for the Data Trace, the format for the Memory Trace is also changed to the same setting.

How to turn ON/OFF 8510 mode

Using Hardkey/SoftTab/Softkey

1. Press Math > Memory > 8510 Mode.

No programming are available for this feature
Equation Editor

Equation Editor allows you to enter an algebraic equation that can mathematically manipulate measured data. The results are displayed as a data trace. Data that is used in the equation can be from the same or different channels.

- Overview
- How to start Equation Editor
- Using Equation Editor
- Data that is used in Equation Editor
- Trace Settings, Error Correction, and an Example
- Functions and Constants
- Operators used in Equation Editor
- Example Equations
- Saving Equation Editor Data

- BestFit.dll
- EqnErrorTerms.dll
- Expansion.dll

Other 'Analyze Data' topics

Overview
Equation Editor allows you to enter an algebraic equation of standard mathematical operators and functions, referencing data that is available in the analyzer. Once a valid equation is entered and enabled, the display of the active trace is replaced with the results of the equation, and updated in real-time as new data is acquired. For equations that can be expressed with Equation Editor's supported functions, operators, and data, there is no need for off-line processing in a separate program.

For example, enter the equation \( \frac{S_{21}}{1 - S_{11}} \). The resulting trace is computed as each \( S_{21} \) data point divided by one minus the corresponding \( S_{11} \) data point. For a 201 point sweep setup, the computation is repeated 201 times, once for each point.

As another example, suppose you want the analyzer to make a directivity measurement of your 3-port DUT. This is not a native measurement, but can be achieved using the Equation Editor. The desired result is the sum and difference of LogMag formatted traces, expressed as: \( S_{12} + S_{23} - S_{13} \).

Because Equation Editor operates on \textbf{unformatted complex data}, the required equation is:

\[
\text{DIR} = \frac{S_{12} \times S_{23}}{S_{13}}
\]

DIR becomes a display label to help you identify the computed data trace.

On the equation trace, set the format to LogMag.

---

**How to start Equation Editor**

**Using Hardkey/SoftTab/Softkey**

1. Press \textbf{Math > Analysis > Equation Editor}.
Notes

- **Double-click**, or type, the Functions, Operators, and Data to build an Equation.
- Scroll down to learn more about Using Equation Editor

**Equation**: The field in which equations are built. Click the down arrow to the right to use or modify equations that have been previously saved. This is where equations are saved when you press 'Store Equation'.

**Enabled** Check this box to enable the equation that is currently in the Equation field. If the Enabled box is not available, then the equation is not valid. If a data trace is used that is from a different channel than the Equation trace, the channels MUST have the same number of data points to be valid.

**< Backspace** Moves the cursor to the left while erasing characters.

**<-** Moves the cursor to the left without erasing characters.

**->** Moves the cursor to the right without erasing characters.

**Store Equation** Press to save the current equation. To later recall the equation, click the down arrow to the right of the equation.
Delete Equation  Removes the current equation from the drop-down list.

Functions/Constants:  See descriptions of Functions.

Select the "library" of functions to view. The "built-in" library appears by default which includes the standard functions of equation editor. Other functions that can appear here are functions that you have written and imported. Learn more.

Operators:  See descriptions of Operators.

Trace Data: Select from ALL of the currently valid displayed traces on ALL channels. Valid displayed traces are defined as: any trace with the same number of points as the equation trace and the trace cannot reference itself.

Parameter: Select from undisplayed data that is available ONLY from the active channel (same channel as the equation trace). See Data that is used in Equations.

Note: With an external test set enabled, only parameters involving ports 1 through 4 are listed. However, all available parameters can be typed directly into the Equation field.

Use Short Names  Some functions have shortened names that are entered automatically when checked. Both long and short names can be used interchangeably.

Fast Processing  When checked, updates from trace references or marker references will occur once per sweep. The underlying trace will still update normally. Also, if there are no trace references or marker references in the equation, then there is no change in behavior.

A trace reference is when the equation uses another trace (for example, “eq = tr1 + tr2”). A marker reference is when the built-in marker functions mrkx() or mrky() are used.

Enable Matlab  Available when a full MATLAB version is installed by you on the analyzer. Learn more.

Import... Click to launch the Import Functions Dialog box.

Keyboard...: Provided to allow navigation of the entire dialog with a mouse.

Using Equation Editor

1. Pick a trace in which to enter the equation

   • Equation Editor works on the active trace.
Either create a new trace, or click the Trace Status button on an existing trace to make the trace active.

2. Enter an equation

Start Equation Editor See how.

- The equation text can be in the form of an expression \((S21)/(1-S11)\) or an equation \((\text{DIR} = S12 * S23 / S13)\). This topic refers to both types as equations.
- Either type, or double-click the Functions, Operators, and Data to build an equation.
- Functions and Constants ARE case-sensitive; Data names are NOT case sensitive.
- Learn more about referring to data traces.

3. Check for a valid equation

When a valid equation is entered, the Enabled checkbox becomes available for checking. When the Enabled box is checked:

- The Equation Trace becomes computed data.
- The equation is visible on the Trace Status (up to about 10 characters).
- The equation is visible in the trace Title area (up to about 45 characters) when the Equation trace is active.
- The equation is visible in the Status Bar at the bottom of the display. This is updated only after the equation is entered and the Trace Status button is clicked.
- If an equation is NOT valid, and a trace from a different channel is used, make sure the number of data points is the same for both channels.

Learn more about the Functions, Operators, and Data that are used in Equation Editor.

Data that is used in Equation Editor

Definitions

- **Equation trace** A trace in which an equation resides.
- **Referred trace** A trace that is used as data in an equation.

Example: \(eq=\text{Tr}2+\text{S}11\) is entered into \(\text{Tr}1\).

\(\text{Tr}1\) becomes an equation trace.
**Notes**

- Referred traces are processed one data point at a time. For example, the expression S11/S21 means that for each data point in S11 and S21, divide point N of S11 by point N of S21.

- Once an equation is enabled, the trace is no longer identified by its original measurement parameter. It becomes an equation trace.

- An equation trace can NOT refer to itself. For example, an equation in Tr1 cannot refer to trace Tr1.

- Referred traces can be selected from S-Parameters, Receiver data, Memory traces, and application channels. When equation editor is opened in an application channel, the corresponding application parameters can be selected.

  - See note regarding External Test Sets.

  - See Using Noise Power Traces in Equation Editor

**There are three ways to refer to traces:**

The following distinction is important when discussing the three ways to refer to traces/data.

- **Trace** - a sequential collection of data points that are displayed on the screen.

- **Data** - analyzer measurements that are acquired but not displayed. When an equation trace refers to data that is not displayed, the analyzer will automatically acquire the data.

1. Using **TrX** Trace notation (for example, Tr2).

When a trace is created, check "Show Tr Annotation" to see the Tr number of that trace.

  - **Simple** - ALWAYS refers to displayed traces.

  - Must be used for referring to traces in a different channel as the equation trace.

  - All trace settings are preserved in the equation trace. If you do NOT want a trace setting to be used in the equation trace, you must disable it in the referred trace.

  - If the referred trace is error corrected, then that data is corrected in the equation trace.

  - Used to refer to a memory trace (it must already be stored in memory). Append .MEM to the TrX trace identifier. For example, Tr2.mem refers to the memory trace that is stored for Tr2.

2. Using **S-parameter** notation (for example, S11/S21)
- **Convenient** - ALWAYS refers to data that is NOT displayed.

- Refers to data that resides in the same channel as the equation.

- NOT the same as referring to a displayed S11 trace using TrX notation. See Example.
  
  - The referred data includes NO trace settings.
  
  - If correction is applied to the channel, equation editor traces in that channel will attempt to use corrected parameter data regardless if correction is on/off for the measurement. If there is no corrected data available, then raw data will be used. TrX notation always ignores the correction state.

3. Using **Receiver** notation (for example AB_2); NOT case sensitive.

At least one receiver is required, followed by an underscore and a number.

- The letters before the underscore refer to the receivers.
  
  - Letters alone refer to physical receivers.
  
  - Letters immediately followed by numbers refer to logical receivers. Learn more.
  
  - If two receivers are referenced, they are ratioed.

- The number after the underscore refers to the source port for the measurement.

Examples

- AR1_2 = physical receiver A / physical receiver R1 with 2 as the source port.

- a3b4_1 = reference receiver for port 3 / test port receiver for port 4 with 1 as the source port.

Learn more about ratioed and unratioed receiver measurements.

Receiver notation is like S-parameter notation in that:

- Refers to data that is NOT displayed and resides in the same channel as the equation.

- The referred data includes NO trace settings.

- If correction is applied to the channel, equation editor traces in that channel will attempt to use corrected parameter data regardless if correction is on/off for the measurement. If there is no corrected data available, then raw data will be used. TrX notation always ignores the correction state.
When the equation trace refers to a trace on a different channel:

- The trace must already be displayed.
- Must refer to the trace using TrX notation.
- The Equation trace and the referred trace MUST have the same number of data points or the Enable checkbox will not be available.
- The Equation trace is updated when the last referred data in the same channel is acquired. Therefore, to prevent 'stale' data from being used, the Equation trace must be on a higher numbered channel than the referred trace. This is because the analyzer acquires data in ascending channel number order - first channel 1, then channel 2, and so forth. If the Equation trace is on channel 1, and it refers to a trace on channel 2, the Equation trace will update after channel 1 is finished sweeping, using 'old' data for the channel 2 trace.

**Port Extensions and Equation Editor**

When using port extension with an equation, turn Fixturing ON to ensure that the underlying parameters have port extension properly applied. Learn more.

**Trace Settings, Error Correction, and an Example**

This discussion highlights the differences between using S-parameter / Receiver notation and TrX notation when referring to traces. The key to understanding the differences is realizing that S-parameter / Receiver notation ALWAYS refers to data that is NOT displayed.

- **Trace Settings** Normalization, Trace Math, Gating, Phase and Mag Offset, Electrical Delay, Time Domain.
- **Equation Editor** processing occurs on the equation trace immediately after error correction.
- **Referred Data/Trace** (used in the equation) is taken from the following locations:
  - When using TrX notation, data is taken immediately before formatting. These traces are always displayed
and include **Trace Settings**.

- When using **S-parameter / Receiver** notation, data is taken immediately after error correction. This data is NOT displayed and includes **NO** trace settings *(see example)*.

See Equation Editor Notes at [GetData Method](#) or [GetDataByString Method](#).

### Error-correction and Equation Editor

**Using **TrX** notation:**

- The Trace Settings and Error-correction on the referred trace are used in the Equation trace.

- If error correction is NOT ON, then the raw, uncorrected data is used in the equation trace.

- To see if error correction is ON, make the trace active, then see the **Correction level in the status bar**.

- Turning error correction ON/OFF on the equation trace has no meaning. The referred data that is used in the equation is ALWAYS what determines its level of correction.

**Using **S-parameter** and **Receiver** notation:**

- Because the data is not displayed, **NO** trace settings are used in the Equation trace.

- If correction is applied to the channel, equation editor traces in that channel will attempt to use corrected parameter data regardless if correction is on/off for the measurement. If there is no corrected data available, then raw data will be used. **TrX** notation always ignores the correction state.

- When using S-parameter and Receiver notation to refer to a trace on a channel that has been calibrated with a **Response Cal** or **Receiver Cal**, correction can NOT be turned ON, even though the Status Bar indicates otherwise. For example: Tr1 is an S11 measurement with a Response Cal. Tr2 is an equation trace that refers to S11. The Tr2 equation trace is NOT corrected, even though the Status Bar may indicate that it is corrected. However, if Tr2 refers to Tr1 (not S11), the Tr2 equation trace is corrected.

### Example

This example illustrates the differences when referring to a trace using **S-parameter** notation and **TrX** notation:
- **Tr1** is an S11 measurement with no equation, 2-port correction ON, and Time Domain transform ON.

- **Tr2** is an equation trace that refers to **Tr1**. Tr2 is corrected because Tr1 is corrected. Tr2 is transformed because Tr1 is transformed. If transform is turned ON for Tr2, the data will be transformed AGAIN, which results in "unusual" data.

- **Tr3** is an equation trace that refers to **S11**. This is NOT the same as referring to Tr1. The S11 trace that is referred to is a different instance of S11 that is NOT displayed, and has NO trace settings. Notice that Tr3 data is NOT transformed, although Tr1 is transformed. Correction for **Tr3** can be turned ON and OFF because a calibration was performed on the channel in which the S11 trace resides.

- **Note**: X-axis annotation of the Equation trace is completely independent of the data that is presented. ONLY the data values from a referred trace are used. For example, notice that the Equation trace **Tr2** has Frequency on the X-axis although the referred trace **Tr1** is presented in Time.

**Functions and Constants used in Equation Editor**
ALL trace data that is used in Equation Editor is unformatted, complex data.

When using a mouse with the analyzer, hover over a function in the dialog to learn how it is used.

In the following table,

- Function(scalar x) means that an automatic conversion from a complex number to its scalar magnitude is performed before passing the value to the function.
- Function(complex x) means that the entire complex value is used.
- \( a, b, c, d \) are arguments that are used in the function.

<table>
<thead>
<tr>
<th>Function/Constant</th>

</tbody>
</table>
\( \sqrt{\text{complex } a} \) returns the square root of \( a \), with phase angle in the half-open interval \((-\pi/2, \pi/2]\).

\( \tan(\text{complex } a) \) takes \( a \) in radians and returns the tangent.

\( \text{traceDataArray}(\text{complex } a) \) returns the entire set of points from a sweep. Function is intended to be used as an argument in a custom function to allow access for data array processing.

\( \text{xAxisArray}() \) or \( \text{xAxisArray}(\text{integer } a) \) returns the current value of the x-axis for this channel or from a specified channel.

\( \text{xAxisIndex}() \) returns the current index in the sweep.

\( \text{xAxisValue}() \) or \( \text{xAxisValue}(\text{integer } a) \) returns the current value of the x-axis index for this channel or from a specified channel.

### Example Equations

The following examples may help you get started with Equation Editor.

**Offset each data point in Tr2 from Tr1 by 2dB**

Use the function: \( \text{pow}(\text{complex } a, \text{complex } b) \) -- returns \( a \) to the power \( b \).

\[
20\log(a) + 2 = 20\log(x) \\
\log(a) + 2/20 = \log(x) \quad // \text{divide all by 20.} \\
x = 10^{\log(a) + 2/20} \quad // \text{swap sides and take 10 to the power of both sides} \\
x = 10^{\log(a)} * 10^{(2/20)} \\
x = a * 10^{(2/20)}
\]
The equation is entered into Tr2 as:

\[ \text{Offset} = \text{Tr}1 \times \text{pow}(10, \frac{2}{20}) \]

To offset by 5 dB

\[ \text{Offset} = \text{Tr}1 \times \text{pow}(10, \frac{5}{20}). \]

**Balanced Match using a 2-port analyzer**

\[ \text{SDD11} = \frac{(\text{S}11 - \text{S}21 - \text{S}12 + \text{S}22)}{2} \]

**Conversion loss**

\[ \frac{\text{B}_1}{\text{pow}(10, \frac{-15}{20})} \]

- \( \text{B}_1 \) is a receiver measurement;
- -15 is the input power in dBm

**Third-order intercept point (IP3 or TOI)**

\[ \text{TR}1 \times \sqrt{\frac{\text{Tr}1}{\text{Tr}3}} \]

- Tr1 = input signal power
- Tr3 = intermodulation power (both traces measured with single receivers)

**Harmonics in dBC**

\[ \frac{\text{B}_1}{\text{Tr}2} \]

- \( \text{B}_1 \) is tuned to a harmonic frequency
- Tr2 = power at fundamental frequency, measured with \( \text{B}_1 \) receiver

**PAE (Power Added Efficiency)**

\[ \frac{\text{Pout} - \text{Pin}}{\text{Pdc}} \]

Type the following equation into a new trace with an unratioed measurement, such as AI1. The data format is REAL:

\[ \text{PAE} = 100 \times \left( \frac{0.001 \times \text{pow} (\text{mag(Tr}1),2)}{\text{Tr}2} - \frac{0.001 \times \text{pow} (\text{mag(Tr}1),2)}{\text{pow} (\text{mag(Tr}2),2)} \right) / (\text{Tr}3 \times \text{Tr}4) \]

Where:
- Tr1 - a trace that measures unratioed B receiver.
- Tr2 - a corrected S21 trace (amplifier gain)
- Tr3 - a trace that measures ADC voltage (AI1) across a sensing resistor.
- Tr4 = an equation trace containing Isupp = (Tr3 / value of sensing resistor).

Data is displayed in Real format with units actually being watts.

1-port Insertion Loss

When it is not possible to connect both ends of a cable to the analyzer, a 1-port insertion loss measurement can be made. However, the measured loss must be divided by 2 because the result includes the loss going down and coming back through the cable. This assumes that the device is terminated with a short or open to reflect all of the power. The 'divide by 2' operation (for dB) is performed as follows using Equation Editor:

- Tr1 - an S11 trace in log mag format.
- Tr2 - an equation trace containing sqrt(Tr1)

Max and Min Hold

These two functions allow you to capture and display either the Maximum or Minimum values for each data point over multiple sweeps.

Maxhold(S21) - displays the maximum value for each data point until reset. Reset by disabling, then enabling the equation. This example refers to an S21 trace that is not displayed.

Saving Equation Editor Data

Equation data can be saved to the analyzer hard drive in the following formats:

- Citifile (.cti) - Equation data is saved and recalled. The file header indicates the "underlying" s-parameter trace type.
- PRN - read by Spreadsheet software. Can NOT be recalled by the analyzer.
- CSV - read by Spreadsheet software. Can NOT be recalled by the analyzer.
- MDIF - compatible with Keysight ADS (Advanced Design System). Can NOT be recalled by the analyzer.
- Print to File (bmp, jpg, png) - saves an image of the screen.
Equation data can NOT be saved in .SnP file format. When attempting to save an Equation trace in .SnP format, the "underlying" S-parameter data is saved; not Equation data.
Import Functions

Several additional functions are provided with the VNA. In addition, you can create custom functions which are compiled into a DLL. Import these functions for use in the Equation Editor.

- How to Import Functions
- Supplied User Functions
  - BestFit.dll
  - EqnErrorTerms.dll
  - Expansion.dll

See Also

Custom Equations In PNA.pdf Detailed directions. (This link requires an internet connection.)

**Note:** When building custom equations, ensure that 64-bit DLLs are built when targeting one of the 64-bit VNA versions.

Create custom functions for Equation Editor Template. (This link requires an internet connection.)

Equation Editor Main topic.

How to Import Functions

From the main Equation Editor dialog, click **Import Functions**

**Import Functions** dialog box help

Imports and removes libraries that are used with Equation Editor. A library is a *.DLL file that contains one or more functions.

Although not all functions are applicable to all channels or data sets, they will still appear in the "Function/Constants" list.

Once imported, each library is automatically loaded when the VNA application starts. If a function is not found or if an error occurs while loading, the VNA will not attempt to reload the library when starting.
Import Library tab

Browse  Click to navigate to the .DLL file on the VNA. The recommended location for the custom equation DLLs is the “C:\Program Files\Keysight\Network Analyzer\UserFunctions” directory on the VNA.

Library Preview  Lists the functions that are contained in the library.

Click OK or Apply to load the library.

Remove Library tab

Left pane  Lists the imported libraries. These also appear in the Equation Editor main dialog and remain until removed from the VNA.

Arrows  Click the relevant arrows to move some (>) or all (>>>) libraries from the VNA.

Right Pane  Lists the libraries to remove.

Click OK or Apply to remove the library.

Supplied User Functions

The VNA firmware includes the following custom equation DLLs to supplement the list of built-in
functions. They are available on the VNA at: 'C:\Program Files\Keysight\Network Analyzer\UserFunctions'.

- BestFit.dll
- EqnErrorTerms.dll
- Expansion.dll

**BestFit.dll**

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>d_best_fit_dB()</code></td>
<td>Draws the best fit linear regression line to data specified by PARAM. The best fit line minimizes the RSS (root-sum-square) of the trace data in log-magnitude format. The phase of the regression line is identically zero.</td>
</tr>
<tr>
<td><code>d_channelPower()</code></td>
<td>Computes the channel power for the specified measurement on the given frequencies.</td>
</tr>
</tbody>
</table>

- **d_best_fit_dB**(getNumPoints(),xAxisIndex(),xAxisArray(),traceDataArray(PARAM))
- **d_channelPower**(FA,FB,CHANNELNUM,xAxisIndex(),TRACETYPE,traceDataArray(PARAM))

Computes the channel power for the specified measurement on the given frequencies.

- **FA** and **FB** specify the frequency start/stop values in Hz.
- **CHANNELNUM** is the 1-based channel number to use.
- **PARAM** indicates the measurement to compute channel power for.
- **TRACETYPE** indicates how to display the computed result.
  - If TRACETYPE= 0, the display is a flat line with value equal to the channel power;
  - if TRACETYPE= 1 (default), the display is set to the trace minimum for frequencies outside the range from FA to FB. See examples below.
- If **CHANNELNUM** is hosting an IM Spectrum measurement, the channel power is computed from the formula:
  \[
  \text{channelPower} = 10\log_{10}\left( \frac{\text{area under PARAM trace between FA and FB}}{\text{resolutionBandwidth}} \right)
  \]

For all other measurement types, the formula is:

\[
\text{channelPower} = 10\log_{10}\left( \frac{\text{area under PARAM trace between FA and FB}}{\text{IFBandwidth}} \right)
\]

**TraceType Example 1**: FA=7.75 GHz, FB=8.5 GHz, CHANNELNUM power is displayed over the entire frequency range.
TraceType Example 2: As above, but TRACETYPE is 1 (the default). Displayed result is set to trace minimum outside of specified range.

\[
d_{DFLP}( \text{FreqStart, FreqStop, xAxisIndex()}, \text{getNumPoints()}, \text{xAxisArr})
\]

Computes the deviation from linear phase data of the specified trace, PAI displayed in Phase format, the displayed data will be residual phase response after the group delay slope has been removed. The FreqStart and FreqStop arguments allow the span for this computation. To cover the channel’s entire span, set the frequency number such as 1E100.
<table>
<thead>
<tr>
<th>Function Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>d_flatness_dB()</code></td>
<td>Computes the magnitude flatness of the trace data in PARAM, by first re-normalizing the results to 0 dB.</td>
</tr>
<tr>
<td><code>d_mean()</code></td>
<td>Computes the mean of the specified trace and creates a resulting trace whose mean is the average of the real part at each stimulus point.</td>
</tr>
<tr>
<td><code>d_min_max_dev()</code></td>
<td>Computes the slope and intercept of the line which minimizes that maximum deviation and the data specified by PARAM.</td>
</tr>
<tr>
<td><code>d_min_max_dev_d2()</code></td>
<td>Computes the parameters of the parabola which minimizes that maximum deviation and the data specified by PARAM.</td>
</tr>
<tr>
<td><code>d_min_max_dev_range()</code></td>
<td>Identical to the function <code>d_min_max_dev()</code>, but only operates on data in the frequency range from FSTART to FSTOP.</td>
</tr>
<tr>
<td><code>d_min_sum_dev()</code></td>
<td>Computes the slope and intercept of the line which minimizes that sum of the absolute deviations and the data specified by PARAM.</td>
</tr>
<tr>
<td><code>d_tilt_dB()</code></td>
<td>The result of the tilt() function when displayed in LogMag format is the total deltaY of the best fit line for the specified trace or parameter.</td>
</tr>
</tbody>
</table>
d_unwrap()  \hspace{1cm} d\_unwrap(getNumPoints(), xAxisIndex(), traceDataArray(PARAM))

The result of the unwrap() function when displayed in Real format is the trace or Parameter in degrees.

---

**EqnErrorTerms.dll**

**d_Corr1P()**  \hspace{1cm} d\_Corr1P(chan, xAxisIndex(), rcvr, src, RAWDATA)

Computes and displays 1 port corrected data for the trace data supplied in the RAWDATA placeholder.

*chan* - the channel of interest.

*xAxisIndex()* - the bucket (data point) number.

*rcvr* - the port number of the receiver used to acquire the data.

*src* - the port being driven. The rcvr and src arguments are needed to select the appropriate error terms used in the correction process.

*RAWDATA* - Select the data to be corrected by substituting in a trace number or parameter name.

---

**d_DIR()**  \hspace{1cm} d\_DIR(chanNum, xAxisIndex(), rcvr, src)

Displays the directivity term from the cal set used by the channel <chanNum>.

Set chanNum to the desired channel.

Set rcvr and src to the port number for the desired directivity term.

---

**d_EnhResp()**  \hspace{1cm} d\_EnhResp(chan, xAxisIndex(), rcvr, src, RAWMATCH, RAWGAIN)

Computes the corrected gain using enhanced response correction techniques. This technique is useful in cases where you want to ignore the output match of a device or the output match cannot be accurately measured. In this the raw input match and gain are supplied to equation (via RAWMATCH and RAWGAIN placeholders). To use this equation select a trace (TR n) or parameter to use in place of the raw match and gain terms.

*chan* - the channel number

*xAxisIndex()* - the bucket number (do not modify)

*rcvr* - The port where the data is acquired.
**Sr** - The port being driven. The src and rcvr ports are required so that the appropriate error terms are used to calculate the result.

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
</tr>
</thead>
</table>
| d\_LDM()   | Displays the loadmatch term from the calset used by the channel `<chanNum>`.
|            | Set chanNum to the desired channel.                                          |
|            | Set rcvr to the load port, and src to the source port for the desired load match term. |
|            | LDM(ch, xAxisIndex(), 2, 1) gives you the match presented by port 2 while driving port 1. |
| d\_RFT()   | Displays the reflection tracking term from the calset used by the channel `<chanNum>`. |
|            | Set chanNum to the desired channel.                                          |
|            | Set rcvr and src to the port number for the desired reflection tracking term. |
| d\_SRM()   | Displays the sourcematch term from the calset used by the channel `<chanNum>`. |
|            | Set chanNum to the desired channel.                                          |
|            | Set rcvr and src to the port number for the desired source match term.       |
| d\_TRT()   | Displays the transmission tracking term from the calset used by the channel `<chanNum>`. |
|            | Set chanNum to the desired channel.                                          |
|            | Set rcvr to the receive port and src to the source port such that TRT( ch, xAxisIndex(), 2, 1) gives you the transmission tracking term for the port 2 input receiver driven by port 1, or in other words, the raw S21 tracking term. |
| d\_XTLK()  | Displays the isolation term from the calset used by the channel `<chanNum>`. |
|            | Set chanNum to the desired channel.                                          |
Set rcvr to the receive port and src to the source port such that XTLK(ch, xAxiIndex(), 2, 1) gives you the isolation term for the port 2 input receiver while port 1 is on.

External DC Meter Data Conversion

When creating equations using values from an external DC meter, it is important to understand how these values are stored in the VNA's data buffers and the conversion that occurs when used in an equation. For example, when a voltage is read from an external DC meter, the value is displayed on the VNA as you would expect. That is, if you are reading a voltage level of 2 V from the DC meter in a trace, the VNA will display a level of 2 V. However, the value stored in the VNA data buffers is not a voltage but is a unit-less value. Voltage, Amperes, dBm, and Watts values from an external DC meter are converted so that the format matches that of the data in the VNA internal receivers. In this way, all of the formats within the VNA are the same. This information is important when performing analysis using the Equation Editor because the trace data is the converted value.

See Also

Equation Editor
Configure a DC Device

The following table shows the formats (which are selected from the Type setting on the External DC Meter Properties dialog) and corresponding equations that convert between external DC meter readings and the VNA representation when using the trace data in an equation.

**Note:** Z0 is the characteristic impedance (typically 50 Ohms), dcMeter is the value from the external DC meter, and pnaVal is the value stored in the VNA data buffers. All data types are REAL.

<table>

</table>

**External DC Meter Voltage Example**

The following example shows how trace data is converted when used in an equation. In this example, a
level of 2 V is read from an external DC meter.

1. Configure the external DC meter as described in Configure a DC Device.
2. In the **External DC Meter** dialog, ensure that **Type** is set to **V**.
3. Press **Trace** > **Trace Setup** > **Add Trace** > **New Trace...**.
4. In the **New Trace** dialog, select the **Receivers** tab, check **Activate**, click on the corresponding down arrow in the **Numerator** column, select the external DC meter from the drop down list, then click **OK**.

![New Trace dialog]

**Note:** If the external DC meter is not displayed in the list, ensure that **Active - Show in UI** is checked in the **External Device Configuration** dialog.

5. Trace 1 and Trace 2 should now be displayed on the VNA. Add markers to both traces. The Trace 2 marker should read 2.00 V from the external DC meter.
6. Select Trace 1, then select **Response**, **Format**, **Lin Mag**.
7. Select **Response**, **Math**, then **Equation Editor...**.
8. Enter the following Trace 1 equation to add a value of 2 to the Trace 2 data.
9. Check **Enable Equation**, then click **OK**.
10. Note that instead of a voltage level of 4.00 V, the Trace 1 marker reads 10.94 U (unit-less value).

As shown in the table above, a voltage from an external DC meter is converted using \( \sqrt{\text{dcMeter}^2 \times \frac{\text{dcMeter}}{Z0} \times 1000} \). Therefore, substituting 2 for dcMeter in the equation and using 50 as Z0 results in a value of 8.94. Adding a value of 2 to the Trace 2 data, as defined in the Trace 1 equation, results in the displayed marker value of 10.94.

10. To ensure that the displayed value is 4 instead of 10.94, which is not useful, use the equation from the **VNA to DC Meter Data Conversion** column of the table above as follows:
11. The Trace 1 marker now displays a value of 4.00 U.
Performing Parameter Conversion of Measurement Results

- **Overview**

- **Selecting Conversion Target Parameter**

### Other 'Analyze Data' topics

### Overview

You can use the parameter conversion function to convert the measurement results of the S-parameter ($S_{ab}$) to the following parameters.

- **Equivalent impedance ($Z_r$) and equivalent admittance ($Y_r$) in reflection measurement**

\[
Z_r = Z_{0a} \times \frac{1 + S_{aa}}{1 - S_{aa}}, \quad Y_r = \frac{1}{Z_r}
\]

- **Equivalent impedance ($Z_t$) and equivalent admittance ($Y_t$) in transmission measurement**

\[
Z_t = \frac{2 \times \sqrt{Z_{0a} \times Z_{0b}}}{S_{ab}} - (Z_{0a} + Z_{0b}), \quad Y_t = \frac{1}{Z_t}
\]

- **Inverse S-parameter (1/$S_{ab}$)**

where:

- $Z_{0a}$: Characteristic impedance of port a
- $Z_{0b}$: Characteristic impedance of port b

- **Z/Y Transmission Shunt**
Conjugation converts the measurement value to complex conjugate number.

When the fixture simulator function is ON and the port impedance function is ON, the value set in the port impedance conversion is used. In other cases, the system $Z_0$ (preset value: 50 &) is used.

**Selecting Conversion Target Parameter**

1. Press **Meas > Meas Setup > Conversions**

2. Select function.

Using Limit Lines

Limit lines allow you to compare measurement data to performance constraints that you define.

- Overview
- Create and Edit Limit Lines
- Display and Test with Limit Lines
- Limit Test Setup
- Point Limit Test
- Saving/Recalling Limit Table
- Displaying Judgement Result of Limit Test
- Testing with Sufficient Data Points

Other Analyze Data topics

Overview

Limit lines are visual representations on the VNA screen of the specified limits for a measurement. You can use limit lines to do the following:

- Give the operator visual guides when tuning devices.
- Provide standard criteria for meeting device specification.
- Show the comparison of data versus specifications.

Limit testing compares the measured data with defined limits, and provides optional Pass or Fail information for each measured data point.

You can have up to 100 discrete lines for each measurement trace allowing you to test all aspects of your DUT response.

Limit lines and limit testing are NOT available with Smith Chart or Polar display format. If limit lines are ON and you change to Smith Chart or Polar format, the analyzer will automatically disable the limit lines and limit testing.
By default, limit lines are drawn in the same color as the trace on which they are created. However, all limit lines can be drawn in Red by setting a preference. **Learn more.**

### Create and Edit Limit Lines

You can create limit lines for all measurement traces. The limit lines are the same color as the measurement trace.

Limit lines are made up of discrete lines with four coordinates:

- BEGIN and END stimulus - X-axis values.
- BEGIN and END response - Y-axis values.

#### Limit Table

**How to turn Limit Table ON/OFF**

**Using Hardkey/SoftTab/Softkey**

1. Press **Math > Analysis**.
2. Click **Limit Table > Limit** to turn ON/OFF the Limit Table.

**Programming Commands**

![](image.png)

**Note:** To ADD a limit line to the table, change the last limit line to either MAX or MIN

1. In the **Type** area of the Limit Table, select **MIN** or **MAX** for Limit Line 1.
   - The MIN value will fail measurements BELOW this limit.
   - The MAX value will fail measurements ABOVE this limit.
2. Click **BEGIN STIMULUS** for Limit Segment 1. Enter the desired value.
3. Click **END STIMULUS** for Limit Segment 1. Enter the desired value.
4. Click **BEGIN RESPONSE** for Limit Segment 1. Enter the desired value.
5. Click **END RESPONSE** for Limit Segment 1. Enter the desired value.

6. Repeat Steps 1-5 for each desired limit line.

**Displaying and Testing with Limit Lines**

After creating limit lines, you can then choose to **display** or **hide** them for each trace. The specified limits remain valid even if limit lines are not displayed.

Limit testing cannot be performed on memory traces.

You can choose to provide a visual and / or audible PASS / FAIL indication.

With limit testing turned ON:

- Any portion of the measurement trace that **fails** is **displayed in red**.
- Any portion of the measurement trace that does **NOT fail** remains unchanged and silent.

**Display failed trace points or trace segments**

You can display the data points that fail limit line testing as red dots or as a red trace segment. The default behavior (red trace) can be changed with a Preference setting. Learn how.

![Red dots and Red trace segment](image)

**PASS is the default mode of Pass / Fail testing.**

A data point will **FAIL** only if a measured point falls outside of the limits.

- If the limit line is set to OFF, the entire trace will PASS.
- If there is no measured data point at a limit line stimulus setting, that point will PASS.

**Limit Test Setup**
How to set Limit Test Setup

Using Hardkey/SoftTab/Softkey

1. Press **Math > Analysis**.

2. Click **Limits...** and then select **Limit** tab on the dialog box.

**Limit Test** dialog box help

**Limit Test ON** Check the box to compare the data trace to the limits and display PASS or FAIL.

**Limit Line ON** Check the box to make the limits visible on the screen. (Testing still occurs if the limits are not visible.)

**Sound ON Fail** Check the box to make the VNA beep when a point on the data trace fails the limit test.

**Pass/Fail Position**

Sets the position of the Limit Line Pass/Fail status indicator on the VNA screen.

**X** - X-axis position. 0 is far left; 10 is far right.

**Y** - X-axis position. 0 is bottom; 10 is top.
Show Table  Shows the table that allows you to create and edit limits.

Load Table - Recall the saved limit table. Learn more.

Save Table - Save the limit table. Learn more.

Note: To ADD a limit line to the table, change the last limit line to either MAX or MIN.

Global Pass/Fail

The Pass/Fail indicator provides an easy way to monitor the status of ALL measurements.

Global Pass/Fail ON  Check to display the Global Pass/Fail status.

Policy:  Choose which of the following must occur for the Global Pass/Fail status to display PASS:

- **All Tests** (with **Limit Test ON**) Must Pass - This setting reads the results from the Limit Tests. If all tests (with **Limit Test ON**) PASS, then the Global Pass/Fail status will PASS.

- **All Measurements Must Pass** - This more critical setting shows FAIL unless all measured data points fall within established test limits and Limit Test is ON. Note: In this mode, if one measurement does NOT have **Limit Test ON**, Global Pass/Fail will show FAIL.

Note: In this mode, if one measurement does NOT have **Limit Test ON**, Global Pass/Fail will show FAIL.

Learn more about displaying and testing with Limits (scroll up)

Saving/Recalling Limit Test Table

The limit test table can be saved in a file and recalled later for use on the screen. The file is saved in the csv format (with the extension *.csv), and values are saved as a character string with the unit. The csv formatted file can also be reused in spreadsheet software made for PCs.
How to turn Save or Load Limit Test Table

Using **Hardkey/SoftTab/Softkey**

1. Press **Math > Analysis.**

2. Click **Limits...** and then select **Limit** tab on the dialog box.

3. Click **Load Table** to recall the saved Limit Table.

4. Click **Save Table** to save the Limit Table.

| No Programming are available for this feature |

**Load Table**

1. To recall the saved limit table, click **Load Table** from the Limit Test Setup dialog and a Recall dialog box is open. At this time, CSV Files (with the extension *.csv) is selected as the file type.

2. Specify the folder that contains the file and then select the file. Click Recall to recall the saved limit table on the screen.

**Note:** You can recall a limit table from a trace on any channel independently of the channel and trace that were active when the limit table was saved to the file.

**Save Table**

1. To save the limit table, click **Save Table** from the Limit Test Setup dialog and a Save As dialog box is open. At this time, CSV Files (with the extension *.csv) is selected as the file type.

2. Specify any folder in which you want to save the file and enter the file name. Click **Save** to save the limit table displayed on the screen to a file.

**The limit table is saved in the following format:**

- First line indicates the type of limit test of the instrument.

- Second line indicates the revision of the limit test.

- Third line indicates a header for the segment items that are output from the fourth line onward.
From the fourth line onward, the segment data are output.

**Sample Limit table saved format:**

"# E5080 Limit Test"

"# Revision: 1.00"

<table>
<thead>
<tr>
<th>TYPE, BEGIN STIMULUS, END STIMULUS, BEGIN RESPONSE, END RESPONSE</th>
</tr>
</thead>
<tbody>
<tr>
<td>MIN, 5.600000 GHz, 7.500000 GHz, -30.000000dB, -30.000000dB</td>
</tr>
<tr>
<td>MAX, 4.700000 GHz, 5.800000 GHz, -10.000000dB, -10.000000dB</td>
</tr>
<tr>
<td>MAX, 6.200000 GHz, 8.000000 GHz, -10.000000dB, -10.000000dB</td>
</tr>
<tr>
<td>OFF, 0.000000 Hz, 0.000000 Hz, 0.00dB</td>
</tr>
</tbody>
</table>

**Displaying Judgement Result of Limit Test**

**Judgment result of measurement points and trace**

Measurement points that fail are displayed in red on the screen. The judgment result of the trace is indicated by Pass or Fail displayed at the right bottom of screen by default and its position can be edited.

**Judgment Result of Channels**

If a channel has a judgment result of fail, the result is displayed at Global Pass/Fail dialog box when the
Global Pass/Fail ON is checked (ON). It will be judged as failed if one or more unsatisfactory trace exists in any of the limit test within the channel.

How to turn ON/OFF Global Pass/Fail

Using Hardkey/SoftTab/Softkey

1. Press **Math > Analysis**.
2. Click **Limits...** and then select **Limit** tab on the dialog box.
3. Check the box to turn ON the Global Pass/Fail.
4. Clear the box to turn OFF the Global Pass/Fail.

Testing with Sufficient Data Points

When **System > System Setup > Preferences**, **Limit: Test the nearest measurement point** is NOT checked, limits are checked only at the actual measured data points. Therefore, it is possible for a device to be out of specification without a limit test failure indication if the data point density is insufficient.

The following image is a data trace of an actual filter using 11 data points (approximately one every vertical graticule). The filter is being tested with a minimum limit line (any data point under the limit line fails).

Although the data trace is clearly below the limit line on both sides of the filter skirts, there is a PASS indication because there is no data point being measured at these frequencies.
The following image shows the exact same conditions, except the number of data points is increased to 1601. The filter now fails the minimum limit test indicated by the red data trace.

When System > System Setup > Preferences, Limit: Test the nearest measurement point is checked, the limit is compared with the nearest measurement point.
Limit Test at certain point

The limit test at a certain frequency point is available. This function is similar to one in the E5071C. When (Begin Stimulus = End Stimulus) and (Begin Response = End Response) in the limit test table, the point is defined as point limit test and v (for max) or ^ (for min) symbol is displayed.

When you use the point limit test, confirm if System > System Setup > Preferences, Limit: Test the nearest measurement point is checked. In this setting, even if the test point (= Begin Stimulus = End Stimulus) is not located at measurement point, the result is determined using the nearest measurement point.
Use Ripple Limit Test

- Overview
- Concept of Ripple Limit Test
- Create and Edit Ripple Limit Lines
- Displaying Ripple Limit Test Results
- Ripple Limit Test Setup
- Saving/Recalling Ripple Limit Table

Other 'Analyze Data' topics

Overview

The ripple limit function can be executed independently of limit test function. Independently of the limit test, you can evaluate the measurement results on a PASS/FAIL basis by setting a limit for the ripple. This function is called the Ripple Limit Test.

In this picture, A is greater than B. Therefore, A is considered as the ripple of the specified stimulus range.

The ripple limit function evaluates the measurement point values only. Interpolated values are not used.

Concept of Ripple Limit Test

The ripple limit test is a function for evaluating the results on a Pass/Fail basis based on the ripple
limit, which is set using the ripple limit table. Ripple is defined as the difference between the largest and smallest value within a specified stimulus range. You can specify up to 12 frequency bands, which permits a test for each frequency band.

The ripple limit test judges the measurement as "Pass" when the ripple value specified with the ripple limit is not exceeded by any of the measurement points on the trace; Otherwise, it judges the measurement as "Fail." For the measurement points in a stimulus range without a specified ripple limit, the test judges the measurement as "Pass."

**Note:** The measurement point alone is the target of evaluation for pass/fail. The interpolated part between measurement points is not evaluated.

The ripple limit is defined with the start point stimulus value, end point stimulus value, ripple limit value and type (on/off). For detailed information, see Ripple Limit Table.

While the ripple limit test function is turned on, the measurement points corresponding to a "FAIL" judgment will be indicated in red on the screen and the trace's test results based on the results of each measurement point will be displayed (judged as "Fail" if one or more red measurement point exist on the trace). For information on how to display the results, see Ripple Limit Setup. You can also confirm the channel test results on the screen (judged as "Fail" if one or more failed traces appear in the limit test, ripple limit test or bandwidth limit test within the channel).

### Create and Edit Ripple Limit Lines

You can create ripple limit lines for all measurement traces. The ripple limit lines are the same color as the measurement trace.

Ripple limit lines are made up of discrete lines with three coordinates:

- Begin Stimulus and End Stimulus - X-axis values.
- Max Ripple - Y-axis values.

### Ripple Limit Table

You must configure the ripple limit before you can use the ripple limit test function. You can specify a ripple limit table for each trace, where up to 12 ripple limit bands (frequency bands) can be configured.
How to turn ON/OFF Ripple Limit Table

Using Hardkey/SoftTab/Softkey

1. Press **Math > Analysis.**

2. Click **Limit Table > Ripple** to turn ON/OFF the Ripple Table.

Note: To ADD a frequency band to the ripple limit table, change the last ripple limit line to either ON or OFF.

Note: No frequency band is provided in the ripple limit table by default.

1. In the **Type** area of the Ripple Limit Table, select **ON or OFF** for Ripple Limit Line 1.
   - ON - Band used for the ripple limit test.
   - OFF - Band not used for the ripple limit test.

2. Click **Begin Stimulus** for Ripple Limit Segment 1. Enter the desired value.

3. Click **End Stimulus** for Ripple Limit Segment 1. Enter the desired value.

4. Click **Max Ripple** for Ripple Limit Segment 1. Enter the desired value.

5. Repeat Steps 1-4 for each desired ripple limit line.

Example of ripple limit configuration

- The individual frequency bands for the ripple limit test can overlap each other; in this case, the ripple limit test is performed for each frequency band.

Note: Acceptable range for the stimulus value: -500G to +500G. If any out ranging value is specified, it will be reset to fall within the range.

Note: Even if the VNA's sweep range is changed after the stimulus value has been set, the stimulus value is not susceptible.
- Even if the VNA’s span value is set to zero, you must enter a parameter for both Begin Stimulus and End Stimulus.

- If the data format is Smith chart or polar, the limit test is performed for the main response value among the two marker response values.

**Displaying Ripple Limit Test Results**

**Test result for trace**

The test result for the trace will be indicated as Pass or Fail in the upper-left area of the graph. You can also display the ripple value at the selected frequency band. If a trace is unsatisfactory, test results and ripple lines are displayed by red color.

The result will be displayed as Ripln: Pass (or Fail) for each trace. n denotes the trace number. Bn will be followed by the ripple value (if the ripple display is turned off, only Bn will be displayed without the ripple value).

![Graph showing Ripple Limit Test Result](image)

**Global Pass/Fail**

The Global Pass/Fail setting in the limit tab is applied to ripple limit test. It will be judged as failed if one or more unsatisfactory trace exists in any of the ripple limit test within the channel.

**Ripple Limit Test Setup**
How to set Ripple Limit Test Setup

Using Hardkey/SoftTab/Softkey

1. Press Channel or Trace to select the trace on which you want to apply the ripple limit test function.
2. Press Math > Analysis.
3. Click Limits... and then select Ripple tab on the dialog box.

**Ripple Test**

**Ripple Test ON** - Check the box to set the ripple test ON or OFF and also display PASS or FAIL.

**Ripple Line ON** - Check the box to make the ripple limit line visible on the screen (Test still runs even though the ripple line does not turns on).

**Ripple Result**

**Type** - Sets how the ripple values are displayed. Available settings are **Off**, **Absolute** value (difference between maximum and minimum values within the band) display and **Margin** (difference between absolute value of ripple and ripple limit) display.
**Segment** - Enable to specify a ripple limit table up to 12 stimulus segment for each trace.

**Ripple Table**

**Show Table** - Check the box to show the table that allows you to create and edit limits.

**Load Table** - Recall the saved ripple limit table. Learn more.

**Save Table** - Save the ripple limit table. Learn more.

**Saving/Recalling Ripple Limit Table**

The ripple limit table can be saved in a file and recalled later for use on the screen. The file is saved in the csv format (with the extension *.csv), and values are saved as a character string with the unit. The csv formatted file can also be reused in spreadsheet software made for PCs.

**How to set Ripple Limit Setup**

**Using Hardkey/SoftTab/Softkey**

1. Press **Math > Analysis.**

2. Click **Limits...** and then select **Ripple** tab on the dialog box.

3. Click **Load Table** to recall the saved Ripple Limit Table.

4. Click **Save Table** to save the Ripple Limit Table.

| No Programming are available for this feature |

**Load Table**

1. To recall the saved ripple limit table, click **Load Table** from the Ripple Limit Test Setup dialog and a Recall dialog box is open. At this time, CSV Files (with the extension *.csv) is selected as the file type.

2. Specify the folder that contains the file and then select the file. Click Recall to recall the saved ripple limit table on the screen.

**Note:** You can recall a ripple limit table from a trace on any channel independently of the channel and trace that were active when the ripple limit table was saved to the file.
Save Table

1. To save the ripple limit table, click Save Table from the Ripple Limit Test Setup dialog and a Save As dialog box is open. At this time, CSV Files (with the extension *.csv) is selected as the file type.

2. Specify any folder in which you want to save the file and enter the file name. Click Save to save the ripple limit table displayed on the screen to a file.

The ripple limit table is saved in the following format:

- First line indicates the type of limit test of the instrument.
- Second line indicates the revision of the limit test.
- Third line indicates a header for the segment items that are output from the fourth line onward.
- From the fourth line onward, the segment data are output.

Sample Ripple Limit table saved format:

"# E5080 Ripple Limit Test"

"# Revision: 1.00"

TYPE, BEGIN STIMULUS, END STIMULUS, MAX RIPPLE
ON, 933.0000000 MHz, 964.0000000 MHz, 1.5 dB
ON, 938.0000000 MHz, 953.0000000 MHz, 500 mDB
Use Bandwidth Limit Test

- Overview
- Displaying Bandwidth Limit Test Results
- Bandwidth Limit Test Setup

Other 'Analyze Data' topics

Overview

The bandwidth limit test function can be used for testing bandwidth for the band-pass filters.

The bandwidth test finds the peak of a signal in the passband and locates a point on each side of the passband at an amplitude below the peak specified in test setup. The frequency between these two points is the bandwidth of the filter. Then, the obtained bandwidth is compared to minimum and maximum allowable bandwidth that you specify beforehand.

Displaying Bandwidth Limit Test Results

Test Result for Trace

The test result for the trace will be indicated as Pass, Wide or Narrow in the upper-left area of the graph by following BWn. "n" denotes the trace number. You can also display the bandwidth value. If a trace is unsatisfactory, test results and bandwidth markers are displayed by red color.
Global Pass/Fail

The Global Pass/Fail setting in the limit tab is applied to bandwidth limit test. It will be judged as failed if one or more unsatisfactory trace exists in any of the bandwidth test within the channel.

Bandwidth Limit Test Setup

You must set up the bandwidth threshold and the upper and lower limits before you can use the bandwidth limit test function. You can specify the threshold, upper limit and lower limit for each trace.

How to set Bandwidth Limit Setup

Using *Hardkey/SoftTab/Softkey*

1. Press Channel or Trace to select the trace on which you want to apply the bandwidth limit test function.

2. Press **Math > Analysis.**

3. Click **Limits...** and then select **Bandwidth** tab on the dialog box.
Bandwidth Test Setup Dialog Box Help

Bandwidth Test

**Bandwidth Test ON** - Check the box to set the bandwidth limit test ON or OFF.

**Bandwidth Marker ON** - Check the box to make the bandwidth marker visible on the screen (Test still runs even though the bandwidth marker does not turn on).

**Sound ON Fail** - Check the box to turn ON when the bandwidth limit test is FAIL.

**Target Bandwidth**

**N dB Points** - Specify the bandwidth threshold in dB unit.

**Min Bandwidth** - Enter the lower limit for the bandwidth in Hz unit.

**Max Bandwidth** - Enter the upper limit for the bandwidth in Hz unit.

**Note:** If the data format is Smith chart or polar, the test is skipped.
Save and Recall a File

You can save and recall files to and from an internal or external storage device in a variety of file formats.

- How to Save Instrument State
- How to Save Measurement Data
- How to Recall a File
- About Instrument State and Calibration Data (.csa, .cst, .sta, .cal)
- About Measurement Data Files (.prn, .snp, .cti, .csv, .mdf)

Other Data Outputting topics

How to Save Instrument State and Calibration Files

Using Hardkey/SoftTab/Softkey

1. Press Save Recall > Save State or Save Other.
Save State

Learn all about VNA Instrument State files.

Save State - Immediately saves the VNA state, possibly calibration data and link to the selected filename by depends on the Save Type. The selected filename is automatically generate in the storage when you performed a save.

Auto Save - Saves state, calibration data and link to the storage. Saves state and calibration data to the internal storage in the D: folder. A filename is generated automatically using the syntax "atxxx"; where xxx is a number that is increment by one when a new file is Auto Saved. The filename is depends on the Save Type to save it in ".sta", ".csa" or ".cst".

Save State As... - Starts the Save As dialog box. (Not available on M948xA and E5080A.)

Save Register - Immediately saves the specified register (Register 1 to 8) to the selected filename by depends on the Save Type. The selected filename is automatically generate in the storage when you performed a save on selected register.

Save Type

State - Save VNA state in .sta filename.

State + Cal Data - Save VNA state and calibration data in .csa filename.

State + Cal Link - Save VNA state and calibration link in .cst filename.

Save Other

Save Calset... & Save Screen... - Starts the Save As dialog box.

Save Data... - Starts the Save Data As dialog box.

Save User Preset... - Start the User Preset dialog box.
**Save As dialog box help**

**Save** Allows you to navigate to the directory where you want to save the file.

**File name** Displays the filename that you either typed in or clicked on in the directory contents box.

**Note:** Filenames (not including the path name) MUST be limited to 64 characters.

**Save as type**

The following file types save **Instrument states and Calibration data**. You can save, and later recall, instrument settings and calibration data for **all channels** currently in use on the analyzer. These file types are only recognized by Keysight VNA analyzers.

*Learn more about these file types.*

- ***.csa** - save Instrument state and actual Cal Set data (cal/state archive) **Default selection.**
- ***.cst** - save Instrument state and a link to the Cal Set data.
- ***.sta** - save Instrument state ONLY (no calibration data)
- ***.cal** - save actual Calibration data ONLY (no Instrument state)

**Note:** To save the screen as .bmp, .jpg, or .png graphics file types, click **File / Print to File.** Learn more.

**Save** Saves the file to the specified file name and directory.

---

**Save VNA Measurement Data**
How to Save Measurement Data

Using **Hardkey/SoftTab/Softkey**

1. Press **Save Recall > Save Other > Save Data...**

**Save Data As** Saves the current trace(s) to the specified type of file.

**Note:** This dialog now contains the settings previously selected from the old **Define Data Save** dialog.

### Save Data As dialog box help

**Note:** Before saving measurement data, always **trigger a single** measurement, and then allow the channel to go into Hold. This ensures that the entire measurement trace is saved.

**Note:** Memory traces can NOT be saved to any file type (PRN, SNP, CTI, CSV, MDF).

**Save in** Allows you to navigate to the directory where you want to save the file.

**File name** Displays the filename that you either typed in or clicked on in the directory contents box.

**Note:** Filenames (not including the path name) MUST be limited to 64 characters.

**Save as type** Choose from: (click each to learn more about each file type): *.prn, *.SNP, *.SNPX, *.cti (citifile), *.csv, *.mdf.

- FCA, GCA, Swept IMD, and Swept IMDx data can be saved to a special csv format. Learn how (FCA, GCA - Swept IMD)

- **Trace and Noise Parameters (*.snp)** - Save the noise figure parameters and S-parameters. Learn more.

- To save the screen as .bmp, .jpg, or .png graphics file types, click **File / Print / Print to File.** Learn more.

- Save Uncertainty (Opt S93015A/B) data (*.u*p, *.dsd, *.sdatcv). Learn more.

### Data Scope

- **Auto**
- When correction is OFF, saves the specified trace.
- When correction is ON, saves all corrected parameters associated with the calibrated ports in the Cal Set.
- For GCA and Swept IMD channels, saves the active trace only.
  - **Single Trace** - Saves the active trace.
  - **Displayed Traces** - Saves all displayed traces for all channels.
  - **Channel Traces** - Saves all displayed traces for active channels.

**Format**

Determines the format of the data. Available with (CTI Formatted, CSV, SNP, MDIF)

  - **Auto** - Data is saved in LogMag or LinMag if one of these is the currently selected display format. If format is other than these, then data is saved in Real/Imag.
  - **LogMag/Angle (dB/deg), LinMag/Angle (unit/deg), Real/Imaginary** - Select output format.
  - The imaginary portion for all LogMag and LinMag data is saved in degrees (dB/deg).
  - **Real/Imaginary data is never smoothed.**
  - **Displayed Format (CSV and MDIF only)** - Data is saved in the format of the displayed trace.

**Note:** .prn files can only save the active trace in the displayed format.

**Save** Saves the file to the specified file name and directory.

**Cancel** - Closes the dialog.

**Help** - Displays **Save Data As** dialog box help.
### How to Recall (open) a file

<table>
<thead>
<tr>
<th>Using Hardkey/SoftTab/Softkey</th>
<th>Using a mouse</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. Press <strong>Save Recall &gt; Recall.</strong></td>
<td>1. Click on <strong>File</strong></td>
</tr>
<tr>
<td></td>
<td>2. Select <strong>Recall Data...</strong></td>
</tr>
</tbody>
</table>

#### Save Recall > Recall Softtab Help

**Recall State** - Recall the specified filename.

**Recall State** - Select from a list of files shown on softkeys. The list can be sorted by 'most recently used' or alphabetically depending on a preference. The preference setting appears at the bottom of the second page of softkeys listing files to be recalled or on the **Preference dialog**.

**Recall State...** - Starts the **Recall** dialog box.

**Recall Register** - Recall the register (Register 1 to 8) which is saved in the D:\ drive (Only the saved register will enable to recall).

**Recall Calset...** - Starts the **Recall** dialog box.

**Recall Data...** - Starts the **Recall** dialog box.

**Recall Order** - A list of files for recall can arrange according to NAME or RECENT files.

### Recall dialog box help

**Look in** Allows you to select the directory that contains the file that you want to recall.

**Filename** Displays the filename that you either typed in or clicked on in the directory contents box.

**Files of type** Allows you view and select files that are listed in categories of a file type. The following types of files can be recalled into the analyzer: All **State files**, Citi files, SNP files.

#### Recalling instrument state files

When an Instrument State file is recalled, the current state of the instrument is overwritten with the recalled state. A *.cal file does not contain an instrument state, but only calibration data. Learn more about Instrument States.

See also **Power ON and OFF during Save / Recall, User Preset, and Preset.**

#### Recalling Data files

Citi files and SNP files can be recalled and viewed in the analyzer.
1. Click **File** then **Recall**.

2. Select **Citifile Data** or **Snp**.

3. Select the file to recall

4. Click **Recall**.

**Note:** Citi files that were saved in **CW Time sweep** can NOT be recalled into the VNA.

**Note:** Filenames (not including the path name) that are longer than 64 characters will NOT be recalled.

Recalled data is ALWAYS displayed using **LogMag format**, regardless of how the file was stored.

The channel is placed in Trigger Hold. If triggering is resumed, the data will be overwritten.

**SNP files** are recalled as traces into a single window and channel, beginning at the **highest available channel number allowed on the analyzer**. For multi-port SNP files (greater than 4 ports), if the number of S parameters in the file is beyond the **maximum number of traces in a window**, then new windows will be created.

**Citi files** are recalled into the same window and channel configuration as when they were saved. However, the new recalled channel numbers begin with the **highest channel number allowed on the analyzer** and decrement for each additional channel.

For example, when a citi file is saved, two traces are in window 1, channel 1 and two additional traces are in window 2, channel 2. When recalled into a factory preset condition (1 trace in window 1, channel 1), the first two recalled traces appear in window 2, highest channel number, and the second two traces appear in window 3, (highest channel number -1). See also **Traces, Channels, and Windows**.

**Recall** Recalls the file displayed in the file name box.

**Instrument State / Calibration Files**

You can save, and later recall, instrument settings and calibration data **for all channels** currently in use on the analyzer.

An **Instrument State** contains almost every analyzer setting. The following settings are NOT saved and recalled with Instrument State:

- **GPIB address**
The following file types are used to save and recall instrument states and Cal Set information:

<table>
<thead>
<tr>
<th>File Types</th>
<th>Information that is stored for each channel</th>
</tr>
</thead>
<tbody>
<tr>
<td>.sta</td>
<td>Instrument State Information</td>
</tr>
<tr>
<td>.cst</td>
<td>Frequency range</td>
</tr>
<tr>
<td>.csa</td>
<td>Number of points</td>
</tr>
<tr>
<td>.cal</td>
<td>IF bandwidth</td>
</tr>
<tr>
<td></td>
<td>Sweep type</td>
</tr>
<tr>
<td></td>
<td>Sweep mode</td>
</tr>
</tbody>
</table>

**Cal Set Information**

- GUID (Globally Unique Identifier)
  - provides link to Cal Set
- Name, Description, Modify date
- Stimulus Information:
  - Frequency range  | Alternate sweep |
  - Number of points | Port powers |
  - IF bandwidth    | Source attenuators |
  - Sweep type      | Receiver attenuators |
  - Sweep mode      | Test Set port map |
- Error Terms: Directivity, Crosstalk, Source match, Load match, Reflection tracking, Transmission tracking

**File Type Descriptions and Recall**

The following describes each file type, and what occurs when the file type is recalled.

Instrument states can have the following suffixes: .sta, .cst, and .csa.

Common to all of the instrument state files is the state of the instrument including the quantity and content of channels, traces, windows, markers, limit lines, etc.
What is different about the instrument state files is the way they handle the calset - a calset is the set of data that results from having executed a calibration on a channel.

**Compatibility of Files**

- There is no compatibility among the VNA family products. For example, M937xA/P937xA cannot recall the state file which is saved by M980xA/P50xxA.
- The analyzers cannot recall file saved by that with the smaller number of port. For example, 2 port VNAs cannot recall the files saved by 4 port VNAs.
- When the installed option is different, recalling the file may fail.

**.sta files**

- Contain ONLY instrument state information - NOT Cal data.
- When recalled, they always replace the current instrument state immediately.

This instrument state file is saved without any calset data. You might choose to use this type of save file if you are concerned about disk space or specifically do not want to store calibration data that tends to have a shelf life. That is, calibrations become less accurate as cables move and temperature changes. Perhaps you want to force a new calibration when the instrument state is used.

**.cst files**

- Contain BOTH instrument state and a LINK to the Cal Sets. [Learn more about Cal Sets.](#)
- The **quickest and most flexible** method of saving and recalling a calibrated instrument state.
- Channels need not have cal data to save as .cst file.
- When recalled, the state information is loaded first. Then the analyzer attempts to apply a Cal Set as you would do manually. If the stimulus settings are different between the instrument state and the linked Cal Set, the usual choice is presented (see Cal Sets). If the linked Cal Set has been deleted, a message is displayed, but the state information remains in place.
- Because only a link to the Cal Set is saved, the Cal Set can be shared with other measurements.
- If you perform a calibration and save the result to a calset called "MyCalSet", then save a .cst file (for example, MyState.cst), then that file will have a reference to the name of the calset ("MyCalSet").
  - If you redo the calibration and store the data again in MyCalSet, then the next time you recall
MyState.cst, your instrument state will use the new calibration data.

- If you subsequently delete MyCalset, and then recall the MyState.cst, the resulting instrument state will not be calibrated as the calset no longer exists.

**Note:** Before saving a .cst file, be sure that a User Cal Set (NOT a Cal Register) is being used for the calibration. Cal Registers are overwritten with new data whenever a calibration is performed, and may not be accurate cal data when the .cst file is recalled. Learn more about Cal Sets.

* .cal files

- Contain ONLY Cal Set information.
- When recalled, the Cal Set is NOT automatically applied. Apply the calibration data to a channel as you would apply any Cal Set.

* .csa files

- Contain ALL instrument state and the actual Cal Set; not a link to the Cal Set.
- The **safest** method of saving and recalling a calibrated instrument state. However, the file size is larger than a .cst file, and the save and recall times are longer.
- Channels need not be calibrated to save as .cst file.
- The Cal Set that is saved could be a **Cal Register or a User Cal Set**.

A .csa file is an instrument state and a collection of calset data. Every channel that has an active calibration (that is, has a calset selected and applied to the channel) stores its calibration data into the .csa file. For example, let's say you have a calset called “mycalset” and you are using that calset on channel 1. You save a .csa file called MyState. If you then perform another calibration and save that calibration to “mycalset”, the data in “mycalset” will not be the same as the calibration data in the MyState file. Consequently, when you recall MyState the old calset called “mycalset” will overwrite the new calset “mycalset”. When this is about to occur, you are given a warning. If this is a problem for you, you might prefer to use a .cst file.

**Note:** *.pcs files are the internal file format used for storing cal sets. These files should never be accessed or copied by the user.

**Measurement Data Files**

932
Measurement data is saved as ASCII file types for use in a spreadsheet or CAE programs.

**Note:** Before saving measurement data, always **trigger a single** measurement, and then allow the channel to go into Hold. This ensures that the entire measurement trace is saved.

**Note:** **Memory traces** can NOT be saved to any file type (PRN, SNP, CTI, CSV, MDF).

The following file types can be saved by the analyzer:

- *.prn files
- *.SNP (Touchstone)
- *.cti (Citifile)
- *.csv
- *.mdf (MDIF)

***.prn Files**

Prn files have the following attributes:

- Comma-separated data which can be read into rows and columns by spreadsheet software, such as Microsoft Excel. To avoid the "delimiting" dialog boxes, change the filename extension from .prn to .csv. Then open directly into Microsoft Excel.
- Contain formatted and corrected stimulus and response data for the current active trace ONLY.
- Are Output only - they cannot be read by the analyzer.
- Applications and **Cal Set Viewer** data can be saved to *.prn files

**How to Save PRN Trace Data (*.prn)**

**Using Hardkey/SoftTab/Softkey**

1. Press **Save Recall > Save Other > Save Data....**
2. Under **Save as type**, select **PRN Trace Data (*.prn)**.
Example:

"S11 Log Mag"

"Frequency (Hz)", "dB"

3.000000e+005  , -3.528682e+001 ,
4.529850e+007  , -2.817913e+001 ,
9.029700e+007  , -3.216808e+001 ,
1.352955e+008  , -3.101017e+001 ,

**SNP Format (\*.s1p, \*.s2p, \*.s3p, \*.s4p, and so forth)**

- \*.SNP file format, also known as Touchstone format, is specified by IBIS. See the Touchstone specification.
- \*.SNP file format is used by CAE programs such as Keysight's Microwave Design System (MDS) and Advanced Design System (ADS).
- \*.SNP data is saved using the **File, Save Data As** dialog.

Before saving measurement data, always **trigger a single** measurement, and then allow the channel to go into Hold. This ensures that the entire measurement trace is saved.

**\*.SNP files and other analyzer settings**

- \*.SNP data can be **recalled** and viewed on the analyzer, or read by the **embed/de-embed** functions.
- To save SNP data with an **external test set** enabled, at the File, **Save As** dialog, select **SNP File(\*.s*p)**, then complete the "Choose Ports " dialog.
- When **Fixturing** is enabled, all of the enabled data transforms (De-embedding, Port Z Conversion, and so forth) are applied to saved SNP files.
- When **Smoothing** is applied to a trace, the smoothing is NOT saved when the format is Real, Imaginary (RI). Select a different format to save the smoothed data.
- Segmented FCA data is saved to **\*.S2PX files**. Scroll down or **click here** to learn more.
- Learn about **FCA parameters that are saved to an S2P file**.
- Noise Figure parameters and S-parameters can be saved to an \*.s2p file. Learn more.
- Balanced parameters can be saved to \*.SNP files. See the "Choose Ports " dialog.
- **IMPORTANT** - ALL valid data is saved using the same format and settings (trace math, offset, delay, and so forth) as the active measurement. This can cause the data that is saved for the non-active measurements to
be dramatically different from the data that is displayed. For example, when saving an S2P file, if the active S11 measurement is set to Data/Mem (data divided by memory), then ALL 4 S-parameters are saved using Data/Mem. The memory trace that is used in the Data/Mem operation is the same as that used in the active (S11) measurement.

What is Saved

*.SNP data is generally used to gather all S-parameters for a fully corrected measurement.

The analyzer saves the data that is available on the channel of the active measurement.

<table>
<thead>
<tr>
<th>File Type</th>
<th># of Ports</th>
<th># of S-parameters saved</th>
</tr>
</thead>
<tbody>
<tr>
<td>*.s1p</td>
<td>1</td>
<td>1 S-parameter</td>
</tr>
<tr>
<td>*.s2p</td>
<td>2</td>
<td>4 S-parameters</td>
</tr>
<tr>
<td>*.s3p</td>
<td>3</td>
<td>9 S-parameters</td>
</tr>
<tr>
<td>*.s4p</td>
<td>4</td>
<td>16 S-parameters</td>
</tr>
<tr>
<td>...</td>
<td>...</td>
<td>...</td>
</tr>
<tr>
<td>*.SNP</td>
<td>N</td>
<td>N^2 S-parameters</td>
</tr>
</tbody>
</table>

- If correction for a **Full N-port cal** is applied, then valid data is returned for all corrected s-parameters. Response cals will save uncorrected data.

- If requesting **less** data than is available, the Choose ports for SNP data dialog appears.

- If correction is NOT applied, the analyzer returns as much applicable raw data as possible using S-parameter measurements on the selected channel. Data that is not available is zero-filled. For example, if correction is NOT applied and the active measurement is S11, and an S21 measurement also exists on the channel, then data is returned for the S11 and S21 measurements. Data for S12 and S22 is not available and therefore returned as zeros in Real/Imaginary format. In Log Mag/Phase format, this appears as -200 dB and 45 degrees.

**How to Save .SNP Format (*.s1p, *.s2p, *.s3p, *.s4p)**

Using **Hardkey/SoftTab/Softkey**

1. Press **Save Recall > Save Other > Save Data...**
2. Under **Save as type**, select **Trace (*.s1p, *.s2p, *.s3p or *.s4p).**

**.SNP Data Output**

*.SNP files contain header information, stimulus data, a response data pair for EACH S-parameter
measurement. The only difference between .s1p, s2p, and so forth, is the number of S-parameters that are saved.

The following is a sample of **Header information:**

!Keysight Technologies,E8362B,US42340026,Q.03.54
!Keysight E8362B: Q.03.54

Example:
**.S2PX Data Output**

*.S2PX files are used for Segmented Mixer Data. [Learn more.](#)

The following ADDITIONAL columns precede parameter data:

SegIndex, InputFreq, OutputFreq, LO1Freq, InputPower, LO1Power, <parameter data>

---

**Choose ports for SNP File** dialog box help

This dialog appears when any of the following conditions exist while attempting to save data to an *snp file:
- you request less data than is available

- you want data for more than 4 ports

- a balanced measurement is active

**Number of ports**  Select the number of ports for which data will be saved.

The following buttons appear ONLY when a **Balanced measurement** is displayed.

**Normal**  Click to save normal (single-ended) port data.

**Mixed Mode**  Click to save balanced (logical) port data. Choices are based on the **topology selection** for current active parameter:

- **SE-Bal**: Choose from S1, D2, C2 (Single-ended port 1, Differential port 2, Common port 2)

- **SE, SE, Bal**: Choose from S1, S2, D3, C3 (Single-ended port 1, Single-ended port 2, Differential port 3, Common port 3)

- **Bal-Bal**: Choose from D1, C1, D2, C2 (Differential port 1, Common port 1, Differential port 2, Common port 2)

For example, with SE-Bal topology, choose 2 ports, S1 for first, and D2 for second. The following 4 parameters are saved: Sss11, Ssd12, Sds21, Sdd22.

**Arrow buttons**  Click to Add or Remove ports from or to the following columns:

**Available Ports**  All test set ports are listed. There may NOT be valid data available for all of these ports. Learn more.

**Chosen Ports**  When **OK** is clicked, SNP data is saved for these ports.

**OK**  Becomes available when the number of **Chosen ports** = the **Number of ports** to save. Click to save to SNP file.

With **Number of ports** = 2, .s2p data is saved; with **Number of ports** = 3, .s3p data is saved, and so forth. Learn more about SNP files

.cti Citifiles

Citifile format is compatible with the Keysight 8510 Network Analyzer and Keysight's Microwave Design System (MDS).

You can do the following using citifiles:
• save the active trace, or all traces.

• save formatted or unformatted citifile data

---

How to Save Citifile Formatted Data (*.cti)

Using Hardkey/SoftTab/Softkey

1. Press **Save Recall** > **Save Other** > **Save Data**.

2. Under **Save as type**, select **Citifile Formatted Data (*.cti)**.

---

*.cti files contain:

• Header information

• Stimulus data

• Data pairs for EACH S-parameter measurement

---

The above image is a Citifile opened in Notepad. There are two traces in separate channels - one is an FCA trace. Each trace has 3 data points. The save settings = **Displayed Traces** Content, and **Auto** Format.

Format is identified by DBANGLE (log mag), MAGANGLE (Lin Mag), or RI (real, imaginary - NOT shown)

On the **data access map**, Formatted data is taken from location 2 or 4.
How to Save Citifile Unformatted Data (*.cti)

Using Hardkey/SoftTab/Softkey

1. Press Save Recall > Save Other > Save Data....

2. Under Save as type, select Citifile Data Data (Real,imag) (*.cti).

On the data access map, Unformatted data is taken from the block just before Format.

Citifiles can be recalled and viewed in the analyzer. Learn more.

*.csv Files

Note: 2D Gain Compression data is saved as *.csv files using a different format than shown here. Learn more.

CSV files are read by spreadsheet programs such as Microsoft Excel.

How to Save CSV Formatted Data (*.csv)

Using Hardkey/SoftTab/Softkey

1. Press Save Recall > Save Other > Save Data....

2. Under Save as type, select CSV Formatted Data (.csv).

*.csv files contain: header information and the following Comma-Separated Values.

- Stimulus data
- Data pairs for EACH S-parameter
*.mdf Files

MDIF files are compatible with Keysight ADS (Advanced Design System). Learn more at the Keysight website.

How to Save MDIF Data (*.mdif)

Using **Hardkey/SoftTab/Softkey**

1. Press **Save Recall > Save Other > Save Data...**
2. Under **Save as type**, select **MDIF Data (*.mdif)**.

*.mdf files contain: header information and space-separated data:

- **Stimulus data**
- **Real and Imaginary data pair for EACH S-parameter measurement**

Define Data Saves

**Note:** Although these settings are still supported, they are no longer necessary to save data files. The **Save Data As** dialog box contains these settings.
How to select Define Data Saves

Using Hardkey/SoftTab/Softkey

1. Press System > System Setup > Preferences....

2. Click the Data Saves... button on the Preferences dialog box.

Define Data Saves dialog box help

Note: Although these settings are still supported, they are no longer necessary to save data files. The Save Data As dialog box contains these settings.

The following settings survive an Instrument Preset and Shutdown.

CitiFile, CSV, and MDIF Contents

Determines what is saved to a .cti file.

Auto - Saves the active trace. Additional traces are saved if correction is ON. For Full 2-port calibration, 4 traces are saved; for Full 3-port calibration, 9 traces are saved, and so forth.

Single Trace - Saves the active trace.

Displayed Traces - Saves all displayed traces for all channels.

CitiFile and CSV Format

Auto - Data is saved in LogMag or LinMag if one of these is the currently selected display format. If format is other than these, then data is saved in Real/Imag.

LogMag, LinMag, Real/Imag - Select output format.

- The imaginary portion for all LogMag and LinMag data is saved in degrees.
- Real/Imag data is never smoothed.

SnP Format (.s1p, .s2p, .s3p)

Learn more about SnP files.

Auto - Data is saved in LogMag or LinMag if one of these is the currently selected format. If format is other than these, then data is saved in Real/Imag.

LogMag, LinMag, Real/Imag - Select output format. The imaginary portion for all LogMag and
LinMag data is output is in degrees.

Manage Files without a Mouse

How to Manage Files without a Mouse

Using Hardkey/SoftTab/Softkey

1. Press Save Recall > Save Other.
2. Click Manage Files... and then D: \ drive folder dialog box appears.

OR

1. Press System > Main.
2. Click Manage Files... and then D: \ drive folder dialog box appears.

Manage Files dialog box help

The Manage Files dialog box is designed to be used from the front panel. It performs the same function as Windows Explorer, but can be used without the use of a mouse or keyboard.
Drive Mapping

Drive mapping allows you to share disk drives between the VNA and an external computer.

To prepare for Drive Mapping:

1. Both the PC and VNA must be connected to a shared computer network.
2. You must know the full computer name of the Analyzer you are mapping TO. Tell me how.

Note: This procedure requires a mouse and keyboard.

Map to a drive on the VNA from an External PC

1. On the analyzer desktop, click Windows Explorer. Right-click on the drive you want to share. Click Sharing...
2. In the dialog box, select Shared this folder. In the Share Name box, type in a share name for the drive. For example: C$. Click OK.
3. On the external PC desktop, click Windows Explorer. From the Tools menu, click Map Network Drive.
4. If the current logon on your PC is different from the current logon on the analyzer, click Connect using a different Logon to connect to using the current analyzer logon. This logon must be registered on the external PC. To see the current logon on either the PC or analyzer, hold Ctrl - Alt, and press Delete.
   a. In the Connect as box, type the logon currently being used by the analyzer.
   b. In the Password box, type the logon password that you use on the external computer. Click OK.
5. In the Folder box, type //computername (prep1)/share name (from step 2). (For example: //SLT1234/C$)
6. Click Finish.
Print a Displayed Measurement

The analyzer allows you to print a displayed measurement to a printer or to a file. The printer can be either networked or local.

- Connecting a Printer
- Printing

Other Outputting Data topics

Connecting a Printer

You can connect a printer to one of the VNA USB ports or to the LAN connector.

To Add a Printer

**Note:** If you try to print from the VNA application and the Add Printer Wizard appears, click Cancel and add the printer using the following procedure.

1. From the VNA application, press System > Main > Minimize Application.
2. On the Windows taskbar, click Devices and Printers.
3. Double-click Add Printer.
4. Follow the instructions in the Add Printer Wizard.

For more information, refer to Microsoft Windows Help or your printer documentation.

Printing

- Print a Hardcopy
- Page Setup
- Print to File

The measurement information on the screen can be printed to any local or networked printer that is connected to the VNA. The graphic below shows an example of how a screen-capture image appears...
when printed. The Page Setup settings allows you to customize the printed form of the measurement information.

How to Print a Hardcopy

Using Hardkey/SoftTab/Softkey

1. Press System > Print.
2. Click Print....

No programming commands are available for this feature.
Note: For information on the choices in the Print dialog box, see Windows Help.

Page Setup

The Page Setup dialog allows flexibility in the appearance that measurement data is printed. After setting up the page, click File, then Print... to obtain a hard-copy.

How to select Page Setup

Using Hardkey/SoftTab/Softkey

1. Press System > Print > Page Setup....

OR

1. Press System > System Setup > Preferences.....

2. Click the Page Setup... button on Preferences dialog box.

Page Setup dialog box help
Paper, Orientation, and Margins

These settings do NOT survive a VNA shutdown.

See Windows Help for information on these settings.

Windows

The following VNA-specific settings DO survive a VNA shutdown:

Minimum vertical size  Adjust to change the amount of a page that the measurement window fills. The adjustment range is from 40 to 100%.

One window per page  Check to print one window per page. Clear to print all selected windows without a forced page break.

Only active window  Check to print only the active window. Clear to print all windows.

Instrument logo  Check to print the Keysight logo to the header.

Data and Time  Check to add the current date and time to the header.

Global Pass/Fail  Check to add the Global Pass/Fail status to the header.

Page Numbers  Check to add page numbers (1 of n) to the header.

Channel Settings Table

Print  Check to print the channel settings table.
Segment data can no longer be printed.

**Trace Attributes Table**

**Print** Check to print the Trace Attributes Table. The Trace Attributes are measurement type, correction factors ON or OFF, smoothing, options, and marker details. The Trace Attributes are listed by Trace ID# for each window.

Each Trace ID# can have multiple entries depending on the number of markers associated with the trace. The marker details are marker number, position and response. If there are multiple markers on a trace, the trace attributes are only shown for the first marker. However, the trace attributes for the first marker apply to all other markers on that trace.

The options column can have one or more options. D for Delay, M for Marker, G for Gating. Multiple options selected would appear as follows: DMG.

**Print marker data** Check to print all marker data. The amount of data depends on how many markers are created.

---

**Print to a File**

The analyzer can save a screen-capture image in any of the following formats:

- .png (preferred format)
- .bmp (bitmap)
- .jpg

The analyzer automatically saves the file to the current path. If not previously defined, the analyzer automatically selects the default path D:\.

A .bmp file, like a .prn file, can be imported into software applications such as Microsoft Excel, Word, or Paint to display a screen-capture image.

See Save and Recall files for more information.

---

**How to Print to a File**

**Using Hardkey/SoftTab/Softkey**

1. Press **System > Print > Print to File**....
Finding Programming Commands

Three ways to find programming commands:

1. **From simulated User Interface:** **Hardkeys**, **SoftTabs**, and **Softkeys**.

   Click on **Command Finder** to display the screen below. Clicking on one of the **Hardkeys** shown in the online help screen opens the corresponding **SoftTab** and **Softkey** menus and corresponding SCPI/COM commands. This is a "mapping" of GUI functions to their corresponding SCPI/COM commands.
2. From a simulated User Interface of the drop-down menus:

File  |  Instrument  |  Response  |  Stimulus  |  Utility  |  Cal  |  Apps  |  Remote ONLY

<p>| | | | | | | |</p>

ActiveParametersApp Object

Description

Controls the Active (Hot) Parameter Application settings.

Accessing the ActiveParametersApp object

```vba
Dim app
Set app = CreateObject("AgilentPNA835x.Application")
app.Preset
app.CreateCustomMeasurementEx 2, "Active Parameters", "IPwr"
Set ActParam = app.ActiveChannel. CustomChannelConfiguration
```

**Application Object**

**Description**

The Application object is the highest object in the VNA **object model**. This object presents methods and properties that affect the entire analyzer, rather than a specific channel or measurement. For example, the application object provides the GetIDString method. There's only one ID string for the instrument, unrelated to the channel or parameter being measured. Likewise, the TriggerSignal Property is global to the instrument. You can elect to use an internally generated (free run) trigger or a manual trigger. Either way, that type of trigger generation will be used on all measurements, on all channels. Therefore, it is under the Application object.

**Accessing the Application object**

This object is unique in that you must **create** this object rather than just get a handle to it.

```vba
Dim app As AgilentPNA835x.Application
Set app = CreateObject("AgilentPNA835x.Application", <analyzerName>)
```

Replace `<analyzerName>` with the full computer name of your VNA. For example, "My VNA". See **Change Computer Name**.

</tbody>
</table>
ManualTrigger  IApplication  Triggers the analyzer when TriggerSignal = naTriggerManual.

Preset  IApplication  Resets the analyzer to factory defined default settings.

PrintToFile  IApplication  Saves the screen data to bitmap (.bmp) file of the screen.

PutShortcut  IApplication  Puts a Macro (shortcut) file into the analyzer.

Quit  IApplication  Ends the Network Analyzer application.

Recall  IApplication  Recalls a measurement state, calibration state, or both from the hard drive into the analyzer.

RecallKits  IApplication  Recalls the calibration kits definitions that were stored with the SaveKits command.

Reset  IApplication  Removes all existing windows and measurements.

RestoreCalKitDefaults  IApplication  Restores the factory defaults for the specified kit.

RestoreCalKitDefaultsAll  IApplication  Restores the factory defaults for all kits.

Save  IApplication  Saves instrument state and calibration files to disk.

SaveCitiDataData  IApplication5  Saves UNFORMATTED trace data to .cti file. **Superseded** with SaveData.

SaveCitiFormattedData  IApplication5  Saves FORMATTED trace data to .cti file. **Superseded** with SaveData.

SaveData  IApplication18  Saves trace data to files on disk.

SaveKits  IApplication  Saves all cal kits to disk.

SetFailOnOverRange  IApplication  Causes over range values to return an error code.

SetIPConfiguration  IApplication14  Modifies settings of the VNAs computer networking configuration.

ShowStatusBar  IApplication  Shows and Hides the Status Bar.

ShowStimulus  IApplication  Shows and Hides Stimulus information.

ShowTitleBars  IApplication  Shows and Hides the Title Bars.

ShowToolbar  IApplication  Shows and Hides the specified Toolbar.

UserPreset  IApplication7  Performs a User Preset.

UserPresetLoadFile  IApplication7  Loads an existing instrument state file (.sta or .cst) to be used for User Preset.
UserPresetSaveState | IApplication7 | Saves the current instrument settings as UserPreset.sta.

</tbody>
</table>
GPIBMode  IApplication  Makes the analyzer the system controller or a talker/listener.

GridLineType  IApplication17  Set and return the line type of the window grid (solid | dotted)

IDString  IApplication  Returns the model, serial number and software revision of the analyzer

InterfaceControl  IApplication8  Control the Interface control features.

IOConfiguration  IApplication19  Provides access to IO Configuration commands

LANConfiguration  IApplication13  Returns the current status of the VNA computer networking configuration.

LXIDeviceIDState  IApplication14  Displays the LAN Status dialog with LAN Status Indicator showing IDENTIFY.

LocalLockoutState  IApplication4  Prevents use of the mouse, keyboard, and front panel while your program is running.

Measurement  IApplication  Create and manage measurements

Measurements  IApplication  Collection for iterating through the Application measurements.

MessageText  IApplication  Returns text for the specified eventID

NaWindows  IApplication  Collection for iterating through the Application windows.

NoiseSourceState  IApplication13  Sets and Reads the ON | OFF state of the noise source

NumberOfPorts  IApplication  Returns the number of hardware test ports on the VNA

Options  IApplication  Returns the options on the analyzer

PathConfigurationManager  IApplication11  Provides access to hardware configuration.

Port Extensions  IApplication  Superseded with Fixturing Object

Preferences  IApplication5  Preferences for many VNA settings.

ScpiStringParser  IApplication  Provides the ability to send a SCPI command from within the COM command.

SecurityLevel  IApplication4  Turns ON or OFF the display of frequency information.

SICL  IApplication5  Allows control of the VNA via SICL

SICLAddress  IApplication8  Sets and returns the VNA SICL address
**SourcePowerCalibrator**  
IApplication2  
Allows capability for performing source power calibrations.

**SourcePowerState**  
IApplication  
Turns Source Power ON and OFF.

**SystemImpedanceZ0**  
IApplication  
Sets the analyzer impedance value.

**SystemName**  
IApplication  
Returns the full computer name of the VNA.

**Touchscreen**  
IApplication12  
Enables and disables touchscreen.

**TriggerDelay**  
IApplication  
Sets or returns the delay time for a trigger.

**TriggerSetup**  
IApplication4  
Controls triggering for the entire VNA application.

**TriggerSignal**  
IApplication  
**Superseded with** Source Property

**TriggerType**  
IApplication  
**Superseded with** Scope Property

**UncertaintyManager**  
IApplication20  
Returns a handle to the (Dynamic) Uncertainty Manager application.

**UserPresetEnable**  
IApplication7  
'Checks' and 'clears' the enable box on the User Preset dialog box.

**VelocityFactor**  
IApplication  
Sets the velocity factor to be used with Electrical Delay, Port Extensions, and Time Domain marker distance calculations.

**Visible**  
IApplication  
Makes the Network Analyzer application visible or not visible.

**WindowState**  
IApplication  
Sets or returns the window setting of Maximized, Minimized, or Normal.

Shared with the NAWindow Object

AuxiliaryTrigger Object

Description

These properties setup Auxiliary triggering on a channel.

Accessing the object

Use chan.AuxTrigger(n) to access the object.

where n= the connector pair to be used for Auxiliary Triggering.

- VNA models: Use 1 or 2

Use app.AuxiliaryTriggerCount to determine the number of auxiliary trigger pairs on the rear panel of a VNA.

```vba
Dim app as AgilentPNA835x.Application
Dim chan as Channel
Set chan = app.ActiveChannel
Dim AuxTrig as AuxTrigger
AuxTrig = chan.AuxTrigger(2)
```

**BalancedTopology Object**

**Description**

The DUTTopology property sets and returns the topology of a balanced DUT.

The following methods *set* the port mappings for the DUT.

The remaining properties *return* the port mappings for the DUT.

Use the BalancedMeasurement object to set the measurement type.

**Accessing the BalancedTopology object**

```vba
dim app as AgilentPNA835x.Application
dim chan as Channel
set chan = app.ActiveChannel

dim balTopology as BalancedTopology
set balTopology = chan.BalancedTopology
```

Calibrator Object

See Also

- Example Programs
- Calibrator Methods and Properties
- ICalData Interface for putting and getting typed Calibration data.
- Superseded commands

Description

The Calibrator object, a child of the channel, is used to perform an **Unguided** calibration.

**Important!**

Do **NOT** use commands from the GuidedCalibration object when performing an Unguided calibration. Use ONLY the Calibrator object.

You can **NOT** perform a full 3 or 4-port using the Calibrator object. You must use the GuidedCalibration object.

There must be a measurement present for the calibrator to use or you will receive a "no measurement found" error. Therefore, to perform a 2-port cal, you must have any S-parameter measurement on the channel. For a 1-port measurement, you must have the measurement (S11 or S22) on the channel. The same is true for a response measurement.

There are a number of approaches to calibration with the calibrator object:

- You can collect data yourself and download it to the ACQUISITION buffer. The acquisition buffer holds the actual measured data for each standard. See the VNA data map.

  1. Calibrator.SetCalInfo
  2. Connect a standard
  3. Trigger a sweep
  4. Retrieve the data for the standard
  5. Download the data - calibrator.putStandard
6. Repeat for each standard
7. Calibrator.CalculateErrorCoefficients

- You can tell the calibrator to acquire a standard. In this case, the calibrator collects the data and places it in the ACQUISITION buffer.

1. Calibrator.SetCalInfo
2. Connect a standard
3. Calibrator.AcquireCalStandard
4. Repeat for each standard
5. Calibrator.CalculateErrorCoefficients

- You can put previously-retrieved error terms in the error correction buffer.

1. PutErrorTerm
2. Repeat for each term
3. Measurement.Caltype = pick one

- You can also "piece together" a 2-port cal from two 1-port cals (S11 and S22) and four response (thru) cals. The system will detect that all the standards needed for a 2-port cal have been acquired even though they may not have gathered at the same time.

**Accessing the Calibrator object**

```vba
Dim app As AgilentPNA835x.Application
Set app = CreateObject("AgilentPNA835x.Application", <analyzerName>)

Dim cal As ICalibrator
Set cal = app.ActiveChannel.Calibrator
```

### ICalData Interface

**Description**

Contains methods for putting Calibration data in and getting Calibration data out of the analyzer using typed data. This interface transfers data more efficiently than variant data. However, this interface is only usable from VB6, C, & C++. All other programming languages must use the ICalSet interface.

There is also an **ICalData Interface** on the CalSet Object

Learn about reading and writing Calibration data.

CalKit Object

Description
The calkit object provides the properties and methods to access and modify a calibration kit.

Accessing a CalKit object
The active cal kit is the kit that is selected for use in Unguided calibrations. To get a handle to the active kit, use the app.ActiveCalKit property. To access the CalKit object for a specific cal kit, you must first make that kit the active kit using app.CalKitType.

The CalKit object behaves differently from other objects in that you can only have a handle to one cal kit -- the active cal kit. Therefore, when you change the CalKitType from either the Application object or the CalKit object, you may also be changing the object to which you may have other references.

For example, the following example specifies two CalKit type objects and in turn, assigns them to two different variables: ck1 and ck2.

```vba
Dim app As AgilentPNA835x.Application
Dim ck1 As calKit
Dim ck2 As calKit
Set app = CreateObject("AgilentPNA835x.Application", <analyzerName>)
app.CalKitType = naCalKit_User1
Set ck1 = app.ActiveCalKit
ck1.Name = "My CalKit1"
app.CalKitType = naCalKit_User2
Set ck2 = app.ActiveCalKit
ck2.Name = "My CalKit2"

Print "ck1: " & ck1.Name
Print "ck2: " & ck2.Name
```

When the pointer to each of these kits is read (printed), they each have a pointer to the last kit to be assigned to the active cal kit:

ck1: My CalKit2
ck2: My CalKit2

CalSet Object

See ICalData Interface for putting and getting typed Cal Set data.

**Description**

Use this interface to query and or change the contents of a Cal Set.

**Accessing the CalSet object**

Get a handle to a CalSet object by using the CalSets collection. This is done through the CalManager object with the app.GetCalManager Method.

```vba
Dim app As AgilentPNA835x.Application
Set app = CreateObject("AgilentPNA835x.Application", <analyzerName>)

Dim calst As ICalSet
Set calst = app.GetCalManager.CalSets.Item(1)

' OR Get a handle by CalSet Name
Set calst = app.GetCalManager.CalSets.Item("MyCalSet")
```

StimulusValues ICalSet3 Returns x-axis values for stimulus or response frequencies

StopFrequency ICalSet3 Returns the stop frequency of the channel.

StopPower ICalSet3 Returns the stop power of the VNA when sweep type is set to Power Sweep.

SweepGenerationMode ICalSet3 Returns the method being used to generate a sweep: analog or stepped.

SweepTime ICalSet3 Returns the sweep time of the analyzer.

SweepType ICalSet3 Returns the type of X-axis sweep that is performed on a channel.

TestPortPower ICalSet3 Returns the RF power level for the channel.

TestSetType ICalSet5 Returns the Test Set type used for the Cal Set.

CalSets Collection

Description

A collection object that provides a mechanism for iterating through all the Cal Sets in the analyzer. There is no ordering to the items in the collection. Therefore make no assumptions about the formatting of the collection.

For the Item and Remove methods, you can specify either the Cal Set string name, or the integer item of the Cal Set in the collection.

Accessing the CalSets collection

Get a handle to the CalSets collection through the CalManager object with the app.GetCalManager Method.

```vba
Dim app As AgilentPNA835x.Application
Set app = CreateObject("AgilentPNA835x.Application", <analyzerName>)

Dim calsts As CalSets
Set calsts = app.GetCalManager.CalSets
```

## CalStandard Object

### Description

Contains all of the settings that are required to modify a calibration standard.

For more information, read *Specifying Calibration Standards and Kits for Keysight Vector Network Analyzers (Application Note 1287-11)*

### Accessing the CalStandard object

Get a handle to a standard with the `calkit.GetCalStandard` Method.

```vba
Dim app As AgilentPNA835x.Application
Set app = CreateObject("AgilentPNA835x.Application", <analyzerName>)

Dim std As ICalStandard
Set std = app.ActiveCalKit.GetCalStandard(1)
std.Delay = 0.00000003
```

C3  ICalStandard  Sets and Returns the C3 value (the fourth capacitance value) for the calibration standard, when the Type is set to "naOpen".

Delay  ICalStandard  Sets and Returns the electrical delay value for the calibration standard.

L0  ICalStandard  Sets and Returns the L0 (L-zero) value (the first inductance value) for the calibration standard, when the Type is set to "naShort".

L1  ICalStandard  Sets and Returns the L1 value (the second inductance value) for the calibration standard, when the Type is set to "naShort".

L2  ICalStandard  Sets and Returns the L2 value (the third inductance value) for the calibration standard, when the Type is set to "naShort".

L3  ICalStandard  Sets and Returns the L3 value (the third inductance value) for the calibration standard, when the Type is set to "naShort".

Label  ICalStandard  Sets and Returns the label for the calibration standard.

Loss  ICalStandard  Sets and Returns the insertion loss for the calibration standard.

Maximum Frequency  ICalStandard  Sets and Returns the maximum frequency for the calibration standard.

Medium  ICalStandard  Sets and Returns the media type of the calibration standard.

Minimum Frequency  ICalStandard  Sets and Returns the minimum frequency for the calibration standard.

Type  ICalStandard  Sets and Returns the type of calibration standard. Selections are: naOpen, naShort, naLoad, naThru, naArbitraryImpedance and naSliding.

TZReal  ICalStandard  Sets and Returns the TZReal value (the Real Terminal Impedance value) for the calibration standard, when the Type is set to "naArbitraryImpedance".

TZImag  ICalStandard  Sets and Returns the TZImag value (the Imaginary Terminal Impedance value) for the calibration standard, when the Type is set to "naArbitraryImpedance".

Z0  ICalStandard  Sets and Returns the characteristic impedance for the calibration standard.

Channel Object

See SourcePowerCalData Interface for putting and getting typed source power calibration data.

Description

The channel object is like the engine that produces data. Channel settings consist of stimulus values like frequency, power, IF bandwidth, and number of points.

Accessing the Channel object

You can get a handle to a channel in a number of ways. But first you have to make sure that the channel exists. When you first startup the analyzer, there is one S11 measurement on channel 1. Thus there is only one channel in existence. You can do the following:

```
Dim app As AgilentPNA835x.Application
Set app = CreateObject("AgilentPNA835x.Application", <analyzerName>)

Dim chan As IChannel
Set chan = app.ActiveChannel
```

or

```
Set chan = app.Channels(2)
```

The first method returns the channel object that is driving the active measurement. If there is no measurement, there may not be a channel. Once a channel is created, it does not go away. So if there once was a measurement (hence a channel), the channel will still be available.

If there is no channel you can create one in a couple ways. You can do the following:

```
Pna.CreateMeasurement( ch1, "S11", port1, window2)
```

or

```
Pna.Channels.Add(2)
```

The latter will have no visible effect on the analyzer. It will simply create channel 2 if it does not already exist.

</table>
centerFrequency  IChannel  Sets or returns the center frequency of the channel.
               Shared with the Segment Object

CenterFrequencyStepSize  IChannel25 Sets and reads the center frequency step size of the analyzer.

CenterFrequencyStepSizeMode  IChannel25 Sets and reads how the center frequency step size is determined.

channelNumber  IChannel  Returns the Channel number.
               Shared with the Measurement Object

Converter  IChannel21 Provides access to a mixer/converter object.

CorrectionMethods  IChannel21 Provides access to channel correction properties.

CoupleChannelParams  IChannel5  Turns ON and OFF Time Domain Trace Coupling.

CouplePorts  IChannel  Turns ON and OFF port power coupling.

CustomChannelConfiguration  IChannel12 Provides access to custom application objects.

CWFrequency  IChannel  Set the Continuous Wave (CW) frequency.

DCStimulus  IChannel23 Provides access to the DCStimulus object.

DefinedRoles  IChannel22 Returns the roles for which sources can be used for the channel.

DwellTime  IChannel  Sets or returns the dwell time for the channel.
               Shared with the Segment Object

ErrorCorrection  IChannel7  Attempts to sets error correction ON or OFF for all of the measurements on the channel.

ExternalTriggerDelay  IChannel6 Sets or returns the external trigger delay value for the channel.

FastCWPointCount  IChannel16 Enables Fast CW sweep and sets the number of data points for the channel.

Fixturing  IChannel6 Provides access to Port Ext, Embedding, and De-embedding functions.

FOM Collection  IChannel9 Provides access to Frequency Offset Measurements

FrequencyOffsetDivisor  IChannel2
FrequencyOffsetFrequency  IChannel2
FrequencyOffsetMultiplier  IChannel2  Superseded with FOM and FOMRange

</table>
PulseGeneratorID
IChannel23  Returns the ID for the specified Pulse Generator name.

PulseGeneratorNames
IChannel23  Returns a list of configured Pulse Generator names.

PulseMeasControl
IChannel20  Provides access to pulse measurement settings.

R1InputPath
IChannel2  Throws internal reference switch.

ReceiverAttenuator
IChannel  Sets or returns the value of the specified receiver attenuator control.

ReduceIFBandwidth
IChannel5  Sets or returns the state of the Reduced IF Bandwidth at Low Frequencies setting.

RoleDevice
IChannel22  Sets and returns the source to be used in the specified role.

RXLevelingConfiguration
IChannel21  Provides access to the ReceiverLeveling Object

Segments
IChannel  Provides access to the Collection for iterating through the sweep segments of a channel.

SignalProcessingModuleFour
IChannel10  Provides access to the SignalProcessingModuleFour object.

SourcePortCount
IChannel13  Returns the number of source ports.

SourcePortFixedFrequency
IChannel27  Set and read the fixed frequency value for a specific port.

SourcePortMode
IChannel9  Sets the state of the VNA sources. (AUTO | ON | OFF)

SourcePortNames
IChannel13  Returns the string names of source ports.

SourcePortStartFrequency
IChannel27  Set and read the start frequency value for a specific port.

SourcePortStopFrequency
IChannel27  Set and read the stop frequency value for a specific port.

SourcePowerCalPowerOffset
IChannel4  Sets or returns a power level offset from the VNA test port power.

SourcePowerCorrection
IChannel  Turns source power correction ON or OFF for a specific source port.

StartFrequency
IChannel  Sets or returns the start frequency of the channel.

Shared with the Segment Object

StartPower
IChannel  Sets the start power of the analyzer when sweep type is set to Power Sweep.

**ISourcePowerCalData Interface**

**Description**

Contains methods for putting source power calibration data in and getting source power calibration data out of the analyzer using typed data. The methods in this interface transfer data more efficiently than methods that use variant data. However, this interface is only usable from VB6, C, & C++. All other programming languages must use the methods on the Channel Object.
**Note:** Interface *ISourcePowerCalData* is abbreviated as *ISPCD* in the following table.

<table>
<thead>
<tr>

Channels Collection

Description

A collection object that provides a mechanism for iterating through the channels.

Collections are, by definition, unordered lists of like objects. You cannot assume that Channels.Item(1) is always Channel 1.

Accessing the Channels collection

```vba
Dim app As AgilentPNA835x.Application
Set app = CreateObject("AgilentPNA835x.Application", <analyzerName>)

Dim chans As Channels
Set chans = app.Channels
```

### ComColors Object

**Description**

Provides access to the methods and properties used to modify the VNA Display and Print colors.

**Accessing the ComColors object**

```vba
Dim app As AgilentPNA835x.Application
Set app = CreateObject("AgilentPNA835X.Application")
Set displayColors = app.Preferences.DisplayColors
'or
'Set printColors = app.Preferences.PrintColors
displayColors.ActiveLabels = 657930
```

</tbody>
</table>
ComTraceColors Object

Description

Provides access to the methods and properties used to modify the VNA Display and Print colors.

Both the Display and Print ComColor objects contain 8 Trace objects (1 to 8).

'1st Trace' is NOT always Tracel (Tr1). For example, the first trace in a window might be Tr2 which is drawn with the "1st Trace" pen.

The first 8 traces are drawn with the defined pen colors. The next eight traces reuse the same colors, and so forth. For example, if all traces are numbered sequentially, the 9th and 17th traces are drawn using the same color as the 1st trace.

Accessing the ComTraceColors object

```vba
Dim app As AgilentPNA835x.Application
Set app = CreateObject("AgilentPNA835X.Application")
Set displayColors = app.Preferences.DisplayColors
' or
'Set printColors = app.Preferences.PrintColors
dim Trace1
Set Trace1 = displayColors.Trace(1)
Trace1.DataAndLimits = RGB(1,251,1)
```

**Converter Object**

**Note:** The Converter Object replaces the IMixer Interface.

**Description**

Contains the methods and properties to setup a mixer for ALL VNA Mixer/Converter applications.

**Accessing the Converter Interface**

```vba
Dim app as AgilentPNA835x.Application
Dim chan as Channel
Set chan = app.ActiveChannel
Dim converter as Converter
Set converter = chan.Converter
```

**Scratch vs Applied Mixer Properties**

Each mixer configuration has two sets of properties:

1. **Scratch mixer** contains the properties that have been set, but NOT YET applied. Send the Apply Method to copy these properties to the Applied mixer.

2. **Applied mixer** contains the properties that makeup the current mixer configuration.

Power settings are immediately applied to both the Scratch and Applied mixer.

A successful Calculate also performs an Apply.

**Note:** Queries always return the Applied mixer properties. Therefore, first send Apply Method before querying new settings.

InputStopFrequency Converter Sets or returns the stop frequency of the mixer input.

InputStopPower Converter Sets and returns the Stop Power value of the mixer Input Power.

IsInputGreaterThanLO Converter Specifies whether to use the Input frequency that is greater than the LO or less than the LO.

LODenominator Converter Sets or returns the denominator value of the LO Fractional Multiplier.

LOFixedFrequency Converter Sets or returns the fixed frequency of the specified LO.

LOName Converter Sets or returns the LO name.

LONumerator Converter Sets or returns the numerator value of the LO Fractional Multiplier.

LOPower Converter Sets or returns the value of the LO Power.

LORangeMode Converter Sets or returns the LO sweep mode to fixed or swept.

LOStage Converter Returns the number of stages.

LOStartFrequency Converter Sets or returns the start frequency of the specified LO.

LOStartPower Converter Sets or returns the start value of a LO Power sweep.

LOStopFrequency Converter Sets or returns the start frequency of the specified LO.

LOStopPower Converter Sets or returns the stop value of a LO Power sweep.

NominalIncidentPowerState Converter Sets or returns whether to use nominal power or measure actual incident power. (SMC ONLY)

NormalizePoint Converter Sets or returns the data point used for normalizing an SMC phase measurement. (SMC Only)

OutputFixedFrequency Converter Sets or returns the fixed frequency of the mixer output.

ConverterEmbeddedLO Object

Description

Provides access to the properties that allow IMDx and IMSpectrum measurements of converters that contain an embedded LO.

This interface contains all the same properties and methods of the Embedded LO interface (used for FCA measurements) EXCEPT access to the EmbeddedLODiagnostic Object.

Accessing the ConverterEmbeddedLO Interface

Access the Interface through the Converter Object.

```vba
Dim app
Set app = CreateObject("AgilentPNA835x.Application")
app.Reset
' Create a Measurement object, in this case using the IMeasurement interface
Dim meas
app.CreateCustomMeasurement 1, "Swept IMD Converters", -1
set meas = app.activemeasurement

Dim converter
set converter = app.ActiveChannel.GetConverter

Dim elo
set elo = converter.ConverterEmbeddedLO
elo.IsOn = 1
```

CorrectionMethods Object

Description

These methods and properties control various error-correction settings for a channel.

Accessing the object

```vba
Dim app as AgilentPNA835x.Application
Dim chan as Channel
Set chan = app.ActiveChannel
Dim corrMethods as CorrectionMethods
corrMethods = chan.CorrectionMethods
```

DCStimulus Object

Description
The DCStimulus object allows you to make DC Source settings for each channel.

Accessing the DCStimulus Object
You can obtain a handle to a DCStimulus object through the Channel object.

```vba
dim app
Set app = CreateObject("AgilentPNA835x.Application")
dim chan
Set chan = app.ActiveChannel
chan.NumberofPoints = 3
dim DC
Set DC = chan.DCStimulus
DC.EnableAllOutput = True
DC.State("AO1") = True
```

E5091Testsets Collection

Description

Two testsets can be connected and controlled by the VNA at any time.

The item number in the testsets collection is set by the DIP switches on the testset rear-panel. The valid item numbers are 1 and 2. If the testset DIP switches are set to 1, then item number in the collection is 1, and so forth. See your E5091A documentation for more information.

If the specified testset is not connected to USB or not ON, then setting Enabled = True will return an error. All other properties can be set when the testset is not connected.

Accessing the E5091Testsets collection

Child of the Application Object. Get a handle to one of the E5091Testset objects by specifying an item of the collection.

```vba
Dim pna
Set pna = CreateObject("AgilentPNA835x.Application")
Dim testsets As E5091Testsets
Set testsets = pna.E5091Testsets
Dim tset1 As E5091Testset
Set tset1 = testsets(1)
```

ECalModule Object

Allows access to ECal modules that are connected to the VNA.

Accessing the ECalModule object

Get a handle to a ECalModule object by using the ECalModules collection. This is done through the CalManager object with the app.GetCalManager Method.

```vba
Dim app As AgilentPNA835x.Application
Set app = CreateObject("AgilentPNA835x.Application", <analyzerName>)
Dim pna
pna.Preset
Const chanNum = 1
pna.Channels(chanNum).StopFrequency = 20E9 ' for a 20 GHz ECal mod
Const pnaPortNumber = 1
Const ecalCharacterizationNum = 0
Dim calMgr
Set calMgr = pna.GetCalManager
Dim ecalPortNumber ' The returned ECal port number is a 1-based number
' (1 = Port A, 2 = Port B, etc)
ecalPortNumber = calMgr.ECalModules(1).AutoOrient(chanNum, pnaPortNumber, ecalCharacterizationNum)
MsgBox "ECal port number attached to PNA port 1 = " & ecalPortNumber
```

ECalUserCharacterizer Object

Description

Controls the settings used to perform an ECal User Characterization. An S-Parameter channel must already be calibrated. These commands will then measure the ECal module with adapters, cables, or fixtures to be included in the User Characterization, allow descriptive text to be entered, then save the User Characterization to the ECal module.

Up to 12 User Characterizations can be stored in an ECal module.

You can NOT perform a remote User Characterization of a 4-port ECal module using a 2-port VNA. This can only be done from the front panel user interface.

Accessing the ECalUserCharacterizer Interface

Access the Interface through the ICalManager Object.

```vba
dim app as agilentPNA835x.application
set app = createobject("agilentPNA835x.application")

dim mgr as icalmanager
set mgr = app.getcalmanager
dim ecalcharacterizer
set ecalcharacterizer = mgr.getecalusercharacterizer()
```

See Also:

EmbeddedLO Object

Description

Provides access to the properties that allow measurement of mixers that contain an embedded LO.

Accessing the EmbeddedLO Interface

Access the Interface through the IMixer Object.

```vba
Dim app As AgilentPNA835x.Application
Set app = CreateObject("AgilentPNA835x.Application")
app.Preset

' FCA Measurements can't share the channel with standard measurements
' Because preset creates a single measurement in channel 1, we first delete the
' standard measurement
Dim standardMeas As IMeasurement
Set standardMeas = app.ActiveMeasurement
standardMeas.Delete

' Create a Measurement object, in this case using the IMeasurement interface
Dim meas As IMeasurement
Set meas = app.CreateCustomMeasurementEx(1, "SMC_Forward.SMC_ForwardMeas", "SC21")

' See if this measurement object supports IMixer
Dim mixer As IMixer
Dim embeddedLO
Set embeddedLO = mixer.EmbeddedLO
```

Note: The Find Now feature on the Embedded LO dialog is performed remotely by doing a 'Single Sweep" with ELO enabled. See example program.

See an example program that shows how to create and calibrate a standard SMC or VMC measurement or a fixed output SMC measurement.

ENRFile Object

Description

Provide commands for creating or editing an ENR file. This is rarely necessary as ENR files, which contain factory calibrated data, are typically provided by the manufacturer of the noise source.

Learn more about Noise Figure Application

Accessing the ENRFile object

```vba
Dim app As AgilentPNA835x.Application
Set app = CreateObject("AgilentPNA835x.Application", <analyzerName>)

Dim enr As ENRFile
Set enr = app.ENRFile
```

ExternalDevice Object

Description

ExternalDevice objects allow you to set properties and methods for each external device.

Accessing the ExternalDevice Object

Obtain a handle to an External Device by specifying an item in the External Devices collection.

Although the following example shows how to create a PMAR external device, you can substitute any supported external device for "PMAR" and DeviceType: "Power Meter".

Supported External Device Objects

ExternalSource Object

ExternalDCDevice Object

PowerSensorAsReceiver Object

ExternalPulseGenerator Object

dim app
Set app = CreateObject("AgilentPNA835x.Application")
dim externalDevices
Set externalDevices = app.ExternalDevices
dim devicecount
devicecount = externalDevices.count
externalDevices.Add "NewPMAR"
dim newExternalDevice
Set newExternalDevice = externalDevices.Item("NewPMAR")
newExternalDevice.DeviceType = "Power Meter"
newExternalDevice.IOConfiguration= "GPIB0::14::INSTR"
newExternalDevice.IOEnable = true

ExternalDevices Collection

Description

ExternalDevices collection provides access to an ExternalDevice object.

Accessing the ExternalDevices collection

The ExternalDevices collection is a property of the main Application Object. You can obtain a handle to an External Device by specifying an item in the collection.

```vba
dim app
Set app = CreateObject("AgilentPNA835x.Application")
dim externalDevices
Set externalDevices = app.ExternalDevices
dim devicecount
devicecount = externalDevices.count
externalDevices.Add "NewPMAR"
dim newExternalDevice
Set newExternalDevice = externalDevices.Item("NewPMAR")
newExternalDevice.DeviceType = "Power Meter"
newExternalDevice.IOConfiguration= "GPIB0::14::INSTR"
newExternalDevice.IOEnable = true
```

ExternalTestsets Collection

Description

ExternalTestsets collection provides access to a TestsetControl object. Only one external testset can be controlled by the VNA at any time.

Accessing the ExternalTestsets collection

The ExternalTestsets collection is a property of the main Application Object. You can obtain a handle to a testset by specifying an item in the collection.

Visual Basic Example

```vba
Dim pna
Dim testsets As ExternalTestsets
Dim tset1 As TestsetControl
Set pna = CreateObject("AgilentPNA835x.Application")
Set testsets = pna.ExternalTestsets
Set tset1 = testsets(1)
' make COM calls on tset1 object
End Sub
```

FIFO Object

Description

These properties control the First IN, First OUT (FIFO) buffer settings for the PNA-X and N5264B.

The 4 GB FIFO data buffer is available with Option S93118A/B on the PNA-X and N5264B.

Accessing the FIFO object

```vba
Dim app as AgilentPNA835x.Application
Dim fifo as FIFO
Set fifo = app.FIFO
```

</table>
PortCoupleToSystemMedia IFixturing4 Couples to system Media type
PortCoupleToSystemVelocity IFixturing4 Couples to system Velocity Factor
PortDelay IFixturing Sets and returns the Port Delay value for the specified port number.
PortDistance IFixturing4 Sets Port Ext in distance
PortNADistanceUnit IFixturing4 Sets distance units
PortExtState IFixturing Turns Port Extension ON and OFF on this channel.
PortExtUse1 IFixturing Sets and returns the USE1 ON/OFF state for the Loss1 and Freq1 values for the specified port number.
PortExtUse2 IFixturing Sets and returns the USE2 ON/OFF state for the Loss2 and Freq2 values for the specified port number.
PortFreq1 IFixturing Sets and returns the 1st Port Frequency value for the specified port number.
PortFreq2 IFixturing Sets and returns the 2nd Port Frequency value for the specified port number.
PortLoss1 IFixturing Sets and returns the 1st Port Loss value for the specified port number.
PortLoss2 IFixturing Sets and returns the 2nd Port Loss value for the specified port number.
PortLossDC IFixturing Sets and returns the Port Loss at DC value for the specified port number.
PortMatching_C IFixturing7 Sets and returns the Capacitance, 'C' value for the specified port number.
PortMatching_G IFixturing7 Sets and returns the Conductance, 'G' value for the specified port number.
PortMatching_L IFixturing7 Sets and returns the Inductance, 'L' value for the specified port number.
PortMatching_R IFixturing7 Sets and returns the Resistance, 'R' value for the specified port number.
PortMatchingCktModel IFixturing Sets and returns the Port Matching circuit model for the specified port number.
PortMatchingState  IFixturing  Turns Port Matching ON and OFF on this channel.

PortMedium  IFixturing4  Sets Media per port

PortVelocityFactor  IFixturing4  Set Velocity Factor per port

PortWGCutoffFreq  IFixturing4  Sets waveguide cutoff frequency per port

Reverse2PortAdapter  IFixturing6  Set and read whether or not to reverse ports on a 2-port fixture or adapter to be de-embedded.

strPort2Pdeembed_S2PFile  IFixturing  Sets and returns the 2 port De-embedding 'S2P' file name for the specified port number.

strPortMatch_S2PFile  IFixturing  Sets and returns the Port Matching 'S2P' file name for the specified port number.

FOM Collection

Description

The FOM collection provides access to the source and receiver range objects which are used for configuring frequency offset measurements.

The FOM range items are typically numbered as follows:

1. Primary
2. Source

FOMRange Object

Description

The FOM Range object provides access to the properties and methods for configuring a specific Range for frequency offset measurements.

Accessing an FOMRange object

Get a handle to a FOM Range by specifying an item in the FOM collection.

The FOM range items are typically numbered as follows:

1. Primary
2. Source
3. Receivers
4. Source2 (if present)
5. Source3 (if present)

External devices can appear in the list of range names. Learn more.

```vba
Dim app as AgilentPNA835x.Application
Set app = CreateObject("AgilentPNA835x.Application", <analyzerName>)

Dim ranges as FOM
Set ranges = app.ActiveChannel.FOM
ranges.item(2).Coupled = False
```

### Gain Compression Measurement Object

**Description**

Controls the Gain Compression Analysis settings.

**Accessing the GainCompressionMeas object**

```vba
Set app = CreateObject("AgilentPNA835x.Application")
app.Preset
app.ActiveMeasurement.Delete
' create a GCA measurement
app.CreateCustomMeasurementEx 1, "Gain Compression","CompIn21", 1
Set meass = app.Measurements ' get the measurements collection
Set ana = meass(1).CustomMeasurementConfiguration 'get the measurement
ana.AnalysisEnable = true ' enable the analysis mode
```

Gain CompressionCal Object

Description

Sets properties that are unique to a Gain Compression Cal (opt S93086A/B).

The remaining commands to perform a GCA Cal use the Guided Calibration commands.

Accessing the GainCompressionCal object

```vba
Dim app as AgilentPNA835x.Application
Set GCAcal = pna.GetCalmanager.CreateCustomCalEx(channelNum)
Set GCACalExtension = GCAcal.CustomCalConfiguration
GCACalExtension.PowerLevel = 5
```

GuidedCalibration Object

Description

Contains the methods and properties used to perform a Guided Calibration.

**Important!**

Do NOT use commands from the Calibrator (Unguided calibration) object when performing a Guided calibration. Use ONLY the GuidedCalibration object.

The ONLY exception is:

Use `OrientECalModule_Property` and `ECalPortMapEx_Property` on the Calibrator Object to specify orientation for both guided and unguided calibrations.

A Guided Calibration must be performed on the Active Channel. To activate a channel, activate any measurement on that channel. Do this using `meas.Activate`, which requires you already have a handle to the measurement.

**Accessing the GuidedCalibration object**

For standard S-parameter channels:

```plaintext
Dim app as AgilentPNA835x.Application
Dim CalMgr
Set CalMgr = App.GetCalManager
Dim guidedCal
Set guidedCal = CalMgr.GuidedCalibration
```

To calibrate an Application channel, see `CreateCustomCalEx` Method.
**THRU Pairs sequence**

The Smart/Guided Cal logic always determines the best calibration based on your specified connectors and ports.

The following three commands overwrite the SmartCal logic. Send these commands ONLY if you have a deliberate reason for overwriting the SmartCal logic.

- ThruPortList
- PathThruMethod
- PathCalMethod

When sending one or more of these commands, they must be sent in the following sequence with the other commands listed here.

**Note:** The `Initialize` command is sent before and after these three commands.

1. ConnectorType (ports)
2. CalKitType (ports)
3. Initialize
4. ThruPortList
5. PathThruMethod
6. PathCalMethod
7. calMethod = guidedCal.PathCalMethod (ports) (recommended)
8. Initialize

GuidedCalibrationPowerSensors Collection

Description

Contains the methods and properties to enable and configure multiple power sensors to be used during a guided calibration.

Note: Guided Power Cal, and "multiple sensors" are allowed ONLY on standard channels.

Accessing the GuidedCalibrationPowerSensors Collection

```
Option explicit

Dim app as AgilentPNA835x.Application
Set app = CreateObject("AgilentPNA835x.Application")

Dim CalMgr
Set CalMgr = App.GetCalManager

Dim guidedCal
Set guidedCal = CalMgr.GuidedCalibration

Dim port: port = 1

Dim powerSensors
Set powerSensors = guidedCal.GuidedCalibrationPowerSensors(port)

powerSensors = powerSensors.Add "26GHzPowerSensor"
```

HWAuxIO Object

Description

Contains the methods and properties that control the rear panel Material Handler I/O and Power I/O connector.

Note: The Aux I/O connector is mentioned in these topics, but NO VNA models supported by this VNA firmware have that connector.

Accessing the HWAuxIO object

```vba
Dim app As AgilentPNA835x.Application
Set app = CreateObject("AgilentPNA835x.Application", <analyzerName>)

Dim AuxIO As HWAuxIO
Set AuxIO = app.GetAuxIO
```

**IMixer Interface (Option S93083A/B) - Superseded**

**Note:** This object and all properties and methods are replaced with Converter Object which can be used for all converter application.

**Description**

Contains the methods and properties to setup FCA Mixer measurements.

For performing calibrations, use either the SMC Type Object or the VMC Type Object.

**Accessing the IMixer Interface**

Access the IMixer Interface through the Measurement Object. If the particular type of Measurement that was created supports IMixer, then the program determines this at run time and can access the functionality exposed by IMixer. Because the determination of IMixer support is not made until runtime, the program should handle the case where IMixer is not supported on the object.

```vba
Dim app As AgilentPNA835x.Application
Set app = CreateObject("AgilentPNA835x.Application", "analyzerName")
app.Preset

' FCA Measurements can't share the channel with standard measurements
' Because preset creates a single measurement in channel 1, we first delete the standard measurement
Dim standardMeas As IMeasurement
Set standardMeas = app.ActiveMeasurement
standardMeas.Delete

' Create a Measurement object, in this case using the IMeasurement interface
Dim meas As IMeasurement
Set meas = app.CreateCustomMeasurementEx(1, "SMC_Forward.SMC_ForwardMeas", "SC21")

' See if this measurement object supports IMixer
Dim mixer As IMixer
Set mixer = meas
```

IndependentPowerCalibration Object

Description

Contains the methods and properties used to perform an independent power calibration.

Accessing the IndependentPowerCalibration object

For standard S-parameter channels:

```vbnet
Dim app as AgilentPNA835x.Application
Dim CalMgr
Set CalMgr = App.GetCalManager
Dim CalAll
Set CalAll = CalMgr.CalibrateAllChannels

Dim IndependentPwrCal
Set IndependentPwrCal = CalAll.IndependentPowerCalibration
```

To calibrate an Application channel, see CreateCustomCalEx Method.

Limit Test Collection

Description

Child of the Measurement Object. A collection that provides a mechanism for iterating through the Measurement's Limit Segment objects (Limit Lines). The collection has 100 limit lines by default.

Accessing the LimitTest collection

Get a handle to an individual limit segment by specifying an item of the LimitTest collection.

```vba
Dim app As AgilentPNA835x.Application
Set app = CreateObject("AgilentPNA835x.Application", <analyzerName>)
Dim limSegs As LimitTest
Set limSegs = app.ActiveMeasurement.LimitTest
limSegs.Item(1).BeginStimulus = 1000000000
limSegs.Item(1).EndStimulus = 1000000000
limSegs.Item(1).BeginResponse = 3.5
limSegs.Item(1).EndResponse = 3.5
```

</tbody>
</table>
Marker Object

Description
Contains the methods and properties that control Markers.

There are two ways to control markers through COM.

1. The Measurement object has properties that apply to ALL of the markers for that measurement.
2. The properties on the Marker object override the Measurement object properties. For example, you can then override the format setting for an individual marker by specifying `mark.Format = naLogMag` on the marker object.

Marker-related commands on the Measurement Object:

- Activate Marker Method
- DeleteAllMarkers Method
- DeleteMarker Method
- GetReferenceMarker Method
- InterpolateMarkers Method
- SearchFilterBandwidth Method
- ActiveMarker Property
- Marker Format Property
- MarkerState Property
- ReferenceMarkerState Property

Important: Learn about programming the Reference marker.

Accessing the Marker object

To turn ON a marker, get a handle to the marker through the measurement object. If not already activated, this command will turn ON marker 1.

```vba
Dim app As AgilentPNA835x.Application
Set app = CreateObject("AgilentPNA835x.Application", <analyzerName>)
app.ActiveMeasurement.marker(1).Format = naLinMag
```

You can also set the marker object to an object variable:
Dim m1 As Marker
Set m1 = app.ActiveMeasurement.Marker(1)
m1.Format = naMarkerFormat_LinMag

Measurement Object

See IArrayTransfer Interface for putting and getting typed data.

See IMixer Interface (used with Option S93083A/B)

Description

The Measurement object is probably the most used object in the VNA Object Model. A measurement object represents the chain of data processing algorithms that take raw data from the channel and make it ready for display, which then becomes the scope of the Trace object.

A Measurement object is defined by it's parameter (S11, S22, A/R1, B and so forth). The measurement object is associated with a channel which drives the hardware that produces the data that feeds the measurement. The root of a measurement is the raw data. This buffer of complex paired data then flows through a number of processing blocks: error-correction, trace math, phase correction, time domain, gating, formatting. All of these are controlled through the measurement object.

The ACTIVE measurement is the measurement that will be acted upon if you make a setting from the front panel. It is the measurement whose "button" is pressed in the window with the red "active window" frame. If you create a new measurement, that measurement becomes the active measurement. Therefore, all automation methods with the word "Active" in them refer to the object associated with the Active measurement, whether that object is a Channel, Window, Trace or Limit line.

Learn about the IMeasurement2 Interface for reading stimulus properties.

Accessing the Measurement object

```vba
Dim app As AgilentPNA835x.Application
Set app = CreateObject("AgilentPNA835x.Application", <analyzerName>)

Dim meas As IMeasurement
Set meas = app.ActiveMeasurement

or

Set meas = app.Measurements(n)
```

You can access four other objects through the Measurement object: markers, limit test, transform, and gating. For example, because each measurement has its own set of markers, you can set a marker by doing this:

```vba
Dim meas as measurement
Set meas = app.ActiveMeasurement
meas.marker(1).Stimulus = 900e6
```
**IMeasurement2 Interface**

Some of the properties and methods for the IMeasurement2 Interface return stimulus values that are set using the channel object. The following is the reason these properties and methods are duplicated.

Every measurement carries with it a snapshot of the stimulus properties of the channel that were in effect when the measurement last acquired data. Therefore, it is the measurement that provides the most accurate stimulus description of its data. Any change made to the channel after the measurement was acquired renders the IChannel interface unreliable in terms of describing the measurement.

GetDataBuffer  IMeasurement19  Retrieves trace data (Y data) from the modulation distortion measurement.
GetDataBufferCompact  IMeasurement19  Retrieves compact signal trace data (Y data) from the modulation distortion measurement.
getDataByString  IMeasurement  Retrieves variant data from the specified location in your choice of formats.
GetFilterStatistics  IMeasurement  Returns all four Filter Statistics.
GetReferenceMarker  IMeasurement  Returns a handle to the reference marker.
Get SnPData  IMeasurement3  Returns SnP data.
GetSnpDataWithSpecifiedPorts  IMeasurement7  Returns sNp data for the specified ports.
GetTraceStatistics  IMeasurement  Returns the Trace Statistics.
GetXAxisValues  IMeasurement2  Returns the stimulus values for the measurement.
GetXDataBuffer  IMeasurement19  Retrieves frequency tone data from the modulation distortion measurement.
GetXDataBufferCompact  IMeasurement19  Retrieves compact signal frequency tone data from the modulation distortion measurement.
InterpolateMarkers  IMeasurement  Turns All Marker Interpolation ON and OFF for the measurement.
putDataComplex  IMeasurement  Puts complex data into one of five data buffers.
putDataScalar  IMeasurement  Puts formatted variant data into the measurement results buffer.
SearchFilterBandwidth  IMeasurement  Searches the domain with the current BW target.
TraceHoldClear  IMeasurement16  Resets the currently-stored data points to the live data trace and restarts the currently-selected Trace Hold type.
WriteSnpFileWithSpecifiedPorts  IMeasurement7  Write sNp data for specified ports to a file.

| **Span** | **IMeasurement2** | Returns the stimulus span (stop - start) for the measurement. |       |
StandardDeviation IMeasurement Returns the standard deviation of the measurement.

Start IMeasurement2 Returns the stimulus value of the first point for the measurement.

StatisticsRange IMeasurement Sets the User Range number for calculating measurement statistics.

Stop IMeasurement2 Returns the stimulus value of the last point for the measurement.

Trace IMeasurement Controls scale, reference position, and reference line.

TraceDeviationType IMeasurement20 Calculates deviation from a least-squares fit line.

TraceHoldType IMeasurement16 Sets the type of trace hold to perform.

TraceMath IMeasurement Performs math operations on the measurement object and the trace stored in memory.

TraceMax IMeasurement10 Maximizes the active trace.

TraceTitle IMeasurement8 Writes and reads a trace title.

TraceTitleState IMeasurement8 Turns trace title ON and OFF

Transform IMeasurement Controls Time Domain transforms.

Uncertainty IMeasurement17 Returns a handle to the (Dynamic) Uncertainty Object.

UserRangeMax IMeasurement15 Sets the stimulus stop value for the specified User Range.

UserRangeMin IMeasurement15 Sets the stimulus start value for the specified User Range.

View IMeasurement Sets (or returns) the type of trace displayed on the screen.

WGCutoffFreq IMeasurement2 Sets or returns the value of the waveguide cut off frequency.

XAxis IMeasurement17 Sets the X-axis of the selected measurement to a DC Source.

XAxisDomain IMeasurement17 Sets and returns the X-Axis domain of the selected DIQ measurement.

**IArrayTransfer Interface**

**Description**

Contains methods for putting data in and getting data out of the analyzer using typed data. This interface transfers data more efficiently than the IMeasurement Interface. However, this interface is only usable from VB6, C, and C++.

See a VB.net example using this interface.

MultiDimensionalSweep Object

Description

Controls a multi-dimensional sweep in a spectrum analyzer channel. This is also called a 3D sweep (power, phase, and frequency). Each sweep can be set to a different power level. Within each sweep is a 2D sweep of phase and frequency.

Accessing the MultiDimensionalSweep object

```vbs
set pna = CreateObject("AgilentPNA835x.Application","A-N5242A-10096")
CreateSAMeasurement
SetupMultiSweep

Sub CreateSAMeasurement
pna.Channels.RemoveChannelNumber(1)
call pna. CreateCustomMeasurementEx(1, "SpectrumAnalyzer", "B")
set chan = pna.ActiveChannel
chan.Hold
End Sub
```

NAWindow Object

Description

The NAWindow object controls the part of the display that contains the graticule, or what is written on
the display.

Accessing the NaWindow object

Dim app As AgilentPNA835x.Application
Set app = CreateObject("AgilentPNA835x.Application", <analyzerName>)

Dim window As NAWindow
Set window = app.NAWindows(1)
window.AutoScale

or

Dim app As AgilentPNA835x.Application
Set app = CreateObject("AgilentPNA835x.Application", "analyzerName")
app.NAWindows(1).AutoScale

NAWindows Collection

Description

A collection object that provides a mechanism for iterating through the Application windows.

Accessing the NaWindows collection

```vbnet
Dim app As AgilentPNA835x.Application
Set app = CreateObject("AgilentPNA835x.Application", <analyzerName>)

Dim windows As NAWindows
Set windows = app.NAWindows
```

NoiseCal Object

Description

Controls the noise figure calibration settings for amplifiers and converters. These commands supplement the standard calibration commands on the GuidedCalibration Object.

Accessing the NoiseCal object

```vba
Dim app as AgilentPNA835x.Application
Set noisecal = pna.GetCalmanager.CreateCustomCalEx(channelNum)
Set noiseCalExtension = noisecal.CustomCalConfiguration
noiseCalExtension.NoiseSourceCold = 300
```

PathConfiguration Object

Description

Provides access to the path configuration currently active on the channel object.

To load, store, or delete a configuration, see ConfigurationManager Object.

Accessing the PathConfiguration object in VB

```vbnet
Dim app As AgilentPNA835x.Application
Set app = CreateObject("AgilentPNA835x.Application", <analyzerName>)

Dim chan as Channel
Set chan = app.ActiveChannel

Dim pathConfig As PathConfiguration
Set pathConfig = chan.PathConfiguration
```

Accessing the PathConfiguration object in C#

```csharp
Type pnaType = Type.GetTypeFromProgID("AgilentPNA835x.Application", "PNA-NAME-HERE");

AgilentPNA835x.Application pna =
    (AgilentPNA835x.Application)Activator.CreateInstance(pnaType);

AgilentPNA835x.Channel chan = (AgilentPNA835x.Channel)pna.ActiveChannel;

AgilentPNA835x.PathConfiguration path =
    (AgilentPNA835x.PathConfiguration)chan.get_PathConfiguration();
```

Note:

To learn how to make configuration (element) settings, see this Path Configuration Example

Also see this list of configurable elements and settings.

PhaseReferenceCalibration Object

Description

Use this interface to perform a Phase Reference Calibration. This calibration is performed as a 'Tier 1' cal. After it is performed and saved, it can then be recalled into an SMC+Phase Calibration.

- It is NOT necessary to create an SMC measurement before performing a remote Phase Reference Cal. It is necessary when performed from the user interface.
- Port selection is made remotely by selecting connectors and Cal Kits for the ports to be included in the SOLT calibration.

Accessing the PhaseReferenceCalibration Object

```vba
Dim app as AgilentPNA835x.Application
Dim CalMgr
Set CalMgr = app.GetCalManager
Dim phaseRefCal
Set phaseRefCal = CalMgr.PhaseReferenceCalibration
' Then get a handle to the GuidedCal object
Dim guidedCal
Set guidedCal = phaseRefCal.GuidedCalibration
```

See Also:

Port Object

Description

Provides access to the properties and methods that are used to assign a cable to the port and reset noise data.

Accessing the Port object

Get a handle to the Port object through the Ports Collection.

```vba
Dim app As AgilentPNA835x.Application
Set app = CreateObject("AgilentPNA835x.Application", <analyzerName>)
Dim oPorts as UncertaintyManager
Set oPorts = app.UncertaintyManager.Ports
Dim oPort1 as Ports(1)
```

Power Range Object

Description

These methods and properties provide access to data sheet specified and typical, max and min power levels (in dBm). Max power refers to the maximum leveled source power at the specified port. Min power is calculated by subtracting the power sweep range from the max leveled power. This information is stored by frequency band in a power specification file. This object provides access to the file’s contents and provides an interface to configure the port number and RF signal path of interest.

Power data is available as either the most restrictive value across a range of frequencies (when `RangeGetMaxPower` and `RangeGetMinPower` are used) or for discrete CW frequencies (when `DiscreteGetMaxPower` and `DiscreteGetMinPower` are used).

No measurement of instrument-specific dynamic range is performed; all power levels are equivalent to power data published in device data sheets. Power levels are valid only for measurement configurations where the front panel jumpers are in their standard positions, as originally shipped. Internal source attenuation and any calibrated external path loss/gain due to cables, fixtures, switches or booster amplifiers are not included in the reported min/max leveled power values. It remains the users’ responsibility to transform the reported factory power range data to a value corresponding to the specific calibration plane of their setups.

The power range data files contain both specified min/max leveled power values and the corresponding "typical" values. Some paths, that are not part of the specifications of the instrument may only have typical data. Only the “Specified” power range data is guaranteed for an instrument with an up-to-date calibration certificate.

Accessing the Power Range object

```vba
Dim app As AgilentPNA835x.Application
Set app = CreateObject("AgilentPNA835x.Application", <analyserName>)
Dim pwrRange As PowerRange
Set pwrRange = app.Capabilities.PowerRange
```

PowerCalRange Object

Description

Contains the methods and properties used to set start and stop frequency, and number of points for an independent power calibration.

Accessing the IndependentPowerCalibration object

For standard S-parameter channels:

```vba
Dim app as AgilentPNA835x.Application
Dim CalMgr
Set CalMgr = App.GetCalManager
Dim CalAll
Set CalAll = CalMgr.CalibrateAllChannels

Dim IndependentPwrCal
Set IndependentPwrCal = CalAll.IndependentPowerCalibration
```

To calibrate an Application channel, see CreateCustomCalEx Method.

PowerMeterInterfaces Collection

Description

A collection object that provides a mechanism for accessing the PowerMeterInterface objects.

The collection size is limited to one PowerMeterInterface object. By default, that PowerMeterInterface object refers to GPIB, and to the GPIB address that is currently set for the power meter on that VNA.

The power meter is specified by using the Path property.

Accessing the PowerMeterInterfaces collection

Get a handle to a power meter object using the PowerMeterInterfaces collection.

```vba
Dim app As AgilentPNA835x.Application
Set app = CreateObject("AgilentPNA835x.Application", <analyzerName>)
Dim pwrMtrInterfaces As PowerMeterInterfaces
Set pwrMtrInterfaces = app.SourcePowerCalibrator.PowerMeterInterfaces
If pwrMtrInterfaces.Count > 0 Then
    Dim pwrMtrInterface As PowerMeterInterface
    Set pwrMtrInterface = pwrMtrInterfaces(1)
    pwrMtrInterface.Path = naUSB
    pwrMtrInterface.Locator = "Agilent Technologies,U2000A,MY12345678"
End If
```

**PowerSensor Object**

**Description**

Each power sensor connected to the power meter associated with Source Power Calibration will have a PowerSensor object created to represent it. These PowerSensor objects reside in the `PowerSensors` collection within the `SourcePowerCalibrator` object. You cannot directly create PowerSensor objects, but can only retrieve existing ones from the `PowerSensors` collection.

The `PowerSensorCalFactorSegment` object is also accessed through the PowerSensor object. These are accessed through the `CalFactorSegments` collection in the PowerSensor object.

**Accessing a PowerSensor object**

```vbnet
Dim pna As AgilentPNA835x.Application
Set pna = CreateObject("AgilentPNA835x.Application", <analyzerName>)

Dim powerCalibrator as SourcePowerCalibrator
Dim powerSensor as PowerSensor
Dim calFactorSegment as PowerSensorCalFactorSegment

Set powerCalibrator = pna.SourcePowerCalibrator

' Specify GPIB address of the power meter.
powerCalibrator.PowerMeterGPIBAddress = 13

' Each time the PowerSensors collection is accessed, the power meter is queried to
determine which channels have sensors attached. The collection is updated
accordingly.
If powerCalibrator.PowerSensors.Count > 0 Then
  ' If channel B of the meter has a sensor attached but channel A does not, then
  ' element 1 of the
  ' collection is sensor B. Whenever channel A has a sensor, sensor A will be element
  ' 1.
  Set powerSensor = powerCalibrator.PowerSensors(1)
  ' Insert one new PowerSensorCalFactorSegment at the beginning of the collection
  ' (index 1).
  powerSensor.CalFactorSegments.Add(1)
  ' Assign our variable to refer to that object.
  Set calFactorSegment = powerSensor.CalFactorSegments(1)

  ' Set property values for that object.
  calFactorSegment.Frequency = 300000
  ' frequency in Hz
  calFactorSegment.CalFactor = 98
  ' cal factor in percent
```

**PowerSensors Collection**

**Description**

A collection object that provides a mechanism for iterating through the PowerSensor objects which are connected to the power meter. Each time this collection object is accessed, the power meter is queried to determine how many sensors are connected to it. The collection size and order of objects is then adjusted accordingly before the requested method or property operation is performed. The power meter is specified by using the `PowerMeterGPIBAddress` property of the `SourcePowerCalibrator` object.

**Accessing the PowerSensors Collection**

```vba
Dim app As AgilentPNA835x.Application
Set app = CreateObject("AgilentPNA835x.Application", <analyzerName>)

Dim PwrSensors As PowerSensors
Set PwrSensors = app.SourcePowerCalibrator.PowerSensors
```

PowerSensorAsReceiver Object

Description

Provides the settings for configuring a Power Meter to be used as a VNA Receiver (PMAR).

Accessing a PowerSensorAsReceiver object

This object is accessed through ExternalDevice.ExtendedProperties. When an external device is added to the ExternalDevices collection, and the DeviceType property is set to Power Meter, then ExtendedProperties is used to get a handle to this object.

```vba
externalDevices.Add "NewPMAR"

dim newExternalDevice
Set newExternalDevice = externalDevices.Item("NewPMAR")
newExternalDevice.DeviceType = "Power Meter"

dim PMAR
Set PMAR = newExternalDevice.ExtendedProperties
PMAR.ReadingsPerPoint = 10
```

Preferences Object

Description

Sets the preferences for the behavior of several properties.

Accessing the Preferences object

```vba
Dim app As AgilentPNA835x.Application
Set app = CreateObject("AgilentPNA835x.Application", <analyzerName>)

Dim pref As Preferences
Set pref = app.Preferences
```

See Also:

PulseGenerator Object

Description

Contains the properties for configuring the five internal pulse generators in the PNA-X.

Learn more about the PNA-X Pulse Generators.

Accessing the PulseGenerator object

```vbnet
Dim app as AgilentPNA835x.Application
Dim chan as Channel
Set chan = app.ActiveChannel
Dim pulse as PulseGenerator
Set pulse = chan.PulseGenerator
```

Each pulse generator is specified in the Pulse Generator properties.

External Pulse Generators

Beginning with A.09.50, External Pulse Generators can be used with the Integrated Pulse Application.

Use `chan.PulseGeneratorNames` and `chan.PulseGeneratorID` to refer to the external pulse generator when setting properties on this (PulseGenerator) Object.

Pulse Definitions

- D = Delay; the time before each pulse begins
- W = Width; the time the pulse is ON
- P = Period; one complete pulse cycle
- W/P = Duty Cycle; the ratio of pulse ON/OFF

**Important:** If \( D + W \) is greater than \( P \), then undefined VNA behavior results. There is NO error message or warning.

</table>
PulseMeasControl Object

Description

Contains the properties for configuring pulse measurements in the PNA-X.

Some of these settings require Opt H08 / S93026A/B.

Learn about Integrated Pulse Application.

Accessing the PulseMeasControl object

```vba
Dim app as AgilentPNA835x.Application
Dim chan as Channel
Set chan = app.ActiveChannel
Dim pulse as PulseMeasControl
Set pulse = chan.PulseMeasControl
```

The following shows how to make two new settings introduced with A.09.50:

- **Primary Pulse Trigger** - to select an external pulse generator as the primary trigger, use `IPathElement.Value` and using “PulseTrigInput” = “Internal” or “External”. However, there is no way to tell which external pulse generator is selected.

- To select an external pulse generator for a receiver, use `IPathElement.Value` commands. For example, to select an external pulse generator for RCVR A, send "IFGateA","RearPanel".

SCPIStringParser Object

Description

Provides the ability to send a SCPI command from within the COM command. The two commands differ in the following ways:

**Execute** - will not return an error unless the Execute command itself fails, which is unlikely. Otherwise, you are required to read the SCPI error queue for errors that were caused by the SCPI command. The Execute command operates with minimal interference between you, the programmer, and the SCPI parser. It does not presume how you want to handle errors: handle by ignore, handle by reading the status byte, etc. This command was defined because automation engines like VB throw runtime errors when a COM method returns a failed HRESULT.

**Parse** - parses the input command, and then reads the SCPI error queue until the queue is empty. If the queue contains errors, Parse returns a failed HRESULT (E_NA_BAD_SCPI_EXECUTE). It then creates an IErrorInfo object and bundles the error numbers and descriptions into the error object. This object is available so that you can detect the failed HRESULT and interrogate the errorInfo object for more details.

The SCPIStringParser Methods can NOT be used with:

- SCPI Status Reporting. However, the *OPC? will work.
- Transferring Binary (block) data with commands such as: MMEM:TRAN or CALC:DATA with Format:Data set to Real32 or Real64

Accessing the ScpiStringParser object

```vba
Dim app As AgilentPNA835x.Application
Set app = CreateObject("AgilentPNA835x.Application", <analyzerName>)

Dim SCPI As IScpiStringParser
Set SCPI = app.ScpiStringParser
```

See Also:

- VNA Automation Interfaces
- The VNA Object Model
- Example Programs
- See an example of how to return error information when using the Parse method.

Segment Object

Description
Contains the methods and properties that affect a sweep segment.

Note: All of these properties are shared with at least one of the following objects: Channel, Cal Set, PowerSensorCalFactorSegment, or PowerLossSegment.

Accessing a Segment object and setting Segment Properties
You can get a handle to a sweep segment through the segments collection.

```vba
Dim app As AgilentPNA835x.Application
Set app = CreateObject("AgilentPNA835x.Application", <analyzerName>)

Dim segs As ISegments
Set segs = app.ActiveChannel.Segments

segs.Add(1)
segs(1).NumberOfPoints = 30
```

Segments Collection

Description

The segment collection provides a mechanism for iterating through the sweep segments of a channel. Sweep segments are a potentially faster method of sweeping the analyzer through only the frequencies of interest. Learn more about Segment Sweep.

Accessing the Segments collection

There are two paths to the Segments Collection:

1. From the Channel object
2. From the FOMRange object

```vba
Dim app As AgilentPNA835x.Application
Set app = CreateObject("AgilentPNA835x.Application", <analyzerName>)

Dim segs As ISegments
Set segs = app.ActiveChannel.Segments

or

Set segs = app.ActiveChannel.FOM.FOMRange(1).Segments
```

SMCType Object

Description

Contains the methods and properties to perform an Scalar Measurement Calibration for the Frequency Converter Application (option S93083A/B).

Accessing the SMCType object

See an example which creates and calibrates an SMC measurement.

You can also do the following:

```vba
Set app = CreateObject("AgilentPNA835x.Application")
Set CalMgr = app.GetCalManager
Set guidedCal = CalMgr.CreateCustomCalEx(1)
Set SMC = guidedCal.CustomCalConfiguration
SMC.ConnectorType(1) = "APC 3.5 male"
```

SourcePowerCalibrator Object

Description

This object is a child of the Application object and is a vehicle for performing source power calibrations.

Accessing the SourcePowerCalibrator Object

```vbs
Dim app As AgilentPNA835x.Application
Set app = CreateObject("AgilentPNA835x.Application", <analyzerName>)

Dim ispc As ISourcePowerCalibrator
Set ispc = app.SourcePowerCalibrator
```

Note: If you see this error:

*The target NA stimulus channel has not been set. With the SourcePowerCalibrator object, you must first call SetCalInfoEx with the channel number. SetCalInfoEx must not be made against a temporary copy of the SourcePowerCalibrator object.*

Or this error:

*Channel not found.*

It is either because you set the wrong channel number in the SetCalInfoEx call or because the SourcePowerCalibrator object is unique in that you MUST use the SAME instance of the SourcePowerCalibrator object for every property that is set. Do this by naming/setting a variable as in this vbs example:

```vbs
set sourcepowercalibrator = app.sourcepowercalibrator
```

<td>Returns pass / fail status of the user-specified tolerance limits on the target cal power.</td>
</tr>
<tr>
<td>MaximumIterationsPerPoint</td>
<td>ISPC3</td>
<td>Specifies maximum number of readings to take at each data point for iterating the source power.</td>
</tr>
</tbody>
</table>
**PowerAcquisitionDevice** ISPC2 Specifies the power sensor channel (A or B) that is currently selected for use at a specific frequency.

**PowerLossSegments (collection)** ISPC2 Collection for iterating through the segments of the power loss table used in source power calibration.

**PowerMeterGPIBAddress** ISPC Specifies the GPIB address of the power meter.

**PowerMeterInterfaces** ISPC6 Collection for getting a handle to the available power meters.

**PowerSensors (collection)** ISPC2 Collection for iterating through the PowerSensor objects which are connected to the power meter for a source power cal.

**ReadingsPerPoint** ISPC Specifies the maximum power readings for power meter settling.

**ReadingsTolerance** ISPC3 Power meter settling tolerance value.

**USBPowerMeterCatalog** ISPC6 Returns a list of USB power meters that are connected to the VNA.

**UsePowerLossSegments** ISPC Specifies if subsequent calls to the AcquirePowerReadings method will make use of the loss table (PowerLossSegments).

**UsePowerSensorFrequencyLimits** ISPC Specifies if subsequent calls to the AcquirePowerReadings method will make use of power sensor frequency checking capability.

SweptIMDCal Object

Description

Sets properties that are unique to a Swept IMD Cal (opt S93087A/B).

Use the Guided Calibration commands for the remaining commands to perform a Swept IMD Cal

Accessing the SweptIMDCal object

```vba
Dim app as AgilentPNA835x.Application
Set IMDcal = pna.GetCalmanager.CreateCustomCalEx(channelNum)
Set IMDCalExtension = IMDcal.CustomCalConfiguration
IMDCalExtension.PowerLevel = 5
```

TestsetControl Object

Description

A TestsetControl object is used to control one of the supported test sets. Only one external test set can be controlled by the VNA at any time. The Testset Control object appears as an item in the ExternalTestsets collection, which in turn is a property of the main application object.

If the specified test set is not connected to the VNA or is not ON, then setting Enabled = True will return an error. All other properties can be set even if the test set is not connected.

Note: The ONLY way to load a test set configuration file is by sending the testsets.Add method. There is no method to query the test set type. See an example program.

Accessing a TestsetControl object

The ExternalTestsets collection is a property of the main Application Object. You can obtain a handle to a testset object by specifying an item in the collection.

Visual Basic Example

```vba
Dim pna
Dim testsets As ExternalTestsets
Dim tset1 As TestsetControl
Set pna = CreateObject("AgilentPNA835x.Application")
Set testsets = pna.ExternalTestsets
Set tset1 = testsets(1)
' make COM calls on tset1 object
End Sub
```

Trace Object

Description

The Trace object controls how the measurement data is displayed. You can control scale, reference position, and value from the Trace Object.

Accessing a Trace object

There are several ways to get a handle to a trace.

```vba
Dim app As AgilentPNA835x.Application
Set app = CreateObject("AgilentPNA835x.Application", <analyzerName>)
Dim trace As Trace

Then you can do any of the following:

Set trace = app.NAWindows(1).traces(1)
set trace = app.NAWindows.item(1).ActiveTrace
set trace = app.ActiveNAWindow.traces.item(1)
set trace = app.ActiveNAWindow.ActiveTrace
Set trace = app.Measurements(1).trace
Set trace = app.ActiveMeasurement.trace
```

</table>
**Traces Collection**

**Description**

Child of the **Application** Object. A collection that provides a mechanism for getting a handle to a trace or iterating through the traces in a window.

**Accessing the Traces collection**

Get a handle to the traces collection through the NaWindows collection. The following example sets the variable `trcs` to the collection of traces in window 1 of the NaWindows collection.

```vba
Dim app As AgilentPNA835x.Application
Set app = CreateObject("AgilentPNA835x.Application", <analyzerName>)

Dim trcs As traces
Set trcs = app.NAWindows(1).traces
```

</tbody>
</table>
Transform Object

Description
Contains the methods and properties that control Time Domain transforms.

Accessing the Transform Object

```vba
Dim app As AgilentPNA835x.Application
Set app = CreateObject("AgilentPNA835x.Application", <analyzerName>)

Dim trans As Transform
Set trans = app.ActiveMeasurement.Transform
```

Uncertainty Object

Description

Provides access to the properties and methods that are used to display uncertainties for the measurement (Option S93015A/B).

Limitations

- Calibrations can be performed for ONLY ONE channel at a time.
- Putting Error Term data into Uncertainty Cal Sets using remote commands is NOT supported.

Accessing the Uncertainty object

Get a handle to the Uncertainty object.

```
Dim app As AgilentPNA835x.Application
Set app = CreateObject("AgilentPNA835x.Application", <analyzerName>)

Dim oUncert as Uncertainty
Set oUncert = app.ActiveMeasurement.Uncertainty
```

**UncertaintyManager Object**

**Description**

Provides access to the properties and methods that are used to characterize Dynamic Uncertainties (Option S93015A/B).

**Accessing the UncertaintyManager object**

Get a handle to a the UncertaintyManager through the Application Object.

```vba
Dim app As AgilentPNA835x.Application
Set app = CreateObject("AgilentPNA835x.Application", <analyzerName>)
Dim uMgr as UncertaintyManager
Set uMgr = app.UncertaintyManager
```

</tbody>
</table>

**Properties**

- **CableRepeatabilityEnabled**
  - UncertaintyManager
  - Allows cable repeatability data to contribute to the uncertainty of a calibration.
Cables
UncertaintyManager Provides access to the collection of characterized cables used in Dynamic Uncertainty calibrations.

Characterizer
UncertaintyManager Provides access to the Methods and Properties used to perform Uncertainty characterizations.

MaximumUncertaintyPoints
UncertaintyManager Sets and returns maximum number of points for which uncertainties are to be computed.

PortNoiseEnabled
UncertaintyManager Allows noise data to contribute to the uncertainty of a calibration.

Ports
UncertaintyManager Provides access to the collection of VNA ports used in Dynamic Uncertainty calibrations.

StandardDefinitionsEnabled
UncertaintyManager Allows cal standard data to contribute to the uncertainty of a calibration.

VMC Type Object

Description

Contains the methods and properties to perform a Vector Measurement Calibration for the Frequency Converter Application (option S93083A/B).

Accessing the VMCType object

See an example which creates and calibrates a VMC measurement.

You can also do the following:

```vba
Set app = CreateObject("AgilentPNA835x.Application")
Set CalMgr = app.GetCalManager
Set guidedCal = CalMgr.CreateCustomCalEx(1)
Set VMC = guidedCal.CustomCalConfiguration
VMC.ConnectorType(1) = "APC 3.5 male"
```

About Trigger

AcceptTriggerBeforeArmed Property

**Description**
Determines what happens to an EDGE trigger signal if it occurs before the VNA is ready to be triggered. (LEVEL trigger signals are always ignored.) For more information, see External triggering.

**VB Syntax**
```
trigsetup.AcceptTriggerBeforeArmed = boolean
```

**Variable**
```
trigsetup - A TriggerSetup2 (object)
```

**Boolean**
Choose from:

- **False** - A trigger signal is ignored if it occurs before the VNA is ready to be triggered.
- **True** - A trigger signal is remembered and then used when the VNA becomes armed (ready to be triggered). The VNA remembers only one trigger signal.

**Return Type**
Boolean

**Default**
False

**Examples**
```
trigsetup.AcceptTriggerBeforeArmed = True 'Write
```

**C++ Syntax**
```
HRESULT get_AcceptTriggerBeforeArmed( BOOL *pVal);
HRESULT put_AcceptTriggerBeforeArmed( BOOL newVal);
```

**Interface**
ITriggerSetup2
### AcquisitionDirection Property

# AcquisitionTime Property

**Description**
Returns the LO acquisition time which is the ADC Record Size x ADC Sampling Frequency (10 nsec or 40 nsec) x (1 + Stacking) x (Video Average.Coefficient).

**VB Syntax**
```vbnet
value = sa.AcquisitionTime
```

**Variable**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>sa</code></td>
<td>A SpectrumAnalyzer (object)</td>
</tr>
<tr>
<td><code>value</code></td>
<td>(Double) Variable to store the returned number of LOs.</td>
</tr>
</tbody>
</table>

Learn about these settings.

**Return Type**
Double

**Default**
N/A

**Examples**
```vbnet
value = sa.AcquisitionTime 'Read
```

See an example program.

**C++ Syntax**
```cpp
HRESULT get_AcquisitionTime(double* val);
```

**Interface**
ISpectrumAnalyzer
ActiveCalKit Property

Description

Returns a handle to the Active CalKit object. The active cal kit is the kit selected for use in **Unguided** calibrations.

You can either (1) use the handle directly to access CalKit properties and methods, or (2) set a variable to the CalKit object. The variable retains a handle to the original object if another CalKit becomes active.

**VB Syntax**

1) `app.ActiveCalKit.<setting>`
   
   or
   
   2) `Set cKit = app.ActiveCalKit`

**Variable (Type) - Description**

- `app` An **Application** (object)
- `<setting>` A CalKit property (or method) and arguments
- `cKit` (object) - A CalKit object

**Return Type** CalKit object

**Default** None

**Examples**

```
Public cKit as calKit
Set cKit = app.ActiveCalKit 'read
```

**C++ Syntax**

```
HRESULT get_ActiveCalKit (ICalkit * kit)
```

**Interface** IApplication
### ActiveChannel Property

**Description**
Returns a handle to the Active Channel object. You can either (1) use the handle directly to access channel properties and methods, or (2) set a variable to the channel object. The variable retains a handle to the original channel if another channel becomes active.

**VB Syntax**
1. `app.ActiveChannel.<setting>`
   or
2. `Set chan = app.ActiveChannel`

**Variable**
- `chan` - A Channel *(object)*
- `app` - An Application *(object)*
- `<setting>` - A channel property (or method) and arguments

**Return Type** Channel object

**Default** Not applicable

**Examples**
1. `app.ActiveChannel.Averaging = 1`
2. `Public chan as Channel
   Set chan = app.ActiveChannel`

**C++ Syntax**
`HRESULT get_ActiveChannel(IChannel* *pVal)`

**Interface** IApplication
Active (ExtDev) Property

Description
Set and return the state of activation of the device. When `extDev.IOEnable = True`, and this command is set to True, the VNA will attempt communication with the external device. An error is returned if communication cannot be verified.

**Note:** Send this command AFTER sending other External Device settings to avoid communicating with the device before it has been fully configured.

See Also: ExternalDeviceDeActivatePolicy Property - Determines whether External Devices remain activated or are de-activated when the VNA is Preset or when a Instrument State is recalled.

**VB Syntax**
```
extDevices.Active = value
```

**Variable (Type) - Description**

*extDevices* An ExternalDevice (object)

*value* (Boolean) Choose from:

- **True** - Device is active.
- **False** - Device is NOT active.

Return Type
Boolean

Default
False - When configured using the front panel user interface, the device is ON (activated) by default.

**Examples**
```
extDevices.Active = True 'Write
bool = extDevices.Active 'Read
```

See example program to configure PMAR device
See example program to configure External Source

**C++ Syntax**
```
HRESULT get_Active( VARIANT_BOOL* value);

HRESULT put_Active( VARIANT_BOOL newVal);
```

**Interface**
IExternalDevices
ActiveMarker Property

Description
Returns a handle to the Active Marker object. You can either (1) use the handle directly to access Marker properties and methods, or (2) set a variable to the Marker object. The variable retains a handle to the original object if another Marker becomes active.

VB Syntax
1) `meas.ActiveMarker.<setting>`
or
2) Set `mark = meas.ActiveMarker`

Variable (Type) - Description
meas (object) - An Measurement object
<setting> A marker property (or method) and arguments
mark (object) - A marker object

Return Type
marker object

Default
None

Examples
`Public mark as marker`
`Set mark = meas.ActiveMarker`

C++ Syntax
`HRESULT get_ActiveMarker(IMarker** marker)`

Interface
IMeasurement
**ActiveMeasurement Property**

**Description**
Returns a handle to the Active Measurement object. You can either (1) use the handle directly to access measurement properties and methods, or (2) set a variable to the measurement object. The variable retains a handle to the original measurement.

**VB Syntax**
1) `app.ActiveMeasurement.<setting>`
2) `Set meas = app.ActiveMeasurement`

**Variable (Type) - Description**
- `meas` A Measurement (object)
- `app` An Application (object)
- `<setting>` A measurement property (or method) and arguments

**Return Type**
Measurement object

**Default**
None

**Examples**
1) `app.ActiveMeasurement.Averaging = 1`
2) `Public meas as Measurement
   Set meas = app.ActiveMeasurement`

**C++ Syntax**
`HRESULT get_ActiveMeasurement(IMeasurement **ppMeas)`

**Interface**
IApplication
ActiveNAWindow Property

Description
Returns a handle to the ActiveWindow object. You can either (1) use the handle directly to access window properties and methods, or (2) set a variable to the window object. The variable retains a handle to the original window if another window becomes active.

VB Syntax
1) `app.ActiveNAWindow.<setting>
or
2) Set `win = app.ActiveNAWindow`

Variable (Type) - Description
- `win` A NAWindow (object)
- `app` An Application (object)
- `<setting>` A NAWindow property (or method) and arguments

Return Type
A NAWindow object

Default
Not applicable

Examples
```vbnet
Public win as NAWindow
Set win = app.ActiveWindow
```

C++ Syntax
```cpp
HRESULT get_ActiveNAWindow(INAWindow **ppWindow)
```

Interface
IApplication
**ActiveTrace Property**

**Description**
Returns a handle to the Active Trace object. You can either (1) use the handle directly to access trace properties and methods, or (2) set a variable to the trace object. The variable retains a handle to the original trace if another trace becomes active.

**VB Syntax**
1) `win.ActiveTrace.<setting>`
   or
2) Set `trce = win.ActiveTrace`

**Variable (Type) - Description**
- `trce`: A Trace (object)
- `win`: An NAWindow (object)

**<setting>:** A trace property (or method) and arguments

**Return Type:** An NAWindow object

**Default:** None

**Examples**
1) `win.ActiveTrace.Autoscale`
2) Public `trce as Trace`
   `Set trce = Application.ActiveNAWindow.ActiveTrace`

**C++ Syntax**
`HRESULT get_ActiveTrace(ITrace* *pVal)`

**Interface**
INAWindow
# ActiveBackground Property

**Description**: Set and return the background color of the active window for the VNA display or hardcopy print.

**VB Syntax**

```vbnet
colors.ActiveBackground = value
```

**Variable**

- **Type**: `ComColors` (object)
- **Value**: `Long Integer` - RGB color of the ActiveBackground pen.

Convert the three RGB colors to an integer as follows:

```
RGB = R + (G * 2^8) + (B * 2^16)
```

To find the three RGB values from the Display Colors dialog, click **Change Color**, then **Define Custom Color**.

**Return Type**: Long

**Default**: Display = 0,0,24

**Examples**

```
R = 10
G = 10
B = 10
RGB = R + (G * 2^8) + (B * 2^16)
```

```vbnet
colors.ActiveBackground = RGB 'Write
color = colors.ActiveBackground 'Read
```

**C++ Syntax**

```csharp
HRESULT get_ActiveBackground(long* pVal);

HRESULT put_ActiveBackground(long newVal);
```

**Interface**: IColors2
### ActiveLabels Property

<table>
<thead>
<tr>
<th>Description</th>
<th>Set and return the labels and grid frame colors in the active window for the VNA display or hardcopy print. (Active labels, Grid frame)</th>
</tr>
</thead>
<tbody>
<tr>

<td><code>RGB = R + (G * 2^8) + (B * 2^16)</code></td>
</tr>
<tr>
<td></td>
<td>To find the three RGB values from the Display Colors dialog, click <strong>Change Color</strong>, then <strong>Define Custom Color</strong>.</td>
</tr>
<tr>
<td><strong>Return Type</strong></td>
<td>Long</td>
</tr>
<tr>
<td><strong>Default</strong></td>
<td>Display = 175,175,175</td>
</tr>
<tr>
<td></td>
<td>Print = 0,0,0 (Black)</td>
</tr>
<tr>
<td><strong>Examples</strong></td>
<td><code>R = 10</code></td>
</tr>
<tr>
<td></td>
<td><code>G = 10</code></td>
</tr>
<tr>
<td></td>
<td><code>B = 10</code></td>
</tr>
<tr>
<td></td>
<td><code>RGB = R + (G * 2^8) + (B * 2^16)</code></td>
</tr>
<tr>
<td></td>
<td><code>colors.ActiveLabels = RGB 'Write</code></td>
</tr>
<tr>
<td></td>
<td><code>color = colors.ActiveLabels 'Read</code></td>
</tr>
</tbody>
</table>

### C++ Syntax

- `HRESULT get_ActiveLabels(long* pVal);`
- `HRESULT put_ActiveLabels(long newVal);`

### Interface

- `IColors`
### ActiveXAxisRange Property

**Description**  
For FCA and GCX measurements, sets the swept parameter to display on the X-axis. This command does not change the default setting for new traces.

Use `Converter.ActiveXAxisRange` to change all existing traces and make the setting the default setting for new traces.

This command is NOT used for NFX, IMDX, and IMSX measurements. Use `Converter.ActiveXAxisRange`.

**VB Syntax**

```vbnet
mixer.ActiveXAxisRange = value
```

**Variable**  
*(Type)* - Description

- `mixer` A Mixer *(object)*
- `value` *(Enum as MixerStimulusRange)* - Parameter to display on the X-axis.

**Return Type**  
Enum

**Default**  
OUTPUT

**Examples**

```vbnet
mixer.ActiveXAxisRange = 1 'Write
variable = mixer.ActiveXAxisRange 'Read
```

**C++ Syntax**

```cpp
HRESULT get_ActiveXAxisRange(tagMixerStimulusRange *Val)

HRESULT put_ActiveXAxisRange(tagMixerStimulusRange newVal)
```

**Interface**  
IMixer3
### ActiveXAxisRange Property

**Description**
Sets the swept frequency range to display on the X-axis for all existing traces and sets the default for all future traces.

**VB Syntax**

```vbnet
obj.ActiveXAxisRange = value
```

**Variable**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>obj</code></td>
<td>A Converter Object (for IMDX and NFX measurements) or A Measurement Object (for GCX, SMC, and VMC measurements)</td>
</tr>
<tr>
<td><code>value</code></td>
<td>(Enum as ConverterStimulusRange)</td>
</tr>
</tbody>
</table>

**Swept stimulus range to display on the X-axis. Choose from:**

- **0 - naInputRange** - Input frequency range
- **1 - naLO1Range** - LO 1 frequency range
- **2 - naLO2Range** - LO 2 frequency range
- **3 - naOutputRange** - Output frequency range
- **4 - naPerMeasurementRange** - reserved for future use.

If the specified frequency range is not swept, the default swept range is used.

**Return Type**
Enum

**Default**
Search is performed in the following order until a swept range is found:

1. OUTPUT
2. INPUT (If the OUTPUT is fixed)
3. Number of Points (If ALL ranges are fixed)

**Examples**

```vbnet
conv.ActiveXAxisRange = naInputRange 'Write
```

```vbnet
variable = meas.ActiveXAxisRange 'Read
```

**C++ Syntax**

```c++
HRESULT get_ActiveXAxisRange(tagConverterStimulusRange range *Val)
```

```c++
HRESULT put_ActiveXAxisRange(tagConverterStimulusRange range newVal)
```
Interface  IConverter

IMeasurement14
**ADCCaptureMode Property**

**Description**
Sets and returns the ADC capture mode modeled as a 2-pole switch in the diagram on the SignalProcessingModuleFour page. The switch either bypasses or routes the IF through the 3-stage digital filter.

**VB Syntax**
```vbnet
spm4.ADCCaptureMode = value
```

**Variable**
*spm4* - Description

- **spm4**: A SignalProcessingModuleFour *(object)*
- **value**: *(Enum as NASTates)* Capture mode.

- **naOFF (0)** - The digital filters are used to process IF information. The filters can be configured automatically or manually using FilterMode Property.

- **naON (1)** - The digital filters are bypassed and the raw ADC readings are taken directly. With DSP 4 versions, a maximum of 4096 data points per sweep can be acquired.

With DSP 5 versions, the VNA maximum data points per sweep can be acquired.

Learn more about DSP Versions.

**Return Type**
Enum

**Default**
OFF

**Examples**
```vbnet
spm4.ADCCaptureMode = 0 'Write
mode = spm4.ADCCaptureMode 'Read
```

**C++ Syntax**
```cpp
HRESULT get_ADCCaptureMode(tagNASTates* pCaptureMode);
HRESULT put_ADCCaptureMode(tagNASTates pCaptureMode);
```

**Interface**
ISignalProcessingModuleFour
### ADCDelay Property

**Description**  
Returns the ADC delay for pulse measurements.

**VB Syntax**  
`value = pulse.ADCDelay`

**Variable** (Type) - Description

- **pulse**  
  A PulseGenerator (object)

- **value**  
  (Double) - Variable to store the returned ADC delay.

**Return Type**  
Double

**Default**  
Not Applicable

**Examples**  
`value = pulse.ADCDelay`  
Read

**C++ Syntax**  
`HRESULT get_ADCDelay(double* delay);`

**Interface**  
IPulseGenerator5
**ADCEnableFIRFor25Mhz Property**

**Description**
Set and read the FIR filter for 25 MHz decimation.

**VB Syntax**
\[ sa.ADCEnableFIRFor25Mhz = value \]

**Variable**
- **(Type)** - Description
  - \( sa \) - A SpectrumAnalyzer (object)
  - \( value \) - (Boolean) Choose from:
    - **0** - OFF - Disable 25 MHz FIR filter.
    - **1** - ON - Enable 25 MHz FIR filter.

**Return Type**
Boolean

**Default**
0

**Examples**
\[
\begin{align*}
sa.ADCEnableFIRFor25Mhz = 0 & \quad \text{'Write} \\
\text{filter} = sa.ADCEnableFIRFor25Mhz & \quad \text{'Read}
\end{align*}
\]

**C++ Syntax**

HRESULT put_ADCEnableFIRFor25Mhz(VARIANT_BOOL bEnable);

HRESULT get_ADCEnableFIRFor25Mhz(VARIANT_BOOL* bEnable);

**Interface**
ISpectrumAnalyzer4
**Description**  
Set and read the ADC filter width mode. The entered frequency value is rounded to the closest value supported by the VNA (11 MHz or 38 MHz).

**VB Syntax**  
```
sa.ADCFilter = value
```

**Variable**  
(Type) - Description  
<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sa</td>
<td>A SpectrumAnalyzer (object)</td>
</tr>
<tr>
<td>value</td>
<td>(Double) Choose a value within the range supported by the VNA.</td>
</tr>
</tbody>
</table>

Learn about these choices.

**Return Type**  
Double

**Default**  
11 MHz

```vbnet
sa.ADCFilter = 11MHz 'Write
value = sa.ADCFilter 'Read
```

**Examples**  
See an example program.

**C++ Syntax**  
```cpp
HRESULT put_ADCFilter(double cutfreq);

HRESULT get_ADCFilter(double* cutfreq);
```

**Interface**  
ISpectrumAnalyzer
### ADCMultRecPeriod Property

**Description**  
Set and read the period to wait between ADC record chunks.

**VB Syntax**  
```vb
sa.ADCMultRecPeriod = value
```

**Variable**  
- **Type**: (object)  
- **Value**  
  - `sa`  
  - A `SpectrumAnalyzer` object
  - `value`  
  - `Long`  
  - Choose a value between 64 and 33554432.

**Return Type**  
Long

**Default**  
64

**Examples**  
```vb
sa.ADCMultRecPeriod = 256 'Write
value = sa.ADCMultRecPeriod 'Read
```

See an example program.

**C++ Syntax**  
```c++
HRESULT put_ADCMultRecPeriod(long val);
HRESULT get_ADCMultRecPeriod(long* val);
```

**Interface**  
`ISpectrumAnalyzer`

**ADCMultRecState Property**

**Description**  
Set and read the ON/OFF state of the multiple recording function. Multiple recording allows the ADC Record Size to be divided and acquired in smaller "chunks" and also to specify a wait period between these acquisitions.

**VB Syntax**  
`sa.ADCMultRecState = value`

**Variable**  
- **sa** - A SpectrumAnalyzer *(object)*
- **value** - *(Boolean)* Choose from:
  - **0 - OFF** - ADC record size "chunking" OFF.
  - **1 - ON** - ADC record size "chunking" ON.

Learn about these settings.

**Return Type**  
Boolean

**Default**  
0

**Examples**  
`sa.ADCMultRecState = OFF`  
`value = sa.ADCMultRecState`

See an example program.

**C++ Syntax**  
```cpp
HRESULT put_ADMultRecState(VARIANT_BOOL bEnable);
HRESULT get_ADMultRecState(VARIANT_BOOL* bEnable);
```

**Interface**  
ISpectrumAnalyzer
ADCRecordSize Property

<table>

</tbody>
</table>
## ADCRecordSizeMax Property

**Description**  
Read the current maximum available ADC record size.

**VB Syntax**  
`value = sa.ADCRecordSizeMax`

**Variable**  
*(Type) - Description*  
- `sa` A `SpectrumAnalyzer (object)`  
- `value` *(Long)* Variable to store the returned value.

**Return Type**  
Long

**Example**  
`value = sa.ADCRecordSizeMax 'Read`

**C++ Syntax**  
`HRESULT get_ADCRecordSizeMax(long* val);`

**Interface**  
ISpectrumAnalyzer5
### ADCRecordSizeMin Property

**Description**  
Read the current minimum available ADC record size.

**VB Syntax**  
```vb
value = sa.ADCRecordSizeMin
```

**Variable**  
- `sa`: A `SpectrumAnalyzer` (object)
- `value`: (Long) Variable to store the returned value.

**Return Type**  
Long

**Example**  
```vb
value = sa.ADCRecordSizeMin 'Read
```

**C++ Syntax**  
```cpp
HRESULT get_ADCRecordSizeMin(long* val);
```

**Interface**  
`ISpectrumAnalyzer5`
**ADCSampleRate Property**

**Description**
Set and read the ADC sample frequency setting. The entered frequency is rounded to the closest value supported by the VNA (25 MHz or 100 MHz).

**VB Syntax**

```
sa.ADCSampleRate = value
```

**Variable**

- **sa** (Type) - Description: A SpectrumAnalyzer object
- **value** (Double) Choose from 100 MHz or 25 MHz.

Learn about these settings.

**Return Type**

Double

**Default**

100 MHz

**Examples**

```
sa.ADCSampleRate = 100MHz  'Write
value = sa.ADCSampleRate 'Read
```

See an example program.

**C++ Syntax**

```
HRESULT put_ADCSampleRate(double rate);
HRESULT get_ADCSampleRate(double* rate);
```

**Interface**

ISpectrumAnalyzer

### ADCStacking Property

**Description**  
Set and read the ADC stacking value.

**VB Syntax**  
```
sa.ADCStacking = value
```

**Variable**  
**Type** - Description

- **sa**: A `SpectrumAnalyzer` (object)
- **value**: (Double) Choose a value between 0 and 65535.

**Learn about these settings.**

**Return Type**  
Double

**Default**  
0

**Examples**  
```
sa.ADCStacking = 1  Write
value = sa.ADCStacking  'Read
```

**See an example program.**

**C++ Syntax**  
```
HRESULT put_ADCStacking(double val);
HRESULT get_ADCStacking(double* val);
```

**Interface**  
`ISpectrumAnalyzer`
### AfterSweepCmd Property

# ALCLevelingMode Property

**Description**  
Sets and returns the ALC mode for the specified channel and port. Use `GetSupportedALCModes` to return a list of valid ALC modes for the VNA.

Learn more about ALC mode.

**VB Syntax**  
```
chan.ALCLevelingMode (sourcePort) = value
```

**Variable**  
*(Type) - Description*

- `chan` *(object)* - A `Channel` object
- `sourcePort` *(long integer)* - The source port for which to make this setting. If ports are remapped, specify the logical port number.

**Note:** If the port is defined by a string name, such as an external source, a balanced port, or one of the Source 2 outputs on the 2-port 2-source VNA-x model, then you must use `chan.getPortNumber` to translate the string into a port number. To learn more see [Remotely Specifying a Source Port](#).

**value** *(enum as `naALCLevelingMode`)* - Choose from:

- 0 `naALCInternal`
- 2 `naALCOpenLoop` (PNA-X only)

**Return Type**  
Enum

**Default**  
`naALCInternal`

**Examples**  
```vbnet
chan.ALCLevelingMode(1) = 2 'Write
state = chan.ALCLevelingMode(4) 'Read
```

**C++ Syntax**  
```cpp
HRESULT get_ALCLevelingMode(long port, tagNAALCLevelingMode* pVal);

HRESULT put_ALCLevelingMode(long port,tagNAALCLevelingMode newVal);
```

**Interface**  
`IChannel9`
**Alignment Property**

**Description**  
Sets the way the PNA computes the DC value of the frequency-domain measurement. The correct DC value is required for inverse-FFT accuracy, and if not estimated properly, can cause distortions in the time-domain measurement in the form of an undesired slope in the waveform.

**VB Syntax**  
trans.Alignment = value

**Variable**  
- **trans**  
  A Transform (object)
- **value**  
  (Enum As NATransformAlignment) - Choose from:

  0 - naTransformAlignmentLegacy - The DC value is extrapolated using three data points. The transform offset is calculated using the delay of the first frequency point. This is the same algorithm used in the HP 8510 network analyzer.

  1 - naTransformAlignmentNormalize - The DC value is extrapolated using three data points. The transform offset is set to zero at t=0 minus six rise-times. This mode requires that a good S-parameter calibration has been performed, which can be verified by observing a flat time-domain response at t=0 when measuring a load located at the physical point corresponding to t=0. Setting the time domain trace to zero at a time before t=0 stabilizes the trace for determining impedances after time t=0, resulting in improved behavior compared to Legacy mode. This method is similar to that used with PLTS, and is very useful in determining the time-domain-transform response of transmission lines and printed-circuit-board characteristics.

**Return Type**  
Enum

**Default**  
0 - naTransformAlignmentNormalize

**Examples**  
trans.Alignment = naTransformAlignmentNormalize 'Write
value = trans.Alignment  'Read

**C++ Syntax**  
HRESULT get_Alignment(enum tagNATransformAlignment *pVal);

HRESULT put_Alignment(enum tagNATransformAlignment newVal);

**Interface**  
ITransform3
AllowArbitrarySegments Property

Description: Enables you to setup a segment sweep with arbitrary frequencies. The start and stop frequencies of each segment can overlap other segments. Also, each segment can have a start frequency that is greater than its stop frequency which causes a reverse sweep over that segment. Learn more about Arbitrary Segment Sweep.

VB Syntax: `segs.AllowArbitrarySegments = value`

Variable (Type) - Description:

- `segs`: A `Segments` collection (object)
- `value`: (boolean)
  - `True`: Allows the setup of arbitrary segment sweep.
  - `False`: Prevents the setup of arbitrary segment sweep.

Return Type: Boolean

Default: False

Examples:

- `segs.AllowArbitrarySegments = True` 'Write
- `AllowArbSegs = AllowArbitrarySegments` 'Read

C++ Syntax:

- `HRESULT get_AllowArbitrarySegments(VARIANT_BOOL *pVal)`
- `HRESULT put_AllowArbitrarySegments(VARIANT_BOOL newVal)`

Interface: ISegments3
AlternateSweep Property

Sets sweeps to either alternate or chopped.

VB Syntax

```vbnet
object.AlternateSweep = value
```

Variable (Type) - Description

- **object**
  - Channel (object)
  - or
  - CalSet (object) - Read-only property

Value (boolean) - Choose either:

- **False** - Sweep mode set to **Chopped** - reflection and transmission are measured on the same sweep.
- **True** - Sweep mode set to **Alternate** - reflection and transmission measured on separate sweeps. Improves Mixer bounce and Isolation measurements. Increases cycle time.

Return Type

boolean

Default

False (0)

Examples

```vbnet
chan.AlternateSweep = True 'Write
altSwp = chan.AlternateSweep 'Read
```

C++ Syntax

```c++
HRESULT AlternateSweep(VARIANT_BOOL *pVal)
HRESULT AlternateSweep(VARIANT_BOOL newVal)
```

Interface

IChannel

ICalSet3
### AmbientTemperature Property

<table>

## AnalysisCWFreq Property

**Description**  
Set and return the CW frequency for a compression analysis trace.

**VB Syntax**  
`gcaMeas.AnalysisCWFreq = value`

**Variable**  
(Type) - Description

- **gcaMeas**  
  A `GainCompressionMeas (object)`

- **value**  
  (Double)  
  CW frequency in Hz. Choose a frequency within the range of the gain compression channel.

**Return Type**  
Double

**Default**  
Not Applicable

**Examples**  
`gcaMeas.AnalysisCWFreq = 1e9  'Write`

`cwfreq = gca.AnalysisCWFreq  'Read`

**C++ Syntax**  
`HRESULT get_AnalysisCWFreq(Double* value)`

`HRESULT put_AnalysisCWFreq(Double  value)`

**Interface**  
`IGainCompressionMeas`
## AnalysisEnable Property

| Description       | Set and read the (ON | OFF) state of Gain Compression Analysis. |
|-------------------|---------------------------------------------|
| **VB Syntax**     | `gcaMeas.AnalysisEnable = value`            |
| **Variable**      | (Type) - Description                        |
| `gcaMeas`         | A GainCompressionMeas (object)              |
| `value`           | (Boolean) Choose from:                      |
|                   | **False** - Disable GCA analysis trace.     |
|                   | **True** - Enable GCA analysis trace.       |
| **Return Type**   | Boolean                                     |
| **Default**       | False                                       |
| **Examples**      | `gcaMeas.AnalysisEnable = True 'Write`      |
|                   | `analysis = gca.AnalysisEnable 'Read`      |
| **C++ Syntax**    | HRESULT get_AnalysisEnable(VARIANT_BOOL* value) |
|                   | HRESULT put_AnalysisEnable(VARIANT_BOOL  value) |
| **Interface**     | IGainCompressionMeas                       |
### AnalysisIsDiscreteFreq Property

**Description**
Sets and returns whether the CW frequency for the compression analysis trace can be set to only the discrete frequencies or provides interpolation.

**VB Syntax**

```
gcaMeas.AnalysisIsDiscreteFreq = value
```

**Variable (Type) - Description**

- **gcaMeas**
  A GainCompressionMeas (object)

- **value**
  (Boolean) Choose from:
  - **False** - Interpolated data points.
  - **True** - Discrete data points only.

**Return Type**
Boolean

**Default**
False

**Examples**

```
gcaMeas.AnalysisIsDiscreteFreq = True 'Write
isDisc = gca.AnalysisIsDiscreteFreq 'Read
```

**C++ Syntax**

```
HRESULT get_AnalysisIsDiscreteFreq(VARIANT_BOOL* value)
HRESULT put_AnalysisIsDiscreteFreq(VARIANT_BOOL  value)
```

**Interface**
IGainCompressionMeas
### AnalysisXAxis Property

- 3 - naStack2
- 4 - naSplit3
- 5 - naQuad4
- 6 - naTracePerWindow
- 7 - naChannelPerWindow
- 8 - naLtoR

**Return Type**

Not Applicable

**Default**

naTile

**Examples**

```vbnet
app.ArrangeWindow = naTile 'Write
```

**C++ Syntax**

```cpp
HRESULT put_ArrangeWindows(tagNAWindowModes newVal)
```

**Interface**

IApplication
About Attenuation

AttenuatorMode Property

Description
Sets or returns the mode of operation of the attenuator control for the specified port number. This command is automatically set to Manual when an Attenuator value is set.

VB Syntax
object.AttenuatorMode(portNum) = value

Variable (Type) - Description

object Channel (object)

or

CalSet (object) - Read-only property

portNum (long) - Port number of attenuator control to be changed.

value (enum NAModes) - Choose from:

0 - naAuto - Attenuator control set to automatic. The analyzer will set the attenuator control appropriately to deliver the specified power at the source.

Return Type
NAModes

Default
0 - Auto

Examples
chan.AttenuatorMode(1) = naAuto 'Write
attn = chan.AttenuatorMode(1) 'Read

C++ Syntax
HRESULT get_AttenuatorMode(long port, tagNAModes* pVal)
HRESULT put_AttenuatorMode(long port, tagNAModes newVal)

Interface
IChannel
ICalSet3
Attenuator Property

**Description**
Sets or returns the value of the source attenuator for the specified port number. Sending this command automatically sets AttenuatorMode to Manual.

**VB Syntax**

```
object.Attenuator(portNum) = value
```

**Variable**

- **object** Channel (object)

  **or**

  CalSet (object) - Read-only property

- **portNum** (long integer) - Port number of source attenuator to be changed.

- **value** (double) - Attenuation value. The range of settable values depends on the VNA model. To determine the valid settings, do one of the following:

  - See VNA models and options to see the range and step size for each model / option.
  - To determine the maximum attenuator value use MaximumSourceStepAttenuator.

If an invalid attenuation setting is entered, the VNA will select the next lower valid value. For example, if 19 is entered, then for an E8361A, 10 dB attenuation will be selected.

**Return Type**
Double

**Default**
20 dB

**Examples**

```
chan.Attenuator(1) = 20 'Write
attn = chan.Attenuator(cnum) 'Read
```

**C++ Syntax**

```
HRESULT get_Attenuator(long port, double *pVal)
HRESULT put_Attenuator(long port, double newVal)
```

**Interface**

- IChannel
- ICalSet3
AutoBandwidth Property

Description
Set and read the default values for DFT bandwidth.

VB Syntax
```
sa.dft.AutoBandwidth = value
```

Variable
(Type) - Description
- `sa.dft` A SpectrumAnalyzerDFT (object)
- `value` (Boolean) Choose from:
  - **0 - OFF** - DFT minimum and maximum values are set manually:
    - Narrow - 500 kHz to 11 MHz
    - Wide - 500 kHz to 44 MHz
  - **1 - ON** - DFT minimum and maximum values are set to their default values:
    - Narrow - 1 MHz to 10 MHz
    - Wide - 1 MHz to 34 MHz

Return Type
Boolean

Default
1

Examples
```
sa.dft.AutoBandwidth = 0  'Write
bwidth = sa.dft.AutoBandwidth  'Read
```

C++ Syntax
```
HRESULT put_AutoBandwidth(VARIANT_BOOL bEnable);
HRESULT get_AutoBandwidth(VARIANT_BOOL* bEnable);
```

Interface
ISpectrumAnalyzerDFT
### AutoCWSweepTime Property

**Description**
This command replaces AutoIFBandWidth Property.

Sets and returns the state of automatic CW sweep time (used in Pulse Profile mode).

**VB Syntax**
```
pulseMeas.AutoCWSweepTime = bool
```

**Variable**
- **(Type)** - Description
- **pulseMeas** - A PulseMeasurementControl *(object)*
  - **bool** - True - In Pulse Profile mode, adjusts the default X-axis start time to zero and the stop time to double the Pulse Width. This allows you to see one complete pulse.
  - **False** - The Sweep Time is not changed.

**Return Type**
Boolean

**Default**
True

**Examples**
```
pulse.AutoCWSweepTime = True 'Write
value = pulse.AutoCWSweepTime 'Read
```

**C++ Syntax**
```
HRESULT get_AutoCWSweepTime(VARIANT_BOOL *pVal);
HRESULT put_AutoCWSweepTime(VARIANT_BOOL newVal);
```

**Interface**
IPulseMeasurementControl2

**AutoPortExtConfig Property**

**Description**
Sets the frequency span that is used to calculate Automatic Port Extension. Learn more about calculating Automatic Port Extension.

**VB Syntax**
```
fixture.AutoPortExtConfig = value
```

**Variable (Type) - Description**
- **fixture**
  A Fixturing (object)
- **value**
  (ENUM as NAAutoPortExtConfig)

0 **naAPEC_CSPN** - Use current span.

1 **naAPEC_AMKR** - Use active marker frequency.

2 **naAPEC_USPN** - Use custom user span. Use **AutoPortExtSearchStart Property** and **AutoPortExtSearchStop Property** to specify start and stop frequency.

**Return Type**
ENUM

**Default**
0 **naAPEC_CSPN**

**Examples**
```
fixture.AutoPortExtConfig = naAPEC_AMKR
value = fixture.AutoPortExtConfig 'Read
```

**C++ Syntax**
```
HRESULT get_AutoPortExtConfig(tagNAAutoPortExtConfig *pVal );

HRESULT put_AutoPortExtConfig(tagNAAutoPortExtConfig Val );
```

**Interface**
IFixturing2
### AutoPortExtDCOffset Property

**Description**
Specifies whether or not to include DC Offset as part of automatic port extension. Learn more about Automatic DC Offset. Only allowed when AutoPortExtLoss Property is set to ON.

**VB Syntax**
```vbnet
fixture.AutoPortExtDCOffset = bool
```

**Variable (Type) - Description**
- **fixture**: A Fixturing (object)
- **bool**: True - Includes DC Offset correction.
  - False - Does NOT include DC Offset correction.

**Return Type**
Boolean

**Default**
False

**Examples**
```vbnet
fixture.AutoPortExtDCOffset = True
value = fixture.AutoPortExtDCOffset 'Read
```

**C++ Syntax**
```cpp
HRESULT get_AutoPortExtDCOffset(VARIANT_BOOL *pState);
HRESULT put_AutoPortExtDCOffset(VARIANT_BOOL bState);
```

**Interface**
IFixturing2
AutoPortExtLoss Property

**Description**
Specifies whether or not to include loss correction as part of automatic port extension. Learn more about Loss Compensation in port extension.

**VB Syntax**
```vbnet
fixture.AutoPortExtLoss = bool
```

**Variable**
- **Type** - Description
  - `fixture` A Fixturing (object)
  - `bool` True - Includes Loss correction.
    - False - Does NOT include Loss correction.

**Return Type**
Boolean

**Default**
False

**Examples**
```vbnet
fixture.AutoPortExtLoss = True
value = fixture.AutoPortExtLoss 'Read
```

**C++ Syntax**
```c++
HRESULT get_AutoPortExtLoss(VARIANT_BOOL *pState);
HRESULT put_AutoPortExtLoss(VARIANT_BOOL bState);
```

**Interface**
IFixturing2
AutoPortExtSearchStart Property

**Description**
Set the start frequency for custom user span. Only applies when `fixture.AutoPortExtConfig = 0 naAPEC_CSPN`.

Learn more about User Span.

**VB Syntax**

```
fixture.AutoPortExtSearchStart = value
```

**Variable**

- **Type**: Description
- **fixture**: A Fixturing (object)
- **value**: (Double) User span start value. Must be within the frequency range of the active channel and less than the value set by `AutoPortExtSearchStop Property`

**Return Type**
Double

**Default**
Start frequency of the current active channel.

**Examples**

```
fixture.AutoPortExtSearchStart = 1E9
value = fixture.AutoPortExtSearchStart 'Read
```

**C++ Syntax**

```
HRESULT get_AutoPortExtSearchStart(double *pdVal);
HRESULT put_AutoPortExtSearchStart(double dVal);
```

**Interface**
IFxituring2
AutoPortExtSearchStop Property

**Description**
Set the stop frequency for custom user span. Only applies when `fixture.AutoPortExtConfig = 0 naAPEC_CSPN`.

Learn more about User Span.

Only applies when `fixture.AutoPortExtConfig = 0 naAPEC_CSPN`.

**VB Syntax**
```
fixture.AutoPortExtSearchStop = value
```

**Variable (Type) - Description**
- **fixture** (A Fixturing (object))
- **value** (Double) User span stop value. Must be within the frequency range of the active channel and greater than the value set by `AutoPortExtSearchStart Property`.

**Return Type**
Double

**Default**
Stop frequency of the current active channel.

**Examples**
```
fixture.AutoPortExtSearchStop = 1E9
value = fixture.AutoPortExtSearchStop  'Read
```

**C++ Syntax**
```
HRESULT get_AutoPortExtSearchStop(double *pdVal);

HRESULT put_AutoPortExtSearchStop(double dVal);
```

**Interface**
IFixturing2
**AutoPortExtState Property**

**Description**
Enables and disables automatic port extensions on the specified port. All enabled ports will have their reference plane automatically adjusted after performing Automatic Port Extension.

**VB Syntax**
```vbnet
fixture.AutoPortExtState (port) = bool
```

**Variable (Type) - Description**
- `fixture` (A Fixturing `object`)
- `port` (Port number to enable or disable. `Integer`)
- `bool` (Boolean)
  - **True** - Enables Auto Port Extensions
  - **False** - Disables Auto Port Extensions

**Return Type**
Boolean

**Default**
False

**Examples**
```vbnet
fixture.AutoPortExtState(1) = True
value = fixture.AutoPortExtState(2)  'Read
```

**C++ Syntax**
```cpp
HRESULT get_AutoPortExtState(short port, VARIANT_BOOL *pState );
HRESULT put_AutoPortExtState(short port, VARIANT_BOOL bVal);
```

**Interface**
IFixturing2
### AutoPulseTiming Property

**Description**
In Narrowband pulse mode, choose to set the delay and width automatically or manually. This is labeled "Autoselect Width and Delay" on the user-interface.

**VB Syntax**
```
pulseMeas.AutoPulseTiming = bool
```

**Variable (Type) - Description**
- **pulseMeas**: A `PulseMeasurementControl` (object)
- **bool**: 
  - **False**: Manually set the delay and width for the measurement.
  - **True**: Automatically set the delay and width for the measurement.

**Return Type**
Boolean

**Default**
True

**Examples**
```
pulse.AutoPulseTiming = True  'Write
value = pulse.AutoPulseTiming  'Read
```

**C++ Syntax**
```
HRESULT get_AutoPulseTiming(VARIANT_BOOL *pVal);
HRESULT put_AutoPulseTiming(VARIANT_BOOL newVal);
```

**Interface**
`IPulseMeasurementControl`
# About Pulse Measurements

## AutoSelectPulseGen Property

**Description**
In Narrowband pulse mode, choose to set the pulse generator used to drive the source modulation automatically or manually.

**VB Syntax**

```vbnet
pulseMeas.AutoSelectPulseGen = bool
```

**Variable**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pulseMeas</td>
<td>A PulseMeasurementControl (object)</td>
</tr>
<tr>
<td>bool</td>
<td></td>
</tr>
</tbody>
</table>

- **False** - Manually set source modulation drive for the measurement.
- **True** - Automatically set source modulation drive for the measurement.

**Return Type**
Boolean

**Default**
True

**Examples**

```vbnet
pulse.AutoSelectPulseGen = True 'Write
value = pulse.AutoSelectPulseGen 'Read
```

**C++ Syntax**

```c++
HRESULT get_AutoSelectPulseGen(VARIANT_BOOL *pVal);
HRESULT put_AutoSelectPulseGen(VARIANT_BOOL newVal);
```

**Interface**
IPulseMeasurementControl
### AuxiliaryTriggerCount Property

<table>
<thead>
<tr>
<th>Description</th>
<th>Returns the number of aux trigger input / output connector pairs in the VNA</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>VB Syntax</strong></td>
<td><code>value = app.AuxiliaryTriggerCount</code></td>
</tr>
<tr>
<td><strong>Variable</strong></td>
<td><em>(Type)</em> - Description</td>
</tr>
<tr>
<td><code>value</code></td>
<td><em>(Long Integer)</em> Variable to store the returned value.</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>2 = PNA-X models</td>
</tr>
<tr>
<td></td>
<td>1 = All other VNA models</td>
</tr>
<tr>
<td></td>
<td>An Application <em>(object)</em></td>
</tr>
<tr>
<td><strong>Return Type</strong></td>
<td>Long Integer</td>
</tr>
<tr>
<td><strong>Default</strong></td>
<td>Not Applicable</td>
</tr>
<tr>
<td><strong>Examples</strong></td>
<td><code>ioConns = app.AuxiliaryTriggerCount</code></td>

<tr>
<td><strong>Interface</strong></td>
<td>IApplication11</td>
</tr>
</tbody>
</table>
**AuxTriggerScopeIsGlobal Property**

**Description**
Sets the Trigger OUT behavior to either Global or Channel. Learn more about this setting.

This command will cause the VNA to Preset.

This setting remains until changed again using this command, or until the hard drive is changed or reformatted.

See the AuxTrigger Object.

**VB Syntax**
`pref.AuxTriggerScopeIsGlobal = value`

**Variable (Type) - Description**
- `pref` (A Preferences object)
- `value` (Boolean) - Choose from:
  - **True** - Trigger properties apply to ALL channels (Global).
    - Default setting for E836x and PNA-L models.
    - Allows use of command to configure the external trigger properties.
    - "Per Point" trigger property is not settable. Use the channel's Point trigger setting.
  - **False** - External Trigger properties apply to each channel independently.
    - Default setting for PNA-X models.
    - Must use AuxTrigger commands to configure the external trigger properties. `ExternalTriggerConnectionBehavior Property` will NOT work.
    - "Per Point" trigger output property is set using the channel's Point trigger setting AND `TriggerOutInterval Property`.

**Return Type**
Boolean

**Default**
- **True** - E836xB and PNA-L models
- **False** - PNA-X models

**Examples**
- `pref.AuxTriggerScopeIsGlobal = 1`  'Write
- `auxTrigPref = pref.AuxTriggerScopeIsGlobal`  'Read
C++ Syntax

HRESULT get_AuxTriggerScopeIsGlobal(VARIANT_BOOL * pref);
HRESULT put_AuxTriggerScopeIsGlobal(VARIANT_BOOL pref);

Interface
IPreferences5
## AvailableMeasurementClasses Property

<table>
<thead>
<tr>
<th>Description</th>
<th>Returns a list of available measurement classes on the VNA.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>VB Syntax</strong></td>
<td><code>value = cap.AvailableMeasurementClasses</code></td>

<tr>
<td><code>value</code></td>
<td>(Variant) - Variable to store the returned list of measurement classes.</td>
</tr>
<tr>
<td><code>cap</code></td>
<td>A Capabilities <em>(object)</em></td>
</tr>
<tr>
<td><strong>Return Type</strong></td>
<td>Variant</td>
</tr>
<tr>
<td><strong>Default</strong></td>
<td>Not Applicable</td>
</tr>
</tbody>
</table>

**Examples**

```vba
'Read all measurement classes
Set app = CreateObject("AgilentPNA835x.Application")
Set cap = app.Capabilities
meas = cap.AvailableMeasurementClasses
dim i
For i = 0 To UBound(meas)
    msg = msg & meas(i) & vbCrLf
Next
MsgBox msg
```

**C++ Syntax**

```cpp
HRESULT get_AvailableMeasurementClasses(Variant *value);
```

**Interface**

ICapabilities7
**AverageMode Property**

</tbody>
</table>
About Averaging

AveragingCount Property

Description
Returns the number of sweeps that have been acquired and averaged into the measurements on this channel. AveragingFactor specifies the number of sweeps to average. AveragingCount indicates the progress toward that goal.

VB Syntax
value = chan.AveragingCount

Variable (Type) - Description
chan A Channel (object)
value (Long Integer) - Variable to store the returned count

Return Type
Long Integer

Default
Not Applicable

Example
avgcount = chan.AveragingCount

C++ Syntax
HRESULT get_AveragingCount(long* count)

Interface
IChannel
### AveragingFactor Property

**Description**  
Specifies the number of measurements to combine for an average. Must also turn averaging ON by setting `chan.Averaging = 1`.

**VB Syntax**  
`chan.AveragingFactor = value`

**Variable**  
- **Type** - Description  
  - `chan`  
    - A Channel (object)  
  - `value`  
    - (Long Integer) - Number of measurement sweeps to average. Choose any number between 1 and 65536 ($2^{16}$).

**Return Type**  
Long Integer

**Default**  
1

**Examples**  
- `chan.AveragingFactor = 5`  
  - `Write`
- `avgfact = chan.AveragingFactor`  
  - `Read`

**C++ Syntax**  
- `HRESULT get_AveragingFactor(long *pVal)`
- `HRESULT put_AveragingFactor(long newVal)`

**Interface**  
IChannel
### Averaging Property

**Description**

Turns trace averaging ON or OFF for all measurements on the channel. Averaging is only allowed on ratioed measurements; not on single input measurements.

**VB Syntax**

```vbnet
chan.Averaging = state
```

**Variable**

- **(chan)**: A Channel (object)
- **(state)**: (boolean)
  - **False**: Turns averaging OFF
  - **True**: Turns averaging ON

**Return Type**

Boolean

**Default**

False

**Examples**

```vbnet
chan.Average = True 'Write
averag = chan.Averaging 'Read
```

**C++ Syntax**

```csharp
HRESULT get_Averaging(BOOL *pVal)
HRESULT put_Averaging(BOOL newVal)
```

**Interface**

IChannel
## AvoidSpurs Property

**Description**
Sets and returns the state of the avoid spurs feature.

**VB Syntax**
```
mixer.AvoidSpurs = boolean
```

**Variable**

**Type** - Description

- **mixer** A Mixer *(object)*
  
  A Converter *(object)*

- **value** *(Boolean)* - State of avoid spurs feature. Choose from

  - **False** Avoid spurs OFF
  - **True** Avoid spurs ON

**Return Type**
Boolean

**Default**
False

**Examples**
```
conv.AvoidSpurs = True 'Write

variable = conv.AvoidSpurs 'Read
```

**C++ Syntax**

```
HRESULT get_AvoidSpurs(Bool *bVal)

HRESULT put_AvoidSpurs(Bool newVal)
```

**Interface**
IMixer3

IConverter5
B_BalPortNegative Property

Description
Returns the negative balanced port number in the balanced DUT topology.

Use SetBPort Method to set the single balanced port DUT topology.

VB Syntax
var = balTopology.B_BalPortNegative

Variable (Type) - Description
balTopology A BalancedTopology (object)
var (Long Integer) Variable to store the returned value.

Return Type Long Integer
Default Not Applicable
Examples variable = balTopology.B_BalPortNegative  'Read

C++ Syntax HRESULT get_B_BalPortNegative(long *NegPort)

Interface IBalancedTopology3
B_BalPortPositive Method

Description
Returns the positive balanced port number in the balanced DUT topology.
Use SetBPort Method to set the single balanced port DUT topology.

VB Syntax
var = balTopology.B_BalPortPositive

Variable (Type) - Description
balTopology A BalancedTopology (object)
var (Long Integer) Variable to store the returned value.

Return Type
Long Integer

Default
Not Applicable

Examples
variable = balTopology.B_BalPortPositive 'Read

C++ Syntax
HRESULT get_B_BalPortPositive(long *PosPort)

Interface
IBalancedTopology3
### Background Property

<table>
<thead>
<tr>
<th>Description</th>
<th>Set and return the background color for the VNA display or hardcopy print.</th>
</tr>
</thead>
<tbody>
<tr>
<td>VB Syntax</td>
<td><code>colors.Background = value</code></td>
</tr>
<tr>
<td>Variable</td>
<td><strong>(Type)</strong> - <strong>Description</strong></td>
</tr>
<tr>
<td><code>colors</code></td>
<td>A <strong>ComColors</strong> <em>(object)</em></td>
</tr>
<tr>
<td><code>value</code></td>
<td><em>(Long Integer)</em> - RGB color of the Background pen.</td>
</tr>
</tbody>
</table>

Convert the three RGB colors to an integer as follows:

\[
RGB = R + (G \times 2^8) + (B \times 2^{16})
\]

To find the three RGB values from the Display Colors dialog, click **Change Color**, then **Define Custom Color**.

<table>
<thead>
<tr>
<th>Return Type</th>
<th>Long</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default</td>
<td>Display = 0,0,0 (Black)</td>
</tr>
<tr>
<td></td>
<td>Print = 255,255,255 (White)</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Examples</th>
<th>R = 10</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>G = 10</td>
</tr>
<tr>
<td></td>
<td>B = 10</td>
</tr>
<tr>
<td>RGB</td>
<td>= R + (G \times 2^8) + (B \times 2^{16})</td>
</tr>
<tr>
<td><code>colors.Background = RGB</code></td>
<td><strong>Write</strong></td>
</tr>
<tr>
<td><code>color = colors.Background</code></td>
<td><strong>Read</strong></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>C++ Syntax</th>
<th>HRESULT get_Background(long* pVal);</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>HRESULT put_Background(long newVal);</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Interface</th>
<th>IColors</th>
</tr>
</thead>
</table>
### BackOff Property

**Description**
Sets and returns the backoff value used to calculate various PNOP parameters. Also set PinOffset Property.

A sweep must be executed (single or continuous) and SearchPowerNormalOperatingPoint Method must be sent before reading marker results.

To turn off the PNOP markers, either turn them off individually or DeleteAllMarkers.

To search a User Range with the PNOP search, first activate marker 1. The user range used with the PNOP search only applies to marker 1 searching for the linear gain value. The other markers may fall outside the user range.

**VB Syntax**

```
pnop.BackOff = value
```

**Variable**

- **Type** - Description
- **pnop** - a PNOP (object)
- **value** - (double) - Backoff value in dB. Choose any number between -500 and 500

**Return Type**
Double

**Default**
0 dB

**Examples**

```
backoff = pnop.BackOff 'Read
```

See example program

**C++ Syntax**

- HRESULT put_BackOff(double newVal);
- HRESULT get_BackOff(double* pNewVal)

**Interface**
IPNOP
# BackOffGain Property

**Description**
Returns the BackOffGain result of the PNOP marker search.

\[ \text{PBO Gain} = \text{PBO Out} - \text{PBO In} \]

**VB Syntax**
```vbnet
bOffGain = pnop.BackOffGain
```

**Variable**
- **Type**: (double) - Variable to store returned value
- **pnop**: A PNOP (object)

**Return Type**
Double

**Default**
Not applicable

**Examples**
```vbnet
bOffGain = pnop.BackOffGain 'Read
```

[See example program](#)

**C++ Syntax**
```cpp
HRESULT get_BackOffGain(double* pNewVal)
```

**Interface**
IPNOP
## BackOffPin Property

<table>
<thead>
<tr>
<th>Description</th>
<th>Returns the BackOffPin result of the PNOP marker search.</th>
</tr>
</thead>
<tbody>
<tr>
<td>VB Syntax</td>
<td>( bOffPin = \text{pnop.BackOffPin} )</td>
</tr>
<tr>
<td>Variable</td>
<td>(Type) - Description</td>
</tr>
<tr>
<td>( bOffPin )</td>
<td>(double) - Variable to store returned value</td>
</tr>
<tr>
<td>( \text{pnop} )</td>
<td>A PNOP (object)</td>
</tr>
<tr>
<td>Return Type</td>
<td>Double</td>
</tr>
<tr>
<td>Default</td>
<td>Not applicable</td>
</tr>
<tr>
<td>Examples</td>
<td>( bOffPin = \text{pnop.BackOffPin} ) 'Read</td>
</tr>
<tr>
<td>C++ Syntax</td>
<td>HRESULT get_BackOffPin(double* pNewVal)</td>
</tr>
<tr>
<td>Interface</td>
<td>IPNOP</td>
</tr>
</tbody>
</table>

PBO In = Marker 2 X-axis

See example program
### BackOffPout Property

<table>
<thead>
<tr>
<th>Description</th>
<th>Returns the BackOffPout result of the PNOP marker search.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>PBO Out</strong></td>
<td>Marker 2 Y-axis</td>
</tr>
</tbody>
</table>

**VB Syntax**

```vbnet
bOffPout = pnop.BackOffPout
```

**Variable**

- **(Type)** - Description
- **bOffPout** *(double)* - Variable to store returned value
- **pnop** - A PNOP *(object)*

**Return Type**

Double

**Default**

Not applicable

**Examples**

```vbnet
bOffPout = pnop.BackOffPout 'Read
```

See example program

**C++ Syntax**

```cpp
HRESULT get_BackOffPout(double* pNewVal)
```

**Interface**

IPNOP
### BalancedMode Property

**Description**
Sets and returns whether the balanced transform is ON or OFF

**VB Syntax**

```vbnet
balMeas.BalancedMode = value
```

**Variable (Type) - Description**

- `value` *(Boolean)* - State of balanced transform. Choose from
  - **False** Balanced Transform OFF
  - **True** Balanced Transform ON

**Return Type**
Boolean

**Default**
**False**

**Examples**

```vbnet
balMeas.BalancedMode = True 'Write
variable = balMeas.BalancedMode 'Read
```

**C++ Syntax**

```cpp
HRESULT get_BalancedMode(VARIANT_BOOL *bVal)

HRESULT put_BalancedMode(VARIANT_BOOL newVal)
```

**Interface**
IBalancedMeasurement
**BalancedPortTrueState(bpnum) Property**

<table>
<thead>
<tr>

</tbody>
</table>
## BalPort1PhaseOffset Property

**Description**
Sets and returns the phase offset between the two ports that comprise Balanced port 1. `balStim.Mode` must be set to a True Stimulus mode. Applicable only with Opt S93460A/B - iTMSA.

**VB Syntax**
```
balStim.BalPort1PhaseOffset = value
```

**Variable**
- **Type**: Description
- **balStim**: A `BalancedStimulus` (object)
- **value**: (Double) - Phase Offset in degrees. Choose a value between -360 and 360.

**Return Type**
- **Double**

**Default**
- **0**

**Examples**
```
balStim.BalPort1PhaseOffset = 10 'Write

variable = balStim.BalPort1PhaseOffset 'Read
```

**C++ Syntax**
- `HRESULT get_BalPort1PhaseOffset (double *pVal)`
- `HRESULT put_BalPort1PhaseOffset (double newVal)`

**Interface**
- `IBalancedStimulus`
### BalPort1StartPhase Property

**Description**
Sets and returns the start phase of a phase sweep.

**VB Syntax**

```
balStim.BalPort1StartPhase = value
```

**Variable**
*balStim* - A BalancedStimulus (object)

*value* - (Double) - Start phase in degrees. Choose a value between -360 and 360.

**Return Type**
Double

**Default**
0

**Examples**

```vbnet
balStim.BalPort1StartPhase = 10 'Write
variable = balStim.BalPort1StartPhase 'Read
```

**C++ Syntax**

```cpp
HRESULT get_BalPort1StartPhase (double *pVal)
HRESULT put_BalPort1StartPhase (double newVal)
```

**Interface**
IBalancedStimulus2
### BalPort1StopPhase Property

<table>
<thead>
<tr>
<th>Description</th>
<th>Sets and returns the stop phase of a phase sweep.</th>
</tr>
</thead>
<tbody>

</tbody>
</table>
### BalPort2PhaseOffset Property

**Description**  
Sets and returns the phase offset between the two ports that comprise Balanced port 2. `balStim.Mode` must be set to a True Stimulus mode. Applicable only with Opt S93460A/B - iTMSA.

**VB Syntax**  
`balStim.BalPort2PhaseOffset = value`

**Variable**  
`balStim` - A `BalancedStimulus` object

`value` - (Double) - Phase Offset in degrees. Choose a value between -360 and 360.

**Return Type**  
Double

**Default**  
0

**Examples**  
`balStim.BalPort2PhaseOffset = 10 'Write`

`variable = balStim.BalPort2PhaseOffset 'Read`

**C++ Syntax**  
`HRESULT get_BalPort2PhaseOffset (double *pVal)`

`HRESULT put_BalPort2PhaseOffset (double newVal)`

**Interface**  
IBalancedStimulus
## BalPort2PowerOffset Property

**Description**
Sets and returns the power offset between the two ports that comprise Balanced port 2. \( \text{balStim.Mode} \) must be set to a True Stimulus mode. Applicable only with Opt S93460A/B - iTMSA.

**VB Syntax**

\[
\text{balStim.BalPort2PowerOffset} = \text{value}
\]

**Variable**

- **balStim**
  - A **BalancedStimulus (object)**

- **value**
  - **(Double)** - Power Offset in dB.

**Return Type**
Double

**Default**
0

**Examples**

```
balStim.BalPort2PowerOffset = 2 'Write
variable = balStim.BalPort2PowerOffset  'Read
```

**C++ Syntax**

```c++
HRESULT get_BalPort2PowerOffset (double *pVal)
HRESULT put_BalPort2PowerOffset (double newVal)
```

**Interface**
IBalancedStimulus
### BalPort2StartPhase Property

**Description**
Sets and returns the start phase of a phase sweep.

**VB Syntax**
```vbnet
balStim.BalPort2StartPhase = value
```

**Variable**
- **balStim** (Type) - Description
  A BalancedStimulus (object)
- **value** (Double) - Start phase in degrees. Choose a value between -360 and 360.

**Return Type**
Double

**Default**
0

**Examples**
```vbnet
balStim.BalPort2StartPhase = 10 'Write

variable = balStim.BalPort2StartPhase 'Read
```

**C++ Syntax**
```cpp
HRESULT get_BalPort2StartPhase (double *pVal)

HRESULT put_BalPort2StartPhase (double newVal)
```

**Interface**
IBalancedStimulus2
# BalPort2StopPhase Property

Sets and returns the stop phase of a phase sweep.

**VB Syntax**

\[
\text{balStim.BalPort2StopPhase} = \text{value}
\]

**Variable**

*balStim* A *BalancedStimulus* (object)

*value* (Double) - Stop phase in degrees. Choose a value between -360 and 360.

**Return Type**

Double

**Default**

0

**Examples**

\[
\begin{align*}
\text{balStim.BalPort2StopPhase} &= 10 \quad \text{'Write} \\
\text{variable} &= \text{balStim.BalPort2StopPhase} \quad \text{'Read}
\end{align*}
\]

**C++ Syntax**

\[
\begin{align*}
\text{HRESULT get_BalPort2StopPhase (double \ast pVal)} \\
\text{HRESULT put_BalPort2StopPhase (double newVal)}
\end{align*}
\]

**Interface**

IBalancedStimulus2
BalSMeasurement Property

Description
Sets and returns the measurement for the Balanced - Single-ended topology.

VB Syntax
`balMeas.BalSMeasurement = value`

Variable (Type) - Description
`balMeas` A `BalancedMeasurement` (object)
`value` (String) - Balanced - Single-ended measurement parameter. Not case sensitive. Choose from:

<p>| | | |</p>
<table>
<thead>

</tbody>
</table>

Return Type
String

Default
Sdd11

Examples
`balMeas.BalSMeasurement = "Sdd11"` 'Write
`variable = balMeas.BalSMeasurement` 'Read

C++ Syntax
`HRESULT get_BalSMeasurement(BSTR *pVal)`
`HRESULT put_BalSMeasurement(BSTR newVal)`

Interface
`IBalancedMeasurement3`
**BandDensityACPRState Property**

**Description**  
Sets and reads the ACPR density marker.

**VB Syntax**  
`mkr.BandDensityACPRState = value`

**Variable**  
*(Type) - Description*

- `mkr` A Marker *(object)*
- `value` *(Enum as NAStates)* Choose from:
  - `naOFF` (or 0) - Turn ACPR density marker OFF
  - `naON` (or 1) - Turn ACPR density marker ON

**Return Type**  
Boolean

**Default**  
`naOFF`

**Examples**

```
Write
mkr.BandDensityACPRState = 0

value = mkr.BandDensityACPRState 'Read
```

**C++ Syntax**

```
HRESULT get_BandDensityACPRState(tagNAStates* pState)

HRESULT put_BandDensityACPRState(tagNAStates pState)
```

**Interface**  
IMarker9
About Spectrum Analyzer Markers

BandDensityBW Property

**Description**: Sets and reads the bandwidth of the band density marker.

**VB Syntax**: `mkr.BandDensityBW = value`

**Variable**

- `mkr` (Type) - Marker (object)
- `value` (Double) - Choose a bandwidth

**Return Type**: Double

**Default**: 1 MHz

**Examples**

```
 mkr.BandDensityBW = 1e6 'Write

value = mkr.BandDensityBW 'Read
```

**C++ Syntax**

- `HRESULT get_BandDensityBW(double* pVal)`
- `HRESULT put_BandDensityBW(double newVal)`

**Interface**: IMarker8
# BandDensityEQSPan Property

**Description**  
Sets and reads the frequency span used by Power Density to normalize the power.

**VB Syntax**  
\[ mkr.BandDensityEQSPan = value \]

**Variable**  
- **mkr**  
  A Marker (object)
- **value**  
  (Double) Choose a span

**Return Type**  
Double

**Default**  
1 MHz

**Examples**  
- \[ mkr.BandDensityEQSPan = 1e6 \]  
  'Write
- \[ value = mkr.BandDensityEQSPan \]  
  'Read

**C++ Syntax**  
- HRESULT get_BandDensityEQSPan(double* pVal)
- HRESULT put_BandDensityEQSPan(double newVal)

**Interface**  
IMarker8
**BandDensityNoiseState Property**

**Description**
Sets and reads the band noise density marker state.

**VB Syntax**

```
mkr.BandDensityNoiseState = value
```

**Variable**

- **mkr**
  - Marker (object)
- **value**
  - Enum as NAStates

Choose from:

- naOFF (or 0) - Turn band noise density marker OFF
- naON (or 1) - Turn band noise density marker ON

**Return Type**
Boolean

**Default**
aOFF

**Examples**

```vbnet
mkr.BandDensityNoiseState = 0 'Write
value = mkr.BandDensityNoiseState 'Read
```

**C++ Syntax**

```
HRESULT get_BandDensityNoiseState(tagNAStates* pState)
HRESULT put_BandDensityNoiseState(tagNAStates pState)
```

**Interface**
IMarker8

## BandDensityPowerBW Property

**Description**
Sets and reads the band power density bandwidth.

**VB Syntax**
```vbnet
mkr.BandDensityPowerBW = value
```

**Variable**
- **mkr** (Type) - Marker (object)
- **value** (Double) Choose a bandwidth

**Return Type**
Double

**Default**
1 MHz

**Examples**
```vbnet
mkr.BandDensityPowerBW = 1e6 'Write
value = mkr.BandDensityPowerBW 'Read
```

**C++ Syntax**
```cpp
HRESULT get_BandDensityPowerBW(double* pVal)
HRESULT put_BandDensityPowerBW(double newVal)
```

**Interface**
IMarker8
### BandDensityPowerState Property

**Description**  
Sets and reads the band power density state.

**VB Syntax**  
\[ mkr.BandDensityPowerState = value \]

**Variable**  
(Type) - Description

- \( mkr \) A Marker (object)
- \( value \) (Enum as NAs) Choose from:
  - naOFF (or 0) - Turn band power density marker OFF
  - naON (or 1) - Turn band power density marker ON

**Return Type**  
Boolean

**Default**  
naOFF

**Examples**

- \[ mkr.BandDensityPowerState = 0 \] Write
- \[ value = mkr.BandDensityPowerState \] Read

**C++ Syntax**

- HRESULT get_BandDensityPowerState(tagNAs pState)
- HRESULT put_BandDensityPowerState(tagNAs pState)

**Interface**  
IMarker8

### BandwidthSearch Property

**Description**
Sets the bandwidth search preference to start a bandwidth or notch search in either peak or marker mode.

**VB Syntax**

```
pref.BandwidthSearch = value
```

**Variable (Type) - Description**

- `pref` A Preferences *(object)*
- `value` *(Enum)* - Choose from:

  0 - `searchPeak` - Search starts at the maximum y-value of the full sweep of data.

  1 - `searchMarker` - Search starts at the x and y position of the active marker.

**Return Type**
Enum

**Default**
searchPeak

**Examples**

```
pref.BandwidthSearch = 1 'Write
bwsearchmode = pref.BandwidthSearch 'Read
```

**C++ Syntax**

```
HRESULT put_BandwidthSearch(enum BandwidthSearchMode preference)
HRESULT get_BandwidthTarget(enum BandwidthSearchMode* preference)
```

**Interface**
IPreferences18
# BandwidthShape Property

<table>
<thead>
<tr>
<th>Description</th>
<th>Set and read the resolution bandwidth shape.</th>

</tbody>
</table>

*Learn about these choices.*

<table>
<thead>
<tr>
<th>Return Type</th>
<th>Enum</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Default</strong></td>
<td>2 - <code>naWindowGaussian</code></td>
</tr>
</tbody>
</table>

**Examples**

```vba
da.BandwidthShape = naWindowFlatTop 'Write
data = da.BandwidthShape 'Read
```

*See an example program.*

**C++ Syntax**

```cpp
HRESULT put_BandwidthShape(tagNASABandwidthShape shape);
HRESULT get_BandwidthShape(tagNASABandwidthShape* shape);
```

**Interface**

`ISpectrumAnalyzer`
**BandwidthTarget Property**

**Description**
Sets the insertion loss value at which the bandwidth of a filter is measured (using BandwidthTracking or SearchFilterBandwidth). For example, if you want to determine the filter bandwidth 3 db below the bandpass peak value, set BandwidthTarget to -3.

**VB Syntax**

```vbnet
meas.BandwidthTarget = value
```

**Variable (Type) - Description**

- **meas** (A Measurement object)
- **value** (single) - Target value. Choose any number between -500 and 500

**Return Type**
Single

**Default**
-3

**Examples**

```vbnet
meas.BandwidthTarget = -3 'Write
```

```vbnet
fbw = meas.BandwidthTarget 'Read
```

**C++ Syntax**

```c++
HRESULT put_BandwidthTarget(float target)
HRESULT get_BandwidthTarget(float* target)
```

**Interface**
IMeasurement
**BandwidthTracking Property**

**Description**

Searches continually (every sweep) for the current BandwidthTarget (default is -3). To search the filter bandwidth for ONE SWEEP only (not continually), use meas.SearchFilterBandwidth.

This feature uses markers 1-4. To turn off these markers, either turn them off individually or DeleteAllMarkers.

The bandwidth statistics are displayed on the analyzer screen. To get the bandwidth statistics, use either GetFilterStatistics or FilterBW, FilterCF, FilterLoss, or FilterQ.

The analyzer screen will show either Bandwidth statistics OR Trace statistics; not both.

To restrict the search to a UserRange with the bandwidth search, first activate marker 1 and set the desired UserRange. Then send the SearchFilterBandwidth command. The user range used with bandwidth search only applies to marker 1 searching for the max value. The other markers may fall outside the user range.

**VB Syntax**

```
meas.BandwidthTracking = value
```

**Variable**

(Type) - Description

- **meas**
  A Measurement (object)

- **value**
  (boolean)
  - **True** - Turns bandwidth tracking ON
  - **False** - Turns bandwidth tracking OFF

**Return Type**

Boolean

**Default**

**False**

**Examples**

```
meas.BandwidthTracking = False 'Write
bwtrack = meas.BandwidthTracking 'Read
```

**C++ Syntax**

```
HRESULT put_BandwidthTracking(VARIANT_BOOL state)
HRESULT get_BandwidthTracking(VARIANT_BOOL* state)
```

**Interface**

IMeasurement
## BandwidthNarrowMax Property

<table>
<thead>
<tr>
<th>Description</th>
<th>Set and read the maximum value for narrow DFT bandwidth. The maximum narrow DFT bandwidth setting is 11 MHz. The <code>AutoBandwidth</code> must be set to OFF to set this value manually.</th>
</tr>
</thead>
<tbody>
<tr>
<td>VB Syntax</td>
<td><code>sa.dft.BandwidthNarrowMax = value</code></td>
</tr>
<tr>
<td>Variable</td>
<td>(Type) - Description</td>
</tr>
<tr>
<td><code>sa.dft</code></td>
<td>A <code>SpectrumAnalyzerDFT</code> (object)</td>
</tr>
<tr>
<td>Return Type</td>
<td>Double</td>
</tr>
<tr>
<td>Examples</td>
<td><code>sa.dft.BandwidthNarrowMax = 11e6</code> 'Write'</td>
</tr>
<tr>
<td></td>
<td><code>value = sa.dft.BandwidthNarrowMax</code> 'Read'</td>

<tr>
<td></td>
<td><code>HRESULT get_BandwidthNarrowMax(double* maxbw);</code></td>
</tr>
<tr>
<td>Interface</td>
<td><code>ISpectrumAnalyzerDFT</code></td>
</tr>
</tbody>
</table>
### BandwidthNarrowMin Property

**Description**
Set and read the minimum value for narrow DFT bandwidth. The minimum narrow DFT bandwidth setting is 500 kHz. The `AutoBandwidth` must be set to OFF to set this value manually.

**VB Syntax**
```vbnet
sa.dft.BandwidthNarrowMin = value
```

**Variable**

<table>
<thead>
<tr>
<th>(Type)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>sa.dft</code></td>
<td>A <code>SpectrumAnalyzerDFT (object)</code></td>
</tr>
</tbody>
</table>

**Return Type**
Double

**Examples**
```vbnet
sa.dft.BandwidthNarrowMin = 5e5 'Write
value = sa.dft.BandwidthNarrowMin 'Read
```

**C++ Syntax**
```c++
HRESULT put_BandwidthNarrowMin(double minbw);
HRESULT get_BandwidthNarrowMin(double* minbw);
```

**Interface**
`ISpectrumAnalyzerDFT`
BandwidthWideMax Property

Description: Set and read the maximum value for wide DFT bandwidth. The maximum wide DFT bandwidth setting is 44 MHz. The AutoBandwidth must be set to OFF to set this value manually.

VB Syntax: `sa.dft.BandwidthWideMax = value`

Variable (Type) - Description
- `sa.dft`: A SpectrumAnalyzerDFT object

Return Type: Double

Examples:
- `sa.dft.BandwidthWideMax = 44e6 'Write`
- `value = sa.dft.BandwidthWideMax 'Read`

C++ Syntax:
- `HRESULT put_BandwidthWideMax(double maxbw);`
- `HRESULT get_BandwidthWideMax(double* maxbw);`

Interface: ISpectrumAnalyzerDFT
## BandwidthWideMin Property

**Description**
Set and read the minimum value for wide DFT bandwidth. The minimum wide DFT bandwidth setting is 500 kHz. The `AutoBandwidth` must be set to OFF to set this value manually.

**VB Syntax**
```
sa.dft.BandwidthWideMin = value
```

**Variable**
*sa.dft* - A `SpectrumAnalyzerDFT` (object)

**Return Type**
Double

**Examples**
```
sa.dft.BandwidthWideMin = 5e5 'Write
value = sa.dft.BandwidthWideMin 'Read
```

**C++ Syntax**
```
HRESULT put_BandwidthWideMin(double minbw);
HRESULT get_BandwidthWideMin(double* minbw);
```

**Interface**
`ISpectrumAnalyzerDFT`
BB_BalPort1Negative Property

Description
With a Balanced - Balanced topology, returns the VNA port number that is connected to the Negative side of the DUT's logical Port 1.

Use SetBBPorts Method to set the port mapping for a Balanced - Balanced topology.

VB Syntax
var = balTopology.BB_BalPort1Negative

Variable (Type) - Description
var (Long Integer) Variable to store the returned value.

balTopology A BalancedTopology (object)

Return Type Long Integer

Default Not Applicable

Examples variable = balTop.BB_BalPort1Negative 'Read

C++ Syntax HRESULT get_BB_BalPort1Negative(long *bVal)

Interface IBalancedTopology
BB_BalPort1Positive Property

Description
With a Balanced - Balanced topology, returns the VNA port number that is connected to the Positive side of the DUT's logical Port 1.

Use SetBBPorts Method to set the port mapping for a Balanced - Balanced topology.

VB Syntax
var = balTopology.BB_BalPort1Positive

Variable (Type) - Description
var (Long Integer) Variable to store the returned value.

balTopology A BalancedTopology (object)

Return Type Long Integer
Default Not Applicable

Examples
variable = balTop.BB_BalPort1Positive 'Read

C++ Syntax
HRESULT get_BB_BalPort1Positive(long *bVal)

Interface IBalancedTopology
### BB_BalPort2Negative Property

**Description**
With a Balanced - Balanced topology, returns the VNA port number that is connected to the Negative side of the DUT's logical Port 2.

Use `SetBBPorts Method` to set the port mapping for a Balanced - Balanced topology.

**VB Syntax**
```
var = balTopology.BB_BalPort2Negative
```

**Variable (Type) - Description**
- `var` (Long Integer) Variable to store the returned value.

**balTopology**
A `BalancedTopology` (object)

**Return Type**
Long Integer

**Default**
Not Applicable

**Examples**
```
variable = balTop.BB_BalPort2Negative  'Read
```

**C++ Syntax**
```
HRESULT get_BB_BalPort2Negative(long *bVal)
```

**Interface**
IBalancedTopology
**BB_BalPort2Positive Property**

**Description**
With a Balanced - Balanced topology, returns the VNA port number that is connected to the Positive side of the DUT's logical Port 2.

Use `SetBBPorts Method` to set the port mapping for a Balanced - Balanced topology.

**VB Syntax**
```vbnet
var = balTopology.BB_BalPort2Positive
```

**Variable (Type) - Description**

- `balTopology`  
  A `BalancedTopology` *(object)*

- `var`  
  (Long Integer) Variable to store the returned value.

**Return Type**
Long Integer

**Default**
Not Applicable

**Examples**
```
variable = balTop.BB_BalPort2Positive  'Read
```

**C++ Syntax**
```cpp
HRESULT get_BB_BalPort2Positive(long *bVal)
```

**Interface**
IBalancedTopology
BBalMeasurement Property

Description
Sets and returns the measurement for the Balanced - Balanced topology.

VB Syntax
balMeas.BBalMeasurement = value

Variable (Type) - Description
balMeas A BalancedMeasurement (object)

value (String) - Balanced - Balanced Measurement parameter. Not case sensitive. Choose from:

<table>
<thead>
<tr>
<th>Sdd11</th>
<th>Sdd12</th>
<th>Sdc11</th>
<th>Sdc12</th>
</tr>
</thead>
<tbody>
<tr>
<td>Sdd21</td>
<td>Sdd22</td>
<td>Sdc21</td>
<td>Sdc22</td>
</tr>
<tr>
<td>Scd11</td>
<td>Scd12</td>
<td>Scc11</td>
<td>Scc12</td>
</tr>
<tr>
<td>Scd21</td>
<td>Scd22</td>
<td>Scc21</td>
<td>Scc22</td>
</tr>
<tr>
<td>Imb1</td>
<td>Imb2</td>
<td>CMRR  -(Sdd21/Scc21)</td>
<td></td>
</tr>
</tbody>
</table>

Return Type
String

Default
Sdd11

Examples

balMeas.BBalMeasurement = "Sdd11" 'Write

variable = balMeas.BBalMeasurement 'Read

C++ Syntax
HRESULT get_BBalMeasurement(BSTR *pVal)

HRESULT put_BBalMeasurement(BSTR newVal)

Interface
IBalancedMeasurement
## BeforeSweepCmd Property

**Description**
Sets and returns the *Before Sweep command* for an external DC Source and an external DC Meter.

**VB Syntax**
```vbnet
extDC.BeforeSweepCmd = value
```

**Variable**
<table>
<thead>
<tr>
<th>(Type)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>extDC</code></td>
<td>A <code>ExternalDCDevice</code> (object)</td>
</tr>
<tr>
<td><code>value</code></td>
<td>(String) The SCPI command to be sent at the beginning of a sweep.</td>
</tr>
</tbody>
</table>

**Return Type**
String

**Default**
" " Empty String

**Examples**
```vbnet
extDC.BeforeSweepCmd = "OUTP ON" 'Write
value = extDC.BeforeSweepCmd 'Read
```

**C++ Syntax**
```cpp
HRESULT get_BeforeSweepCmd( BSTR* cmd);
HRESULT put_BeforeSweepCmd( BSTR cmd);
```

**Interface**
`IExternalDCDevice3`
### BeginResponse Property

**Description**
When constructing a limit line, specifies the amplitude value of the start of a limit segment.

**VB Syntax**
`limtseg.BeginResponse = value`

**Variable**
- **Type** - Description
  - `limtseg` - A LimitSegment *(object)*
  - `value` - *(double)* - Amplitude value. No units

**Return Type**
Double

**Default**
0

**Examples**
```
Set limtseg = meas.LimitTest(1)
limtseg.BeginResponse = 10 'Write

BegResp = limtseg.BeginResponse 'Read
```

**C++ Syntax**
```
HRESULT get_BeginResponse(double *pVal)
HRESULT put_BeginResponse(double newVal)
```

**Interface**
ILimitSegment
**BeginStimulus Property**

**Description**
When constructing a limit line, specifies the beginning X-axis value.

**VB Syntax**

```vbnet
limtseg.BeginStimulus = value
```

**Variable**

- **Type** - Description
  - `limtseg` A LimitSegment (object)
  - `value` (double) - Stimulus value. No units

**Return Type**
Double

**Default**
0

**Examples**

Set `limtseg = meas.LimitTest(1)`
- `limtseg.Type = naLimitSegmentType_Maximum`
- `limtseg.BeginStimulus = 3e9`
- `limtseg.EndStimulus = 4e9`
- `limtseg.BeginResponse = 10`
- `limtseg.EndResponse = 10`

```vbnet
BegStim = limtseg.BeginStimulus 'Read
```

**C++ Syntax**

```cpp
HRESULT get_BeginStimulus(double *pVal)
HRESULT put_BeginStimulus(double newVal)
```

**Interface**
ILimitSegment
### BinaryFileEnabled Property

<table>
<thead>
<tr>
<th>Description</th>
<th>Enables/disables binary file (*.bin) output.</th>
</tr>
</thead>
<tbody>
<tr>
<td>VB Syntax</td>
<td><code>sa.dft.BinaryFileEnabled = value</code></td>
</tr>
<tr>
<td>Variable</td>

<td>ISpectrumAnalyzerDFT</td>
</tr>
</tbody>
</table>
### BroadbandTuningSpan Property

**Description**
Sets and returns the frequency span for the broadband tuning sweep.

**VB Syntax**
```
obj.BroadbandTuningSpan = value
```

**Variable**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>obj</td>
<td>An EmbeddedLO (object) or A ConverterEmbeddedLO (object)</td>
</tr>
<tr>
<td>value</td>
<td>(Double) Broadband frequency span in Hz.</td>
</tr>
</tbody>
</table>

**Return Type**
(Double)

**Default**
3 MHz

**Examples**
```
embedLO.BroadbandTuningSpan = 1E6 'write
value = embedLO.BroadbandTuningSpan 'read
```

**C++ Syntax**
```
HRESULT get_BroadbandTuningSpan(double* span);
HRESULT put_BroadbandTuningSpan(double span);
```

**Interface**
IEmbededLO
### BS_BalPortNegative Property

**Description**  
With a Balanced - Single-ended topology, returns the VNA port number that is connected to the Negative side of the DUT's balanced port.

Use **SetSBPorts Method** to set the port mapping for a Balanced - Single-ended topology.

**VB Syntax**  
```vbnet
var = balTopology.BS_BalPortNegative
```

**Variable**  
(Type) - Description

- `var` (Long Integer) Variable to store the returned value.

- `balTopology` A **BalancedTopology (object)**

**Return Type**  
Long Integer

**Default**  
Not Applicable

**Examples**  
`variable = balTop.BS_BalPortNegative 'Read`

**C++ Syntax**  
```cpp
HRESULT get_BS_BalPortNegative(long *bVal)
```

**Interface**  
IBalancedTopology2
## About Balanced Measurements

### BS_BalPortPositive Property

**Description**
With a Balanced - Single-ended topology, returns the VNA port number that is connected to the Positive side of the DUT's balanced port.

Use **SetSBPorts Method** to set the port mapping for a Balanced - Single-ended topology.

**VB Syntax**

```vb
var = balTopology.BS_BalPortPositive
```

**Variable** *(Type)* - Description

- `var` *(Long Integer)* Variable to store the returned value.

- `balTopology` A **BalancedTopology** *(object)*

**Return Type**
Long Integer

**Default**
Not Applicable

**Examples**

```vb
variable = balTop.BS_BalPortPositive  'Read
```

**C++ Syntax**

```cpp
HRESULT get_BS_BalPortPositive(long *bVal)
```

**Interface**
IBalancedTopology2
### BS_SEPort Property

<table>
<thead>
<tr>

### BSS_BalPortNegative Property

**Description**
With a Balanced - Single-ended - Single-ended topology, returns the VNA port number that is connected to the Negative side of the DUT's balanced port.

Use `SetBSSPorts Method` to set the port mapping for a Balanced - Single-ended - Single-ended topology.

**VB Syntax**
```
var = balTopology.BSS_BalPortNegative
```

**Variable**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>var</code></td>
<td>(Long Integer) Variable to store the returned value.</td>
</tr>
</tbody>
</table>

**balTopology**
ABalancedTopology (object)

**Return Type**
Long Integer

**Default**
Not Applicable

**Examples**
```
variable = balTop.BSS_BalPortNegative 'Read
```

**C++ Syntax**
```
HRESULT get_BSS_BalPortNegative(long *pbalanceNegative)
```

**Interface**
IBalancedTopology4
# BSS_BalPortPositive Property

**Description**
With a Balanced - Single-ended - Single-ended topology, returns the VNA port number that is connected to the Positive side of the DUT's balanced port.

Use the [SetBSSPorts Method](#) to set the port mapping for a Balanced - Single-ended - Single-ended topology.

**VB Syntax**
```vbnet
var = balTopology.BSS_BalPortPositive
```

**Variable**
- **Type** - Description
- `var` (Long Integer) Variable to store the returned value.

**balTopology**
A BalancedTopology (object)

**Return Type**
Long Integer

**Default**
Not Applicable

**Examples**
```vbnet
variable = balTop.BSS_BalPortPositive  'Read
```

**C++ Syntax**
```csharp
HRESULT get_BSS_BalPortPositive(long *pbalancePositive)
```

**Interface**
IBalancedTopology4
### BSS_SEPort1 Property

**Description**  
With a Balanced - Single-ended - Single-ended topology, returns the VNA port number that is connected to the Single-ended port 1.

Use [SetBSSPorts Method](#) to set the port mapping for a Balanced - Single-ended - Single-ended topology.

**VB Syntax**  
```vbnet
var = balTopology.BSS_SEPort1
```

**Variable**  
*(Type)* - Description

<table>
<thead>
<tr>
<th>var</th>
<th>(Long Integer) Variable to store the returned value.</th>
</tr>
</thead>
</table>

**balTopology**  
A BalancedTopology *(object)*

**Return Type**  
Long Integer

**Default**  
Not Applicable

**Examples**  
```vbnet
variable = balTop.BSS_SEPort1 'Read
```

**C++ Syntax**  
```cpp
HRESULT get_BSS_SEPort1(long *pSEPort1)
```

**Interface**  
IBalancedTopology4
### BSS_SEPort2 Property

**Description**  
With a Balanced - Single-ended - Single-ended topology, returns the VNA port number that is connected to the Single-ended port 2.

Use **SetBSSPorts Method** to set the port mapping for a Balanced - Single-ended - Single-ended topology.

**VB Syntax**  
\`\`var = balTopology.BSS_SEPort2\`\`

**Variable (Type) - Description**  
- **var** (Long Integer) Variable to store the returned value.

**balTopology**  
A **BalancedTopology** *(object)*

**Return Type**  
Long Integer

**Default**  
Not Applicable

**Examples**  
\`\`variable = balTop.BSS_SEPort2 \`\`

**C++ Syntax**  
\`\`HRESULT get_BSS_SEPort2(long *pSEPort2)\`\`

**Interface**  
IBalancedTopology4
**BSSMeasurement Property**

**Description**

**VB Syntax**
`balMeas.BSSMeasurement = value`

**Variable**
(Type) - Description

- `balMeas`: A `BalancedMeasurement` (object)
- `value`: (String) - Balanced - Single-Ended - Single-Ended Measurement parameter. Not case sensitive. Choose from:

<table>
<thead>
<tr>
<th>Sdd11</th>
<th>Sdc11</th>
<th>Sds12</th>
<th>Sds13</th>
</tr>
</thead>
<tbody>
<tr>
<td>Scd11</td>
<td>Scc11</td>
<td>Scs12</td>
<td>Scs13</td>
</tr>
<tr>
<td>Ssd21</td>
<td>Ssc21</td>
<td>Sss22</td>
<td>Sss23</td>
</tr>
<tr>
<td>Ssd31</td>
<td>Ssc31</td>
<td>Sss32</td>
<td>Sss33</td>
</tr>
<tr>
<td>Imbal1</td>
<td>Imbal2</td>
<td>Sds12/Scs12</td>
<td>Sds13/Scs13</td>
</tr>
</tbody>
</table>

**Return Type**
String

**Default**
Sdd11

**Examples**

```
balMeas.BSSMeasurement = "Sdd11" 'Write

variable = balMeas.BSSMeasurement 'Read
```

**C++ Syntax**

```c++
HRESULT get_BSSMeasurement(BSTR *pVal)

HRESULT put_BSSMeasurement(BSTR newVal)
```

**Interface**
`IBalancedMeasurement4`

---

1412
BucketNumber Property

Description
Sets or returns the bucket number (data point) for the active marker. When the markers are interpolated (non-discrete), the returned value is the nearest marker bucket position.

VB Syntax
mark.BucketNumber = value

Variable (Type) - Description
mark A Marker (object)
value (long integer) - Data point. Choose any number between 0 and the measurement's number of data points - 1. For example, with Number of points = 201, choose between 0 and 200

Return Type
Long Integer

Default
The first marker is set to the middle of the span. Subsequent markers are set to the bucket number of the previously active marker.

Examples
mark.BucketNumber = 100 'moves the active marker to data point 100 - Write
pointNumber = mark.BucketNumber 'returns the data point number of the marker object. When the markers are interpolated (non-discrete), the returned value is the nearest marker bucket position.

C++ Syntax
HRESULT get_BucketNumber(long *pVal)
HRESULT put_BucketNumber(long newVal)

Interface IMarker
### C0 Property

**Description**
Sets and Returns the C0 (C-zero) value (the first capacitance value) for the calibration standard.

To set the other capacitance values, use C1, C2, C3

**VB Syntax**
```
calstd.C0 = value
```

**Variable**
- **calstd** (object) - A CalStandard (object). Use calKit.GetCalStandard to get a handle to the standard.
- **value** (single) - Value for C0 in femtofarads (1E-15)

**Return Type**
Single

**Default**
Not Applicable

**Examples**
```
calstd.C0 = 15 'Write the value of C0 to 15 femtofarads
```
```
cap0 = calstd.C0 'Read the value of C0
```

**C++ Syntax**
- `HRESULT get_C0(float *pVal)`
- `HRESULT put_C0(float newVal)`

**Interface**
ICalStandard
## C1 Property

<table>
<thead>
<tr>
<th>Description</th>
<th>Sets and Returns the C1 value (the second capacitance value) for the calibration standard. To set the other capacitance values, use C0, C2, C3.</th>
</tr>
</thead>
</table>

### VB Syntax

```vbnet
calstd.C1 = value
```

### Variable (Type) - Description

- **value**: (single) - Value for C1.

### Return Type

Single

### Default

Not Applicable

### Examples

- `calstd.C1 = 15 'Write the value of C1.
- `cap1 = calstd.C1 'Read the value of C1.

### C++ Syntax

```cpp
HRESULT get_C1(float *pVal)
HRESULT put_C1(float newVal)
```

### Interface

ICalStandard
# C2 Property

**Description**  
Sets and Returns the C2 value (the third capacitance value) for the calibration standard.

To set the other capacitance values, use C0, C1, C3.

**VB Syntax**  
`calstd.C2 = value`

**Variable**  

*value* - Value for C2.

**Return Type**  
Single

**Default**  
Not Applicable

**Examples**  
```
calstd.C2 = 15 'Write the value of C2.
cap2 = calstd.C2 'Read the value of C2
```

**C++ Syntax**  
```
HRESULT get_C2(float *pVal)
HRESULT put_C2(float newVal)
```

**Interface**  
ICalStandard
### C3 Property

**Description**  Sets and Returns the C3 value (the fourth capacitance value) for the calibration standard.

To set the other capacitance values, use \( C0, C1, C2 \)

**VB Syntax**  
\`
calstd.C3 = value
``

**Variable**  
- `value`  (single) - Value for C3.

**Return Type**  Single

**Default**  Not Applicable

**Examples**  
- `calstd.C3 = 15`  'Write the value of C3.'
- `cap3 = calstd.C3`  'Read the value of C3'

**C++ Syntax**  
- `HRESULT get_C3(float *pVal)`
- `HRESULT put_C3(float newVal)`

**Interface**  ICalStandard
## Cable Property

<table>
<thead>
<tr>
<th>Description</th>
<th>Sets and returns the name of the cable that is assigned to the port object for Dynamic Uncertainty.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>VB Syntax</strong></td>
<td><code>port.Cable = value</code></td>

<tr>
<td><strong>Variable</strong></td>
<td><em>(Type)</em> - Description</td>
</tr>
<tr>
<td><code>port</code></td>
<td>A <em>Port</em> <em>(object)</em></td>
</tr>
<tr>
<td><code>value</code></td>
<td><em>(String)</em> - Cable name.</td>
</tr>
<tr>
<td><strong>Return Type</strong></td>
<td>String</td>
</tr>
<tr>
<td><strong>Default</strong></td>
<td>Not Applicable</td>
</tr>
<tr>
<td><strong>Examples</strong></td>
<td><code>port.Cable = &quot;MyNewCable&quot;</code> <em>Write the value</em></td>
</tr>
<tr>
<td><strong>C++ Syntax</strong></td>
<td><code>HRESULT get_Cable([out,retval] BSTR *pCableName);</code></td>
</tr>
<tr>
<td></td>
<td><code>HRESULT put_Cable([in] BSTR cableName);</code></td>
</tr>
<tr>
<td><strong>Interface</strong></td>
<td>IPort</td>
</tr>
</tbody>
</table>
CableRepeatabilityEnabled Property

**Description**
Sets and returns the ON/OFF state of allowing cable repeatability data to contribute to the uncertainty of a calibration performed using Dynamic Uncertainty. Repeatability data must also be present for the ports at the time the calibration is performed.

**VB Syntax**
```
uncertMan.CableRepeatabilityEnabled = value
```

**Variable**
(***Type*** - Description

- **uncertMan** An **UncertaintyManager** Object
- **value** (Boolean) Enable state. Choose from:
  - **True** - Cable repeatability uncertainty ON.
  - **False** - Cable repeatability uncertainty OFF.

**Return Type**
Boolean

**Default**
True

**Examples**
```
uncertMan.CableRepeatabilityEnabled = True
```

See example program

**C++ Syntax**
```
HRESULT get_CableRepeatabilityEnabled([out,retval] VARIANT_BOOL* pState);

HRESULT put_CableRepeatabilityEnabled([in] VARIANT_BOOL state);
```

**Interface**
IUncertaintyManager
### CableRepeatabilityUncertainty Property

**Description**
Sets and returns whether the cable/connection repeatability contribution is currently included in the uncertainty values for the measurement trace.

**VB Syntax**

```vbnet
uncert.CableRepeatabilityUncertainty = value
```

**Variable** *(Type) - Description*

- ** uncert** An Uncertainty *(object)*
- ** value** (Boolean) Choose from:
  - **False** - Cable repeatability is NOT included.
  - **True** - Cable repeatability IS included.

**Return Type**
Boolean

**Default**
True

**Examples**

```vbnet
uncert.CableRepeatabilityUncertainty = True
```

**C++ Syntax**

```cpp
HRESULT get_CableRepeatabilityUncertainty(VARIANT_BOOL *pState);
HRESULT put_CableRepeatabilityUncertainty(VARIANT_BOOL state);
```

**Interface**
IUncertainty
## CalFactor Property

**Description**  
Sets or returns the cal factor value associated with a power sensor cal factor segment.

**VB Syntax**  
`calFactSeg.CalFactor = value`

**Variable**  
(Type) - Description  
`calFactSeg`  
A PowerSensorCalFactorSegment (Object) or  
A PowerSensorCalFactorSegmentPMAR (Object)

`value`  
(double) – Cal factor in percent. Choose any value between 1 and 150

**Return Type**  
Double

**Default**  
0

**Examples**  
`calFactSeg.CalFactor = 98 'Write`  
`factor = calFactSeg.CalFactor 'Read`

**C++ Syntax**  
HRESULT put_CalFactor(Double newVal);  
HRESULT get_CalFactor(Double *pVal);

**Interface**  
IPowerSensorCalFactorSegment
About Performing a Calibration

CalibrationType Property  **Superseded**

**Description**

**Note:** This command has been replaced by `CalibrationTypeID_property`, which provides selection of Calibration Type by string.

Specifies the type of calibration to perform or apply to the active S-Parameter measurement. This command determine the ports involved in the CalType by the ports being used by the active measurement.

For example:

- If the measurement is an S23, it uses ports 2 and 3.
- If the measurement is an S22 it will use the legacy load port to figure out which two ports form the caltype. The legacy load port is set using `CreateMeasurement`.
- If `naCalType_ThreePort_SOLT` is specified on a 4-port VNA, an `E_NA_DEPRECATED_COMMAND` error is returned. There is no way to determine the intended three ports.
- If `naCalType_FourPort_SOLT` is specified on a 4-port VNA, it is obvious that the ports involved are ports 1,2,3, and 4.

**Note:** For FCA measurements, use `CalibrationName` and `CalibrationTypeID`.

**VB Syntax**

```vb
meas.CalibrationType = type
```

**Variable**

- **(Type)** - Description
  - `meas` A Measurement (object)
  - `type` (enum NACalType) - Calibration type. Choose from:
    - 0 - `naCalType_Response_Open`
    - 1 - `naCalType_Response_Short`
    - 2 - `naCalType_Response_Thru`
    - 3 - `naCalType_Response_Thru_And_Isol`
    - 4 - `naCalType_OnePort`
    - 5 - `naCalType_TwoPort_SOLT`
    - 6 - `naCalType_TwoPort_TRL`
```
7 - naCalType_None
8 - naCalType_ThreePort_SOLT
9 - Custom
10 - naCalType_FourPort_SOLT

Return Type NACalType
Default naCalType_None

Examples
meas.CalibrationType = naCalType_Response_Open 'Write
meascal = meas.CalibrationType 'Read

C++ Syntax
HRESULT put_CalibrationType (tagNACalType CalType)
HRESULT get_CalibrationType (tagNACalType* pCalType)

Interface IMeasurement
## CalibrationName Property

<table>
<thead>
<tr>
<th>Description</th>
<th>Returns the name of the current Cal Type.</th>

</tbody>
</table>
CalibrationPort Property - Obsolete

Description: Beginning with Rev 6.0, this command is no longer necessary. Because of improved calibration techniques, Both is always selected although a power meter measurement is performed only on port 1.

Specifies which SMC port to calibrate.

VB Syntax: 

```vbnet
SMC.CalibrationPort = value
```

Variable (Type) - Description

<table>
<thead>
<tr>
<th>Variable</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SMC</td>
<td>SMCTYPE (object)</td>
<td></td>
</tr>
<tr>
<td>value</td>
<td>(String)</td>
<td>Port number to be calibrated. Choose from:</td>
</tr>
</tbody>
</table>

- 1 - SMC forward
- 2 - SMC reverse
- Both

Return Type: String

Default: 1

Examples: 

```vbnet
value = SMC.CalibrationPort = "Both"
```

C++ Syntax: 

```cpp
HRESULT put_CalibrationPort(BSTR port);
HRESULT get_CalibrationPort(BSTR *port);
```

Interface: 

<table>
<thead>
<tr>
<th>Interface</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SMCType</td>
<td></td>
</tr>
<tr>
<td>VMCTYPE</td>
<td></td>
</tr>
</tbody>
</table>
CalibrationPorts Property

Description
For each channel to be calibrated, sets and returns the ports to be calibrated. The port numbers need to be specified only for standard channels. Apps channels have designated input/output/LO ports.

Select any of the native VNA ports.

VB Syntax

```vbnet
calAll.CalibrationPorts (chan) = ports
```

Variable

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>calAll</code></td>
<td>A CalibrateAllChannels (object)</td>
</tr>
<tr>
<td><code>chan</code></td>
<td>Channel to be calibrated with a Calibrate All Channels calibration.</td>
</tr>
<tr>
<td><code>port</code></td>
<td>(Variant Array) Ports to be calibrated for the specified channel.</td>
</tr>
</tbody>
</table>

Return Type
Variant Array

Default
Standard channels - ports 1 and 2

Apps channels - the designated input and output ports.

Examples

```vbnet
calAll.CalibrationPorts(2) = 0 'Ports to calibrate for channel 2
value = calAll.CalibrationPorts(2) 'returns the ports for channel 2
```

C++ Syntax

```cpp
HRESULT get_CalibrationPorts (long channel, Variant ports);
HRESULT put_CalibrationPorts (long channel, Variant* ports);
```

Interface
ICalibrateAllChannels
### CalibrationTypeID Property

**Description**  
**Note:** This command replaces Calibration Type Property.

Sets or returns the current cal type for the measurement using a Cal Type Name.

This command is used to set the Cal Type after recalling a Cal Set. Learn more

You can also use the CLSID or GUID associated with the Cal Type.

**VB Syntax**  
```vbnet
meas.CalibrationTypeID = id
```

**Variable**  
- **meas** (Type) - A Measurement (object)
- **id** (String) - Cal type. Case sensitive. Use one of the following:

#### For Full Calibrations:

This command does not distinguish between TRL and SOLT. The same number of error terms is applied for both Cal Types.

"Full n Port(x,y,z,...)"

where

- `n =` the number of ports to calibrate
- `x,y,z =` the port numbers to calibrate

For example:

"Full 7 Port(2,3,4,5,6,7,8)"

#### For Response Calibrations:

"Response(param)" OR

"ResponseAndIsolation(param)"

Where `param =`

- S-parameter. For example""Response(S21)"

| Sets or returns the current cal type for the measurement using a Cal Type Name. |

| This command is used to set the Cal Type after recalling a Cal Set. Learn more |

| You can also use the CLSID or GUID associated with the Cal Type. |
- "ResponseAndIsolation(A/R)"

- Single or ratioed receivers using either logical receiver notation or physical receiver notation. For example:
  - "Response (A)"
  - "ResponseAndIsolation(a3/b4)"

**For FCA Calibrations:**

- "SMC_2P" (Response + Input + Output) All four sweeps required. Most accurate.
- "SMCRsp+IN" No Output match. All four sweeps required.
- "SMCRsp+OUT" No Output match. All four sweeps required.
- "SMCRsp" No Input or Output match. Saves two sweeps.

For VMC, multiple Cal types are not available.

**For Gain Compression Cal**

where r = receive port; s = source port

- "GCA 2P (r,s)" - full 2-port cal
- "GCA Enh Resp (r,s)" - Enhanced Response Cal

About SweptIMDCal

**CalibrationFrequencies Property**

**Description**
Sets and returns the whether to perform the source power cal at the center frequencies midway between the main tones, or at all main tone frequencies.

**VB Syntax**

```
imd.CalibrationFrequencies = value
```

**Variable**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>imd</code></td>
<td>A SweptIMDCal (object)</td>
</tr>
<tr>
<td><code>value</code></td>
<td>(Enum as NAIMDCalibrationFrequencies) Choose from:</td>
</tr>
</tbody>
</table>

0 - **naIMDCenterFrequencies** - Perform source power calibration at only the center frequencies midway between the main tones.

1 - **naIMDALLFrequencies** - Perform source power calibration at all main tone frequencies.

**Return Type**
Enum

**Default**
0 - naIMDCenterFrequencies

**Examples**

```
imd.CalibrationFrequencies = naIMDALLFrequencies 'Write

calFreq = imd.CalibrationFrequencies 'Read
```

**C++ Syntax**

```
HRESULT get_CalibrationFrequencies(tagNAIMDCalibrationFrequencies * Val)
HRESULT put_CalibrationFrequencies(tagNAIMDCalibrationFrequencies newVal)
```

**Interface**
ISweptIMD
CalKitType Property

**Description**
Sets and returns a calibration kit type to be used for **UNGUIDED** calibration and for cal kit modification. To get a handle to this kit, use `app.ActiveCalKit`.

Although an unlimited number of cal kits can be imported into the VNA, ONLY mechanical cal kits #1 through #95 can be accessed.

There is also a CalKitType property for use during a Guided, SMC, and VMC Calibration.

**VB Syntax**

```vbnet
object.CalKitType = value
```

**Variable**

- **object** - Description
- `calkit` (object) or `Application` (object)

**Note:** `app.CalKitType` and `calkit.calKitType` perform exactly the same function.

**value**

- **(enum naCalKit)** - Calibration Kit type. Choose from:
  1 - naCalKit_User1
  2 - naCalKit_User2
  3 - naCalKit_User3
  4 - naCalKit_User4
  ..
  ..
  94 - naCalKit_User94
  95 - naCalKit_User95

These enumerated values correspond with the calibration kit ID on the Advanced Cal Kit Modify dialog box.

To change the cal kit name, use Name property.

**Note:** Always check the list of available cal kits using CalKitTypes to ensure that the correct cal kit is selected.

**Return Type**

NACalKit
<table>
<thead>
<tr>
<th>Default</th>
<th>Not Applicable</th>
</tr>
</thead>
</table>
| Examples  | `calkit.CalKitType = naCalKit_User27`  
            `kiType = app.CalKitType` |
| C++ Syntax| `HRESULT get_CalKitType(tagNACalKit *pVal);`  
            `HRESULT put_CalKitType(tagNACalKit newVal);` |
| Interface | `IApplication`  
            `ICalKit` |
CalKitType Property

Description
Sets and returns the ECal or mechanical cal kit for the specified port number to be used during the calibration.

There is also a CalKitType Property for use during an Unguided Cal.

Note: Sliding loads are not fully supported from the GuidedCalibration object. The Measure button must be pressed manually on the VNA.

Note: This command replaces Do1PortEcal Property and Do2PortEcal Property for SMC and VMC Calibrations.

VB Syntax
object.CalKitType (port) = value

Variable (Type) - Description
object Any of the following:
GuidedCalibration (object)
SMCType (object)
VMCType (object)

port (Long) Port number to which the cal kit will be assigned.
For Guided Cals and SMC, select port number.
For VMC calibrations:
   • 1 - Mixer Input.
   • Any unused port can be used for the mixer output.
   • Output port of MUT +1 - Output port of the calibration mixer. Generally this is port 3.

value (string) - Calibration Kit type. Case-sensitive.
Use GetCompatibleCalKits to return a list of valid Cal Kits.

Return Type String
Default Not Applicable

Examples 'Note: All of the following specify port 1 only
'Mechanical Cal Kit
guidedCal.CalKitType(1) = "85052C"

' Standard ECal modules

guidedCal.CalKitType(1) = "N4691-60004 ECal"

' Non-factory ECal characterizations are specified as follows:

guidedCal.CalKitType(1) = "N4691-60004 User 1 ECal"

' When two or more ECal modules with the same model number are
' connected, also specify the serial number as follows:

guidedCal.CalKitType(1) = "N4691-60004 ECal 01234"

' When Disk Memory ECal user characterizations are used,
' specify both the User char and the serial number as follows:

'guidedCal.CalKitType(1) = "N4691-60004 MyDskChar ECal 01234"

' Turn on auto orientation for the ECal (default behavior).

value = smc.CalKitType(1)  'Read

C++ Syntax

HRESULT get_CalKitType( long port, BSTR *calkit)

HRESULT put_CalKitType( long port, BSTR calkit)

Interface

IGuidedCalibration

### CalMethod Property

**Description**
Sets and returns the method for performing calibration on a noise channel.

**VB Syntax**
`noise.CalMethod = value`

**Variable (Type) - Description**
- `noise` A NoiseCal *(object)*
- `value` *(string)* Cal Method. Choose from:
  - "VectorFull" or "Vector"
  - "SParameter" (Not available for NFX measurements)
  - "ScalarFull" or "Scalar"

**Return Type**
String

**Default**
"VectorFull"

**Examples**
- `noise.CalMethod = "VectorFull"` *Write*
- `calMethod = noise.CalMethod` *Read*

**C++ Syntax**
- `HRESULT get_CalMethod(BSTR* pValue)`
- `HRESULT put_CalMethod(BSTR pNewValue)`

**Interface**
INoiseCal

### CalPower Property Superseded

**Description**  
This command is replaced with `chan.TestPortPower`.  
Returns the RF power level for the channel.

**VB Syntax**  
```vbnet
value = powerCalibrator.CalPower(chan, sourcePort)
```

**Variable**  
<table>
<thead>
<tr>
<th>Variable</th>
<th>Type</th>
<th>Description</th>
</tr>

<td>Channel number of the VNA.</td>
</tr>
<tr>
<td>sourcePort</td>
<td>long integer</td>
<td>Source port number.</td>
</tr>
</tbody>
</table>

Use `GetPortNumber` to return the port number of a source that only has a string name, such as an External Source.

**Return Type**  
None

**Default**  
Not applicable

**Examples**  
```
Set powerCalibrator = pna.SourcePowerCalibrator
power = powerCalibrator.CalPower(1,2) 'Read
```

**C++ Syntax**  
```cpp
HRESULT get_CalPower(long channel, long sourcePort, double *pVal);
```

**Interface**  
ISourcePowerCalibrator
### CalSet Property

<table>
<thead>
<tr>
<th>Description</th>
<th>Set and read the Cal Set name into which the calibration will be saved. The phase reference cal can NOT be saved to a cal register. The Cal Set is saved by calling <code>GenerateErrorTerms</code> at the conclusion of the Guided Cal.</th>

</tbody>
</table>
Center Property

Description
Sets or returns the Center time of either Gating or Time Domain transform windows

VB Syntax
object.Center = value

Variable
(Type) - Description

object (object) As Gating
or
(object) As Transform

value (double) - Center time in seconds. Choose any number between:
 ± (points-1) / frequency span

Return Type
Double

Default
0

Examples
trans.Center = 4.5e-9 'sets the Center time of a transform window
-gate.Center = 4.5e-9 'sets the Center time of a gating window
-cnt = trans.Center 'Read

C++ Syntax
HRESULT get_Center(double *pVal)
HRESULT put_Center(double newVal)

Interface
ITransform
IGating
### Center Property

**Description**
Returns the stimulus value of the center data point for the measurement. This function does NOT work for segment sweep measurements. To understand how this property is useful, see IMeasurement2 Interface.

**VB Syntax**

```
value = meas.Center
```

**Variable**

- `value` *(Double)* - Variable to store the returned value.
- `meas` A Measurement *(object)*

**Return Type**
Double

**Default**
Not Applicable

**Examples**

```
Print meas.Center 'prints the center data point
```

**C++ Syntax**

```
HRESULT get_Center(double * Val);
```

**Interface**
IMeasurement2
### CenterFrequency Property

**Description**
Sets or returns the center frequency of the channel
or
Sets or returns the center frequency of the segment.

See the Measurement2 Interface to learn how this method differs from meas.Center.

**VB Syntax**
```
object.CenterFrequency = value
```

**Variable (Type) - Description**
- **object**
  - A Channel (object)

  or

  - A Segment (object)

- **value**
  - (double) - Center frequency in Hertz. Choose any number between the minimum and maximum frequencies of the analyzer.

**Return Type**
Double

**Default**
Center of the frequency range

**Examples**
- `chan.CenterFrequency = 4.5e9` 'sets the center frequency of a linear sweep for the channel object -Write
- `centfreq = chan.CenterFrequency` 'Read

**C++ Syntax**
```
HRESULT get_CenterFrequency(double *pVal)
HRESULT put_CenterFrequency(double newVal)
```

**Interface**
IChannel
ISegment
## CenterFrequencyStepSize Property

**Description**
Sets and reads the center frequency step size of the analyzer. This command sets the manual step size (only valid when CenterFrequencyStepSizeMode is FALSE).

**VB Syntax**
```
chan.CenterFrequencyStepSize = value
```

**Variable**

- `chan` *(Type)* - A `Channel` object
- `value` *(Double)* - Choose a value (in Hz.) below the stop frequency of the analyzer.

**Return Type**
Double

**Default**
Default is 40 MHz. When CenterFrequencyStepSizeMode is TRUE, this value is ignored.

**Examples**
```
chan.CenterFrequencyStepSize = 1e5 'Write
value = chan.CenterFrequencyStepSize 'Read
```

**C++ Syntax**
```
HRESULT get_CenterFrequencyStepSize(Double* pVal);
HRESULT put_CenterFrequencyStepSize(Double pVal);
```

**Interface**
IChannel25
CenterFrequencyStepSizeMode Property

| object              | A Channel *(object)*  
or      | A Measurement *(object)*  |

**Return Type** Long Integer

**Default** Not applicable

**Examples**

- `chanNum = chan.ChannelNumber`  
  *returns the channel number*
- `chanNum = meas.ChannelNumber`  
  *returns the channel number of the measurement*

**C++ Syntax**

- `HRESULT get_ChannelNumber(long *pVal)`

**Interface**

- IChannel
- IMeasurement
# Channels Property

**Description**  
Sets and returns the list of channels to be calibrated during the Cal All session.

**VB Syntax**  
`calAll.Channels = chans`

**Variable**  
*(Type)* - Description

- `calAll` A `CalibrateAllChannels` *(object)*
- `chans` (Variant) Array of channel numbers to be calibrated, separated by commas. These channels must already exist.

**Return Type**  
Variant

**Default**  
The existing channels

**Examples**  
`calAll.Channels = Array(1,2,3) 'sets channels to be cal'd`

`chans = calAll.Channels 'returns the channel numbers to be cal'd`

**C++ Syntax**

```
HRESULT get_Channels (VARIANT selectedChannels);

HRESULT put_Channels (VARIANT* selectedChannels);
```

**Interface**  
`ICalibrateAllChannels`
CharacterizationNumber Property

**Description**  
Sets and reads the number to which the user characterization will be stored in the ECal module. The number must be set before sending `Initialize` or the default value (1) will be used.

**VB Syntax**  
`userChar.CharacterizationNumber = value`

**Variable**
- **(Type)** - Description
- **userChar** - An `IECalUserCharacterizer` Object
- **value** - (Long) User Characterization number. Choose a value between 1 and 12.

**Return Type**  
Long Integer

**Default**  
Not Applicable

**Examples**

```vbnet
userChar.CharacterizationNumber = 5
```

**C++ Syntax**  
`HRESULT put_CharacterizationNumber(long *Number);`

**Interface**  
`IECalUserCharacterizer`
### CharacterizeMixerOnly Property

<table>
<thead>
<tr>
<th>Description</th>
<th>Sets and returns whether to perform ONLY a mixer characterization.</th>
</tr>
</thead>
<tbody>
<tr>

<td>VMCType</td>
</tr>
</tbody>
</table>
### CharFileName Property

#### Description
Specifies the mixer characterization (.S2P) file and immediately loads the file. Also specify the use of a characterization file with LoadCharFromFile Property.

#### VB Syntax
```vbnet
VMC.CharFileName = value
```

#### Variable (Type) - Description

- **VMC**: VMCType (object)
- **value**: String (Full path, file name, and extension of the mixer characterization file.)

#### Return Type
Not Applicable

#### Default
Not Applicable

#### Examples
```vbnet
VMC.CharFileName = "c:\users\public\network\analyzer\documents\default.S2P"
```

#### C++ Syntax
```cpp
HRESULT put_CharFileName(BSTR filename);
HRESULT get_CharFileName(BSTR *filename);
```

#### Interface
VMCType
### CharMixerReverse Property

**Description**
Specifies the direction in which to characterize the calibration mixer. [Learn more about the calibration mixer.](#)

**VB Syntax**

```vbnet
VMC.CharMixerReverse = bool
```

**Variable**

- **(Type)** - **Description**
  - **VMC**
    - VMCType (object)
  - **bool** (Boolean)

- **0** - Characterize the calibration mixer in the SAME direction as that specified in the mixer setup.
- **1** - Characterize the calibration mixer in the REVERSE direction as that specified in the mixer setup.

**Return Type**
Boolean

**Default**
0

**Examples**

```vbnet
VMC.CharMixerReverse = 0
```

**C++ Syntax**

```c++
HRESULT put_CharMixerReverse(VARIANT_BOOL bcharReverse);
HRESULT get_CharMixerReverse(VARIANT_BOOL *bcharReverse);
```

**Interface**
VMCType2
CitiContents Property - **Superseded**

**Description**
This command is replaced with SaveData Method

Specifies the contents of subsequent citifile saves using app.SaveCitiDataData or app.SaveCitiFormattedData

**VB Syntax**
`pref.CitiContents = value`

**Variable (Type) - Description**

- **pref**: A Preferences (object)
- **value**: (string) - Contents that will be saved with subsequent save commands. Choose from:
  - "Single" - Single trace
  - "Displayed" - All displayed traces
  - "Auto" - All displayed traces

**Return Type**
String

**Default**
"Auto"

**Examples**
```
pref.CitiContents = "Single" 'Write
content = pref.CitiContents 'Read
```

**C++ Syntax**
```
HRESULT get_CitiContents(BSTR *Contents)
HRESULT put_CitiContents(BSTR Contents)
```

**Interface**
IPreferences
## CitiFormat Property - Superseded

**Description**  
This command is replaced with `SaveData Method`.

Specifies the format of subsequent citifile saves using `app.SaveCitiFormattedData`.

**VB Syntax**  
`pref.CitiFormat = value`

**Variable**  
*(Type) - Description*

- `pref`  
  A `Preferences` *(object)*

- `value`  
  *(string)* - Format in which the citifile will be saved with subsequent save commands. Choose from:

  - "MA" - Linear Magnitude / degrees
  - "DB" - Log Mag / degrees
  - "RI" - Real / Imaginary
  - "Auto" - Format in which the trace is already displayed. If other than Log Mag, Linear Magnitude, or Real/Imag, then the format will be in Real/Imag.

**Return Type**  
String

**Default**  
"Auto"

**Examples**  
`pref.CitiFormat = "MA" 'Write`

`format = pref.CitiFormat 'Read`

**C++ Syntax**  
`HRESULT get_CitiFormat(BSTR *Format)`

`HRESULT put_CitiFormat(BSTR Format)`

**Interface**  
`IPreferences`
**CmnModeZConvPortImag Property**

<table>
<thead>
<tr>
<th>Description</th>

## CmnModeZConvPortReal Property

**Description**
Sets the real part of the impedance value for the common port impedance conversion function.

**VB Syntax**
```vbnet
fixture.CmnModeZConvPortReal(portNum) = value
```

**Variable**
- **fixture** *(Type)* - Description
  A Fixturing *(object)*
- **portNum** *(Integer)* - Balanced (logical) port number. Choose from logical ports 1, 2, or 3. Learn more about logical ports.
- **value** *(Double)* - Real part of the Impedance value. Choose a value between 0 and 1E18.

**Return Type**
Double

**Default**
See Common Mode Port Z Conversion Default

**Examples**
```vbnet
fixture.CmnModeZConvPortReal(2) = 75 'Write
value = fixture.CmnModeZConvPortReal(1) 'Read
```

**C++ Syntax**
```cpp
HRESULT get_CmnModeZConvPortReal( short portNum, double *pVal)
HRESULT put_CmnModeZConvPortReal( short portNum, double newVal)
```

**Interface**
IFixturing2
**CmnModeZConvPortZ0 Property**

**Description**  
Sets the impedance value for the common port impedance conversion function. Set either this single value or set the real and imaginary parts separately. The imaginary part is set to 0.0 using this command.

**VB Syntax**  
`fixture.CmnModeZConvPortZ0(portNum) = value`

<table>
<thead>
<tr>
<th>Variable</th>
<th>(Type) - Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>fixture</code></td>
<td>A Fixturing (object)</td>
</tr>
<tr>
<td><code>portNum</code></td>
<td>(Integer) The number of balanced ports. For example, if the device topology is SE-BAL-SE-BAL-SE-BAL, then this configuration would have 6 logical ports and 3 balanced ports. Learn more about logical and balanced ports.</td>
</tr>
<tr>
<td><code>value</code></td>
<td>(Double) Impedance value. Choose a value between 0 and 1E7.</td>
</tr>
</tbody>
</table>

**Return Type**  
Double

**Default**  
See Common Mode Port Z Conversion Default

**Examples**  

```vbnet
fixture.CmnModeZConvPortZ0(2) = 75 'Write
value = fixture.CmnModeZConvPortZ0(1) 'Read
```

**C++ Syntax**  
`HRESULT get_CmnModeZConvPortZ0( short portNum, double *pVal)`

`HRESULT put_CmnModeZConvPortZ0( short portNum, double newVal)`

**Interface**  
IFixturing2
Write/Read

About Fixturing

CmnModeZConvState Property

Description
Turns ON or OFF 4-port common port impedance conversion function. Must also set the fixture simulator function to ON using FixturingState Property.

VB Syntax
fixure.CmnModeZConvState = value

Variable
(fixture) - Description
value (Boolean)

False - Turns common port impedance conversion OFF
True - Turns common port impedance conversion ON

Return Type
Boolean

Default
False

Examples
fixture.CmnModeZConvState = False 'Write
value = fixture.CmnModeZConvState 'Read

C++ Syntax
HRESULT get_CmnModeZConvState( VARIANT_BOOL *pVal)

HRESULT put_CmnModeZConvState( VARIANT_BOOL newVal)

Interface
IFixturing2
## CompatibleCalKits Property

**Description**

Returns a comma-separated list of valid kits that use the specified connector type. This includes mechanical cal kits, applicable characterizations found within ECal modules currently connected to the VNA, and all user characterizations stored in VNA disk memory.

*Note:* The serial number is returned for ALL ECal modules that are connected with the connector type of the specified port. Previously, the returned list would include the serial numbers to distinguish the ECal modules only when two or more identical ECal models were connected to the VNA.

### VB Syntax

```vbnet
value = obj.CompatibleCalKits (port)
```

### Variable (Type) - Description

- **value** (Variant) Variable to store the returned list of Cal Kits.
- **obj** Any of the following:
  - `GuidedCalibration` (object) *Superseded* Replaced with `GetCompatibleCalKits` Method
  - `SMCType` (object)
  - `VMCType` (object)

- **port** (Long) Port number for which you want compatible kits.

First set the `ConnectorType` for the port.

### Return Type

Variant

### Default

Not Applicable

### Examples

```vbnet
Dim kits As Variant
kits = MySMC.CompatibleCalKits(1)
```

### C++ Syntax

```cpp
HRESULT get_CompatibleCalKits(long port, VARIANT* Kits);
```

### Interface

IGuidedCalibration

- `SMCType`
- `VMCType`
CompositeNormalizationMode Property

**Description**
Sets and returns the method by which CTB and CSO calculations are performed.

**VB Syntax**
```
imd.CompositeNormalizationMode = value
```

**Variable**
(Type) - Description
- `imd` A SweptIMD Object
- `value` (Enum)

0 - **naNone** - the normalized power is not used in calculation

1 - **naNumberOfCarriers** - CTB and CSO is corrected by subtracting $10 \times \log(N/2)$, where

- $N = \#\ of\ carriers\ for\ CTB$
- $N = \#\ of\ distortion\ products\ for\ CSO$

2 - **naPdBm** - the composited normalized power for CTB or CSO is treated as a dBm value

3 - **naPdBmV** - the composited normalized power for CTB or CSO is treated as a dBmV value.

**Note:** Power values are stored using the currently-set units. Therefore, first set units with this command, then set power values using:

- `CompositeNormalizedCSOPower`
- `CompositeNormalizedCTBPower`

**Return Type**
Enum

**Default**
**naNumberOfCarriers**

**Examples**
```
imd.CompositeNormalizationMode = naNone 'Write
value = imd.CompositeNormalizationMode 'Read
```

**C++ Syntax**
```
HRESULT get_CompositeNormalizationMode(tagNAIMDCompositeNormalizationMode *pVal)

HRESULT put_CompositeNormalizationMode(tagNAIMDCompositeNormalizationMode pVal)
```
Interface    ISweptIMD
### CompositeNormalizedCSOPower Property

**Description**
Sets and returns the CSO Power for POWER normalization mode. Valid only with measurement parameters: CSO2Lo and CSO2Hi and for Normalization Modes dBm and dBmV.

**VB Syntax**

```
imd.CompositeNormalizedCSOPower = value
```

**Variable** *(Type)* - Description

- **imd** *(Type)* - A SweptIMD Object
- **value** *(Type)* - (Double) Power level. The units are determined by `CompositeNormalizationMode` Property, which must be set first.

**Return Type**
Double

**Default**
0

**Examples**

```
imd.CompositeNormalizedCSOPower = -5 'Write
value = imd.CompositeNormalizedCSOPower 'Read
```

**C++ Syntax**

```
HRESULT get_CompositeNormalizedCSOPower(double *pVal)
HRESULT put_CompositeNormalizedCSOPower(double  pVal)
```

**Interface**
ISweptIMD
### CompositeNormalizedCTBPower Property

**Description**
Sets and returns the CSO Power. Valid only with measurement parameters: CTB Lo and CTB Hi and for Normalization Modes dBm and dBmV.

**VB Syntax**

```
imd.CompositeNormalizedCTBPower = value
```

**Variable (Type) - Description**

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>imd</td>
<td>A SweptIMD Object</td>
</tr>
<tr>
<td>value</td>
<td>(Double) Power level. The units are determined by CompositeNormalizationMode Property, which must be set first.</td>
</tr>
</tbody>
</table>

**Return Type**
Double

**Default**
0

**Examples**

```
imd.CompositeNormalizedCTBPower = -5 'Write
value = imd.CompositeNormalizedCTBPower 'Read
```

**C++ Syntax**

```
HRESULT get_CompositeNormalizedCTBPower(double *pVal)
HRESULT put_CompositeNormalizedCTBPower(double  pVal)
```

**Interface**
ISweptIMD
### Compression Property

<table>
<thead>
<tr>
<th>Description</th>
<th>Returns the Compression result of the PNOP marker search.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pnop Comp</td>
<td>Pnop Gain - Linear Gain (not shown on marker readout).</td>
</tr>
</tbody>
</table>

**VB Syntax**

```vbnet
comp = pnop.Compression
```

**Variable**

- **Type**: Description
- **comp** (double) - Variable to store returned value
- **pnop** A PNOP (object)

**Return Type**

Double

**Default**

Not applicable

**Examples**

```vbnet
comp = pnop.Compression 'Read
```

See example program

**C++ Syntax**

```cpp
HRESULT get_Compression(double* pNewVal)
```

**Interface**

IPNOP
### CompressionAlgorithm Property

**Description**
Set and read the algorithm method used to compute gain compression.

**VB Syntax**
`(gca.CompressionAlgorithm = value`

**Variable**
- **Type**
- **Description**
  - `gca` A GainCompression (object)
  - `value` (tagNAGCACompressionAlgorithm) - Algorithm method. Choose from:
    - `naCompressionFromLinearGain (0)`
    - `naCompressionFromMaximumGain (1)`
    - `naBackoffCompression (2)`
    - `naXYCompression (3)`
    - `naSaturation (4)`

**Return Type**
Enum

**Default**
`naCompressionFromLinearGain (0)`

**Examples**
```
gca.CompressionAlgorithm = naXYCompression 'Write
compAlg = gca.CompressionAlgorithm 'Read
```

**C++ Syntax**
```
HRESULT get_CompressionAlgorithm(tagNAGCACompressionAlgorithm* pVal)
HRESULT put_CompressionAlgorithm(tagNAGCACompressionAlgorithm newVal)
```

**Interface**
IGainCompression
# CompressionBackoff Property

**Description**  
Set and read value for the BackOff compression algorithm.

**VB Syntax**  
`gca.CompressionBackoff = value`

**Variable**  
<table>
<thead>
<tr>
<th>(Type)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>gca</code></td>
<td>A GainCompression (object)</td>
</tr>
<tr>
<td><code>value</code></td>
<td>(Double)  Backoff value in dB. Choose from 30 to (-30)</td>
</tr>
</tbody>
</table>

**Return Type**  
Double

**Default**  
10

**Examples**  
- `gca.CompressionBackoff = 7`  
- `acqMode = gca.CompressionBackoff`

**C++ Syntax**  
- `HRESULT get_CompressionBackoff(double* pValue)`
- `HRESULT put_CompressionBackoff(double newValue)`

**Interface**  
IGainCompression
### CompressionDeltaX Property

**Description**
Set and read the "X" value in the delta X/Y compression algorithm.

**VB Syntax**

```vbnet
gca.CompressionDeltaX = value
```

**Variable**

- `gca` (Type) - A `GainCompression` object
- `value` (Type) - X value in dB. Choose from 30 to (-30)

**Return Type**
Double

**Default**
10

**Examples**

```vbnet
(gca.CompressionDeltaX = 'Write

xDelta = gca.CompressionDeltaX 'Read
```

**C++ Syntax**

```cpp
HRESULT get_CompressionDeltaX(double* pVal)

HRESULT put_CompressionDeltaX(double newVal)
```

**Interface**
 IGainCompression
## CompressionDeltaY

<table>
<thead>
<tr>
<th>Description</th>
<th>Set and read the 'Y&quot; value in the delta X/Y compression algorithm.</th>
</tr>
</thead>
<tbody>
<tr>
<td>VB Syntax</td>
<td><code>gca.CompressionDeltaY = value</code></td>
</tr>
<tr>
<td>Variable</td>
<td>(Type) - Description</td>
</tr>
<tr>
<td>gca</td>
<td>A GainCompression (object)</td>
</tr>
<tr>
<td>value</td>
<td>(double) -</td>
</tr>
<tr>
<td>Return Type</td>
<td>Double</td>
</tr>
<tr>
<td>Default</td>
<td>9</td>
</tr>
<tr>
<td>Examples</td>
<td><code>gca.CompressionDeltaY = 7   'Write</code></td>
</tr>
<tr>
<td></td>
<td><code>xDelta = gca.CompressionDeltaY   'Read</code></td>
</tr>
<tr>
<td>C++ Syntax</td>
<td>HRESULT get_CompressionDeltaY(double* pVal)</td>
</tr>
<tr>
<td></td>
<td>HRESULT put_CompressionDeltaY(double newVal)</td>
</tr>
<tr>
<td>Interface</td>
<td>IGainCompression</td>
</tr>
</tbody>
</table>
### CompressionInterpolation Property

**Description**
Sets whether or not interpolation should be performed on 2D measured compression data. Applies ONLY to 2D acquisition modes.

**VB Syntax**
```vbnet
gca.CompressionInterpolation = value
```

**Variable**
<table>
<thead>
<tr>
<th>(Type)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>gca</code></td>
<td>A GainCompression (object)</td>
</tr>
<tr>
<td><code>value</code></td>
<td>(boolean) - Choose from:</td>
</tr>
<tr>
<td>True</td>
<td>Interpolate the results</td>
</tr>
<tr>
<td>False</td>
<td>Do NOT interpolate the results but return the value closest to compression.</td>
</tr>
</tbody>
</table>

**Return Type**
Boolean

**Default**
False

**Examples**
```vbnet
gca.CompressionInterpolation = True 'Write
compInt = gca.CompressionInterpolation 'Read
```

**C++ Syntax**
```cpp
HRESULT get_CompressionInterpolation(VARIANT_BOOL* pVal)

HRESULT put_CompressionInterpolation(VARIANT_BOOL newVal)
```

**Interface**
IGainCompression
### CompressionLevel Property

<table>
<thead>
<tr>
<th>Description</th>
<th>Set and read the desired gain reduction (from reference gain). This value is used for Compression Methods: Compression from Linear Gain and Compression from Maximum Gain.</th>
</tr>
</thead>
<tbody>
<tr>
<td>VB Syntax</td>
<td><code>gca.CompressionLevel = value</code></td>
</tr>
<tr>
<td>Variable</td>
<td>(Type) - Description</td>
</tr>
<tr>
<td><code>gca</code></td>
<td>A GainCompression (object)</td>
</tr>
<tr>
<td><code>value</code></td>
<td>(Double) - Compression level in dB. Choose a value greater than 0.1 dB.</td>
</tr>
<tr>
<td>Return Type</td>
<td>Double</td>
</tr>
<tr>
<td>Default</td>
<td>1</td>
</tr>
<tr>
<td>Examples</td>
<td><code>gca.CompressionLevel = 1.5</code> 'Write'</td>
</tr>
<tr>
<td></td>
<td><code>compLevel = gca.CompressionLevel</code> 'Read'</td>
</tr>
<tr>
<td>C++ Syntax</td>
<td>HRESULT get_CompressionLevel(double* pVal)</td>
</tr>
<tr>
<td></td>
<td>HRESULT put_CompressionLevel(double newVal)</td>
</tr>
<tr>
<td>Interface</td>
<td>IGainCompression</td>
</tr>
</tbody>
</table>
## CompressionMax Property

<table>
<thead>
<tr>
<th>Description</th>
<th>Returns the Compression Max result of a PSat or PNOP marker search.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Comp Max = Gain Max - Linear Gain (not shown on PNOP marker readout).</td>
</tr>
</tbody>
</table>

### VB Syntax

```vbnet
compMax = pMarker.CompressionMax
```

### Variable (Type) - Description

- `compMax` (double) - Variable to store returned value
- `pMarker` A PNOP (object) or a PSaturation (object)

### Return Type

- Double

### Default

- Not applicable

### Examples

```vbnet
compMax = pMark.CompressionMax  'Read
```

See example program

### C++ Syntax

```cpp
HRESULT get_CompressionMax(double* pNewVal)
```

### Interface

- IPNOP or IPSaturation
## CompressionLevel (Marker) Property

**Description**  
Set and read the marker compression level. First use `SearchCompressionPoint` to create the compression marker.

**VB Syntax**  
```vbnet
mkr.CompressionLevel = value
```

**Variable (Type) - Description**
- `mkr`  
  A Marker (object)
- `value`  
  (Double) - Compression level in dB. Choose any number between: -500 dB to 500 dB

Standard gain compression values are positive.

**Return Type**  
Double

**Default**  
1

**Examples**  
See example program

**C++ Syntax**
```c++
HRESULT get_CompressionLevel(double* pVal)
HRESULT put_CompressionLevel(double newVal)
```

**Interface**  
IMarker4
### CompressionPin Property

**Description**
Reads the input power at the marker compression level. First issue `SearchCompressionPoint Method` or `Tracking Property`.

**VB Syntax**

```
value = mkr.CompressionPin
```

**Variable (Type) - Description**

- `mkr` A Marker (object)
- `value` (Double) - Variable to store the returned input power value.

**Return Type**
Double

**Default**
Not Applicable

**Examples**

```
compLevel=mkr.CompressionPin 'Read
```

See example program

**C++ Syntax**

```
HRESULT get_CompressionPin(double* pVal)
```

**Interface**
IMarker4
### CompressionPout Property

<table>
<thead>
<tr>
<th>Description</th>
<th>Reads the output power at the marker compression level. First issue SearchCompressionPoint Method or Tracking Property.</th>
</tr>
</thead>
<tbody>
<tr>
<td>VB Syntax</td>
<td><code>value = mkr.CompressionPout</code></td>
</tr>
<tr>
<td>Variable</td>
<td><em>(Type)</em> - Description</td>
</tr>
<tr>
<td>mkr</td>
<td>A Marker <em>(object)</em></td>
</tr>
<tr>
<td>value</td>
<td><em>(Double)</em> - Variable to store the returned output power value.</td>
</tr>
<tr>
<td>Return Type</td>
<td>Double</td>
</tr>
<tr>
<td>Default</td>
<td>Not Applicable</td>
</tr>
<tr>
<td>Examples</td>
<td><code>compLevel=mkr.CompressionPout</code> 'Read'</td>
</tr>
<tr>
<td>C++ Syntax</td>
<td>HRESULT get_CompressionPout(double* pVal)</td>
</tr>
<tr>
<td>Interface</td>
<td>IMarker4</td>
</tr>
</tbody>
</table>
### CompressionSaturation Property

<table>
<thead>
<tr>
<th>Description</th>
<th>Returns the Compression Saturation result of a PSat marker search.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Comp Sat</td>
<td>Gain Sat - Gain Linear</td>
</tr>
</tbody>
</table>

#### VB Syntax

```vb
compSat = pSat.CompressionSaturation
```

#### Variable (Type) - Description

- `compSat` (double) - Variable to store returned value
- `pSat` A `PSaturation` (object)

#### Return Type

Double

#### Default

Not applicable

#### Examples

```vb
compSat = pSat.CompressionSaturation 'Read
```

See example program

#### C++ Syntax

```cpp
HRESULT get_CompressionSaturation(double* pNewVal)
```

#### Interface

`IPSaturation`
**ConfigurationFile Property**

**Description**
Recalls an Interface Control file from the hard drive into the analyzer.

**VB Syntax**
```vbnet
IntControl.ConfigurationFile = filename
```

**Variable**
(Type) - Description

*IntControl*  An InterfaceControl (object)

*filename*  (string) - Full path, file name, and extension (.xml) of the file to recall.

Files are typically stored in "c:\users\public\network analyzer\documents"

**Return Type**
Not Applicable

**Default**
Not Applicable

**Examples**
```vbnet
IntControl.ConfigurationFile = "c:\users\public\network analyzer\documents\MySettings.xml"
```

**C++ Syntax**
```cpp
HRESULT put_ConfigurationFile(BSTR bstrFile)
```

**Interface**
IInterfaceControl
### Configurations Property

<table>
<thead>
<tr>
<th>Description</th>
<th>Returns an array of stored configuration names that can be used with DeleteConfiguration Method and LoadConfiguration Method</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>VB Syntax</strong></td>
<td><code>names = pathMgr. Configurations</code></td>
</tr>
<tr>
<td><strong>Variable</strong></td>
<td><em>(Type) - Description</em></td>
</tr>
<tr>
<td><code>names</code></td>
<td><em>(Variant array)</em> Variable to store the returned configuration names.</td>
</tr>
<tr>
<td><code>pathMgr</code></td>
<td>PathConfigurationManager <em>(object)</em></td>
</tr>
<tr>
<td><strong>Return Type</strong></td>
<td>Variant array</td>
</tr>
<tr>
<td><strong>Default</strong></td>
<td>Not Applicable</td>
</tr>
<tr>
<td><strong>Examples</strong></td>
<td><code>names = path. Configurations</code></td>
</tr>
<tr>
<td><strong>C++ Syntax</strong></td>
<td><code>HRESULT get_Configurations (VARIANT* configurations );</code></td>
</tr>
<tr>

## ConfirmPreset Property

<table>
<thead>
<tr>
<th>Description</th>
<th>Set and return preset confirmation. If preset confirmation is OFF, pressing the green PRESET key presets the instrument and opens the Preset softkey menu. If preset confirmation is ON, pressing the green PRESET causes the Preset menu to appear.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>VB Syntax</strong></td>
<td><code>pref.ConfirmPreset = bool</code></td>
</tr>
<tr>
<td><strong>Variable</strong></td>
<td><strong>(Type) - Description</strong></td>
</tr>
<tr>
<td><code>pref</code></td>
<td>A <code>Preferences</code> (object)</td>
</tr>
<tr>
<td><code>bool</code></td>
<td><strong>(boolean)</strong></td>
</tr>
<tr>
<td><code>False</code></td>
<td>Set preset confirmation to OFF as the default.</td>
</tr>
<tr>
<td><code>True</code></td>
<td>Set preset confirmation to ON as the default.</td>
</tr>
<tr>
<td><strong>Return Type</strong></td>
<td>Boolean</td>
</tr>
<tr>
<td><strong>Default</strong></td>
<td>False</td>
</tr>
<tr>
<td><strong>Examples</strong></td>
<td><code>pref.ConfirmPreset = True 'Write prefer = pref.ConfirmPreset 'Read</code></td>
</tr>
<tr>
<td><strong>C++ Syntax</strong></td>
<td><code>HRESULT get_ConfirmPreset(VARIANT_BOOL *presetState)</code></td>
</tr>
<tr>
<td></td>
<td><code>HRESULT put_ConfirmPreset(VARIANT_BOOL presetState)</code></td>
</tr>
<tr>
<td><strong>Interface</strong></td>
<td><code>IPreferences18</code></td>
</tr>
</tbody>
</table>
### ConnectorType Property

<table>
<thead>
<tr>
<th>Description</th>
<th>Sets or queries the connector type for the specified port.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>VB Syntax</strong></td>
<td>obj.ConnectorType (port) = value</td>
</tr>
<tr>

<td>(Type) - Description</td>
</tr>
<tr>
<td>obj</td>
<td>Any of the following:</td>
</tr>
<tr>
<td>GuidedCalibration (object)</td>
<td></td>
</tr>
<tr>
<td>SMCType (object)</td>
<td></td>
</tr>
<tr>
<td>VMCType (object)</td>
<td></td>
</tr>
<tr>
<td>port</td>
<td>(Long) Port number of the connector type.</td>
</tr>
<tr>
<td>For Guided Cals and SMC, select port number.</td>
<td></td>
</tr>
<tr>
<td>For VMC calibrations:</td>
<td></td>
</tr>
<tr>
<td>● 1 - Mixer Input.</td>
<td></td>
</tr>
<tr>
<td>● Any unused port can be used for the mixer output.</td>
<td></td>
</tr>
<tr>
<td>● Output port of MUT +1 - Output port of the calibration mixer. Generally this is port 3.</td>
<td></td>
</tr>
<tr>
<td><strong>value</strong></td>
<td>(String) - Connector type. <strong>Case-sensitive.</strong></td>
</tr>
<tr>
<td>Use ValidConnectorType Property to list connector types.</td>
<td></td>
</tr>
<tr>
<td><strong>Return Type</strong></td>
<td>String</td>
</tr>
<tr>
<td><strong>Default</strong></td>
<td>None</td>
</tr>
<tr>
<td><strong>Examples</strong></td>
<td>SMC.ConnectorType(1) = &quot;APC 3.5 male&quot;</td>
</tr>
<tr>
<td></td>
<td>value = SMC.ConnectorType(1)</td>
</tr>
<tr>
<td><strong>C++ Syntax</strong></td>
<td>HRESULT get_ConnectorType(long port, BSTR *connector)</td>
</tr>
<tr>
<td></td>
<td>HRESULT put_ConnectorType(long port, BSTR connector)</td>

<tr>
<td><strong>Interface</strong></td>
<td>IGuidedCalibration</td>
</tr>
<tr>
<td></td>
<td>SMCType</td>
</tr>
<tr>
<td></td>
<td>VMCType</td>
</tr>
</tbody>
</table>
ConnectorType Property

**Description**  Sets or queries the connector type for the specified port.

**VB Syntax**  `ecalUser.ConnectorType (port) = value`

**Variable**  
- **Type** - **Description**
  - `ecalUser`  An ECalUserCharacterizer (object)
  - `port`  (Enum) ECal port for which connector type is to be set. Choose from:
    - 1 or `naECalPort_A`
    - 2 or `naECalPort_B`
    - 3 or `naECalPort_C`
    - 4 or `naECalPort_D`
  - `value`  (String) - Connector type.

When the User Characterization is to be stored in the ECal module, then the connector type is limited to a Factory-defined connector type. See the list.

When the User Characterization is to be stored in VNA disk memory, then the connector type can also be a User-defined connector type.

**Return Type**  String

**Default**  "" (Empty String)

**Examples**

```vbnet
ecalUser.ConnectorType(naECalPort_B) = "APC 3.5 male" ' Write
Value = ecalUser.ConnectorType(naECalPort_B)
```

**C++ Syntax**

```cpp
HRESULT get_ConnectorType(NAECalPort port, BSTR *connector);

HRESULT put_ConnectorType(NAECalPort port, BSTR connector);
```

**Interface**  IECalUserCharacterizer
ControlLines Property

Description
Sets the control lines of the specified test set. Control lines, provided through the front panel connector of a test set, are used to control external equipment such as a part handler. See your test set documentation to learn more about control lines.

VB Syntax
\[ tset.\text{ControlLines}(\text{chNum}) = \text{value} \]

Variable (Type) - Description
\( tset \) A TestsetControl object.

OR

An E5091Testset object.

\( \text{chNum} \) (Integer) Channel number of the measurement.

\( \text{value} \) (Double) Data value used to set control lines. Values are obtained by adding weights from the following table that correspond to individual lines.

<table>
<thead>
<tr>
<th>Line</th>
<th>Weight</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>1</td>
</tr>
<tr>
<td>2</td>
<td>2</td>
</tr>
<tr>
<td>3</td>
<td>4</td>
</tr>
<tr>
<td>4</td>
<td>8</td>
</tr>
<tr>
<td>5</td>
<td>16</td>
</tr>
<tr>
<td>6</td>
<td>32</td>
</tr>
<tr>
<td>7</td>
<td>64</td>
</tr>
<tr>
<td>8</td>
<td>128</td>
</tr>
</tbody>
</table>

- The E5091A interprets SENS:MULT1:OUTP 0 as all lines LOW.
- All "Z" and "H" series test sets interpret SENS:MULT1:OUTP 0 as all lines HIGH.

Refer to your test set documentation for setting control line values.

Return Type
Variant

Default
0

Examples
'For a Z5623A K64 test set, the following sets line 3 and 4 OFF; all other lines ON.'
testset1.ControlLines(2) = 12

See E5091A Example Program

See External Testset Program

**C++ Syntax**

HRESULT get_ControlLines(long channelNum, VARIANT *stateByte);
HRESULT put_ControlLines(long channelNum, VARIANT stateByte);

**Interface**

Count Property

**Description**
Returns the number of items in a collection of objects.

**VB Syntax**
`object.Count`

**Variable**
*(Type) - Description*
*object* Any of the following *(objects)*:

- Cables Collection
- CalFactorSegments Collection
- CalFactorSegmentsPMAR Collection
- Cal Sets Collection
- Channels Collection
- E5091Testset Collection
- ExternalDevices Collection
- ExternalTestsets Collection
- GuidedCalibrationPowerSensors Collection
- LimitTest Collection
- Measurements Collection
- NaWindows Collection
- Ports Collection
- PowerLossSegments Collection
- PowerLossSegmentsPMAR_Collection.htm
- PowerSensors Collection
- Segments Collection
- Traces Collection
- PowerMeterInterfaces Collection

**Return Type**
Long Integer

**Default**
Not applicable
### Examples
```
numofchans = chans.Count 'return the number of channels
-Read
```

### C++ Syntax
```
HRESULT get_Count(long *pInterface)
```

### Interface
All listed above
**CouplePorts Property**

**Description**
Turns ON and OFF port power coupling. ON means the power level is the same for both ports. OFF means the power level may be set independently for each port.

**VB Syntax**
```vbnet
object.CouplePorts = value
```

**Variable**
*(Type) - Description*

`object` Channel *(object)*  

or

CalSet *(object)* - Read-only property

`value` *(enum NAStates)* Choose from:

- 0 - **NaOff** - Turns coupling OFF
- 1 - **NaOn** - Turns coupling ON

**Return Type**
Long Integer

- 1 - ON
- 0 - OFF

**Default**
NaON (1)

**Examples**
```
chan.CouplePorts = NaOff 'Write
```
```
couplport = chan.CouplePorts 'Read
```

**C++ Syntax**
```
HRESULT get_CouplePorts(tagNAStates *pState)
HRESULT put_CouplePorts(tagNAStates newState)
```

**Interface**
IChannel

|CalSet3
## CoupleChannelParams Property

**Description**
Turns ON and OFF Time Domain Trace Coupling. All of the measurements in the specified channel are coupled.

- To select Transform parameters to couple, use `Trans.CoupledParameters Property`
- To select Gating parameters to couple, use `Gate.CoupledParameters Property`

**VB Syntax**
```
chan.CoupleChannelParams = state
```

**Variable**
- `chan` (Type): A Channel (object)
- `state` (boolean)
  - `False` - Turns Trace Coupling OFF
  - `True` - Turns Trace Coupling ON

**Return Type**
Boolean

**Default**
True

**Examples**
```
chan.CoupleChannelParams = False 'Write
couple = chan.CoupleChannelParams 'Read
```

**C++ Syntax**
```
HRESULT get_CoupleChannelParams(VARIANT_BOOL *isCoupled);
HRESULT put_CoupleChannelParams(VARIANT_BOOL isCoupled);
```

**Interface**
IChannel5
### Coupled Property

**Description**
Sets and returns the state of coupling (ON or OFF) of this range to the primary range.

**VB Syntax**
\[ FOMRange.Coupled = value \]

**Variable**
- **object** (Type) - Description
  - An FOMRange (object)
- **value** (boolean) - State of coupling.

  **True** - Couple range to primary range.

  **False** - Do NOT couple to primary range.

**Return Type**
Boolean

**Default**
True

**Examples**
- `fomRange.Coupled = False 'this range is NOT coupled to the primary range.`
- `coupl = fomRange.Coupled 'Read`

**C++ Syntax**
- HRESULT get_Coupled(VARIANT_BOOL *pVal)
- HRESULT put_Coupled(VARIANT_BOOL pVal)

**Interface**
IFOMRange
**CoupledMarkers Property**

**Description**
Sets and Reads the state of Coupled Markers (ON and OFF).

See also: CoupledMarkersMethod Property

**VB Syntax**
```vbnet
app.CoupledMarkers = state
```

**Variable**
- **app** An Application *(object)*
- **state** *(boolean)*
  - **False** *(0)* - Turns Coupled Markers OFF
  - **True** *(1)* - Turns Coupled Markers ON

**Return Type**
Boolean
- **False** - OFF
- **True** - ON

**Default**
**False**

**Examples**
```vbnet
app.CoupledMarkers = True 'Write

coupl = app.CoupledMarkers 'Read
```

**C++ Syntax**
```cpp
HRESULT put_CoupledMarkers(VARIANT_BOOL bState)
HRESULT get_CoupledMarkers(VARIANT_BOOL *bState)
```

**Interface**
IApplication
CoupledMarkersMethod Property

Description  Sets and Reads the scope Coupled Markers.

**Note:** This command will not take effect until CoupledMarkers Property is turned on.

**Note:** The preset behavior of Coupled Markers depends on the setting of MarkCoupControlsMkrState, MarkCoupMethPresetIsChan, and MarkCoupPresetIsOn.

VB Syntax

```vbnet
app.CoupledMarkersMethod = value
```

Variable  *(Type)* - Description

- `app` An Application *(object)*
- `value` *(Enum as NAMarkerCouplingMethod)*

- **0** - `naMarkerCouplingAll` - Coupling occurs across all channels.
- **1** - `naMarkerCouplingChannel` - Coupling is limited to traces in the same channel.

Return Type  Enum

Default  **0** - `naMarkerCouplingAll`

Examples

```vbnet
app.CoupledMarkersMethod = naMarkerCouplingAll 'Write

coupl = app.CoupledMarkersMethod 'Read
```

C++ Syntax

```cpp
HRESULT put_CoupledMarkersMethod(tagNAMarkerCouplingMethod, value)

HRESULT get_CoupledMarkersMethod(NAMarkerCouplingMethod, *value)
```

Interface  IApplication20
**CoupledParameters Property (Gating)**

**Description**
Specifies the time domain gating parameters to be coupled. The settings for those parameters will be copied from the active measurement to all other measurements on the channel.

To turn coupling ON and OFF, use `CoupleChannelParams Property`

To specify Transform parameters to couple, use `Transform.CoupledParameters Property`

**VB Syntax**
```
gate.CoupledParameters = value
```

**Variable (Type) - Description**
- `trans` A Gating (object)
- `value` (Enum As NAGatingCoupledParams) - Parameters to couple. To specify more than one parameter, add the numbers. Choose from:
  - 1 - naGatingStimulusCoupled (Start, Stop, Center, and Span TIME settings.)
  - 2 - naGateStateCoupled (ON / OFF)
  - 4 - naGatingShapeCoupled (Minimum, Normal, Wide, and Maximum)
  - 8 - naGatingTypeCoupled (Bandpass and Notch)

**Return Type**
Enum

**Default**
29

**Examples**
```
gate.CoupledParameters = 15 'Couple all parameters
CP = gate.CoupledParameters 'Read
```

**C++ Syntax**

```
HRESULT get_CoupledParameters(long *lParams);

HRESULT put_CoupledParameters(long lParams);
```

**Interface**
IGating2
**CoupledParameters Property (Transform)**

### Description
Specifies the time domain transform parameters to be coupled. The settings for those parameters will be copied from the active measurement to all other measurements on the channel.

To turn coupling ON and OFF, use `CoupleChannelParams Property`

To specify Gating parameters to couple, use `Gate.CoupledParameters Property`

### VB Syntax
```
trans.CoupledParameters = value
```

### Variable (Type) - Description
- **trans**: A `Transform (object)`
- **value**: (Enum As NATransformCoupledParams) - Parameters to couple. To specify more than one parameter, add the numbers. Choose from:
  1. `naTransformStimulusCoupled` (Start, Stop, Center, and Span TIME settings.)
  2. `naTransformStateCoupled` (ON / OFF)
  4. `naTransformWindowCoupled` (Kaiser Beta / Impulse Width)
  8. `naTransformModeCoupled` (Low Pass Impulse, Low Pass Step, Band Pass)
  16. `naTransformDistMkrUnitCoupled` (Distance maker Units)

### Return Type
`Enum`

### Default
29

### Examples
```
trans.CoupledParameters = 31 'Couple all parameters
CP = trans.CoupledParameters 'Read
```

### C++ Syntax
```
HRESULT get_CoupledParameters(long *lParams);
HRESULT put_CoupledParameters(long lParams);
```

### Interface
`ITransform2`
### CouplePhasePortSettings Property

**Description**
Sets and returns whether to couple phase control settings (IFBW, Tolerance, Max Iterations).

**VB Syntax**
```
phase.CouplePhasePortSettings(srcPort) = value
```

**Variable**
- **phase**: A PhaseControl Object
- **srcPort**: (Long Integer) Source port for which to make phase control settings.

**Note:** If the source port is defined by a string name, such as an external source, a balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model, then use chan.getPortNumber to translate the string into a port number. To learn more see Remotely Specifying a Source Port

**value**: (Boolean) Coupling state. Choose from:
- **True** - Couple phase control settings. The phase control settings from <port> are copied to the other phase-controlled ports.
- **False** - Do NOT couple phase control settings. The phase control settings for each phase-controlled port are made independently.

**Return Type**
Boolean

**Default**
False

**Examples**
```
phase.CouplePhasePortSettings 1 = True ' Write
value = phase.CouplePhasePortSettings 2' Read
```

**C++ Syntax**
```
HRESULT get_CouplePhasePortSettings(long port, VARIANT_BOOL* pVal);

HRESULT put_CouplePhasePortSettings(long port, VARIANT_BOOL newVal);
```

**Interface**
IPhaseControl
**CoupleTonePower Property**

**Description**
Sets and returns the ON | OFF state of power coupling for F1 and F2.

**VB Syntax**

```vbnet
object.CoupleTonePower = value
```

**Variable (Type) - Description**

- **object**: A SweptIMD or IMSpectrum Object
- **value**: (Boolean) - Choose from:
  - **True**: F1 and F2 power is coupled.
  - **False**: F1 and F2 power is NOT coupled. Set power levels individually.

**Return Type**
Boolean

**Default**
True

**Examples**

```vbnet
ims.CoupleTonePower = true 'Write
value = ims.CoupleTonePower 'Read
```

**C++ Syntax**

```cpp
HRESULT get_CoupleTonePower(VARIANT_BOOL* val)
HRESULT put_CoupleTonePower(VARIANT_BOOL val)
```

**Interface**
ISweptIMD
IMSpectrum
## CpuRevision Property

**Description**  
Returns a number that corresponds to the CPU speed of the VNA.

**VB Syntax**  
\[ value = cap.CpuRevision \]

**Variable (Type) - Description**  
\( value \) (String) - Variable to store the returned number. Use the following table to learn the CPU speed.

Reported CPU version  - Clock speed

- **1.0** - 266 MHz
- **2.0** - 500 MHz
- **3.0** - 1100 MHz
- **4.0** - 1600 MHz
- **5.0** - 2000 MHz
- **6.0** - 2000 MHz dual core
- **7.0** - 2200 MHz dual core

**cap**  
A `Capabilities (object)`

**Return Type**  
String

**Default**  
Not Applicable

**Examples**  
\[ value = cap.CpuRevision \]  
'Read'

**C++ Syntax**  
`HRESULT get_CpuRevision(BSTR *value);`

**Interface**  
ICapabilities6
# CSONumDistortionProducts Property

**Description**  
Sets and returns the “N = number of distortion products” value for the calculation of the CSO parameter.  
[Learn more.](#)

**VB Syntax**  
```
imd.CSONumDistortionProducts = value
```

**Variable (Type) - Description**  
- `imd` - A SweptIMD Object
- `value` - (Long Integer) Number of distortion products

**Return Type**  
Long Integer

**Default**  
40

**Examples**  
```
imd.CSONumDistortionProducts = True 'Write
value = imd.CSONumDistortionProducts 'Read
```

**C++ Syntax**  
```
HRESULT get_CSONumDistortionProducts(long *pVal)
HRESULT put_CSONumDistortionProducts(long *pVal)
```

**Interface**  
ISweptIMD
### CSOOffset Property

**Description**
Sets and returns the offset that is applied to CSO measurements. Valid only with measurement parameters: CSO2Lo and CSO2Hi.

**VB Syntax**
```vbnet
imd.CSOOffset = value
```

**Variable** *(Type)* - Description

- `imd` A SweptIMD Object
- `value` (Double) Offset value in dBm.

**Return Type**
Double

**Default**
0

**Examples**
```vbnet
imd.CSOOffset = 2 'Write
value = imd.CSOOffset 'Read
```

**C++ Syntax**
```cpp
HRESULT get_CSOOffset(double *pVal)
HRESULT put_CSOOffset(double pVal)
```

**Interface**
ISweptIMD
**CTBOffset Property**

**Description**  
Sets and returns the offset that is applied to CTB measurements. Valid only with measurement parameters: CTB, CTBLo, CTBHi, CTBE, CTBELo, and CTBEHi.

**VB Syntax**  
`imd.CTBOffset = value`

**Variable**  
`imd` (Type) - Description  
A SweptIMD Object

`value` (Type) - Description  
(Double) Offset value in dBm.

**Return Type**  
Double

**Default**  
0

**Examples**  
`imd.CTBOffset = 2 'Write`

`value = imd.CTBOffset 'Read`

**C++ Syntax**  
`HRESULT get_CTBOffset(double *pVal)`
`HRESULT put_CTBOffset(double pVal)`

**Interface**  
ISweptIMD
**CTBXMODNumCarriers Property**

**Description**
Sets the “N = Total number of carriers” value used in the calculation of the XMOD and CTB parameter.

**Learn more.**

**VB Syntax**

```vbnet
imd.CTBXMODNumCarriers = value
```

**Variable (Type) - Description**

- **imd** A SweptIMD Object
- **value** (Long Integer) Number of carriers.

**Return Type**
Long Integer

**Default**
40

**Examples**

```vbnet
imd.CTBXMODNumCarriers = 15 'Write
value = imd.CTBXMODNumCarriers 'Read
```

**C++ Syntax**

```c++
HRESULT get_CTBXMODNumCarriers(double *pVal)
HRESULT put_CTBXMODNumCarriers(double *pVal)
```

**Interface**
ISweptIMD
### CurrentLimit Property

**Description**
Sets and returns the maximum output current value of the external DC Source. This command supports Keysight B2900A and N6700 series devices only.

**VB Syntax**
```
extDC.CurrentLimit (devicename) = value
```

<table>
<thead>
<tr>
<th>Variable</th>
<th>(Type) - Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>extDC</code></td>
<td>A <code>ExternalDCDevice</code> (object)</td>
</tr>
<tr>
<td><code>devicename</code></td>
<td>(String) Name of the device.</td>
</tr>
<tr>
<td><code>value</code></td>
<td>(Double) Current limit value.</td>
</tr>
</tbody>
</table>

**Return Type**
Double

**Default**
0

**Examples**
```
extDC.CurrentLimit("myDCDevice") = 4 'Write
Limit = extDC.CurrentLimit("myDCDevice") 'Read
```

**C++ Syntax**
```c++
HRESULT get_CurrentLimit(BSTR devicename, double *cLimit)
HRESULT put_CurrentLimit(BSTR devicename, double newLimit)
```

**Interface**
`IExternalDCDevice2`
**CustomBalNegativePort Property**

**Description**  
Returns the VNA physical port number that is connected to the Negative side of the specified logical balanced port of the DUT.

**VB Syntax**  
```
var = balTopology.CustomBalNegativePort(logicalBalancedPort)
```

**Variable**  
*(Type)* - Description

- `balTopology` A `BalancedTopology` *(object)*
- `var` (Long Integer) Variable to store the returned value.
- `logicalBalancedPort` (Long Integer) Logical balanced port number.

**Return Type**  
Long Integer

**Default**  
Not Applicable

**Examples**  
'In the following example, 6 logical ports are mapped to 8 physical VNA ports.  
'Logical ports 3 and 6 are balanced.  
'Logical port 3 is queried returning physical port 4.

```c
int portlist[] = {1,2,3,4,5,6,7,8}
balTopology.SetCustomDuTTopology("SSBSSB", portlist)  
variable = balTopology.CustomBalNegativePort(3)  
```

**C++ Syntax**  
```
HRESULT get_CustomBalNegativePort(long *logicalBalancedPort)
```

**Interface**  
`IBalancedTopology3`
### CustomBalPositivePort Property

**Description**
Returns the VNA physical port number that is connected to the Positive side of the specified logical balanced port of the DUT.

**VB Syntax**
```
var = balTopology.CustomBalPositivePort(logicalBalancedPort)
```

**Variable**
- **balTopology**: A `BalancedTopology (object)`
- **var**: (Long Integer) Variable to store the returned value.
- **logicalBalancedPort**: (Long Integer) Logical balanced port number.

**Return Type**
Long Integer

**Default**
Not Applicable

**Examples**
```
'In the following example, 6 logical ports are mapped to 8 physical VNA ports.
'Logical ports 3 and 6 are balanced.
'Logical port 3 is queried returning physical port 3.
Int portlist[] = {1,2,3,4,5,6,7,8}
balTopology.SetCustomDuTTopology ("SSBSSB", portlist)
variable = balTopology.CustomBalPositivePort(3) 'Read
```

**C++ Syntax**
```
HRESULT get_CustomBalPositivePort(long *logicalBalancedPort)
```

**Interface**
IBalancedTopology3
**CustomCalConfiguration Property**

**Description**
Calibration for the following VNA Applications is performed using the GuidedCalibration Object. This command provides access to additional Properties and Methods which extends the GuidedCal Object.

<table>
<thead>
<tr>
<th>Meas Type</th>
<th>Custom Cal Interface</th>
</tr>
</thead>
<tbody>
<tr>
<td>Gain Compression</td>
<td>IGainCompressionCal Object</td>
</tr>
<tr>
<td>Noise Figure</td>
<td>INoiseCal Object</td>
</tr>
<tr>
<td>Swept IMD</td>
<td>ISweptIMD Cal Object</td>
</tr>
</tbody>
</table>

**VB Syntax**

```vbnet
set custCal = cal.CustomCalConfiguration()
```

**Variable**

- **(Type)** - Description
  - `custCal` *(object)* The handle to an interface that provides application-specific calibration properties.
  - `cal` GuidedCalibration Object.

**Return Type**

Depends on the MeasType. See above table.

**Default**

None

**Examples**

See examples: NoiseFigure GainCompression SweptIMD

**C++ Syntax**

```c++
HRESULT CustomCalConfiguration(IDispatch** value);
```

**Interface**

IGuidedCalibration4
CustomChannelConfiguration Property

Description Returns a handle to the custom application object on the active channel. You can either (1) use the handle directly to access measurement properties and methods, or (2) set a variable to the measurement object. The variable retains a handle to the original measurement.

Currently, the custom application objects to which this property provides access are:

- NoiseFigure Object
- GainCompression Object
- SweptIMD Object

VB Syntax
1) set custChan = chan.CustomChannelConfiguration. <setting>
or
2) set custChan = app.ActiveChannel.CustomChannelConfiguration

Variable (Type) - Description

custChan A variable in which the handle to a custom application is returned. (object)
chan A Channel (object)
<setting> A property or method setting on the custom application object.

Return Type Custom application object
Default None

Examples See examples: NoiseFigure GainCompression SweptIMD

C++ Syntax
HRESULT CustomChannelConfiguration(IDispatch** value);

Interface IChannel12
**CustomMeasurementConfiguration Property**

**Description**
Returns a handle to a custom measurement object on the active channel. You can use the handle to access custom measurement properties and methods.

Currently, the custom measurement objects to which this property provides access is:

- **GainCompressionMeas Object**

**VB Syntax**

```vbnet
Set custMeas = meas.CCustomMeasurementConfiguration
```

**Variable**  
*(Type)* - Description  
*custMeas* A variable in which the handle to a custom measurement is returned. *(object)*  
*chan* A *Measurement* *(object)*

**Return Type**  
Custom Measurement object

**Default**  
None

**Examples**

See examples: GainCompression

**C++ Syntax**

```cpp
HRESULT CustomMeasurementConfiguration(IDispatch** value);
```

**Interface**  
IMeasurement12
### CustomPhysicalPortsSequence Property

**Description**
Returns an array of physical port numbers corresponding to the logical ports. To view the type of each logical port, use the CustomPortTypeSequence command.

**VB Syntax**
```vbnet
var = balTopology.CustomPhysicalPortsSequence
```

**Variable**
- **(Type)** - Description
  - `balTopology` **A** BalancedTopology **(object)**
  - `var` **(Variant)** Variable to store the returned value.

**Return Type**
Variant

**Default**
Not Applicable

**Examples**
```
'In the following example, 6 logical ports are mapped to 8 physical VNA ports.
'This query returns the portlist, which is the sequence of the 8 physical VNA ports.
Int portlist[] = {1,2,3,4,5,6,7,8}
balTopology.SetCustomDuTTopology ("SSBSSB", portlist)
variable = balTopology.CustomPhysicalPortsSequence 'Read
```

**C++ Syntax**
```cpp
HRESULT get_CustomPhysicalPortsSequence(VARIANT *physicalPorts)
```

**Interface**
IBalancedTopology3
CustomPortTypeSequence Property

**Description**
Returns a string containing the characters "S" (single-ended) or "B" (balanced) corresponding to the logical port types. To view the physical ports, use the `CustomPhysicalPortsSequence` command.

**VB Syntax**
`var = balTopology.CustomPortTypeSequence`

**Variable (Type) - Description**
- `balTopology` A `BalancedTopology` (object)
- `var` (String) Variable to store the returned value.

**Return Type** String

**Default** Not Applicable

**Examples**
In the following example, 6 logical ports are mapped to 8 physical VNA ports.
This query returns `SSBSSB`, which is the sequence of the 6 logical ports.

```
Int portlist[] = {1,2,3,4,5,6,7,8}
balTopology.SetCustomDuTTopology("SSBSSB", portlist)
variable = balTopology.CustomPortTypeSequence 'Read
```

**C++ Syntax**
`HRESULT get_CustomPortTypeSequence(BSTR *portType)`

**Interface** IBalancedTopology3
## CustomSEPhysicalPort Property

**Description**  
Returns the VNA physical port number that is mapped to the specified single-ended logical port.

**VB Syntax**  
```vbnet
var = balTopology.CustomSEPhysicalPort(logicalSingleEndedPort)
```

**Variable**  
**(Type) - Description**

- `balTopology`  
  A `BalancedTopology` object

- `var`  
  (Long Integer) Variable to store the returned value.

- `logicalSingleEndedPort`  
  (Long Integer) Logical single ended port number.

**Return Type**  
Long Integer

**Default**  
Not Applicable

**Examples**  
In the following example, 6 logical ports are mapped to 8 physical VNA ports.

- Logical ports 1, 2, 4 and 5 are single-ended.
- Logical port 5 is queried returning physical port 6.

```csharp
int portlist[] = {1, 2, 3, 4, 5, 6, 7, 8}
balance.SetCustomDuTTTopoTogy("SSBSSB", portlist)
variable = balance.CustomSEPhysicalPort(5) 'Read
```

**C++ Syntax**  
```c++
HRESULT get_CustomSEPhysicalPort(long *physicalPort)
```

**Interface**  
`IBalancedTopology3`
# CustomTopologyPortCount Property

**CWFrequency Property**

**Description**  
Set the Continuous Wave (CW) frequency. Must first send chan.SweepType = naCWTimeSweep.

See Also: calset.CWFrequency Property

**VB Syntax**  
`object.CWFrequency = value`

**Variable (Type) - Description**

- `object` One of the following:
  - Channel (object)
  - FOMRange  (object) Range must be UNCOUPLED.

See also Measurement2 interface.

- `value` (double) CW frequency. Choose any number between: the minimum and maximum frequency limits of the analyzer  
Units are Hz

**Return Type**  
Double

**Default**  
1e9

**Examples**
```
chan.CWFrequency = 5e9  'Write

cwfreq = chan.CWFrequency  'Read
```

**C++ Syntax**

- HRESULT put_CWFrequency(double newVal)
- HRESULT get_CWFrequency(double *pVal)

**Interface**

IChannel

</tr>
<tr>
<td>Interface</td>
<td>CalSet3</td>
</tr>
</tbody>
</table>
### Data Property

**Description**
Reads the next specified number of data points from the FIFO buffer. The data is returned in 32 bit real/imaginary pair. Data is cleared as it is read.

**Note:** This method is the slowest way to transfer data using COM. However, it is supported by all COM client programming languages. For better performance, try using DataInCompactForm.

**VB Syntax**

```vbnet
array = fifo.Data(count)
```

**Variable**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>array</td>
<td>(Variant) Variable to store the returned data.</td>
</tr>
<tr>
<td>fifo</td>
<td>A FIFO Object</td>
</tr>
<tr>
<td>count</td>
<td>(Long Integer) Number of data points to read.</td>
</tr>
</tbody>
</table>

**Return Type**

Variant array. Each VARIANT is typed as a 4-byte floating point number.

**Default**

Not Applicable

**Examples**

```vbnet
value = fifo.Data(500) 'Read
```

**C++ Syntax**

```c++
HRESULT get_Data(long count, VARIANT * data);
```

**Interface**

IFIFO
## DataAndLimits Property

<table>
<thead>
<tr>
<th>Description</th>
<th>Set and return the color of Data and Limit Lines for nth trace in a window.</th>
</tr>
</thead>
<tbody>
<tr>
<td>VB Syntax</td>
<td><code>trace(n).DataAndLimits = value</code></td>
</tr>
<tr>
<td>Variable</td>
<td><em>(Type)</em> - Description</td>
</tr>
<tr>
<td></td>
<td><strong>value</strong> <em>(Long Integer)</em> - RGB color of the DataAndLimits pen.</td>
</tr>
</tbody>
</table>

Convert the three RGB colors to an integer as follows:

\[
RGB = R + (G \times 2^8) + (B \times 2^{16})
\]

To find the three RGB values from the Display Colors dialog, click **Change Color**, then **Define Custom Color**.

<table>
<thead>
<tr>
<th>Return Type</th>
<th>Long</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default</td>
<td>Varies for each trace.</td>
</tr>
</tbody>
</table>
| Examples    | R = 10  
G = 10  
B = 10  
RGB = 10+(10\times2^8)+(10\times2^{16})  
trace1.DataAndLimits = RGB 'Write  
color = trace1.DataAndLimits 'Read |
| C++ Syntax  | HRESULT get_DataAndLimits(long* pVal);  
HRESULT put_DataAndLimits(long newVal);  
INTERFACE ITraceColors |

<tr>
<td><strong>Interface</strong></td>
<td>IFIFO2</td>
</tr>
</tbody>
</table>
# DataByteSize Property

**Description**

Returns the byte size of the data to be exported in binary mode.

**Note:** Returned number can exceed the maximum integer number size. In that case, an error will be raised. For that reason, we provide an access to larger numbers with the same query and LSB or MSB suffixes.

**VB Syntax**

```vbnet
value = sa.dft.DataByteSize
```

**Variable (Type) - Description**

- `sa.dft` (object) - A SpectrumAnalyzerDFT
- `value` (Variant) - Variable to store the returned value.

**Return Type**

Variant

**Example**

```vbnet
value = sa.dft.DataByteSize 'Read
```

**C++ Syntax**

```cpp
HRESULT get_DataByteSize(VARIANT* val);
```

**Interface**

ISpectrumAnalyzerDFT
### DataByteSizeLOW Property

<table>
<thead>
<tr>
<th>Description</th>
<th>Returns the least significant bytes of the byte size of the data to be exported.</th>
</tr>
</thead>
<tbody>
<tr>

<tr>
<td><strong>C++ Syntax</strong></td>
<td>HRESULT get_DataCount(long *value)</td>
</tr>
<tr>
<td><strong>Interface</strong></td>
<td>IFIFO</td>
</tr>
</tbody>
</table>
### DataExportMarkersEnabled Property

<table>
<thead>
<tr>
<th>Description</th>
<th>Enables/disables adding marker data to the text file (*.txt) output.</th>
</tr>
</thead>
<tbody>
<tr>
<td>VB Syntax</td>
<td><code>sa.dft.DataExportMarkersEnabled = value</code></td>
</tr>
<tr>
<td>Variable</td>
<td><strong>sa.dft</strong> - A <code>SpectrumAnalyzerDFT</code> (object)</td>
</tr>
<tr>
<td></td>
<td><strong>value</strong> - (Boolean) Choose from:</td>
</tr>
<tr>
<td></td>
<td>0 - <strong>OFF</strong> - Disable marker data to the file output.</td>
</tr>
<tr>
<td></td>
<td>1 - <strong>ON</strong> - Enable marker data to the file output.</td>
</tr>
<tr>
<td>Return Type</td>
<td>Boolean</td>
</tr>
<tr>
<td>Default</td>
<td>OFF</td>
</tr>
<tr>
<td>Examples</td>
<td><code>sa.dft.DataExportMarkersEnabled = ON</code> 'Write`</td>
</tr>
<tr>
<td></td>
<td><code>value = sa.dft.DataExportMarkersEnabled</code> 'Read`</td>
</tr>
<tr>
<td>C++ Syntax</td>
<td>HRESULT get_DataExportMarkersEnabled(VARIANT_BOOL* enable)</td>
</tr>
<tr>
<td></td>
<td>HRESULT put_DataExportMarkersEnabled(VARIANT_BOOL enable)</td>
</tr>
<tr>
<td>Interface</td>
<td>ISpectrumAnalyzerDFT2</td>
</tr>
</tbody>
</table>
# DataExportWindowingFactor Property

**Description**
Returns the windowing factor for band power computation. This factor is derived from the window type (Gaussian, flat top, etc.). When doing the sum of linear power over a band, use this factor to compensate the side lobe effect of windowing to get an accurate band power value.

**VB Syntax**

```vbnet
value = sa.dft.DataExportWindowingFactor
```

**Variable**

- **Type**: Description
- **sa.dft**: A SpectrumAnalyzerDFT (object)
- **value**: (Double) Variable to store the returned value.

**Return Type**

Double

**Example**

```vbnet
value = sa.dft.DataExportWindowingFactor 'Read
```

**C++ Syntax**

```cpp
HRESULT get_DataExportWindowingFactor(double* WindowingFactor);
```

**Interface**

ISpectrumAnalyzerDFT2
### DataFirstRFBin Property

**Description**

Returns the frequency of the first RF bin.

**Note:** This value can differ slightly from the SA Sweep start frequency, the frequency of the first RF bin is aligned with the current DFT grid.

**VB Syntax**

```vbnet
value = sa.dft.DataFirstRFBin
```

**Variable**

*sa.dft* is a `SpectrumAnalyzerDFT` *(object)*

*value* is a *(Double)* Variable to store the returned value.

**Return Type**

`Double`

**Example**

```vbnet
value = sa.dft.DataFirstRFBin 'Read
```

**C++ Syntax**

```c++
HRESULT get_DataFirstRFBin(double* val);
```

**Interface**

`ISpectrumAnalyzerDFT`
DataFormat Property

Description  Sets and returns the data format.

VB Syntax  

\[ sa.dft.DataFormat = value \]

Variable  

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sa.dft</td>
<td>A SpectrumAnalyzerDFT (object)</td>
</tr>
<tr>
<td>value</td>
<td>(enum NASADataType) - Choose from:</td>
</tr>
</tbody>
</table>

0  naSAFloatMAGdb: Set data format to log magnitude in dBm.

1  naSAFloatAMPVolt: Set data format to linear magnitude in volts.

2  naSAPackedInt: Set data format to Packed Integers: a more compact (2 bytes) numeric representation for dBm. Each set of 2 bytes is a short number s, to get the dBm value compute \((s/200.0 - 36.165)\).

Return Type  Enum as NASADataType

Default  naSAFloatMAGdb

Examples  

\[ sa.dft.DataFormat = naSAFloatMAGdb \] 'Write

\[ FormatType = sa.dft.DataFormat \] 'Read

C++ Syntax  

HRESULT get_DataFormat(tagNASADataType* pVal)

HRESULT put_DataFormat(tagNASADataType newVal)

Interface  ISpectrumAnalyzerDFT
### DataInCompactForm Property

**Description**
Reads FIFO data the same as Data Property but returns the data in a more compact form of SAFEARRAY. This is significantly faster but it is not supported in all client environments.

**VB Syntax**

```vbnet
array = fifo.DataInCompactForm(count)
```

**Variable (Type) - Description**

- `array` (Variant) Variable to store the returned data
- `fifo` A FIFO Object
- `count` (Long Integer) Number of data points to read.

**Return Type**
Returns an array of 4 byte floating point numbers.

**Default**
Not Applicable

**Examples**

```vbnet
value = fifo.DataInCompactForm(500) 'Read
```

**C++ Syntax**

```
HRESULT get_DataInCompactForm(long count,VARIANT * data);
```

**Interface**
IFIFO
DataLevelThreshold Property

### Description
Sets and returns the threshold value (dBm). For text file output with verbose mode, only the frequencies with power greater than this threshold setting will be written to the file. This command can be used as a kind of simple spurious search.

### VB Syntax
```vbnet
sa.dft.DataLevelThreshold = value
```

### Variable
- **sa.dft** - Description
  - A SpectrumAnalyzerDFT (object)

### Return Type
Double

### Default
-60 dBm

### Examples
```vbnet
sa.dft.DataLevelThreshold = -5 dBm  'Write
value = sa.dft.DataLevelThreshold  'Read
```

### C++ Syntax
```csharp
HRESULT put_DataLevelThreshold(double threshold);
HRESULT get_DataLevelThreshold(double* threshold);
```

### Interface
ISpectrumAnalyzerDFT2
# DataLevelThresholdEnabled Property

<tr>
<td></td>
<td>HRESULT put_DataLevelThresholdEnabled(VARIANT_BOOL enable)</td>
</tr>
<tr>
<td><strong>Interface</strong></td>
<td>ISpectrumAnalyzerDFT2</td>
</tr>
</tbody>
</table>
### DateTime Property

**Description**  
Returns the system date and time.

**VB Syntax**  
`datetime = app.DateTime`

**Variable**  
(Type) - Description

`datetime` Variant to store the date and time.

`app` An Application (object)

**Return Type**  
Variant of type VT_DATE.

**Default**  
Not Applicable

**Examples**  
`datetime = app.DateTime 'Read`

**C++ Syntax**  
`HRESULT get_DateTime(VARIANT *datetime);`

**Interface**  
IApplication22
### DCCorrection Property

**Description**
Sets and returns the correction ON/OFF state for a DC Meter and a DC Source.

**VB Syntax**
```
extDC.DCCorrection = value
```

**Variable**
- **(Type) - Description**
- `extDC` - An `ExternalDCDevice` *(object)*
- `value` - *(Boolean)* Correction ON/OFF state. Choose from:
  - **True** - Turn Correction ON
  - **False** - Turn Correction OFF

**Return Type**
Boolean

**Default**
False

**Examples**
```
extDC.DCCorrection = True 'Write
bool = extDC.DCCorrection 'Read
```

**C++ Syntax**
```
HRESULT get_DCCorrection (BOOL *pValue)
HRESULT put_DCCorrection (BOOL newVal)
```

**Interface**
IExternalDCDevice
**DCOffset Property**

**Description**
Sets and returns the offset correction value for an external DC Device which can be configured as either a DC Meter or a DC Source.

**VB Syntax**

```
extDC.DCOffset = value
```

**Variable**

- **extDC** (Type) - An ExternalDCDevice (object)
- **value** (Double) - DC offset value.

The VNA will display readings from a DC Meter as:

```
Display = (Meas'd value - Offset) * Scale
```

The VNA will adjust the output from a DC Source as:

```
Output  = (Set value - Offset) * Scale
```

**Return Type**
Double

**Default**
0

**Examples**

```
extDC.DCOffset = 4 'Write
offset = extDC.DCOffset 'Read
```

**C++ Syntax**

```
HRESULT get_DCOffset (double *pValue)

HRESULT put_DCOffset (double newVal)
```

**Interface**
IExternalDCDevice
DCOrder Property

Description Set and read the order for the specified DC source in the multidimensional sweep.

VB Syntax

```
md.DCOrder (name,port) = value
```

Variable (Type) - Description

- **name, port** (string) Name of the "DC source, port"
- **value** (long) Dimension order. Choose an integer value of 1 or higher.

Return Type long

Default 1

Examples

```
md.DCOrder ("AO1") = 2   'Write
value = md.DCOrder("MyDCSource,Port 1") 'Read
```

C++ Syntax

```
HRESULT put_DCOrder (BSTR name, long value);
HRESULT get_DCOrder (BSTR name, long* value);
```

Interface IMultiDimensionalSweep
## DCScale Property

**Description**
Sets and returns the scale correction value for an external DC Device which can be configured as either a DC Meter or a DC Source.

**VB Syntax**

```vbnet
extDC.DCScale = value
```

**Variable**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>extDC</code></td>
<td>An ExternalDCDevice (object)</td>
</tr>
<tr>
<td><code>value</code></td>
<td>(Double) DC scale value.</td>
</tr>
</tbody>
</table>

The VNA will display readings from a DC Meter as:

\[
\text{Display} = (\text{Meas'd value} - \text{Offset}) \times \text{Scale}
\]

The VNA will adjust the output from a DC Source as:

\[
\text{Output} = (\text{Set value} - \text{Offset}) \times \text{Scale}
\]

**Return Type**

Double

**Default**

1

**Examples**

```vbnet
extDC.DCScale = -2 'Write
slope = extDC.DCScale 'Read
```

**C++ Syntax**

```c++
HRESULT get_DCScale (double *pValue)
HRESULT put_DCScale (double newVal)
```

**Interface**

IExternalDCDevice
## DCSourcePointCount Property

**Description**  Set and read the number of steps the source will make across the specified source DC range. This setting is common to all sources.

**VB Syntax**  
```vbnet
sa.DCSourcePointCount = value
```

**Variable**  
- **sa**: A SpectrumAnalyzer (object)
- **value**: (Long) Point count. Choose an integer value of 1 or higher.

**Return Type**  Long

**Default**  1

**Examples**  
```vbnet
sa.DCSourcePointCount = 10 'Write
value = sa.DCSourcePointCount 'Read
```

**C++ Syntax**  
```c++
HRESULT put_DCSourcePointCount(long points);
HRESULT get_DCSourcePointCount(long* points);
```

**Interface**  ISpectrumAnalyzer
DCSourceSweepFirstDimension Property

Description Set and read the DC sweep order. The SA may be programmed to loop through a series of spectrum measurements at multiple RF source frequencies, multiple RF source powers, and multiple DC voltages. These settings determine whether the DC sources are swept before the RF power and frequencies are swept, or whether the DC sources are swept after the RF power and frequencies are swept.

VB Syntax

\[ \text{sa.DCSourceSweepFirstDimension(source) = value} \]

Variable (Type) - Description

- \( sa \): A SpectrumAnalyzer (object)
- \( value \): (Enum as NASADCSweepFirstTypes) Choose from:
  
  0 - naSADCFirst - Sweep through each DC voltage step first then sweep through the next frequency.
  
  1 - naSARFFirst - Sweep through each frequency step first then sweep through the next DC voltage.

Learn about these settings

Return Type Enum

Default \( \text{naSADCFirst} \)

Examples

\[ \text{sa.DCSourceSweepFirstDimension("Port 1").= naSADCFirst 'Write} \]

\[ \text{value = sa.DCSourceSweepFirstDimension("Port 1") 'Read} \]

C++ Syntax

HRESULT put_DCSourceSweepFirstDimension(tagNASADCSweepFirstTypes first);

HRESULT get_DCSourceSweepFirstDimension(tagNASADCSweepFirstTypes* first);

Interface ISpectrumAnalyzer
### DCSourceSweepState

<table>
<thead>
<tr>
<th>Description</th>
<th>Set and read the ON/OFF state of the DC sources. If ON, the DC sources sweep between their start and stop voltages.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>VB Syntax</strong></td>
<td><strong>sa.DCSourceSweepState = value</strong></td>
</tr>
<tr>
<td><strong>Variable</strong> <em>(Type)</em> - Description</td>

</table>

**C++ Syntax**

```cpp
HRESULT put_DCSourceSweepState(VARIANT_BOOL bEnable);

HRESULT get_DCSourceSweepState(VARIANT_BOOL* bEnable);
```

**Interface** ISpectrumAnalyzer
**DCState Property**

**Description**
Set and read the specified DC source’s ON/OFF state in the multi-dimensional sweep.

**VB Syntax**
```vbnet
md.DCState (name, port) = value
```

**Variable**
- `(Type)` - Description
  - `md` A `MultiDimensionalSweep` object which belongs to a SA channel.
  - `name, port` (string) Name of the "DC source, port"
  - `value` (Boolean) Choose from:
    - **0 - OFF** - Disable the specified DC source in multi-dimensional sweep.
    - **1 - ON** - Enable the specified DC source in multi-dimensional sweep.

**Return Type**
Boolean

**Default**
0

**Examples**
```vbnet
md.DCState ("AO1") = OFF   'Write
value = md.DCState ("MyDCSource,Port 1")   'Read
```

**C++ Syntax**
```csharp
HRESULT put_DCState (BSTR name, VARIANT_BOOL value);

HRESULT get_DCState (BSTR name, VARIANT_BOOL* value);
```

**Interface**
`IMultiDimensionalSweep`
**DCType Property**

**Description**  
Sets and returns the DC Type for an external DC Device which can be configured as either a DC Meter or a DC Source. This setting is used as the units for display on the VNA X-axis.

**VB Syntax**  
`extDC.DCType = value`

**Variable (Type) - Description**

- **extDC**  
  An ExternalDCDevice (object)
- **value**  
  (String) DC type. Choose from:
  
  "dBm", "A", "V", "W", "K", "F", "C"

**Return Type**  
String

**Default**  
"V"

**Examples**  
```
extDC.DCType = "A" 'Write
```
```
units = extDC.DCType 'Read
```

**C++ Syntax**  
```c++
HRESULT get_DCType (BSTR *pValue)
```

```c++
HRESULT put_DCType (BSTR newVal)
```

**Interface**  
IExternalDCDevice
# DefinedRoles Property

**Description**

This command replaces `GetSourceRoles Method`. Returns the roles for which sources can be used for the channel.

Use `RoleDevice` to assign a source to a role.

**VB Syntax**

```vbnet
value = chan.definedRoles
```

**Variable**

- `value` (Variant) - Variable to store the returned channel roles.
- `chan` A Channel (object)

**Return Type**

Variant

**Default**

Not Applicable

**Examples**

```vbnet
vRoles = chan.definedRoles  'Read
```

**C++ Syntax**

```c++
HRESULT get_DefinedRoles(Variant* roles);
```

**Interface**

IChannel22
### Delay (Segment Sweep) Property

**Description**
Sets or returns the segment delay property of the sweep segment. Enable delay using the [DelayOption Property](#) of Segments collection.

**VB Syntax**

```vbnet
seg.Delay = value
```

**Variable**

<table>
<thead>
<tr>
<th>(Type)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>seg</code></td>
<td>A Segment <em>(object)</em></td>
</tr>
<tr>
<td><code>value</code></td>
<td>(Double) Delay value in seconds.</td>
</tr>
</tbody>
</table>

**Return Type**

Double

**Default**

0

**Examples**

```vbnet
seg.Delay = 0.001 'Write
value = seg.Delay 'Read
```

**C++ Syntax**

```
HRESULT get_Delay(double* delay);

HRESULT put_Delay(double delay);
```

**Interface**

ISegment3
## Delay Property

<table>
<thead>
<tr>
<th>Description</th>
<th>Sets and Returns the electrical delay value for the calibration standard.</th>
</tr>
</thead>
<tbody>
<tr>
<td>VB Syntax</td>
<td><code>calstd.Delay = value</code></td>
</tr>
<tr>
<td>Variable</td>
<td><em>(Type) - Description</em></td>
</tr>
<tr>
<td><code>calstd</code></td>
<td>A CalStandard <em>(object)</em>. Use <code>calKit.GetCalStandard</code> to get a handle to the standard.</td>
</tr>
<tr>
<td><code>value</code></td>
<td><em>(single) - Electrical delay in picoseconds</em></td>
</tr>
<tr>
<td>Return Type</td>
<td>Single</td>
</tr>
<tr>
<td>Default</td>
<td>Not Applicable</td>
</tr>
<tr>
<td>Examples</td>
<td><code>calstd.Delay = 12 'Write 12ps Delay</code></td>
</tr>
<tr>
<td></td>
<td><code>stdDelay = calstd.Delay 'Read the value of Delay</code></td>

</tbody>
</table>
**Delay (pulse) Property**

**Description**
Sets the pulse delay - the amount of time before a new pulse begins.

**VB Syntax**

```
pulse.Delay(n) = value
```

**Variable (Type) - Description**

- **pulse**
  A PulseGenerator (object)

- **n** (Integer) Pulse generator number. Choose from 0 to 4.
  
  Or use PulseGeneratorID to refer to an external pulse generator.

  0 is the generator that pulses the ADC.

- **value** (Double) Delay value in seconds. Choose a value from about 33ns to about 70 seconds.

**Return Type**
Double

**Default**
0

**Examples**

```
pulse.Delay(1) = 1ms 'Write
value = pulse.Delay(4) 'Read
```

**C++ Syntax**

```
HRESULT get_Delay(integer pulse, double* delay);
HRESULT put_Delay(integer pulse, double delay);
```

**Interface**
IPulseGenerator
**Delay Property**

<table>
<thead>
<tr>
<th>Description</th>
<th>Specifies the delay that should be applied by the VNA after the aux trigger input is received and before the acquisition is made.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Note:</strong> Use on PNA-X ONLY. Other models do NOT have an Aux Input.</td>
<td></td>
</tr>
</tbody>
</table>

**VB Syntax**

```vbnet
auxTrig.Delay = value
```

**Variable**

- **Type** - Description
- `auxTrig` An `AuxTrigger` (object)
- `value` (double) - Delay value in seconds. Choose a value between 0 and 3.0 seconds.

**Return Type**

Double

**Default**

Not Applicable

**Examples**

```vbnet
auxTrig.Delay = 1.2 'Write 1.2s Delay
value = auxTrig.Delay 'Read the value
```

**C++ Syntax**

```c++
HRESULT get_Delay(double *val);
HRESULT put_Delay(double val);
```

**Interface**

IAuxTrigger
### DelayCalculationMethod Property

**Description**
Set and return the method of setting the delay through the calibration mixer.

To select Phase Reference Cal method for correcting an SMC+Phase measurement, use [ImportDataSet Method](#).

**VB Syntax**
```
smc.DelayCalculationMethod = value
```

**Variable**
- **Type** - Description
  - *smc* - An [SMCType](#) (object)
  - *value* - (Enum as NA\[DelayCalculationMethod](#))

**Return Type**
Enum

**Default**
0 - *na\[DelayCalculationMethod](#)_FixedDelay* - use a known delay value set with [FixedDelay Property](#)

1 - *na\[DelayCalculationMethod](#)_MixerCharacterizationFile* - use the S2P file set with [MixerCharacterizationFile Property](#)

**Example**
```
SMC.DelayCalculationMethod = na\[DelayCalculationMethod](#)_FixedDelay
```

**C++ Syntax**
```
HRESULT put_DelayCalculationMethod(tagNA\[DelayCalculationMethod](#) Value);

HRESULT get_DelayCalculationMethod(tagNA\[DelayCalculationMethod](#)* Value);
```

**Interface**
[SMCType5](#)
### DelayIncrement Property

**Description**
Sets the pulse delay increment. The delay increments with each pulse by the `<value>` amount.

For example, in this diagram the delay starts as 1. On the second pulse, delay=2. On the third pulse, delay=3.

**Important:** If $D + W$ is greater than $P$, then undefined VNA behavior results. There is NO error message or warning. Delay includes the incremented value.

This is useful for pulse profiling.

![Diagram](image-url)

**VB Syntax**

```vbnet
pulse.DelayIncrement(n) = value
```

**Variable (Type) - Description**

- **pulse**
  - A PulseGenerator (object)
- **n**
  - (Integer) Pulse generator number. Choose from 0 to 4.
  - Or use PulseGeneratorID to refer to an external pulse generator.
  - 0 is the generator that pulses the ADC.
- **value**
  - (Double) Delay increment value in seconds.

**Return Type**
Double

**Default**
0

**Examples**

```vbnet
pulse.DelayIncrement(1) = 1ms 'Write
value = pulse.DelayIncrement(4) 'Read
```

**C++ Syntax**

```csharp
HRESULT get_DelayIncrement(integer pulse, double* dIncre);
```

```csharp
HRESULT put_DelayIncrement(integer pulse, double dIncre);
```

**Interface**
IPulseGenerator
## DelayOption Property

<table>
<thead>
<tr>
<th>Description</th>
<th>Enables or disables segment delay. Value is set using the Delay (Segment Sweep) Property on a Segment.</th>

<td>ISegments6</td>
</tr>
</tbody>
</table>
**DeltaFrequency Property**

**Description**
Sets and returns the fixed tone spacing value. Use with IMD sweep types:

- `naIMDToneCWSweep`
- `naIMDTonePowerSweep`
- `naIMDToneCenterFreqSweep`

**VB Syntax**

```
object.DeltaFrequency = value
```

**Variable (Type) - Description**

- `object` - A `SweptIMD` or `IMSpectrum` Object
- `value` - (Double) - Tone spacing frequency in Hz. Both the F1 and F2 tones MUST be within the frequency range of the VNA.

**Return Type**
Double

**Default**
1 MHz

**Examples**

```
imd.DeltaFrequency = 1e6 'Write
value = imd.DeltaFrequency 'Read
```

**C++ Syntax**

```
HRESULT get_DeltaFrequency(double *pVal)
HRESULT put_DeltaFrequency(double newVal)
```

**Interface**

- `ISweptIMD`
- `IIMSpectrum`
**DeltaFrequencyStart Property**

**Description**
Sets and returns the starting main tone separation for sweep type=naIMDDeltaFrequencySweep

**VB Syntax**
```vbnet
imd.DeltaFrequencyStart = value
```

**Variable (Type) - Description**
- `imd` (A SweptIMD Object)
- `value` (Double) - Starting tone separation between F1 and F2 in Hz. Both F1 and F2 tones MUST be within the frequency range of the VNA where:
  
  \[
  F1 \text{ (start)} = imd.FrequencyCenter - \frac{imd.DeltaFrequencyStart}{2}
  \]

  \[
  F2 \text{ (start)} = imd.FrequencyCenter + \frac{imd.DeltaFrequencyStart}{2}
  \]

**Return Type**
Double

**Default**
1 MHz

**Examples**
```vbnet
imd.DeltaFrequencyStart = 5e6 'Write
value = imd.DeltaFrequencyStart 'Read
```

**C++ Syntax**
```
HRESULT get_DeltaFrequencyStart(double *pVal))
HRESULT put_DeltaFrequencyStart(double newVal)
```

**Interface**
ISweptIMD
### DeltaFrequencyStop Property

**Description**  
Sets and returns the stop spacing of the main tones. Use with `sweep type=naIMDDeltaFrequencySweep`

**VB Syntax**  
`imd.DeltaFrequencyStop = value`

**Variable (Type) - Description**

- `imd` (A SweptIMD Object)
- `value` (Double) - Stopping tone separation between F1 and F2 in Hz. Both F1 and F2 tones MUST be within the frequency range of the VNA where:

  \[
  F1 \text{ (stop)} = \text{imd.FrequencyCenter} - \frac{\text{imd.DeltaFrequencyStop}}{2} \\
  F2 \text{ (stop)} = \text{imd.FrequencyCenter} + \frac{\text{imd.DeltaFrequencyStop}}{2}
  \]

**Return Type**  
Double

**Default**  
10 MHz

**Examples**

```vbnet
imd.DeltaFrequencyStop = 20e6 'Write
value = imd.DeltaFrequencyStop 'Read
```

**C++ Syntax**

```c++
HRESULT get_DeltaFrequencyStop(double *pVal))
HRESULT put_DeltaFrequencyStop(double newVal)
```

**Interface**  
ISweptIMD
### DeltaMarker Property

**Description**  
Sets a marker as a delta marker. The reference marker must already be turned ON. See \texttt{meas.ReferenceMarkerState}

**VB Syntax**  
\texttt{mark.DeltaMarker = state}

**Variable**  
\begin{itemize}
  \item \texttt{mark} \, \textbf{(Type)} - \textbf{Description}
  \item \texttt{state} \, \textbf{(boolean)} -
\end{itemize}

- **True** - marker is a delta marker
- **False** - marker is NOT a delta marker

**Return Type**  
Boolean

**Default**  
False

**Examples**
\begin{itemize}
  \item \texttt{mark.DeltaMarker = True} \textit{'Write}
  \item \texttt{delta = mark.DeltaMarker} \textit{'Read}
\end{itemize}

**C++ Syntax**

- \texttt{HRESULT get_DeltaMarker(VARIANT_BOOL bState)}
- \texttt{HRESULT put_DeltaMarker(VARIANT_BOOL *bState)}

**Interface**  
\texttt{IMarker}
### Description Property

Sets or returns the descriptive string assigned to the Cal Set. Change this string so that you can easily identify each Cal Set constructed.

**VB Syntax**

```
CalSet.Description = value
```

**Variable**

- **Type**: Description
- **CalSet** (object) - A Cal Set object
- **value** (string) – Description of the Cal Set

**Return Type**

String

**Default**

“CalSet_n” where n is an integer number.

**Examples**

```vbscript
CalSet.Description = "My Cal Set" 'Write
desc = CalSet.Description 'Read
```

**C++ Syntax**

```
HRESULT get_Description(BSTR *pVal)
HRESULT put_Description(BSTR newVal);
```

**Interface**

ICalSet
### DescriptiveText Property

**Description**
Write and read descriptive text associated with the configuration. This text is displayed in the path configuration dialog. Text is generally used to describe external connections that must be made manually to complete the configuration setup.

**VB Syntax**
```vbnet
pathConfig.DescriptiveText = text
```

**Variable**
- **(Type) - Description**
- **name** (String) Variable to store the returned configuration name.
- **pathConfig** A PathConfiguration (object)
- **text** (String) Descriptive text enclosed in quotes.

**Return Type** String

**Default** Not Applicable

**Examples**
```vbnet
pathConf.DescriptiveText "here are the instructions for connecting the device for this configuration"
```

**C++ Syntax**
```cpp
HRESULT get_DescriptionText(BSTR* pConnectionText );
HRESULT put_DescriptionText(BSTR connectionText );
```

**Interface** IPathConfiguration
## DetectorFunction Property

**Description**  
Set and read the detector type.

**VB Syntax**  
\( sa.DetectorFunction = value \)

**Variable**  
*(Type)* - Description |
---|---
\( sa \) | A `SpectrumAnalyzer (object)`
\( value \) | *(Enum as NASADetectorFunction)* Choose from:

- 0 - `naDTAverage`
- 1 - `naDTSample`
- 2 - `naDTPeak`
- 3 - `naDTNormal`
- 4 - `naDTNegPeak`
- 5 - `naDTPeakSample`
- 6 - `naDTPeakAverage`

Learn more about these settings.

**Return Type**  
Enum

**Default**  
2 - `naDTPeak`

**Examples**  
\( sa.DetectorFunction = naDTAverage \)  
\( value = sa.DetectorFunction \)

See an example program.

**C++ Syntax**  
\( \	ext{HRESULT put\_DetectorFunction(tagNASADetectorType type);} \)
\( \	ext{HRESULT get\_DetectorFunction(tagNASADetectorType* type);} \)

**Interface**  
`ISpectrumAnalyzer`
## DeviceInputPort Property

<table>
<thead>
<tr>
<th>Description</th>
<th>Returns the VNA port number to be used for the DUT input.</th>
</tr>
</thead>
<tbody>
<tr>
<td>VB Syntax</td>
<td><code>port = obj.DeviceInputPort</code></td>
</tr>
<tr>
<td>Variable</td>
<td>(Type) - Description</td>
</tr>
<tr>
<td><code>port</code></td>
<td>(long) Variable to store the VNA port number of the DUT input.</td>
</tr>
<tr>
<td><code>mixer</code></td>
<td>A Mixer (object)</td>
</tr>
<tr>
<td>Return Type</td>

</tr>
<tr>
<td>Examples</td>
<td><code>value = mixer.DeviceInputPort</code></td>
</tr>
<tr>
<td>C++ Syntax</td>
<td>HRESULT get_DeviceInputPort(long *pVal)</td>
</tr>
<tr>
<td>Interface</td>
<td>IMixer8</td>
</tr>
</tbody>
</table>
## DeviceInputPort Property

**Description**
Read the VNA port number which is connected to the DUT input.

Use `SetPortMap` Method to change the port mapping.

**VB Syntax**

```vbnet
obj.DeviceInputPort
```

**Variable**

**`obj`**
A `Converter (object)` or
A `GainCompression (object)` or
A `SweptIMD (object)` or
An `IMSpectrum (object)`
A `NoiseFigure (object)`

**Return Type**
Integer

**Default**
1

**Examples**

```vbnet
inPort = gca.DeviceInputPort 'Read
```

**C++ Syntax**

```cpp
HRESULT get_DeviceInputPort(int* pVal)
```

**Interface**

- IGainCompression
- ISweptIMD
- IMSpectrum
- INoiseFigure6
- IConverter6
### DeviceNames Property

<table>
<thead>
<tr>
<th>Description</th>
<th>Returns a list of configured device names of the specified device type.</th>
</tr>
</thead>
<tbody>
<tr>
<td>VB Syntax</td>
<td>value = extDevices.DeviceNames(devType)</td>
</tr>
<tr>
<td>Variable (Type) - Description</td>
<td>value (Variant) Variable to store the device names.</td>

</tbody>
</table>
**DeviceOutputPort Property**

**Description**
Read the VNA port number which is connected to the DUT Output.

Use **SetPortMap Method** to change the port mapping.

**VB Syntax**

```vb
obj.DeviceOutputPort
```

**Variable (Type) - Description**

- **obj** A Converter (object) or
- A GainCompression (object) or
- A SweptIMD (object) or
- An IMSpectrum (object)
- A NoiseFigure (object)

**Return Type**
Integer

**Default**
2

**Examples**

```vb
outPort = gca.DeviceOutputPort 'Read
```

**C++ Syntax**

```cpp
HRESULT get_DeviceOutputPort(int* pVal)
```

**Interface**
IGainCompression
ISweptIMD
IM Spectrum
INoiseFigure6
IConverter6
DeviceType Property

Description
Sets and returns the DeviceType for the external device.

VB Syntax
`extDevices.DeviceType = value`

Variable
(Type) - Description
`extDevices` An `ExternalDevice (object)`
`value` (String) Device Type.

"Source" - external source

"Power Meter" - power meter

"DC Meter" - DC voltmeter

"DC Source" - DC power supply

"Pulse Generator" - external pulse generator

Return Type
String

Default
"Unknown"

Examples
`extDevices.DeviceType = "source` Write
`value = extDevices.DeviceType` 'Read

See example program to configure PMAR device

See example program to configure External Source

C++ Syntax
`HRESULT get_DeviceType( BSTR* value);`

`HRESULT put_DeviceType( BSTR newVal);`

Interface
`IExternalDevices`
**DiffPortMatch_C Property**

**Description**
Sets the Capacitance value of the differential matching circuit.

**VB Syntax**
```vbnet
fixture.DiffPortMatch_C(portNum) = value
```

**Variable**

- **fixture** (Type) - A Fixturing (object)
- **portNum** (Integer) - Balanced (logical) port number. Choose from logical ports 1, 2, 3. Learn more about logical ports.
- **value** (Double) - Capacitance value in farads. Choose a value between \(-1E18\) to \(1E18\).

**Return Type**
Double

**Default**
0

**Examples**
```vbnet
fixture.DiffPortMatch_C(2) = 1e-6 'Write
value = fixture.DiffPortMatch_C(1) 'Read
```

**C++ Syntax**
```cpp
HRESULT get_DiffPortMatch_C( short portNum, double *pVal)
HRESULT put_DiffPortMatch_C( short portNum, double newVal)
```

**Interface**
IFixturing2
**DiffPortMatch_G Property**

**Description**: Sets the Conductance value of the differential matching circuit.

**VB Syntax**: `fixture.DiffPortMatch_G(portNum) = value`

**Variable**

- **Type** - Description
  - `fixture` A Fixturing (object)
  - `portNum` (Integer) Balanced (logical) port number. Choose from logical ports 1, 2, or 3. Learn more about logical ports.
  - `value` (Double) Conductance value in siemens. Choose a value between -1E18 to 1E18.

**Return Type**: Double

**Default**: 0

**Examples**

- `fixture.DiffPortMatch_G(2) = 1e-3` 'Write
- `value = fixture.DiffPortMatch_G(1)` 'Read

**C++ Syntax**

- `HRESULT get_DiffPortMatch_G( short portNum, double *pVal)`
- `HRESULT put_DiffPortMatch_G( short portNum, double newVal)`

**Interface**: IFixturing2
## DiffPortMatch_L Property

Sets the Inductance value of the differential matching circuit.

### VB Syntax

```vb
fixture.DiffPortMatch_L(portNum) = value
```

### Variable (Type) - Description

- **fixture** (object)
- **portNum** (Integer) Balanced (logical) port number. Choose from logical ports 1, 2, or 3. Learn more about logical ports.
- **value** (Double) Inductance value in henries. Choose a value between \(-1E18\) to \(1E18\).

### Return Type

Double

### Default

0

### Examples

```vb
fixture.DiffPortMatch_L(2) = 1e-3 'Write
value = fixture.DiffPortMatch_L(1) 'Read
```

### C++ Syntax

```cpp
HRESULT get_DiffPortMatch_L( short portNum, double *pVal)
HRESULT put_DiffPortMatch_L( short portNum, double newVal)
```

### Interface

IFixturing2
**DiffPortMatch_R Property**

<table>
<thead>
<tr>
<th>Description</th>
<th>Sets the Resistance value of the differential matching circuit.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>VB Syntax</strong></td>
<td><code>fixture.DiffPortMatch_R(portNum) = value</code></td>
</tr>
<tr>
<td><strong>Variable</strong></td>
<td><em>(Type)</em> - Description</td>

</tr>
<tr>
<td><strong>Return Type</strong></td>
<td>Double</td>
</tr>
<tr>
<td><strong>Default</strong></td>
<td>0</td>
</tr>
</tbody>
</table>
| **Examples** | `fixture.DiffPortMatch_R(2) = 1e3` *Write*  
`value = fixture.DiffPortMatch_R(1)` *Read* |
| **C++ Syntax** | `HRESULT get_DiffPortMatch_R(short portNum, double *pVal)`  
`HRESULT put_DiffPortMatch_R(short portNum, double newVal)` |
| **Interface** | IFixturing2 |
## DiffPortMatchMode Property

**Description**  
Sets the differential matching circuit type. To select a user-defined circuit, specify IN ADVANCE the 2-port touchstone filename with `DiffPortMatch_UserFilename Property`. If you do not specify the appropriate file and you select USER, an error occurs and `naNO_CIRCUIT` is automatically selected.

**VB Syntax**  
`fixture.DiffPortMatchMode(pNum) = value`

<table>
<thead>
<tr>
<th>Variable</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>fixture</code></td>
<td>A Fixturing (object)</td>
<td></td>

<td>Balanced (logical) port number. Choose from logical ports 1, 2, or 3. Learn more about logical ports.</td>
</tr>
<tr>
<td><code>value</code></td>
<td>(Enum as NADiffPortMatchCircuitMode)</td>
<td>Choose from:</td>
</tr>
<tr>
<td>0 or <code>naSHUNT_L_SHUNT_C_CIRCUIT</code></td>
<td>Specifies the circuit that consists of shunt L and shunt C.</td>
<td></td>
</tr>
<tr>
<td>1 or <code>naUSER_FILE_CIRCUIT</code></td>
<td>Specifies the user-defined circuit.</td>
<td></td>
</tr>
<tr>
<td>2 or <code>naNO_CIRCUIT</code></td>
<td>Specifies no-circuit.</td>
<td></td>
</tr>
</tbody>
</table>

**Return Type**  
Enum

**Default**  
`naSHUNT_L_SHUNT_C_CIRCUIT`

**Examples**  
<table>
<thead>
<tr>
<th>Write</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>fixture.DiffPortMatchMode(2) = naNO_CIRCUIT</code></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Read</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>value = fixture.DiffPortMatchMode(1)</code></td>
</tr>
</tbody>
</table>

**C++ Syntax**  
```cpp
HRESULT get_DiffPortMatchMode( short port, tagNADiffPortMatchCircuitMode *eVal)

HRESULT put_DiffPortMatchMode( short port, tagNADiffPortMatchCircuitMode eVal)
```

**Interface**  
`IFixturing2`
**DiffPortMatchState Property**

**Description**
Turns ON or OFF 4-port differential port matching function. Must also set the fixture simulator function to ON using FixturingState Property.

**VB Syntax**
```
fixture.DiffPortMatchState = value
```

**Variable**
- **(Type)** - Description
  - `fixture` (A Fixturing (object))
  - `value` (Boolean)

**False** - Turns differential port matching OFF

**True** - Turns differential port matching ON

**Return Type**
Boolean

**Default**
False

**Examples**
```
fixture.DiffPortMatchState = False 'Write
value = fixture.DiffPortMatchState 'Read
```

**C++ Syntax**
```
HRESULT get_DiffPortMatchState( VARIANT_BOOL *pVal)
HRESULT put_DiffPortMatchState( VARIANT_BOOL newVal)
```

**Interface**
IFixturing2
**DiffPortMatchUserFilename Property**

**Description**  Specifies the 2-port touchstone file in which the information on the user-defined differential matching circuit is saved. Following this command, send **DiffPortMatchCircuit Property**. If the specified file does not exist, an error occurs when you set the type of differential matching circuit to USER.

**VB Syntax**  
```vbnet
fixture.DiffPortMatchUserFilename(pNum) = value
```

**Variable**  
- **fixture**  A Fixturing (object)
- **pNum**  (Integer) Balanced (logical) port number. Choose from logical ports 1, 2, or 3. Learn more about logical ports.
- **value**  (String) Full path, file name, and extension (.s2P) of the de-embedding circuit.

Files are typically stored in "D:\".

**Return Type**  String

**Default**  Not Applicable

**Examples**  
```vbnet
fixture.DiffPortMatchUserFilename(2) = "D:\myFile.s4p"  'Write
value = fixture.DiffPortMatchUserFilename(1)  'Read
```

**C++ Syntax**  
```cpp
HRESULT get_DiffPortMatchUserFilename( short port, BSTR *bstrFile)

HRESULT put_DiffPortMatchUserFilename( short port, BSTR bstrFile)
```

**Interface**  IFixturing2
### DiffZConvPortImag Property

**Description**
Sets the imaginary part of the impedance value for the differential port impedance conversion function.

**VB Syntax**
```
fixture.DiffZConvPortImag(portNum) = value
```

**Variable (Type) - Description**
- **fixture** (A Fixturing object)
- **portNum** (Integer) Balanced (logical) port number. Choose from logical ports 1, 2, or 3. [Learn more about logical ports.](#)
- **value** (Double) Imaginary part of the Impedance value. Choose a value between 0 and 1E18

**Return Type**
Double

**Default**
0

**Examples**
```
fixture.DiffZConvPortImag(2) = 75 'Write
value = fixture.DiffZConvPortImag(1) 'Read
```

**C++ Syntax**
```
HRESULT get_DiffZConvPortImag( short portNum, double *pVal)
HRESULT put_DiffZConvPortImag( short portNum, double newVal)
```

**Interface**
IFixturing2
**DiffZConvPortReal Property**

**Description**
Sets the real part of the impedance value for the differential port impedance conversion function.

**VB Syntax**
```
fixture.DiffZConvPortReal(portNum) = value
```

**Variable (Type) - Description**
- **fixture** (Fixturing (object))
- **portNum** (Integer) Balanced (logical) port number. Choose from logical ports 1, 2, or 3. Learn more about logical ports.
- **value** (Double) Real part of the Impedance value. Choose a value between 0 and 1E18

**Return Type**
Double

**Default**
See Differential Port Z Conversion Default

**Examples**
```
fixture.DiffZConvPortReal(2) = 75 'Write
value = fixture.DiffZConvPortReal(1) 'Read
```

**C++ Syntax**
```
HRESULT get_DiffZConvPortReal( short portNum, double *pVal)
HRESULT put_DiffZConvPortReal( short portNum, double newVal)
```

**Interface**
IFixturing2
**DiffZConvPortZ0 Property**

**Description**
Sets the impedance value for the differential port impedance conversion function. Set either this single value or set the real and imaginary parts separately. The imaginary part is set to 0.0 using this command.

**VB Syntax**
```
fixture.DiffZConvPortZ0(portNum) = value
```

**Variable**
- (Type) - Description
- fixture (A Fixturing object)
- portNum (Integer) Balanced (logical) port number. Choose from logical ports 1, 2, or 3. Learn more about logical ports.
- value (Double) Impedance value. Choose a value between 0 and 1E18

**Return Type**
Double

**Default**
See Differential Port Z Conversion Default

**Examples**
```
fixture.DiffZConvPortZ0(2) = 75 'Write
value = fixture.DiffZConvPortZ0(1) 'Read
```

**C++ Syntax**
```
HRESULT get_DiffZConvPortZ0( short portNum, double *pVal)
HRESULT put_DiffZConvPortZ0( short portNum, double newVal)
```

**Interface**
IFixturing2
**DiffZConvState Property**

**Description**
Turns ON or OFF 4-port differential impedance conversion function. Must also set the fixture simulator function to ON using `FixturingState Property`.

**VB Syntax**
```vbnet
fixture.DiffZConvState = value
```

**Variable**
- **(Type) - Description**
  - `fixture` - A `Fixturing` (object)
  - `value` - (Boolean)
    - **False** - Turns differential impedance conversion OFF.
    - **True** - Turns differential impedance conversion ON.

**Return Type**
Boolean

**Default**
False

**Examples**
```vbnet
fixture.DiffZConvState = False 'Write
value = fixture.DiffZConvState 'Read
```

**C++ Syntax**
```cpp
HRESULT get_DiffZConvState( VARIANT_BOOL *pVal)
HRESULT put_DiffZConvState( VARIANT_BOOL newVal)
```

**Interface**
IFixturing2
### DimensionCatalog Property

**Description**  
Read the names of source domains in the multi-dimensional sweep whose state is ON and whose dimension order is the specified dimension order.

**VB Syntax**  
```vb
names = md.DimensionCatalog(dim)
```

**Variable**  
- **Type**: Variant  
- **Description**: Variable to store the returned source domain names.
- **md**: A `MultiDimensionalSweep (object)` which belongs to a SA channel.
- **dim**: A `long` Dimension order. Choose an integer value of 1 or higher.

**Return Type**  
String. Names are separated by commas.

**Default**  
Not Applicable

**Examples**  
```vb
names = md.DimensionCatalog(3) 'Read
```

**C++ Syntax**  
```c++
HRESULT get_DimensionCatalog (long dim, VARIANT * pValue);
```

**Interface**  
IMultiDimensionalSweep
DimensionCount Property

Description: Read the highest dimension order in the multi-dimensional sweep.

VB Syntax:
```
count = md.DimensionCount
```

Variable (Type) - Description:
- **count** (long): Variable to store the returned dimension order value.
- **md**: A MultiDimensionalSweep (object) which belongs to a SA channel.

Return Type: long

Default: 0

Examples:
```
count = md.DimensionCount 'Read
```

C++ Syntax:
```
HRESULT get_DimensionCount(long* count);
```

Interface: IMultiDimensionalSweep
DimensionPointCount Property

Description
Set and read the point count for the specified dimension order in the multi-dimensional sweep.

VB Syntax
```
md.DimensionPointCount (dim) = value
```

Variable (Type) - Description
- `md`: A `MultiDimensionalSweep (object)` which belongs to a SA channel.
- `dim`: (long) Dimension order. Choose an integer value of 1 or higher.
- `value`: (long) Point count. Choose an integer value of 1 or higher.

Return Type
long

Default
1

Examples
```
md.DimensionPointCount (2) = 3 'Write
value = md.DimensionPointCount(4) 'Read
```

C++ Syntax
```
HRESULT put_DimensionPointCount (long dim, long value);
HRESULT get_DimensionPointCount (long dim, long* value);
```

Interface
IMultiDimensionalSweep
### DimensionRepeatCount Property

**Description**
Set and read the repeat count for the specified dimension order in the multi-dimensional sweep.

**VB Syntax**
```
md.DimensionRepeatCount (dim) = value
```

**Variable (Type) - Description**
- **md** (MultiDimensionalSweep (object)) which belongs to a SA channel.
- **dim** (long) Dimension order. Choose an integer value of 1 or higher.
- **value** (long) Repeat count. Choose an integer value of 1 or higher.

**Return Type**
long

**Default**
1

**Examples**
```
md.DimensionRepeatCount (2) = 1  'Write
value = md.DimensionRepeatCount(4) 'Read
```

**C++ Syntax**
```
HRESULT put_DIMENSIONREPEATCOUNT (long dim, long value);

HRESULT get_DIMENSIONREPEATCOUNT (long dim, long* value);
```

**Interface**
IMultiDimensionalSweep
### DirectoryPath Property

<table>
<thead>
<tr>
<th>Description</th>

<td><code>HRESULT put_DiscreteFrequencies(VARIANT Freq);</code></td>
</tr>
<tr>
<td><strong>Interface</strong></td>
<td>IPowreRange</td>
</tr>
</tbody>
</table>
Format Property

Description: Sets or returns the display format of the measurement.

VB Syntax: `meas.Format = value`

Variable (Type) - Description:

- `meas`: A Measurement (object)
- `value`: (enum NADataFormat) - Choose from:
  - 0 - naDataFormat_LinMag
  - 1 - naDataFormat_LogMag
  - 2 - naDataFormat_Phase
  - 3 - naDataFormat_Polar
  - 4 - naDataFormat_Smith
  - 5 - naDataFormat_Delay
  - 6 - naDataFormat_Real
  - 7 - naDataFormat_Imaginary
  - 8 - naDataFormat_SWR
  - 9 - naDataFormat_PhaseUnwrapped
  - 10 - naDataFormat_InverseSmith
  - 11 - naDataFormat_Kelvin
  - 12 - naDataFormat_Fahrenheit
  - 13 - naDataFormat_Celsius
  - 14 - naDataFormat_PhasePositive

Return Type: Long Integer

Default: 1 - naDataFormat_LogMag

Examples:

- `meas.Format = naDataFormat_Real 'Write`
- `fmt = meas.Format 'Read`
C++ Syntax
HRESULT get_Format(tagDataFormat *pVal)
HRESULT put_Format(tagDataFormat newVal)

Interface
IMeasurement
## DisplayAutomationErrors Property

**Description**
Enables or disables automation error messages from being displayed on the screen.

**VB Syntax**
```vbnet
app.DisplayAutomationErrors = value
```

**Variable**
- `(Type)` - Description
  - `app` An Application (object)
  - `value` (Boolean)

- **True** allows error to show on display,
- **False** turns error off from display.

**Return Type**
Boolean

**Default**
True

**Examples**
```vbnet
Dim app As Application
Set app = New Application
app.DisplayAutomationErrors = False 'Turns off display
print app.DisplayAutomationErrors 'prints False
```

**C++ Syntax**
```cpp
HRESULT get_DisplayAutomationErrors(VARIANT_BOOL * Val);
HRESULT put_DisplayAutomationErrors(VARIANT_BOOL Val);
```

**Interface**
IApplication2
DisplayDomain Property

Description
Set and read the X-axis domain type.

VB Syntax
HotS22.DisplayDomain = value

Variable
(Type) - Description
HotS22 A ActiveParametersApp (object)
value (Enum as NAAxisDomainType) - Choose from:

- 0 - naAxisFrequency  Sets a linear frequency sweep that is displayed on a standard grid with ten equal horizontal divisions.
- 1 - naAxisPower  Sets a power sweep at a single specified frequency.
- 2 - naAxisPhase  Sets a phase sweep.
- 3 - naAxisDCValue  Sets value of dc source.
- 4 - naAxisPoints  Sets the number of phase points.
- 5 - TypeNum

Return Type
Enum

Default
naAxisFrequency

Examples
HotS22.DisplayDomain = naAxisFrequency 'Write
value = HotS22.DisplayDomain 'Read

C++ Syntax
HRESULT get_DisplayDomain(tagNAAxisDomainType* value)
HRESULT put_DisplayDomain(tagNAAxisDomainType value)

Interface
IAActiveChannelSettings
### DisplayGlobalPassFail Property

**Description**  
Shows or hides the dialog which displays global pass/fail results. Learn more about Global Pass/Fail.

**VB Syntax**  
```vbnet
app.DisplayGlobalPassFail = value
```

**Variable**  
(Type) - Description

- **app** An Application (object)
- **value** (Boolean)
  
  - **True** - displays the pass/fail dialog.
  - **False** - hides the pass/fail dialog.

**Return Type**  
Boolean

**Default**  
False

**Examples**
```vbnet
Dim app As Application
Set app = New Application
app.DisplayGlobalPassFail = true  'shows dialog
```

**C++ Syntax**  
```csharp
HRESULT get_DisplayGlobalPassFail(VARIANT_BOOL * Val);  
HRESULT put_DisplayGlobalPassFail(VARIANT_BOOL Val);
```

**Interface**  
IAplication6
## DisplayInputPower Property

<table>

<tr>
<td>Interface</td>
<td>IActiveChannelSettings</td>
</tr>
</tbody>
</table>
### DisplayInterpolationState Property

**Description**
Sets whether or not interpolation is on for display. Frequency, power, and phase X axis are supported for display. Interpolation may be applied in the trace.

**VB Syntax**

```
HotS22.DisplayInterpolationState = value
```

**Variable**
- **Type** - Description
  - *HotS22*
    - A `ActiveParametersApp (object)`
  - *value*
    - (boolean) - Choose from:
      - **True** - Turns interpolation ON
      - **False** - Turns interpolation OFF

**Return Type**
Boolean

**Default**
False

**Examples**

```
HotS22.DisplayInterpolationState = False
value = HotS22.DisplayInterpolationState 'Read
```

**C++ Syntax**

```
HRESULT get_DisplayInterpolationState(VARIANT_BOOL* value);
HRESULT put_DisplayInterpolationState(VARIANT_BOOL value);
```

**Interface**
IACTiveChannelSettings
## DisplayRange Property

<table>
<thead>
<tr>
<th>Description</th>
<th>Sets or returns the range to be displayed on the VNA x-axis. All traces in the channel have this same x-axis scaling.</th>

<tr>
<td></td>
<td>HRESULT put_DisplayRange(BSTR pDspRange)</td>
</tr>
<tr>
<td><strong>Interface</strong></td>
<td>IFOM</td>
</tr>
</tbody>
</table>
**Distance Property**

**Description**  Set or query marker distance on a time domain trace.

The Write command moves the marker to the specified distance value. Once moved, you can read the Y axis value or read the X-axis time value. (Distance is calculated from the X-axis time value.)

The Read command reads the distance of the marker.

If the marker is set as delta, the WRITE and READ data is relative to the reference marker.

**VB Syntax**  

```vbnet
mark.Distance = value
```

**Variable**  

- **mark**  A Marker (object)
- **value**  (double) - Marker distance in the unit of measure specified with DistanceMarkerUnit Property

**Return Type**  Double

**Default**  Not Applicable

**Examples**  

```vbnet
mark.Distance = 3e9 'Write
XVal = mark.Distance 'Read
```

**C++ Syntax**  

```cpp
HRESULT get_Distance(double *pVal);
HRESULT put_Distance(double newVal);
```

**Interface**  IMarker2
About Distance Marker Settings

DistanceMarkerMode Property

Description: Specifies the measurement type in order to determine the correct marker distance.

- Select Auto for S-Parameter measurements.
- Select Reflection or Transmission for arbitrary ratio or unratioed measurements.

This setting affects the display of all markers for only the active measurement.

VB Syntax: `trans.DistanceMarkerMode = value`

Variable: (Type) - Description

- `trans`: A Transform (object)
- `value`: (enum As NADistanceMarkerMode) - Choose from:
  - 0 - naDistanceMarkerModeAuto
  - 1 - naDistanceMarkerModeReflection
  - 2 - naDistanceMarkerModeTransmission

Return Type: Enum

Default: 0 - naDistanceMarkerModeAuto

Examples: `trans.DistanceMarkerMode = naDistanceMarkerModeReflection` 'Write

`DMM = trans.DistanceMarkerMode` 'Read'

C++ Syntax: HRESULT get_DistanceMarkerMode(tagNADistanceMarkerMode *pVal);

HRESULT put_DistanceMarkerMode(tagNADistanceMarkerMode newVal);

Interface: ITransform2
DistanceMarkerUnit Property

Description: Specifies the unit of measure for the display of marker distance values. This setting affects the display of ALL markers for only the ACTIVE measurement (unless Distance Maker Units are coupled using CoupledParameters Property.

VB Syntax: `trans.DistanceMarkerUnit = value`

Variable (Type) - Description

- `trans`: A Transform (object)
- `value`: (Enum As NADistanceMarkerUnit) - Distance Marker Units. Choose from
  - 0 - naDistanceMarkerUnitMeter
  - 1 - naDistanceMarkerUnitFeet
  - 2 - naDistanceMarkerUnitInch

Return Type: Enum

Default: 0 - naDistanceMarkerUnitMeter

Examples:

- `trans.DistanceMarkerUnit = naDistanceMarkerUnitFeet` 'sets the
- `U = trans.DistanceMarkerUnit` 'Read

C++ Syntax:

- `HRESULT get_DistanceMarkerUnit(tagNADistanceMarkerUnit *pVal);`
- `HRESULT put_DistanceMarkerUnit(tagNADistanceMarkerUnit newVal);`

Interface: ITransform2
## Divisor Property

### Description
Sets and returns the Divisor value to be used when coupling this range to the primary range.

This setting is valid only if the specified range is coupled to the primary range.

### VB Syntax
```vbnet
FOMRange.Divisor = value
```

### Variable (Type) - Description
- **object**: An FOMRange
- **value**: (Double) - Divisor value.-(Unitless)

### Return Type
Double

### Default
0

### Examples
- ```vbnet
  fomRange.Divisor = 0.5 'Write
  Div = fomRange.Divisor 'Read
```

### C++ Syntax
- `HRESULT get_Divisor(double *pVal)`
- `HRESULT put_Divisor(double *pVal)`

### Interface
- IFOMRange
**Do1PortEcal Property - Superseded**

<table>
<thead>
<tr>
<th>Description</th>

**Do2PortEcal Property - Superseded**

**Description**

*Note:* This command is replaced with `CalKitType` which sets the ECal module or mechanical cal kit.

Specify ECAL or Mechanical calibration. For VMC, this selection only applies to the 2-port calibration portion. For mixer characterization (VMC), use `Do1PortEcal` Property.

**VB Syntax**

```
object.Do2PortEcal = bool
```

**Variable**

`(Type) - Description`

- `object` SMCType (object) or VMCType (object)
- `bool` (Boolean)

  - `True` - ECAL
  - `False` - Mechanical

**Return Type**

Boolean

**Default**

False

**Examples**

```
value = VMC.Do2PortEcal
```

**C++ Syntax**

```
HRESULT put_Do2PortEcal(VARIANT_BOOL bDoEcal);

HRESULT get_Do2PortEcal(VARIANT_BOOL *bDoEcal);
```

Write/Read

DwellTime Property

Description: Sets or returns the dwell time at the start of each sweep point for all measurements in a channel. Dwell time is only available with `Chan.SweepGenerationMode = naSteppedSweep` (not `naAnalogSweep`).

Sets or returns the dwell time of a specified sweep segment.

VB Syntax: `object.DwellTime = value`

Variable (Type) - Description

- `object`: A Channel (object)
- `or` CalSet (object) - Read-only property
- `or` Segment (object)

- `value`: (double) - Dwell Time in seconds. Choose any number between 0 and 86400. Note that 0 is equivalent to no dwell time.

Return Type: Double

Default: 0

Examples:

- `chan.DwellTime = 3e-3 'sets the dwell time for the channel -Write`
- `segs(3).DwellTime = 5e-3 'sets the dwell time of segment 3 -Write`
- `dwell = chan.DwellTime 'Read`

C++ Syntax: `HRESULT get_DwellTime(double *pVal)`

- `HRESULT put_DwellTime(double newVal)`

Interface: IChannel

ISegment

|CalSet3
# DwellPerPoint Property

**Description**  
Sets and returns the amount of time the VNA should wait after for an external source to settle before making a measurement at each data point.

**VB Syntax**  
`extSource.DwellPerPoint = value`

**Variable**  
- `chan` An ExternalSource (object)
- `value` (Double) Dwell time in milliseconds.

**Return Type**  
Double

**Default**  
3

**Examples**  
- `extSource.DwellPerPoint = 10 'Write`
- `dpp = extSource.DwellPerPoint 'Read`

**C++ Syntax**  
- `HRESULT get_DwellPerPoint (tagNAExtDevDwellPerPoint *pValue)`
- `HRESULT put_DwellPerPoint (tagNAExtDevDwellPerPoint newVal)`

**Interface**  
IExternalSource

**Return Type**

Long

**Default**

0 - Factory Characterization

**Examples**

```
VMC.ECALCharacterization (1,True) = 4
```
C++ Syntax

HRESULT put_ECALCharacterization( long moduleNumber, long characterization);

HRESULT get_ECALCharacterization( long moduleNumber, long* characterization);

Interface

IVMCType
**ECALCharacterizationEx Property**

**Description**
This property replaces ECALCharacterization Property.

Specifies the characterization data within an ECal module to be used for the calibration.

Learn more about ECal User Characterization.

**VB Syntax**
```
cal.ECALCharacterizationEx (module) = value
```

**Variable**
- **cal** (Calibrator (object))
- **module** (long integer) Optional argument. ECal module.

Choose from modules 1 through 8

Use IsECALModuleFoundEx to determine the number of modules connected to the VNA

Use GetECALModuleInfoEx to returns the model and serial number of each module.

**value** (Long) – Characterization data within the ECal module to be used for ECal operations. Choose from:

- 0 – Factory Characterization
- 1 – UserCharacterization1
- 2 – UserCharacterization2
- ..and so forth up to...
- 12 – UserCharacterization12

**Return Type**
Long

**Default**
0 - Factory Characterization

**Examples**
```
cal.ECALCharacterizationEx (4) = 2
```

**C++ Syntax**
```
HRESULT put_ECALCharacterizationEx( long moduleNumber, long characterization);

HRESULT get_ECALCharacterizationEx( long moduleNumber, long* characterization);
```
Interface  ICalibrator4
## ECalID Property

<table>
<thead>
<tr>
<th>Description</th>
<th>Selects the model and serial number of the ECal module to be characterized. This command does NOT set the model and serial number of the ECal module.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>VB Syntax</strong></td>

<tr>
<td><strong>C++ Syntax</strong></td>
<td>HRESULT put_ECalID(BSTR id);</td>
</tr>
<tr>
<td><strong>Interface</strong></td>
<td>IECalUserCharacterizer</td>
</tr>
</tbody>
</table>
ECALIsolation Property

**Description**

Note: The inherent isolation of the VNA is better than that attained with this command. ONLY use this command when using an external test set, and ONLY using a 8509x ECal module.

Specifies whether the acquisition of the ECal calibration should include isolation or not.

**VB Syntax**

```vbnet
cal.ECALIsolation = value
```

**Variable**

- **cal** (Type) - Description
  - A Calibrator (object)
- **value** (boolean)
  - False - Exclude Isolation
  - True - Include Isolation

**Return Type**

Boolean

**Default**

False

**Examples**

```vbnet
Dim oPNA as AgilentPNA835x.Application
Dim oCal as Calibrator
Set oPNA = CreateObject("AgilentPNA835x.Application", "MachineName")
Set oCal = oPNA.ActiveChannel.Calibrator
' Uncomment the following line to have the cal include isolation
' oCal.ECALIsolation = True
' Uncomment the following line to have the cal omit isolation
' oCal.ECALIsolation = False
oCal.DoECAL2Port ' Do the cal
```

**C++ Syntax**

```cpp
HRESULT put_ECALIsolation ( VARIANT_BOOL bIsolationState );

HRESULT get_ECALIsolation ( VARIANT_BOOL *bIsolationState );
```

**Interface**

Calibrator
Read-only

**ECALModuleNumberList Property**

**Description**
Returns a list of index numbers to be used for referring to the ECal modules that are currently attached to the VNA.

**VB Syntax**

```vbnet
clist = cal.ECALModuleNumberList
```

**Variable**

<table>
<thead>
<tr>
<th>(Type)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>clist</code></td>
<td>Variable to store the returned list of index numbers.</td>
</tr>
<tr>
<td><code>cal</code></td>
<td>Calibrator (object)</td>
</tr>
</tbody>
</table>

**Return Type**
Variant

**Default**
Not Applicable

**Examples**

```vbnet
clist = cal.ECALModuleNumberList
'If 2 modules are attached to the VNA
'then the returned list will be:
1,2
```

**C++ Syntax**

```csharp
HRESULT get_ECALModuleNumberList(VARIANT *modules);
```

**Interface**
ICalibrator6
EcalOrientation Property

Description
Specifies which port of the ECal module is connected to which port of the VNA when the AutoOrient property = False.

VB Syntax
SMC.EcalOrientation (mod) = value

Variable (Type) - Description
SMC SMCType (object)
mod (Long)

1 - Use ECAL Module for the calibration.

value (string) - Format this parameter in the following manner:
Aw,Bx,Cy,Dz

where

- A, B, C, and D are literal ports on the ECAL module
- w,x,y, and z are substituted for VNA port numbers to which the ECAL module port is connected.

Ports of the module which are not used are omitted from the string.

For example, on a 4-port ECal module with

- port A connected to VNA port 2
- port B connected to VNA port 3
- port C not connected
- port D connected to VNA port 1

the string would be: A2,B3,D1

Return Type String
Default "A1,B2"

Examples
SMC.EcalOrientation (1) = "A2,B1"
**C++ Syntax**

HRESULT put_EcalOrientation(long lModuleNum, BSTR orientation);
HRESULT get_EcalOrientation(long lModuleNum, BSTR *orientation);

**Interface**

SMCType
Read/Write

**EcalOrientation1Port Property**

<table>
<thead>
<tr>
<th>Description</th>
<th>For Mixer Characterization ONLY Specifies which port of the ECAL module is connected to which port of the VNA for the Do1PortECAL property when the AutoOrient property = False.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>VB Syntax</strong></td>
<td><code>VMC.EcalOrientation1Port (mod) = value</code></td>
</tr>
<tr>
<td><strong>Variable</strong></td>

<td>VMCTYPE (object)</td>
</tr>
<tr>
<td><code>mod</code></td>
<td>(Long)</td>
</tr>
<tr>
<td><code>value</code></td>
<td>(string) - Choose from:</td>
</tr>
<tr>
<td></td>
<td>&quot;A1&quot; - ECAL module port A is connected to VNA port 1</td>
</tr>
<tr>
<td></td>
<td>&quot;B1&quot; - ECAL module port A is connected to VNA port 1</td>
</tr>
<tr>
<td><strong>Return Type</strong></td>
<td>String</td>
</tr>
<tr>
<td><strong>Default</strong></td>
<td>&quot;A1&quot;</td>
</tr>
<tr>
<td></td>
<td>If anything other than port 1 is specified, &quot;B1&quot; will be used. For example, if &quot;A2&quot; is specified, &quot;B1&quot; is used.</td>
</tr>
<tr>
<td><strong>Examples</strong></td>
<td><code>VMC.EcalOrientation1Port(1) = &quot;B1&quot;</code></td>
</tr>
<tr>
<td><strong>C++ Syntax</strong></td>
<td>HRESULT put_EcalOrientation1Port(long lModuleNum, BSTR orientation);</td>
</tr>
<tr>
<td></td>
<td>HRESULT get_EcalOrientation1Port(long lModuleNum, BSTR)</td>
</tr>
<tr>
<td><strong>Interface</strong></td>
<td>VMCTYPE</td>
</tr>
</tbody>
</table>
### EcalOrientation2Port Property

**Description**
Specifies which port of the ECal module is connected to which port of the VNA for the Do2PortECAL property when the AutoOrient property = False.

**VB Syntax**

```
VMC.EcalOrientation2Port (mod) = value
```

**Variable**

**VMC VMCType (object)**

**mod**
(Long) Module being used for the calibration.
Choose from 1 or 2.

**value**
(string) - Format this parameter in the following manner:

Aw,Bx,Cy,Dz

where

- A, B, C, and D are literal ports on the ECAL module
- w,x,y, and z are substituted for VNA port numbers to which the ECAL module port is connected.

Ports of the module which are not used are omitted from the string.

For example, on a 4-port ECal module with

- port A connected to VNA port 2
- port B connected to VNA port 3
- port C not connected
- port D connected to VNA port 1

the string would be: A2,B3,D1

**Return Type**
String

**Default**
"A1,B2"

**Examples**

```
VMC.EcalOrientation1Port(1) = "A2,B1"
```
C++ Syntax
HRESULT put_EcalOrientation2Port(long lModuleNum, BSTR orientation);
HRESULT get_EcalOrientation2Port(long lModuleNum, BSTR *orientation);

Interface
VMCTYPE
**ECALPortMapEx Property**

**Description**

This property replaces ECALPortMap Property

Specifies which ports of the ECal module are connected to which ports of the VNA for the DoECAL1PortEx and DoECAL2PortEx methods when the OrientECALModule property = False.

This setting remains until the VNA is restarted or this command is sent again.

**Note:** For guided calibrations where Orient is OFF and the same ECal module is used in more than one Connection Step, you are not allowed to specify how the ECal module is connected. Instead, the VNA determines the orientation. The VNA does not verify that you made the connection properly.

This command, and OrientECALModule_Property, can be used to perform ECal orientation using the Guided Calibration interface.

**VB Syntax**

`cal.ECALPortMapEx (module) = value`

**Variable (Type) - Description**

- `cal` A Calibrator (object)
- `module` (long integer) Optional argument. ECal module.

Choose from modules 1 through 8

Use IsECALModuleFoundEx to determine the number of modules connected to the VNA

Use GetECALModuleInfoEx to return the model and serial number of each module.

- `value` (string) - Format this parameter in the following manner:

  Aw,Bx,Cy,Dz

  where

  - A, B, C, and D are literal ports on the ECAL module
  - w,x,y, and z are substituted for VNA port numbers to which the ECAL module port is connected.

  Ports of the module which are not used are omitted from the string.
For example, on a 4-port ECal module with

- port A connected to VNA port 2
- port B connected to VNA port 3
- port C not connected
- port D connected to VNA port 1

the string would be: A2,B3,D1

DoECAL1PortEx or DoECAL2PortEx methods will fail if the port numbers passed to those methods are not in the string of this property and OrientECALModule property = False.

**Return Type**  String

**Default**  Not Applicable

**Examples**

```vba
Dim cal As Calibrator
Dim sPortMap As String
Set cal = PNAapp.ActiveChannel.Calibrator
cal.ECALPortMapEx = "a2,b1" 'Write
sPortMap = cal.ECALPortMap 'Read
```

**C++ Syntax**

```cpp
HRESULT put_ECALPortMapEx( long moduleNumber, BSTR strPortMap);
HRESULT get_ECALPortMapEx( long moduleNumber, BSTR *strPortMap);
```

**Interface**  ICalibrator4
## ElecDelayMedium Property

**Description**
Sets or returns the electrical delay medium.

**VB Syntax**
`meas.ElecDelayMedium = value`

**Variable**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><em>meas</em></td>
<td>A Measurement <em>(object)</em></td>
</tr>
<tr>
<td><em>value</em></td>

<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>naCoax</td>
</tr>
<tr>
<td>1</td>
<td>naWaveGuide</td>
</tr>
</tbody>
</table>

**Return Type**
NACalStandardMedium

**Default**
Not Applicable

**Examples**

```
Print meas.ElecDelayMedium 'prints the value of the electrical delay medium
```

**C++ Syntax**

```
HRESULT get_ElecDelayMedium(tagNACalStandardMedium *pVal);
HRESULT put_ElecDelayMedium(tagNACalStandardMedium newVal);
```

**Interface**
IMeasurement2
## ElecDistanceDelay Property

<table>
<thead>
<tr>
<th>Description</th>
<th>Sets the electrical delay in physical length (distance) for the selected measurement.</th>
</tr>
</thead>
<tbody>
<tr>
<td>VB Syntax</td>
<td><code>meas.ElecDistanceDelay = value</code></td>
</tr>
<tr>

<td><code>Meas.ElecDistanceDelay = 1e-3</code> <em>Write</em></td>
</tr>
<tr>
<td>C++ Syntax</td>
<td>HRESULT get_ElecDistanceDelay(VARIANT *pVal)</td>
</tr>
<tr>
<td>Interface</td>
<td>IMeasurement11</td>
</tr>
</tbody>
</table>

Examples

```vbnet
edelay = meas.ElecDistanceDelay 'Read
```

```csharp
// This property returns an object, and the object must be cast to a double to access the value.
Edelay = (double)meas.ElecDistanceDelay 'read
```

```cpp
HRESULT get_ElecDistanceDelay(VARIANT *pVal)
HRESULT put_ElecDistanceDelay(VARIANT newVal)
```

1624
# ElecDistanceDelayUnit Property

**Description**: Sets and returns the units for specifying electrical delay in physical length (distance).

**VB Syntax**

```vbnet
meas.ElecDistanceDelayUnit = value
```

**Variable**

<table>
<thead>
<tr>
<th>(Type)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>meas</td>
<td>A Measurement (object)</td>
</tr>
<tr>
<td>value</td>
<td>(enum naDistanceUnit)</td>
</tr>
</tbody>
</table>

Choose from:

- 0 – `naDistanceUnit_Meter`
- 1 – `naDistanceUnit_Feet`
- 2 – `naDistanceUnit_Inch`

**Return Type**: Enum

**Default**: 0 – `naDistanceUnit_Meter`

**Examples**

```vbnet
meas.ElecDistanceDelayUnit = naDistanceUnit_Meter  'Write
edelay = meas.ElecDistanceDelayUnit  'Read
```

**C++ Syntax**

```csharp
HRESULT get_ElecDistanceDelayUnit(tagNADistanceUnit *pVal)
HRESULT put_ElecDistanceDelayUnit(tagNADistanceUnit newVal)
```

**Interface**: IMeasurement11
# ElectricalDelay Property

**Description**
Sets the Electrical Delay for the active channel.

**VB Syntax**
`meas.ElectricalDelay = value`

**Variable**
*meas* - A Measurement (object)

*value* - (double) - Electrical Delay in seconds. Choose any number between -9.99 and 9.99

**Return Type**
Double

**Default**
0

**Examples**
```
meas.ElectricalDelay = 1e-3  'Write
edelay = meas.ElectricalDelay  'Read
```

**C++ Syntax**
```cpp
HRESULT get_ElectricalDelay(double *pVal)
HRESULT put_ElectricalDelay(double newVal)
```

**Interface**
IMeasurement

### Embed4PortA Property

**Description**
Returns the VNA port number associated with 'a' based on the device topology.

To see 'a' for all topologies, and to specify the port connections, use Embed4PortList Property

Specify topology using Embed4PortTopology Property

**VB Syntax**
```
value = fixture.Embed4PortA
```

**Variable**
- **(Type)** - Description
  - **value** (Short Integer) Variable to store the returned VNA port number.
  - **fixture** A Fixturing (object)

**Return Type**
Integer

**Default**
Not Applicable

**Examples**
```
value = fixture.Embed4PortA 'Read
```

**C++ Syntax**
```
HRESULT get_Embed4PortA(short *portA );
```

**Interface**
IFixturing2
### Embed4PortB Property

**Description**
Returns the VNA port number associated with 'b' based on the device topology.

To see 'b' for all topologies, and to specify the port connections, use `Embed4PortList Property`.

Specify topology using `Embed4PortTopology Property`.

**VB Syntax**
```vbnet
value = fixture.Embed4PortB
```

**Variable (Type) - Description**
- **Value** (Short Integer) Variable to store the returned VNA port number.
- **fixture** A Fixturing (object)

**Return Type**
Integer

**Default**
Not Applicable

**Examples**
```vbnet
value = fixture.Embed4PortB 'Read
```

**C++ Syntax**
```c++
HRESULT get_Embed4PortB(short *portB);
```

**Interface**
IFixturing2
## Embed4PortC Property

**Description** Returns the VNA port number associated with 'c' based on the device topology.

To see 'c' for all topologies, and to specify the port connections, use Embed4PortList Property.

Specify topology using Embed4PortTopology Property.

**VB Syntax**

```vbnet
value = fixture.Eembed4PortC
```

**Variable (Type) - Description**

- **value** (Short Integer) Variable to store the returned VNA port number.
- **fixture** A Fixturing (object)

**Return Type** Integer

**Default** Not Applicable

**Examples**

```vbnet
value = fixture.Embed4PortC 'Read
```

**C++ Syntax**

```cpp
HRESULT get_Eembed4PortC(short *portC);
```

**Interface** IFixturing2
### Embed4PortD Property

**Description**  
Returns the VNA port number associated with 'd' based on the device topology.

To see 'd' for all topologies, and to specify the port connections, use Embed4PortList Property.

Specify topology using Embed4PortTopology Property

**VB Syntax**

```vbnet
value = fixture.Embed4PortD
```

**Variable**  
(value) - Description

- value (Short Integer) Variable to store the returned VNA port number.

- fixture A Fixturing (object)

**Return Type**  
Integer

**Default**  
Not Applicable

**Examples**

```vbnet
value = fixture.Embed4PortD 'Read
```

**C++ Syntax**

```cpp
HRESULT get_Embed4PortD(short *portD );
```

**Interface**  
IFixturing2
### Embed4PortList Property

**Description**
Specifies the VNA port connections for ALL topologies. The port assignment is dependent on the DUT topology. All four port numbers are required. However, for:

- Topology A, only the first two arguments are valid,
- Topology B, only the first three arguments are valid,
- Topology C, ALL arguments are valid.

Specify topology using `Embed4PortTopology Property`.

Read the port assignments using the following commands. A, B, C, and D, refer to the port; NOT the topology.

- `Embed4PortA Property`
- `Embed4PortB Property`
- `Embed4PortC Property`
- `Embed4PortD Property`

<table>
<thead>
<tr>
<th>Topology A</th>
<th>Topology B</th>
</tr>
</thead>
<tbody>
<tr>
<td><img src="image1.png" alt="Topology A Diagram" /></td>
<td><img src="image2.png" alt="Topology B Diagram" /></td>
</tr>
</tbody>
</table>
VB Syntax  

\[ \text{fixture.Embed4PortList}(p1, p2, p3) = p4 \]

Variable (Type) - Description

- **fixture** A Fixturing (object)
  - \( p1 \) VNA Port number assigned to \( a \) in above graphic.
  - \( p2 \) VNA Port number assigned to \( b \) in above graphic.
  - \( p3 \) VNA Port number assigned to \( c \) in above graphic.
  - \( p4 \) VNA Port number assigned to \( d \) in above graphic.

Default 1,2,3,4

Examples

Port 1, 2, 3, 4 configuration:
\[ \text{fixture.Embed4PortList}(1,2,3) = 4 \]  'Write

Port 4, 3, 2, 1 configuration:
\[ \text{fixture.Embed4PortList}(4,3,2) = 1 \]  'Write

Port 2, 4, 1, 3 configuration:
\[ \text{fixture.Embed4PortList}(2,4,1) = 3 \]  'Write

C++ Syntax

```cpp
HRESULT put_Embed4PortList(short pPortA, short pPortB, short pPortC, short pPortD);
```

Interface IFixturing2
**Embed4PortNetworkFilename Property**

**Description**
Specifies the 4-port touchstone file (*.s4p) in which the network to embed or de-embed resides. If the specified file does not exist, an error occurs when type command is sent.

Following this command, send Embed4PortNetworkMode Property.

**Note:** This command affects ALL measurements on the channel.

**VB Syntax**

```vbnet
fixture.Embed4PortNetworkFilename(netNum) = value
```

**Variable** *(Type)* - Description

- **fixture** A Fixturing (object)
- **netNum** (Integer) Network position. Choose from 1 or 2. See Embed4PortTopology Property
- **value** (String) Full path, file name, and extension (.s4P) of the circuit.

Files are typically stored in "D:\".

**Return Type**
String

**Default**
Not Applicable

**Examples**

```vbnet
fixture.Embed4PortNetworkFilename(2) = "D:\myFile.s4p" 'Write

value = fixture.Embed4PortNetworkFilename(1) 'Read
```

**C++ Syntax**

```c
HRESULT get_Embed4PortNetworkFilename( short networkNum, BSTR *filename);

HRESULT put_Embed4PortNetworkFilename( short networkNum, BSTR filename);
```

**Interface**
IFixturing2
### Embed4PortNetworkMode Property

**Description**
Specify the type of processing to take place on the specified 4-port network. First specify the network filename with `FSim.Embed4PortNetworkFilename` Property.

**VB Syntax**

```
fixture.Embed4PortNetworkMode(netNum) = value
```

**Variable**

- **fixture**  
  A Fixturing (object)

- **netNum** (Integer) Network position. Choose from 1 or 2. See `Embed4PortTopology` Property

- **value** (Enum as `NA4PortEmbedNetworkMode`) Processing mode. Choose from:
  - 0 or `naNO_NETWORK` - The same as disabling.
  - 1 or `naEMBED_NETWORK` - Add Network circuit.
  - 2 or `naDEEMBED_NETWORK` - Remove Network circuit

**Return Type**

Enum

**Default**

`naNO_NETWORK`

**Examples**

```vbnet
fixture.Embed4PortNetworkMode(1) = naNO_NETWORK 'Write
tvalue = fixture.Embed4PortNetworkMode(2) 'Read
```

**C++ Syntax**

```
HRESULT get_Embed4PortNetworkMode( short networkNum, 
tagNA4PortEmbedNetworkMode *eVal );
HRESULT put_Embed4PortNetworkMode( short networkNum, 
tagNA4PortEmbedNetworkMode eVal );
```

**Interface**

IFixturing2
### Embed4PortState Property

**Description**
Turns ON or OFF 4-port Network embedding for all ports on the channel.

**VB Syntax**
```vbnet
fixture.Embed4PortState = value
```

**Variable**
- **(fixture)**: A Fixturing (object)
- **(value)**: (Boolean)

- **False**: Turns Embedding OFF
- **True**: Turns Embedding ON

**Return Type**
Boolean

**Default**
False (OFF)

**Examples**
```vbnet
fixture.Embed4PortState = False 'Write
value = fixture.Embed4PortState 'Read
```

**C++ Syntax**
```cpp
HRESULT get_Emb4PortState(VARIANT_BOOL *pVal)
HRESULT put_Emb4PortState(VARIANT_BOOL newVal)
```

**Interface**
IFixturing2
# Embed4PortTopology Property

## Description
Specifies the VNA / DUT topology. Learn more about these and other VNA/DUT configurations.

## VB Syntax
```
fixture.Embed4PortTopology = value
```

## Variable
**Type** - Description
- `fixture` A Fixturing (object)
- `value` (Enum as NA4PortEmbedTopology) VNA / DUT topology. Choose from:
  - 0 or `naTOPOLOGY_A` - 2 VNA/DUT Ports
  - 1 or `naTOPOLOGY_B` - 3 VNA/DUT Ports
  - 2 or `naTOPOLOGY_C` - 4 VNA/DUT Ports
  - 3 or `naTOPOLOGY_D` - >4 VNA/DUT Ports

## Return Type
Enum

## Default
`naTOPOLOGY_A` (2 VNA/DUT Ports)

## Examples
```
fixture.Embed4PortTopology = naTOPOLOGY_A 'Write
value = fixture.Embed4PortTopology 'Read
```

## C++ Syntax
```
HRESULT get_Embed4PortTopology( tagNA4PortEmbedTopology *eVal );
HRESULT put_Embed4PortTopology( tagNA4PortEmbedTopology eVal );
```

## Interface
IFixturing2

EnableADCFilterAuto Property

Description
Set and read how the ADC filter is set. When set to 1, ADC filter is set based on the
ADC sampling frequency.

VB Syntax

\[ sa.\text{EnableADCFilterAuto} = \text{value} \]

Variable (Type) - Description
\( sa \) A SpectrumAnalyzer (object)
\( value \) (Boolean) Choose from:

0 - OFF - ADC filter is set manually using ADCFilter.

1 - ON - Automatically select ADC filter based on the ADC sampling frequency.

Learn about these settings.

Return Type
Boolean

Default 1

Examples

\[
\begin{align*}
\text{sa.EnableADCFilterAuto} = 0 & \quad \text{'Write} \\
\text{value} = \text{sa.EnableADCFilterAuto} & \quad \text{'Read}
\end{align*}
\]

See an example program.

C++ Syntax

\[
\begin{align*}
\text{HRESULT put_EnableADCFilterAuto(VARIANT_BOOL bEnable);} \\
\text{HRESULT get_EnableADCFilterAuto(VARIANT_BOOL* bEnable);} \\
\text{ISpectrumAnalyzer}
\end{align*}
\]
### EnableADCSampleRateAuto Property

**Description**  
Set and read how the ADC sample rate is set. When set to 1, ADC sample rate is set based on the ADC filter setting.

**VB Syntax**  
`sa.EnableADCSampleRateAuto = value`

**Variable**  
*sa* A `SpectrumAnalyzer (object)`

*value* (Boolean) Choose from:

- **0 - OFF** - ADC sampling rate is set manually using `ADCSampleRate`.
- **1 - ON** - Automatically select ADC sample rate based on the ADC filter setting.

**Learn about these settings.**

**Return Type**  
Boolean

**Default**  
1

**Examples**  
```vbnet
sa.EnableADCSampleRateAuto = 1 'Write
value = sa.EnableADCSampleRateAuto 'Read
```

**See an example program.**

**C++ Syntax**  
```cpp
HRESULT put_EnableADCSampleRateAuto(VARIANT_BOOL bEnable);
HRESULT get_EnableADCSampleRateAuto(VARIANT_BOOL* bEnable);
```

**Interface**  
`ISpectrumAnalyzer`
EnableAllOutput Property

Description
Sets and returns the ON / OFF state of all DC sources for the channel.

VB Syntax
```
dc.EnableAllOutput = state
```

Variable (Type) - Description
- `dc`: An DCStimulus (object)
- `state`: (boolean)
  - True - All DC sources ON
  - False - All DC sources OFF

Return Type
Boolean

Default
False

Examples
```
dc.EnableAllOutput = True 'Write
value = dc.EnableAllOutput 'Read
```

C++ Syntax
```
HRESULT get_EnableAllOutput(VARIANT_BOOL * pValue);
HRESULT put_EnableAllOutput(VARIANT_BOOL newValue);
```

Interface
IDCStimulus
Enabled Property

Description
Enables and disables (ON/OFF) the port mapping and control line output of the specified test set.

If the specified test set is not connected or not ON, then setting Enabled = True will report an error. All other properties can be set when the test set is not connected.

When this command is set to ON or OFF, then the display of the test set status bar (ShowProperties Property) is also set to ON or OFF.

VB Syntax
`tset.Enabled = value`

Variable (Type) - Description

`tset`  A TestsetControl object

OR

An E5091Testset object

`value`  (Boolean)

`True`  Enables test set control.

`False`  Disables test set control.

Return Type
Boolean

Default
False

Examples
See E5091A Example Program
See External Testset Program

C++ Syntax
HRESULT get_Enabled(VARIANT_BOOL *state);
HRESULT put_Enabled(VARIANT_BOOL state);

Interface
ITestsetControl
IE5091Testsets
EnableDetectorBypass Property

Description  Set and read the ON/OFF state of the detector bypass setting.

VB Syntax  

\[ sa.\text{EnableDetectorBypass} = value \]

Variable  

(sa) A SpectrumAnalyzer (object)

(value) (Boolean) Choose from:

0 - OFF - Detector bypass OFF.

1 - ON - Detector bypass ON.

Learn about these settings.

Return Type  Boolean

Default  0

Examples  

\[ sa.\text{EnableDetectorBypass} = \text{ON} \quad \text{'Write} \]
\[ \text{value} = sa.\text{EnableDetectorBypass} \quad \text{'Read} \]

See an example program.

C++ Syntax  

HRESULT put_EnableDetectorBypass(VARIANT_BOOL bEnable);

HRESULT get_EnableDetectorBypass(VARIANT_BOOL* bEnable);

Interface  ISpectrumAnalyzer
### EnableDitherFFTGridOrigin Property

**Description**
Set and read the FFT grid dither state.

**VB Syntax**

```vbnet
sa.EnableDitherFFTGridOrigin = value
```

**Variable** *(Type) - Description*

- **sa**
  A `SpectrumAnalyzer` (object)
- **value** *(Boolean) Choose from:*
  - **0 - OFF** - FFT grid dithering is disabled.
  - **1 - ON** - FFT grid dithering is enabled.

**Return Type**
Boolean

**Default**
0

**Examples**
See an example program.

**C++ Syntax**

```cpp
HRESULT put_EnableDitherFFTGridOrigin(VARIANT_BOOL bEnable);
HRESULT get_EnableDitherFFTGridOrigin(VARIANT_BOOL* bEnable);
```

**Interface**
ISpectrumAnalyzer
### EnableForceADCRecordSize Property

**Description**  
Set and read enable force ADC record size mode.

**VB Syntax**  
`sa.EnableForceADCRecordSize = value`

**Variable**  

<table>
<thead>
<tr>
<th>(Type)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>sa</code></td>
<td>A <code>SpectrumAnalyzer</code> (object)</td>
</tr>
<tr>
<td><code>value</code></td>
<td>(Boolean) Choose from:</td>
</tr>
<tr>
<td></td>
<td>0 - OFF - ADC record size set automatically.</td>
</tr>
<tr>
<td></td>
<td>1 - ON - Manually set ADC record to specified size using <code>ForceADCRecordSize</code>.</td>
</tr>
</tbody>
</table>

Learn about these settings.

**Return Type**  
Boolean

**Default**  
0

**Examples**  
See an example program.

**C++ Syntax**  
`HRESULT put_EnableForceADCRecordSize(VARIANT_BOOL bEnable);`

`HRESULT get_EnableForceADCRecordSize(VARIANT_BOOL* bEnable);`

**Interface**  
`ISpectrumAnalyzer`
EnableForceLOToFrequency Property

Description  Set and read enable force LO to frequency mode.

VB Syntax  

```
sa.EnableForceLOToFrequency = value
```

Variable  

**(Type)** - Description

- `sa` A `SpectrumAnalyzer (object)`
- `value` (Boolean) Choose from:

  0 - **OFF** - Force LO to frequency is disabled.

  1 - **ON** - Force LO to frequency is set manually using `ForceLOToFrequency`.

Learn about these settings.

Return Type  Boolean

Default  0

```
sa.EnableForceLOToFrequency = AUTO  'Write
value = sa.EnableForceLOToFrequency  'Read
```

Examples  See an example program.

C++ Syntax  

```
HRESULT put_EnableForceLOToFrequency(VARIANT_BOOL bEnable);
HRESULT get_EnableForceLOToFrequency(VARIANT_BOOL* bEnable);
```

Interface  ISpectrumAnalyzer
## EnableImageRejectTraces Property

**Description**  
Set and read the show / hide state of the image reject traces in the measurement parameters dialog.

**VB Syntax**  
```vbnet
sa.EnableImageRejectTraces = value
```

**Variable**  
- **(Type)** - Description
  - `sa`: A `SpectrumAnalyzer` (object)
  - `value`: (Boolean) Choose from:
    - **0** - OFF - Disable image reject traces.
    - **1** - ON - Enable image reject traces and set mode using `ImageReject`.

Learn about these settings.

**Return Type**  
Boolean

**Default**  
0

**Examples**  
```vbnet
sa.EnableImageRejectTraces = 0  'Write
value = sa.EnableImageRejectTraces 'Read
```

See an example program.

**C++ Syntax**  
```cpp
HRESULT put_EnableImageRejectTraces(VARIANT_BOOL bEnable);
HRESULT get_EnableImageRejectTraces(VARIANT_BOOL* bEnable);
```

**Interface**  
`ISpectrumAnalyzer`
## EnableLOPowerCal Property

**Description**
Sets and returns whether or not the LO power cal step is included in the cal steps when a Cal is performed.

Set LO Power Level using

**VB Syntax**

```vb
obj.EnableLOPowerCal(n) = value
```

**Variable**

<table>
<thead>
<tr>
<th>(Type)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>obj</td>
<td>A SMCType (object)</td>
</tr>
<tr>
<td></td>
<td>A VMCType (object)</td>
</tr>
<tr>
<td></td>
<td>A SweptIMDCal (object)</td>
</tr>
<tr>
<td></td>
<td>A NoiseCal (object)</td>
</tr>
</tbody>
</table>

**n**
LO Stage. Choose 1. (Only single LO allowed)

**value**
(Boolean) Choose from:

**False** - Skips over the LO Power Cal when calibrating.

**True** - Includes a step for LO Power Cal when calibrating.

**Return Type**
Boolean

**Default**
**False**

**Examples**

```vb
imd.EnableLOPowerCal(1)= true 'Write
loPwrCal = imd.EnableLOPowerCal(1) 'Read
```

**C++ Syntax**

```c++
HRESULT get_EnableLOPowerCal (long stage, BOOL *enable)

HRESULT put_EnableLOPowerCal (long stage, BOOL enable)
```

**Interface**
ISMCType
IVMCType
ISweptIMD2
INoiseCal2
## EnableModulationControl Property

**Description**
Sets and reads the state of the modulation control. Modulation control must be ON to control the modulation of an external source.

**VB Syntax**
```vbnet
extSource.EnableModulationControl = value
```

**Variable**
- **Type**: An `ExternalSource Object` (object)
- **Description**: `value` (Boolean) Choose from:
  - 1 - Enable control of external modulation.
  - 0 - Disable control of external modulation.

**Return Type**
Boolean

**Default**
0

**Examples**
```vbnet
extSource.EnableModulationControl = 1 'Write
value = extSource.EnableModulationControl 'Read
```

**C++ Syntax**
```cpp
HRESULT put_EnableModulationControl(VARIANT_BOOL bEnable);
HRESULT get_EnableModulationControl(VARIANT_BOOL* bEnable);
```

**Interface**
IExternalSource2
# EnableOffsetDelays Property

</tbody>
</table>
### EnablePhase Property

**Description**
Sets and returns the state of SMC Phase measurements.

In the User Interface, there are two "enable phase" checkboxes: in the Phase Settings dialog and in the Calibration Wizard. Checking one enables both. This single command also enables both.

**VB Syntax**

```vbnet
obj.EnablePhase = bool
```

**Variable (Type) - Description**

- **obj**: A Mixer Interface pointer to the Measurement (object)
  - A Converter (Object)
- **bool**: (Boolean) -
  - **True**: Include phase in SMC measurements
  - **False**: Do NOT include phase in SMC measurements

**Return Type**: Boolean

**Default**: False

**Examples**

```vbnet
mixer.EnablePhase = True
```

**C++ Syntax**

```cpp
HRESULT get_EnablePhase(VARIANT_BOOL * val);
HRESULT put_EnablePhase(VARIANT_BOOL val);
```

**Interface**: IMixer13
**EnablePowerCompensation Property**

**Description**
Adjusts the source power at the specified port by the combined amount of loss through ALL enabled fixturing operations. Use this function to set the power level at the DUT input. Learn more.

*Note:* This command affects ALL measurements on the specified channel.

**VB Syntax**
```
fixture.EnablePowerCompensation(port) = bool
```

**Variable**
- **(Type)** - Description
  - fixture
    - A Fixturing (object)
  - port
    - (Integer) Port number to receive power compensation.
  - bool
    - (Boolean)

  **True** - Compensate source power
  **False** - Do NOT compensate source power

**Return Type**
Boolean

**Default**
False

**Examples**
```
fixture.EnablePowerCompensation(1) = True
value = fixture.EnablePowerCompensation(2) 'Read
```

**C++ Syntax**
```
HRESULT get_EnablePowerCompensation(short port, VARIANT_BOOL *pState );
HRESULT put_EnablePowerCompensation(short port, VARIANT_BOOL bVal);
```

**Interface**
IFixturing5
**EnableSnPDataExtrapolation**

**Description**
Turns ON and OFF SNP file extrapolation for both 2-port and 4-port embedding/de-embedding.

**VB Syntax**

```vbnet
fixture.EnableSnPDataExtrapolation = bool
```

**Variable (Type) - Description**

- `fixture` A **Fixturing (object)**
- `bool` **True** - Turns Extrapolation ON
  **False** - Turns Extrapolation OFF

**Return Type**
Boolean

**Default**
False

**Examples**

```vbnet
fixture.EnableSnPDataExtrapolation = True
value = fixture.EnableSnPDataExtrapolation
```

**C++ Syntax**

```cpp
HRESULT get_EnableSnPDataExtrapolation(VARIANT_BOOL *pExtrap);
HRESULT put_EnableSnPDataExtrapolation(VARIANT_BOOL bExtrap);
```

**Interface**
IFixturing6
## EnableRandomizedLO Property

</tbody>
</table>
| Variable    | `pref` - A Preferences (object)  
`bool` - Choose from:  
**False** - Do NOT report Source Unleveled Errors.  
**True** - Report Source Unleveled Errors. |
| Return Type | Boolean                                                                                                                                                                                      |
| Default     | False                                                                                                                                                                                        |
| Examples    | **Write**  
`pref.EnableSourceUnleveledEvents = False`  
**Read**  
`prefer = pref.EnableSourceUnleveledEvents` |
| C++ Syntax  | `HRESULT put_EnableSourceUnleveledEvents( VARIANT_BOOL bsourcUnlEnable)`  
`HRESULT get_EnableSourceUnleveledEvents( VARIANT_BOOL *bsourcUnlEnable)` |
| Interface   | IPreferences3                                                                                                                                                                               |
EndOfSweepOperation Property

Description
Set and read the action which should be taken at the end of the last frequency or power sweep in the measurement. This setting is used to protect a sensitive device from too much power during the sweep retrace.

VB Syntax
```vbnet
gca.EndOfSweepOperation = value
```

Variable
- **gca** - A GainCompression (object)
- **value** - (NAGCAEndOfSweepOperation)

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>naStandard (0)</td>
<td>Use the default VNA method. <a href="#">Learn more</a></td>
</tr>
<tr>
<td>naSetToStartPower (1)</td>
<td>Sweep Start power</td>
</tr>
<tr>
<td>naSetToStopPower (2)</td>
<td>Sweep Stop power.</td>
</tr>
<tr>
<td>naSetRFOff (3)</td>
<td>Always turn power OFF while waiting.</td>
</tr>
</tbody>
</table>

Return Type
Enum

Default
naStandard

Examples
```vbnet
gca.EndOfSweepOperation = naSetToStartPower 'Write
```
```vbnet
eos = gca.EndOfSweepOperation 'Read
```

C++ Syntax
```c++
HRESULT get_EndOfSweepOperation(tagNAGCAEndOfSweepOperation* pVal)

HRESULT put_EndOfSweepOperation(tagNAGCAEndOfSweepOperation newVal)
```

Interface
IGainCompression
# ENRFile Property

Sets and returns the name of the ENR file associated with the noise source.

## VB Syntax

```vbnet
noise.ENRFile = value
```

## Variable (Type) - Description

- **noise** (A NoiseCal object)
- **value** (string) Full path and ENR filename.

## Return Type

String

## Default

Not Applicable

## Examples

```vbnet
noise.ENRFile = "c:/ProgramFiles/Keysight/Network Analyzer/Documents/ENR/346C.enr" 'Write

ENR = noise.ENRFile 'Read
```

## C++ Syntax

```cpp
HRESULT get_ENRFile(BSTR* pValue)

HRESULT put_ENRFile(BSTR pNewValue)
```

## Interface

INoiseCal
### ENRID Property

<table>
<thead>
<tr>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Sets and returns ID of ENR table.</td>
</tr>
</tbody>
</table>

**VB Syntax**

```
enr.ENRSN = ID
```

**Variable** *(Type) - Description*

<table>
<thead>
<tr>
<th>Variable</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>enr</code></td>
</tr>
<tr>
<td>An <code>ENRFile</code> <em>(object)</em></td>
</tr>
</tbody>
</table>

| `ID` |
| Identifier for the ENR table |

**Return Type**

String

**Default**

Not Applicable

**Examples**

*See example program*

**C++ Syntax**

```
HRESULT get_ENRID(BSTR *Val);
HRESULT put_ENRID(BSTR Val);
```

**Interface**

IENRFile
# ENRSN Property

**Description**  
Sets and returns the serial number of the noise source for which the ENR file applies.

**VB Syntax**  
```
enr.ENRSN = serialNumber
```

**Variable**  
- `enr` **(Type)**: ENRFile **(object)**
- `serialNumber` **(String)**: Serial number of the noise source.

**Return Type**  
String

**Default**  
Not Applicable

**Examples**  
See example program

**C++ Syntax**  
```
HRESULT get_ENRSN(BSTR *Val);
HRESULT put_ENRSN(BSTR Val);
```

**Interface**  
IENRFile
**EqualTonePower Property - Superseded**

**Description**

*Note: This command is replaced with LevelingMethod Property*

Sets and returns the ON | OFF state of Equal Tone Power for the Swept IMD or IMSpectrum measurement.

**VB Syntax**

```vbnet
object.EqualTonePower = value
```

**Variable (Type) - Description**

- **object** - A SweptIMD or IMSpectrum Object
- **value** - (Boolean) - Choose from:
  - **True** - Set equal tone power.
  - **False** - Do NOT set equal tone power.

**Return Type**

Boolean

**Default**

False

**Examples**

```vbnet
ims.EqualTonePower = true 'Write
value = imd.EqualTonePower 'Read
```

**C++ Syntax**

```cpp
HRESULT get_EqualTonePower(VARIANT_BOOL* val)
```

```cpp
HRESULT put_EqualTonePower(VARIANT_BOOL val)
```

**Interface**

ISweptIMD2

IIMSSpectrum2
FastProcessing Property

Description
Set and return equation editor trace update delay. This property delays updating the equation editor trace until all trace references have finished updating to ensure that all data is present.

**Note:** This property does not work in application channels. In addition, this property does not work with the standard channel when the channel is in HOLD and then SINGLE sweeps are sent.

VB Syntax
`
equation.FastProcessing = value
`

Variable (Type) - Description
- `equation` (Type) - Description
  - A MeasurementEquation (object)
- `value` (Boolean) - Choose from:
  - **True** - Delay equation editor trace update.
  - **False** - Do not delay equation editor trace update.

Return Type
Boolean

Default
**True**

Examples
`
equation.FastProcessing = 1 'Write
fast = equation.FastProcessing 'Read
`

C++ Syntax
```
HRESULT get_FastProcessing(VARIANT_BOOL * pref);
HRESULT put_FastProcessing(VARIANT_BOOL pref);
```

Interface
IMeasurementEquation3
## ErrorCorrection Property

**Description**
Sets (or returns) error correction ON or OFF for the measurement.

**VB Syntax**
```
meas.ErrorCorrection = value
```

**Variable**
(Type) - Description

| meas   | A Measurement (object) |
| value  | (boolean)              |

- **False** - Turns error correction OFF
- **True** - Turns error correction ON

**Return Type**
Boolean

**Default**
See Error Correction

**Examples**
```
meas.ErrorCorrection = True  'Write
errcorr = meas.ErrorCorrection  'Read
```

**C++ Syntax**
```
HRESULT put_ErrorCorrection (VARIANT_BOOL bState)
HRESULT get_ErrorCorrection (VARIANT_BOOL *bState)
```

**Interface**
IMeasurement
## ErrorCorrection (Channel) Property

**Description**
Attempts to set error correction ON or OFF for all of the measurements on the channel. This setting may not be successful for some measurements because the Cal Set currently in place may not contain the appropriate calibration data. To read the error correction state for a measurement, use Error Correction Property.

**VB Syntax**
```vbnet
chan.ErrorCorrection = value
```

**Variable**
- **Type** - Description
- **chan** - A Channel (object)
- **value** - (boolean)

- **False** - Turns error correction OFF
- **True** - Turns error correction ON

**Return Type**
Boolean

**Default**
About Error Correction

**Examples**
```vbnet
chan.ErrorCorrection = True
```

**C++ Syntax**
```cpp
HRESULT put_ErrorCorrection (VARIANT_BOOL bState)
```

**Interface**
IChannel7
**ErrorCorrectionIndicator Property**

*Description*
Returns the error correction state for the measurement.

*VB Syntax*
```vbnet
value = meas.ErrorCorrectionIndicator
```

*Variable (Type) - Description*

- `value` (Enum) Error correction state.
  
  - **0 - naErrorCorrectionIndicator_None** - No error correction
  
  - **1 - naErrorCorrectionIndicator_Master** - Original error correction terms applied.
  
  - **2 - naErrorCorrectionIndicator_Interpolated** - Error terms are interpolated.
    Learn more
  
  - **3 - naErrorCorrectionIndicator_Delta** - Delta Match calibration terms. Learn more
  
  - **4 - naErrorCorrectionIndicator_Invalid** - Error terms are not valid.

*meas* A Measurement *(object)*

*Return Type* Enum as NAErrorCorrectionIndicator

*Default* See Error Correction

*Examples*
```vbnet
errcorr = meas.ErrorCorrectionIndicator 'Read
```

*C++ Syntax*
```cpp
HRESULT get_ErrorCorrectionIndicator (enum NAErrorCorrectionIndicator *pIndicator);
```

*Interface* IMeasurement14
**ErrorQuery Property**

**Description**
Sets and returns the Error Query command for an external DC Source and an external DC Meter.

**VB Syntax**
```vbnet
extDC.ErrorQuery = value
```

**Variable** *(Type) - Description*
- `extDC` A `ExternalDCDevice` *(object)*
- `value` *(String)* The SCPI command for returning DC Source and DC Meter errors.

**Return Type**
String

**Default**
"SYST:ERR?"

**Examples**
```vbnet
extDC.ErrorQuery = "SYST:ERR?" 'Write
value = extDC.ErrorQuery 'Read
```

**C++ Syntax**
```cpp
HRESULT get_ErrorQuery( BSTR* cmd);
HRESULT put_ErrorQuery( BSTR cmd);
```

**Interface**
IExternalDCDevice3
### ErrorTermUncertainty Property

<table>
<thead>
<tr>
<th>Description</th>
<th>Sets and returns whether the uncertainties associated with the correction error terms are being included in the uncertainty values for the measurement trace.</th>
</tr>
</thead>
<tbody>

<td>IUncertainty</td>
</tr>
</tbody>
</table>
### ExitCmd Property

**Description**
Sets and returns the **Disable I/O command** for an external DC Source and an external DC Meter.

**VB Syntax**
```vbnet
extDC.ExitCmd = value
```

**Variable**
- **(Type)** - Description
  - `extDC` A `ExternalDCDevice` *(object)*
  - `value` *(String)* The SCPI command used to disable the DC Source and DC Meter.

**Return Type**
String

**Default**
" " Empty String

**Examples**
```vbnet
extDC.ExitCmd = "OUTP OFF" 'Write
value = extDC.ExitCmd 'Read
```

**C++ Syntax**
```cpp
HRESULT get_ExitCmd( BSTR* cmd);

HRESULT put_ExitCmd( BSTR cmd);
```

**Interface**
`IExternalDCDevice3`
## ExportReceiverCount Property

<table>
<thead>
<tr>
<th>Description</th>
<th>Returns the number of currently exported receivers.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>VB Syntax</strong></td>
<td><code>value = sa.dft.ExportReceiverCount</code></td>
</tr>
<tr>
<td><strong>Variable</strong> (Type)</td>
<td>(Long) Variable to store the returned value.</td>
</tr>
<tr>
<td><code>sa.dft</code></td>
<td>A SpectrumAnalyzerDFT (object)</td>
</tr>
<tr>
<td><code>value</code></td>
<td>(Long) Variable to store the returned value.</td>
</tr>
<tr>
<td><strong>Return Type</strong></td>
<td>Long</td>
</tr>
<tr>
<td><strong>Example</strong></td>
<td><code>value = sa.dft.ExportReceiverCount 'Read</code></td>
</tr>
<tr>
<td><strong>C++ Syntax</strong></td>
<td>HRESULT get_ExportReceiverCount(long* val);</td>
</tr>
<tr>
<td><strong>Interface</strong></td>
<td>ISpectrumAnalyzerDFT</td>
</tr>
</tbody>
</table>
# ExportReceiverList Property

**Description**
Returns the currently exported receiver list.

**Note:** The list is set with `ExportReceiverSetList` can contain more receivers, this query will only return the ones that are currently measured and that are in the receiver list.

**VB Syntax**
```vbnet
list = sa.dft.ExportReceiverList
```

**Variable**
- **(Type) - Description**
  - `sa.dft` A `SpectrumAnalyzerDFT (object)`
  - `list` (String) Variable to store the returned list.

**Return Type**
String

**Example**
```
list = sa.dft.ExportReceiverList 'Read
```

**C++ Syntax**
```cpp
HRESULT get_ExportReceiverList(BSTR* ReceiverList);
```

**Interface**
`ISpectrumAnalyzerDFT`
### ExportReceiverSetList Property

**Description**
Sets and returns the list of exported receivers.

**Note:** This list can contain receivers that are not currently measured in the channel. However, this is not an issue. To get the current list of receivers that export data, query `ExportReceiverList`.

#### VB Syntax

```vbnet
sa.dft.ExportReceiverSetList = list
```

#### Variable (Type) - Description

- **sa.dft** A `SpectrumAnalyzerDFT` (object)
- **list** (String) Variable to store the returned list.

#### Return Type

String

#### Example

```vbnet
sa.dft.ExportReceiverSetList = "B" 'Write
list = sa.dft.ExportReceiverSetList 'Read
```

#### C++ Syntax

```c++
HRESULT get_ExportReceiverSetList(BSTR* ReceiverList);
HRESULT put_ExportReceiverSetList(BSTR ReceiverList);
```

#### Interface

`ISpectrumAnalyzerDFT`
## ExtDCDeviceCorrectionScale Property

<table>
<thead>
<tr>
<th>Description</th>
<th>Returns the correction scaling for an external DC Source.</th>
</tr>
</thead>
<tbody>
<tr>
<td>VB Syntax</td>
<td><code>value = extDC.ExtDCDeviceCorrectionScale</code></td>
</tr>
<tr>
<td>Variable</td>
<td><code>(Type) - Description</code></td>
</tr>
<tr>
<td><code>extDC</code></td>
<td>An <code>ExternalDCDevice (object)</code></td>
</tr>
<tr>
<td><code>value</code></td>
<td>(Double) Variable to store the returned correction scaling value.</td>
</tr>
<tr>
<td>Return Type</td>
<td>Double</td>
</tr>
<tr>
<td>Default</td>
<td>0</td>
</tr>
<tr>
<td>Example</td>
<td><code>value = extDC.ExtDCDeviceCorrectionScale 'Read</code></td>
</tr>
<tr>
<td>C++ Syntax</td>
<td>HRESULT get_ExtDCDeviceCorrectionScale(double *value)</td>
</tr>
<tr>
<td>Interface</td>
<td>IExternalDCDevice3</td>
</tr>
</tbody>
</table>
## ExtendedProperties Property

<table>
<thead>
<tr>
<th>Description</th>
<th>Provides access to the custom properties and methods of an external device.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>VB Syntax</strong></td>
<td>Set <code>PSG = ExtDev.ExtendedProperties</code></td>
</tr>
<tr>
<td><strong>Variable</strong></td>
<td><em>(Type) - Description</em></td>
</tr>
<tr>
<td><code>PSG</code></td>
<td><em>(Object) Variable to store the returned handle to an external device.</em></td>
</tr>
<tr>
<td><code>ExtDev</code></td>
<td>An <code>ExternalDevice (object)</code></td>
</tr>
<tr>
<td><strong>Return Type</strong></td>
<td>Object</td>
</tr>
<tr>
<td><strong>Default</strong></td>
<td>Not Applicable</td>
</tr>
<tr>
<td><strong>Examples</strong></td>
<td>See Example</td>
</tr>
<tr>
<td><strong>C++ Syntax</strong></td>
<td><code>HRESULT getExtendedProperties(IDispatch** ppObject);</code></td>
</tr>
<tr>
<td><strong>Interface</strong></td>
<td>IExternalDevice</td>
</tr>
</tbody>
</table>
### ExternalALC Property

**Description**
Sets or returns the source of the analyzer leveling control.

**VB Syntax**
```vbnet
app.ExternalALC = value
```

**Variable**

<table>
<thead>
<tr>
<th>(Type)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>app</code></td>
<td>An Application (object)</td>
</tr>
</tbody>
</table>
| `value` | (boolean) - Choose from:  
| True   | - Leveling control supplied through the rear panel. |
| False  | - Leveling control supplied inside the analyzer |

**Return Type**
Boolean

**Default**
False

**Examples**
```vbnet
app.ExternalALC = True 'Write
extALC = app.ExternalALC 'Read
```

**C++ Syntax**

```c++
HRESULT get_ExternalALC(VARIANT_BOOL *pVal)
HRESULT put_ExternalALC(VARIANT_BOOL newVal)
```

**Interface**
IApplication
### ExternalDeviceDeActivatePolicy Property

**Description**
Set and return whether External Devices remain activated or are de-activated when the
VNA is Preset or when a Instrument State is recalled.

This setting remains until changed again using this command, or until the hard drive is
changed or reformatted.

See the ExternalDevices collection.

**VB Syntax**

```vbnet
pref.ExternalDeviceDeActivatePolicy = value
```

**Variable**

<table>
<thead>
<tr>
<th>(Type)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pref</td>
<td>A Preferences (object)</td>
</tr>
<tr>
<td>value</td>
<td>(Boolean) - Choose from:</td>
</tr>
</tbody>
</table>

- **True** - External device are **de-activated** when the VNA is Preset or when a Instrument State is recalled.
- **False** - External devices **remain active** when the VNA is Preset or when a Instrument State is recalled.

**Return Type**
Boolean

**Default**
**True**

**Examples**

```vbnet
pref.ExternalDeviceDeActivatePolicy = 1 'Write
dDevPolicy = pref.ExternalDeviceDeActivatePolicy 'Read
```

**C++ Syntax**

```csharp
HRESULT get_ExternalDeviceDeActivatePolicy(VARIANT_BOOL * pref);
HRESULT put_ExternalDeviceDeActivatePolicy(VARIANT_BOOL pref);
```

**Interface**
IPreferences10
ExternalTriggerConnectionBehavior Property

Description
Configures the external triggering signal for the VNA and PNA-X.

- TriggerSource Property is automatically set to External when ExternalTriggerConnectionBehavior is sent.
- Edge triggering is only available on some VNA models.
- For more information, see External Triggering.

VB Syntax
trigsetup. ExternalTriggerConnectionBehavior (conn) = value

Variable
Type - Description
trigsetup A TriggerSetup (object)
conn (enum NATriggerConnection) Rear Panel connector to send or receive trigger signals. Choose from:

Only one of the input connectors is active at a time. When a command is sent to one, the VNA automatically makes the other INACTIVE.

0 - naTriggerConnectionAUXT Trigger IN from rear-panel AUX IO connector Pin 19 (No longer supported.

1 - naTriggerConnectionBNC1 Trigger IN

- MEAS TRIG IN on models

2 - naTriggerConnectionBNC2 Trigger OUT. Only useful in point sweep mode.

- AUX TRIG 1 OUT on models

3 - naTriggerConnectionMATH Trigger IN from rear-panel Material Handler connector Pin 18

4 - naTriggerConnectionBypassPulse3 - Internal routing of pulse 3 output to the MEAS TRIG IN on the rear panel.

Value (enum NAExternalTriggerBehavior) -

0 - naTriggerInactive - Disables the specified connector.
Choose from 1 through 4 when `<conn>` is set to `naTriggerConnectionBNC1`

1 - `naTriggerInEdgeNegative` - Triggers the VNA when receiving a negative going signal

2 - `naTriggerInEdgePositive` - Triggers the VNA when receiving a positive going signal

3 - `naTriggerInLevelLow` - Triggers the VNA when receiving a low level signal

4 - `naTriggerInLevelHigh` - Triggers the VNA when receiving a High-level signal

Choose from 5 through 8 when `<conn>` is set to `naTriggerConnectionBNC2`.

In addition to sending this command, you must also use `TriggerOutputEnabled Property` to enable the BNC2 output.

5 - `naTriggerOutPulsePositiveAfter` - Sends a POSITIVE going TTL pulse at the END of each point during the sweep.

6 - `naTriggerOutPulsePositiveBefore` - Sends a POSITIVE going TTL pulse at the START of each point during the sweep.

7 - `naTriggerOutPulseNegativeAfter` - Sends a NEGATIVE going TTL pulse at the END of each point during the sweep.

8 - `naTriggerOutPulseNegativeBefore` - Sends a NEGATIVE going TTL pulse at the START of each point during the sweep.

<table>
<thead>
<tr>
<th>Return Type</th>
<th>Default</th>
</tr>
</thead>
</table>
| BNC1 = `naTriggerInactive` | BNC2 = `naTriggerInactive` 

When `Output is enabled`

BNC1 = `naTriggerInactive`

BNC2 = `naTriggerOutPulsePositiveAfter`
Examples

```c
trigsetup.ExternalTriggerConnectionBehavior (naTriggerConnectionBNC1) = naTriggerInLevelLow
```

```c
trigBehav = trigsetup.ExternalTriggerConnectionBehavior
               (naTriggerConnectionAUXT)
```

C++ Syntax

```c
HRESULT get_ExternalTriggerConnectionBehavior(tagNATriggerConnection connection,tagNAExternalTriggerBehavior *trigger);

HRESULT put_ExternalTriggerConnectionBehavior(tagNATriggerConnection connection,tagNAExternalTriggerBehavior trigger);
```

Interface

ITriggerSetup
### ExternalTriggerDelay Property

**Description**
Sets and reads the trigger delay for all measurements in the CHANNEL. This delay is only applied while in app.Source = naTriggerSourceExternal and trigsetup.Scope = naChannelTrigger. After an external trigger is applied, the start of the sweep is delayed for the specified delay value plus any inherent latency.

To apply a trigger delay for all channels (Global), use TriggerDelay Property.

**VB Syntax**

```vbnet
chan.ExternalTriggerDelay = value
```

**Variable**

- **chan** - A Channel (object)
- **value** - Double - Trigger delay value in seconds. Range is from 0 to 3 seconds.

**Return Type**

Double

**Default**

0

**Examples**

```vbnet
chan.ExternalTriggerDelay = .003 'Write
delay = chan.ExternalTriggerDelay 'Read
```

**C++ Syntax**

```c++
HRESULT get_ExternalTriggerDelay(double *delay);
HRESULT put_ExternalTriggerDelay(double delay)
```

**Interface**

IChannel6
**ExtractionToneMode Property**

**Description**
Set and read the tuning tone mode. The tuning tone is the source at the output port to extract the X parameters.

**VB Syntax**

```
HotS22.ExtractionToneMode = value
```

**Variable**

*HotS22*(ActiveParametersApp (object))

*value* (Enum as NAExtractionToneMode) - Choose from:

- **0 - naRelative** Tone power is a dBc power relative to the input power.
- **1 - naAbsolute** Tone power is an absolute power.

**Return Type**

Enum

**Default**
naAbsolute

**Examples**

```
HotS22.ExtractionToneMode = naAbsolute 'Write
value = HotS22.ExtractionToneMode 'Read
```

**C++ Syntax**

```
HRESULT get_ExtractionToneMode(tagNAExtractionToneMode* value)
HRESULT put_ExtractionToneMode(tagNAExtractionToneMode value)
```

**Interface**
IActiveChannelSettings
### F1Frequency Property

**Description**  
Sets and returns the frequency of the F1 tone. Use with IMD sweep types:

- `naIMDToneCWSweep`
- `naIMDTonePowerSweep`

**VB Syntax**  
`object.F1Frequency = value`

**Variable**  
- **object** A SweptIMD or IMSpectrum Object
- **value** (Double) F1 tone frequency in Hz. The F1 and F2 tones MUST be within the frequency range of the VNA.

**Return Type**  
Double

**Default**  
.9995 GHz

**Examples**  
```vbnet
imd.F1Frequency = 100e6 'Write
value = imd.F1Frequency 'Read
```

**C++ Syntax**  
```c++
HRESULT get_F1Frequency(double *pVal)
HRESULT put_F1Frequency(double newVal)
```

**Interface**  
ISweptIMD

IIMSpectrum
# F2Frequency Property

**Description**  
Sets and returns the frequency of the F2 tone. Use with IMD sweep types:

- `naIMDToneCWSweep`
- `naIMDTonePowerSweep`

**VB Syntax**  
`object.F2Frequency = value`

**Variable**  
*Type* - Description

- **object**: A `SweptIMD` or `IMSpectrum` Object
- **value**: (Double) F2 tone frequency in Hz. The F1 and F2 tones MUST be within the frequency range of the VNA.

**Return Type**  
Double

**Default**  
1.0005 GHz

**Examples**  
```
imd.F2Frequency = 200e9  'Write
value = imd.F2Frequency  'Read
```

**C++ Syntax**  
```cpp
HRESULT get_F2Frequency(double *pVal)
HRESULT put_F2Frequency(double newVal)
```

**Interface**  
ISweptIMD

IMSpectrum
FailedTraces Property

Description  Set and return the limit line color of failed traces or failure indicators (dots) and the word Fail.

VB Syntax  \textit{colors.FailedTraces} = \textit{value}

Variable  (\textbf{Type}) - Description
\begin{itemize}
  \item \textit{colors} \hspace{1cm} \textbf{A ComColors \textbf{(object)}}
  \item \textit{value} \hspace{1cm} \textbf{(Long Integer)} - RGB color of the FailedTraces pen.
\end{itemize}

Convert the three RGB colors to an integer as follows:

\begin{equation}
\text{RGB} = R + (G \times 2^8) + (B \times 2^{16})
\end{equation}

To find the three RGB values from the Display Colors dialog, click Change Color, then Define Custom Color.

Return Type  Long

Default  Display = 255,20,20

Print = 255,20,20

Examples  \begin{itemize}
  \item \textbf{R} = 10
  \item \textbf{G} = 10
  \item \textbf{B} = 10
  \item \textbf{RGB} = R + (G \times 2^8) + (B \times 2^{16})
  \item \textit{colors.FailedTraces} = \text{RGB} \quad \textit{\textbf{Write}}
  \item \textit{color} = \textit{colors.FailedTraces} \quad \textit{\textbf{Read}}
\end{itemize}

C++ Syntax  \begin{itemize}
  \item HRESULT \texttt{get\_FailedTraces(long* pVal)};
  \item HRESULT \texttt{put\_FailedTraces(long newVal)};
\end{itemize}

Interface  IColors
FastCWPointCount Property

**Description**

Enables Fast CW sweep and sets the number of data points for the channel. *Sweep Type* must already be set to CWTime and FIFO must already be enabled.

**See Also**

FIFO and other Antenna Features

FIFO Object

Example program

N5264B Measurement Receiver

**VB Syntax**

```vb
chan.FastCWPointCount = value
```

**Variable (Type) - Description**

- **chan**
  - A Channel Object

- **value**
  - (Long Integer) Number of data points to measure in Fast CW mode. This setting overwrites the standard number of points setting for the channel. This setting overwrites the standard number of points setting for the channel. The minimum value is 1. The maximum value is $2^{32} - 1 = 2,147,483,647$. The "-1" indicates infinite point count (i.e., go forever). Any other value will produce invalid results.

If the data acquisition rate exceeds 400,000 points per second, the upper limit on the number of points is 11e6. The following are conditions that can cause the higher data rate:

- IFBW's $\geq 1$ MHz and internally triggered.

- fastCW sweeps that are externally triggered at a rate faster than 400,000 points per second.

Set to 0 to disable Fast CW.

**Return Type**

Long Integer

**Default**

0

**Examples**

```vb
chan.FastCWPointCount = 1e3 'Write
value = chan.FastCWPointCount 'Read
```
<table>
<thead>
<tr>
<th><strong>C++ Syntax</strong></th>
<th>HRESULT get_FastCWPPointCount(long *value)</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>HRESULT put_FastCWPPointCount(long value)</td>
</tr>
</tbody>
</table>

**Interface**

ICloneStream16
## FastMode Property

**Description**  
Sets and returns the state of a separate IFBW setting for leveling sweeps. ON allows a higher (faster) IFBW than the measurement sweep. It also causes leveling sweeps to be noisier.

**VB Syntax**  
```vb
RxLevel.FastMode(srcPort) = value
```

**Variable**  
<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>RxLevel</td>
<td>A ReceiverLeveling Object</td>
</tr>
<tr>
<td>srcPort</td>
<td>(Long Integer) Source port for which to set Fast Mode for Receiver Leveling.</td>
</tr>
</tbody>
</table>

**Value**  
(Boolean) Separate IFBW setting state. Choose from:

- **True** - Use separate IFBW setting. Specify IFBW using `LevelingIFBW`.
- **False** - Use same IFBW as the measurement sweep. Specify IFBW using `IF Bandwidth`.

**Return Type**  
Variant Boolean

**Default**  
True

**Examples**  
```vbnet
rxLevel.FastMode (1) = True ' Write
value = rxLevel.FastMode 2' Read
```

**C++ Syntax**  
```cpp
HRESULT get_FastMode(long port, VARIANT_BOOL* pVal);
HRESULT put_FastMode(long port, VARIANT_BOOL newVal);
```

**Interface**  
IReceiverLevelingConfiguration
**FFTResolution Property**

<table>
<thead>
<tr>
<th>Description</th>

</tr>
<tr>
<td><strong>C++ Syntax</strong></td>
<td>HRESULT get_FFTResolution(double* resolution);</td>
</tr>
<tr>
<td><strong>Interface</strong></td>
<td>ISpectrumAnalyzer</td>
</tr>
</tbody>
</table>
**FIFOEnabled Property**

**Description**
Enables/disables exporting data to the FIFO (First-IN, First-OUT) data buffer. FIFO is a circular buffer that allows very fast Read-Write access.

*Note:* FIFO commands are under the FIFO Object, and a new set of commands has been added here for binary data.

**VB Syntax**
```
sa.dft.FIFOEnabled = value
```

**Variable (Type) - Description**
- `sa.dft` A `SpectrumAnalyzerDFT (object)`
- `value` (Boolean) Choose from:
  - 0 - OFF - Export data to FIFO disabled.
  - 1 - ON - Export data to FIFO enabled.

**Return Type**
Boolean

**Default**
OFF

**Examples**
```
sa.dft.FIFOEnabled = ON 'Write
value = sa.dft.FIFOEnabled 'Read
```

**C++ Syntax**
```
HRESULT get_FIFOEnabled(VARIANT_BOOL* enable)
HRESULT put_FIFOEnabled(VARIANT_BOOL enable)
```

**Interface**
ISpectrumAnalyzerDFT
FileEraseEachSweep Property

Description
Enables/disables erasing output data files after each sweep. When disabled, data is appended to the output file after each sweep which could lead to very large file sizes (and eventually fill the disk).

VB Syntax
\[ \text{sa.dft.FileEraseEachSweep} = \text{value} \]

Variable
\( \text{sa.dft} \) - A SpectrumAnalyzerDFT (object)

\( \text{value} \) - (Boolean) Choose from:

0 - OFF - Erase data files after each sweep disabled.

1 - ON - Erase data files after each sweep enabled.

Return Type
Boolean

Default
ON

Examples
\[ \text{sa.dft.FileEraseEachSweep} = \text{ON} \ 'Write \]
\[ \text{value} = \text{sa.dft.FileEraseEachSweep} \ 'Read \]

C++ Syntax
HRESULT get_FileEraseEachSweep(VARIANT_BOOL* enable)
HRESULT put_FileEraseEachSweep(VARIANT_BOOL enable)

Interface
ISpectrumAnalyzerDFT
## FilePrefix Property

**Description**
Sets and returns the file name prefix for the data file. The receivers selected in `ExportReceiverSetList` will be appended to the specified prefix name with either "_X.txt" if a text file is exported (`TextFileEnabled`) or "_X.bin" if a binary file is exported (`BinaryFileEnabled`). X is the receiver name.

**VB Syntax**

```vbnet
sa.dft.FilePrefix = prefix
```

**Variable (Type) - Description**

- `sa.dft` *A SpectrumAnalyzerDFT (object)*
- `prefix` *(String) Specified prefix.*

**Return Type**

String

**Example**

```vbnet
sa.dft.FilePrefix = "C:\TEMP\SA_DATA_OUT"  'Write
value = sa.dft.FilePrefix  'Read
```

**C++ Syntax**

```cpp
HRESULT get_FilePrefix(BSTR* prefix);

HRESULT put_FilePrefix(BSTR prefix);
```

**Interface**

`ISpectrumAnalyzerDFT`
**FileVerboseEnabled Property**

**Description**
Enables/disables exporting frequency and data for text files. Data is not exported until the next new sweep occurs.

**VB Syntax**
```
sa.dft.FileVerboseEnabled = value
```

**Variable**

<table>
<thead>
<tr>
<th>(Type) - Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>sa.dft</code></td>
<td>A <a href="#">SpectrumAnalyzerDFT</a> (object)</td>
</tr>
<tr>

<td>(Boolean) Choose from:</td>
</tr>
<tr>
<td></td>
<td>0 - OFF - Disable verbose mode.</td>
</tr>
<tr>
<td></td>
<td>1 - ON - Enable verbose mode.</td>
</tr>
</tbody>
</table>

**Return Type**
Boolean

**Default**
OFF

**Examples**
```
sa.dft.FileVerboseEnabled = ON 'Write
value = sa.dft.FileVerboseEnabled 'Read
```

**C++ Syntax**
```
HRESULT get_FileVerboseEnabled(VARIANT_BOOL* enable)
HRESULT put_FileVerboseEnabled(VARIANT_BOOL enable)
```

**Interface**
ISpectrumAnalyzerDFT
## FilterBW Property

<tr>
<td>C++ Syntax</td>
<td>HRESULT get_FilterQ(float* quality)</td>
</tr>
<tr>
<td>Interface</td>
<td>IMeasurement</td>
</tr>
</tbody>
</table>
# FilterErrors Property

## Description

Returns the error string associated with the digital filters. The return string has three fields separated by commas: "stage1 status, stage2 status, stage3 status"

Each of these fields can contain one or more of the following error codes:

- **NO ERROR**
- **NUMBER-OF-COEFFICIENTS** - the number of coefficients is excessive for that filter-stage
- **COEFFICIENT VALUE** - one or more coefficients are out of range for that filter-stage
- **SUM-OF-COEFFICIENTS** - the sum of all coefficients is excessive for that filter-stage,
- **FREQUENCY** - the frequency for Stage 1 is out of range (only applies stage1 field),
- **PARAMETER** - one or more parameters are out of range (only applies to stage 3 field).

## VB Syntax

```vbnet
value = spm4.FilterErrors
```

## Variable (Type) - Description

- **value**
  - Variable to store the returned errors.
- **spm4**
  - A `SignalProcessingModuleFour` object

## Return Type

String

## Default

Not Applicable

## Examples

```vbnet
mode = spm4.FilterErrors 'Read
'example return strings"

NO ERROR, NO ERROR, NO ERROR
indicates no errors,

*SUM-OF-COEFFICIENTS, NO ERROR, NO ERROR
indicates that the sum of all filter coefficients exceed the maximum value for the Stage-1 filter,

*COEFFICIENT *SUM-OF-COEFFICIENTS, NO ERROR, *PARAMETER
indicates a problems with Stage 1 coefficients and a problem with one or more of the parameters associated with the Stage 3 filter.
```
<table>
<thead>
<tr>
<th>C++ Syntax</th>
<th>HRESULT get_FilterErrors(BSTR* dspErrors);</th>
</tr>
</thead>
<tbody>
<tr>
<td>Interface</td>
<td>ISignalProcessingModuleFour</td>
</tr>
</tbody>
</table>
**FilterMode Property**

**Description**
Sets and returns whether the VNA configures the 3-stage digital filter settings or they will be configured manually. When making manual settings, also send ADCCaptureMode Property which routes the IF through the 3-stage filter.

**VB Syntax**
```
spm4.FilterMode = value
```

**Variable**
*spm4 A SignalProcessingModuleFour (object)*

*value (enum as NAModes) Filter mode. Choose from:*

- **naAUTO**  VNA controls digital filter settings.
- **naMANUAL**  You control digital filter settings using other SignalProcessingModuleFour commands.

**Return Type**
Enum

**Default**
naAUTO

**Examples**
```
spm4.FilterMode = naAUTO 'Write
mode = spm4.FilterMode 'Read
```

**C++ Syntax**

```
HRESULT get_FilterMode(tagNAModes* dspMode);
HRESULT put_FilterMode(tagNAModes dspMode);
```

**Interface**
ISignalProcessingModuleFour
FirmwareMajorRevision Property

Description
Returns the major firmware revision number as an integer. For example, given a firmware revision number A.03.30, this command returns 3.

VB Syntax
value = cap.FirmwareMajorRevision

Variable (Type) - Description
value (Long) - Variable to store the returned integer value of the firmware revision number.

cap A Capabilities (object)

Return Type
Long

Default
Not Applicable

Examples
value = cap.FirmwareMajorRevision 'Read

C++ Syntax
HRESULT get_FirmwareMajorRevision(long * majorRev );

Interface
ICapabilities
# FirmwareMinorRevision Property

**Description**  
Returns the minor firmware revision number as an integer. For example, given a firmware revision number A.03.30, this command returns 30.

**VB Syntax**  
`value = cap.FirmwareMinorRevision`

**Variable (Type) - Description**  
- `value` (Long) - Variable to store the returned decimal value of the firmware revision number.
- `cap` A Capabilities (object)

**Return Type**  
Long

**Default**  
Not Applicable

**Examples**  
`value = cap.FirmwareMinorRevision`  
`value = cap.FirmwareMinorRevision`  

**C++ Syntax**  
`HRESULT get_FirmwareMinorRevision(long * minorRev );`

**Interface**  
ICapabilities
# FirmwareSeries Property

<table>
<thead>
<tr>
<th>Description</th>
<th>Returns the alpha portion of the firmware revision number. For example, given a firmware revision number A.03.30, this command returns A.</th>
</tr>
</thead>
<tbody>
<tr>

<td>(Type) - Description</td>
</tr>
<tr>
<td><code>value</code></td>
<td>(String) - Variable to store the returned alpha value of the firmware revision number.</td>
</tr>
<tr>
<td><code>cap</code></td>
<td>A Capabilities (object)</td>
</tr>
<tr>
<td>Return Type</td>
<td>String</td>
</tr>
<tr>
<td>Default</td>
<td>Not Applicable</td>
</tr>
<tr>
<td>Examples</td>
<td><code>value = cap.FirmwareSeries</code> 'Read'</td>
</tr>
<tr>
<td>C++ Syntax</td>
<td>HRESULT get_FirmwareSeries(BSTR * series);</td>
</tr>
<tr>
<td>Interface</td>
<td>ICapabilities</td>
</tr>
</tbody>
</table>
### FixedDelay Property

**Description**  
Set and return the known delay through the calibration mixer.

**VB Syntax**  
`smc.FixedDelay = value`

**Variable**  
**Type** - Description  
- `smc` An SMCType (object)  
- `value` (Double) Known delay through the calibration mixer in seconds.

**Return Type**  
Double

**Default**  
0 seconds

**Example**  
```
SMC.FixedDelay = 12e-9  'Write

value = SMC.FixedDelay  'Read
```

**C++ Syntax**  
```
HRESULT put_FixedDelay(Double Value);

HRESULT get_FixedDelay(Double* Value);
```

**Interface**  
SMCType5
## FixedPhase Property

**Description**
Write and read the fixed phase value. Must not be logarithmic sweep type.

**VB Syntax**
`phase.FixedPhase(srcPort) = value`

**Variable**
- **(Type)** - Description
  - **phase** A PhaseControl Object
  - **srcPort** (Long Integer) Source port for which to make phase control settings.

**Note:** If the source port is defined by a string name, such as an external source, a balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model, then use `chan.getPortNumber` to translate the string into a port number. To learn more see Remotely Specifying a Source Port

**value** (Double) Phase value in degrees. Choose a value between -360 and 360.

**Return Type**
Double

**Default**
0 degrees

**Examples**
- `phase.FixedPhase 1 = 15` ' Write
- `value = phase.FixedPhase 2` ' Read

**C++ Syntax**
- `HRESULT get_FixedPhase(long port, double* pVal);`
- `HRESULT put_FixedPhase(long port, double newVal);`

**Interface**
IPhaseControl
# FixedRatioedPower Property

**Description**
Write and read the fixed power ratioed value. Must NOT be in power sweep to use this value during phase control.

**VB Syntax**
\[ phase.FixedRatioedPower(srcPort) = value \]

**Variable**
- **phase** (Type: A PhaseControl Object)
- **srcPort** (Long Integer) Source port for which to make phase control settings.

**Note:** If the source port is defined by a string name, such as an external source, a balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model, then use `chan.getPortNumber` to translate the string into a port number. To learn more see Remotely Specifying a Source Port

- **value** (Double) Fixed power ratio value in dBC within the allowable range of the VNA.

**Return Type**
Double

**Default**
0 dBC

**Examples**
- `phase.FixedRatioedPower 1 = -1` 'Write
- `value = phase.FixedRatioedPower 2` 'Read

**C++ Syntax**
- `HRESULT get_FixedRatioedPower(long port, double* pVal);`
- `HRESULT put_FixedRatioedPower(long port, double newVal);`

**Interface**
IPhaseControl
**FixturingState Property**

<table>
<thead>
<tr>
<th>Description</th>
<th>Turns all three fixturing functions (de-embedding, port matching, impedance conversion) ON or OFF for all ports on the specified channel. This does NOT affect port extensions.</th>
</tr>
</thead>
</table>

**VB Syntax**

```vbnet
fixture.FixturingState = value
```

**Variable**

- **fixture** *(Type)* - Description
  - A Fixturing *(object)*
- **value** *(boolean)*
  - **True** - Turns Fixturing ON
  - **False** - Turns Fixturing OFF

**Return Type**

Boolean

**Default**

False

**Examples**

```vbnet
fixture.FixturingState = True 'Write
value = fixture.FixturingState 'Read
```

**C++ Syntax**

```c
HRESULT get_FixturingState(VARIANT_BOOL *pVal)
HRESULT put_FixturingState(VARIANT_BOOL newVal)
```

**Interface**

IFixturing
## FootSwitch Property

<table>
<thead>
<tr>
<th>Description</th>

</tr>
<tr>
<td>2 - naRecallNextState</td>
<td>Footswitch presses recall an instrument state. When more than one state is available, then each footswitch press recalls the next state, then starts over from the beginning. It is possible for a recalled state to override the current mode. If the recalled state is IGNore, then mode changes and additional footswitch presses are ignored.</td>
</tr>
<tr>
<td>3 - naRunMacro</td>
<td>Footswitch presses load and run a macro. When more than one macro is available, then each footswitch press loads and runs the next macro, then starts over from the beginning. It is possible for a Macro to override the current mode. If the macro contains a Preset, then the mode changes to the default setting IGNore and additional footswitch presses are ignored.</td>
</tr>
</tbody>
</table>

**AuxIO** *(object)* - A Hardware Aux I/O object

**Return Type**  NAFootSwitchMode

**Default**  0 - naIgnoreFootswitch

**Examples**  `auxIo.FootSwitchMode = naIgnoreFootSwitch`  'Write

**C++ Syntax**

```
HRESULT get_FootSwitchMode(NAFootSwitchMode *pFootSwitchMode )
HRESULT put_FootSwitchMode(NAFootSwitchMode newFootSwitchMode)
```

**Interface**  IHWAuxIO3
**ForceADCRecordSize Property**

**Description**
Set and read the ADC record size.

**VB Syntax**

```
sa.ForceADCRecordSize = value
```

**Variable (Type) - Description**

- `sa` A SpectrumAnalyzer (object)
- `value` (Long) Choose a value between 64 and 33554432

**Learn about these settings.**

**Return Type**
Long

**Default**
64

**Examples**

```
sa.ForceADCRecordSize = 256    'Write
value = sa.ForceADCRecordSize 'Read
```

See an example program.

**C++ Syntax**

```
HRESULT put_ForceADCRecordSize(long val);
HRESULT get_ForceADCRecordSize(long* val);
```

**Interface**
ISpectrumAnalyzer

## Frequency Property

**Description**
Sets group delay aperture using a fixed frequency range.

**VB Syntax**
`gdAperture.Frequency = value`

**Variable** *(Type)* - Description

- **gdAperture** A GroupDelayAperture *(object)*
- **value** *(Double)* Frequency range (in Hz) to use for the aperture setting.

**Return Type**
Double

**Default**
Frequency range that equates to 11 points.

This can be changed to two points with a preference setting.

**Examples**
```
gdAperture.Frequency = 1e6 'Write
aperture = gdAperture.Frequency 'Read
```

**C++ Syntax**
- `HRESULT get_Frequency(double Frequency *pVal)`
- `HRESULT put_Frequency(double Frequency newVal)`

**Interface**
IGroupDelayAperture
**Frequency Property**

| Description                                      | Sets or returns the frequency associated with a Power Sensor CalFactor Segment
|                                                 | or
|                                                 | Sets or returns the frequency associated with a Power Loss Segment.
| **VB Syntax**                                   | *object*.**Frequency** = *value*
| **Variable (Type) - Description**               | *object*
|                                                 | One of the following objects:
|                                                 | PowerSensorCalFactorSegment

| **value** (double) – Frequency in units of Hz.  | This can be any non-negative value (limited by the maximum value of double).
| **Return Type**                                 | Double
| **Default**                                     | 0
| **Examples**                                    | `seg.Frequency = 6e9`  `Write`
|                                                 | `freq = seg.Frequency`  `Read`
| **C++ Syntax**                                  | HRESULT put_Frequency(double newVal);
|                                                 | HRESULT get_Frequency(double *pVal);
| **Interface**                                   | One of the above objects.
### FrequencyCenter Property

**Description**
Sets and returns the center frequency of the main tones. Use with IMD sweep types:

- `naIMDToneCWSweep`
- `naIMDTonePowerSweep`
- `naIMDDeltaFrequencySweep`

**VB Syntax**
```vbnet
object.FrequencyCenter = value
```

**Variable**
- **Object**
  - A SweptIMD or IMSpectrum Object
- **Value**
  - (Double) Tone center frequency in Hz. Both the F1 and F2 tones MUST be within the frequency range of the VNA.

**Return Type**
Double

**Default**
1.0 GHz

**Examples**
```vbnet
imd.FrequencyCenter = 2e9 'Write
value = imd.FrequencyCenter 'Read
```

**C++ Syntax**
```cpp
HRESULT get_FrequencyCenter(double *pVal)
HRESULT put_FrequencyCenter(double *pVal)
```

**Interface**
ISweptIMD

IIMSpectrum
## FrequencyCenterCenter Property

<table>
<thead>
<tr>
<th>Description</th>
<th>Sets and returns the sweep center frequency when sweeping the main tones. Use with sweep type = naIMDToneCenterFreqSweep.</th>
</tr>
</thead>
</table>

### VB Syntax

```vbnet
imd.FrequencyCenterCenter = value
```

### Variable (Type) - Description

<table>
<thead>
<tr>
<th>imd</th>
<th>A SweptIMD Object</th>
</tr>
</thead>
<tbody>
<tr>
<td>value</td>
<td>(Double) Center frequency in Hz. The F1 and F2 tones MUST be within the frequency range of the VNA.</td>
</tr>
</tbody>
</table>

### Return Type

Double

### Default

13.255 GHz

### Examples

```vbnet
imd.FrequencyCenterCenter = 10e9 'Write
value = imd.FrequencyCenterCenter 'Read
```

### C++ Syntax

```c++
HRESULT get_FrequencyCenterCenter(double *pVal)
HRESULT put_FrequencyCenterCenter(double newVal)
```

### Interface

ISweptIMD
# FrequencyCenterSpan Property

**Description**: Sets and returns the frequency span when sweeping the main tones. Use with sweep type `naIMDToneCenterFreqSweep`.

**VB Syntax**: `imd.FrequencyCenterSpan = value`

**Variable (Type) - Description**

- `imd` - A SweptIMD Object
- `value` - (Double) Frequency span in Hz. The F1 and F2 tones MUST be within the frequency range of the VNA.

**Return Type**: Double

**Default**: 26.489 GHz

**Examples**:  
```
imd.FrequencyCenterSpan = 10e9 'Write
value = imd.FrequencyCenterSpan 'Read
```

**C++ Syntax**:  
```
HRESULT get_FrequencyCenterSpan(double *pVal)
HRESULT put_FrequencyCenterSpan(double newVal)
```

**Interface**: ISweptIMD
# FrequencyCenterStart Property

**Description**
Sets and returns the start frequency when sweeping the main tones. Use with sweep type = `naIMDToneCenterFreqSweep`.

**VB Syntax**
```vbnet
imd.FrequencyCenterStart = value
```

**Variable (Type) - Description**

- `imd` - A SweptIMD Object
- `value` - (Double) Start frequency in Hz. The F1 and F2 tones MUST be within the frequency range of the VNA.

**Return Type**
Double

**Default**
10.5 MHz

**Examples**
```vbnet
imd.FrequencyCenterStart = 20e6 'Write
value = imd.FrequencyCenterStart 'Read
```

**C++ Syntax**
```cpp
HRESULT get_FrequencyCenterStart(double *pVal)
HRESULT put_FrequencyCenterStart(double newVal)
```

**Interface**
ISweptIMD
## FrequencyCenterStop Property

**Description**
Sets and returns the stop frequency when sweeping the main tones. Use with sweep type = `naIMDToneCenterFreqSweep`.

**VB Syntax**
```
imd.FrequencyCenterStop = value
```

**Variable (Type) - Description**
- **imd**: A `SweptIMD` Object
- **value** (Double): Stop frequency in Hz. The F1 and F2 tones MUST be within the frequency range of the VNA.

**Return Type**
Double

**Default**
26.4995 MHz

**Examples**
```
imd.FrequencyCenterStop = 20e9  'Write
value = imd.FrequencyCenterStop  'Read
```

**C++ Syntax**
```
HRESULT get_FrequencyCenterStop(double *pVal)
HRESULT put_FrequencyCenterStop(double newVal)
```

**Interface**
ISweptIMD
# FrequencyOffsetDivisor Property **Superseded**

**Description**
This method is replaced by properties on the FOMRange Object. Specifies (along with FrequencyOffsetMultiplier) the value to multiply by the stimulus. See other Frequency Offset properties

**VB Syntax**
```
object.FrequencyOffsetDivisor = value
```

**Variable** *(Type)* - Description

- **object** Channel *(object)*
- or

- **CalSet (object)** - Read-only property
  
- **value** *(Double)* - Divisor value. Range is 1 to 1000

**Return Type** Double

**Default** 1

**Examples**
```
chan.FrequencyOffsetDivisor = 2 'Write
fOffsetDiv = chan.FrequencyOffsetDivisor 'Read
```

**C++ Syntax**
```
HRESULT get_FrequencyOffsetDivisor(double*pval)

HRESULT put_FrequencyOffsetDivisor(double newVal)
```

**Interface**
IChannel2

|CalSet3
**FrequencyOffsetFrequency Property Superseded**

**Description**
This method is replaced by properties on the FOMRange Object.

Specifies an absolute offset frequency in Hz. For mixer measurements, this would be the LO frequency. See other Frequency Offset properties.

**VB Syntax**

```vbnet
object.FrequencyOffsetFrequency = value
```

**Variable**

**(Type) - Description**

- `object` Channel *(object)*

  or

  CalSet *(object)* - Read-only property

**(value) - Description**

- *(Double)* - Offset value. Range is +/- 1000 GHz. (Offsets can be positive or negative.)

**Return Type**

- Double

**Default**

- 0 Hz

**Examples**

```vbnet
chan.FrequencyOffsetFrequency = 2 'Write
fOffsetFreq = chan.FrequencyOffsetFrequency 'Read
```

**C++ Syntax**

```c++
HRESULT get_FrequencyOffsetFrequency(double*pval)
HRESULT put_FrequencyOffsetFrequency(double newVal)
```

**Interface**

- IChannel2
- ICalSet3
**FrequencyOffsetMultiplier Property Superseded**

**Description**
This method is replaced by properties on the FOMRange Object.

Specifies (along with FrequencyOffsetDivisor) the value to multiply by the stimulus. See other Frequency Offset properties.

**VB Syntax**

```vbnet
object.FrequencyOffsetMultiplier = value
```

**Variable (Type) - Description**

- `object`: Channel `(object)`

  or

- `CalSet (object)`: Read-only property

  - `value` (Double) - Multiplier value. Range is 1 to 1000

**Return Type**
Double

**Default**
1

**Examples**

```vbnet
chan.FrequencyOffsetMultiplier = 2 'Write
fOffsetMult = chan.FrequencyOffsetMultiplier 'Read
```

**C++ Syntax**

```c++
HRESULT get_FrequencyOffsetMultiplier (double*pval);
HRESULT put_FrequencyOffsetMultiplier (double newVal);
```

**Interface**

`IChannel2`

`|CalSet3`
**Write/Read**

### FrequencyOffsetRangeForCalComputations Property

</tbody>
</table>
### FrequencyOffsetCWOverride Property

**Superseded**

**Description**

This method is replaced by properties on the FOMRange Object.

Establishes a fixed (CW) stimulus frequency while measuring the Response over a swept frequency range. For example, a fixed-frequency VNA stimulus may be applied to the RF input of a mixer whose local oscillator (LO) is being swept. Because the IF output of the mixer will be swept, the VNA receivers must also be swept.

See other Frequency Offset properties.

**VB Syntax**

```vbnet
object.FrequencyOffsetCWOverride = value
```

**Variable (Type) - Description**

- `object` Channel (object)

  or

- CalSet (object) - Read-only property

  ```vbnet
  value (Enum as NaStates) - Choose from:
  naOFF (0) - Turns CW override OFF
  naON (1) - Turns CW override ON
  ```

**Return Type**

Enum

**Default**

0 Hz

**Examples**

```vbnet
chan.FrequencyOffsetCWOverride = 1 'Write
fOffsetOV = chan.FrequencyOffsetCWOverride 'Read
```

**C++ Syntax**

```c++
HRESULT get_FrequencyOffsetCWOverride (tagNAStates *pstate)
HRESULT put_FrequencyOffsetCWOverride (tagNAStates newState)
```

**Interface**

- IChannel2
- CalSet3

---

1730
**FrequencyOffsetState Property Superseded**

**Description**
This method is replaced by properties on the FOMRange Object.

Enables Frequency Offset on ALL measurements that are present on the active channel. This immediately causes the source and receiver to tune to separate frequencies. The receiver frequencies are specified with other channel and offset settings. To make the stimulus settings, use Channel Start, Stop Frequency properties. See other Frequency Offset properties.

Tip: To avoid unnecessary errors, first make other frequency offset settings. Then turn Frequency Offset ON.

**VB Syntax**

```vbnet
object.FrequencyOffsetState = value
```

**Variable**

**object** - Channel (**object**)

or

**CalSet (object)** - Read-only property

**value** - (Enum as NaStates) - Choose from:

- **naOFF** (0) - Turns Frequency Offset OFF
- **naON** (1) - Turns Frequency Offset ON

**Return Type**

Enum

**Default**

naOFF (0)

**Examples**

```vbnet
chan.FrequencyOffsetState = naON 'Write
Foffset = chan.FrequencyOffsetState 'Read
```

**C++ Syntax**

```cpp
HRESULT FrequencyOffsetState (tag NAStates *pState);
HRESULT FrequencyOffsetState (tag NAStates newState)
```

**Interface**

IChannel2

|CalSet3
## FrequencyStep Property

**Description**
Sets the frequency step size across the selected frequency range. This effectively sets the number of data points. Available ONLY when `SweepType = Linear`.

**VB Syntax**
```
object.FrequencyStep = value
```

**Variable**
- **object** (Type) - Description
  - A Channel (`object`)
- **value** (double) - Frequency step size in Hertz. Select any value up to the frequency range of the analyzer.

**Return Type**
Double

**Default**
Not Applicable

**Examples**
```
chan.FrequencyStep = 1e9 'sets the frequency step size of a linear sweep for the channel object -Write
freqstep = chan.FrequencyStep 'Read
```

**C++ Syntax**
```
HRESULT get_FrequencyStep(double *pVal)
HRESULT put_FrequencyStep(double newVal)
```

**Interface**
IChannel24
**FrequencyType Property**

**Description**
Sets and returns the frequency range to use for receiver leveling. On the user interface, this is the "Receiver frequency is determined by:" setting.

**VB Syntax**

```vbnet
RxLevel.FrequencyType(srcPort) = value
```

**Variable**

- **(Type)** - Description
  - **RxLevel** - A ReceiverLeveling Object
  - **srcPort** - (Long Integer) Source port for Receiver Leveling.

**Note:** If the source port is defined by a string name, such as an external source, a balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model, then use `chan.getPortNumber` to translate the string into a port number.
To learn more see [Remotely Specifying a Source Port](#).

**value**

- **naAutoFrequency** (0) - always uses the frequency range that is assigned to the measurement receiver.
- **naInputFrequency** (3) - Mixer/Converter input frequency range.
- **naOutputFrequency** (4) - Mixer/Converter input frequency range.
- **naReceiverFrequency** (1) - FOM Receiver frequency range.
- **naSourceFrequency** (2) - FOM Source frequency range

**Return Type**
Enum

**Default**
**naAutoFrequency** (0)

**Examples**

```vbnet
rxLevel.FrequencyType (1) = naAutoFrequency ' Write
value = rxLevel.FrequencyType 2' Read
```

**C++ Syntax**

```cpp
HRESULT get_FrequencyType(long port, tagNAFrequencyType* pVal);
HRESULT put_FrequencyType(long port, tagNAFrequencyType newVal);
```

**Interface**
IRxLevelingConfiguration3
### FullyCorrectedPorts Property

**Description**
Sets and returns the selected ports to include in a full NPort correction. All other ports are corrected with enhanced response calibration if available. [Learn more](#).

**Note:** The `CorrectionSubsettingState` must be set to ON to enable the full command.

**VB Syntax**
```
value = corrMethods.FullyCorrectedPorts
```

**Variable**
*(Type)* - Description

- **value** (Variant) Variable to store a comma separated list of ports to include in the full correction.

**corrMethods**  CorrectionMethods (object)

**Return Type**  Variant

**Default**  All ports included

**Example**  
16-port VNA with an active 16-port calibration
```
corrMethods CorrectionSubsettingState = True
portlist = Array(1,2,3)
portlist = corrMethods.FullyCorrectedPorts
```

Result: Full correction on ports 1, 2, and 3
All other port parameters are uncorrected

**C++ Syntax**
```
HRESULT get_FullyCorrectedPorts(VARIANT *portList);
HRESULT put_FullyCorrectedPorts(VARIANT portList);
```

**Interface**  ICorrectionMethods2
## Gain Property

<table>
<thead>
<tr>
<th>Description</th>
<th>Returns the Gain result of the PNOP marker search.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pnop Gain</td>
<td>Pnop Out - Pnop In.</td>
</tr>
</tbody>
</table>

**VB Syntax**

```vbnet
gain = pnop.Gain
```

**Variable**

- `gain` *(double)* - Variable to store returned value
- `pnop` A PNOP *(object)*

**Return Type**

Double

**Default**

Not applicable

**Examples**

```vbnet
gain = pnop.Gain 'Read
```

See example program

**C++ Syntax**

```cpp
HRESULT get_Gain(double* pNewVal)
```

**Interface**

IPNOP
# GainLinear Property

This property returns the Linear Gain result of a PSat marker search.

**Description**

Gain Linear = Marker 1 - Y-axis value MINUS X-axis value

**VB Syntax**

```vbnet
gainLin = pSat.GainLinear
```

**Variable**

- `gainLin` *(double)* - Variable to store returned value
- `pSat` - A PSaturation (object)

**Return Type**

Double

**Default**

Not applicable

**Examples**

```vbnet
gainLin = pSat.GainLinear
```

See example program

**C++ Syntax**

```cpp
HRESULT get_GainLinear(double* pNewVal)
```

**Interface**

IPSaturation
## GainMax Property

**Description**
Returns the GainMax result of the PNOP or PSAT marker search.

\[
\text{Gain Max} = \text{PMax Out} - \text{PMax In}
\]

**VB Syntax**

\[
gainMax = pMarker.GainMax
\]

**Variable**

<table>
<thead>
<tr>

</table>

See example program
# FrequencySpan Property

**Description**
Sets or returns the frequency span of the channel.

Sets or returns the frequency span of the segment.

**VB Syntax**
```vbnet
object.FrequencySpan = value
```

**Variable (Type) - Description**
- **object**
  - A Channel (object)
  - or
  - A Segment (object)

- **value**
  - (double) - Frequency span in Hertz. Choose any number between 70 (minimum) and maximum frequency span of the analyzer.

**Return Type**
Double

**Default**
Full frequency span of the analyzer

**Examples**
- `chan.FrequencySpan = 4.5e9 'sets the frequency span of a linear sweep for the channel object  -Write`
- `freqspan = chan.FrequencySpan 'Read`

**C++ Syntax**
```cpp
HRESULT get_FrequencySpan(double *pVal)
HRESULT put_FrequencySpan(double newVal)
```

**Interface**
- IChannel
- ISegment
## Shape Property

**Description**
Specifies the shape of the gate filter.

**VB Syntax**
`gat.Shape = value`

**Variable**
- **(Type)** - Description
  - `gat` - A Gating (object)
  - `value` - (enum NAGateShape) - Choose from:
    - 0 - naGateShapeMaximum
    - 1 - naGateShapeWide
    - 2 - naGateShapeNormal
    - 3 - naGateShapeMinimum

**Return Type**
NAGateShape

**Default**
2 - Normal

**Examples**
- `gat.Shape = naGateShapeMaximum` 'Write
- `filterShape = gat.Shape` 'Read

**C++ Syntax**
- HRESULT get_Shape(tagNAGateShape *pVal)
- HRESULT put_Shape(tagNAGateShape newVal)

**Interface**
IGating
# Type (gate) Property

# GPIBAddress Property

**Description**
Sets and returns the VNA GPIB address on the talker/listener bus.

**VB Syntax**
```
app.GPIBAddress (bus) = value
```

**Variable**
- **app** (Type) - Description
  - **app** An Application (object)
- **bus** (Short Integer) GPIB bus. MUST be set to 0 - the talker/listener bus.
- **value** (Short Integer) GPIB Address on the VNA. Choose a value between 0 and 30.

**Return Type**
Short Integer

**Default**
16

**Examples**
```
address=app.GPIBAddress(0) 'Read

app.GPIBAddress(0)=16 'Write
```

**C++ Syntax**
```
HRESULT get_GPIBAddress(short busIndex, short* address);

HRESULT put_GPIBAddress(short busIndex,short address);
```

**Interface**
IApplication8
**GPIBMode Property**

**Description**
Changes the analyzer to a GPIB system controller or a talker/listener on the bus. The analyzer must be the controller if you want to use it to send commands to other instruments. The analyzer must be a talker/listener if you want to send it commands from another PC.

*Note:* This command has no affect in VNAs with dedicated Controller and Talker/Listener GPIB connectors.

**VB Syntax**
```vbnet
app.GPIBMode value
```

**Variable**
(Shape) - Description
- `app` - An Application (object)
- `value` - (enum `NAGPIBMode`) - Choose either:
  - `0` - `naTalkerListener` - the analyzer is a talker / listener
  - `1` - `naSystemController` - the analyzer is the system controller

**Return Type**
Long Integer

**Default**
`0` - `naTalkerListener`

**Examples**
```vbnet
app.GPIBMode = naTalkerListener 'Write
mode = app.GPIBMode 'Read
```

**C++ Syntax**
```cpp
HRESULT get_GPIBMode(tagGPIBModeEnum* eGpibMode)
HRESULT put_GPIBMode(tagGPIBModeEnum eGpibMode)
```

**Interface**
`IApplication`
## GPIBPortCount Property

<table>
<thead>
<tr>
<th>Description</th>
<th>Returns the number of GPIB ports that are present on the VNA rear-panel.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>VB Syntax</strong></td>
<td><code>value = cap.GPIBPortCount</code></td>
</tr>
<tr>
<td><strong>Variable</strong></td>
<td>(Type) - Description</td>

</table>
## Grid Property

<table>
<thead>
<tr>
<th>Description</th>
<th>Set and return the inner lines of all grid in all windows, and the grid frame in inactive windows for the VNA display or hardcopy print.</th>
</tr>
</thead>
<tbody>
<tr>
<td>VB Syntax</td>
<td><code>colors/Grid = value</code></td>
</tr>
<tr>
<td>Variable</td>
<td>(Type) - Description</td>
</tr>
<tr>
<td><code>colors</code></td>
<td>A <code>ComColors (object)</code></td>
</tr>
<tr>
<td><code>value</code></td>
<td>(Long Integer) - RGB color of the Grid pen.</td>
</tr>
</tbody>
</table>

Convert the three RGB colors to an integer as follows:

\[
\text{RGB} = R + (G \times 2^8) + (B \times 2^{16})
\]

To find the three RGB values from the Display Colors dialog, click **Change Color**, then **Define Custom Color**.

<table>
<thead>
<tr>
<th>Return Type</th>
<th>Long</th>
</tr>
</thead>
<tbody>
<tr>

<td>= <code>colors/Grid</code> <code>Read</code></td>
</tr>
</tbody>
</table>

### C++ Syntax

```cpp
HRESULT get_Grid(long* pVal);
HRESULT put_Grid(long newVal);
```

**Interface**

`IColors`
GridLineType Property

**Description**
Set and return whether the grid lines are displayed in solid or dotted lines for all open windows. Grid lines are returned to solid when the VNA is Preset.

**VB Syntax**
`app.GridLineType = value`

**Variable**
- `app` [Type] Application Object [object]
- `value` [Enum as naLineType] - Choose from:
  
  - 0 - naLineTypeSolid
  - 1 - naLineTypeDotted

**Return Type**
Enum

**Default**
aLineTypeSolid

**Examples**
```
app.GridLineType = naLineTypeSolid 'Write
grid = app.GridLineType 'Read
```

**C++ Syntax**
```
HRESULT get_GridLineType(tag naLineType* pVal);
```
```
HRESULT put_GridLineType(tag naLineType newVal);
```

**Interface**
IApplication
HandshakeEnable Property

Description

Turns handshake ON / OFF.

To enable handshake, the main trigger enable must ALSO be set using Enable.

When ON, VNA acquisition waits indefinitely for the input line to be asserted before continuing with the acquisition.

**Note:** Use on PNA-X ONLY. Other models do NOT have an Aux Input.

VB Syntax

```vbnet
auxTrig.HandshakeEnable = state
```

Variable (Type) - Description

- `auxTrig` An AuxTrigger (object)
- `state` (boolean) -
  - *True* - Handshake enabled
  - *False* - Handshake NOT enabled

Return Type

Boolean

Default

False

Examples

```vbnet
auxTrig.HandshakeEnable = True 'Write
value = auxTrig.HandshakeEnable 'Read
```

C++ Syntax

```c
HRESULT get_HandshakeEnable(VARIANT_BOOL * enable);
HRESULT put_HandshakeEnable(VARIANT_BOOL enable);
```

Interface

IAuxTrigger
### Has2ndOrderTrace Property

<table>
<thead>
<tr>
<th>Description</th>
<th>Returns the state of whether or not 2nd order parameters are measured. True indicates 2nd order parameters are measured.</th>

# HasLowFrequencyExtension Property

**Description**  
Returns whether or not the VNA has the low frequency extension (LFE) installed. Learn more.

**VB Syntax**  
```
value = chan.HasLowFrequencyExtension
```

**Variable**  
(Type) - Description  
```
value (boolean)
```

- **False** - LFE is not installed.
- **True** - LFE is installed.

**cap**  
Capabilities (object)

**Return Type**  
Not applicable

```
hasLFE = cap.HasLowFrequencyExtension 'Read
```

**C++ Syntax**  
```
HRESULT get_HasLowFrequencyExtension(VARIANT_BOOL* hasLFE);
```

**Interface**

</tbody>
</table>
# HighestOrderProduct Property

**Description** Returns the highest order product that can be measured by Swept IMD.

**VB Syntax**
```
value = imd.HighestOrderProduct
```

**Variable** *(Type)* - Description
- **value** (Long Integer) Variable in which to store the returned value.
- **imd** A Swept IMD Object

**Return Type** Integer

**Default** **Always returns 9**

**Examples**
```
value = imd.HighestOrderProduct 'Read
```

**C++ Syntax**
```
HRESULT get_HighestOrderProduct(long *pVal)
```

**Interface** ISweptIMD
### HighestOrderProductInUse Property

<table>
<thead>
<tr>
<th><strong>Description</strong></th>
<th>Returns the highest order product measured by SweptIMD.</th>
</tr>
</thead>
<tbody>
<tr>

</tr>
<tr>
<td><strong>Interface</strong></td>
<td>ISweptIMD</td>
</tr>
</tbody>
</table>
ID Property

Returns the test set ID number. For GPIB testsets, the ID is equivalent to the GPIB address. For testset I/O testsets, the ID is the base address of the testset (0 for the first testset, 1 for the second, and so on).

**VB Syntax**
```
value = tset.ID
```

**Variable (Type) - Description**
- `value` (Long) variable to store the returned information.
- `testsets(I)` A TestsetControl object.

OR

An E5091Testset object.

**Return Type** Long Integer

**Default** Not Applicable

**Examples**
```
value = testset1.ID
```

See E5091A Example Program

See External Testset Program

**C++ Syntax**
```
HRESULT get_ID(long *idNumber);
```

**Interface** ITestsetControl

IE5091Testset
### IDQuery Property

<table>
<thead>
<tr>
<th>Description</th>
<th>Sets and returns the <strong>ID Query command</strong> for an external DC Source and an external DC Meter.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>VB Syntax</strong></td>
<td><code>extDC.IDQuery = value</code></td>

</tr>
<tr>
<td><strong>Interface</strong></td>
<td>IExternalDCDevice3</td>
</tr>
</tbody>
</table>
IDString Property

Description
Returns the ID of the analyzer, including the Model number, Serial Number, and the Software revision number.

Note: Beginning with Rev 6.01, this command now returns the software revision with 6 digits instead of 4. For example, A.06.01.02.

VB Syntax
value = app.IDString

Variable
app (Type) - Description
An Application (object)

value (string) - variable to contain the returned ID string

Return Type
String

Default
Not Applicable

Examples
id = app.IDString

C++ Syntax
HRESULT IDString(BSTR* IDString)

Interface
IApplication
IFBandwidthOption Property

**Description**
Enables the IFBandwidth to be set on individual sweep segments. This property must be set True **before** `seg.IFBandwidth = value` is sent. Otherwise, this command will be ignored.

**VB Syntax**
```
segs.IFBandwidthOption = value
```

**Variable**
- **Type**
  - `segs` A Segments collection *(object)*
  - `value` *(boolean)*

**Examples**
```
segs.IFBandwidthOption = True 'Write
IFOption = IFBandwidthOption 'Read
```

**C++ Syntax**
```
HRESULT get_IFBandwidthOption(VARIANT_BOOL *pVal)
HRESULT put_IFBandwidthOption(VARIANT_BOOL newVal)
```

**Interface**
ISegments
IFBandwidth Property

Description

Sets or returns the IF Bandwidth of the channel.

Sets or returns the IF Bandwidth of the segment.

Returns the IF Bandwidth used in the Cal Set.

VB Syntax

```
object.IFBandwidth = value
```

Variable (Type) - Description

- **object**
  - Channel (object)
  
  or
  
  Segment (object)
  
  or
  
  CalSet (object) - Read-only property

- **value**
  - (double) - IF Bandwidth in Hz. The list of valid IF Bandwidths is different depending on the VNA model. (Click to see the lists.) If an invalid number is specified, the analyzer will round up to the closest valid number.

Return Type

Double

Default

Varies with VNA model.

Examples

```
chan.IFBandwidth = 3e3 'sets the IF Bandwidth of the channel object to 3 kHz. -Write
seg.IFBandwidth = 5 'sets the IF Bandwidth of the segment to 5 Hz. -Write
ifbw = chan.IFBandwidth -Read
```

C++ Syntax

```
HRESULT get_IFBandwidth(double *pVal);
```

```
HRESULT put_IFBandwidth(double newVal);
```

Interface

IChannel

ISegment

|CalSet3
## IFBW Property

**Description**  
Sets and returns the IFBW for a Cal All calibration. Learn more about this setting.

**VB Syntax**  
`calAll.IFBW = value`

**Variable (Type) - Description**

- **calAll**  
  A `CalibrateAllIFBW (object)`

- **value**  
  (Double) IFBW in Hz.

**Return Type**  
Variant

**Default**  
1 kHz

**Examples**

```vba
calAll.IFBW = 10e3 'sets IFBW to 10 kHz

ifbw = calAll.IFBW 'returns the ifbw setting
```

**C++ Syntax**

```cpp
HRESULT get_IFBW (Double *Val)

HRESULT put_IFBW (Double newVal)
```

**Interface**  
ICalibrateAllChannels
**IFBWList Property**

**Description**  Returns a list of supported IFBW values.

**VB Syntax**  

\[ \text{value} = \text{cap}.\text{IFBWList} \]

**Variable**  

- **(Type)** - Description
  - **value**  (Variant) - Variable to store the returned array of IFBW values
  - **cap**  A Capabilities (Object)

**Return Type**  Variant array

**Default**  Not Applicable

**Examples**  

'Read the supported IFBW values

```vbnet
Set app = CreateObject("AgilentPNA835x.Application")
Set cap = app.Capabilities
list=cap.IFBWList
For i = 0 To UBound(list)
    msg = msg & list(i) & vbCrLf
Next
MsgBox msg
```

**C++ Syntax**  

```csharp
HRESULT get_IFBWList(Variant *value);
```

**Interface**  ICapabilities8
# IFDenominator Property

**Description**  
Sets or returns the denominator value of the IF Fractional Multiplier. Only applies to 2 stage mixers.  
If you are changing several mixer configuration settings, you can make all the changes first and then issue the Calculate and Apply commands as you would do from the user interface.

**VB Syntax**  
```vbnet
conv.IFDenominator = value
```

**Variable**  
*conv*  
A Converter (object)

*value*  
(long) IF Denominator value.

**Return Type**  
Long

**Default**  
1

**Examples**  
```vbnet
Print mixer.IFDenominator 'prints the value of the IFDenominator
```

**C++ Syntax**  
```c++
HRESULT get_IFDenominator(long *pVal)

HRESULT put_IFDenominator(long newVal)
```

**Interface**  
IConverter4

### IFFrequency Property

**Description**
Sets and returns the IF frequency for ALL receiver paths being used for the specified channel. To set this frequency, **IFFrequencyModeProperty** must be set to OFF (Manual).

**VB Syntax**

```
IfConfig.IFFrequency = value
```

**Variable**

- **Type**: Description
- **Description**: An IFConfiguration (object)
- **Value**: (double) IF Frequency. Use **MaximumIFFrequency** and **MinimumIFFrequency** to determine the range of value for this command.

**Return Type**: Double

**Default**: 9 MHz

**Examples**

```
IfConfig.IFFrequency = 9.3e6
```

**C++ Syntax**

```
HRESULT get_IFFrequency (double *pVal);

HRESULT put_IFFrequency (double pVal);
```

**Interface**: IFConfiguration3
# IFFrequencyMode Property

Write/Read About Mixer Configuration

IFSideband Property

Description: When two LOs are used, sets or returns whether to select the sum or difference for the IF1 product. (Input + or - LO1 = IF1)

- This setting corresponds to the buttons on LO1.
- Also set OutputSideband to LOW or HIGH to determine the output frequency of the mixer.
- This setting is ignored when ONE LO is used.
- If you are changing several mixer configuration settings, you can make all the changes first and then issue the Calculate and Apply commands as you would do from the user interface.

Note: There is also an IFSideband_Property on the Mixer Interface.

VB Syntax: 
```
obj.IFSideband = value
```

Variable (Type) - Description

- **obj** - A Converter Object
- **value** - (enum as ConverterSideBand) - Choose from:
  - 0 or **naLowSide** Minus (-) on the Mixer setup dialog
  - 1 or **naHighSide** Plus (+) on the Mixer setup dialog

Return Type: Enum as ConverterSideBand

Default: 0 - **naLowSide**

Examples: 
```
conv.IFSideband = naLowSide
```

C++ Syntax:
```
HRESULT get_IFSideband(ConverterSideBand *pVal)

HRESULT put_IFSideband(ConverterSideBand newVal)
```

Interface: IConverter
**IFSideband Property**

**Description**

When two LOs are used, sets or returns whether to select the sum or difference for the IF1 product. (Input + or - LO1 = IF1)

- This setting corresponds to the buttons on LO1.
- Also set OutputSideband to LOW or HIGH to determine the output frequency of the mixer.
- This setting is ignored when ONE LO is used.
- If you are changing several mixer configuration settings, you can make all the changes first and then issue the Calculate and Apply commands as you would do from the user interface.

**Note:** There is also an IFSideband_Property on the Converter Object.

**VB Syntax**

```vb
mixer.IFSideband = value
```

**Variable**

- **mixer** (Type) - Description
  - A Mixer (object)
- **value** (enum as FCASideBand) - Choose from:
  - 0 or LOW  Minus (-) on the Mixer setup dialog
  - 1 or HIGH  Plus (+) on the Mixer setup dialog

**Return Type**

Enum as FCASideBand

**Default**

0 - LOW

**Examples**

```vb
Print mixer.IFSideband  'prints the value of the IFSideband
```

**C++ Syntax**

```cpp
HRESULT get_IFSideband(FCASideBand *pVal)

HRESULT put_IFSideband(FCASideBand newVal)
```

**Interface**

IMixer
### IFStartFrequency Property

**Description**  
Sets or returns the start frequency value of the mixer IF frequency.

Only applies to 2 stage mixers.

If you are changing several mixer configuration settings, you can make all the changes first and then issue the Calculate and Apply commands as you would do from the user interface.

**VB Syntax**  
`mixer.IFStartFrequency = value`

**Variable (Type) - Description**

- `mixer`  
  A Converter (object)

- `value`  
  (double) - Frequency in Hertz.

**Return Type**  
Double

**Default**  
Not Applicable

**Examples**

```vbnet
Print mixer.IFStartFrequency 'prints the value of the IFStartFrequency
```

**C++ Syntax**

```c++
HRESULT get_IFStartFrequency(double *pVal)

HRESULT put_IFStartFrequency(double newVal)
```

**Interface**  
IMixer
## IFStopFrequency Property

**Description**  Sets or returns the stop frequency value of the mixer IF frequency.

Only applies to 2 stage mixers.

If you are changing several mixer configuration settings, you can make all the changes first and then issue the Calculate and Apply commands as you would do from the user interface.

**VB Syntax**  

```vbnet
mixer.IFStopFrequency = value
```

**Variable**  

- `mixer`  A `Converter` (object)
- `value`  (double) - IF stop frequency in Hertz.

**Return Type**  Double

**Default**  Not Applicable

**Examples**  

```vbnet
Print mixer.IFStopFrequency 'prints the value of the IFStopFrequency
```

**C++ Syntax**  

```csharp
HRESULT get_IFStopFrequency(double *pVal)

HRESULT put_IFStopFrequency(double newVal)
```

**Interface**  IMixer
### ImageRejectMethod Property

</tbody>
</table>
ImageRejectStrength Property

Description
Sets and returns the image rejection strength. During the image rejection process, several LO acquisitions overlap at the same RF frequency. As a result, different RF signal values can be returned. This command sets the acceptable power differences between LOs in determining actual signals.

VB Syntax

```
sa.ImageRejectStrength = value
```

Variable (Type) - Description

- **sa**: A SpectrumAnalyzer (object)
- **value**: (enum NASAStrength) - Choose from:
  - 0: naSAWeak: 3 dB (approximate value, depends on RBW)
  - 1: naSANormal: 1 dB (approximate value, depends on RBW)
  - 2: naSAStrong: 0.5 dB (approximate value, depends on RBW)

Return Type
Enum as NASAStrength

Default
naSANormal

Examples

```
sa.ImageRejectStrength = naSAStrong 'Write
Strength = sa.ImageRejectStrength 'Read
```

C++ Syntax

```
HRESULT get_ImageRejectStrength(tagNASAStrength* pVal)
HRESULT put_ImageRejectStrength(tagNASAStrength newVal)
```

Interface
ISpectrumAnalyzer4
### ImpedanceStates Property

**Description**
Sets the number of impedance states to use during calibrated measurements.

**VB Syntax**

```vbnet
noise.ImpedanceStates = value
```

**Variable (Type) - Description**

- `noise` (A `NoiseFigure` object)
- `value` (double) - Impedance states. Choose between 4 and the maximum number allowed by the noise tuner device. If the specified number exceeds the capability of the device, the measurement will use the maximum number of states the device allows.

**Return Type**
Double

**Default**
4

**Examples**

- `noise.ImpedanceStates = 10` 'Write
- `AvgNoise = noise.ImpedanceStates` 'Read

**C++ Syntax**

```
HRESULT get_ImpedanceStates(double* pVal)
HRESULT put_ImpedanceStates(double newVal)
```

**Interface**
`INoiseFigure`
ImpulseWidth Property

Description: Sets or returns the Impulse Width of Time Domain transform windows.

VB Syntax: `trans.ImpulseWidth = value`

Variable (Type) - Description:
- `trans` A Transform (object)
- `value` (double) - Impulse Width in seconds. Range of settings depends on the frequency range of your analyzer.

Return Type: Double

Default: .98 / Default Span

Examples:
- `trans.ImpulseWidth = 200e-12` 'sets the Impulse width of a transform window -Write
- `IW = trans.ImpulseWidth` 'Read

C++ Syntax:
- `HRESULT get_ImpulseWidth(double *pVal)`
- `HRESULT put_ImpulseWidth(double newVal)`

Interface: ITransform
### IMToneIFBandwidth Property

**Description**
Sets and returns the IF Bandwidth for measurement of the intermodulation products.

**VB Syntax**
```
imd.IMToneIFBandwidth = value
```

**Variable (Type) - Description**
- **imd** (A SweptIMD Object)
- **value** (Double) IF Bandwidth in Hz. Choose from: 1 | 2 | 3 | 5 | 7 | 10 | 15 | 20 | 30 | 50 | 70 | 100 | 150 | 200 | 300 | 500 | 700 | 1k | 1.5k | 2k | 3k | 5k | 7k | 10k | 15k | 20k | 30k | 50k | 70k | 100k | 150k | 200k | 280k | 360k | 600k

Learn more about setting IFBW for IMD.

If an invalid number is specified, the analyzer will round up to the closest valid number.

**Return Type**
Double

**Default**
1 kHz

**Examples**
```
imd.IMToneIFBandwidth = 2e3 'Write
value = imd.IMToneIFBandwidth 'Read
```

**C++ Syntax**
- HRESULT get_IMToneIFBandwidth(double *pVal)
- HRESULT put_IMToneIFBandwidth(double newVal)

**Interface**
ISweptIMD
InactiveLabels Property

**Description**
Set and return the Inactive (not selected) Window Labels for the VNA display or hardcopy print.

**VB Syntax**
```
colors.InactiveLabels = value
```

**Variable**
- **(Type)** - Description
  - colors
    - A `ComColors (object)`
  - value
    - `(Long Integer)` - RGB color of the Inactive Labels pen.

Convert the three RGB colors to an integer as follows:

```
RGB = R+(G*2^8)+(B*2^16)
```

To find the three RGB values from the Display Colors dialog, click **Change Color**, then **Define Custom Color**.

**Return Type**
- Long

**Default**
- Display = 160,160,160
- Print = 0,0,0 (Black)

**Examples**
```
R = 10
G = 10
B = 10
RGB = R+(G*2^8)+(B*2^16)
colors.InactiveLabels = RGB 'Write
color = colors.InactiveLabels 'Read
```

**C++ Syntax**
```
HRESULT get_InactiveLabels(long* pVal);
HRESULT put_InactiveLabels(long newVal);
```

**Interface**
- `IColors`
### Include2ndOrderProduct Property

**Description**  
Sets and returns whether to include the second order products in the calibration. These frequencies of these products can be far from the main tones.

**VB Syntax**  
```vbnet
imd.Include2ndOrderProduct = value
```

**Variable**  
- `(Type)` - `Description`  
- `imd` - A `SweptIMDCal (object)`  
- `value` - (Boolean) Choose from:
  - **False** - Do NOT include 2nd order products  
  - **True** - Include 2nd order products

**Return Type**  
Boolean

**Default**  
**False** - Do NOT include 2nd order products

**Examples**  
```vbnet
imd.Include2ndOrderProduct = true 'Write
incl = imd.Include2ndOrderProduct 'Read
```

**C++ Syntax**  
```cpp
HRESULT get_Include2ndOrderProduct(VARIANT_BOOL * Val)
HRESULT put_Include2ndOrderProduct(VARIANT_BOOL newVal)
```

**Interface**  
ISweptIMD
# IncludePort Property

Sets and returns the enable state for the specified port.

## Description
Sets and returns the enable state for the specified port.

## VB Syntax
```vb
phaseRef.IncludePort (n) = value
```

## Variable

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>object</code></td>
<td><code>PhaseReferenceCalibration (object)</code></td>
</tr>
<tr>
<td><code>n</code></td>
<td>Port number to enable or disable.</td>
</tr>
<tr>
<td><code>value</code></td>
<td>Port enable state. Choose from:</td>
</tr>
</tbody>
</table>

- `True` - Enable port <n>
- `False` - Disable port <n>

## Return Type
Boolean

## Default

- Ports 1 and 2 are enabled.
- Ports 3 and 4 (if present) are disabled

## Examples
```vb
phaseRef.IncludePort(3) = True
value = phaseRef.IncludePort(3) 'Read
```

## C++ Syntax
```cpp
HRESULT get_IncludePort(Long port, VARIANT_BOOL *value)

HRESULT put_IncludePort(Long port, VARIANT_BOOL value)
```

## Interface
IPhaseReference2
# IncludeReverseSweep Property

<table>

### IncludeUnknownMixer Property

**Description**
Sets and returns the state of Unknown Mixer calibration.

**VB Syntax**

```vbnet
phaseRef.IncludeUnknownMixer = value
```

**Variable**

- **(Type)** - Description
  - `object` PhaseReferenceCalibration (object)
  - `value` (Boolean) Unknown Mixer cal state. Choose from:

  - **True** - Enable Unknown Mixer cal. The start frequency becomes 10 MHz and can NOT be changed.
  - **False** - Disable Unknown Mixer cal.

**Return Type**
Boolean

**Default**
False

**Examples**

- `phaseRef.IncludeUnknownMixer = True`
- `value = phaseRef.IncludeUnknownMixer 'Read`

**C++ Syntax**

- `HRESULT get_InvokeUnknownMixer(VARIANT_BOOL *value)`
- `HRESULT put_InvokeUnknownMixer(VARIANT_BOOL value)`

**Interface**
IPhaseReference2
## IndependentPowerCalibration Property

<table>
<thead>
<tr>
<th>Description</th>
<th>This property returns a handle to the <code>IndependentPowerCalibration</code> object.</th>
</tr>
</thead>
<tbody>
<tr>
<td>VB Syntax</td>
<td><code>calAll.IndependentPowerCalibration()</code></td>
</tr>
<tr>
<td>Variable</td>
<td><em>(Type)</em> - Description</td>
</tr>
<tr>
<td><code>calAll</code></td>
<td>A <code>CalibrateAllChannels</code> <em>(object)</em></td>
</tr>
<tr>
<td>Return Type</td>
<td><code>IIndependentPowerCalibration</code></td>
</tr>
<tr>
<td>Default</td>
<td>Not Applicable</td>
</tr>
<tr>
<td>Example</td>
<td><code>CalibrateAllChannels.IndependentPowerCalibration()</code></td>
</tr>
<tr>
<td>C++ Syntax</td>
<td><code>HRESULT IndependentPowerCalibration( IIndependentPowerCalibration **obj);</code></td>
</tr>
<tr>
<td>Interface</td>
<td><code>ICalibrateAllChannels2</code></td>
</tr>
</tbody>
</table>
**IndexState Property**

**Description**
Determines the control of Material Handler connector Pin 20.

**VB Syntax**
`handler.IndexState = value`

**Variable**
- **(Type)** - Description
- **handler** - A `Handler I/O` object
- **value** - A `boolean`
  
  - False - Pin 20 is controlled by Output Port B6
  
  - True - Pin 20 is controlled by the Index signal

**Return Type**
Boolean

**Default**
False

**Examples**

```
handler.IndexState = False 'Write
bState = handler.IndexState 'Read
```

**C++ Syntax**

```
HRESULT put_IndexState (BOOL *pVal);
HRESULT get_IndexState (BOOL newVal);
```

**Interface**
`IHWMaterialHandlerIO2`
**InitCmd Property**

**Description**
Sets and returns the Enable I/O command for an external DC Source and an external DC Meter.

**VB Syntax**
`extDC.InitCmd = value`

**Variable**
`extDC` (Type) - Description

`value` (String) The SCPI command used to enable the DC Source and DC Meter.

**Return Type**
String

**Default**
"" Empty String

**Examples**
```vbnet
extDC.InitCmd = "OUTP ON" 'Write
value = extDC.InitCmd 'Read
```

**C++ Syntax**
```cpp
HRESULT get_InitCmd( BSTR* cmd);
HRESULT put_InitCmd( BSTR cmd);
```

**Interface**
IExternalDCDevice3
# InputA Property - **Obsolete**

This property has NO replacement and no longer works correctly. (Sept. 2004)

Sets a Port Extension value for Receiver A

**VB Syntax**

```vbnet
portExt.InputA = value
```

**Variable**

- **(Type)** - Description
- **portExt** - A Port Extension **(object)**
- **value** - Port Extension value in seconds. Choose any number between -10 and 10

**Return Type**

Double

**Default**

0

**Examples**

```vbnet
portExt.InputA = 10e-6 'Write
inA = portExt.InputA 'Read
```

**C++ Syntax**

```cpp
HRESULT get_InputA(double *pVal)
HRESULT put_InputA(double newVal)
```

**Interface**

IPortExtension
### InputB Property - Obsolete

**Description**

This property has NO replacement and no longer works correctly. (Sept. 2004)

Sets the Port Extension value for Receiver B

**VB Syntax**

```vbnet
portExt.InputB = value
```

**Variable (Type) - Description**

- `portExt` (object) - A Port Extension
- `value` (double) - Port Extension value in seconds. Choose any number between -10 and 10

**Return Type**

Double

**Default**

0

**Examples**

```vbnet
portExt.InputB = 10e-6 'Write
inB = portExt.InputB 'Read
```

**C++ Syntax**

```cpp
HRESULT get_InputB(double *pVal)
HRESULT put_InputB(double newVal)
```

**Interface**

IPortExtension
InputC Property **Obsolete**

**Description**

*This property has NO replacement and no longer works correctly. (Sept. 2004)*

Sets the Port Extension value for Receiver C

**VB Syntax**

```vbnet
    portExt.InputC = value
```

**Variable**

*Type* - Description

- `portExt` - A Port Extension *(object)*
- `value` - Port Extension value in seconds. Choose any number between -10 and 10

**Return Type**

Double

**Default**

0

**Examples**

```vbnet
    portExt.InputC = 10e-6 'Write
    inc = portExt.InputC 'Read
```

**C++ Syntax**

```c
    HRESULT get_InputC(double *pVal)
    HRESULT put_InputC(double newVal)
```

**Interface**

IPortExtension
InputDenominator Property

Description
Sets or returns the denominator value of the Input Fractional Multiplier.

If you are changing several mixer configuration settings, you can make all the changes first and then issue the Calculate and Apply commands as you would do from the user interface.

VB Syntax

```
obj.InputDenominator = value
```

Variable

- **obj**
  - A Mixer Interface pointer to the Measurement (object)
  - Or
  - A Converter Object

- **value**
  - **(Long)** - Input denominator value.

Return Type

Long

Default

1

Examples

```
Print mixer.InputDenominator 'prints the value of the InputDenominator
```

C++ Syntax

```
HRESULT get_InputDenominator(long *pVal)

HRESULT put_InputDenominator(long newVal)
```

Interface

IMixer

IConverter
### InputFixedFrequency Property

**Description**
Sets or returns the mixer fixed Input frequency value.

If you are changing several mixer configuration settings, you can make all the changes first and then issue the Calculate and Apply commands as you would do from the user interface.

**VB Syntax**

```vbnet
obj.InputFixedFrequency = value
```

**Variable**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>obj</code></td>
<td>A Mixer Interface pointer to the Measurement (object)</td>
</tr>
<tr>
<td>Or</td>
<td>A Converter Object</td>
</tr>
</tbody>
</table>

**value**

*(double)* - Input Fixed Frequency in Hertz.

**Return Type**
Double

**Default**
Not Applicable

**Examples**

```vbnet
mixer.InputFixedFrequency = 1e9
```

**C++ Syntax**

```cpp
HRESULT get_InputFixedFrequency(double *pVal)
HRESULT put_InputFixedFrequency(double newVal)
```

**Interface**

- IMixer6
- IConverter
IsInputGreaterThanLO Property

Description
Specifies whether to use the Input frequency that is greater than the LO or less than the LO. To learn more, see the mixer setup dialog box help.

If you are changing several mixer configuration settings, you can make all the changes first and then issue the Calculate and Apply commands as you would do from the user interface.

VB Syntax

```vbnet
obj.IsInputGreaterThanLO (LO) = bool
```

Variable (Type) - Description

- **obj** - A Mixer Interface pointer to the Measurement (object)
- Or
- A Converter Object
- **LO** - LO stage number
  - Choose from 1 (default) or 2
- **bool** -
  - **True** - Use the Input that is Greater than the specified LO.
  - **False** - Use the Input that is Less than the specified LO.

Return Type
Boolean

Default
True

Examples

```vbnet
mixer.IsInputGreaterThanLO (1) = True
```

C++ Syntax

```cpp
HRESULT get_IsInputGreaterThanLO(VARIANT_BOOL * val);
HRESULT put_IsInputGreaterThanLO(VARIANT_BOOL val);
```

Interface
IMixer2
IConverter
## InputNumerator Property

**Description**
Sets or returns the numerator value of the Input Fractional Multiplier.

If you are changing several mixer configuration settings, you can make all the changes first and then issue the `Calculate` and `Apply` commands as you would do from the user interface.

**VB Syntax**

```vbnet
obj.InputNumerator = value
```

**Variable**

- **Type** - `obj` - A Mixer Interface pointer to the Measurement (object)
- Or
- A Converter Object

- **value** - `Long` - Input numerator value.

**Return Type**

`Long`

**Default**

1

**Examples**

```vbnet
Print mixer.InputNumerator 'prints the value of the InputNumerator
```

**C++ Syntax**

- `HRESULT get_InputNumerator(long *pVal)`
- `HRESULT put(InputNumerator(long newVal)`

**Interface**

- `IMixer`
- `IConverter`
## InputPower Property

**Description**
Sets or returns the value of the Input Power.

If you are changing several mixer configuration settings, you can make all the changes first and then issue the `Calculate` and `Apply` commands as you would do from the user interface.

**VB Syntax**
```vbnet
obj.InputPower = value
```

**Variable (Type) - Description**

- `obj` A Mixer Interface pointer to the Measurement (object)
  
  Or

- A Converter Object

- `value` (double) - Input power in dBm.

**Return Type**
Double

**Default**
-15 dBm for IMixer
-20 dBm for IConverter

**Examples**
`Print mixer.InputPower 'prints the value of the InputPower`

**C++ Syntax**

```cpp
HRESULT get_InputPower(double *pVal)
HRESULT put_InputPower(double newVal)
```

**Interface**
IMixer
IConverter
### InputRangeMode Property

<table>
<thead>
<tr>
<th>Description</th>
<th>Sets or returns the Input sweep mode.</th>
</tr>
</thead>
</table>

If you are changing several mixer configuration settings, you can make all the changes first and then issue the Calculate and Apply commands as you would do from the user interface.

**Note:** There is also a InputRangeMode Property on the Converter Object.

**VB Syntax**  
`obj.InputRangeMode = value`

**Variable (Type) - Description**

- `obj` A Mixer Interface pointer to the Measurement (object)
- `value` (Enum as MixerRangeMode) - Input sweep mode. Choose from:
  - `0 - mixSwept`
  - `1 - mixFixed`

**Return Type**  
Enum

**Default**  
0 - mixSwept

**Examples**  
`mixer.InputRangeMode = mixSwept`

**C++ Syntax**

- `HRESULT get_InputRangeMode(long *pVal)`
- `HRESULT put_InputRangeMode(long newVal)`

**Interface**  
IMixer6
### InputRangeMode Property

**Description**  
Sets or returns the Input sweep mode.

If you are changing several mixer configuration settings, you can make all the changes first and then issue the **Calculate** and **Apply** commands as you would do from the user interface.

**Note:** There is also a InputRangeMode on the Mixer Interface.

**VB Syntax**  
`obj.InputRangeMode = value`

**Variable**  
**(Type) - Description**

- `obj` : A Converter Object
- `value` : (Enum as NARangeMode) - Input sweep mode. Choose from:
  - `0 - naSwept`
  - `1 - naFixed`

**Return Type**  
Enum

**Default**  
0 - naSwept

**Examples**  
`conv.InputRangeMode = naSwept`

**C++ Syntax**  

```
HRESULT get_InputRangeMode(long LO, enum *pVal)

HRESULT put_InputRangeMode(long LO, enum newVal)
```

**Interface**  
IConverter
## InputStartFrequency Property

<table>
<thead>
<tr>
<th>Description</th>
<th>Sets and returns the start frequency value of the mixer Input frequency.</th>
</tr>
</thead>
<tbody>
<tr>
<td>If you are changing several mixer configuration settings, you can make all the changes first and then issue the Calculate and Apply commands as you would do from the user interface.</td>
<td></td>
</tr>
</tbody>
</table>

### VB Syntax

```
obj.InputStartFrequency = value
```

### Variable 

- **obj** (Type) - Description
  - A Mixer Interface pointer to the Measurement (object)
  - Or
    - A Converter Object

- **value** (double) - Input start frequency in Hertz.

### Return Type

Double

### Default

Start frequency of the VNA

### Examples

```
mixer.InputStartFrequency = Start_Freq
```

### C++ Syntax

```
HRESULT get_InputStartFrequency(double *pVal)
```

```
HRESULT put_InputStartFrequency(double newVal)
```

### Interface

- IMixer
- IConverter
**InputStartPower Property**

<table>
<thead>
<tr>
<th>Description</th>
<th>Sets and returns the Start Power value of the mixer Input Power.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>If you are changing several mixer configuration settings, you can make all the changes first and then issue the Calculate and Apply commands as you would do from the user interface.</td>
</tr>
</tbody>
</table>

**VB Syntax**

```vbnet
obj.InputStartPower = value
```

**Variable** *(Type)* - Description

- **obj** - A Converter Object
- **value** - (double) - Input start Power in dBm.

**Return Type** Double

**Default** Start Power of the VNA

**Examples**

```vbnet
mixer.InputStartPower = 0
```

**C++ Syntax**

```cpp
HRESULT get_InputStartPower(double *pVal)

HRESULT put_InputStartPower(double newVal)
```

**Interface** IConverter
### InputStopFrequency Property

**Description**
Sets and returns the stop frequency value of the mixer Input frequency.

If you are changing several mixer configuration settings, you can make all the changes first and then issue the Calculate and Apply commands as you would do from the user interface.

**VB Syntax**

```
obj.InputStopFrequency = value
```

**Variable**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>obj</td>
<td>A Mixer Interface pointer to the Measurement (object)</td>
</tr>
</tbody>
</table>

Or

A Converter Object

<table>
<thead>
<tr>
<th>value</th>
<th>(double) - Input stop frequency in Hertz.</th>
</tr>
</thead>
</table>

**Return Type**
Double

**Default**
Stop frequency of the VNA

**Examples**

```
mixer.InputStopFrequency = Stop_Freq
```

**C++ Syntax**

- HRESULT get_InputStopFrequency(double *pVal)
- HRESULT put_InputStopFrequency(double newVal)

**Interface**
IMixer
IConverter
### InputStopPower Property

**Description**
Sets and returns the Stop Power value of the mixer Input Power.

If you are changing several mixer configuration settings, you can make all the changes first and then issue the Calculate and Apply commands as you would do from the user interface.

**VB Syntax**

```vbnet
obj.InputStopPower = value
```

**Variable**

<table>
<thead>
<tr>
<th>(Type)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>obj</code></td>
<td>A Converter Object</td>
</tr>
<tr>
<td><code>value</code></td>
<td>(double) - Input Stop Power in dBm.</td>
</tr>
</tbody>
</table>

**Return Type**
Double

**Default**
Stop Power of the VNA

**Examples**

```vbnet
mixer.InputStopPower = 0
```

**C++ Syntax**

```cpp
HRESULT get_InputStopPower(double *pVal)

HRESULT put_InputStopPower(double newVal)
```

**Interface**
IConverter
### InternalDCReceiverCount Property

<table>
<thead>
<tr>
<th>Description</th>
<th>Returns the number of internal DC receivers in the analyzer.</th>

</table>
Interpolate Correction Property

Description
Turns ON and OFF correction interpolation which calculates new error terms when stimulus values change after calibration.

When this property is ON and error correction is being applied, the calibration subsystem attempts to interpolate the error terms whenever the stimulus parameters are changed.

When this property is OFF under the same circumstances, error correction is turned OFF.

VB Syntax
```
meas.InterpolateCorrection = value
```

Variable (Type) - Description

- **meas**: A Measurement (object)
- **value**: (boolean) - Choose from:
  - **True**:Turns correction interpolation ON
  - **False**:Turns correction interpolation OFF

Return Type
Boolean

Default
True

Examples
```
meas.InterpolateCorrection = False
```

C++ Syntax
```
HRESULT get_InterpolateCorrection(boolean *pVal)
HRESULT put_InterpolateCorrection(boolean newVal)
```

Interface
IMeasurement
Write/Read

Interpolated Property

Description: Turns marker Interpolation ON and OFF. Marker interpolation enables X-axis resolution beyond the discrete data values. The analyzer will calculate the x and y-axis data values between discrete data points. Use meas.Interpolate to change interpolation of all markers in a measurement. This command will override the measurement setting.

**VB Syntax**

```vbnet
mark.Interpolated = value
```

**Variable (Type) - Description**

- **mark**: A Marker (object)
- **value**: (boolean)
  - **False**: Turns interpolation OFF
  - **True**: Turns interpolation ON

**Return Type**: Boolean

**Default**: True

**Examples**

```vbnet
mark.Interpolated = True 'Write
interpolate = mark.Interpolated 'Read
```

**C++ Syntax**

```cpp
HRESULT get_Interpolated(VARIANT_BOOL *pVal)
HRESULT put_Interpolated(VARIANT_BOOL newVal)
```

**Interface**: IMarker
InterpolateMemory Property

Description
Sets and reads the state of the memory data interpolation. Learn more.

VB Syntax
meas.InterpolateMemory = bool

Variable (Type) - Description
meas (measurement (object))
bool (boolean)
False - Turn memory data interpolation OFF.
True - Turn memory data interpolation ON.

Return Type
Boolean

Default
False

Examples
meas.InterpolateMemory = True 'Write
state = meas.InterpolateMemory 'Read

C++ Syntax
HRESULT get_InterpolateMemory(VARIANT_BOOL *intState)
HRESULT put_InterpolateMemory(VARIANT_BOOL intState)

Interface
IMeasurement18
## InterpolateMemoryIsDefault Property

**Description**  
Sets and reads the state of the memory data interpolation default preference. The PNA will return to the default interpolation state after a Preset, creating a new trace, or closing the PNA application. Learn more.

**VB Syntax**  
```vbnet
pref.InterpolateMemory = bool
```

**Variable**  
(`Type`) - Description

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>pref</code></td>
<td>A Preferences (object)</td>
</tr>
<tr>
<td><code>bool</code></td>
<td>(boolean)</td>
</tr>
<tr>
<td></td>
<td><strong>False</strong> - Set memory interpolation to OFF as the default.</td>
</tr>
<tr>
<td></td>
<td><strong>True</strong> - Set memory interpolation to ON as the default.</td>
</tr>
</tbody>
</table>

**Return Type**  
Boolean

**Default**  
False

**Examples**  
```vbnet
pref.InterpolateMemoryIsDefault = True 'Write
prefer = pref.InterpolateMemory 'Read
```

**C++ Syntax**  
```cpp
HRESULT get_InterpolateMemory(VARIANT_BOOL *intState)
HRESULT put_InterpolateMemory(VARIANT_BOOL intState)
```

**Interface**  
IPreferences
**InterpolateNormalization Property  Superseded**

**Description**  
*Note: This property is replaced by DoReceiverPowerCal Method.*

Turns ON and OFF normalization interpolation which calculates new divisor data when stimulus values change after normalization.

When this property is ON and normalization is being applied, the Normalization algorithm attempts to interpolate the divisor data whenever the stimulus parameters are changed.

When this property is OFF under the same circumstances, normalization is turned OFF.

Normalization is currently supported only on measurements of unratioed power for the purpose of performing a receiver power calibration.

**VB Syntax**  
`meas.InterpolateNormalization = value`

**Variable (Type) - Description**
- `meas` (object) - A Measurement object
- `value` (boolean)
  - False – Turns normalization interpolation OFF
  - True – Turns normalization interpolation ON

**Return Type**  
Boolean

**Default**  
False -OFF

**Examples**
- `meas.InterpolateNormalization = False 'Write`
- `normalized = meas.InterpolateNormalization 'Read`

**C++ Syntax**

- `HRESULT put_InterpolateNormalization(VARIANT_BOOL bState);`
- `HRESULT get_InterpolateNormalization(VARIANT_BOOL *bState);`

**Interface**  
IMeasurement
### Interrupt Property

**Description**
Reads the boolean that represents the state of the Interrupt In line (pin 13) on the external test set connector.

**VB Syntax**
```
value = ExtIO.Interrupt
```

**Variable**
- **value** (boolean) - Variable to store the returned data
- **ExtIO** (object) - An ExternalTestSetIO object

**Return Type**
Boolean

- **False** - indicates the line is being held at a TTL High
- **True** - indicates the line is being held at a TTL Low

**Default**
Not Applicable

**Examples**
```
value = ExtIO.Interrupt
```

**C++ Syntax**
```
HRESULT get_Interrupt( VARIANT_BOOL* bValue);
```

**Interface**
IHWExternalTestSetIO
### Invert Property

**Description**  
Sets whether to invert the polarity of the pulse.

**VB Syntax**  
`pulse.Invert (n) = value`

**Variable (Type) - Description**

- `pulse` A `PulseGenerator (object)`
- `n` (Integer) Pulse generator number. Choose from 0 to 4.
  
  Or use `PulseGeneratorID` to refer to an external pulse generator.

  0 is the generator that pulses the ADC.

- `value` (Boolean) - Invert the pulse generator polarity. This causes the pulse ON time to be active low and OFF be active high.
  
  **True** - Invert the pulse generator polarity.
  
  **False** - Do NOT Invert the pulse generator polarity.

**Return Type**  
Boolean

**Default**  
False

**Examples**

```markdown
pulse.Invert(1) = True 'Write
value = pulse.Invert(4) 'Read
```

**C++ Syntax**

```cpp
HRESULT get_Invert(integer pulse, VARIANT_BOOL *pVal);

HRESULT put_Invert(integer pulse, VARIANT_BOOL newVal);
```

**Interface**  
`IPulseGenerator4`
# IOConfiguration Property

**Description**
Sets and returns the method of communication and address for the external device.

**VB Syntax**
`extDevices.IOConfiguration = value`

**Variable**
- **(Type)**: `Description`  
  - `extDevices` (*An ExternalDevice* object)  
  - `value` (*String*) Configuration path. Any valid VISA resource shown in the IO Configuration field of the External Devices dialog, enclosed in quotes.

  Do NOT use the ID string of a PMAR USB power sensor as the resource string. The ID string is returned by the `USBPowerMeterCatalog Property`

**Return Type**
String

**Default**
" " Empty String

**Examples**
```vbnet
extDevices.IOConfiguration = "TCPIP::141.121.76.239::inst0::INSTR" 'Write
value = extDevices.IOConfiguration 'Read
```

See example program to configure PMAR device

See example program to configure External Source

**C++ Syntax**
- `HRESULT get_IOConfiguration( BSTR* value);`
- `HRESULT put_IOConfiguration( BSTR newVal);`

**Interface**
`IExternalDevices`
IOEnable Property

**Description**
Sets and returns whether an external device is enabled for IO communication with the VNA.

When disabled (False), the VNA will NOT attempt to connect to the external device regardless of the instrument state (Active). Therefore, no errors will be produced if the device is not connected.

This command is useful for debugging and testing states when the external device is not connected. This command is unnecessary in ordinary operation (when the device is connected).

**VB Syntax**
```
extDevices.IOEnable = value
```

**Variable (Type) - Description**
- **extDevices**: An ExternalDevice (object)
- **value**: (Boolean) Choose from:
  - **True**: Device is available for IO communication.
  - **False**: Device is NOT available for IO communication.

**Return Type**: Boolean
**Default**: True

**Examples**
```
extDevices.IOEnable = True 'Write
bool = extDevices.IOEnable 'Read
See example program to configure PMAR device
See example program to configure External Source
```

**C++ Syntax**
```
HRESULT get_IOEnable( VARIANT_BOOL* value);
HRESULT put_IOEnable( VARIANT_BOOL newVal);
```

**Interface**: IExternalDevices
### IsBalanced Property

<table>
<thead>
<tr>
<th>Description</th>
<th>Returns whether or not the specified logical port number is balanced.</th>

<td><code>balTopology.SetCustomDuTTopology (&quot;SSBSSB&quot;, portlist)</code></td>
</tr>
<tr>
<td></td>
<td><code>variable = balTopology.IsBalanced(3) 'Read</code></td>
</tr>
<tr>
<td>C++ Syntax</td>
<td><code>HRESULT get_IsBalanced(long logicalPort, VARIANT_BOOL *bBalanced);</code></td>
</tr>
<tr>
<td>Interface</td>
<td>IBalancedTopology3</td>
</tr>
</tbody>
</table>
IsContinuous Property

Description
Returns whether or not a channel is in continuous mode. To set the channel to continuous mode, use Continuous Method.

VB Syntax

\[
value = chan.IsContinuous
\]

Variable

(Type) - Description

\[value\] (boolean) - Choose either:

- **False** - Channel trigger is NOT set to continuous.
- **True** - Channel trigger IS set to continuous.

\[chan\] Channel (object)

Return Type
Boolean

Default
Not Applicable

Examples

\[trig = chan.IsContinuous \]  

C++ Syntax

HR\RESULT get_IsContinuous ( VARIANT\_BOOL *bContinuous);

Interface
IChannel4
### IsDevicePresent Property

**Description**  
Returns whether the named device is present on the bus for which it is configured.

**VB Syntax**  
```vbnet
value = extDevices.IsDevicePresent(devName)
```

**Variable** *(Type) - Description*

- **value** *(Boolean)* Variable to store the returned value:
  
  - **False** - The device is not in the collection or the device fails to respond and times out when communication is attempted.
  
  - **True** - The device responds when communication is attempted.

- **extDevices** An **ExternalDevices (collection)**

- **devName** *(String)* Name of the device with which you want to communicate.

**Return Type**  
Boolean

**Default**  
Not Applicable

**Examples**  
```vbnet
present = extDevices.IsDevicePresent("MyPowerMeter") 'Read
```

**C++ Syntax**  
```cpp
HRESULT get_IsDevicePresent(VARIANT_BOOL *present);
```

**Interface**  
IExternalDevices2
IsECALModuleFoundEx Property

Description
This property replaces IsECALModuleFound Property.

Returns true or false depending on whether communication was established between the VNA and the specified ECAL module.

VB Syntax

```vbnet
modFound = cal.IsECALModuleFoundEx(module)
```

Variable (Type) - Description

```vbnet
modFound (boolean) - Variable to store the returned test result.
```

**True** - The VNA identified the presence of the specified ECAL module.

**False** - The VNA did NOT identify the presence of the specified ECAL module.

```vbnet
cal (object) - A Calibrator object

module (long integer) - ECAL module.
```

Choose from modules 1 through 8.

Use GetECALModuleInfoEx to return the model and serial number of each module.

Return Type
Boolean

Default
Not applicable

Examples

```vbnet
Set cal = pna.ActiveChannel.Calibrator
moduleFound = cal.IsECALModuleFoundEx(1)
```

C++ Syntax

```cpp
HRESULT get_IsECALModuleFoundEx( long moduleNumber,
                                VARIANT_BOOL *bModuleFound);
```

Interface
ICalibrator4
### IsEnhancedModulationControl Property

**Description**
Sets and reads the state of modulation sources having the capability to download modulation files. Modulation distortion control must be ON to control the modulation of an external source.

**VB Syntax**
```
extSource.IsEnhancedModulationControl = value
```

**Variable**

- **extSource** (Type) - Description: An ExternalSource Object (object)
- **value** (Boolean) Choose from:
  - 1 - Enable control of external modulation.
  - 0 - Disable control of external modulation.

Learn about these settings and about adding an external source.

**Return Type**
Boolean

**Default**
0

**Examples**
```vbnet
eextSource.IsEnhancedModulationControl = 1 'Write
value = extSource.IsEnhancedModulationControl 'Read
```

**C++ Syntax**
```
HRESULT put_IsEnhancedModulationControl(VARIANT_BOOL bEnable);
HRESULT get_IsEnhancedModulationControl(VARIANT_BOOL* bEnable);
```

**Interface**
IEternalSource3
### IsFrequencyOffsetPresent Property

**Description**
Returns a value indicating the presence of Frequency Offset Option S93080A in the remote VNA.

**VB Syntax**
```
value = cap.IsFrequencyOffsetPresent
```

**Variable**
- **value** (Boolean) - Variable to store the returned value
  - True - Frequency Offset Option S93080A is present
  - False - Frequency Offset Option S93080A is not present

**cap**
A `Capabilities` (object)

**Return Type**
Boolean

**Default**
Not Applicable

**Examples**
```
value = cap.isFrequencyOffsetPresent(1) 'Read
```

**C++ Syntax**
```
HRESULT get_IsFrequencyOffsetPresent(VARIANT_BOOL * present);
```

**Interface**
ICapabilities
# IsHold Property

## IsolationIncrementAveraging Property

### Description
Value by which to increment (increase) the channel's averaging factor during measurement of isolation in an ECal calibration.

**Note:** If `<value>` is greater than 1 and the channel currently has averaging turned OFF, averaging will be turned ON only during the isolation measurements and with the averaging factor equal to `<value>`.

### VB Syntax
```
cal.IsolationIncrementAveraging = value
```

### Variable *(Type)* - Description
- **cal**
  - A **Calibrator** *(object)*
- **value**
  - A **Long** Incremental Averaging factor. The maximum averaging factor is 65536 ($2^{16}$).

### Return Type
Long Integer

### Default
8

### Examples
```vba
oCal.IsolationAveragingIncrement = 16 'Write
avgIncr = oCal.IsolationAveragingIncrement ' Read
```

### C++ Syntax
```c++
HRESULT get_IsolationAveragingIncrement(long *pVal);

HRESULT put_IsolationAveragingIncrement(long newVal);
```

### Interface
ICalibrator7
**IsOn Property**

| Description | Sets and returns the ON |OFF state of Embedded LO. |
|-------------|------------------------|
| VB Syntax   | *obj*.IsOn = *value*   |
| Variable    | (Type) - Description   |
| *obj*       | An EmbeddedLO *(object)* or |
|             | A ConverterEmbeddedLO *(object)* |
| *value*     | (Boolean)               |
|             | False - Turns Embedded LO OFF |
|             | True - Turns Embedded LO ON |
| Return Type | (Boolean)               |
| Default     | False (OFF)             |
| Examples    |                         |

|             | data= embedLO.IsOn 'read |
| C++ Syntax  | HRESULT get_IsOn( VARIANT_BOOL* IsOn); |
|             | HRESULT put_IsOn( VARIANT_BOOL IsOn); |
| Interface   | IEmbeddedLO             |
IsReceiverStepAttenuatorPresent Property

Description
Returns a value indicating the presence of Receiver step attenuators in the remote VNA.

VB Syntax
value = cap.IsReceiverStepAttenuatorPresent(n)

Variable
- **value** (Boolean) - Variable to store the returned value.
  - True - Receiver step attenuators are present.
  - False - Receiver step attenuators are not present.

- **cap** - A Capabilities (object)

- **n** (Long) - port number to query for step attenuators

Return Type
Boolean

Default
Not Applicable

Examples
value = cap.IsReceiverStepAttenuatorPresent(1) 'Read

C++ Syntax
HRESULT get_IsReceiverStepAttenuatorPresent(long portNumber, 
VARIANT_BOOL * present);

Interface
ICapabilities
**IsReferenceBypassSwitchPresent Property**

**Description**
Returns a value indicating the presence of a Reference Bypass Switch in the remote VNA.

**VB Syntax**

```vbnet
value = cap.IsReferenceBypassSwitchPresent(n)
```

**Variable**

- `value` (Boolean) - Variable to store the returned value.
  - True - Reference Bypass Switch is present.
  - False - Reference Bypass Switch is not present.

- `cap` A `Capabilities` (object)

- `n` (Long) - port number to query for reference bypass switch

**Return Type**
Boolean

**Default**
Not Applicable

**Examples**

```vbnet
value = cap.IsReferenceBypassSwitchPresent(1) 'Read
```

**C++ Syntax**

```csharp
HRESULT get_IsReferenceBypassSwitchPresent(long portNumber, VARIANT_BOOL * present);
```

### Item Property

<table>
<thead>
<tr>
<th>Description</th>
<th>Add or change a name-value pair in the Cal Set, or read the value associated with a name.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>After editing, <strong>Save</strong> the CalSet to the VNA.</td>
</tr>
<tr>
<td><strong>About Name-Value pairs</strong></td>
<td>A Cal Set name-value pair is a general purpose data structure that maps a name to a value. This property allows you to associate a name with a value. Then, using this same property, you can read the value using the name.</td>
</tr>
<tr>
<td></td>
<td>For example, one of the items added by the VNA firmware to every Cal Set is named 'Created By'. The value attached to this item is the name of the VNA App that created the Cal Set. When an SMC cal is performed, you can query the Cal Set for the 'Create By' item, and it will return 'Scalar Mixer/Converter'. The same query on an NFx channel returns 'Noise Figure Converters'.</td>
</tr>
<tr>
<td><strong>Warning</strong></td>
<td>Do NOT change the name or value of any Items that you did NOT create. Otherwise, the VNA firmware may behave unpredictably.</td>
</tr>
<tr>
<td><strong>See Also</strong></td>

### IterationNumber Property

<table>
<thead>
<tr>
<th>Description</th>
<th>Sets and returns the maximum leveling sweep iterations to be used in order to achieve the tolerance setting.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>VB Syntax</strong></td>
<td><code>RxLevel.IterationNumber(srcPort) = value</code></td>
</tr>
<tr>
<td><strong>Variable</strong></td>
<td><em>(Type)</em> - Description</td>
</tr>
<tr>
<td><code>RxLevel</code></td>
<td>A ReceiverLeveling Object</td>
</tr>
<tr>
<td><code>srcPort</code></td>
<td>(Long Integer) Source port for which to set the IterationNumber for Receiver Leveling.</td>
</tr>
</tbody>
</table>

**Note:** If the source port is defined by a string name, such as an external source, a balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model, then use `chan.getPortNumber` to translate the string into a port number. To learn more see Remotely Specifying a Source Port.

| **value** | (Long Integer) Max iterations. Choose a value between 1 and 25. |
| **Return Type** | (Long Integer) |
| **Default** | 5 |

| **Examples** | `rxLevel.IterationNumber (1) = 10` 'Write' |
| *value = rxLevel.IterationNumber 2' 'Read* |

| **C++ Syntax** | `HRESULT get_IterationNumber(long port, long* pVal);` |
| | `HRESULT put_IterationNumber(long port, long newVal);` |

| **Interface** | IReceiverLevelingConfiguration |
IterationsTolerance Property

**Description**
This command, along with MaximumIterationsPerPoint Property deal with adjustments made to the source power.

Sets the maximum desired deviation from the sum of the test port power and the offset value. Power readings will continue to be made, and source power adjusted, until a reading is within this tolerance value or the max number of readings has been met. The last value to be read is the valid reading for that data point.

The following two commands allow for settling of power readings.

**ReadingsPerPoint Property**

**ReadingsTolerance Property**

**VB Syntax**

```
pwrCal.IterationsTolerance = value
```

**Variable**

(Variable) - Description

- `pwrCal` (object) - A SourcePowerCalibrator (object)
- `value` (Double) – Tolerance value in dBm. Choose any number between 0 and 5

**Return Type**
Double

**Default**
.05 dB

**Examples**

```
Set powerCalibrator = pna.SourcePowerCalibrator
powerCalibrator.IterationsTolerance = .1 'Write
ReadTol = powerCalibrator.IterationsTolerance 'Read
```

**C++ Syntax**

```
HRESULT get_IterationsTolerance( double *pVal);

HRESULT put_IterationsTolerance( double newVal);
```

**Interface**
ISourcePowerCalibrator3
## KaiserBeta Property

<table>
<thead>
<tr>
<th>Description</th>
<th>Sets or returns the Kaiser Beta of Time Domain transform windows</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>VB Syntax</strong></td>
<td><code>trans.KaiserBeta = value</code></td>
</tr>
<tr>
<td><strong>Variable (Type) - Description</strong></td>
<td></td>
</tr>
<tr>
<td><code>trans</code></td>
<td>A Transform (object)</td>
</tr>
<tr>
<td><code>value</code></td>
<td>(single) - Kaiser Beta. Choose any number between 0 and 13.</td>
</tr>
<tr>
<td><strong>Return Type</strong></td>
<td>Single</td>
</tr>
<tr>
<td><strong>Default</strong></td>
<td>0</td>
</tr>
<tr>
<td><strong>Examples</strong></td>
<td><code>trans.KaiserBeta = 6 'sets the Kaiser Beta of a transform window</code></td>
</tr>
<tr>
<td></td>
<td><code>KB = trans.KaiserBeta 'Read</code></td>
</tr>
<tr>
<td><strong>C++ Syntax</strong></td>
<td>HRESULT get_KaiserBeta(float *pVal)</td>
</tr>
<tr>
<td></td>
<td>HRESULT put_KaiserBeta(float newVal)</td>
</tr>
<tr>
<td><strong>Interface</strong></td>
<td>ITransform</td>
</tr>
</tbody>
</table>
### L0 Property

**Description**
Sets and Returns the L0 (L-zero) value (the first inductance value) for the calibration standard.

To set the other inductance values, use L1, L2, L3.

**VB Syntax**
```vbnet
calstd.L0 = value
```

**Variable (Type) - Description**
- `value` (single): Value for L0 in femtohenries (1E-15)

**Return Type**
Single

**Default**
Not Applicable

**Examples**
```vbnet
calstd.L0 = 15 'Write the value of L0 = 15 femtohenries
Induct0 = calstd.L0 'Read the value of L0
```

**C++ Syntax**
```cpp
HRESULT get_L0(float *pVal)
HRESULT put_L0(float newVal)
```

**Interface**
ICalStandard
L1 Property

Description: Sets and Returns the L1 value (the second inductance value) for the calibration standard.

To set the other inductance values, use L0, L2, L3.

VB Syntax: `calsld.L1 = value`

Variable (Type) - Description:
- `value`: (single) - Value for L1.

Return Type: Single

Default: Not Applicable

Examples:
- `calsld.L1 = 15 'Write the value of L1`
- `Induct1 = calsld.L1 'Read the value of L1`

C++ Syntax:
- `HRESULT get_L1(float *pVal)`
- `HRESULT put_L1(float newVal)`

Interface: ICalStandard
L2 Property

Description  Sets and Returns the L2 value (the third inductance value) for the calibration standard.
To set the other inductance values, use L0, L1, L3.

VB Syntax  
\[ \text{calstd}.L2 = \text{value} \]

Variable  
- \(\text{calstd}\) (Type) - Description
- \(\text{value}\) (single) - Value for L2.

Return Type  Single

Default  Not Applicable

Examples  
\[ \text{calstd}.L2 = 15 \ 'Write the value of L2. \]
\[ \text{Induct2} = \text{calstd}.L2 \ 'Read the value of L2 \]

C++ Syntax  
- HRESULT get_L2(float *pVal)
- HRESULT put_L2(float newVal)

Interface  ICalStandard
## L3 Property

<table>
<thead>
<tr>
<th>Description</th>
<th>Sets and Returns the L3 value (the third inductance value) for the calibration standard. To set the other inductance values, use L0, L1, L2.</th>
</tr>
</thead>
<tbody>
<tr>

<tr>
<td><strong>C++ Syntax</strong></td>
<td>HRESULT get_Label(BSTR *pVal)</td>
</tr>
<tr>
<td></td>
<td>HRESULT put_Label(BSTR newVal)</td>
</tr>
<tr>
<td><strong>Interface</strong></td>
<td>ICalStandard</td>
</tr>
</tbody>
</table>
# Label Property

**Description**
Sets or gets the display label for a given channel/testset combination. The label appears in a status bar at the bottom of the VNA display when the `ShowProperties` property is set to TRUE.

**VB Syntax**
```vbnet
tset.Label(chNum) = value
```

**Variable**

- **tset**  
  A `TestsetControl` object. Obtained from the `ExternalTestsets` collection.

- **chNum**  
  (Integer) Channel number of the measurement.

- **value**  
  (String) The text of the label.

**Return Type**
String

**Default**
None

**Examples**

The following sets the label for channel 5 corresponding to a given testset object.

```
testset1.label(5) = 'High-power output'
```

**C++ Syntax**

```c++
HRESULT get_Label(long channelNum, BSTR *pLabel);
HRESULT put_Label(long channelNum, BSTR label);
```

**Interface**
`ITestsetControl`
LANConfiguration Property

Description
Returns information about the current status of the VNA’s computer networking configuration. This is the same set of information that is returned in an NA_IPConfiguration data structure by the GetIPConfigurationStruct method.

VB Syntax
value = app.LANConfiguration

Variable
(Type) - Description
value (String) Variable to contain the VNA’s LAN configuration string
app An Application (object)

Return Type
Comma-delimited string

Default
Not Applicable

Examples
networkConfigInfo = app.LANConfiguration

C++ Syntax
HRESULT get_LANConfiguration (BSTR * pStrConfig);

Interface
IApplication13
About Source Power Cal

LastCalPassedTolerance Property

<table>
<thead>
<tr>
<th>Description</th>
<th>Returns the pass / fail status of the tolerance limits of the target power from the most recent source power cal.</th>
</tr>
</thead>
<tbody>
<tr>
<td>VB Syntax</td>
<td><code>value = pwrCal.LastCalPassedTolerance</code></td>
</tr>
<tr>
<td>Variable</td>
<td><strong>pwrCal</strong> <em>(object)</em> – A <em>SourcePowerCalibrator</em> (object)</td>
</tr>
<tr>
<td>value</td>
<td><em>(boolean)</em> -</td>
</tr>
<tr>
<td></td>
<td><strong>False</strong> – Source power cal did NOT achieve the specified tolerance limits.</td>
</tr>
<tr>
<td></td>
<td><strong>True</strong> – Source power cal DID achieve the specified tolerance limits.</td>
</tr>
<tr>
<td>Return Type</td>
<td>Boolean</td>
</tr>
<tr>
<td>Default</td>
<td>Not Applicable</td>
</tr>
<tr>
<td>Examples</td>
<td><code>status = powerCal.LastCalPassedTolerance</code> 'Read'</td>
</tr>
<tr>
<td>C++ Syntax</td>
<td><code>HRESULT get_LastCalPassedTolerance(VARIANT_BOOL *bState);</code></td>
</tr>
<tr>
<td>Interface</td>
<td>ISourcePowerCalibrator7</td>
</tr>
</tbody>
</table>
### LastLevelingAsSPC Property

**Description**
Sets and returns the state of **Use Last Result for Source Power Cal**. When Leveling Mode is switched back to Internal, this feature turns Source Power Cal correction ON using the latest receiver leveling correction data.

**VB Syntax**
```vba
RxLevel.LastLevelingAsSPC(srcPort) = value
```

**Variable**

<table>
<thead>
<tr>
<th><strong>Type</strong></th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>RxLevel</strong></td>
<td>A ReceiverLeveling Object</td>
</tr>
<tr>
<td><strong>srcPort</strong></td>
<td>(Long Integer) Source port being used for Receiver Leveling.</td>
</tr>
</tbody>
</table>

**Note:** If the source port is defined by a string name, such as an external source, a balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model, then use `chan.getPortNumber` to translate the string into a port number. To learn more see [Remotely Specifying a Source Port](#).

**value**

- **True** - When Leveling Mode is switched back to Internal, Source Power Cal correction is turned ON using the latest receiver leveling correction data.
- **False** - When Leveling Mode is switched back to Internal, Source Power Cal correction is NOT turned ON.

**Return Type**
Variant Boolean

**Default**
False

**Examples**
```vba
rxLevel.LastLevelingAsSPC (1) = True ' Write
value = rxLevel.LastLevelingAsSPC 2 ' Read
```

**C++ Syntax**
```cpp
HRESULT get_LastLevelingAsSPC(long port, VARIANT_BOOL* pVal);

HRESULT put_LastLevelingAsSPC(long port, VARIANT_BOOL newVal);
```

**Interface**
IReceiverLevelingConfiguration2
### LastModified Property

<table>
<thead>
<tr>
<th>Description</th>
<th>Returns the time stamp of the last modification to this Cal Set. The time is returned in the local time zone setting of the VNA.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>VB Syntax</strong></td>

</tr>
<tr>
<td>or</td>
<td></td>
</tr>
<tr>
<td></td>
<td>CalSet (object) - Read-only property</td>
</tr>
<tr>
<td>value</td>
<td>(Variant) – Variable to store the time stamp.</td>
</tr>
<tr>
<td><strong>Return Type</strong></td>
<td>Variant</td>
</tr>
<tr>
<td><strong>Default</strong></td>
<td>Not Applicable</td>
</tr>
<tr>
<td><strong>Examples</strong></td>
<td>date = CalSet.LastModified 'Read</td>
</tr>
<tr>
<td><strong>C++ Syntax</strong></td>
<td>HRESULT get_LastModified(VARIANT* datetime)</td>
</tr>
<tr>
<td><strong>Interface</strong></td>
<td>ICalSet3</td>
</tr>
</tbody>
</table>
### LegacyGroupDelayApertureMath Property

Sets the group delay aperture to use the legacy computation method.

**VB Syntax**

```vbnet
pref.LegacyGroupDelayApertureMath = value
```

**Variable** *(Type) - Description*

- **pref** - A Preferences *(object)*
- **value** - *(Boolean)* - Choose from:

  - True - Use legacy computation method.
  - False - Do not use legacy computation method.

**Return Type**

Boolean

**Default**

False

**Examples**

```vbnet
pref.LegacyGroupDelayApertureMath = True 'Write

gda = pref.LegacyGroupDelayApertureMath 'Read
```

**C++ Syntax**

```cpp
HRESULT get_LegacyGroupDelayApertureMath(VARIANT_BOOL* pVal);
HRESULT put_LegacyGroupDelayApertureMath(VARIANT_BOOL pVal);
```

**Interface**

IPreferences19
Write/Read  

About Receiver Leveling

**LevelingIFBW Property**

<table>
<thead>
<tr>
<th>Description</th>
<th>Sets and returns the IFBW to be used for leveling sweeps. Enable separate IFBW for leveling sweeps using <em>FastMode Property</em>.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>VB Syntax</strong></td>
<td><em>RxLevel.LevelingIFBW(srcPort) = value</em></td>
</tr>
<tr>
<td><strong>Variable</strong></td>
<td><em>(Type)</em> - Description</td>
</tr>
<tr>
<td><strong>RxLevel</strong></td>
<td>A <em>ReceiverLeveling</em> Object</td>
</tr>
<tr>
<td><strong>srcPort</strong></td>
<td>(Long Integer) Source port for which to set the LevelingIFBW for Receiver Leveling.</td>
</tr>
</tbody>
</table>

**Note:** If the source port is defined by a string name, such as an external source, a balanced port, or one of the Source 2 outputs on the 2-port 2-source PNA-X model, then use *chan.getPortNumber* to translate the string into a port number. To learn more see *Remotely Specifying a Source Port*.

<table>
<thead>
<tr>
<th><strong>value</strong></th>
<th>(Double) IFBW for leveling sweeps in Hz. The list of valid IF Bandwidths is different depending on the VNA model. See <em>list</em>. If an invalid number is specified, the VNA will round up to the closest valid number.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Return Type</strong></td>
<td>(Double)</td>
</tr>
<tr>
<td><strong>Default</strong></td>
<td>100 kHz</td>
</tr>
</tbody>
</table>
| **Examples** | *rxLevel.LevelingIFBW (1) = 1e3*  'Write'  
 *value = rxLevel.LevelingIFBW 2' Read* |
| **C++ Syntax** | HRESULT get_LevelingIFBW(long port, double* pVal);  
 HRESULT put_LevelingIFBW(long port, double newVal); |
| **Interface** | IReceiverLevelingConfiguration |
# Limit Property

Sets and returns the power limit for the specified port.

**VB Syntax**

```vbnet
gpl.Limit (port) = value
```

**Variable**

- **gpl**: A `GlobalPowerLimit` object
- **port**: `Long` - Port number for which power limit value is to be set.
- **value**: `Double` - Power limit value. Choose a value between -27 dBm (approximately) and the max settable power for the VNA.

**Return Type**

Double

**Default**

100 dBm for all ports

**Examples**

```vbnet
jgl.Limit(1) = 0 'Write
Limit = jgl.Limit(2) 'Read
```

**C++ Syntax**

```cpp
HRESULT get_Limit(long port, double *pVal)
HRESULT put_Limit(long port, double newVal)
```

**Interface**

`IGlobalPowerLimit`
## LimitCmd Property

**Description**  
Sets and returns a user-defined command string that is used to set the DC limit of the external DC source. The actual limit value is set using either the `VoltageLimit` (voltage) or `CurrentLimit` (current). The limit command is sent to the external DC source at the beginning of a sweep for each channel. The firmware automatically selects the current or voltage limit value depending on the external DC source type.

**VB Syntax**  
```
extDC.LimitCmd = value
```

**Variable (Type) - Description**

- **extDC**  
  An `ExternalDCDevice` (object)
- **value**  
  (String) User-defined command name: Include `{%f}` in the command string which will be substituted by the actual limit value.

**Return Type**  
String

**Default**  
Not Applicable

**Examples**

```vbnet
extDC.LimitCmd = "myDCDevice","Limit Command {%f}" 'Write

value = extDC.LimitCmd 'Read
```

**C++ Syntax**

```
HRESULT get_LimitCmd (BSTR* cmd)
HRESULT put_LimitCmd (BSTR cmd)
```

**Interface**  
`IExternalDCDevice4`
### LimitFrequency Property

<table>
<thead>
<tr>

<tr>
<td></td>
<td><em>value</em></td>
</tr>
<tr>
<td><strong>Return Type</strong></td>
<td>Double</td>
</tr>
<tr>
<td><strong>Default</strong></td>
<td>0</td>
</tr>
<tr>
<td><strong>Examples</strong></td>
<td>Set <code>limtseg = meas.LimitTest(1)</code>&lt;br&gt;<code>limtseg.EndResponse = 10</code> <em>(Write)</em>&lt;br&gt;<code>EndResp = limtseg.EndResponse</code> <em>(Read)</em></td>
</tr>
<tr>
<td><strong>C++ Syntax</strong></td>
<td>HRESULT <code>get_EndResponse(double *pVal)</code>&lt;br&gt;HRESULT <code>put_EndResponse(double newVal)</code></td>
</tr>
<tr>
<td><strong>Interface</strong></td>
<td>ILimitSegment</td>
</tr>
</tbody>
</table>
## LimitMax Property

<table>
<thead>
<tr>
<th>Description</th>
<th>Sets and returns the Max DC limit value for a DC source.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>VB Syntax</strong></td>
<td><code>dc.LimitMax(deviceName) = value</code></td>
</tr>
<tr>
<td><strong>Variable</strong></td>
<td>(Type) - Description</td>
</tr>
<tr>
<td><code>dc</code></td>
<td>A DCStimulus (object)</td>
</tr>
<tr>
<td><code>deviceName</code></td>
<td>(String) Name of the &quot;DC source&quot;</td>
</tr>
</tbody>
</table>

Use Source Property to read a list of configured DC source names.

- **value** (Double) Max DC limit value. Choose a value within the range of the DC source.

<table>
<thead>
<tr>
<th>Return Type</th>
<th>Double</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Default</strong></td>
<td>10</td>
</tr>
</tbody>
</table>

**Examples**

```vbnet
dc.LimitMax("myDCSource") = 10 'Write
value = dc.LimitMax("myDCSource") 'Read
```

**C++ Syntax**

```cpp
HRESULT get_LimitMax(BSTR deviceName, double* value);
HRESULT put_LimitMax(BSTR deviceName, double value);
```

**Interface**

IDCStimulus2
## LimitMin Property

<table>
<thead>
<tr>
<th>Description</th>
<th>Sets and returns the Min DC limit value for a DC source.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>VB Syntax</strong></td>
<td><code>dc.LimitMin(deviceName) = value</code></td>
</tr>
<tr>
<td><strong>Variable (Type) - Description</strong></td>
<td></td>
</tr>
<tr>
<td><code>dc</code></td>
<td>A DCStimulus (object)</td>
</tr>
<tr>
<td><code>deviceName</code></td>
<td>(String) Name of the &quot;DC source&quot;</td>
</tr>
</tbody>
</table>

Use **Source Property** to read a list of configured DC source names.

<table>
<thead>
<tr>
<th><strong>value (Double)</strong></th>
<th>Min DC limit value. Choose a value within the range of the DC source.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Return Type</strong></td>
<td>Double</td>
</tr>
<tr>
<td><strong>Default</strong></td>
<td>-10</td>
</tr>
</tbody>
</table>

### Examples

```
dc.LimitMin("myDCSource") = -10    'Write
value = dc.LimitMin("myDCSource")  'Read
```

### C++ Syntax

```cpp
HRESULT get_LimitMin(BSTR deviceName, double* value);
HRESULT put_LimitMin(BSTR deviceName, double value);
```

### Interface

`IDCStimulus2`
## LimitTestFailed Property

**Description**: Returns the results of limit testing for the measurement.

**VB Syntax**: `testFailed = meas.LimitTestFailed`

**Variable**

- **(Type)** - Description
  - `testFailed` (boolean): Variable to store the returned value
    - **False**: Limit Test Passed
    - **True**: Limit Test Failed

- **meas**: A Measurement (object)

**Return Type**: Boolean

**Default**: False returned if there is no testing in progress.

**Examples**

```vbnet
Dim testRes As Boolean
testRes = meas.LimitTestFailed
MsgBox (testRes)
```

**C++ Syntax**: `HRESULT get_LimitTestFailed(VARIANT_BOOL* trueIfFailed)`

**Interface**: IMeasurement
## LimitTestXPosition Property

<table>
<thead>
<tr>
<th>Description</th>
<th>Sets and returns the X-axis position of the Limit Line Pass/Fail indicator on the VNA screen. The lower-left corner of the Pass/Fail indicator is the point of reference for positioning.</th>
</tr>
</thead>
<tbody>
<tr>
<td>VB Syntax</td>
<td><code>win.LimitTestXPosition = value</code></td>
</tr>
<tr>
<td>Variable</td>
<td><em>(Type)</em> - Description</td>
</tr>
<tr>
<td><code>win</code></td>
<td>A NAWindow (object)</td>
</tr>
<tr>
<td><code>value</code></td>
<td><em>(Double)</em> X-axis position. Choose a value between 0 (far left) and 10 (far right).</td>
</tr>
<tr>
<td>Return Type</td>
<td>Double</td>
</tr>
<tr>
<td>Default</td>
<td>7</td>
</tr>
<tr>
<td>Examples</td>
<td><code>win.LimitTestXPosition = 3</code> <em>(Write)</em></td>
</tr>
<tr>
<td></td>
<td><code>value = app.ActiveNAWindow.LimitTestXPosition</code> <em>(Read)</em></td>
</tr>
<tr>
<td>C++ Syntax</td>
<td>HRESULT get_LimitTestXPosition(double *pVal)</td>
</tr>
<tr>
<td></td>
<td>HRESULT put_LimitTestXPosition(double newVal)</td>
</tr>
<tr>
<td>Interface</td>
<td>INAWindow4</td>
</tr>
</tbody>
</table>
## LimitTestYPosition Property

<table>
<thead>
<tr>
<th>Description</th>
<th>Sets and returns the Y-axis position of the Limit Line Pass/Fail indicator on the VNA screen. The lower-left corner of the Pass/Fail indicator is the point of reference for positioning.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>VB Syntax</strong></td>
<td><code>win.LimitTestYPosition = value</code></td>
</tr>
<tr>
<td><strong>Variable</strong></td>
<td>(Type) - Description</td>
</tr>
<tr>
<td><code>win</code></td>
<td>A NAWindow (object)</td>
</tr>
<tr>
<td><code>value</code></td>
<td>(Double) Y-axis position. Choose a value between 0 (bottom) and 10 (top).</td>
</tr>
<tr>
<td><strong>Return Type</strong></td>
<td>Double</td>
</tr>
<tr>
<td><strong>Default</strong></td>
<td>0</td>
</tr>
<tr>
<td><strong>Examples</strong></td>
<td><code>win.LimitTestYPosition = 3 'Write</code></td>
</tr>
<tr>
<td></td>
<td><code>value = app.ActiveNAWindow.LimitTestYPosition 'Read</code></td>
</tr>
<tr>
<td><strong>C++ Syntax</strong></td>
<td>HRESULT get_LimitTestYPosition(double *pVal)</td>
</tr>
<tr>
<td></td>
<td>HRESULT put_LimitTestYPosition(double newVal)</td>
</tr>
<tr>
<td><strong>Interface</strong></td>
<td>INAWindow4</td>
</tr>
</tbody>
</table>
## Type (limit) Property

<table>
<thead>
<tr>
<th>Description</th>
<th>Specifies the Limit Line type.</th>
</tr>
</thead>
<tbody>
<tr>
<td>VB Syntax</td>
<td><code>limt(index).Type = value</code></td>
</tr>
<tr>
<td>Variable</td>
<td><strong>(Type) - Description</strong></td>
</tr>
<tr>
<td></td>
<td><code>limt</code> A LimitSegment (object)</td>
</tr>
<tr>
<td></td>
<td><code>index</code> (variant) - Limit line number in the LimitTest collection</td>
</tr>
<tr>
<td></td>
<td><code>value</code> (enum NALimitSegmentType) - Limit Line type. Choose from:</td>
</tr>
<tr>
<td></td>
<td>0 - <code>naLimitSegmentType_OFF</code> - turns limit line OFF</td>
</tr>
<tr>
<td></td>
<td>1 - <code>naLimitSegmentType_Maximum</code> - limit line fails with a data point ABOVE the line</td>
</tr>
<tr>
<td></td>
<td>2 - <code>naLimitSegmentType_Minimum</code> - limit line fails with a data point BELOW the line</td>
</tr>
<tr>
<td>Return Type</td>
<td>Long Integer</td>
</tr>
<tr>
<td>Default</td>
<td>0 - OFF</td>
</tr>
<tr>
<td>Examples</td>
<td><code>Set limts = meas.LimitTest</code></td>
</tr>
<tr>
<td></td>
<td><code>limts.Type = naLimitSegmentType_Maximum</code> 'Write</td>
</tr>
<tr>
<td></td>
<td><code>limitType = limts.Type</code> 'Read</td>
</tr>
<tr>
<td>C++ Syntax</td>
<td>HRESULT put_Type(tagNALimitSegmentType *pVal)</td>
</tr>
<tr>
<td></td>
<td>HRESULT get_Type(tagNALimitSegmentType newVal)</td>
</tr>
<tr>
<td>Interface</td>
<td>ILimitSegment</td>
</tr>
</tbody>
</table>
### LineDisplay Property

**Description**
Turns the display of limit lines ON or OFF. To turn limit TESTING On and OFF, use State Property.

**Note:** Trace data must be ON to view limit lines

**VB Syntax**
```
limits.LineDisplay = state
```

**Variable**
- **Type** - Description
- **limitst** A LimitTest *(object)*
- **state** *(boolean)*
  - **False** - Turns the display of limit lines OFF
  - **True** - Turns the display of limit lines ON

**Return Type**
Long Integer

**Default**
**True**

**Examples**
```
LimitTest.LineDisplay = true 'Write
lineDsp = LimitTest.LineDisplay 'Read
```

**C++ Syntax**
- HRESULT get_LineDisplay(VARIANT_BOOL *pVal)
- HRESULT put_LineDisplay(VARIANT_BOOL newVal)

**Interface**
ILimitTest
ListData Property

Description
Sets and returns the DC stimulus values per point from the specified DC source.

This setting overrides the Start and Stop DC settings for the channel. Only the values that are set with this command can be read by this command. The read command does NOT read the values that are set using the Start and Stop settings.

VB Syntax

\[ DCStim.ListData(name, port) = values \]

Variable

- **DCStim**: A DCStimulus (object)
- **name, port**: (String) Name of the DC source and source port.

Use Source Property to read a list of configured DC source names.

To set the DC source to be always ON, do NOT specify a port.

- **value**: (Variant) DC stimulus value array. The size of the array must equal the sweep point number.

Return Type
Variant array

Default
Not Applicable

Examples

'The following shows how to set a DC value for each data point

```vba
dim data(2)
data(0) = 1
data(1) = 2
data(2) = 1
DC.ListData("AO1") = data
```

'Read

```vba
varData = dc.ListData("AO1")
for i=0 to 2
msgbox (varData (i))
next
```
C++ Syntax

HRESULT get_ListData(BSTR name, VARIANT * pValue);
HRESULT put_ListData(BSTR name, VARIANT  newValue);

Interface

IExternalDCSource
Read/Write

**LoadCharFromFile Property**

**Description**
Sets and returns whether a Mixer characterization file is to be loaded. Specify and load the filename with `CharFileName Property`.

**VB Syntax**

```vbnet
VMC.LoadCharFromFile = bool
```

**Variable**

- **VMC** - VMCType (object)
- **bool** - (Boolean)

  - **True** - Load from file
  - **False** - Perform mixer characterization

**Return Type**

Boolean

**Default**

False

**Examples**

```vbnet
value = VMC.LoadCharFromFile
```

**C++ Syntax**

```c++
HRESULT put_LoadCharFromFile(VARIANT_BOOL bLoadCharFromFile);
HRESULT get_LoadCharFromFile(VARIANT_BOOL *bLoadCharFromFile);
```

**Interface**

VMCType
**LoadImpedance Property**

<table>
<thead>
<tr>
<th>Description</th>
<th>Sets and returns the load impedance of the pulse generator.</th>
</tr>
</thead>
<tbody>
<tr>
<td>VB Syntax</td>
<td><code>extPulseGen.LoadImpedance = value</code></td>
</tr>
<tr>
<td>Variable</td>
<td><em>(Type)</em> - Description</td>
</tr>
<tr>
<td><code>extPulseGen</code></td>
<td>An <code>ExternalPulseGenerator</code> <em>(object)</em></td>
</tr>
<tr>
<td><code>value</code></td>
<td><em>(Double)</em> Pulse generator load impedance.</td>
</tr>
<tr>
<td>Return Type</td>
<td>Double</td>
</tr>
<tr>
<td>Default</td>
<td>50</td>
</tr>
<tr>
<td>Examples</td>
<td><code>extPulseGen.LoadImpedance = 50</code> <em>(Write)</em></td>
</tr>
<tr>
<td></td>
<td><code>load = extPulseGen.LoadImpedance</code> <em>(Read)</em></td>
</tr>
<tr>
<td>C++ Syntax</td>
<td>HRESULT get_LoadImpedance (double *pValue)</td>
</tr>
<tr>
<td></td>
<td>HRESULT put_LoadImpedance (double newVal)</td>
</tr>
<tr>
<td>Interface</td>
<td>IExternalPulseGenerator</td>
</tr>
</tbody>
</table>
**LoadPort Property**

**Description**
Returns the load port number associated with an S-parameter reflection measurement. If the measurement is not a reflection S-parameter, the number returned by this property will have no meaning.

**VB Syntax**

```vbnet
loadPort = meas.LoadPort
```

**Variable**

- **loadPort**
  - *(Type)* - Description
  - *(long integer)* - The reflection measurement’s load port number.
- **meas**
  - A Measurement *(object)*

**Return Type**
Long Integer

**Default**
Not Applicable

**Examples**

```vbnet
Set meas = pna.ActiveMeasurement
loadPort = meas.LoadPort
```

**C++ Syntax**

```cpp
HRESULT get_LoadPort(long *pPortNumber);
```

**Interface**
IMeasurement
Write/Read

**LocalLockoutState Property**

**Description**
Prevents use of the mouse, keyboard, and front panel while your program is running. Use of these controls while this property is set TRUE causes an error message on the VNA display. To prevent these messages, see About Error Messages.

**VB Syntax**
```
app.LocalLockoutState = bool
```

**Variable**
(Type) - Description
- `app` - An Application (object)
- `bool` - Choose either:
  - **False** - User Interface is NOT locked out.
  - **True** - User Interface IS locked out.

**Return Type**
Boolean

**Default**
False

**Examples**
```
app.LocalLockoutState = True 'Write
block = app.LocalLockoutState 'Read
```

**C++ Syntax**
```
HRESULT get_LocalLockoutState(VARIANT_BOOL *State);
HRESULT put_LocalLockoutState(VARIANT_BOOL *State);
```

**Interface**
IApplication4
Locator Property

**Description**
Specifies the location, address, or ID string of the power meter / sensor that is used during a source power calibration.

Use **Path Property** to specify the type of interface.

**VB Syntax**
`pwrMtrInterface.Locator = value`

**Variable**
(Type) - Description

- `pwrMtrInterface` (object) - A PowerMeterInterface (object)
- `value` (string) - Location of the power meter / sensor, depending on the type of interface (**Path Property**)

- For **naGPIB**, address of the power meter. Choose any integer between 0 and 30.
- For **naUSB**, the ID string of the power sensor. Use **USBPowerMeterCatalog Property** to see a list of ID strings of connected power sensors.
- For **naLAN**, the hostname or IP address of the power meter.
- For **naANY**, any VISA resource string or a VISA alias.

**Return Type**
String

**Default**
Not applicable

**Examples**
- `pwrMeterInterface.Locator = "13"` 'GPIB address'
